Note: VA's Office of General Counsel is reviewing whether VAMC business practices where rates for individual authorizations are not negotiated are considered a contract subject to interest penalties. If VHA is found liable, it would be subject to pay retrospective interest penalties to Non-VA providers operating under individual authorizations and subject to greater interest penalties in the future.			

7.4.1   Process for Oversight of Interest Penalties

The Prompt Payment Act requires federal agencies to pay vendors in a timely manner. The Act stipulates that interest penalties apply when agencies pay vendors after the due date. When VHA enters into a contractual agreement with a Non-VA provider it is subject to the Prompt Payment Act. If a claim is not paid within 30 days of receipt, VHA must pay the applicable interest rate for each day the payment is delinquent.[188] To evaluate penalties our team interviewed stakeholders at CBO and at VAMCs. We analyzed penalty data supplied by CBO. We also discussed penalty processing with the Financial Services Center (FSC) in Austin.

---

[186] Per CBO Interest.xlsx 2014, "Penalties as % of Paid" = "Penalties" / "Paid Amount"

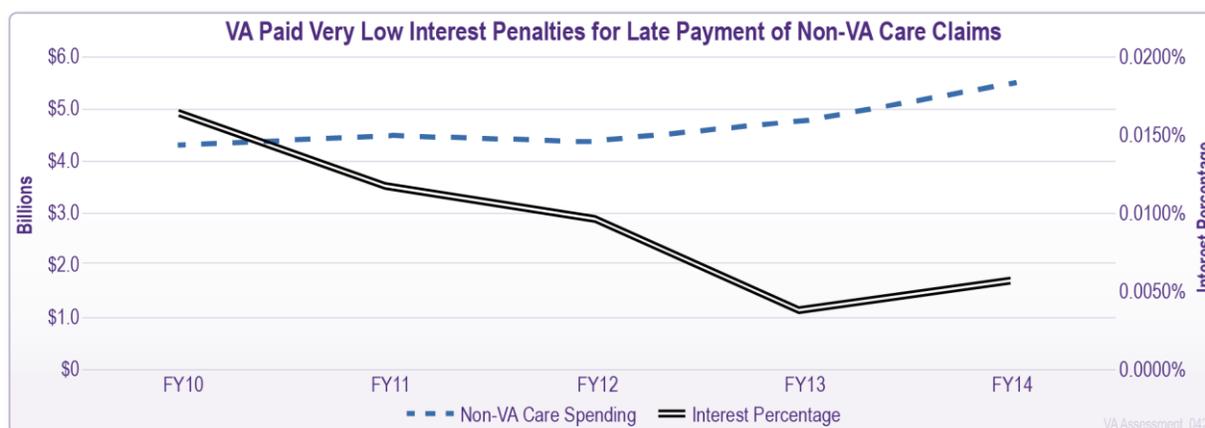
[187] AHIP Center for Policy and Research, Update: A Survey of Health Care Claims Receipt and Processing Times, 2013

[188] Note: Interest payments are calculated automatically in FMS based on Prompt Payment Act requirements. Interest rates may vary every six months.

Finding

1. **VHA does not conduct sufficient management and oversight activities to understand, manage, and prevent interest penalties paid to Non-VA providers.**

- In 2014, VHA incurred $292,217 in interest penalties on $5,580,590,777 of paid claims. Of these interest penalties, 39.9 percent were paid on contract nursing home and dental claims, which are not processed in FBCS. [189] VHA processes nursing home and dental claims manually in the VistA system.

Figure 7-8. Total Paid Claims and Percentage of Penalties[190]


- According to one benchmark for commercial payers, 0.8 percent of claims paid include a penalty or interest for late payment.[191] While the 0.005 percent interest paid as a percent of claims paid for Non-VA Care compares favorably to the private sector, a significant portion (approximately 50 percent) of Non-VA Care is provided through individual authorizations and not local contracts or national contracts such as PC3.[192] These individual authorizations with Non-VA providers serve as a guarantee VHA will pay for the services identified. However, because reimbursement rates are not negotiated VHA has not considered the authorizations to be a contract subject to the Prompt Payment Act. As a result, VHA did not pay interest on individual authorizations.

- In response to complaints from Non-VA providers regarding timely payment and requests for interest, VA's Office of General Counsel reviewed the process of individual authorizations to determine what constitutes a contract between the two parties. Now,

---

[189] Per Paid Data and Timeliness FY12-14 v2.xlsx prepared by VA informatics team; $112,359 interest in "Payment Category" "Community Nursing Home"; $4,191 in "Payment Category" "Dental". Total is $116,550, which is 39.9% of the total interest paid ($292,207).

[190] Per Paid Data and Timeliness FY12-14 v2.xlsx prepared by VA informatics team and Interest Report. The percentage of interest paid is calculated as "Penalties as % of Paid" = "Penalties" / "Paid Amount"

[191] AHIP Updated Survey of Health Insurance Claims Receipt and Processing Times, 2011

[192] Per CBO Purchased Care Operations Directorate

CBO considers individual authorizations, for which the rates are negotiated, the provider is identified, and services are identified as a contract. CBO recently released guidance to VAMCs instructing them that interest policies apply to these individual authorizations. OIG is reviewing whether interest should be back-paid for late payments on individual authorizations from prior years. CBO is currently awaiting the final decision of this review. If VHA is found liable, it would be subject to pay retrospective interest penalties to Non-VA providers operating under individual authorizations and subject to greater interest penalties in the future.[193] Future contracting trends such as expansion of PC3 may also affect VHA's exposure.

- While interest penalties are lower than commercial benchmarks VHA is at risk due to lack of oversight of interest at the facility level. VHA tracks the interest penalties imposed on each facility at the national level, but it is not communicated to the VAMCs. Several VAMCs indicated the inability to break down interest penalties by program. As a result, VAMCs may not be aware of how many penalties they have incurred to date.[194] The finance department at each VAMC monitors an interest report that includes payments for all products and services; however, finance department staff indicated challenges deciphering Non-VA Care specific interest. VHA organizes the report by obligation number; therefore, the finance staff must identify Non-VA Care obligations and extract them individually.

Recommendation

- Establish transparent reporting of interest at the facility level and stronger coordination between national and VAMC level management over interest penalties. Improving transparency at all levels will provide the ability to analyze and identify root causes of interest penalties on an ongoing basis, and proactively develop corrective actions.

- Modify reporting capabilities to report interest penalties at the program level. This will provide transparency into interest at the detailed level, and accelerate corrective actions in identifying and addressing root causes of interest charges.

- Define roles and responsibilities of staff who can drive avoidance of interest penalties. This addresses the need for awareness at the VAMC levels of the issues and risks that drive interest penalties.

- Develop an ongoing root-cause analysis and feedback program across VHA addressing interest penalties. Interest penalties are the result of process breakdowns in the claims payment process. Therefore, is it critical that the VAMC community has continuous visibility into what is working to eliminate interest penalties, and how to apply successful approaches to local requirements.

7.5   People

Our review of the people component of Non-VA Care identified themes centered on staffing and training. We detail our findings related to these functions in the following sections.

7.5.1   Staffing

To improve claims processing timeliness and accuracy in the face of increasing claims volumes, VHA needs to emphasize productivity of Non-VA Care claims processing staff. Effective staffing practices include assessing available resources, workload, and staff to develop and implement a structure that meets the organization's goals.[195] In addition to interviews across all levels of CBO and the VAMC, we observed staff interaction with FBCS to understand effects to productivity. Based upon our site visits and reviews, the following sections provide detail on our findings and recommendations related to people.

Findings

1. **The process to pay Non-VA providers requires higher staffing levels relative to other payers.**

- FBCS is heavily reliant on manual processes when compared to private sector health plans, which negatively affects timeliness and accuracy. FBCS auto-adjudicates zero percent of claims compared to private sector insurance benchmarks of 79 percent.[196]

- The inconsistencies in job responsibilities and functions contribute to the variations in claims timeliness and accuracy results across the country. Across VA, there are inconsistent practices regarding the responsibilities of Non-VA Care staff. In some locations, claims clerks and supervisors are involved in care coordination and work closely with the clinical staff responsible for authorizations, in addition to their claims processing responsibilities. A report released in early 2015 cited the system's failure to define roles, responsibilities, and processes as a contributing factor in organizational failure.[197] *Essentials of Managed Care* states, "Interruptions with telephones calls severely impedes claims adjudication productivity and quality if both tasks are assigned to the same at the same person."[198]

- The multitude of duties required of Non-VA Care staff contributes to higher staffing levels, an increase in processing errors, and slower manual processing of claims. Private sector plans more clearly segregate duties and have separate staff to perform ancillary tasks.

---

[195] Minnesota Department of Management and Budget, Strategic Staffing Guidebook, "The effective development and implementation of Strategic Staffing and its subsequent strategies and actions require the involvement and commitment of individuals who both participate in and access resources from the human resource function."

[196] AHIP (2013) Center for Policy and Research, Update: A Survey of Health Care Claims Receipt and Processing Times

[197] VHA (2015) Task Force on Improving Effectiveness of VHA Governance, Report to VHA under Secretary for Health

[198] Peter Kongstvedt "Essentials of Managed Care" Fifth Edition, 2007 Pg. 397

Currently, VHA staffs approximately 1.35 FTE per 1,000 Veterans using Non-VA Care services, not including current vacancies. [199,200] Industry experts estimate commercials payers staff at about .6 FTE per 1,000 members.[201,202] We recognize direct comparisons of Non-VA Care staffing levels against private sector health insurance plans is challenging due to the additional tasks Non-VA Care staff perform. For example, most private sector health plans employ provider relations staff to outreach to the health care provider community to facilitate issues affecting timely and accurate claims processing; and VHA does not. Other payers also employ member services staff dedicated to responding to member inquiries related to claims and eligibility; again, VHA does not. VHA claims clerks answer both provider and Veteran inquiries in addition to their claims processing responsibilities. Lack of automated technology also requires additional staff to process and pay claims.

- High staff vacancy rates and poor retention contribute to delays and errors in claims payment, which is further exacerbated since VHA does not have adequate technology. [203] Staff vacancies lead to higher overtime costs, inexperienced staff, and a constant focus on employee recruitment, training, retention, and negatively affects the timeliness and accuracy of claims payments. During the implementation of the Veterans Choice Act in October 2014, CBO leadership reported there were 295 vacant positions (out of 1,982 authorized positions) for Non-VA Care claims clerks, supervisor, and support positions, such as clinical staff and budget technicians.[204] Since the implementation of the Veterans Choice Act, CBO has indicated some progress reducing the number of staff vacancies; however, during our site visit interviews, we found staffing retention and vacancy rates to be a significant and widespread challenge facing local Non-VA Care operations.[205] In addition, CBO staff noted that Non-VA Care spends $1.7 million per year on claims processing staff overtime.[206]

---

[199] Calculation: Number of claims processing staff (1,687) divided by the number of unique Veterans that received Non-VA Care (1,252,710) x 1,000. The source of the claims processing staff is the CBO Purchased Care Operations Directorate and the source for the Veterans that received Non-VA Care is per Paid Data and Timeliness FY12-14 v2.xlsx prepared by CBO Department of Informatics; excludes Manila and VAMCs with less than 1000 claim lines.

[200] MITRE attempted to acquire Sherlock Benchmarks particularly for staffing, but was not able to come to an agreement with Sherlock.

[201] The volume of NVC claims represents a subset of all services rendered to the Veteran who access Non-VA Care. In contrast, commercial payers process claims for all services their members use. This difference in the calculation of this measure further demonstrates the disproportionate staffing levels at VA.

[202] Per Navigant Consulting industry subject matter expertise

[203] CBO Purchased Care Operations Directorate indicated that they began tracking staff turnover rates; however, they only began tracking this data in October 2014, limiting our ability to draw comprehensive conclusions. In addition, CBO tracks and reports turnover data on a pay period basis.

[204] Per CBOPC OPS FTEE by VISN.xlsx prepared by CBO Purchased Care Operations Directorate

[205] As of August 2015, there are currently 83 vacancies within Non-VA Care; however, over that same time, CBO transferred a number of positions to other departments, reducing the total number of authorized positions in Non-VA Care to 1,871. The CBO provided the updated number of staff vacancies and authorized positions but the data was not independently validated.

[206] Per Interviews with CBO Purchased Care

- CBO Purchased Care's headquarters has significant staffing vacancies. The requisite staff members are responsible for the oversight and administration of the overall Non-VA Care program. When leadership and key positions are vacant the implementation of necessary process improvement falters, and negatively affects claims processing performance.

- Due to limited availability of VA Care services and clinical staffing, VHA staff reported increases in Non-VA Care claims volume for some services, particularly behavioral health. At one VAMC staff noted that authorizations for behavioral health services have more than quadrupled, and described challenges with getting Non-VA behavioral health specialists to see VHA patients. The authorization process and the claims processing for behavioral health are often more complex and time consuming than more clearly defined medical or surgical services. Because of these complexities, many commercial payers outsource the management of behavioral health to firms that specialize in that field. The increase in Non-VA Care claims volumes requires adequate staffing and/or outsourcing to process claims timely and accurately.

Recommendations

To address these findings, CBO should:

- Refine job responsibilities so claims staff can specialize in core claims processing functions.[207] These roles and responsibilities should be standard across all VAMCs.

- CBO is assessing staffing levels across Non-VA Care. An objective of this process is the development of enterprise wide productivity standards. The study is scheduled to be completed in June 2015, and the results were not available at the time of this report.[208] We support CBO's efforts and recommend as Non-VA Care continues to evolve continually assessing staffing levels are appropriate to ensuring the accuracy and timeliness of claims processing.

- Continue to build the tiger team and deploy resources to alleviate claims backlogs, assist VAMCs or VISNs with vacancies and focus on timeliness and accuracy problems. [209] To manage spikes in claims volume and to work Choice claims, CBO trained clerks who can provide assistance to Non-VA Care departments across VHA. When deployed to assist VAMCs these teams are called VHA Tiger teams.

---

[207] Peter Kongstvedt's book Essentials of Managed Care discusses the advantages and disadvantages of dividing the roles and responsibilities of claims processors and member and provider focused delivery services. One advantage of claims clerks taking calls is the ability to resolve errors on claims and suspended claims and a potential disadvantage is that the caller may be inquiring about other issues that require transfer to a member or provider service representative. Kongstvedt also argues that constant interruptions of calls with members and providers would deter the accuracy and timeliness of the auto-adjudication process.
[208] Per Interviews with CBO Purchased Care
[209] Tiger teams can remotely access the FBCS system at local VAMCs to process claims.

- Review 2015 timeliness and accuracy data from all 21 VISNs, identify underperforming VAMCs, and utilize tiger teams to improve the timeliness and accuracy of processing Non-VA Care claims.

7.5.2 Training

Training is integral to improving timeliness and accuracy when paying claims. Effective training increases job satisfaction and improves work performance, particularly if training is tied directly to the mission.[210]

Leading practices are to provide mandatory onboarding training that introduces policies, procedures, and necessary skills. Onboarding programs include various activities that expose new hires to the culture of the organization and expectations based on roles and responsibilities. A report released by the Society for Human Resources Management suggests, "Formal orientation programs help new employees understand many important aspects of their jobs and organizations, including the company's culture and values, its goals and history and it is power structure."[211] Newly hired Non-VA Care staff members are assigned mentors who provide hands-on training, particularly on IT systems used to complete tasks. Due to the complexities of Non-VA Care claims processing, training is particularly essential to prevent deficiencies in Non-VA Care claims payment timelines and accuracy.

Finding

1. **Training for Non-VA Care claims payment staff is inconsistent not comprehensively applied across VHA.**

- Lack of consistent, comprehensive training requirements across Non-VA Care affects VHA's capability to ensure that CBO training reaches the intended audience and improves claims timeliness and accuracy. CBO leadership indicated adequate training is available for claims clerks and training materials are regularly updated; however, this training is not mandated for staff (aside from training on one FBCS Patch, which is a system upgrade/improvement to the FBCS).[212] At all four of the VAMCs we visited, Non-VA Care staff indicated that training was inconsistent. Claim clerks and supervisors indicated differences in how claims are processed at each VAMC. Assessment C noted that, "Existing VA guidance pertaining to purchased care is scattered, sometimes outdated, and inconsistent in setting clear standards, leaving local facilities to develop their own policies and procedures."[213]

---

[210] Per University of Rhode Island (2003). [Labor Research Center] Job Satisfaction. Retrieved from http://www.uri.edu/research/lrc/scholl/webnotes/Satisfaction.htm. "An employee's attitudinal response to his or her organization. As an attitude, job satisfaction is summarized in the evaluative component and composed of cognitive, affective, behavioral components. As with all attitudes, the relationship between satisfaction and behavior, most specifically job performance"
[211] Society for Human Resources Management (SHRM), Onboarding New Employees: Maximizing Success
[212] Per Interviews with CBO Purchased Care and VAMCs
[213] Assessment C - Page vi

- At present, VHA does not offer training programs for monitoring and managing Non-VA Care targeted to supervisors. A report released by the Office of Inspector General in 2009 presented similar findings, "VHA has not developed current and comprehensive fee policies and procedures, identified core competencies and established mandatory training requirements for fee staff, and implemented clear oversight responsibilities and procedures for the Fee Program. Furthermore, while the National Fee Program Office offers training for fee staff and supervisors, VHA does not require these employees to take the training."[214]

- One fee supervisor told our team it can take up to a year to train someone to properly process claims. With proper desk-level procedures, VHA can shorten the training window.[215]

- As noted above, the lack of a centralized claims processing system and the lack of standardized business processes hamper VHA's ability to develop standardized or keystroke training for all claims clerks. Since keystroke-level training and desk-level procedures are not available CBO and local VAMCs are forced to engage in one-on-one training efforts that are lengthy and not in uniform across VHA. Extended training periods result in timeliness and accuracy issues during these transition periods.[216]

- Additionally, VHA lacks an FBCS testing sandbox (training environment) for onboarding claims clerks; a clerk's first exposure to keying claims is with live claims in the production system.[217] A testing sandbox is a training tool for new hires to learn and understand the system without affecting live claims.

Recommendations

To address these findings, CBO should standardize the Non-VA Care claims processing methods and train claim clerks on the new methods by following the six recommendations below.

- Emphasize FBCS training and capabilities. In addition, when there are changes to policy, system, or procedures, CBO should include these changes in a recurring training program for all affected staff. The implementation of a structured training program will enable consistency across all Non-VA Care claims processing. Best practices include emphasizing the importance of onboarding training, particularly ensuring that new hires understand the organization's role of business, products, and the meaning of the systems processing instructions.[218]

- Identify and share positive deviant VAMCs Non-VA Care claims processing through analyses of the IPERIA reports and other audits. CBO should coordinate with VAMCs to

[214] OIG Audit of Veteran's Health Administration's Non-VA Care Outpatient Fee Program, Report No. 08-02901-185, August 3, 2009

[215] Per Interview with Salt Lake City VAMC

[216] Per Interview with CBO Learning and Development Directorate and four VAMCs

[217] Per Interview with CBO Learning and Development Directorate

[218] Peter Kongstvedt "Essentials of Managed Care" Fifth Edition, 2007 Pg. 397

facilitate targeted training programs that communicate leading internal practices to underperforming VAMCs, and provide the necessary training to improve payment timeliness and accuracy.

- Develop and conduct training in customer service skills for claims processors whose roles also include call center duty. Claims clerks and call center representatives require different training.

- Create a training program focused on the supervisory skill set needed by Non-VA Care supervisors. VHA should initiate and implement training focused on staff retention and professional development.

- Create a FBCS environment for staff to train on before keying live claims.

- Formulate a training plan that includes training methods that are interactive, engaging, and conducted consistently. In accordance with industry best practice, VHA should develop a comprehensive training program that includes classroom, web-based and CD-ROM courseware, conference calls, webinars, online simulations training in conjunction with their mentors. In addition, assessing the effectiveness of training is also as important to measure the effect of training staff competency and improvement.

7.6   Non-VA Care Summary of Findings and Recommendations

The following table summarizes the findings and recommendations presented in this chapter, providing further detail to identify each finding's significance and each associated recommendation's timeline and effect.

Table 7-9. Summary of Findings and Recommendations

FINDINGS	RECOMMENDATIONS	SIGNIFICANCE	TIMELINE	IMPACT
Patient Centered Community Care (PC3) is experiencing challenges in scheduling appointments and meeting administrative requirements of the PC3 vendor contracts.	CBO should work with VAMCs to ensure standardization and centralization of provider contracting has been realized. Consider allowing PC3 vendors to directly enter electronic medical documentation received from Non-VA Care providers into the VHA system	Tier 1	Short	Process, Technology

FINDINGS	RECOMMENDATIONS	SIGNIFICANCE	TIMELINE	IMPACT
VHA does not conduct sufficient management and oversight activities to understand, manage, and prevent interest penalties paid to Non-VA providers.	Analyze and identify the root cause of interest penalties and provide these analyses to VAMCs on a regular basis to ensure VHA tracks interest penalties appropriately, and, when penalties exist, implements corrective action.	Tier 1	Short	People, Process, Technology
Proactive and retrospective processes are in place to find inaccurate payments, but these practices are highly manual, in nature, and there is little evidence to show how effective some mechanisms are.	Improve current pre- and post-payment review and oversight practices, so that VHA is using the most effective and highly automated tools and practices with emphasis on automated pre-payment edit techniques.	Tier 1	Short	Process, Technology
Training for Non-VA Care claims payment staff is inconsistent and not comprehensively applied across VHA.	Emphasize FBCS training and capabilities. Emphasize the importance of onboarding training. Develop and conduct training in customer service skills for claims processors.	Tier 1	Short	Process, People

FINDINGS	RECOMMENDATIONS	SIGNIFICANCE	TIMELINE	IMPACT
Inadequate Non-VA Care claims submission guidance contributes to increased workload and payment errors.	Adopt a single set of practices and guidance for authorizing and paying Non-VA claims (including PC3 and Choice Program requirements). Apply consistent naming standards across departments responsible for authorization and payment.	Tier 2	Short	People, Process
Policy complexity for Staff and Non-VA Providers Results in a High Risk of Improper Payments and Causes Confusion, Inefficiencies, and Errors in a Manual Environment	Adopt a single set of practices and guidance for authorizing and paying Non-VA claims (including PC3 and Choice Program requirements). Apply consistent naming standards across departments responsible for authorization and payment.	Tier 2	Short	People, Process
Authorization requirements for Non-VA Care are unclear and inconsistent among VAMCs. Considerable claims do not reflect care authorized, leading to risk of improper payment.	Incorporate applicable CPT codes or ranges of CPT codes on the authorization to provide more clear and concise direction to the Non-VA provider. Analyze and report routinely the reasons for referrals for Non-VA Care nationally	Tier 2	Short	People, Process, Technology

FINDINGS	RECOMMENDATIONS	SIGNIFICANCE	TIMELINE	IMPACT
The process to pay Non-VA providers requires higher staffing levels relative to other payers.	Redefine job responsibilities to be more narrowly defined so claims staff can specialize in core claims processing functions. These roles and responsibilities should be standard across all VAMCs. Establish CBO-wide productivity standards for staff Continue to build the tiger team to quickly deploy resources and alleviate claims backlogs, assist VAMCs or VISNs with many vacancies and focus on VAMCs with timeliness and accuracy problems	Tier 2	Short	Process, Technology
Training for all staff responsible for processing and paying Non-VA Care clams is not consistently and comprehensively applied across VHA. Additionally, the lack of standardized policies and procedures at VHA contributes to inconsistencies with training.	Standardize the Non-VA Care claims processing methods and train claim clerks on the new methods	Tier 2	Short	People, Process, Technology

FINDINGS	RECOMMENDATIONS	SIGNIFICANCE	TIMELINE	IMPACT

Impacts People Process Technology				

8 Analysis of Information Technology—Lack of Automation and Integration Prevent VHA from Optimizing Performance in both Collections and Payments.

8.1 Introduction

Information Technology (IT) provides the foundation for the execution of VHA's revenue billing and collections and Non-VA Care vendor reimbursement processes. While Assessment H (Health Information Technology) from the Choice Act provides an in-depth assessment of VA's IT Strategies, and Assessment C provides an assessment of the authorities and mechanisms for purchased care, we focused on evaluating the effectiveness of VHA's primary IT systems used for billing and collection of revenue for VA Care and for processing payments for Non-VA Care.

The overarching finding and challenge identified for the IT systems during our assessment is that a lack of integrated automation is preventing VHA from optimizing collections and payments processes and outcomes.

8.1.1 Information Technology—History

The primary IT systems used to execute business processes across VHA Care and Non-VA Care Operations are the Veterans Health Administration Systems and Technology Architecture (VistA), Computerized Patient Record System (CPRS), and the Fee Based Claims System (FBCS).

Developed in-house in the 1990's from earlier VA information systems (the Decentralized Hospital Computer Program) VistA is an integrated outpatient and inpatient information system that supports day-to-day operations at local VHA facilities. VistA "consists of 104 separate computer applications, including 56 health provider applications; 19 management and financial applications; eight registration, enrollment, and eligibility applications; five health data applications; and three information and education applications. Besides being numerous, these applications have been customized at all 128 VHA sites."[219] [220]

In the 1990's, CPRS was released to provide an updated graphical user interface (GUI) to complement VistA capabilities. CPRS is a desktop client application that provides a single Windows-style interface for health care providers to review and update any patient information, to place orders, including medications, special procedures, x-rays, patient care nursing orders, diets, and laboratory tests stored and managed in the VistA Electronic Health Record (EHR).[221]

[219] Part III, VA Consolidated Financial Statements for FY2014, page 98. Retrieved from http://www.va.gov/budget/docs/report/2014-VAparPartIII.pdf

[220] First View Federal TS ,Veterans Health Administration Chief Business Office Current Enterprise Architecture Assessment Deliverable 0002AA v1.7.2, December 31, 2013

[221] The MITRE Corporation (2015). Assessment H (Health IT) Final Report. p115

Implemented throughout VHA in 2010, FBCS processes and pays Non VA medical care claims. FBCS electronic data processing allows for automated workload assignments and data capture for reporting. FBCS creates, tracks, and manages claim authorizations, and makes claim payments.[222]

8.1.2 Modernization Efforts

VistA 4, expected to be delivered in fiscal year 2018, is the next evolution of VistA. "VistA 4 is intended to harness the powerful core of software and business processes embedded within VistA and apply a modern computing architecture that is modular and extensible, fully leveraging VA's investment in VistA, and allowing for an interoperable EHR that provides patient-centered care to Veterans, Service members, and their dependents."[223] One of the objectives for VistA 4 is to "Establish and maintain methods to develop business (clinical and administrative) processes and revise existing procedures and policies that advance VA health care and health informatics capabilities"[224] VistA 4 capabilities will eventually replace CPRS. Assessment H provides more insight and analysis of the VistA 4 (i.e., VistA Evolution) program.

VHA initiated the Health Care Payment System (HCPS) development to be an automated system to replace FBCS. According to the Deputy Chief Business Officer (DCBO) for Purchased Care, the CBO identified a need in 2008 for a centralized claims processing system that would help improve Non-VA provided care payment accuracy and claims processing timeliness.[225] The system is approximately two-thirds completed, but as the incorrect funds were used for purchase and development it requires appropriate funding before it can be completed and put into operation.

In addition to these major system developments, VHA has plans to make incremental improvements to current tools. For example, VHA is improving the electronic Insurance Verification (eIV) functionality and strategizing on enhancements to FBCS.

Previous reports from the OIG and GAO have identified weaknesses in VA's control and oversight of payments made to Non-VA entities and have identified areas for improvement in collection reimbursements from third parties Appendix E provides an overview of previous reports addressing IT systems.

8.1.3 Key IT Systems Supporting Collections and Payments—Current State

Table 8-1 provides a summary of the primary and support systems used by key components of revenue cycle and Non VA Care operations. We recognize that this list may not include all systems and tools; our intent is to provide a summary of the primary systems and tools identified during our assessment.

Table 8-1. Key VHA Revenue Cycle and Non- VA Care Payment Systems

Process Area	Key Components	Key Systems and Tools

Patient Access	▪ Scheduling/Preregistration/Registration
	   o Insurance identification
	   o Veteran eligibility
	   o Demographics
		VistA
		Insurance Capture Buffer (ICB)
		Electronic Insurance Verification (eIV)

Clinical Processes	▪ Clinical Documentation
	   o Timeliness and accuracy
	   o Response to physician queries
	▪ Coding
	   o Receipt of clinical documentation
	   o Coding outpatient and inpatient Encounters
	   o Health Information Management Services (HIMS)
		CPRS
		Nuance (Computer Assisted Coding)
		VistA Billing Package
		Third Party Billing Software
		Billing Workflow Driver

Patient Accounting	▪ Billing
	   o First- and third-party billing
	   o Bill editor/edit checks
	   o Submission to payer
	   o Specialty billing
	▪ Accounts Management
	   o Follow up
	   o Denials management
		VistA (IB and AR)
		VistA Chargemaster
		Nuance
		CPAC Workflow Tool
		Payment Variance Tool
		Denials Management Tool
		FBCS

Vendor Reimbursement	▪ Vendor claim adjudication
	   o Authorizations
	   o Vendor payment
		FBCS
		VistA
		CPRS
		Program Integrity Tool
		Quality Inspector Tool

- VistA is currently the primary IT system to execute business processes. VistA includes AR and Integrated Billings (IB) modules. The AR module maintains the detailed records for

each receivable while the IB module provides functionality to create first-party and third-party bills. VistA also allows for the capture, maintenance, and storage of insurance data through the Insurance Capture Buffer (ICB).[226] Non-VA Care also uses VistA to perform the majority of the non-adjudication functions and for adjudicating claims not processed in FBCS.[227] Assessment H provides a more detailed assessment of VHA's information systems, including VistA.

- The clinical documentation captured in VHA's Clinical Patient Record System (CPRS) is the primary input required to code patient encounters. For VA Care, accurate coding of encounters is a prerequisite to third-party reimbursements. Non-VA Care uses CPRS predominantly for documentation of consults, and medical records management. Assessment H and Assessment F provide a more detailed assessment of VHA's CPRS.

- VHA staffs use FBCS for a majority of Non-VA Care claim processing. They also use FBCS to manage the authorization and payment for Non-VA medical care. FBCS interfaces with CPRS to populate basic fee consult information. FBCS automates certain elements of the administrative review. It allows for electronic claims submission and reimbursement.

- Nuance (QuadraMed) is VHA's national encoder software package. It is a coding and claims scrubbing system that checks encounters against national integrated billing edits that check for common errors. The Nuance system also has an audit and reporting mechanism and is widely used and accepted in the private sector.

We used a qualitative approach to evaluate the primary IT systems and tools during out assessment. Our approach included interviews with system users, process and system walkthroughs, review of industry benchmarking and comparison of key system functionality to industry best practices.

Overall, we noted that VHA's technical architecture around the revenue cycle lacks interoperability, causing many functions, or departments, within VA to operate in silos with limited visibility into the lifecycle of a claim. For Non-VA Care operations, FBCS does not process all of the required types of Non-VA Care vendor claims. Both revenue cycle and Non-VA Care systems require staff to be trained on and logged in to several different systems to perform their job responsibilities. In addition, the lack of key automation of activities and integration and access to the various systems and data necessitates a high degree of manual intervention for revenue cycle and Non-VA Care processes.

---

[226] First View Federal TS ,Veterans Health Administration Chief Business Office Current Enterprise Architecture Assessment Deliverable 0002AA v1.7.2, December 31, 2013

[227] Claims not processed through FBCS include: dental, pharmacy, adult day care, bowel and bladder, home health for contract nursing homes claims, and dialysis. Dialysis claims processed in separate COTS product, not FBCS or VistA.

8.2 VHA Revenue IT Findings

8.2.1 Inadequate Technology Prevents Effective Veteran Education, Delays Veteran Payment Plans and Delays Veteran Co-payment Collection.

In the private sector, financial counselors and the technology play a significant role in helping patients understand payment options, set up payment plans, pay out-of-pocket expenses, and resolve balances. Effective financial counseling available during Patient Intake serves to improve overall patient understanding and satisfaction as well as first party collections. Technology also enables private sector providers to calculate estimated charges and providing patients with estimated out-of-pocket expenses prior to rendering services. Consequently, private providers typically request a deposit or pro-rated amount during pre-registration or registration. Patients are instructed to be prepared to meet financial obligations prior to or on the day of the scheduled service. Leading practices are to train patient access personnel to appropriately identify and communicate with these patients.

Findings

1. **VHA does not have automated tools or functionality to provide real-time Veteran out-of-pocket responsibilities during scheduling, pre-registration, or registration/check-in.**[228]
   - The complications associated with service connected status, priority groups and tiered co-payment structures confuse VHA staff and Veterans alike. Lack of technology to assist with this determination negatively affects VHA's ability to collect.[229] Additional detail is located in the First Party collections section.

2. **VHA systems do not allow electronic submission of Veteran's payment plan forms.**
   - Currently the Veteran accesses the payment plan forms online, prints a completed form and sends via postal mail to each CPAC for manual review and processing. Our interviews with CPAC staff noted that CPACs can experience backlogs of payment plan processing due to process inefficiencies and volume of requests.[230]

3. **VHA systems lack functionality to automate first-party refunds and claims matching.**
   - VHA's first party refunds and claims matching process is extremely labor intensive and inefficient.[231] First party claims matching is the process of matching insurance payments and Veteran co-payments to appropriate claims for the correct dates of service. VHA uses

---

[228]Qualitative interviews at three CPACs indicated that this was an issue.

[229]Qualitative interviews at three CPACs indicated that this was an issue.

[230]One CPAC noted that they are experiencing a backlog of 30-45 days, equating to roughly 500-600 payment plans.

[231]Qualitative interviews at two CPACs indicated that this was an issue.

---

this information to offset co-payments, refunding the Veteran once insurance companies pay amounts due (it is offset dollar for dollar).[232]

- Our site visits and interviews found that the VHA claims-matching process is a manually intensive and often requires substantial rework when multiple insurance payments apply to a patient's claim. Interviews with CPAC staff highlighted that CPACs have a current claims matching backlog. [233] This necessitates VHA staff overtime hours, as well as use of outside contractors, to work and minimize the backlog.

- CPAC staff members must manually review all Non-VA Care co-payments made by Veterans in Non-VA facilities, to determine and process refunds due. This process and lack of adequate technology adds tremendous workload and pressure on already inundated CPAC staff.

4. **The Treasury Department's online platform, www.pay.gov, periodically posts payments to the wrong Veteran's account.**

- This site is used to help facilitate the collection of co-payments due from Veterans. Our interviews found that misapplication of payments is due to the website prompting Veterans to input their account number and amount due in a free-text field on the portal. Misapplied payments to Veteran's accounts require additional CPAC resources to investigate and resolve the issue.

Recommendations

- Working with OIT, VHA should invest in tools, technology, and/or functionality that will allow staff to a) provide patients with out-of-pocket responsibilities and b) perform automatic claims matching and adjustments for co-payments (for both VA and Non-VA Care). Patient Intake staff should electronically access the VHA co-payment schedules (see 10A.2.5.2) to explain co-payment amounts specific to the Veteran's status.
  - Enhancing system functionality for the generation of enhanced itemized statements for patients including information related to third-party payers billed, detail of charges (description, quantity, and amount), payments and adjustments, and contact information for billing and other questions will improve the Veteran's visibility into amount owed to VA.
  - Invest in technology that will automate the Veteran payment plan process. This includes functionality to calculate the optimum payment plan for each Veteran based on the patient's ability to pay and the organization's payment plan guidelines. The solution would incorporate a financial screening program that would create a plan in the best interest of VA and the Veteran, yielding a higher inclination to pay, and likely decreasing first party AR days-outstanding.

---

[232]Based on review of 38 CFR Part 17, RIN 2900-AP24. Expanded Access to Non-VA Care Through the Veterans Choice Program. November 5, 2014.

[233]Qualitative interviews with two CPACs identified this as an issue. One CPAC site identified a claims matching backlog.

- Coordinate with the Department of Treasury to redesign the user's experience on the www.pay.gov website and add the functionality to create unique profiles for each Veteran based on a secure unique identifier. By associating each patient's bill with a Veteran's unique identifier, it will allow the Veteran to log onto the www.pay.gov website, access their individual profile, and then have the ability to view their statements and submit payment for all associated outstanding debts to VA. This would assist in reducing misapplied patient payments, as well as reduce the administrative burdens of VA staff, decreasing overtime hours and allowing staff to focus additional time on other job responsibilities.

8.2.2 Significant Limitations in the Integration of Tools and Functions Across Clinical and Revenue Management Systems Increase Collection Delays and Denials.

Findings

1. **VistA has interoperability limitations (both internally and externally) that inhibits VHA's ability to bill and collect revenue accurately and timely.**

   - While interviews with VAMC staff revealed that the VistA system is working well for VHA clinicians and coders, they also revealed that VHA coders work in multiple systems (VistA and Nuance) to complete the same tasks. This results in coders losing valuable coder productivity due to multiple logs-ins to access different systems, inputting redundant data, and performing manual checks to ensure information matches.

2. **VHA systems are not integrated, inhibiting consolidated management reporting.**

   - We learned on our site visits that in order for supervisors to pull staff productivity metrics they have to switch between dashboards contained in multiple systems to aggregate reports.

3. **VHA's clinical systems do not automate diagnosis and linking functions as efficiently as private sector systems.**

   - In our experience, many private sector organizations are transitioning to technological solutions, such as computer-assisted coding (CAC) devices, to automate clinical documentation. CAC devices scan electronic documentation to identify key items, suggest medical codes that match the terms in the documentation, and convert text into ICD-9/ICD-10 and Current Procedural Terminology (CPT) codes.[234]

   - During site visit interviews, clinicians reported challenges using CPRS to link encounters with clinical documentation, which creates follow-up work for coders to resolve incomplete patient files. Interviews revealed that VA purchased ICD-10 coding software from Nuance but has not yet provided clinicians and coders with CAC devices.

4. **The VHA Chargemaster does not automatically apply codes to certain procedures and supplies as is industry standard.**

---

[234] International Classification of Diseases

- According to industry experts, the Chargemaster automatically applies codes to certain procedures and supplies so coders do not have to. The Chargemaster is typically updated with codes and charges immediately when the updates are available, and integrated with the hospital's coding system. According to VHA's HIMS, VHA's Chargemaster is not integrated with Nuance and does not apply codes automatically, requiring Coders to do so manually.

Recommendations

- VHA, working with OIT, should prioritize the integration of tools (and functions) across clinical administration and patient accounting systems. In particular, we recommend that VHA integrate medical records, coding, chargemaster and billing systems with single sign-on to facilitate expedited claims generation and payment. In addition, all non-clinical decision making should be automated, such as the determination of whether medical services fall under Veteran's service connected disability. One integrated system will allow billers and coders to access the information they need from one site rather than multiple sites, reducing human error, and time needed to complete tasks.

- Consider providing coders and clinicians with improved tools. CAC devices will help VHA streamline previously manual clinical documentation practices for clinicians and increase coder productivity by helping coder's process claims more quickly.[235] Investigate system enhancements to CPRS to help support clinician coding, such as auto coding functionality.

- Conduct studies in clinical management systems that have proven successful in large integrated health care systems in the private sector. We understand that VA is considering migrating HIMS coding and claims editing functionality to an automated billing system. VA should consider investing in an automated billing system option since it has the potential to reduce VA's operational costs and increase the quality of claims submitted to third party payers.

8.2.3 Annual CPT® Code Updates are not Implemented Timely Due to Inefficiencies in the VistA Update Process.

Finding

1. **Annual CPT® code updates are released every October/November by the American Medical Association. As they are effective January 1 of the next year, the industry standard is to load, test and implement CPT® updates prior to the end of the year.**

- VHA's annual CPT® code update process requires significant collaboration between HIMS, CBO, and OIT. While private sector providers update their systems with the new codes by January 1, our interviews revealed that VHA's process operates under a five to six month delay across all VAMCs and CPACs. This delay has a significant effect on revenue

---

[235] Note: We understand that VHA previously sought CAC devices; however, efforts did not materialize due to funding issues.

operations as VHA cannot bill a payer until the new CPT codes and prices are available. CPAC billing staff stated that they either hold bills where the CPT® codes have changed, or bill the provider expecting to receive an initial denial. Coding staff will also hold encounters if the CPT® codes need to be updated. This creates a coding backlog that may require the use of coding contractors to resolve.

- Once the new CPT codes are released every October/November, HIMS will post the new codes in January. The HIM Director stated that the 2015 CPT annual update was released to the field via a patch on January 8. CBO also updates the VHA Chargemaster with prices for each CPT code via a patch that is released by January 1. Once HIMS and CBO have posted the CPT codes and prices, OIT must develop and deploy a new patch.

- We learned that VHA's five to six month delay is due to the processes associated with developing, testing, and deploying the annual CPT patch to all VAMCs and CPACs. In developing the patch, OIT must review the CPT codes and Chargemaster files, build a patch using existing templates, conduct internal testing, and prepare developer documentation. OIT selects VHA test sites to release the new patch to, which requires the signing of a Memorandum of Understanding (MOU) with VAMC and VISN leadership. This testing, both internally and in the field, includes several steps for quality assurance and product approval. Once the patch is successfully tested in the field, it is released nationally. This process is extensive and involves feedback and approval from several entities within VHA

Recommendations

- Work with OIT to revise the current approach to implementing and releasing annual CPT® code updates so they are available by January 1. For example, develop multi-year MOUs to avoid having to select new test sites each year. This will bring VHA into alignment with the appropriate billing standards and the private sector practices.

- Planning efforts to integrate a patient accounting system should include an automated annual CPT code update process that requires less extensive system patches.

8.2.4 VHA Billing Staff are Manually Reviewing 100 percent of Claims Subsequent to Automated Claim Edits, Resulting in Significant Workload and Affecting Billing Timeliness.

Finding

1. **VHA's percent of manual review of claims is extremely high compared to the industry standard of 10-20 percent. The maturity of private sector billing edits requires less manual review.**[236]

---

[236] Qualitative interviews at three CPACs indicated that this was an issue. 10-20% industry standard is based on feedback from industry subject matter experts.

- We understand two primary drivers necessitate the manual review of VHA claims prior to submission to third-party payers.[237]

  o VHA has to test for service connectedness, a function that is unique to VA.

  o It is common for a VHA patient to have multiple services in one day, which adds to the complexity of the bill as driven by the policy.

- Due to the manual billing of claims, the CPACs have a combined 607 billers. In our experience with private sector, VHA could reduce the number of billers required if a manual review each claim after the claim editor process was not required.

Recommendations

- VHA, in coordination with VA OIT, should prioritize funding and accelerate planning efforts to integrate a patient accounting system that includes automated billing that will support algorithmic edits and, where appropriate, automate correction of claims to minimize manual review requirements. Once a new automated solution is developed and put into place, VHA should reevaluate staffing levels to account for the change in workload and reallocate personnel accordingly.

8.3 Non-VA Care IT Findings

8.3.1 Lack of Automation for Non-VA Care Claims Processing (via FBCS) Delays Payments, Causes Inaccuracies, and Increases Improper Payments.

In the private sector, payer systems typically automate claims processing. These payer systems carry an edit status or disposition. By assigning a disposition to an edit, the payer creates a framework to deny claims automatically, without manual intervention. Edits that are more complex carry a "suspend" disposition, and, in a typical commercial claims processing system, it is only those claims with a "suspend" status that require manual intervention.

Finding

1. **VHA's claim adjudication system, FBCS, lacks the functionality to adjudicate claims automatically.[238]**

- Manual review of edits is costly and time-intensive. Currently FBCS does not maintain an edit status or disposition. Clerks must manually works each edit that posts to the claim. To work the claim edit, a clerk analyzes the edit, edit description and other claims information to determine if the edit should be marked as "pay," "deny" or "reject."

---

[237]Qualitative interviews at three CPACs and interviews with CBO leadership described this process.

[238] As of January 2015, 0 percent of all claims auto adjudicated (Source: HAC Interview)

- The lack of automation leads to issues with paying claims timely and accurately, and when VA cannot pay for Non-VA -VA Care timely, VA accrues interest penalties.[239] A white paper released in 2011 addressing VA's "fee" program also noted the significant effect of limited automation of VA's claims systems on efficiency and accuracy of processing Non-VA and VA claims.[240] The manual nature of the system is the largest contributors for errors in the last three Improper Payments Elimination and Recovery Act (IPERA) reports.[241] In addition, Assessment C found, "Others have criticized the lack of updated automated processes for claims handling by VHA under the traditional purchased care program, noting that the primary application being used to handle claims from Non-VA providers is more than two decades old."

- Manually applying rules to claims inherently takes longer than computerized application of the same rules. For each item that VHA can automate, VHA saves processing time, reducing the payment window for claims and reducing the staff workload. Additionally, manual processes will never be as accurate as computerized processes – each manual step that can be automated leads to greater accuracy, increasing overall accuracy of claims payment.

- Although VHA is automating FBCS, there are additional areas that require manual claims reconciliation. While observing individual claims clerk, our team noted several points of manual intervention that payers typically automate. For example, in FBCS, claims clerks manually associate authorizations to claims (called distribution), batch claims for payment, and, for contracted claims and claims that should price at the billed charge, price claims.[242]

- For PC3 and claims that should price at the billed charge, the claim clerk needs to manually select the billed charge from a rate drop-down menu on the claim line.[243] Manually working claims introduces errors and takes longer than processing claims automatically. Our finding is consistent with the 2010 OIG Report, which found that VA's system is too manual.

---

[239] Per CBO Staff: VA Office of General Counsel (OGC) is reviewing whether "individual authorizations" meet the definition of a contract. If the determination is yes, this would mean "all" individual authorizations issued from individual VAMCs to providers would be a contract and would be applicable to prompt pay and interest payments. The previous OGC informal opinion was individual authorizations were not considered as contracts and did not meet the prompt pay requirements.

[240] National Academy of Public Administration, Veterans Health Administration Fee Program, Report No. 2165, September 2011.

[241] Per 2014 IPERIA AUDIT REPORT NVC FINAL DRAFT 101414.docx and IPERA 2013 Exec Sum DRAFT v3.docx. These documents summarize VHA's annual review (internal) of Non-VA Care improper payments in accordance with IPERIA.

[242] Peter Kongstvedt "Essentials of Managed Care" Fifth Edition, 2007 Pg. 433-435 shows that it is common practice to have the following payment methodologies automated in the adjudication engine: Fee Schedule pricing, Capitations, Discounting, Per Diem pricing, Case Rates, Diagnosis Related Grouper (DRG) pricing, Ambulatory Surgical Codes (ASC) pricing. Pricing is not automated in FBCS as described as a best practice in this text.

[243] Per Interviews/observations with four VAMCs

- We observed additional downstream technology processes for Non-VA Care that are highly manual. For example, we observed clerks rekeying or cutting and pasting data from one system to another as they created authorizations. Clerks then printed authorizations for future use in appointment follow-up.[244]

- All VAMCs that we visited and stakeholders at CBO reported the manual nature of VA's system negatively affected accuracy and timeliness.[245] Payment accuracy and timeliness directly affects providers' satisfaction with payers. As mentioned earlier, untimely payment of claims "translates into provider dissatisfaction with possible degradation of the network." Degradation of the network means loss of providers in a network, which could directly affect patient access for Non-VA and VA Care. For patients, this equates to fewer options when seeking care and potentially longer wait times when locating providers accepting Veterans.

2. **FBCS is not the claims system for all types of Non-VA Care.**

- The inability to process all claims in a consistent manner prevents standardized processes, procedures and training from materializing. For example, Dental and Long Term Care (LTC) claims cannot be processed through FBCS.[246] These claims require a much higher level of manual effort.[247]

Recommendations

- To address these findings, CBO should:

  o Develop and implement both a short-term and a long-term approach to reduce the degree of manual intervention in claims adjudication and other manual processes related to Non-VA Care business processes.

  o Prioritize in the short-term automation initiatives (presumably with FBCS). We understand VHA is enhancing FBCS to automatically reject duplicate claims—these will be the first Non-VA Care claims to go to a final status (e.g., Paid, Rejected, or Denied) without manual intervention.

  o Develop and implement a strategy to build or acquire a centralized, highly automated claims adjudication system. We recognize that VHA has initiated HCPS as the "centralized claims processing system that would help improve Non-VA provided care payment accuracy and claims processing timeliness."[248] We also understand that this initiative is currently on hold because of findings from a recent OIG investigation.[249] A

---

[244] Per Interview/observation with the Philadelphia VAMC

[245] Per Interviews with four VAMCs

[246] Claims not processed through FBCS include: Dental, Adult day care, bowel and bladder, Home Health for contract nursing homes claims, and Dialysis

[247] Claims processed in VistA take longer for staff to enter and process. These claims can only be billed on paper, and it takes a staff member longer to adjudicate a claim in VistA than in FBCS.

[248] Review of Alleged Misuse of VA Funds To Develop the Health Care Claims Processing System http://www.va.gov/oig/pubs/VAOIG-14-00730-126.pdf

[249] Ibid.

centralized and highly automated system is integral for VHA to standardize the claims adjudication process across VAMCs and, in turn, improve payment accuracy and timeliness.

8.3.2 Non-VA Care Providers Do Not Have Visibility into the Status of Claims Due to a Lack of Online, Automated Tools.

Finding

1.Currently providers cannot determine the status of their claim online, which results in them rebilling the claim, creating additional workload for VHA.

- Online access to claims status allows providers to easily check the status of claims and determine, for example, if the claim is suspended and under review. With this online information, providers would be more likely to wait for claims resolution instead of resubmitting.

- Nearly all commercial plans allow providers to check claim status online. Some providers also support health care claims status request (formerly referred to as EDI Claim transaction set 276/277) and response.

- Payers support these methods because it allows providers to obtain claim status at their convenience, as well as decreasing demand on the provider call center. In contrast, for Non-VA Care, claims clerks perform this function through telephone communication.[250] Allowing providers to check claim status online would lessen the workload of FBCS clerks, allowing them more time to process and resolve issues with incomplete claims, which should improve timeliness.

Recommendation

- CBO: Work with OIT to develop tools to provide the ability for providers to determine their claim status online. Transparency and convenience will lead to provider satisfaction and reduce the burden on the FBCS claims staff, which will increase claims payment timeliness. Providing online claim inquiry will reduce duplicate claims submitted by Non-VA Care providers that FBCS staff members must manually process, which will free them to pay claims more promptly. The approach should include the ability for providers to determine their claim status online. Transparency and convenience will lead to provider satisfaction and reduce the burden on the FBCS claims staff, which will increase claims payment timeliness. Providing online claim inquiry will reduce duplicate claims submitted by Non-VA Care providers that FBCS staff members must manually process, which will free them to pay claims more promptly.

---

[250] Per Interviews/Observations with four VAMCs

8.3.3   The Rate of Electronic Claims Submission for Non-VA Care is Low.

Finding

1.Non-VA providers submit few electronic claims to VA, which negatively affects payment timeliness and accuracy.

- Non-VA Care providers submitted 28.6 percent of their claims electronically for fiscal year 2014.[251] A comparable benchmark for commercial payers shows that 94 percent of providers submit electronically.[252] High levels of paper claims affect accuracy and timeliness. Some Non-VA Care providers are reticent to submit EDI claims to VHA because there is significant confusion regarding VA's billing rules, particularly those related to electronic claims submission.[253]

- For VHA and other payers, processing paper claims requires additional steps relative to processing electronic claims. VHA calls these steps Scan, Upload, and Verify. The "Scan" process transforms the information on the paper document into data for FBCS. The "Upload" process brings the data into FBCS. During "Verify," claims clerks manually ensure that the Optical Character Recognition (OCR) process read the data correctly. These steps are similar for other private payers.

- Generally, the more a payer electronically automates claims processing, the cheaper and more reliably their systems operate. Most commercial and other government payers actively encourage their providers to submit all claims electronically. Providers submit electronic claims using a national standard format, the Electronic Data Interchange (EDI) format. These national EDI standards include:
    - 837I—this is the electronic format for institutional providers (replaces the UB-04)
    - 837P—this is the electronic format for physicians and other providers (replaces CMS-1500)
    - 837D—this is the electronic format for dental providers (replaces ADA form).

- Since all EDI claims are processed at a central location then routed to a VAMC based on the Zip Code in which the Veterans resides, a portion of EDI claims route to the incorrect VAMC for processing.[254] This erroneous routing leads to delays in VHA paying claims and denials. Non-VA providers reported that they solve this issue through billing paper claims, which they manually route to the correct VAMC. One Non-VA Care provider stated that its facility initially bills all claims electronically. However, when VHA does not the claim processed within 45 days, it bills the same claim a second time through paper directly to

---

[251] Source: Per Paid Data and Timeliness FY12-14 v2.xlsx prepared by VA informatics team.

[252] AHIP Center for Policy and Research: An Updated Survey of Health Insurance Claims Receipt and Processing Times, 2011, published February 2013.

[253] Per Interviews with two VAMCs

[254] Per Discussion with Minneapolis VAMC, providers submit all EDI claims to one location. Claims are translated and sent to VA closest to the member (distribution uses members' zip code). If the service did occur in that VA's area, the claim is routinely denied, even if an authorization exists at another VAMC. Note: This VAMC was selected as a positive deviant as a result of their ability to pay claims accurately and timely.

---

the "correct" VAMC. VHA now has a duplicate claim issue to address, which consumes staff resources and affects accuracy. The American National Standards Institute (ANSI), "Chartered the Accredited Standards Committee (ASC) X12 to develop uniform standards for inter-industry electronic exchange of business transactions-electronic data interchange (EDI)." This body created the 837 implementation guides referenced above. However, payers create 837 "companion guides" to assist providers with further instructions on billing electronic claims. For example, Medicare states that they publish companion guides to, "Clarify, supplement and further define specific data content requirements to be used in conjunction with, and not in place of, the ASC X12," implementation guides. Currently, VHA does not have a companion guide to provide additional guidance on electronic claims submission.[255]

- Processing claims electronically is less costly and more accurate than paper claims. Electronic claims also process faster.[256]

Recommendations

To address these findings, CBO should:

- Increase EDI claims submission rates by creating provider manuals, known in the industry as 837 companion guides,[257] which will offer Non-VA Care providers the information they need to submit their claims electronically.

- Route EDI claims based on service authorization rather than Veteran Zip Code. VHA could use a "throw away"/currently unused EDI field to indicate the VAMC that issued the service authorization.

- Encourage, through contract provisions and preferential contacting approaches, Non-VA Care providers to submit electronic rather than paper claims.

- Create a provider portal so that providers can routinely check the status of submitted claims.

- Conduct outreach to providers submitting a large volume of paper claims, explaining billing rules and strongly encouraging electronic submission.

---

[255] Per CBO Purchased Care Operations Directorate

[256] Based on Navigant Consulting industry subject matter expertise

[257] 837 is the EDI standard for claims submission. All claims must be submitted in the 837 format per the EDI implementation guide. 837 companion guides are designed to describe the network-specific business requirements, above and beyond those found in the HIPAA claims standards.

8.3.4 The Non-VA Care Claims Processing System is Not Centralized, Leading to Inconsistencies in Standardizing Claims Processing Across VAMCs.

Findings

1. **There are discrepancies among deployed technical processes and local instances of FBCS, leading to inconsistent claims processing and the inability to establish keystroke-level training.**

- The CBO training team commented that creating keystroke-level training is nearly impossible without a centralized system. Keystroke-level training describes the work steps required to perform a function keystroke by keystroke.

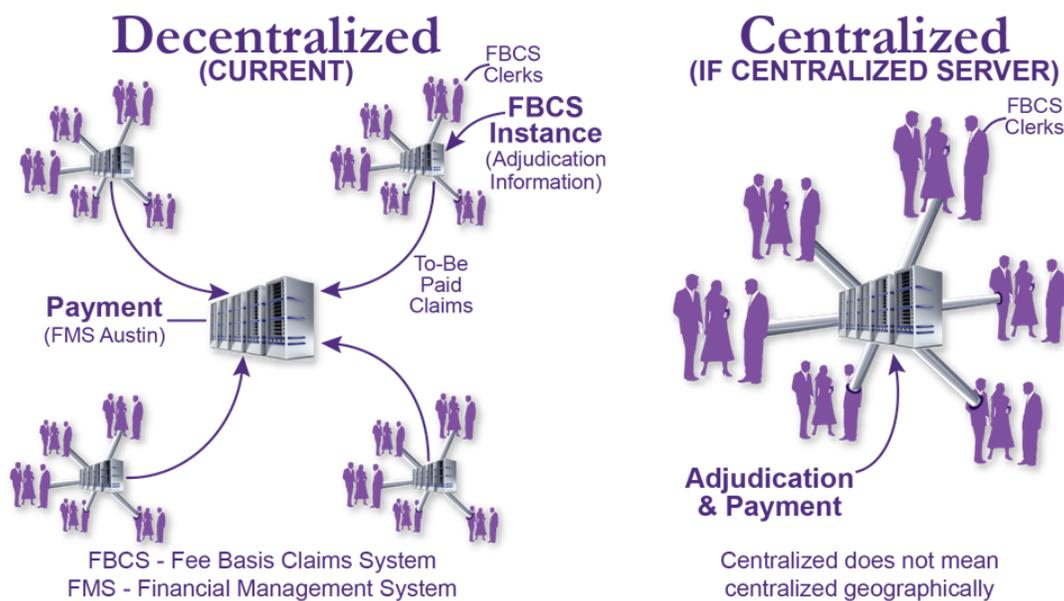
- The 2013 and 2014 IPERIA reports cited VA's decentralized structure as a factor leading to inaccurate claims processing.[258] Furthermore, two recent OIG reports recommended centralizing the Non-VA and VA Care claims processing system. In 2014, the OIG stated, "A centralized system will help with Mill Bill and unauthorized claims routing," while in 2010, the OIG stated:

  > "Efforts are needed to reduce the cost associated with processing claims and the time it takes to process claims by improving processing efficiencies. Inefficiencies occurred because of the Fee Program's decentralized structure and its labor-intensive payment system."

- Figure 8-1 highlights the nature of decentralized versus centralized processing. Moving to a centralized processing model will allow VHA to standardize functionality, improving claims processing consistency, and reducing the resources required to maintain the systems.

---

[258] Per 2014 IPERIA AUDIT REPORT NVC FINAL DRAFT 101414.docx and IPERA 2013 Exec Sum DRAFT v3.docx. These documents summarize VHA's annual review (internal) of Non-VA Care improper payments in accordance with IPERIA.

Figure 8-1. Decentralized Claims Processing System Inhibits Performance


Source: Grant Thornton's rendition of VHA's decentralized claims processing system

- Adding to the complexities of the decentralized Non-VA Care claims processing, some VAMCs run FBCS at their facilities; other VAMCs partner with VISNs; and others consolidate multiple VAMCs into a 'Consolidated Fee Unit' to process claims. For example, Philadelphia, part of VISN 4, processes a portion of its claims on-site, while all of VISN 19 claims process in one location. FBCS processes all Non-VA Care claims on one of 34 servers located across the nation, and each server represents a separate instance of FBCS.

Table 8-2. FBCS Server and Use Summary

Number of VAMCS using FBCS[259]	Number of locations processing claims[260]	Number of FBCS servers[261]
150	88	34

- VHA can deny Non-VA Care claims due to misrouting of claims. This can happen as another consequence of the decentralized claims processing system, and is an issue that angers and frustrates Veterans, according to interviews with VAMC personnel. Claims may route to a VAMC that did not create the authorization because a decentralized system

---

[259] The Manila VAMC does not use FBCS
[260] Per CBO Purchase Care Operations Directorate
[261] Per CBO Non-VA Care Way Forward Directorate

---

cannot reroute a claim to the correct VAMC.[262,263] Clerks do not always check other VAMCs for authorizations, and so they deny claims in cases where both the Veteran and provider were assured the services were approved for payment. In these cases, VHA sends a letter to the provider and Veteran communicating that the services are not reimbursable through VA, instructing the provider to seek reimbursement from the Veteran. This leads to extreme dissatisfaction on behalf of the Veteran and the provider. In a centralized system, all authorizations are in the same system, which will reduce these denial errors dramatically.

Recommendations

- CBO: Develop keystroke-level training for staff with clear and complete billing instructions for Non-VA Care providers with the implementation of a centralized, highly automated claims processing system.

- CBO: Centralize all claims processing functions to create standardization. The October 2014 organizational consolidation of claims processing will benefit the development and implementation of standards around processes, adoption of policies and use of technology.

  o We recognize CBO is in process of centralizing oversight of claims processing across five regions. A five-region approach should result in better performance and outcomes, similar to the MACs supporting CMS. This is a step in the right direction. In addition to consolidating leadership, VHA should consolidate the requisite staff members to support the centralization of a highly automated claims processing system. Additionally, a centrally deployed claims system will support standardization and uniform claims processing across business functions and geographically dispersed areas. VHA will also reap the benefits of standardized staff training and stronger internal controls.

- CBO/VHA: Resolve the funding issues that preclude the implementation of HCPS as the "centralized claims processing system that would help improve Non-VA provided care payment accuracy and claims processing timeliness."[264] We understand that this initiative is currently on hold as a result of findings from a recent OIG investigation.[265] Rectifying the issue is integral for VHA to standardize the claims adjudication process across VAMCs will improve payment accuracy and timeliness.

---

[262] Claims can be misrouted as the result of the EDI process or because the provider billed a paper claim to a VAMC that did not create the authorization.

[263] Per Minneapolis VAMC, clerks frequently deny claims for authorized services when the claim is misrouted to a VAMC that did not authorize the care. Theoretically, clerks can search for authorizations from other VAMCs on the same FBCS server, but more commonly, these are denied. This question was asked to staff at VISN 8 and Salt Lake City who confirm that this was a common problem across VHA.

[264] Review of Alleged Misuse of VA Funds To Develop the Health Care Claims Processing System http://www.va.gov/oig/pubs/VAOIG-14-00730-126.pdf

8.4 Information Technology Summary of Findings

The following table summarizes the findings and recommendations presented in this chapter, providing further detail to identify each finding's significance and each associated recommendation's timeline and effect.

FINDINGS	RECOMMENDATIONS	SIGNIFICANCE	TIMELINE	IMPACT
VA Care				
Inadequate technology prevents effective Veteran education, delays Veteran payment plans and delays Veteran co-payment collection	VHA should invest in tools, technology, and/or functionality that will allow staff to provide patients with real-time estimate of out-of-pocket expenses	Tier 1	Short	People, Process, Technology
Significant limitations in the integration of tools and functions across clinical and revenue management systems increase collection delays and denials	VHA should prioritize the integration of tools (and functions) across patient intake, clinical administration, and billing systems. In particular, we recommend VA to integrate medical records, coding, and billing systems with single sign-on to facilitate expedited claims generation and payment.	Tier 1	Medium	People, Process, Technology

FINDINGS	RECOMMENDATIONS	SIGNIFICANCE	TIMELINE	IMPACT
VHA Billing staff are manually reviewing 100 percent of claims subsequent to automated claim edits, resulting in significant workload and affecting billing timeliness	Prioritize funding and accelerate planning efforts to integrate a patient accounting system that includes automated billing that will support algorithmic edits and where appropriate, automate correction of claims to minimize manual review requirements.	Tier 1	Medium	People, Process, Technology
Lack of automation for Non-VA Care Claims processing (via FBCS) delays payments, causes inaccuracies, and increases improper payments.	Develop and implement both a short-term and a long-term approach to reduce the degree of manual intervention in claims. Prioritize in the short-term automation initiatives (presumably with FBCS). Develop and implement a strategy to build or acquire a centralized, highly automated claims adjudication system.	Tier 1	Short	Technology
Non-VA Care Providers Do Not Have Visibility into the Status of Claims Due to a Lack of Online, Automated Tools	Invest in technology solution to provide the ability for providers to determine their claim status online.	Tier 2	Medium	Technology

FINDINGS	RECOMMENDATIONS	SIGNIFICANCE	TIMELINE	IMPACT
The rate of electronic claims submission for Non-VA Care is low	Increase EDI claims submission rates by creating provider manuals	Tier 2	Medium	Technology
The Non-VA Care claims processing system is not centralized, leading to inconsistencies in standardizing claims processing across VAMCs	Centralize all claims processing functions to create standardization.	Tier 2	Medium	Technology

Legend

Significance   Tier 1 = Direct effect to payment and billing timeliness and accuracy

Tier 2 = Supporting actions to improve payment and/or billing timeliness and accuracy

9 Analysis of Oversight and Metrics—VHA Lacks Certain Performance Reporting to Provide Effective Oversight and Proactive Process Improvements for Collections and Payments.

9.1 Introduction

As described in Chapter 6, to better support VA Care operations, all VAMCs have transitioned their Patient Accounting operations to one of the seven CPACs. The transition to the CPAC structure drove standardization and coordination across Patient Accounting functions. VHA placed the CPACs under the Central Business Operations (CBO) agency. Today, VAMCs execute the "front-end" (Patient Intake and Clinical Administration) operations, and the CPACs, perform "back-end" (billing and accounts management) operations.

Chapter 7 describes the role of the CBO Purchased Care organization and their responsibilities for the development of administrative processes, policy, regulations and directives associated with the delivery of the Non-VA Care program. CBO is now responsible for all claims processing and payment operations and staff. Supervisors and claims clerks manage and conduct the day-to-day activities of the Non-VA Care program. These activities include scanning claims, reviewing administrative eligibility, processing claims for payment, answering Non-VA provider inquiries.

The findings and recommendations below address opportunities to benefit from stronger national reporting, leveraging private-sector benchmarks, more insightful decision support, common productivity standards, and management over interest payments. The findings also address program integrity tools, an area where VHA is realizing results and should continue momentum with additional automation initiatives.

9.2 VHA Medical Care—Revenue

Finding

1. **VHA lacks standard national reporting of key performance metrics for timely insurance identification and verification across VHA, inhibiting visibility into insurance capture performance of VAMCs.**

   - Insufficient national reporting on Patient Intake key performance metrics hinders visibility into the Patient Intake functions of VAMCs and contributes to lack of accountability by all responsible parties.[266]

---

[266] Qualitative interviews at four VAMCs.

- VAMCs maintain some Patient Intake metrics (e.g., the insurance capture buffer error rate that identifies missed insurance capture opportunities at check-in) and reports to Compliance and/or the VISN; however, this reporting is not standard or published on a national scale.[267]

Recommendations

- VHA: Create a Patient Intake national reporting platform and centralized database to monitor key Patient Intake performance metrics that include:
  - Scheduling rate
  - Pre-registration rate of scheduled patients
  - Insurance verification rate of scheduled patients
  - Insurance verification rate of pre-registered patients
  - Insurance verification rate of unscheduled patients within one business day
- Leverage existing VHA Support Service Center platform to improve monitoring. This platform includes the nationally reported HIMS metrics in addition to Compliance and Business Integrity (CBI) metrics.
- Enhance reporting and monitoring of key Patient Intake performance metrics by requiring VAMCs to report the key Patient Intake performance metrics listed above on a monthly basis. This enterprise system would provide leadership at the VAMC, VISN, CPAC, and CBO with insight into key areas for improvement as well as to develop resolutions to ensure that third-party insurance is identified and verified prior to a service performed at least monthly.

Finding

2. **Reporting in the current patient accounting system (VistA) is not comparable to the private sector, inhibiting the identification of areas for improvement.**

- AR shows the amounts owed to VHA by third-party insurers. Aged AR reflects amounts owed by the length of time the balance has been outstanding. These are standard metrics used to assess performance in the private sector.
- However, interviews with CPAC staff and CBO leadership revealed that aged AR is not tracked the same way as private sector, preventing qualified insight into performance. VA tracks third-party AR greater than 90 days against a standard of less than 18 percent and were able to achieve this goal every month in 2014.[268] VA's AR metric calculation starts at the date of the most recent bill (which includes rebills) rather than the date of encounter or original bill date.

---

[267]Qualitative interviews at four VAMCs.
[268]CBO Revenue Cycle Performance Metrics Panel for Fiscal Year 2015.

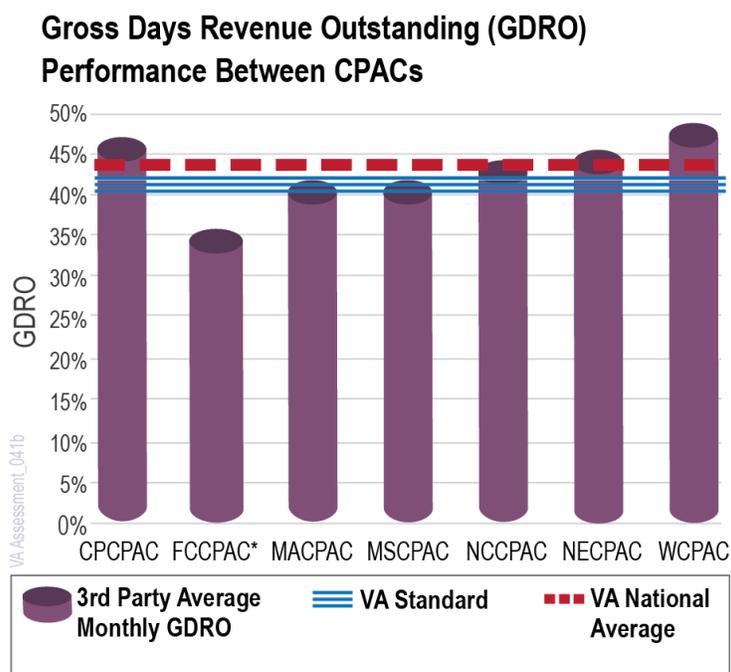
- The result of this reporting is that the age of AR reported by VHA is significantly skewed and reported as more favorable than would be the case in the private sector.[269] This presents a risk to VHA's ability to collect third-party insurance balances due, since they are unable to obtain a more refined and accurate snapshot of the age of VA's outstanding AR. In addition the follow up teams are working from an AR aging that does not reflect the most appropriate age of the account.

- VHA defines GDRO as the average number of days for a third party to pay a bill. VHA calculates GDRO by taking aged AR (excluding unbilled accounts) divided by the billings of the previous three months, divided by the number of days in the previous three months. This metric allows VHA to assess the timeliness of the CPAC's third-party collections. VHA's standard for GDRO is 43 days, displayed in Figure 9-1, and some VHA CPAC's are achieving this metric while others are not. The industry best practice benchmark of net days in AR (net AR divided by average daily net revenue) is 55 days or less. Net GDRO accounts for contractual and other adjustments made to gross patient revenue.

- The manner in which VHA calculates GDRO is unique and not comparable to the private sector. The private sector calculates GDRO by including unbilled and billed AR amounts and utilizing both gross and net revenue. VHA calculates GDRO by excluding unbilled AR amounts because some amounts relate to non-billable service connected care. In addition, GDRO as calculated by VHA uses gross billings as opposed to net revenue. Figure 9-1 shows the gross days revenue that are outstanding for CY 2014.

---

[269]Qualitative interviews at one CPAC indicated that this was an issue.

Figure 9-1. Gross Days Revenue Outstanding – CY2014[270]


Source: CPAC GDRO Performance from CBO, CY2014

Note: San Juan is excluded from FCCPAC analysis due to unique payers not on electronic billing.

Recommendations

- Create a Patient Intake national reporting platform and centralized database to monitor key Patient Intake performance metrics such as: scheduling rate, pre-registration rate of scheduled patients, insurance verification rate of scheduled patients, insurance verification rate of pre-registered patients, and insurance verification rate of unscheduled patients within one business day. Reporting should be completed on a monthly basis to provide leadership at the VAMC, VISN, CPAC, and CBO with insight into areas for improvement.

- Evaluate the current reporting capabilities of the patient accounting system and perform a gap analysis with equitable private sector reports. Specifically for AR, VA should adjust the tracking and reporting of aged AR to match leading practices in the private sector. This would further enhance VA's ability to identify the root causes for process improvement areas and knowledge from which to develop and act on resolution plans.

---

[270]CBO. (2015). *Average Monthly GDRO for Third Party, CY2014*. Retrieved from POWER and reported in POWER by CPAC. The figure above displays VA nationwide GDRO in comparison to VA target of 43 days for CY2014, and CY2014 performance with national average 43.2. San Juan is excluded from FCCPAC analysis due to unique payers not on electronic billing.

Finding

3. Ineffective payer contracting at the regional level negatively affects oversight and standardization from VHA's Revenue Operations Payer Relations Office.

- Contracts are the foundation for payment for applicable payers, and VHA needs to be paid competitive rates and correctly. CBO has established national contracts with large payers as managed by the Revenue Operations Payer Relations Office. Each CPAC manages their own regional contracts, with guidance provided by the Revenue Operations Payer Relations Office only on an 'as-needed' basis. This arrangement limits the opportunity for local regional contracts to reap the benefits and negotiating strengths of the Revenue Operations Payer Relations Office.[271]

- Standardization across regional payers may be an opportunity for CBO to increase collections. It is common that a CPAC could have several regional contracts and several national contracts with payers. For regional contracts, we recognize that the Revenue Operations Payer Relations Office affords the CPAC access to a national support service that will perform background analysis on the regional payer, including reimbursement rates. Although the Revenue Operations Payer Relations Office provides guidance, the CPAC Payer Relations Department is ultimately responsible for contract negotiations with the regional payer. Further, during our interviews it was reported that CPACs may not have sufficient FTE funding or available legal resources to appropriately negotiate with regional payers, which adds to the risk of sub-optimal rates.

- During our interviews, it was indicated that it takes an inordinate amount of time (several months) for a CPAC Payer Relations Department to establish a new payer contract. This length of time may prevent VHA from receiving appropriate reimbursement for services while a contract is not in place. This may also affect collection efforts, decreasing cash flow and reducing realized revenue. In these instances (with payers without contracts), VHA accepts any payment from these regional payers. Without disciplined payer contracting in place at the regional level, loss of revenue may occur, directly affecting the collection of amounts owed to VHA for care provided.

Recommendations

- CPAC Payer Relations staff should report to the Revenue Operations Payer Relations Office. Doing so should allow VHA to have better leverage with payers and achieve better economies of scale. This should further optimize reimbursement rates and further support VHA's continuous improvement efforts. A standardized approach should allow for flexibility at the CPAC/regional level, while addressing issues promptly with national leverage, particularly payer negotiations. Payer Relations staff should remain co-located at the CPAC to better understand regional influences, maintain a local presence, and resolve local issues such as shortages of key specialties or provider types (e.g., nursing homes).

---

[271] Qualitative interviews at three CPACs indicated that this was an issue.

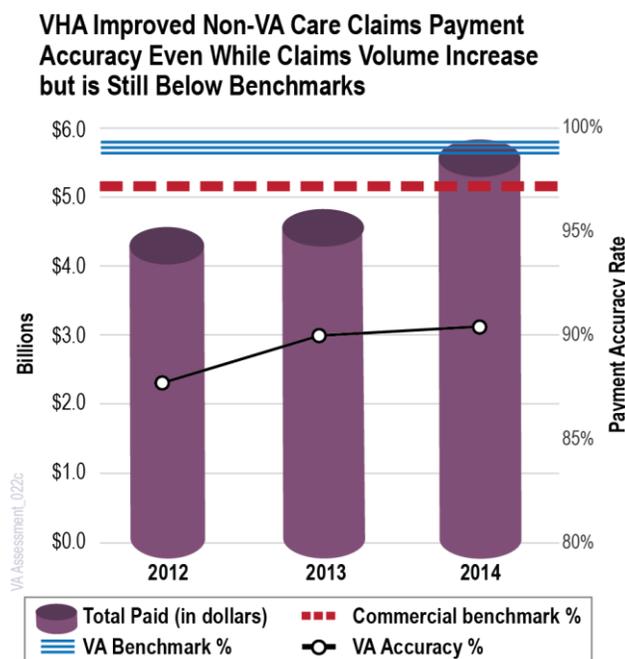
- The Revenue Operations Payer Relations Office should create payer scorecards to gain insight into payer reimbursement and further optimize VHA's relationship with payers. Internal payer scorecards should be built with adjudication analytics in place, including claims/dollars denied by payer, cost to collect, etc., to help support contract negotiations. Scorecards should help provide transparency into the relationships between negotiated rates and the cost of care.

9.3   Non-VA Care—Payment

Finding

1. **VHA implemented additional oversight mechanisms to increase payment accuracy, leveraging the Program Integrity Tool (PIT) and Quality Inspector Tool (QIT), to improve payment accuracy.**

- VHA introduced PIT and QIT to identify inaccurately processed claims prior to payment. During the last three years, accuracy improved while the total claims paid has increased. Increasing claims volume puts additional strain on staff and system resources. Generally, increasing claims load would have a negative effect on accuracy performance; however, VHA improved its accuracy numbers while also accepting a higher claims volume.

Figure 9-2. Claims Paid Volume and Accuracy[272]


Source: Paid Data and Timeliness FY12-FY14 Data

- All inaccurate payments negatively affect the payer and the provider, because they create additional administrative work for both parties. Inaccurate payments can also lead to

---

[272] Per Paid Data and Timeliness FY12-14 v2.xlsx prepared by CBO Department of Informatics

misdistribution of funds. When payers overpay providers, payers must coordinate with providers to recoup the overpayments. Underpayments cause provider dissatisfaction. When there are duplicate payments, the payer pays twice for a service only rendered once.

Recommendation

- Continue developing technical solutions, such as QIT and PIT, which catch claims processing errors before making payments. While QIT and PIT are good tools to track payment accuracy, over reliance on these tools will result in needless additional costs and workload. We understand VHA is working to add additional rules into PIT, and this should be a continuous process. For example, VHA is working to implement rules from the QIT process into PIT. Because not every VAMC uses QIT, this will promote running the QIT checks on all claims. VHA should also continue to build additional rules into PIT (to supplement rules not coded in FBCS) to further improve payment accuracy.

Finding

2. **Current decision support capabilities are not sufficient to support oversight and management of Non-VA Care claims processing and payment.**

Decision support or business intelligence systems are uses of technology that allows organizations to analyze their data effectively. Decision support systems play a key role in "data warehousing, security, standard and ad hoc analytics, care and disease management, fraud and abuse detection, other-party liability administration, and financial functions such as forecasting and reporting."[273] Leaders depend upon data to make informed financial and clinical decisions. Lack of reliable and complete data impairs leaders' abilities to analyze their health care delivery systems properly, regarding appropriateness and quality of care, financial management, and all aspects of operations.

Leading health insurer practices involve "[extracting] and [manipulating] key elements…to make virtually all data elements reportable so that [payer] analysts can include any number of factors in business and health care improvement needs."[274] For example, insurers routinely use reports to track trends and patterns in denied or pended claims to identify potential root causes. They also use reports to identify patterns in claims volume over time, so that they can deploy appropriate numbers of staff to work through anticipated claims backlog, staff provider services hotlines or conduct provider outreach.

CBO performs most of the decision support analysis for VHA for Non-VA Care claims. When VHA leadership needs reporting on clinical or financial metrics, the CBO Department of Informatics creates the reports primarily using data from paid claims processed through FBCS and VistA. Our team worked with the Department of Informatics to extract data related to Non-VA Care.

---

[273] Peter Kongstvedt "Essentials of Managed Care" Fifth Edition, 2007 Pg. 398
[274] Ibid

Our team also reviewed OIG reports related to VA's decision support systems and interviewed Informatics staff.

- The analytical deficiencies across claims processing and payment prevent VHA from effectively assessing the performance of and management of the processing system. For example, VHA is not able to determine the reasons for denial or suspense of claims. Due to this deficiency, VHA is unable to analyze enterprise-wide denials.[275]

- Another example is VHA's inability to load critical information into CBO decision support system. For example, the current decision support system cannot accurately report on the number of claims paid, since decision support system does not maintain the internal control number assigned to claims. VHA staff members do not load denied and rejected claims into the decision support system. These denied claims data is available only at the local level. As a result, CBO stated that retrieving denied claims data would be a lengthy and involved process. Additionally, CBO cannot identify or stratify Millennium Bill (referred to as Mill Bill – which as specific subset of requirements) from unauthorized claims for reporting purposes.[276]

- Without a robust decision support system, VHA analysts have limited capabilities to report on trends to executives, clinical and financial staff. Since VHA is not equipped to identify high frequency or common denials across the system, VHA cannot identify geographic areas or topics to focus provider outreach on. VHA cannot achieve valuable insights (e.g., transparency into the largest billers of paper claims) through the current decision support system.[277]

- The decision support system does not contain fields for commonly used data fields, such as "claim form type" (e.g., UB-04, CMS-1500, etc.), which are helpful for analyses. It does not receive the "claim form type" field from FBCS. VHA needs additional fields to enable analyses that drill into the root causes for interest and penalties. A more robust decision support system may also assist with care management and care coordination processes.[278]

Recommendations

- Retain more information from claims processing in VHA's decision support system and develop more comprehensive reports for Non-VA Care management. VHA should retain and load all denied and rejected claims into the decision support system.[279] Making this additional information available to the staff will allow them to conduct more robust analysis to drive provider outreach, reducing the rate and frequency of denials.

---

[275] Based on Interview with CBO Informatics and industry subject matter experts

[276] Based on Interview with CBO Informatics and industry subject matter experts

[277] Ibid.

[278] Ibid.

[279] CBO reported that taking steps to retain and load this information is on its roadmap.

Consequently, VHA can lessen the workload of the clerks, which will also improve payment timeliness.

- Use the decision support system to inform VHA's training programs for claims processing staff by identifying claims processing protocols that are not applied consistently by staff. Leading practice is to use it to identify error rates and patterns across individual staff members to inform training plan development.

Finding

3.**VHA cannot establish productivity standards and monitor employee performance because its processes are not consistent across VAMCs and VISNs.**

- For example, some VAMCs appear to have the claims clerks work closely with the authorization personnel and involved in care coordination, while others do not. Some claims clerks are more involved in "provider relations" activities than are others. Additionally, claims clerks work on all types of claims that require varying levels of effort. Some claims clerks process only authorized claims while others work both authorized and unauthorized. In some cases, even outpatient and inpatient claims are divided among claims staff. In the private sector, claims clerks have uniform responsibilities resulting in better outcomes.[280]

- The inconsistency extends beyond processes and procedures to department naming conventions. From facility to facility, the same departments often have varying names and position descriptions, leading to Non-VA provider confusion. For example, at a sample of four VAMCs, the authorization and scheduling department for Non-VA Care is referred to using four different names: Patient Administration Services (PAS), Health Administration Services (HAS), Business Service, and Non-VA Care Coordination.[281]

Recommendation

- Establish VHA-wide productivity standards for staff. VHA should employ these standards to project staffing needs and evaluate staff performance to assure sufficient staff to support the claims processing process. As Non-VA Care continues to evolve, continually assessing VHA staffing levels is critical in leveraging human resources necessary to improve the accuracy and timeliness of claims processing. We understand CBO is assessing staffing levels across Non-VA Care. CBO will use these studies to identify production standards across all VAMCs and evaluate staffing to support achievement of the standards. The study is scheduled to complete in June 2015.[282] Productivity standards and staffing projections should account for the future influence of technology.

---

[280] Per Interviews with four VAMCs

[281] Per site visits to four VAMCs

[282] Per Interviews with CBO Purchased Care

Finding

4. **VHA does not conduct sufficient management and oversight activities to understand, manage, and prevent interest penalties paid to Non-VA providers.**

- This finding addresses oversight activities; Chapter 7 covers Non-VA Care in detail. We cross-reference it here to highlight that a critical component of the findings and recommendations supporting interest penalties is oversight across the VHA management team. We found a lack of awareness and transparency of information of interest penalties at the VAMC level. Reducing the risk of interest penalties requires coordinated and clear definition of roles and responsibilities for oversight and execution of interest penalty management.[283]

9.4 Summary of Findings and Recommendations

The following table summarizes the findings and recommendations presented in this chapter, providing further detail to identify each finding's significance and each associated recommendation's timeline and effect.

Table 9-1. Summary of Findings and Recommendations

10 Conclusion

Strengthened business processes provide VHA with significant opportunity to improve the financial viability of VA. We recognize VHA has made notable improvements across both revenue and payment processes in recent years. Synchronizing people, process, and technology is critical for VHA to continue improvements to increase collections and pay claims timely and accurately. As transformation efforts take place, consistent messaging from VHA leadership supported by ongoing organizational change management around business processes is essential for any strategy to succeed. Both Veterans and VHA staff members need to be included in planning and decision-making. During site visits for this assessment, we were routinely impressed with the commitment and resolve of VHA staff members. VHA leaders need to harness this energy by educating, stimulating, and guiding staff members through business process challenges, tying performance to positive outcomes for Veterans. The resulting empowerment will allow VHA to reap the benefits of a rich and mission focused culture.

The recommendations in this report focus on culture, as well as process and system improvements. The standardization and alignment of performance metrics, simplification of rules, and effective communication offer tremendous upside that is currently lacking in business processes. Adopting the recommendations in this report will allow VHA to improve business process performance, and increase satisfaction for both VHA staff members and the Veterans they serve.

Appendix A Background Information

A.1 VA Care, Revenue

A.1.1 Denials

Table A-1 provides the denial categories, definitions, corrective actions with our corresponding recommendations to correct the business processes, per each denial category. The last column references the section of this report that addressing the issue.

Table A-1. Denial Categories and Recommendations

Denial Category	Definition	Corrective Action	Revenue Cycle Business Process	Controllable or Uncontrollable	Recommendation	Report Section
Authorization Issue	Denied claim for service without pre-authorization	1st: Complete Pre-Auth at Time of Scheduling and/or prior to service; 2nd: Revenue Utilization Review (RUR) Nurse/ Follow-Up	Patient Intake	Controllable	Enhance Insurance Identification at Scheduling and Pre-Registration to enable Insurance Verification in advance of visit. Continue enhancement of electronic insurance verification tool and of automation and control improvements with Kiosks to support Insurance Identification and Verification.	See section 6.3.2
Coverage Period Termed	Denied for invalid insurance coverage at time of service	Verify coverage prior to providing services; patient executes a document indicating it is the patient's responsibility if their insurance is denied	Patient Intake	Controllable	Enhance Insurance Identification at Scheduling and Pre-Registration to enable Insurance Verification in advance of visit. Continue enhancement of electronic insurance verification tool and of automation and control improvements with Kiosks to support Insurance Identification and Verification.	See section 6.3.2

Denial Category	Definition	Corrective Action	Revenue Cycle Business Process	Controllable or Uncontrollable	Recommendation	Report Section
Coordination of Benefits	Billed incorrect insurance or billed multiple insurance carriers in the incorrect sequence.	Verify insurance and determine primary and secondary carriers so that claims are submitted properly	Patient Intake	Primarily Controllable	Enhance Insurance Identification at Scheduling and Pre-Registration to enable Insurance Verification in advance of visit. Continue enhancement of electronic insurance verification tool and of automation and control improvements with Kiosks to support Insurance Identification and Verification.	See section 6.3.2
Maximum Benefit	Maximum coverage benefits reached. Insurance will not reimburse for services rendered.	Verify coverage prior to rendering services.	Patient Intake	Controllable	Enhance Insurance Identification at Scheduling and Pre-Registration to enable Insurance Verification in advance of visit. Continue enhancement of electronic insurance verification tool and of automation and control improvements with Kiosks to support Insurance Identification and Verification.	See section 6.3.2
Non-Covered Charge	Denied as service charge is not covered by insurance carrier.	Verify coverage prior to rendering services. Timely updates to charge description master.	Patient Intake and Clinical Administration	Controllable/ Uncontrollable	Enhance Insurance Identification at Scheduling and Pre-Registration to enable Insurance Verification in advance of visit. Continue enhancement of electronic insurance verification tool and of automation and control improvements with Kiosks to support Insurance Identification and Verification. Timely update of charge description master.	See sections 6.3.2, 6.3.3
Patient Eligibility	Patient not covered by insurance when services provided.	Verify coverage prior to rendering services.	Patient Intake	Controllable	Enhance Insurance Identification at Scheduling and Pre-Registration to enable Insurance Verification in advance of visit. Continue enhancement of electronic insurance verification tool and of automation and control improvements with Kiosks to support Insurance Identification and Verification.	See section 6.3.2

Denial Category	Definition	Corrective Action	Revenue Cycle Business Process	Controllable or Uncontrollable	Recommendation	Report Section
Medical Necessity	Denied as the procedure was deemed not medically necessary by the third-party payer.	Submit clinical and other information supporting provision of services, contract negotiation, and verify coverage for specific services	Clinical Administration/ Patient Accounting	Controllable	CDI role and initiative.	See section 6.3.2, 6.3.3
Wrong Procedure Code	Denied claim due to system/coding issues	Incorrect code; Need coder training or update to code in Nuance	Clinical Administration	Controllable	Coder training and certified coders, effective updating and management of charge description master.	See section 6.3.3
Duplicate Claim	Denied for duplicate billing	Root cause analysis to identify reasons for duplicate submission. Timely resolution of the initial denial received.	Patient Accounting	Controllable	Account management and Billing education and timely resolution of initial denials as received.	See section 6.3.4
File Limit Expired	Denied for untimely submission of claim to payer	Identification and verification of correct payer prior to providing services, timely coding of accounts and submission of claim within payer guidelines. Contracts with filing times VHA can meet.	Patient Accounting, Clinical Administration and Patient Intake	Controllable	Conduct root cause analysis of key reasons for untimely submission. Develop corrective action plans based on findings.	See section 6.3.2, 6.3.3, 6.3.4

Denial Category	Definition	Corrective Action	Revenue Cycle Business Process	Controllable or Uncontrollable	Recommendation	Report Section
Information Requested	Payer denied claim and is requesting additional information related to services provided.	Respond to information as requested by payer	Patient Accounting coordination with Patient Intake and Clinical Administration	Uncontrollable	Primarily uncontrollable. Send required information that is known when claims are submitted.	N/A

A.1.2   Insurance Verification

Insurance verification process standards include obtaining patient dates of eligibility, service coverage, and pre-certification/authorization requirements from a patient's third-party insurance carrier. VA staff should verify all third-party insurance benefits prior to providing scheduled services to a patient or immediately after providing services related to emergent care. Disciplined insurance verification allows for billing of amounts due to the appropriate third-party carriers and obtaining pre-authorization information, as required. These efforts typically increase overall cash collections and increase net revenue by reducing third-party denials.

Private sector insurance verification processes frequently occur when an appointment is scheduled or during pre-registration procedures. For emergency cases, insurance verification should occur upon the completion of services and/or initial stabilization of the patient. Leading practices are to verify insurance benefits and coverage for all scheduled inpatients within 72 hours prior of the date of service. During this process, VHA validates dates of eligibility, service coverage rules, and pre-certification/authorization requirements.

We assessed VHA insurance verification performance by conducting site visits to multiple CPACs and VAMCs and by collecting VAMC insurance identification data via a national data call. During the VAMC site visits, we held interviews with the patient administration staff that requests third-party insurance information from patients during the check-in process. During the CPAC site visits, we also held interviews with staff at the CPAC who process the insurance information captured by the Patient Check-In clerks at the VAMCs. Additional assessment activities included observing the insurance capture buffer (ICB) tool used by VHA (a tool that signals Patient Check-In clerks which patient's third-party insurance information needs to be identified and captured at 'check-in'). Our team also reviewed the amount spent annually on outside contractors to perform additional insurance verification procedures. We evaluated VHA insurance capture performance metrics. Facilities and clinics are accountable to these performance metrics. Our team also reviewed OIG reports related to billing for VHA-provided care.

Current State

Current Organizational Structure

Key VA components and employees across the organization administer the revenue cycle process. Roles and responsibilities described below highlight respective organization functions that facilitate coordination of care for the Veteran as well as collections:

- **VHA's Office of the Chief Financial Officer (CFO)**: The Office of the CFO at VHA is responsible for establishing financial management and accounting policies and procedures, monitoring financial activity, and monitoring compliance with fiscal policy.

- **Chief Business Office (CBO)**: Located in Washington, DC, CBO is responsible for providing national leadership for advancing business practices that support patient care and delivery of health benefits. This group is responsible for ensuring that activities associated with the generation and management of revenue-cycle activities related to medical care comply with business standards and requirements, including implementing appropriate internal controls

and performance measures. The CPACs, as well as the Health Eligibility Center (HEC) and the Health Resource Center (HRC), are under the guidance of the CBO.

- **Financial Services Center (FSC)**: Located in Austin, TX, the FSC has direct involvement in many of the key-business processes for VA's financial reporting and the medical-care revenue cycle, such as completing first and third-party payment transactions.

- **Health Eligibility Center (HEC):** Located in Atlanta, GA the HEC supports VA's health care delivery system by providing centralized eligibility verification and enrollment processing services. The HEC verifies income reported by patients on the 10-10EZ (Application for Health Benefits) and 10-10EZR (Health Benefits Renewal Form) applications used for determining eligibility. HEC uses the Income Verification Matching (IVM) process to verify Veteran's–self-reported income information by computer matching with the Social Security Administration (SSA) and the Internal Revenue System (IRS).

- **Health Resources Center (HRC):** Located in Topeka, KS, the HRC is responsible for the Health Benefits Call Center (HBCC) and the First Party Call Center (FPCC). The HBCC is responsible for updating Veterans' profile information, such as address changes and contact information, and then transmitting these updates to the HEC. The FPCC responds to inquiries from Veterans who have questions regarding co-payments, as well as questions regarding medication, hardship waivers, and repayment plans.

- **Austin Information Technology Center (AITC):** Located in Austin, TX, the AITC is responsible for providing automated data processing support for medical reimbursement activities to all VAMCs. AITC is responsible for accumulating the data used for the allocation of Veterans Equitable Resource Allocation (VERA) funds. VERA is the primary methodology that VA uses to distribute resources based upon historical workload and utilization of services by Veterans.

- **Consolidated Patient Account Centers (CPAC):** Located in seven regional offices throughout the country, CPACs centralize the traditional VHA accounting functions focused on the back-end of the revenue cycle process. The purpose of the CPAC system is to "[re]engineer and integrate all business processes of the revenue cycle of the Department. CPACs standardize and coordinate all activities of the Department related to the revenue cycle for all health care services furnished to Veterans for non-service-connected medical conditions. They apply commercial industry standards for measures of access, timeliness, and performance metrics with respect to revenue enhancement of the Department."[284] The CPACs take the coded encounters from the VAMCs, generate the patient bills, and work with Veterans and third-part insurance carriers to collect and process payments. CPAC staff members are located both at the regional CPAC and at each VAMC in an effort to improve coordination and communication between the two entities.

A.1.3   First Party

The following table depicts the financial health benefit co-payment obligations of Veterans whose income exceed VA income limits and those Veterans who choose not to complete the financial assessment during enrollment:[285]

Table A-2 VA Copays[286]

Priority Group & Inpatient/Outpatient[287]	Services	Copay Due
Priority Group 1	Same services are generally available to all enrolled Veterans	None
Priority Group 1	Prescriptions: 30-day or less supply of medication	None
Priority Group 2	Same services are generally available to all enrolled Veterans	None
Priority Group 2	Prescriptions: 30-day or less supply of medication	$8 (Limited to $960 annual cap)
Priority Group 3	Same services are generally available to all enrolled Veterans	None
Priority Group 3	Prescriptions: 30-day or less supply of medication	$8 (Limited to $960 annual cap)
Priority Group 4	Same services are generally available to all enrolled Veterans	None
Priority Group 4	Prescriptions: 30-day or less supply of medication	$8 (Limited to $960 annual cap)

---

[285]VA Health Benefit co-payments: http://www.va.gov/HEALTHBENEFITS/cost/copays.asp

[286]VA 2015 Co-payment Rates, http://www.va.gov/healthbenefits/resources/publications/IB10-430_copay_rates.pdf

[287]Note: There are two inpatient copay rates, the full rate and the reduced rate (20 percent of VA's inpatient copay rate). A letter accompanies the bill explaining the charges, along with VA contact information for questions. If the patient does not respond within 90 days, the bill enters a Biller's work list at the CPAC. The CPAC is responsible for reaching out to patients with outstanding debts, verifying eligibility and copay amounts, matching Third Party insurance payments to First Party copays, answering Veteran questions, setting up payments plans, processing Veteran refunds through VA Patient Account Resource System (VAPARS) system, and conducting follow-up duties to clear the debt. After 90 days, unpaid Veteran bills are sent to VA's Debt Management Center (DMC) for collection, and if collection efforts remain unsuccessful, bills are transferred to the Treasury Offset Program (TOP).

Priority Group & Inpatient/Outpatient[287]	Services	Copay Due
Priority Group 5	Same services are generally available to all enrolled Veterans	None
Priority Group 5	Prescriptions: 30-day or less supply of medication	$8 (Limited to $960 annual cap)
Priority Group 6	Same services are generally available to all enrolled Veterans	None
Priority Group 6	Prescriptions: 30-day or less supply of medication	$8 (Limited to $960 annual cap)
Priority Group 7 Inpatient	Copay for the first 90 days of care during a 365-day period	$252
Priority Group 7 Inpatient	Copay for each additional 90 days of care during a 365-day period	$126
Priority Group 7 Inpatient	Daily Charge	$2/day
Priority Group 7 Outpatient	Prescriptions: 30-day or less supply for higher income Veterans	$9 (No medication copay annual cap)
Priority Group 8 Inpatient	Copay for the first 90 days of care during a 365-day period	$1,260
Priority Group 8 Inpatient	Copay for each additional 90 days of care during a 365-day period	$630
Priority Group 8 Inpatient	Daily Charge	$10/day
Priority Group 8 Outpatient	Prescriptions: 30-day or less supply for higher income Veterans	$9 (No medication copay annual cap)
Outpatient	Primary Care	$15
Outpatient	Specialty Care	$50
Geriatric and Extended Care	Inpatient Copay	Up to $97 per day (Community Living (Nursing home), Respite, Geriatric Evaluation)

Priority Group & Inpatient/Outpatient[287]	Services	Copay Due
Geriatric and Extended Care	Outpatient Copay	$15 per day (Adult Day Health Care, Respite, Geriatric Evaluation)
Geriatric and Extended Care	Domiciliary Copay	$5/day
Long Term Care	Spousal Resource Protection Amount	$119, 220

A.2 Non-VA Care

A.2.1 Technology to Enable Oversight of Claims Processing Performance

Decision support systems or BI tools allow organizations to analyze their data effectively. Data used in claims are significant drivers for analytics and informed decision-making. Decision support systems play a key role in, "data warehousing, security, standard and ad hoc analytics, care and disease management, fraud and abuse detection, other-party liability administration, and financial functions such as forecasting and reporting."[288] Leaders depend upon accurate and detailed data to make informed financial and clinical decisions. Lack of reliable and complete data impairs leaders' abilities to analyze their health care delivery systems regarding appropriateness and quality of care, financial management, and all aspects of operations.

Leading health insurer practices involve, "[extracting] and [manipulating] key elements…to make virtually all data elements reportable so that [payer] analysts can include any number of factors in business and health care improvement needs."[289] For example, insurers routinely use reports to track trends and patterns in denied or pending claims, and then to identify potential root causes of those claims denials and pending claims. They also use reports to identify patterns in claims volume over time, so that they can deploy appropriate numbers of staff to work through anticipated claims backlog, staff provider services hotlines or conduct provider outreach.

VA's Informatics team performs most of the decision support and BI analysis for VA for Non-VA Care claims. When VHA leadership needs reporting on clinical or financial metrics, the informatics team creates the reports primarily using data from paid claims processed through FBCS and VistA.

A.2.2 Overview of Care Authorities

Three main authorities provide VA the ability to purchase care for Veterans in the community. The following list describes these authorities.

---

[288] Peter Kongstvedt "Essentials of Managed Care" Fifth Edition, 2007 Pg. 398
[289] Ibid.

- 38 U.S.C. 1703 – Authorized; 38 U.S.C. 1703, Authorized Care, allows for VA to contract with non-department facilities and provide care to Veterans with a service connected disability when VA is not capable of furnishing the care or services and geographical inaccessibility.[290]

- 38 U.S.C. 1728 – Unauthorized; 38 USC 1728, Unauthorized Care for a service Connected Disability, allows VA to reimburse for emergency care related to a service-connected condition.[291]

- 38 U.S.C. 1725 – Millennium Bill (Mill Bill), 38 USC 1725, Millennium Bill, allows VA to reimburse a Veteran or the provider of emergency care for a non-service connected condition. The Veteran must not be covered by 38 USC 1703 (Contracts for Hospital Care and Medical Services in Non-Department Facilities) nor 38 USC 1728 (Reimbursement of Certain Medical Expenses). In order for the Veteran to be eligible for care under this authority, the Veteran must meet the following criteria:[292]

  - Veteran received health care services from VHA during the 24- month period preceding the emergency treatment

  - Veteran has no other form of health insurance coverage for the episode of care being claimed

  - VHA or other Federal facilities were not feasibly available at the time of the emergency

  - Care was rendered in a medical emergency of such a nature, that a prudent layperson would have reasonably expected a delay in medical treatment to be hazardous to life or health

  - Treatment was provided in a hospital emergency room department or a similar facility providing emergency care to the public

  - Veteran is financially liable to the provider for payment of the emergency treatment received

  - Veteran has no other contractual or legal recourse against a third party that would, in whole, extinguish the Veteran's liability, and the Veteran has exhausted all claims against a third party without success

  - Care beyond the medical emergency is for a continued medical emergency such that the Veteran could not safely discharge or transfer to a VHA facility (unless the Non-VA provider makes and documents reasonable attempts to transfer the Veteran).

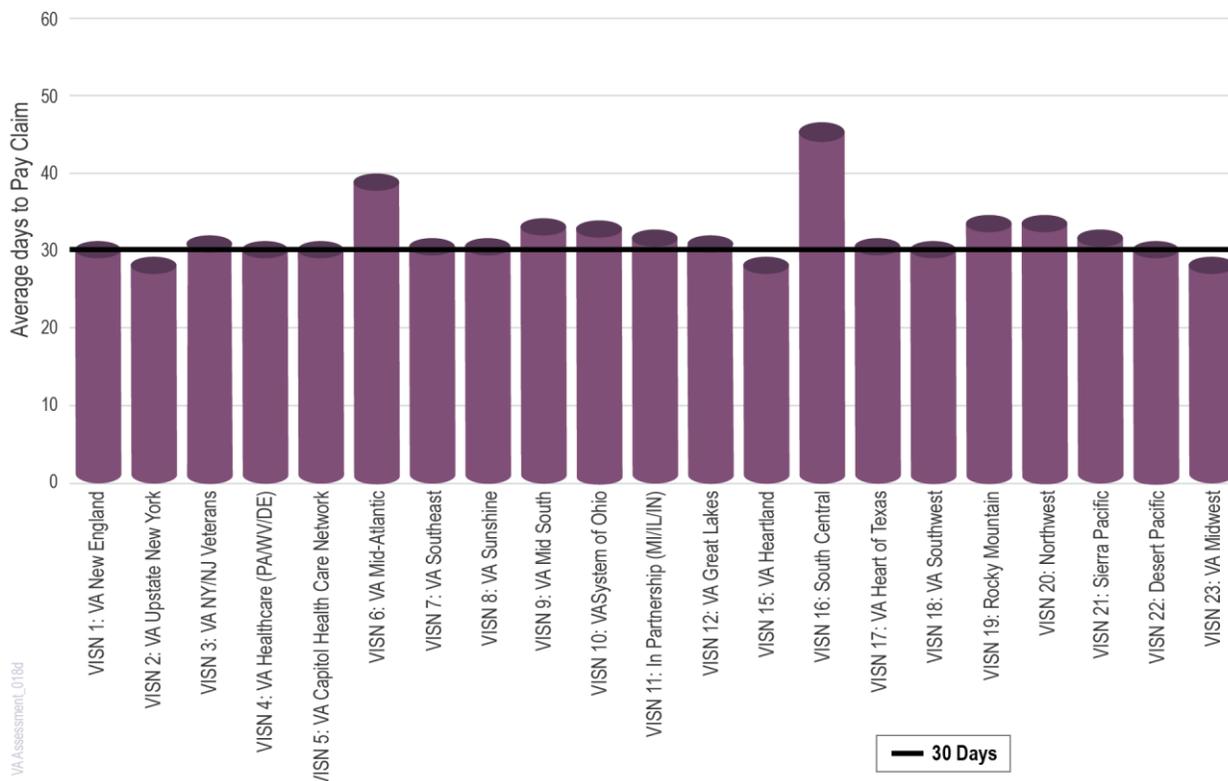
A.2.3   Timeliness by VISN

At the VISN level, Figure A- shows that a number of VISNs have average claims processing timeframes of 30 days or less, many slightly exceed the timeframe, and only two VISNs have processing times far exceeding the 30 day benchmark.

Figure A-1 Average Number of Days to Pay a Claim from Receipt Date for FY 2014[293]

Only 8 VISNs Paid Claims in 30 Days or Less, on Average


Source: Paid Data and Timeliness FY12-FY14 Data

To better understand VISN 16's relatively high processing time, we interviewed Non-VA Care leadership within VISN 16. The VISN reported a technical issue with its FBCS server that caused a significant backlog and increased time to adjudicate claims in FY 2014. This issue has since been resolved.

Most of the VISNs, through sheer will and extensive manual labor, are meeting or close to meeting the timeliness standards, despite the volume of claims being processed, the associated complexities, and the technology challenges that exist.

---

[293] Per Paid Data and Timeliness FY12-14 v2.xlsx prepared by CBO Department of Informatics; excludes Manila and VAMCs with less than 1000 claim lines

---

The views, opinions, and/or findings contained in this report are those of Grant Thornton should not be construed as an official government position, policy, or decision.

A.2.4   Detailed Authorized Care Process

- Consult/Referral: The Non-VA Care process begins when a VA provider makes a determination that the patient is in need of medical care VHA is unable to provide. Once the VA Provider determines the need for Non-VA resources, he or she creates a consult in Computerized Patient Record System (CPRS). A consult is the formal documentation in CPRS used to refer a Veteran for Non-VA Medical Care. The consult includes the requested services and justification for purchasing care from the community.

- Authorization and Scheduling (Non-VA Care Coordination): Once the VA Provider enters the consult, CPRS routes the claim to the Non-VA Care Coordination claims clerk. The administrative review ensures that the Veteran is eligible to receive Non-VA Medical Care and that VHA is unable to provide the requested treatment. Once the NVCC confirms the Veteran meets the eligibility requirements for Non-VA Care, he or she initiates a new authorization in FBCS. While CPRS automatically populates demographic information via the interface, the NVCC Claims clerk manually enters the services authorized into FBCS. Once FCBS has the authorization created, the claims clerk contacts the Veteran to identify his or her preferences for time for the appointment and Non-VA Provider. Non-VA Providers are health care professionals who prescribe medications, such as doctors, nurse practitioners, or physician's assistants employed by private hospitals or facilities, such as hospitals. The NVCC claims clerk then reaches out to the Non-VA Provider to schedule the appointment. After confirmation of the appointment, the NVCC claims clerk sends notification to the Veteran. In addition to notifying the Veteran, the NVCC Claims clerk also sends notification to the Non-VA Provider. The letter confirms the specific medical services for which VHA will reimburse the Non-VA Provider.

- Mode of Claims Submission: When providers render services, they must bill payers for reimbursement. Providers can submit claims via paper or electronically. Paper standards include:
    - UB-04—this form is for institutional providers, such as hospitals. Both inpatient and outpatient claims are commonly billed on the UB-04.
    - CMS-1500—this form is for physicians and other individual providers. A doctor administering a physical in his office would generally use the CMS-1500 for billing.
    - ADA claim form—this form is used by dentist to submit claims.

- Paper Claims - Scan/Verify: For VHA and other payers, processing paper claims requires additional steps relative to processing electronic claims. VHA calls these steps Scan, Upload, and Verify. The "Scan" process transforms the information on the paper document into data for Fee Basis Claims System (FBCS). The "Upload" process brings the data into FBCS. During "Verify," claims clerks manually ensure that the OCR process read the data correctly. These steps are similar for other private payers.

- Electronic Claims Submission: For electronic claims, the Scan, Upload and Verify steps are unnecessary because electronic claims data enters the system directly and without manual intervention. Thus, electronic claims enter the system more quickly and generally process more accurately, relative to paper claims.

- Generally, the more a payer electronically automates claims processing, the cheaper and more reliably their systems operate.[294] Most commercial and other government payers actively encourage their providers to submit all claims electronically. Providers submit electronic claims using a national standard format, the Electronic Data Interchange (EDI) format. These national EDI standards include:
    - 837I—this is the electronic format for institutional providers (replaces the UB-04)
    - 837P—this is the electronic format for physicians and other providers (replaces CMS-1500)
    - 837D—this is the electronic format for dental providers (replaces ADA form)
- The ANSI "chartered the ASC X12 to develop uniform standards for inter-industry electronic exchange of business transactions-electronic data interchange (EDI)".[295] This body created the 837 implementation guides referenced above. However, payers create 837 "companion guides" to assist providers with further instructions on billing electronic claims. For example, Medicare states that they publish companion guides to "clarify, supplement and further define specific data content requirements to be used in conjunction with, and not in place of, the ASC X12"[296] implementation guides. Currently VHA does not have a companion guide to provide additional guidance on electronic claims submission.
- Processing claims electronically is less costly and more accurate [297] than paper claims. Electronic claims are also processed faster[298].
- Processing: The purpose of adjudication is to apply a series of rules that will ultimate determine if the claim should pay, deny or reject and to also determine the rate the claim should pay. Whenever providers render services, they expect reimbursement at mutually agreed upon rates. Providers expect the payment to be timely and accurate. However, the provider must satisfy a level of completeness and correctness when billing their claim for it to pay. Generally, the rules on billing completely and correctly are defined in the provider and billing manuals produced by the payer. If the provider bills

---

[294] 2013 U.S. Healthcare Efficiency Index, CAQH, Electronic Administrative Transaction Adoption and Savings, Revised May 5, 2014 "We conclude that the healthcare industry could save billions by continuing the shift from manual to electronic transactions for the six processes [claims submissions, eligibility verification, prior authorization, claim status inquiry, claim payment and claim remittance advice/electronic payments] studied. We estimate that most of the potential savings from continued automation of routine processes would accrue to healthcare providers and facilities."

[295] http://www.x12.org/about/faqs.cfm

[296] http://www.cms.gov/Medicare/Billing/ElectronicBillingEDITrans/CompanionGuides.html

[297] 2013 U.S. Healthcare Efficiency Index, CAQH, Electronic Administrative Transaction Adoption and Savings, Revised May 5, 2014 "Today, individual providers, facilities, payers, and related business partners conduct more administrative transactions electronically than ever before, streamlining workflows for greater productivity, improving data accuracy, and reducing administrative costs."

[298] AHIP, Center for Policy and Research, Update: A Survey of Health Care Claims Receipt and Processing Times, 2013—93 percent of electronic claims are processed within two weeks versus 79 percent for paper claims

---

the claim incorrectly or without sufficient level of detail, the payer should reject or deny the claim with information on why the claim rejected or denied. If the member is covered and the service is in-plan, the provider can rebill the claim for reimbursement. The adjudication process helps bill claims correctly, and when they are not, the process denies or rejects the claim to the provider. The adjudication process also prices the claim. For VA, a denial means VHA policy does not cover the claim. Reasons for denial include the Veteran not being eligible or the provider rendering services without an authorization. When VHA denies a claim, the Veteran and provider receive notification that the service is not covered under policy and the provider should seek reimbursement from the Veteran. Conversely, a rejection means that there is a coding or administrative issue with the claim. For rejections, if the provider corrects the issue, they can resubmit the claim for VHA for reimbursement. Providers cannot seek reimbursement from the Veteran for rejections. VHA utilizes Fee Basis Claims System (FBCS), a Commercial-Off-The-Shelf (COTS) product, and Veterans Health Information Systems and Technology Architecture (VistA) to perform adjudication functions. FBCS adjudicates a majority of claims[299], with the few exceptions processed in VistA or other tools. FBCS was created from an OCR tool that interfaced with a claims rules engine for VA. This means that FBCS did not start as an adjudication system optimized to adjudicate claims automatically. As a result, the operational processes are much more manual than those found in private sector systems.

A.2.4.1   Distribution

Once the claim is entered in FBCS and has undergone the "Verify" process, the claim enters the "Distribution and Processing" module. Within this module, claims clerks process the claim to validate a number of criteria, such as:

- Using Veteran eligibility files, determine the Veteran's eligibility for coverage of the service(s) provided, and
- Using prior authorization information, determine whether the service required prior authorization and, if required, whether VHA issued the authorization. During "Distribution", claims clerks manually associate the authorization to the claim.

A.2.4.2   Pricing

After the claims clerk associates the authorization to the claim, the clerk clicks the "Calculate" button, which sends the claim to pricing. This process takes up to two days. During this period, the claim processes through the Program Integrity Tool (PIT), as described in the next section. The claim returns with the Medicare price on the line. If the line's submitted charge is less than the Medicare price, FBCS displays the line-allowed charge in yellow. When the allowed charge is yellow, the claims clerk must manually change the line price to the billed charge by selecting a

---

[299] Claims not processed through FBCS include: Pharmacy, Dental, Adult day care, bowel and bladder, Home Health for contract nursing homes claims, newborn, and Dialysis. Dialysis claims processed in COTS product, not VistA. All other claims processed in VistA.

drop-down. For contracted claims, the clerk manually enters the correct rate by keying the rate into the claim line. For PC3 claims, the claims clerk selects the price by using the drop-down box and selecting the correct rate.

A.2.4.3 Editing

During processing, the system also applies various edits to the claim. Examples of the types of edits employed in automated adjudication might include:

- Member eligibility edits, such as determining whether the member is eligible for services,

- Provider edits, such as determining whether the provider is eligible to render services,

- Duplicate checking, to deny claims for which an exact duplicate claim has previously been paid,

- Clinical and Coding edits, such as determining whether the procedure and diagnosis are clinically appropriate together, determining if there is a procedure code gender conflict (e.g., a hysterectomy billed for a male) or detecting unallowable combinations of procedures, and

- Other edits, such as validating timely filing, enforcing date checks, and confirming that nationally standard codes are submitted.

At VA, a claims clerk manually works each edit that posts to the claim. This means that the claims clerk analyzes the edit, edit description and other claims information to determine if the edit should pay, deny or reject the claim or claim line.

A.2.4.4 Post Adjudication/Pre-payment Accuracy Mechanisms

Within the "Processing and Distribution" module, claims feed into technical tools and edit checks such as Claims Scrubber, Program Integrity Tool (PIT) and Quality Inspector Tool (QIT).

The Program Integrity Tool (PIT) is used to detect Fraud, Waste and Abuse (FWA) for Non-VA Care claims submitted for reimbursement and avoid improper payments. The PIT tool was created from a commercial fraud, abuse and waste tool used to monitor claims payment for commercial clients. As such, issues commonly identified during adjudication in commercial systems are also identified on VA's claims. When clerks submit claims to calculate pricing, the claims also process through PIT, which applies predefined rules to the claim. Claims return from this process within two days for further processing by the clerk. The PIT tool performs additional checks related to the evaluating the reasonableness of diagnosis codes, procedure codes and other codes on the claim. PIT identifies issues such as determining whether the provider's name exists on Medicare's exclusionary list, finding duplicate claims, and identifying missing data on a claim line. Currently, all FBCS claims process through PIT.

The Quality Inspector Tool (QIT) reviews data extracted from medical and facility claims prior to payment for accurate claims processing. VHA created QIT based upon claims reports run at Minneapolis VAMC. VAMCs run QIT prior to submitting the batch for payment. The tool consists of automated inspections, which provide results on pass/fail basis. The report identifies the reason for each fail, such as incorrect payment methodology applied. When the tool identifies claims as "fails," further review is required—the claim may not contain an accuracy issue. Once

QIT identifies a failure, staff investigates the claim using the claim ID number. If the claim complies with VHA policy, the fee clerk or supervisor will override the error.

The tool also tracks individual payment processing performance using trend charts and performance summaries by fiscal year. At current, using QIT is not mandatory. Our team visited a VAMC that choose not to run QIT as part of their processing. VA, however, is working towards integrating the QIT checks into PIT. From interviews with staff concerning the QIT tool, it seems VHA created the QIT tool to find errors that would normally not occur in a more automated system; when a centralized, highly-automated claims adjudication system is implemented, the QIT tool may no longer be needed. Additional analysis on the QIT tool is necessary when this transpires.

Based on the results of these tests, the claims clerk applies any necessary changes to the claim. If a reject/deny suggestion is in-line with VHA guidance, the claims clerk or supervisor can override the error.

A.2.4.5   Payment

The purpose of the payment process is to report which claims are paid and denied, report the rate of payment on the claims, report why claims are denied, and create a check for all "paid" claims.

For VA, once the claim has undergone processing, the claims clerk approves or denies line items on the claim for payment. The claims clerk acknowledges the line item approval by using the "Send to Payment" function that routes the claim to pricing, the next step in the process. In the event a line item or multiple line items on the claim do not meet the necessary requirements, the claims clerk denies or rejects the claim. The clerk uses the "Deny" function in the Distribution and Processing Module. After denial or rejection, the claims clerk documents the reason for denial in the message box and notifies the Non-VA provider.

The "Send to Payment" function in FBCS routes the claim to Central Fee System located in Austin, TX. Within Central Fee, the claims clerks perform additional edits and send the claim to FMS for payment. FMS calculates the interest for the claim, if applicable. The payment process sums paid claims, creates checks, and creates remittance advices to send to providers. Remittance Advices describe the reason for claims denials.

A.2.4.6   Return of Medical Documentation

After the date of the appointment passes, the authorization clerk contacts the Veteran to verify that the appointment took place as expected. If it did occur, the NVCC authorization clerk contacts the Non-VA Provider to obtain necessary medical documentation from the patient's visit. Once the NVCC authorization clerks receive the documentation, he or she closes out the consult in CPRS.

A.2.5 Detailed Emergent Care Process

In emergent care, VA reimburses community providers for emergency treatment when the urgency of the situation does not allow for pre-approval. Section 2 describes the differences between Unauthorized and Mill Bill.

- Notification from Emergency Department (ED)/Receipt of Claim
- When a Veteran presents to a Non-VA Emergency Department (ED), the Non-VA hospital notifies the local VAMC. The Non-VA hospital alerts VHA in one of two ways:
- Receipt of a phone call when the Veteran is admitted to the ED
- Receipt of bill from the ED

Once the Non-VA hospital notifies VHA of the admitted Veteran, a transfer coordinator will monitor the situation. If the care is inpatient, the transfer coordinator documents the Veteran admitted to the hospital. If service connectedness is established and the hospital notifies VHA within 72 hours, the transfer coordinator can immediately create a tentative authorization. The tentative authorization allows the Non-VA provider to stabilize the Veteran to the point of discharge or transfer to the nearest VAMC. VHA categorizes the tentative authorization as "review for payment."

The other means of notification is the receipt of a claim. In some instances, VHA is not aware of the Veteran's admission to a Non-VA hospital until they receive the claim and additional medical documentation. In this case, the claims clerk scans the claim and supporting documentation into FBCS to perform an administrative review of the medical records. In this case, when the clinician determines the visit meets medical necessity standards (discussed in Section 4.2), the NVCC clerk creates an authorization. VHA uses the authorization to pay all claims related to the emergency visit.

A.2.5.1 Processing and Payment

The processing and payment on Unauthorized and Mill Bill claims follows closely to that of Authorized claims as discussed in Section 3.3, but with a few exceptions.

A.2.5.2 Eligibility and Coordination of Benefits

The claims clerk reviews the Veterans service connectedness rating and determines if the Veteran is eligible for Non-VA Care. In addition, they check the Veteran profile in VistA for evidence of a third-party insurance. The service connectedness and third-party insurance are critical determinations to ensure the correct payment authority is used. For example, as mentioned above in Section 2.3 Millennium Bill, if the Veteran is non-service connected and does not have other insurance, the care may be approved under 38 USC 1725. If the Veteran is service-connected, VHA can only approve the care can under 38 USC 1728.

A.2.5.3 Clinical Review

A clinician must review unauthorized claims received at the VAMC to determine medical necessity. A visit to the ED, in and of itself, does not justify medical necessity. A designated VHA

The views, opinions, and/or findings contained in this report are those of Grant Thornton should not be construed as an official government position, policy, or decision.

A-17

Fee clinician performs all clinical reviews for unauthorized claims. The Clinical Reviewer reviews the Non-VA claim and provider notes, in addition to considering the judgment of a prudent layperson (one who possesses an average knowledge of health and medicine would have reasonably expected that delay in seeking immediate medical attention would have been hazardous to life or health). The clinical reviewer ensures the encounter was emergent in nature and the VAMC was not feasibly available at the time.

A.2.6   Detailed Information on the Choice Program

A.2.6.1   Process Overview/Consolidation of Payment

If the Veteran meets one of the eligibility criteria above, VHA places him or her on the Veterans Choice List (VCL). The VCL serves as a way of verifying eligibility and guaranteeing payment for the Non-VA Provider. Before seeking care from a Non-VA Provider, the Veteran should call VHA to ensure that he or she is eligible for the Choice Program. VHA authorizes care upon eligibility confirmation and schedules an appointment with a Non-VA Provider. VHA has expanded contracts with the PC3 vendors described above to help administer Choice program. While use of the PC3 vendor's networks are preferred the Veteran can select their own provider outside of PC3, however, VHA must approve them in advance. If PC3 administers the care, HealthNet or TriWest is responsible for creating the authorization and scheduling the care.

The PC3 vendor or the Non-VA Provider (if PC3 is not used) submits the claim to VHA upon services rendered. The claims processing and payment processes are consistent with those of traditional Non-VA Care as described in Section 3.4. VHA routes all Choice claims to the Health Administration Center (HAC) in Denver, CO, but the claims are processed virtually using the St. Louis VAMC FBCS server.

- 30-day eligibility: provides eligibility for the Veteran if she/he has attempted to schedule an appointment with VA, and VHA is unable to schedule the appointment within 30 days of his or her preferred date.[300]
- 40-mile eligibility: provides eligibility for Veterans residing more than 40 miles from a VHA medical facility that is closest to their residence. This includes any VHA facility even if that facility is not capable of providing the required services.[301]

A.2.7   Detailed Information on PC3

VHA contracted with HealthNet and TriWest to provide Veterans with access to care through a network of community-based providers. PC3 vendors serve as administrators of the contract and act as intermediaries between VHA and their network providers. PC3 vendors manage networks of providers, coordinate care for the Veteran, and reimbursement network providers for care. PC3 vendors submit claims to VHA in accordance with their stated contracts. VHA instituted PC3 to improve Non-VA Care process. Examples include:

---

[300] Section 101 of the Veterans Choice Act (§ 17.1510(b)(1))
[301] Ibid.

- Ensure quality as providers and facilities meet quality standards

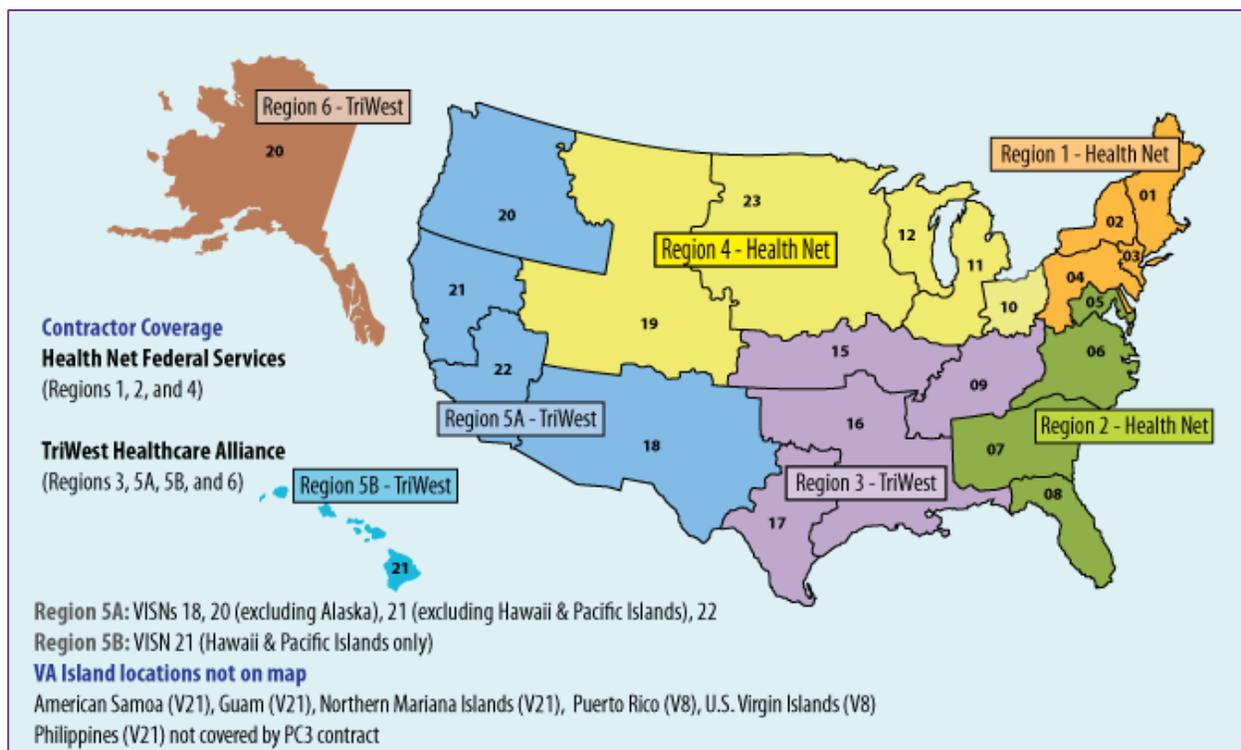
- Provide efficiency as providers help the VA Medical Centers (VAMC) manage high volumes of one type of care. Contractors set appointments and authorizations do not require additional contracting review

- Provide convenient method for Veterans to be seen quickly and within required commute times

- Decrease improper payments as payment rates are defined by the contract and contractors perform an additional level of review to ensure services performed match the authorization and were billed correctly to VA

- Support care coordination by providing medical documentation back to the VAMC in a timely manner

- Standardize processes by providing national contract administration and oversight from the CBO Purchased Care, and integrating into Non-VA Care Coordination processes

Figure A-2. Vendors Serving in Each PC3 Geographic Region


Source: VHA map of vendors serving PC3 geographic regions.

The process starts when a Veteran requires care and the Veteran is covered under the PC3 eligibility standards. VHA creates an authorization for the Veteran and submits it to HealthNet or TriWest based on the Veteran's region. Upon authorization, the vendor is responsible for scheduling an appointment for the Veteran. The PC3 contractor must contact the Veteran regarding the scheduled appointment and provide appropriate information about the appointment. According to PC3 contracts, the appointment must be scheduled within five days

of receipt of authorization and take place within 30 calendar days of scheduling the appointment.[302]

Additionally, the PC3 provider rendering the care must submit supporting documentation to VHA upon completion of the appointment. According to the HealthNet contract, VHA requires that, "Medical documentation recoding of authorized episode of outpatient care shall be submitted to VHA within 14 calendar days after completion of the initial appointment."[303]

The following subsections briefly describe other PC3 vendor responsibilities, as well as the related business processes, related to billing and payment.

A.2.7.1 Processing and Payment

PC3 vendors reimburse providers within their network. PC3 vendors contract directly with their network providers or otherwise coordinate with providers of medical services. PC3 vendors also are responsible for coordinating care delivering and returning medical documentation. Once the PC3 vendor reimburses the providers and receives the medical documentation, the PC3 vendor submits the claims to VHA for payment through FBCS. VHA processes PC3 claims similarly to all other claims.

While the PC3 vendors serve a function similar to a Third Party Administrator (TPA), some processes differ from traditional payer/TPA relationships. Typically, payers employ TPAs to support the operational functions necessary for adjudication and paying claims, such as processing and paying claims. The payer, in this scenario, outsources this function; the TPA will perform the claims operations functions, in this case, instead of the payer performing this function directly. Medicare, for example, contracts with 16 Medicare Administrative Contractors (MACs) to process their Part A, Part B, Durable Medical Equipment (DME), home health and hospice claims[304]. For Medicare, the claims are adjudicated by the MAC instead of by Medicare directly. For VA, the claims adjudication and payment functions occur at both VHA and the PC3 vendor.

---

[302] Department of Veterans Affairs (2014), Patient Centered Community Care, *Contracts Provide Primary Care Access*

[303] HealthNet Contract

[304] http://www.medicarenewsgroup.com/news/medicare-faqs/individual-faq?faqId=c8e2f9da-cec3-45ed-afa0-adb6ffbf68a7 Medicare Administrative Contractors, or MACs, are private organizations that carry out the administrative responsibilities of Traditional Medicare (Parts A and B). They also handle durable medical equipment, home health and hospice claims. Currently, there are 12 contracts for Parts A and B, which the Centers for Medicare & Medicaid Services (CMS) is consolidating down to just 10 contracts over the coming years. Four separate contracts have been rewarded for durable medical equipment claims processing.

Appendix C   Data Requests

C.1   Summary of Data Requests

This outlines the primary and secondary data requests submitted to VA by the VA Care and Non-VA Care teams.[305] The following tables summarize the numbers of data requests needed, received, and retracted, as well as an overview on the numbers of documents collected to conduct this assessment.[306]

Table C-1. Team I Joint Data Requests with Other Teams

Team I Joint Requests with Other Teams

Total Number of Data Requests	55
# Data Meets the Need	54
# Data Submission Pending	1

% Data Meets Need	% Retracted
98.18%	0.00%

Table C-2. Team I Solo Data Requests

Team I Solo Data Requests

Total Number of Data Requests	86
# Data Meets the Need	77
# Request Withdrawn	9
# RR = Partial Fulfillment	5
# RR = Fulfilled as part of different data request	1
# RR = Duplicate Request	1
# RR = No longer needed	1
# RR = VA data not available	1

% Data Meets Need	% Withdrawn
89.53%	10.47%

---

[305] Note: Not all requested data was received.

[306] Note: Retracted or withdrawn data requests occurred when data needs were fulfilled by another data request.

The views, opinions, and/or findings contained in this report are those of Grant Thornton should not be construed as an official government position, policy, or decision.

Table C-3. Team I Documents Collected

Team I Documents Collected

Total Number of Documents Collected	690
In the Shared Document Repository	645
Document tagged only to Team I	193
Documents tagged to, including Team I	452
In the Private Team I Area	45

C.2 VHA Revenue Data Requests Detail

C.2.1 Primary Data Requests

1. **Revenue Cycle Key Performance Indicators Reporting**
   a. Monthly CPAC dashboard reports for last 12 months and reports used to monitor progress, productivity, and/or performance for Patient Intake and CPAC functions.
2. **Accounts Receivable Aged Trial Balance Summary (ATB)**
   a. ATB Summary: Totals for accounts receivable balances. Report should separate In house, Unbilled, and Billed AR. Billed AR should be aged in 30-day increments, and including the number of accounts and dollar values by financial class and aging category (date of report should be as of the most recent month end).
3. **Summary Cash Collection Report**
   a. Third party cash collections in total and by payer/financial class for each month over the past 12 months.
4. **Revenue by Payer Report**
   a. Revenue (gross and net charges) in total and by payer/financial class for the past 12 months.
5. **Denials**
   a. Reports for initial denials received across the CPACs for each month over the past 12 months.
   b. Aggregate reports for denial write-offs for each month for the past 12 months, including standard denial adjustment codes and rejection category mapping. Include data for write-off of third-party billable amounts for last 12 months.
6. **Patient Intake Summary Volume**
   a. Summary volume data for the past 12 months for each VAMC for Patient Intake functions provided in percentage of patient totals that are scheduled in advance by VAMC for the last 12 months.
   b. Percentage of patients where pre-registration and insurance verification is currently completed By VAMC for last 12 months.

C.2.2 Secondary Data Requests

1. **Financials**
   a. VHA Financial Statements for the last two fiscal years (FY).
2. **Organization Charts**
   a. Current organization charts including FTE's for Patient Intake functions (Admitting/Registration/Insurance Capture).
   b. Current organization charts including FTE's for Patient Financial Services/Consolidated Patient Account Center (CPAC).
3. **Projects/Future Strategic Plans**
   a. List of all major Patient Intake and Patient Financial Services projects (operational and technology) currently underway or in development.
   b. Copies of proposed or tentatively accepted future strategic plans across the revenue cycle function.
4. **Revenue Cycle Policies and Procedures**
   a. Electronic copies of insurance capture/verification and third-party collection policies and procedures.
5. **Patient Intake Services, Patient Financial Services and Collection Agency/Vendor Reports**
   a. List of existing vendors currently assisting Patient Intake Services and Patient Financial Services, including costs and performance reports. Include eligibility services, billing and follow-up outsourcing, contract payment compliance, etc.
   b. Most recent monthly performance reports from collection agencies and other outside vendors, which perform services as a part of the verification and third-party collection process.
6. **Information Systems**

   Provide name(s) of the following information systems that are currently used at the organization to facilitate insurance verification and third-party collection efforts:
   a. Patient accounting/accounts receivable
   b. Insurance verification
   c. Denial management
   d. Patient management system for admissions/registration
   e. Remittance posting
   f. Scheduling
   g. Pre-billing edit and electronic billing
   h. Account follow-up
7. **Summary Adjustments Report**
   a. Monthly summary level adjustment reports in total and by major payer for the past 12 months.
8. **DNFB & Bill Hold/Edits Reports**
   a. 6 Months prior and most recent month-end Unbilled / Discharged Not Final Billed (DNFB) reports with bill hold reason by CPAC.
   b. Bill hold/bill edit reports, summarized by number and dollar by bill edit or reason from the Patient Accounting system for most recent month end.

    c. Bill hold/bill edit reports, summarized by number and dollar by bill edit or reason from any stand-alone (or bolt-on) bill editing systems utilized for most recent month end.

    d. Standard bill hold length for both inpatient and outpatient accounts.

9. **Patient Financial Services Productivity**

    a. Productivity data for the past 12 months: productivity standards and performance for the third-party collections area.

    b. Any reporting of errors, rejections, and denials detected per month related to patient financial services and Patient Intake errors.

10. **Patient Intake Services**

    a. Policies and procedures around the functions considered part of and reportable to Patient Intake (i.e., scheduling, pre-registration, insurance verification, onsite registration, financial counseling, cashier, information desk, etc.).

11. **Patient Intake Productivity**

    a. Insurance verification productivity data for the past 12 months.

    b. Any reporting of errors, rejections, and denials detected per month related to insurance verification errors.

C.3 Non-VA Care Data Requests Detail

C.3.1 Primary Data Requests

1. **Non-VA Policies and Procedures**

Provide Policies, Procedures and Guidance for Authorization, Processing, and Payment of Non-VA Care claims, to include:

    a. Deadlines for filing claims and appealing claims adjudication decisions.

    b. Reimbursement methodologies allowed (such as Diagnosis Related Groups (DRG), Resource-based relative value scale (RBRVS), Ambulatory Payment Classifications (APC), and Ambulatory Patient Groups (APG)).

    c. Veterans Health Administration (VHA) policies and procedures for defining eligibility to be a Non-VA health care provider.

    d. Rules, edits, policies, procedures, for Veterans Health Administration (VHA) as a secondary or primary payer on Coordination of Benefits (COB), Third Party Liability (TPL), Workers Compensation (WC), etc.

    e. Rules/systems for avoiding duplicate claim payments.

2. **Related Process Documentation**

    a. Flow chart detailing claims payment process including logging of claims, verification of eligibility, authorization, review process, claims edits, payment authorization, and payment date related to Non-VA Care payments.

    b. Data required for Fee Basis Claims System (FBCS) by each Department of Veterans Affairs Medical Center (VAMC) to process a claim (i.e., Veteran ID, provider ID, service, procedure code, revenue code, diagnosis, date of service (DOS), etc.). This request is for a listing of the data elements, not the actual data. This information can include 837 Companion Guide or Billing Manual instructions.

    c. Documentation on requirements imposed on providers when submitting claims such as, filing deadlines, documentation, medical record information required, and authorization and pre-certification requirements (including any authorization decision turnaround time requirements for Veterans Health Administration (VHA)). If this varies across VA, include how this varies.

    d. Documentation on electronic/manual processes used by the Veterans Health Administration (VHA) to monitor payment compliance with regulatory/legal requirements. Also, provide information on the role of Program Integrity Tool in Fraud Waste and Abuse (FWA) and compliance checks.

    e. Documentation/electronic system for tracking high utilizers of Non-VA Care.

3. **Non-VA Key Performance Indicators Reporting**

    a. Management reports on claims payments, timeliness and accuracy by the Department of Veterans Affairs Medical Center (VAMC) for (along with the data sources for the reports):

- Last 12 months on a monthly basis
- Last three years on a yearly basis

4. **Payment Accuracy and Timeliness**

    a. Reports showing claims expense reductions and recoveries on Coordination of Benefits (COB), Third Party Liability (TPL), Workers Compensation (WC), etc. by the Department of Veterans Affairs Medical Center (VAMC) for the last 12 months as a percentage of billed charges and paid amounts.

    b. Any data (e.g., documented processes to determine accuracy, amount of inaccurate payments, internal or external audit information) the Veterans Health Administration (VHA) has related to accuracy of payment to vendors (by the Department of Veterans Affairs Medical Center (VAMC) and claim type), including rates of inaccurate payments based upon paper vs. electronic claims for these timeframes:

- Last 12 months on a monthly basis
- Last three years on a yearly basis

    c. Reports, by claim type, for the last 3 fiscal years (reported annually) on claims being submitted electronically and manually.

    d. Average length of time between date of receipt of claim and date of payment with as granular breakout as possible (e.g., by the Department of Veterans Affairs Medical Center (VAMC), claim type, and electronic versus paper claim) for the la 3 fiscal years (reported annually).

5. **Information Systems**

    a. Descriptions of all systems used in the adjudication of Non-VA claims (e.g., which claims adjudication system is each Department of Veterans Affairs Medical Center (VAMC) using, what COTS products are used during processing (such as McKesson/Bloodhound/iHealth for National Correct Coding Initiative (NCCI) edits or 3M for Diagnostic Related Groups (DRG) assignment).

6. **Interest Penalties**

    a. Number of claims and amount of billed charges, paid amounts and penalties paid to vendors with as granular of breakout as possible (e.g., by the Department of

Veterans Affairs Medical Center (VAMC) and claim type, such as inpatient, outpatient, physician,) for the last 3 fiscal years on an annual basis.

b. Amounts of penalties paid by the Department of Veterans Affairs Medical Center (VAMC) showing penalties paid for claims submitted electronically vs paper with a breakout of billed amounts, reimbursed amounts, penalties, and raw claim counts with counts of claims with penalties.

7. **Denials**

a. Summary level reports of percent of submitted claims paid and percent denied by VAMC (by claim type if possible) for the last 3 fiscal years (monthly or annual reports fine). Categorize denials by reason (service not prior authorized, TPL not present on claim, Veteran ID not on file, provider not on file, service not covered, duplicate check, utilization review issue, etc.) and include the allowed amounts denied by reason code.

8. **Claims Processing Productivity**

Management reports related to claims processing (e.g., edit descriptions for denials in adjudication system) for the last 3 fiscal years on an annual basis by the Department of Veterans Affairs Medical Center (VAMC):

a. Percent of clean claims, total charges and amounts paid on those claims from Non-VA provider paid within 2 weeks of date of service/discharge

b. Percent of clean claims, total charges and amounts paid on those claims from Non-VA provider paid within 30 days of date of service/discharge

c. Percent of clean claims, total charges and amounts paid on those claims from Non-VA provider paid after 365 days of date of service/discharge

d. Percent of clean claims suspended during first pass

e. Percent of clean claims adjudicated within 5, 10, 15, 20, 25, 30, 60, 90, 120, 150, 180 days

f. Percent of clean claims adjudicated automatically[307]

g. Percent of claims where allowed amount equals the contracted amount

C.3.2 Secondary Data Requests

1. **Organization Charts**

Organization charts including Full-Time Equivalent (FTE's) for fee departments processing claims:

a. Number of Staff scanning/entering claims

b. Number of staff correcting/adjusting claims

c. Staff providing Veteran and provider support

2. **Policies, Procedures, and Related Documentation**

---

[307]Note: *Clean claim* means one that can be processed without obtaining additional information from the provider of the service or from a third party. It includes a claim with errors originating in a payer's claims system. It does not include a claim from a provider who is under investigation for fraud or abuse, or a claim under review for medical necessity.

a. Any policy and procedures related to creating agreements between the Veterans Health Administration and Non-VA health care providers for the provision of Non-VA health care services and sample copies of regional or national agreements of this nature. This may include:
- Department of Veterans Affairs (VA) – national
- Veterans Integrated Service Network (VISN)
- Department of Veterans Affairs Medical Center(VAMC)-level

b. Any rules regarding credentialing of Non-VA providers.

3. **Information Systems**
   a. Information regarding the electronic sharing of information with Non-VA providers.

4. **Payment Accuracy and Timeliness**
   a. Scrubbed example of typical invoices for each claim form and any non-standard claim information submitted (such as an invoice).
   b. Internal audit results of Non-VA Care for the past 3 fiscal years (e.g., Improper Payments Elimination and Recovery Act (IPERA), Management Quality Assurance Service (MQAS), Compliance and Business Integrity (CBI), External Auditor, etc.) for the last 12 months. Include any monthly reports for the last 3 years and any yearly reports.

5. **Care Authorization**
   a. Data on average, median and percentiles for logging a request for authorization and the decision date on the request for authorization by the Department of Veterans Affairs Medical Center(VAMC), claim type and number of authorization requests approved versus denied for the last 3 fiscal years on an annual basis for Inpatient Care.

6. **Service Level Agreements (SLAs)**
   a. Contractors, if any, utilized for functions related to vendor claim processing (e.g., discovery of TPL data, prior approval of services, etc.). If using contractors, provide copies of the Service Level Agreements (SLA).
   b. Patient Centered Community Care (PC3) Vendor Management information:
   - Patient Centered Community Care (PC3) vendor management (i.e., TriWest and HealthNet), key Service Level Agreements (SLAs) related to claims processing and payment with VA.
   - Other contracts (Choice or local contracts) key Service level agreements (SLAs) related to claims processing and payment.

7. **Projects/Current Improvement Efforts**
   a. Information related to the Non-VA Care Way Forward initiatives that affect claims processing and payment.
   b. Patient Centered Community Care (PC3) Vendor Management information:
   - Anticipated changes to processes and procedures related to Patient Centered Community Care (PC3) vendor management (i.e., TriWest and HealthNet) related to claims processing and payment with VA.
   - Oversight or performance reports (e.g., for claims processing, provider network exit interview findings, audits of vendors).
   - Other documentation communicating billing requirements to network providers (e.g., provider manuals, provider contracts, etc.).

    c. Information regarding any system enhancements and the manner in which they are anticipated to affect claims processing and payment.

    d. New policies around the role of CO (Contracting Officer) and Contracting Officer's Technical Representative (COTRs) in administering provider contracts for Non VA Care.

8. Interest Penalties

    a. Amounts of penalties paid by the Department of Veterans Affairs Medical Center (VAMC) showing penalties paid for claims submitted electronically vs paper with a breakout of billed amounts, reimbursed amounts, penalties, and raw claim counts with counts of claims with penalties.

Appendix D   Standards and Benchmarks

D.1   VA Care: Private-Sector Benchmarks and Related VA Standards

Table D-1. VA Care Benchmarks and Related Standards

Process Area	Private Sector Benchmark	VA Measure	Differences
Insurance Identification	Overall advance insurance verification rate of scheduled patients: >= 98 percent (Source: HFMA).	Insurance Capture Buffer Exception Rate<=10 percent.	VHA does not track insurance verification rate of scheduled patients; however, VA considers ICB exceptions missed identification opportunities.

Process Area	Private Sector Benchmark	VA Measure	Differences
Clinical Documentation	No commercial benchmark available to cite, however, leading commercial practices are to hold clinicians accountable to finalize and submit documentation within 24-48 hours.	VA Clinicians have 7 days to submit their clinical documentation for encounter coding (per interview findings).	VHA report on date of discharge to date of transmission to coding inflates the clinical documentation lag time due to multiple reasons. As such, obtained outpatient billable latency percentage.

Process Area	Private Sector Benchmark	VA Measure	Differences
Coding/Clinical Documentation Quality	No commercial benchmark or leading commercial practices are used to benchmark coding quality and turn-around time.	Denial Inflow Summary displays all denials broken down by Minor Denial Reason Code. Coding quality will be measured by taking Wrong Procedure Code denials as a percent of Total Denials to show the total number of denials that resulted from the wrong procedure code.	N/A
Health Information Management	Inpatient charts coded per coder/per day: 23-26 (Source: HFMA). Outpatient charts coded per coder/per day: 150-230 (Source: HFMA).	Commenting on VA benchmarks for IP turnaround time (7 days), OP turnaround time (14 days), and coding backlog. (Source: HIMS).	Productivity per coder is not available.
Gross Days Revenue Outstanding	HFMA does not publish a gross days in AR metric rather they state a net days in AR metric (55 days).	GDRO Detail Report: (AR Total $ Monthly/ Average Daily Billings for the Previous 3 Months) VA FY14 Target: 43 days. (Source: Power+).	VHA does not track contractual adjustments, bad debt adjustments or the resulting net revenue. VA only tracks gross revenue.
Cash Collections	Cash Collection percent: (Total Cash Collected ($)/Average Monthly Net ($) Revenue) = Cash Collections as percent of Adjusted Net Patient Services Revenue.	Power+ Data - FMS Collections (Total Funds) Report calculates expected and actuals for FMS collections. (Source Power+). Total Cash Collection as a percent of Billed Gross Revenue each month.	Standard will have to be reported as a collections as a percent of gross revenue. VA does not track net revenue like the HFMA standard.

D.2 Non-VA Care: Private-Sector Benchmarks and Related VA Standards

Table D-2. Non-VA Care: Benchmarks and Related Standards

Process Area	Private Sector Benchmark	VA Measure	Differences
Accuracy	≥ 97 percent of claims processed and paid accurately.	Non-VA Care accuracy standard is 98.5 percent.	VHA does not review denied or rejected claims as part of their accuracy review.
Payment to Vendors	96 percent of clean claims are processed within 30 days.	90 percent of ALL claims to be processed within 30 days.	VHA does not track timeliness for "clean" claims.[308]
Interest Payment	0.8 percent of claims included penalties or interest due to late payment.	.03 percent of the claims included penalties or interest due to late payments.	A review of VHA's allocation of interest to claims is being conducted to assess whether interest was applied accordingly.
Mode of Claims Submissions	79 percent of all claims automatically adjudicated.	0 percent of the claims are automatically adjudicated.	Commercial systems created for high rates of auto-adjudication. FBCS created from OCR tool.

---

[308]Note: VHA changed timeliness standards for authorized (30 days) and unauthorized (45) claims. However, VHA does not officially designate claims as 'clean or unclean' by using edits. While a change was recently made, VHA's standard is still not comparable to industry standards.

Process Area	Private Sector Benchmark	VA Measure	Differences
Payment	≥96 percent of payments are within 30 days.	90 percent of ALL claims to be processed within 30 days.	In 2014, only 66.9 percent of the claims were processed within 30 days.
Payment to Vendors	98.5 percent of claim lines paid.	~55 percent of claims paid.	Benchmark for claim lines and VHA measure is claims.

Preface

Congress enacted and President Obama signed into law the Veterans Access, Choice, and Accountability Act of 2014 (Public Law 113-146) ("Veterans Choice Act"), as amended by the Department of Veterans Affairs (VA) Expiring Authorities Act of 2014 (Public Law 113-175), to improve access to timely, high-quality health care for Veterans. Under "Title II – Health Care Administrative Matters," Section 201 calls for an Independent Assessment of 12 areas of VA's health care delivery systems and management processes.

VA engaged the Institute of Medicine of the National Academies to prepare an assessment of access standards and engaged the Centers for Medicare & Medicaid Services (CMS) Alliance to Modernize Healthcare (CAMH)[1] to serve as the program integrator and as primary developer of the remaining 11 Veterans Choice Act independent assessments. CAMH subcontracted with Grant Thornton, McKinsey & Company, and the RAND Corporation to conduct 10 independent assessments as specified in Section 201, with MITRE conducting the 11th assessment. Drawing on the results of the 12 assessments, CAMH also produced the Integrated Report in this volume, which contains key findings and recommendations. CAMH is furnishing the complete set of reports to the Secretary of Veterans Affairs, the Committee on Veterans' Affairs of the Senate, the Committee on Veterans' Affairs of the House of Representatives, and the Commission on Care.

The research addressed in this report was conducted by McKinsey & Company, Inc., under a subcontract with The MITRE Corporation.

---

Executive Summary

BACKGROUND

Title II Section 201 of the Veterans Choice Act required an independent assessment of the purchasing, distribution, and use of pharmaceuticals, medical and surgical supplies, medical devices, and health care related services by VA and VHA.

In line with the language of the legislation, pharmaceuticals, medical and surgical supplies (hereafter referred to as clinical supplies), and medical devices are considered within the scope of this assessment. In addition, services directly related to the purchasing, distribution, and use of these products are also considered, such as third party distributors and inventory management services. However, medical equipment (capital, reusable, or durable) was not included as its evaluation was not mandated in the legislation.

To complete this report, the assessment team visited eight VA Medical Centers (VAMCs), two Consolidated Mail Order Pharmacies (CMOPs), and three contracting organizations; interviewed 185 VA/VHA personnel and 20 non-VA subject matter experts; analyzed large sets of purchase history and other data from 12 different sources; and reviewed more than 24 prior reports. The assessment's findings and recommendations are summarized below.

FINDINGS

General findings

As a general characterization, VA's supply chain performs well for pharmaceuticals but less so for clinical supplies and medical devices. VA pays relatively low prices for drugs, it has a robust and efficient pharmaceutical distribution network that achieves high Veteran satisfaction scores, and has mechanisms in place to ensure appropriate utilization of medications that have strong buy-in from clinicians and pharmacists. However, the performance of VA's supply chain related to clinical supplies, medical devices, and related services is poor when compared with VA's pharmacy organization or to best practices in leading hospital systems. Its contracting processes are bureaucratic and slow, which can delay Veterans' access to care. Purchasing processes are cumbersome, which has driven VHA staff to workarounds and exacerbates the variation in prices VA pays for products. Utilization is difficult to measure or manage given lack of data, which likely leads to significant avoidable expense for the VA.

A number of factors inherent to these product categories may have contributed to the difference in VA's current supply chain performance, including:

- Product and supplier complexity: Pharmaceuticals is a well-defined and narrow product category for which a limited set of highly regulated suppliers exist. Clinical supplies is a diverse category that typically has more suppliers for a given clinical supply than there are for a given drug. This impacts the ease of supplier management and product selection.

- Access to clinical evidence: Pharmaceuticals must go through rigorous clinical trials prior to regulatory approval and clinical evidence often exists to compare drug effectiveness. Medical devices also go through rigorous testing but there are more feature variations and less comparative effectiveness data is typically available. Data on the efficacy or

safety of clinical supplies is limited. This impacts the organization's ability to make fact-based procurement and utilization decisions.

- Industry-wide data standardization: The naming and numbering of pharmaceuticals is standardized nationally. No such system exists for clinical supplies or medical devices, which makes it hard to know whether two products are the same and to compare disparate data sets.

Several internally-driven factors have also led to the performance disparity seen between the supply chain management of pharmaceuticals relative to the other product categories within scope. The factors observed and described in this report are broad and relate to differences in organizational structure and alignment, processes and the degree of process standardization, IT systems and their interoperability, and data quality and management.

While we have contrasted the performance of what is, in effect, two supply chains, nuances certainly underlie our broad characterization. For example, VA does not consistently buy pharmaceuticals at the lowest price available and Veterans' transitions into VA from active military service could be improved. Conversely, the Denver Acquisition and Logistics Center (DALC) is a bright spot within VA's supply chain management related to clinical supplies and medical devices, as are several other pockets of innovation.

However, because the strengths and opportunities related to pharmaceuticals are quite distinct from those related to the other product categories within scope, we have structured this report in two parts: (1) Pharmaceuticals and related services, and (2) clinical supplies, medical devices and related services. Specific findings are outlined below and described in more detail in the body of this report.

Findings related to pharmaceuticals and related services

Overall, VA performs well on the key dimensions of purchasing, distribution, and use of pharmaceuticals. Across VA, the Pharmacy Benefits Management (PBM) organization's two-way cascade of committees – from the national PBM organization to Veterans Integrated Service Networks (VISNs) to VA Medical Centers (VAMCs) and vice versa – provides an effective mechanism to escalate insights and innovation from the field, develop policy centrally, and build buy-in quickly across the country to facilitate implementation. Within VAMCs, clinical pharmacists are well integrated into multidisciplinary care teams and are highly valued by physicians and Veterans.

Key findings include the following:

- **VA pays relatively low prices for pharmaceuticals overall but several factors limit its ability to consistently access the lowest price available:** Through federally mandated price concessions and national contracting, VA has secured relatively low pricing overall on the pharmaceuticals it buys. However, pharmaceuticals are not always bought at the lowest price available to VA for a number of reasons, including contract lapses, national drug shortages, and requirements to buy pharmaceuticals from countries that are compliant with the Trade Agreements Act (TAA).

- **VA's distribution of pharmaceuticals is efficient and effective:** VA's pharmaceutical prime vendor (PPV) is a distributor that sources pharmaceuticals from suppliers and delivers them to VA facilities. The PPV provides a number of additional services that support VA's purchasing, distribution, and use of pharmaceuticals, including web-based purchasing, regular data reports, and inventory management services. The PPV model ensures efficient delivery of pharmaceuticals to facilities and CMOPs and supports a just-in-time inventory management approach. The PPV model received unanimous support from the pharmacists, pharmacy managers, and CMOP leaders interviewed during this assessment.

  VA's seven CMOPs deliver 80 percent of VA's outpatient prescriptions directly to Veterans' homes, and they do so efficiently and cost effectively at $1.53 per prescription (VA, 2015b; VA, 2015c). The CMOP program also achieved the highest overall customer satisfaction scores of any mail order pharmacy in the country in a recent J.D. Power customer survey (871 points out of a possible 1000) (J.D. Power, 2014).

  However, CMOP facilities have opportunities to increase automation of packing and shipping to improve throughput and quality, and to optimize the network's footprint to improve utilization of fixed assets and reduce costs.

- **VA has developed effective mechanisms to drive appropriate utilization such as its formulary, clinical use guidelines, and involvement of clinical pharmacists:** All physicians and pharmacists interviewed believed the VA formulary helps guide good clinical decision-making around prescribing, and they expressed strong buy-in to the formulary decision-making process.

  Standardized processes are also in place to enable off-formulary prescribing, which includes electronic submission of clinical justification by physicians and review by clinical pharmacists. Around 80 percent of such off-formulary requests are approved (VA, FY2014b). Currently, five percent of outpatient prescriptions dispensed by VA are for drugs that are not on the VA formulary (VA, 2010-2014b). Inpatient data was not available. In summary, VA's formulary process is sufficiently flexible to give Veterans access to medications based on clinical need regardless of a medication's formulary status.

  VA does not measure the use of generic medications in a way that is easily comparable with industry benchmarks (typically the proportion of generic prescriptions dispensed of all prescriptions). However, VA purchases 97 percent of its drugs (by volume) as a generic when a generic exists (VA, 2010-2014a) – similar to the health care leader Kaiser Permanente which claims a 99 percent generic prescription dispensing rate when a generic exists (Kaiser Permanente, 2015). This helps deliver high quality, FDA-approved medications to Veterans while ensuring efficient use of taxpayers' dollars. However, there are pockets of opportunity to use a higher share of generics within certain drug classes in some geographies.

- **VA has implemented policies and processes to improve patient transitions from the Department of Defense (DoD) to VHA but challenges remain:** Several prior reports have highlighted challenges related to Veterans' transitions directly from DoD care to VA care, particularly related to medication continuity.

VA has taken steps to improve this process in recent years, including the release and implementation of a January 2015 directive. However, three key challenges remain:

- o Poor access to primary care: The most recent studies report that new VA patients wait on average 40 days to see a primary care physician (VA, 2014c) and the average time between servicemember discharge date and first VA appointment is 81 days (GAO, 2012). Many prescriptions are written for less than the 81 day average as evidenced by 54 percent of VA's own prescriptions being for 30 days or less (VA, 2014d). Therefore, patients who have a 30-day supply could run out of medication while they are waiting to see a VA physician. While policies exist to address patients running out of medications (GAO, 2012; Staff interviews, 2015), access improvements may improve transitions. Access to physicians is beyond the scope of this assessment but is covered in Assessment B and scheduling in Assessment E.

- o Limited mobility of health information between DoD and VA: In line with findings from previous reports, physicians and administrators interviewed during this assessment consistently cited poor access to DoD medical records and medication history as the biggest challenge associated with transitions from DoD. Without access to previous medical records, they reported challenges understanding why patients were taking certain medications. Access to such information can be critical to ensure Veterans continue to receive their medication. For example, a physician may need a patient's medical history to be comfortable prescribing a medication such as a high risk or high potency drug, or to prescribe an off-formulary medication.

- o Differences between DoD and VA formularies: DoD's and VA's formularies and formulary processes are different. DoD has a three-tiered formulary, of which the third tier is considered non-formulary and not stocked on military bases. Instead, these non-preferred medications are only available through community pharmacies or mail order, and a large co-pay applies. All FDA-approved medications, until reviewed, are required by law to be placed in the second tier. VA has one national formulary and no tiers, and all medications are provided through VA pharmacies or CMOPs. However, both systems have mechanisms to provide access to off-formulary medications if clinically indicated. Media reports have raised risks regarding medication switches during transitions. While accurately understanding the rate of medication switches driven by formulary differences would require a prospective study of transitioning servicemembers (which is beyond the scope of this report), an internal VHA PBM audit of 2,000 new patients showed approximately three percent of patients transitioning from DoD within a year of discharge (21 of 759) had a medication switched by VA physicians without documented clinical justification (VHA Pharmacy Benefits Management, 2015a). Deeper analysis of that three percent was not available, but several factors could have driven the switch, including undocumented clinical reasons, a patient's request to try a new medication, or a physician's desire to adhere to VA's formulary. The assessment team is not aware of any work underway to align the formularies at this time.

- **VA has implemented programs to reduce utilization of high risk medications and early results are promising**: For example, VA's opioid reduction program has cut the share of

---

patients prescribed opiates by almost three percentage points since 2012 (VHA Pharmacy Benefits Management, 2015b). However, there are opportunities to improve the current measurement approach by taking into account the type, strength, and dosage frequency of opioids dispensed.

Findings related to clinical supplies, medical devices, and related services

In contrast to the management of pharmaceuticals and to best practice in the industry, the rest of VA's medical supply chain faces major performance challenges. Specific findings include the following:

- **The organizational structure of the VA's supply chain enterprise is unduly complex and duplicative:** VA and VHA both contain organizations that play a role in the management of VA's medical supply chain. VA's Office of Acquisition, Logistics, and Construction (OALC) is subdivided into two organizations – the Office of Acquisition and Logistics (OAL) and the Office of Acquisition Operations (OAO). VHA's medical supply chain consists of three organizations – the Procurement and Logistics Organization (PLO) that is responsible for clinical supplies, the Prosthetics and Sensory Aids Service (PSAS) that is responsible for medical devices, and the Pharmacy Benefits Management (PBM) organization that is responsible for pharmaceuticals. These three organizations are responsible for additional product categories that are outside the scope of this assessment.

  Within PLO, the procurement and logistical management of clinical supplies are managed by two separate groups – the Office of Procurement and the Office of Logistics respectively – and the reporting structure for each group is different. Procurement personnel report through VHA's NCOs and SAOs to the VHA's national Office of Procurement. In contrast, facility-based and regional logistics personnel do not report up to VHA's national Office of Logistics. Instead, they report into their local VAMC or VISN Director respectively.

  Together, VA and VHA have 28 entities involved in aspects of contracting in some way. There are 4 contracting entities within VA – the Strategic Acquisition Center (SAC) and the Technology Acquisition Center (TAC) that sit within OAO, and the National Acquisition Center (NAC) and Denver Acquisition and Logistics Center (DALC) that sit within OAL. There are 24 contracting entities within VHA for the medical supply chain – 21 Network Contracting Offices (NCOs) that establish contracts for each VISN and three Service Area Organizations (SAOs) that establish contracts on behalf of multiple VISNs. The SAOs are geographically aligned to the western, central, and eastern regions of the country.

  The assessment team's analysis showed that there are several areas of overlap between VA and VHA overall, between national and regional contracting organizations, and between the four VA-level contracting organizations, particularly the NAC and SAC. Senior leaders in VA's and VHA's supply chain organizations who were interviewed unanimously said that the current organizational structure is too complex and should be simplified. Several interviewees described tension between some of the groups involved in supply chain management. Others described a vacuum of ownership and accountability because of the organization's siloed and fragmented structure as well as lack of clarity on roles and responsibilities.

- **VA's current IT systems, data systems, and analytical capabilities related to finance, inventory management, and purchasing are major impediments to effective supply chain management:** VA's IT and data systems in these areas are antiquated, not integrated, and do not meet the needs of a modern health system. Many health care systems today operate with or are adopting integrated Enterprise Resource Planning (ERP) systems, which give them end-to-end visibility into the operational and financial performance of their supply chains. This enables more effective budgeting, forecasting, and inventory management, as well as automation of key supply chain processes such as ordering. Best in class health care systems build advanced business intelligence capabilities on centralized and standardized data systems, allowing them to perform sophisticated analysis on spend and utilization.

  In contrast, VA has at least 130 separate and independently maintained instances of Veteran Information System Technology Architecture (VistA) (VA, 2015e), the underlying architecture for its clinical, procurement, and inventory management systems. Each has its own product nomenclature and numbering system for the items in its database, and because entries are mainly free text, data from each instance can be quite different. Therefore cross-site comparisons or regional/national roll-ups are almost impossible. This situation is a major impediment to effective management of VA's medical supply chain.

- **The performance of VA's contracting organization does not meet customers' expectations, so frontline staff have developed workarounds:** Ninety one of 122 interviewees we spoke to regarding contracting for clinical supplies and medical devices, including contracting leadership, expressed concerns about the proliferation of VA contracting organizations or their ability to collectively meet performance needs of the organization. When the assessment team asked clinicians, logistics staff, and facility administrators to identify three areas they would most like to improve, speed and responsiveness of contracting was almost always one of their recommendations.

  Our analysis confirmed issues with the responsiveness of contracting. For example, at one facility, if a request was submitted to contracting that was incomplete or inaccurate, it took on average 21-39 days from the date of initial submission to receive the first response from contracting requesting, for example, additional information or paperwork (VAMC site visit, 2015).

  VHA customer surveys show that communication from contracting is another area for improvement. Of all the dimensions assessed in surveys of contracting users (included on all email communications by contracting), communication received from contracting officials scored lowest by customers (3.3 average NCO score out of 5, ranging from 2.7 to 4.0 for overall communication effectiveness and 2.8 to 3.8 for status updates) (VHA, 2015a). Several interviewees recommended that VA provide more clarity on the status of a contracting request to help them plan and schedule care.

  Conversely, individuals in contracting believed that VAMC staff were responsible for some of the delays in the contracting process. They reported that requests submitted to them from VAMCs were often incomplete or unclear and that facilities were poor at forecasting demand for items, leading to unpredictable peaks in demand for contracting services that exceeded their capacity. PLO and facilities are seeking to address these challenges by

placing Contract Liaisons in facilities to better support Contracting Officer Representatives throughout the process (VHA Assistant Deputy Under Secretary for Health Administrative Operations, 2014).

As a result of the ongoing contracting challenges, frontline staff reported that they had developed two interrelated workarounds to avoid using contracting. First, they try to buy the majority of their clinical supplies and devices on VA-issued purchase cards because this gives them more autonomy to choose the products they want and to buy through their preferred channel (for example, directly from a manufacturer or through a local distributor). Second, they try to ensure that any orders placed (regardless of payment mechanism) are below the $3,000 micro purchase threshold that would trigger involvement of contracting. As a result, approximately 98 percent of VA's purchases of clinical supplies are made on purchase cards, which accounts for around 75 percent of VA's spend on that category (VA, FY2014a). Ninety-seven percent of VA's clinical supplies and prosthetics purchase orders are below $3,000, although this only accounts for 59 percent of the total spend for those categories (VA, FY2014a; VA, FY2014c). Data also confirmed that a disproportionately high number (two to three times the expected number) of purchase orders for clinical supplies are within $500 of the micro-purchase threshold ($2,500 to 3,000) (VA, FY2014a).

Use of purchase cards is encouraged in Federal Acquisition Regulations (FAR), partly because their use reduces the need for contracting to make multiple small-value awards. However, their use limits VA's ability to ensure compliance with government contracting regulations because purchase card holders are responsible for identifying appropriately priced goods and contracted vendors, and VA's current systems do not support these tasks with integrated catalogs and controls. This likely leads to higher than necessary prices paid for goods.

Purchase card purchasing processes are also inefficient when compared with modern alternatives, such as electronic order transmission and funds transfer. Purchase card holders are required to maintain appropriate documentation and to reconcile purchases. Electronic ordering and payment can automate reconciliations, reduce errors, and also enable automatic reordering based on utilization forecasting.

- **VA has not taken full advantage of its scale or potential for product standardization to achieve optimal pricing and efficiency:** Unlike pharmaceuticals, no external unit price benchmarks exist for medical and surgical supplies, medical devices, and related services. Therefore, as a proxy, the assessment team evaluated variation in prices paid for identical items across sites and the share of items bought on government contracts, which typically provide access to prices that are significantly below open market prices.

Analysis of unit prices for facilities across two VISNs showed significant variation in price paid for identical items (VA, FY2014a). On average, the highest price paid for an identical item was 1.3 times the lowest price. However, in some cases, the difference in prices was much greater. For example, the highest price paid for a commonly used disposable blood pressure cuff was more than twice the lowest price.

In addition, contracting compliance analysis showed significant opportunity for improvement. Analysis of purchase order data showed that 38 percent of purchases were made on a government contract, 27 percent were made at open market prices, and 34 percent did not have a source type specified (VA, FY2015). Private sector organizations typically aim to buy 80-90 percent of their clinical supplies and medical devices on some type of negotiated contract (High performing health system interviews, 2015).

Interviews and observations revealed that there are two primary reasons for VA's relatively high share of open market purchasing. First, in contrast to pharmaceutical purchasing, VA's supply purchasing systems are not integrated with contract or pricing catalogs. Therefore, the purchasing process relies on buyers (often clinical staff) to research whether an item is on contract and through which contract a purchase should be made. Because of that complexity, several buyers reported that they bypass this step and buy products through the channel that is most familiar and convenient, for example, by replicating previous orders to their usual supplier, despite changes that may have occurred (new contracts and pricing arrangements, for example). Second, VA has limited ability to monitor and drive compliance with the contract hierarchy because the required data is not captured electronically. In fact, over 60 percent of all clinical supply items do not have a contract number listed (VA, FY2014a).

In addition, despite numerous reports highlighting the need for greater product standardization, VA has achieved limited product standardization to date. This has led to a fragmented supplier network and a high number of items under management by the logistics organization.

Finally, VA does not have a mechanism to identify products for which central contracts should be established. High performing organizations routinely analyze purchase order data and partner with clinical teams to identify products that should be prioritized for contract negotiation or renegotiation, as well as for utilization management. These integrated teams write comprehensive requirements that meet clinicians' needs and have an appropriate supply chain strategy. In some cases, VA standardized national contracts have missed important end user input that complicates use.

- **Inventory management process, practices, and systems are neither integrated nor optimized:** VA has contracts with six Medical/Surgical Prime Vendors (MSPVs) – distribution companies that provide services to support the purchasing, distribution, and use of clinical supplies and medical devices. Each MSPV covers a different part of the country. In addition to distribution, MSPVs have the capability to provide a range of additional services to support VA's management of its inventory such as electronic ordering platforms, warehousing services, just-in-time inventory management services (for example, low unit of measure distribution), and data analytics.

To date, VA has taken limited advantage of these services. For example, only one VISN has partnered with a MSPV to support a lean, low unit of measure inventory model.

VA's fragmented inventory management systems and processes also create challenges. VA's current inventory management does not have a feedback loop that links inventory to product utilization, contracting, ordering, and vice versa. This prevents optimal utilization

of the Medical/Surgical Prime Vendor (MSPV) program and missed opportunities to establish more effective volume-based national or regional contracts. It also leads to peaks and troughs in demand for contracting services, which can overwhelm contracting's capacity.

- **VA struggles to attract, hire, and retain high caliber supply chain talent:** There was limited central data on vacancies in the logistics organization. However, interviewees estimated that 20-30 percent of positions in logistics were currently unfilled, which required staff to incur overtime to ensure timely delivery and distribution of supplies. As an example, as of May 12th 2015, VA had 563 open positions for medical supply aides and technicians, which represents around 20 percent of all employees of that type or almost four vacancies per facility on average (VA, 2014e; VHA, 2015d).

  Supply chain leaders described three factors that could have contributed to their recruitment and retention challenges. First, supply chain leaders perceive that the recent downgrade of several supply chain positions has impacted morale and has made some positions less attractive for potential recruits. Second, sixty percent of supply chain and contracting interviewees also expressed concerns about the time it takes HR to fill open positions. They cited long lead times and a small eligible applicant pool as the primary drivers. It is beyond the scope of this report to evaluate HR policies and practices. However, VA recruiting regulations do preferentially favor Veteran and internal hires, which can restrict VA's access to a potentially large pool of talent that does not fulfill those criteria. Third, logistics leaders reported a lack of opportunities for career progression. They gave several examples of high performing individuals who had left the supply chain organization to take a non-supply-chain VA position at a higher grade.

  Experts interviewed during this assessment said that competition for supply chain talent in health care is higher now than in the past and organizations are paying more to attract and retain the highest performers (High performing health system interviews, 2015). This may be contributing to VA's recruitment and retention challenges.

- **There are pockets of good performance and innovation in VA that could be replicated across its supply chain:** The Denver Acquisition and Logistics Center (DALC) is a bright spot within VA's supply chain organization in its acquisition and distribution of select devices such as hearing aids to Veterans. It has developed an integrated operating model that brings together clinicians, contracting, finance, logistics, and program management. That integrated team makes decisions around product and supplier selection based on a holistic view of what is best for Veterans and for VA.

  In addition, VA medical centers and VISNs have a degree of autonomy to test and pilot new processes, management approaches, and technologies. Several innovations were observed during this assessment that could be scaled across VA to improve service to Veterans.

RECOMMENDATIONS FOR CONSIDERATION

Based on these findings, the assessment team believes VA should consider the following recommendations. The body of the report provides additional details that would support implementation of the recommendations below.

Recommendations related to pharmaceuticals and related services

- **Establish mechanisms to ensure VA secures a reliable supply of pharmaceuticals and accesses the lowest possible pricing more consistently**
  - Modernize VA Acquisition Regulations (VAAR) to enable access to lower priced commercial sources when possible
  - Identify pharmaceuticals at highest risk of shortages and price spikes, and develop specific strategies to limit impact
  - Improve lifecycle management of contracts to prevent lapses
- **Continue driving efficiency through VA's CMOP network**
  - Drive more volume through CMOPs, particularly for prescription refills
  - Continue to automate processes in the CMOPs
  - Evaluate consolidation of CMOPs to drive efficiency and higher utilization
- **Develop more robust mechanisms to improve the transition of patients from the Department of Defense to VA care**
  - Improve access to primary care for transitioning Veterans as per Assessment B and Assessment E
  - Improve sharing of medical records and medication history between DoD and VA and make it a strategic priority (see Assessment H)
  - Explore opportunities to align or integrate formularies taking into account clinical evidence and economic impact
  - Develop drug-class-specific guidance for medication changes related to transitions
  - Develop mechanisms to track transitioning DoD servicemembers
  - Improve communication with Veterans about their medications during transitions
- **Build sophisticated approaches to drive appropriate utilization of pharmaceuticals**
  - Incorporate evidence-based prescribing guidelines into clinical protocols and pathways, building upon recommendations in Assessment F
  - Invest in IT and analytic capabilities to support outcomes-based data analysis
  - Drive appropriate data interpretation and utilization through peer review
  - Build utilization rules into prescribing system to reduce inappropriate use

Recommendations related to clinical supplies, medical devices, and related services

- **Transform and consolidate VA's entire medical supply chain organization**
  - Rationalize the organizational structure by consolidating entities into one integrated supply chain organization that manages all VA contracting and logistical management of clinical supplies and medical devices
  - Establish robust performance management of supply and device procurement that is focused on Veteran outcomes
  - Develop deep category-level expertise within the organization

---

- **Improve key enablers required to support the organizational transformation, including IT systems, data standardization, and talent management**
  - o Update or replace supply chain IT systems to make them fit for purpose
  - o Standardize supply chain data and overlay user-friendly interfaces that enable robust and timely decision-making
  - o Revise VA's approach to talent management
- **Streamline, standardize, and integrate key supply chain management processes**
  - o Expedite product selection and standardization in key product categories
  - o Rationalize contracting requirements wherever possible and provide VAMC-level staff with access to contracting status
  - o Standardize and simplify purchasing processes by automating wherever possible, linking inventory management systems to ordering systems, and driving greater use of electronic order entry
  - o Systematically identify, collect data from, and propagate innovations across VA

1   Introduction

1.1 Background, Purpose, and Scope

The Veterans Access, Choice, and Accountability Act of 2014 was signed into law by President Obama in 2014 in response to emerging issues related to delivering care at the Department of Veterans Affairs (VA) facilities. In addition to authorizing non-VA care for Veterans, it also mandated an independent assessment of twelve areas of the VA's delivery of health care. Assessment J, identified under Title II – Health Care Administrative Matters, Section 201, outlines a structured assessment of the purchasing, distribution and use of pharmaceuticals, medical and surgical supplies, medical devices and health care related services by VA including the following:

- The prices paid for, standardization of, and VA's use of the following:
  - o Pharmaceuticals
  - o Medical and surgical supplies
  - o Medical devices
- VA's use of group purchasing arrangements to purchase pharmaceuticals, medical and surgical supplies, medical devices, and health care related services (defined as services that are directly related to the purchasing, distribution, and use of pharmaceuticals, medical supplies, surgical supplies, and medical devices).
- VA's strategy and systems to distribute pharmaceuticals, medical and surgical supplies, medical devices, and health care related services to Veterans Integrated Service Networks (VISNs) and medical facilities of the VA.

The purpose of this assessment is to identify evidence-based findings and develop actionable recommendations that will, if implemented, improve the quality, efficiency, and effectiveness of the VA's purchasing, distribution, and use of pharmaceuticals, medical and surgical supplies (hereafter referred to collectively as clinical supplies), medical devices, and health care related services.

The scope of Assessment J, as outlined in the Choice Act legislation, includes four major medical product categories: pharmaceuticals, clinical supplies, medical devices, and health care-related services. The definition of each category and topics addressed by this assessment are outlined below in Table 1-1. For medical devices, the scope was based on the FDA definition of regulated medical devices, but excludes capital equipment such as MRI and surgical robots, and durable medical equipment such as crutches and wheel chairs. These equipment are generally considered by the health care industry as different than medical devices because of their lifecycles and management approaches. As these equipment were not in scope for this Assessment, it may be in the interest of VA and the Commission on Care to initiate an additional assessment of these areas.

Many of the challenges we and other assessment teams have observed are interrelated and highly complex. Implementing solutions to long-standing challenges will require collaboration among Congress and the Executive Branch, VA leadership (VACO, VISN, and VAMC) and staff, as

---

well as the unions and external stakeholders. We see this assessment as an opportunity for improvement, to be achieved by all stakeholders through a combination of local, regional, and national action. Addressing these challenges will require sustained commitment as a part of an integrated transformation effort for the system as a whole.

Table 1-1. Definition of Categories Covered in Assessment J

Categories	Definition
Pharmaceuticals	(1) Articles recognized in the official United States Pharmacopoeia, official Homoeopathic Pharmacopoeia of the United States, or official National Formulary, or any supplement to any of the above (2) Articles intended for use in the diagnosis, cure, mitigation, treatment, or prevention of disease in man or other animals (3) Articles (other than food) intended to affect the structure or any function of the body of man or other animals (4) Articles intended for use as a component of any articles specified in clause (1), (2), or (3)
Clinical supplies	Defined as supplies that: (1) Are usually disposable in nature or require refurbishment or sterilization after use (2) Are primarily and customarily used to serve a medical purpose (3) Generally are not useful to a person in the absence of illness or injury
Medical devices	(1) Items that are intended for use in the diagnosis of disease or other conditions, or in the cure, mitigation, treatment, or prevention of disease (2) Items that are intended to affect the structure or any function of the body, and which: (a) Do not achieve its primary intended purposes through chemical action within or on the body (b) Are not dependent upon being metabolized for the achievement of its primary intended purposes (3) Items funded through VA supply budgets and directly interface with or are implanted into a patient's body and would only be used by those to whom they were prescribed
Health care-related services	Defined as services that are directly related to the purchasing, distribution, and use of pharmaceuticals, medical supplies, surgical supplies, and medical devices

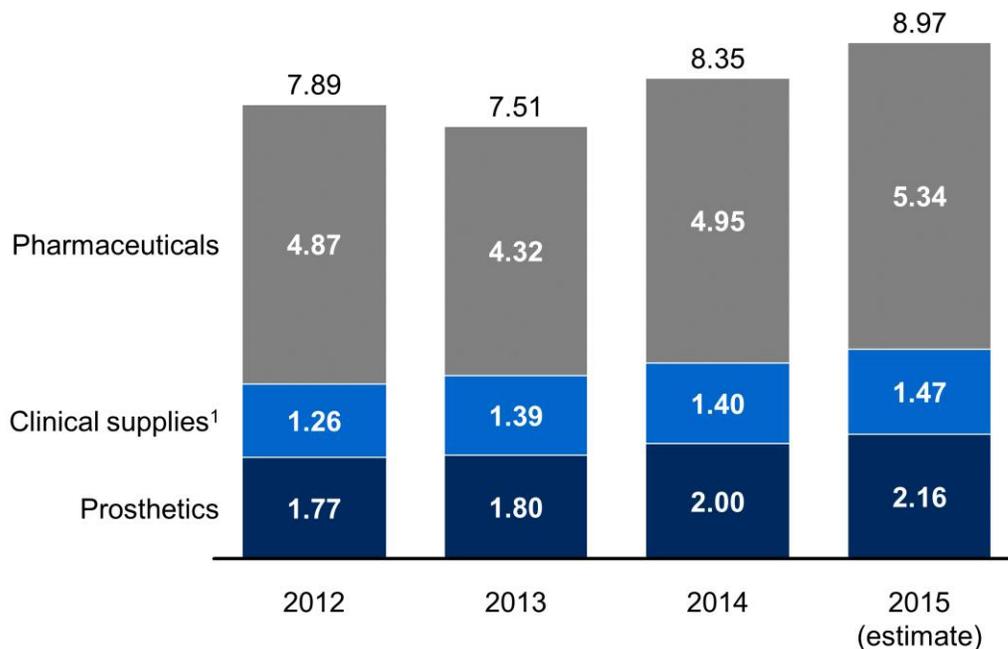
1.2 Context

1.2.1 Organization & Key Statistics

VA is one of the largest integrated health care systems in the world. Its more than 150 VA Medical Centers (VAMCs) are organized into 21 Veterans Integrated Service Networks (VISNs). Together, they provide care to over 6 million unique patients. To support the delivery of care to this population, VA operates a supply network that procures and distributes approximately $9 billion in supplies and materials. VA's supply spend includes ~$4.9 billion for drugs and medicines, ~$1.4 billion for medical and dental supplies, and ~$2 billion for prosthetic appliances and other patient-related services (see detail in Figure 1-1) (VA, 2014a; VA, 2015a). In 2014, VA's total spend on pharmaceuticals, clinical supplies, surgical supplies, and medical devices represented approximately 5 percent of the total VA budget and 15 percent of the budget allocated to medical care (VA, 2014b). VA estimates that its medical supply spend will increase by approximately 7.4 percent between 2014 and 2015 compared to an overall decrease of 3.5 percent in spend for the entire VA organization.

**Figure 1-1. Summary of VA's Actual and Budgeted Expenditures
for Supplies and Materials (FY2013-15)**

$ Billions


1 Includes dental

SOURCE: VA. (2014a). Congressional budget submission. Volume II - Medical programs and information technology
programs. Data represents Object code 26 (Supplies) only.

VA manages its pharmaceutical, medical supply, and medical device spend through four organizations (Figure 1-2):

- **VA Office of Acquisition, Logistics, and Construction** (OALC). The OALC provides operational support and oversight for the VA's procurement and logistics functions. Key activities include strategic contracting, setting department-wide policy, and ensuring compliance with other Federal partners.

- **VHA Pharmaceutical Benefits Management Organization** (PBM). The PBM organization coordinates the VA formulary management process through collaboration with the Medical Advisory Panel (MAP) and the VISN Pharmacist Executives Committee. It also is responsible for standardizing drug benefits to reduce variation in cost and utilization.

- **VHA Procurement and Logistics Organization** (PLO). The PLO is responsible for all purchases and distribution of clinical supplies, medical device purchases greater than $3,000, and health care-related services. It is also responsible for the standardization of supply utilization through contracting and monitoring logistics data. Contracting staff are organized into 21 Network Contracting Offices (NCOs) aligned with each VISN, and report to three Service Area Organizations (SAOs) aligned by geography (East, Central, and West). Field logistics staff report directly to facility leadership and not to PLO. Additional information on supply chain structure can be found in Section 4.1.1 and Figure 4-2.

- **VHA Prosthetics and Sensory Aids Service** (PSAS). PSAS provides a range of prosthetic aids, medical devices, medical equipment, and services to Veterans. Staff are responsible

for the procurement of relevant items less than $3,000, inventory management, distribution, and coordination of care related to these items. Field prosthetic staff may directly report to either facility leadership or to the VISN Prosthetic Representative.

This page intentionally left blank.

2   Methodology

The assessment was conducted using both quantitative data collected from key organizations on the purchasing, distribution, and use of relevant supplies, and a number of qualitative interviews with field staff during site visits and with central office leadership. The team responsible for Assessment J visited 13 sites – eight VA Medical Centers (VAMCs), two Consolidated Mail Order Pharmacies (CMOPs), three acquisition / distribution / contracting centers, and spoke with more than 185 staff. Additional interviews with industry experts and supply chain leaders in best in class health care systems were also conducted. Three high performing health systems that were nationally recognized for care and have demonstrated leadership in sourcing and/or supply chain management were interviewed. The team collected and analyzed large data sets from more than 12 sources.

2.1   Data Sources

Data was collected from departments and individuals across the VA system (for example, at national, VISN, and VAMC levels). Throughout the data collection process, VA teams provided quick and comprehensive responses and data pulls for the assessment team where data was readily available. However, for clinical supplies and medical devices in particular, much of the data was available only facility-by-facility, which made data extracts cumbersome and time consuming. In those cases, we requested data for a sub-set of facilities. It should also be noted that we did not conduct a review to validate the accuracy of data that was provided, although, where applicable, we did note potential data integrity issues highlighted during site visit interviews. In some cases, gaps in data exist because of limitations in the data systems. Such gaps will be noted throughout the assessment. Several large data sets from 12 different sources were analyzed in the course of this assessment. Details of these data sets can be found in Appendix A.1, and include:

- System wide pharmaceutical prime vendor purchase data from CY2012 through CY2014
- All purchase order and line item data for five VISNs from FY2014 through Q2 FY2015
- Medical and surgical supplies purchase data from October 1, 2014 through January 31, 2015 with an item master file number
- Prosthetic appliance purchase data for the entire system for FY2014
- Various prime vendor reports for pharmaceuticals, and medical and surgical supplies
- Procurement and logistics staffing and budget information
- Public source data including Federal Business Opportunities and data from the Federal Procurement Data System

Detailed methodology for the analysis of these data can be found in Appendix A.2.

2.2   Site Selection and Interviews

Eight VAMCs were selected from a core sample of 25 facilities selected for the entire Choice Act Assessment effort. That core sample was selected using the process in Appendix A.3.

Assessment J ensured that the eight VAMCs selected from the core sample included facilities that covered the full range characteristics deemed to be relevant to the scope and purpose of the assessment, including: large, complex, full service urban facility; small, less complex rural facility; facility affiliated with a medical school; facility that is believed to have a well-functioning procurement and supply chain function; facility that is believed to have major challenges related to procurement and supply chain management. Geographic breadth was also taken into consideration in the selection process. The list of sites visited is shown below in Table 2-1.

Table 2-1. VA Medical Centers Selected for Assessment J Site Visits

VISN	Facility	City	State
1	Brockton VA Medical Center	Brockton	MA
1	Augusta VA Medical Center	Augusta	ME
8	Malcom Randall VA Medical Center	Gainesville	FL
8	Miami VA Healthcare System	Miami	FL
9	Lexington VA Medical Center	Lexington	KY
17	Central Texas VA Healthcare System- Olin E. Teague VA Medical Center	Temple	TX
21	San Francisco VA Healthcare System	San Francisco	CA
21	VA Palo Alto Healthcare System	Palo Alto	CA

The assessment team visited two of the VA's seven CMOPs (Table 2-2). Sites were chosen based on number of prescriptions and proximity to other sites visited during the course of the Choice Act assessment.

Table 2-2. Overview of CMOPs Selected for Assessment J Site Visits

CMOP	City	State
Leavenworth CMOP	Leavenworth	KS
Great Lakes CMOP	Hines	IL

Contracting organizations were selected based on the impact of each organization on the VA's procurement of pharmaceuticals, clinical supplies, and medical devices (Table 2-3). The National Acquisition Center (NAC) was selected given that it is the largest contracting organization (by spend) and is responsible for the majority of Federal Supply Schedule (FSS) contracts. The Denver Acquisition and Logistics Center was selected given that it has developed and successfully implemented a number of innovative contracting tactics (to be discussed in Section 3). Network Contracting Office (NCO) 15 was selected because of its role in pharmaceutical contracting for the CMOPs.

Table 2-3. Overview of Contracting Organizations Selected for Assessment J Site Visits

Contracting organizations selected	City	State
National Acquisition Center	Hines	IL
Denver Acquisition and Logistics Center	Denver	CO
Network Contracting Office 15	Leavenworth	KS

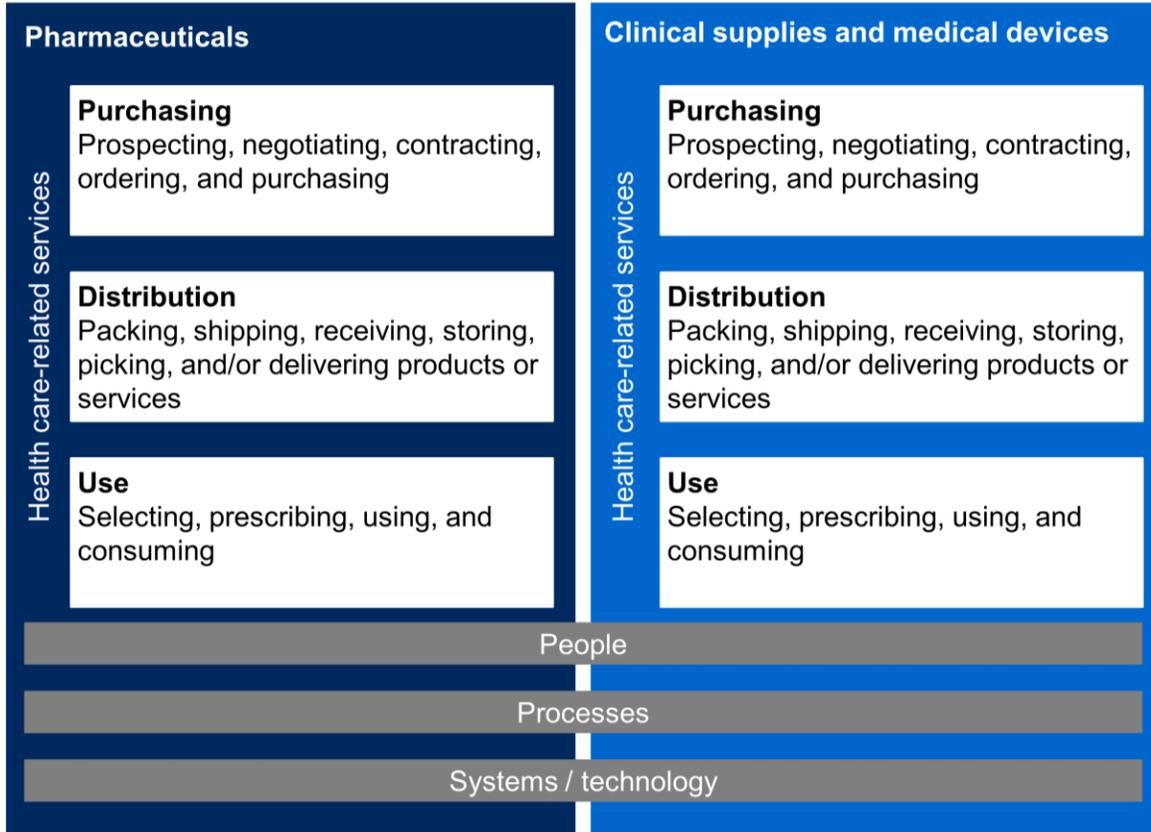
In addition to the site visits above, the assessment team interviewed leaders from the Strategic Acquisition Center, Office of Acquisition and Logistics, Office of Acquisition Operations, and several VISNs. Three high performing health systems were interviewed for this work. They were selected based on their national recognition for supply chain management, spend of at least one billion dollars in supplies annually, and their volume of at least 100,000 inpatient admissions each year.

2.3   Approach

The assessment team developed a structured approach for its investigation to ensure a comprehensive assessment of the VA's medical supply chain. This approach was syndicated and revised with 10 industry supply chain experts and 20 VA SMEs prior to launching site visits and data requests. The write-up of the assessment was split into two sections based on VA's current organizational structure and the degree of operational overlap, particularly between medical / surgical supplies and medical devices. The two sections are:

1. Pharmaceuticals and related services
2. Clinical, medical devices, and related services

In each section, current performance was assessed in relation to the purchasing, distribution, and use of specified products along dimensions of quality (i.e., getting the right product to the right Veteran), efficiency (i.e., getting the product to the Veteran at the right time), and value (i.e., getting the product to the Veteran at the lowest possible price). Finally, health care-related services were assessed for their impact on quality, efficiency, and value as functional enablers (Figure 2-1). For example, within the pharmaceutical supply chain, the services associated with the VA's prime vendor contract were analyzed to determine their relative impact on the VA's care delivery.

Figure 2-1. Overview of Approach to Assessment J


The assessment team took a four-phased approach to complete the work. Key activities conducted during each phase are summarized in Table 2-4. An independent Blue Ribbon Panel, consisting of high-level health care industry leaders, was formed to provide expert input throughout the assessment process. The panel members possessed a thorough understanding of health care industry best practices and leading edge practices. The Blue Ribbon Panel provided advice and feedback on the emerging findings and recommendations for the assessment.

Due to the required independence of the Choice Act, Section 201 assessments, findings and recommendations were developed independently. We therefore expect these recommendations will need to be refined and integrated by VHA leadership and the Commission on Care into the ongoing efforts.

Table 2-4. Overview of Key Assessment Activities by Phase of the Assessment

Phase	Activities
Discovery	- Reviewed existing workflow documentation, tools, and interfaces - Interviewed VHA subject matter experts - Researched best-practices (through literature searches, industry reports, internal knowledge / expertise, for example)
Analysis	- Conducted site visits at VAMCs, VISNs, CMOPs, and contracting and distribution centers - Conducted external subject matter expert interviews to revise / refine best practices and gather benchmarks - Analyzed VA data to determine performance against benchmarks - Tested analytical approach with VA SMEs to ensure accuracy and validity of data interpretation
Findings	- Revised and drew out insights from analyses - Synthesized findings and outlined major themes - Shared findings with Blue Ribbon Panel (a panel of external experts) and incorporated feedback - Conducted follow up interviews with key leaders and VA staff to address open questions
Recommendations	- Developed and documented recommendations to maintain, improve, or replace existing VA practices - Identified interdependencies with other assessment areas

This page intentionally left blank.

3   Pharmaceuticals and Related Services

3.1   Context

3.1.1   Organization

Purchasing

VA's pharmaceutical organization is supported by two major contracting organizations that oversee all national-level contracts for pharmaceuticals:

- The National Acquisition Center (NAC), located in Hines, IL, is responsible for management of all Federal Supply Schedule (FSS) contracts, many high volume, multiple award schedule national contracts, and blanket purchase agreements (BPAs) with pharmaceutical vendors worldwide.

- Network Contracting Office (NCO) 15, located in Leavenworth, KS, is responsible for all purchasing and contract management for the VA's Consolidated Mail Outpatient Pharmacies (CMOPs) that cannot be accomplished through FSS or prime vendor contracts and for emergency procurements (e.g., during shortages). While this role was originally supported by the NAC, it was transferred to NCO 15 in October 2013 at the request of CMOP leadership.

VAMCs do not engage in contracting but they do buy medications for use in the inpatient setting and for some outpatient prescriptions, such as outpatient prescriptions that are picked up at pharmacy windows or are mailed to Veterans from the VAMC. The majority of these purchases are made through the Pharmaceutical Prime Vendor (PPV) that is described in the following section.

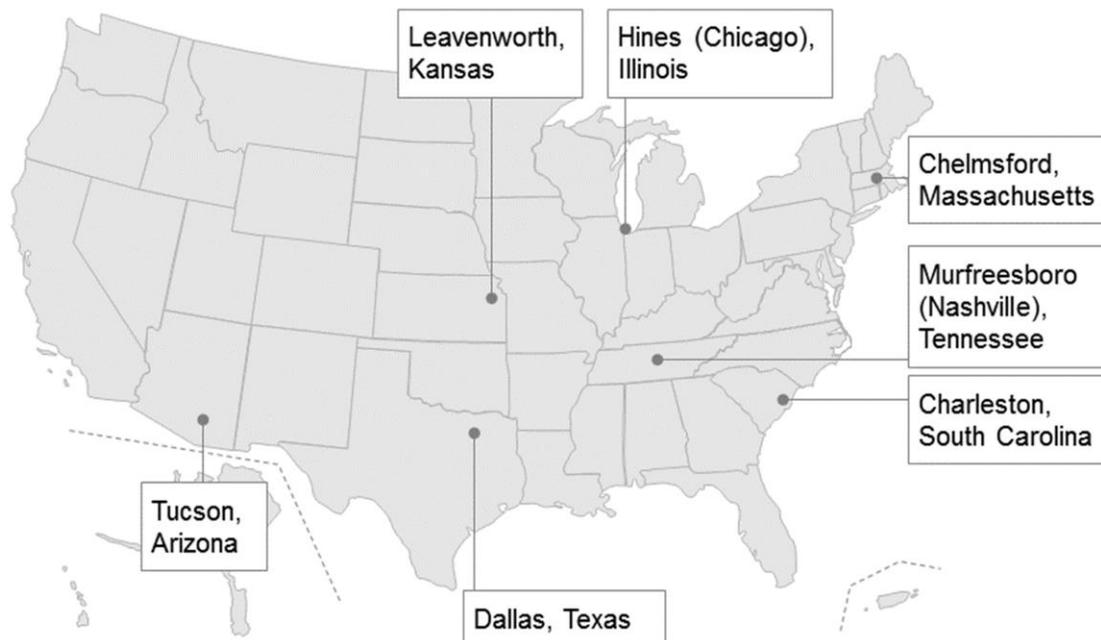
Distribution

VA acquires around 90 percent of its pharmaceutical supplies through its pharmaceutical prime vendor (PPV) (VA, 2012-2014; VA, 2015a). The PPV program has been in existence since 2001 and the distributor provides next-day, direct shipping of pharmaceuticals to CMOPs and facilities such as VAMCs. The PPV also provides a number of services to VA (for example: IT platforms for ordering, logistics support, emergency shipments) which will be discussed in detail in the Findings section. The remainder is acquired directly from manufacturers or from other distributors such as local distributors of specialty drugs.

Veterans receive almost all their medications either from VA's outpatient "window" pharmacies located in VAMCs and clinics, or from the CMOPs, both of which are described below:

- **Consolidated Mail Outpatient Pharmacy (CMOP) Network:** VA has seven CMOPs across the continental U.S. In aggregate, CMOPs distribute approximately 80 percent of VA's outpatient pharmaceutical prescription volume to Veterans (VA, 2015b). Each CMOP is aligned with one or more VISNs and is responsible for dispensing and shipping pharmaceuticals directly to Veterans. CMOPs use an integrated, automated pharmaceutical dispensing system to process between nine and 26 million prescriptions

annually per facility (VA, 2015c). The locations of the CMOPs are summarized in Figure 3-1.

Figure 3-1. Overview of CMOP Geographic Distribution


SOURCE: VA. (2015c). CMOP Fiscal data.

- **VAMC outpatient "window" pharmacies:** VA also dispenses outpatient prescriptions at pharmacy windows in each of its VAMCs. In total, around 20 percent of VA's outpatient prescriptions are dispensed from window pharmacies (VA, 2015b). While window pharmacies predominately serve Veterans who are in-person at the VAMC (for appointments, lab testing, radiological examinations), they are also responsible for mailing prescriptions to Veterans that cannot be processed by the CMOPs (because they are controlled substances, specialty drugs, or because of a stock out, for example). Clinical pharmacists at the VAMC's outpatient pharmacies are also responsible for front-end processing (validation of the signature, checking for drug-drug interactions and allergies) of all outpatient prescriptions prior to transmission to a CMOP.

Use

Veterans get almost all of their VA outpatient prescriptions from VA's window pharmacies or CMOPs as described above. When Veterans are inpatients in VA facilities, medications are dispensed to them from pharmacies within those facilities.

Three principal entities monitor, manage, and operationalize the use of pharmaceuticals within the VA system:

- **Pharmaceutical Benefits Management Services (PBM)**: PBM is a national-level organization that reports into VHA through Patient Care Services. PBM is responsible for managing VA's formulary, monitoring and reporting on pharmaceutical utilization, and

developing and implementing programs to improve quality and safety associated with use of pharmaceuticals. The PBM organization is supported by over 7,300 clinical pharmacists and 4,200 pharmacy technicians nationwide (VA, 2015d). The assessment team could not source benchmarks to evaluate the appropriateness of this level of staffing.

- **Clinical pharmacists**: Within each VAMC, clinical pharmacists manage drug dispensing in inpatient and outpatient pharmacies, and provide clinical guidance on the use of medications. These pharmacists support compliance with the VA's formulary and collaborate closely with care teams to determine appropriate pharmaceutical treatment of Veterans.

- **Clinical providers**: Clinicians at the front-line of care delivery (like physicians, nurse practitioners, physician assistants) are responsible for making pharmaceutical treatment decisions to provide appropriate, evidence-based clinical care while maintaining compliance with the VA formulary.

The pharmaceutical organization's evolution over the past 60 years has greatly increased its ability to influence VA prescribing practices (GAO, 2010). From 1955 to 1995, each VAMC had its own formulary, supported through local contracts with pharmaceutical suppliers. In 1995, VA created a centralized group (PBM) to manage pharmacy benefits nationwide. During the transition period, formulary management and contracting moved from the VAMC to the VISN, enabling more standardization and greater use of bulk purchasing. In 1997, all formulary management was centralized at the national level when VA rolled out its first national formulary. However, local VAMC formularies continued to exist until 2001 and VA ended all VISN-level formularies in 2009. In parallel, distribution transitioned to the current prime vendor model, which has helped facilitate VA's current level of standardization and centralized purchasing (to be discussed in more detail in the Findings section). The service level provided by the PBM group and its engagement with VISNs and VAMC's was critical throughout this evolution. Strong physician engagement has also helped drive the success of the pharmaceutical organization.

3.1.2 Key Trends

In CY2014, VA spent approximately $4.8 billion on pharmaceuticals through its prime vendor (VA, 2010-2014a; VA, 2010-2014b), the majority of which were dispensed on an outpatient basis (Figure 3-2).

Figure 3-2. VA Spend on Pharmaceuticals through the Prime Vendor

$ Billions

Note: Data is reported for calendar year and will not be directly comparable with fiscal year budget spend reported in Figure 1-1

SOURCE: VA. (2010-2014a). PPV Spend by Calendar Year. VA. (2010-2014b). Outpatient prescription data

VA's spend per patient on drugs increased by 19 percent over the past year, which reversed the trend of declining costs from CY2010 to CY2013 (Figure 3-3) (VA, 2010-2014b).

The introduction of new Hepatitis C drugs (Sofosbuvir, Simeprevir, and Ledipasvir / Sofosbuvir) accounted for 59 percent of the spend growth between 2013 and 2014 (VA, 2012-2014). Thirty percent of the spend growth was due to price increases of existing drugs (Figure 3-4). Over the same period nationally, drug spend in health care increased 13 percent, 26 percent of which was due to the introduction of new Hepatitis C drugs (IMS Institute for Health Informatics, 2015). These drugs accounted for more than half of all new drug spend in 2014. Prevalence of Hepatitis C is believed to be higher in Veterans using VA care than the U.S. population as a whole (VA, n.d.), which would account for the disproportionate impact of Hepatitis C drugs on VA. While the increase in expenditure on these drugs was notable in the last year, treatment with these drugs may reduce long-term cost of care for patients with Hepatitis C by, for example, reducing inpatient admissions or the need for nursing home care. Additionally, unit prices of these drugs are expected to decline over time as other Hepatitis C therapies enter the market, and there is some evidence this is already happening (Hirst, 2015).

Figure 3-3. Trends in Pharmaceutical Cost per Patient for Outpatient Prescriptions

Dollars per patient

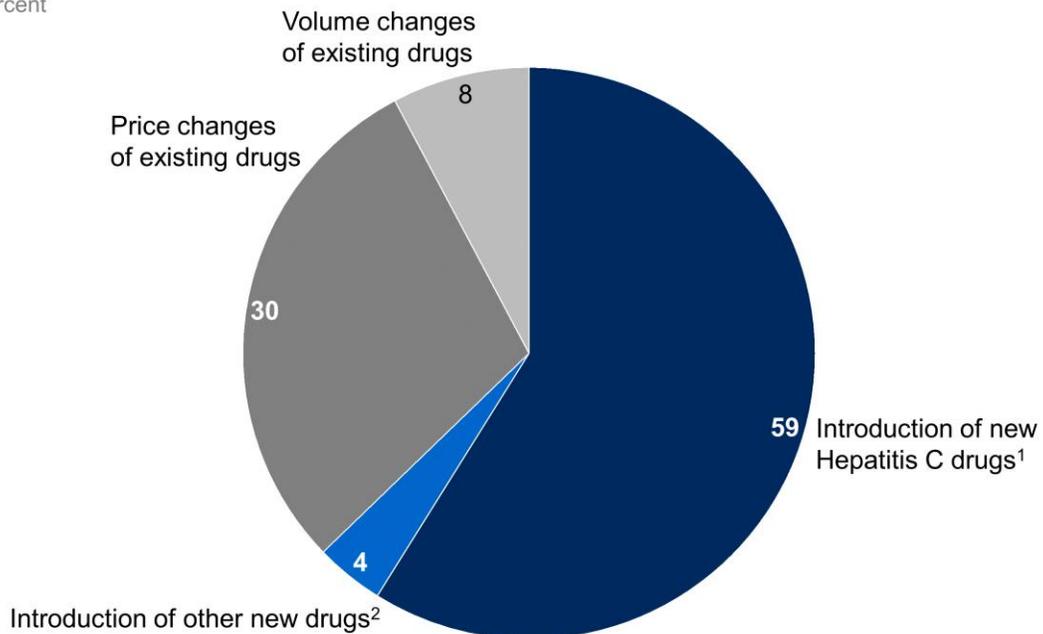
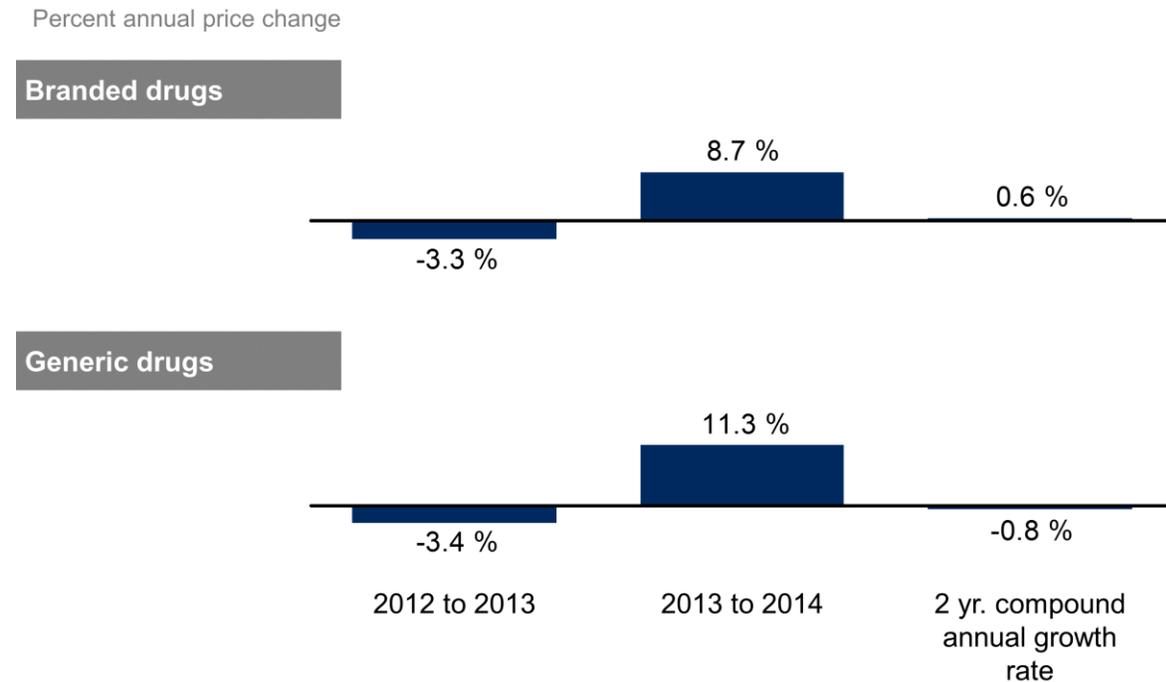
Figure 3-4. Growth in VA Pharmaceutical Prime Vendor Spend (CY 2013-14) by Major Spend Driver

Percent


1 Additional cost for Sofovuvir, Simprevir, and Ledipasvir / Sofosbuvir in CY14 compared with CY13
2 Drugs which had no volume in CY13

SOURCE: VA. (2012-2014). Pharmaceutical Prime Vendor Purchase Order Data

From 2013-14, average prices paid by VA for branded drugs rose by 8.7 percent and by 11.3 percent for generic drugs (Figure 3-5). Nationally, drug prices rose by 4.1 percent and 8.6 percent for branded[2] and generic drugs (Elsevier Gold Standard, 2014) respectively over the same time frame. It is unclear why VA experienced a greater price increase than the national average. However, if the two years from 2012-2014 are taken together, prices remained relatively flat at 0.6 percent and -0.8 percent per annum for branded and generic drugs respectively.

Figure 3-5. Annual Price Changes of Drugs Purchased by VA


Note: Year over year average price changes or 2-year CAGR were calculated for each equivalent VA product (active ingredient, dosage, and form); price change was excluded if more than 10 fold change. Weighted by volume in last year considered (i.e., weighted by total volume in 2014, for 2013-14 price changes)

SOURCE: VA. (2012-2014). Pharmaceutical Prime Vendor Purchase Order Data

3.1.3 Previous Assessments

VA's system for purchasing, distributing, and using pharmaceuticals has been the subject of numerous reports by the Office of the Inspector General (OIG), the Government Accountability Organization (GAO) and several third parties. Major findings and recommendations relevant to this assessment are summarized in Appendix B.1. Common themes that cut across these assessments included the following:

- There is an opportunity to optimize pricing through improving processes and standardization of purchasing at the lowest price point that is accessible to VA.

---

[2] Average price change of Wholesale Acquisition Cost for branded drugs between Q42013 and Q42014 using PriceRx data.

- There may be an opportunity to more effectively leverage scale (e.g., to reduce prices) by combining VA and DoD purchasing power.
- There is an opportunity to improve the transition process for active servicemembers that are switching to the VA formulary.

Where applicable, previous findings and actions taken to address them will be discussed in the findings. These past assessments have tended to focus on specific issue areas and/or individual facilities, separately developing recommendations for improvement in discrete areas. In contrast, our assessment tries to take an end-to-end view of inpatient clinical operations across five key sub-assessment areas and all high- and medium-complexity VAMCs.

3.2   Findings

Data findings, observations, and interviews with a broad range of administrative and clinical personnel confirm that VA's pharmacy organization and operating model performs well; it purchases drugs cost-effectively, distributes them efficiently to facilities and Veterans, and uses them in a measured and clinically appropriate way.

Across VA, the Pharmacy Benefits Management (PBM) organization's two-way cascade of committees – from the PBM organization to Veterans Integrated Service Networks (VISNs) to VA Medical Centers (VAMCs) and vice versa – provides an effective mechanism to escalate insights and innovation from the field and to develop policy centrally and build buy-in quickly across the country to facilitate implementation. Within VAMCs, clinical pharmacists are well integrated into multidisciplinary care teams and are highly valued by physicians and Veterans.

Based on our assessment, the characteristics in Table 3-1 have helped drive this level of performance.

Table 3-1. Pharmacy Benefit Management Key Success Factors

People	▪ Highly trained, professional workforce supported by extensive development program
	▪ Clear roles and responsibilities for policy making, contracting, purchasing, and utilization management
	▪ Strong alignment and buy-in/engagement across the organization
Process	▪ Cascade of facility to VISN to national committees that integrates pharmacist and physician input for policy-making and implementation
	▪ Pharmacist-doctor collaboration that increases product selection safety and performance and expanded scope of pharmacist practice which alleviates physician workloads
	▪ National Formulary that provides standard evidence-based, safe and efficacious drugs with processes for flexible off-formulary prescribing as needed
Systems	▪ Largely standardized data (from the PPV), facilitating utilization management
	▪ Purchasing system (through the PPV) that facilitates contract compliance and efficient ordering

| | ▪ Cascade of safety and utilization management indicators from national to facility level that drives performance improvements |
| | ▪ Efficient and effective consolidated distribution of pharmaceuticals through the PPV and CMOP network
▪ Effective systems for best practice sharing and information dissemination |

As in all organizations, there are opportunities for improvement, but overall the pharmacy organization is a bright spot. The organization's performance, the positive characteristics outlined above, and some of the key improvement opportunities are described in more detail in the findings below:

1. VA pays relatively low prices for pharmaceuticals overall, but several factors limit its ability to consistently access the lowest price available.

2. VA's distribution of pharmaceuticals is efficient and effective.

3. VA has developed effective mechanisms to drive appropriate utilization such as its formulary, clinical use guidelines, and involvement of clinical pharmacists.

4. VA has implemented policies and processes to improve patient transitions from the Department of Defense (DoD) to VA but challenges remain.

5. VA has successfully implemented programs to reduce utilization of high risk medications such as opioids and benzodiazepines, and early results are promising.

Each of these themes is described in more detail below with supporting data, observations, interview findings, and comparisons to leading organizations or standard industry practice.

3.2.1 VA Pays Relatively Low Prices for Pharmaceuticals Overall, but Several Factors Limit its Ability to Consistently Access the Lowest Price Available

The prices VA pays for drugs have been evaluated multiple times in the past and have been found to be some of the lowest prices in the country (Von Oehsen, 2001; US Congressional Budget Office, 2005; Render, Nowak, Hammond, & Roselle, 2003; US Congressional Budget Office, 2014). All indicators evaluated in this assessment confirm that to be the case. Specific findings related to pricing are the following:

a. VA has achieved relatively low pricing overall due to federal price restrictions and VA's ability to contract centrally.

b. VA faces regulatory constraints, operational contracting challenges, and drug shortages that limit its ability to consistently access the lowest available price.

a. VA has achieved relatively low pricing overall due to federal price restrictions and VA's ability to contract centrally

VA's average price paid for drugs is significantly below national benchmarks. A report from 2005 suggested that VA paid 42-53 percent of Average Wholesale Price (AWP) for its drugs (US Congressional Budget Office, 2005). Our analysis suggests that VA's pricing may now be lower than that range, at 35-38 percent of AWP (Figure 3-6).

As context, Average Wholesale Price (AWP) is a benchmark that has been used by the industry for many years. The Average Wholesale Price itself is not particularly meaningful because it is not regulated, is set by manufacturers, and does not take into account the volume discounts and rebates often involved with prescription drug sales (Gencarelli, 2005). Therefore, AWP (or percent of AWP) is typically used to enable like-for-like comparisons of drug prices and is typically not used alone as a true indicator of price competitiveness.

The National Average Drug Acquisition Cost (NADAC) referred to in Figure 3-6 is a benchmark based on a survey of community pharmacies that includes large retail chains. In the survey, pharmacies report their acquisition costs for drugs purchased over the last month. NADAC prices are gathered by a third party and are published weekly on Medicaid's website. NADAC benchmarks are often used by states when setting Medicaid reimbursement rates (Centers for Medicare and Medicaid Services, n.d.).

Figure 3-6. Comparison of VA Average Prices to Average Wholesale Prices and Retail Acquisition Costs

VA pays low prices for its drugs

2 National Average Drug Acquisition Cost (NADAC) is a government drug price index based off aggregated invoice surveys from retail pharmacies
3 Weighted average price per pill for each National Drug Code (NDC) purchased in April 2014, data only includes tablets and capsules, excluded drugs with NADAC price change in April 2014, n = 926 branded NDCs, 191 generic NDCs

SOURCE: VA. (2012-2014). Pharmaceutical Prime Vendor Purchase Order Data; Centers for Medicare and Medicaid Services. (2014, April). *National Average Drug Acquisition Cost (NADAC)*. Retrieved from Pharmacy Drug Pricing: http://www.medicaid.gov/Medicaid-CHIP-Program-Information/By-Topics/Benefits/Prescription-Drugs/Pharmacy-Pricing.html

VA's relatively low prices are protected under law. Pricing for the majority of products purchased by VA is established in accordance with the 65 I B Schedule program under the Federal Supply Schedule (FSS) service. Specific pricing stipulations for VA pharmaceuticals purchased through FSS contracts are outlined in Section 603, Public Law 102-585, which states the following:

"The price charged during the one-year period beginning on the date on which the agreement takes effect may not exceed 76 percent of the non-Federal average manufacturer price"

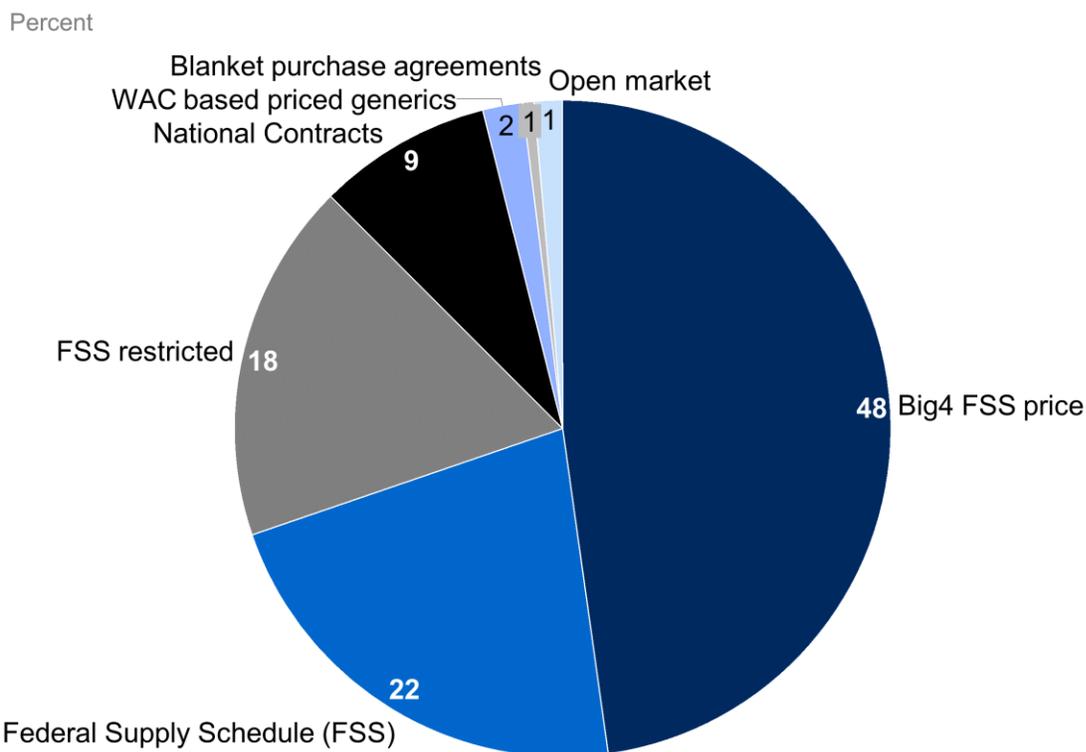
- Veterans Health Care Act of 1992, Public Law 102-585

This applies to "Big 4" customers (i.e., Department of Veterans Affairs, Department of Defense, Public Health Services including Indian Health Services, and the Coast Guard) who should receive at least a 24 percent discount from the net prices that wholesalers pay to manufacturers for covered drugs (also known as the Federal Ceiling price). Vendors may offer a higher price for other government agencies in addition to the Big 4 price (dual pricing), or a single price if it meets the Federal Ceiling Price threshold.

In addition to this 24 percent discount, VA has successfully centralized the majority of its contracting for pharmaceuticals so prices can be negotiated further at a national level. Multiple vendors on the FSS are competed to drive down costs, and longer-term national contracts can be established. Ninety-eight point six percent of purchases through its prime vendor are on some form of government contract (Figure 3-7), many of which achieve pricing below the FSS or Big 4 price (Table 3-2)[3]. In this way, VA is effectively its own group purchasing organization (GPO) for pharmaceuticals.

---

[3] If a single price is offered by the supplier, it is considered FSS. If a supplier has dual pricing, VA pays the Big4 FSS price. FSS Restricted represents a temporary price reduction off the base FSS contract price for one or more specific agencies. This is typically done by companies for competitive purposes and is typically long-term; the "temporary" in temporary price reduction just differentiates it from the permanent base FSS contract price.

Figure 3-7. VA PPV Spend by Contract Type


SOURCE: VA. (2012-2014). Pharmaceutical Prime Vendor Purchase Order Data

VA's pharmaceutical distributor (also known as its prime vendor, which is described below) provides tools that support VA's centralized, consolidated procurement and standardized purchasing process (VA, 2012). These tools help VA and its contracting entities generate insights from volume and pricing data to support effective negotiations.

Table 3-2. Price Comparison by Contract Type

Contract type	Price relative to Federal Supply Schedule (FSS)[4]	
	Generics	**Brands**
National contracts	0.62	0.57
FSS restricted	0.96	0.91
FSS	1.00	1.00
Big 4 FSS price	-	1.00

---

[4] For drugs purchased through multiple pricing arrangements in each calendar year from 2012-2014, the volume weighted average price for each contract type was indexed to the FSS volume weighted average price. The median relative value is shown (VA, 2012-2014).

| Contract type | Price relative to Federal Supply Schedule (FSS)[4] | |
	Generics	Brands
WAC priced generics	2.14	-
Open market	2.41	1.81

While purchases made through the PPV are overwhelmingly through government contracts, around nine percent of overall spend each year is made through vendors other than the prime vendor. These purchases are recorded in the Integrated Funds Distribution, Control Point Activity, Accounting and Procurement (IFCAP) system. IFCAP data is difficult to analyze due to numerous standardization issues. From sample IFCAP data from five VISNs (VA, FY2014a), the assessment team estimates six percent of total pharmaceutical spend is purchased on the open market.[5] However, this number may be inflated because the data also includes some purchases of clinical supplies and diagnostic kits, which are hard to exclude.

Open market prices tend to be significantly higher than contracted prices. Indeed, analysis of VA data shows that on a like-for-like basis, open market prices for generics (80 percent of open market purchases) tend to be more than two times higher than FSS prices. However, VA can negotiate off-contract generic drug purchases through the PPV if those drugs have a published Wholesaler Average Cost (WAC) price, are approved by the FDA, and are Trade Act Agreement (TAA) compliant (VA OIG, 2012a). WAC Based Priced Generics pricing is similar to that achieved on the open market (Table 3-2). Bringing these purchases onto national contracts with better pricing terms represents an opportunity, albeit one that is likely hard to capture for reasons outlined later in this section.

b. VA faces regulatory constraints, operational contracting challenges, and drug shortages that limit its ability to consistently access the lowest available price.

VA achieves relatively low prices on most of its pharmaceutical purchases but it is not always able to access the lowest price. While 80 percent of all spend is made within 25 percent of the lowest price, approximately nine percent of all spend in 2014 ($434 million) was made at prices more than 2x the lowest price paid in that time period (Figure 3-8) (VA, 2012-2014). Reasons for not being able to access the lowest price include VA Acquisition Regulations (VAAR) priorities for procurement vehicles, statutory restrictions on purchasing from certain countries, product availability due to drug shortages, and lapses in contracts.

---

[5] In FY2014 for five VISNs, there were $40.7 M open market purchases from vendors (including from PPV) without contract numbers in IFCAP, $18.6M in spend with contract numbers, and $627 M in PPV spend (VA, FY2014a).

Figure 3-8. Cumulative VA Pharmaceutical Spend by Price Point

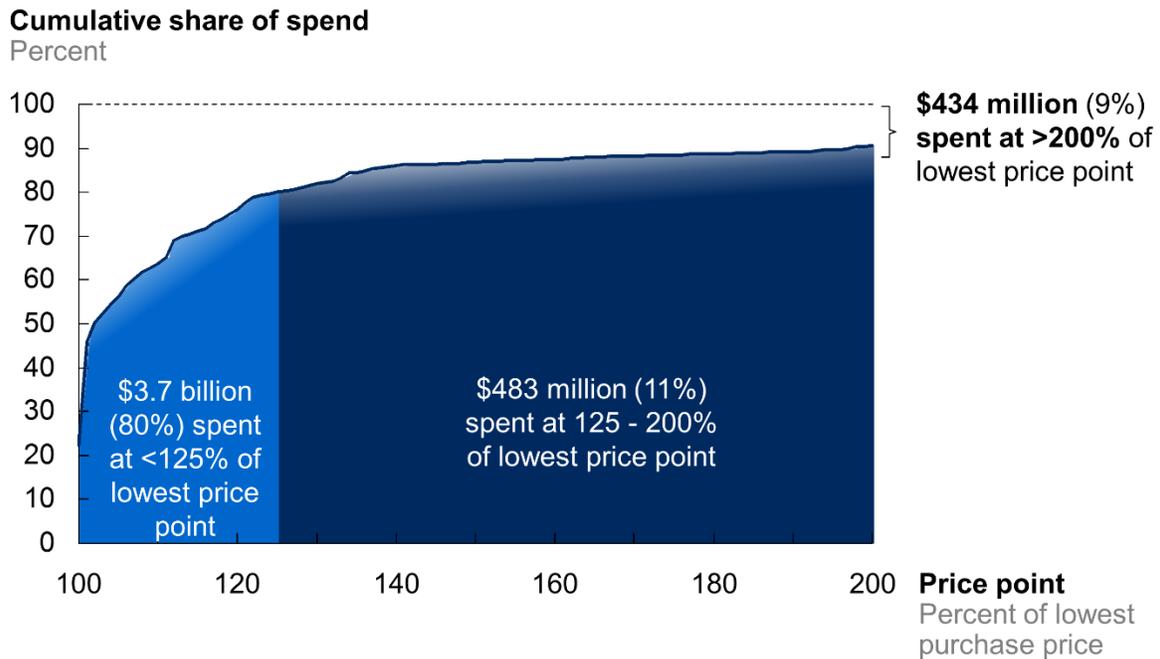
VA buys a significant proportion of drugs above the lowest available price[1,2]

Cumulative share of spend
Percent

$434 million (9%) **spent at >200%** of lowest price point

$3.7 billion (80%) spent at <125% of lowest price point

$483 million (11%) spent at 125 - 200% of lowest price point

Price point
Percent of lowest purchase price


1 Includes all generic and branded drugs, CY2014. Lowest price point defined as lowest cost per pill for an individual transaction
2 Low outliers and high outliers excluded. Low outliers defined as a price point <10% of the average price point. High outliers defined as a price point equal to 1000% above average price point for the year (volume weighted)

SOURCE: VA. (2012-2014). Pharmaceutical Prime Vendor Purchase Order Data

According to section 8.002 of the VAAR, VA contracting officers are required to purchase supplies through a hierarchy of sources which places FSS contracts above open market commercial sources. However, in some instances only a single FSS supplier is available for a pharmaceutical, allowing them to command prices from VA above what other open market suppliers may charge. Senior PBM leadership stated that this is one major reason VA cannot access the lowest prices available (VA Pharmacy Benefit Management, 2015). Recognizing this issue in other contexts, federal agencies changed the Federal Acquisition Regulations (FAR) in January 2014 to clarify that non-mandatory FSS sources are not subject to a required prioritization above open market competition (although they are encouraged) (Federal Acquisition Regulation; Prioritizing Sources of Supplies and Services for Use by the Government, 2013). While VAAR is based on the FAR, the VAAR prioritization language remains in place and likely limits contractors' willingness to compete suppliers, even when it might be in VA's best interest.

The VA's purchasing flexibility is currently limited by the Trade Agreement Act (TAA) (19 USC 2501) which states that Federal agencies "may only acquire U.S.-made or designated country end products or U.S. or designated country services. Products/services offered under the VA Schedule Program that are end products/services of countries other than the United States or identified designated countries will not be considered for award." This poses a challenge because India and China are major producers of generics. Forty percent of all new FDA generic drug applications were from an Indian manufacturer in 2013 (FDA, 2013), and China and India

produce a substantial portion of the active pharmaceutical ingredients (API) used by other manufacturers (59 percent of the world API market in 2010) (Chemical Pharmaceutical Generic Association, 2012). However, TAA restrictions mean that, under normal circumstances, VA cannot source medications from those countries, or those containing API produced there, even if they are FDA-approved.

TAA restrictions are most critical in times when FSS or other contracted suppliers cannot supply VA with needed pharmaceuticals. In these instances, VA must procure drugs at open market prices or from other non-preferred suppliers at sub-optimal prices. Drugs that have recently been affected by TAA restrictions include baclofen, donepezil, mesalamine, and cefepime. In some cases, suppliers seek cheaper sources of API, and drugs which were TAA compliant become non-compliant. For example, beginning in July 2014, the producer of cyclophosphamide tablets changed its product to a capsule form with API produced in China. Price per pill and total spending increased more than six times as it was no longer on contract and had to be sourced on the open market. This was the sole producer of a life-saving cancer treatment and there were no alternatives.

National drug shortages also limit VA's ability to consistently access the lowest available price. Interviewees who were familiar with pharmacy issues uniformly stated that national shortages were becoming more widespread. Between 2012 and 2014, the FDA had 205 reported shortages (FDA, 2015). In shortage situations, VA must either source drugs from non-preferred suppliers (often at open market prices) or do without and use alternative treatments. As a specific example, in the second quarter of 2014, VA experienced a drug shortage from its only contracted supplier of bumetanide tablets. As a result, there was a rapid, nearly uniform shift in spend from contracted suppliers to off-contract suppliers. This shift led to prices that were approximately 10 times higher than contract prices for the remainder of the year.

Interviews with PBM leadership, CMOP leadership, and facility purchasers suggested that in some cases, failure to manage contract expirations and long contracting times led to extended periods of open market purchasing. PBM leadership stated that the most common reason FSS contracts expire is due to products being divested to a different manufacturer that did not have a contract with the government (VHA Pharmacy Benefits Management, 2015c). Two challenges were highlighted across these interviews:

- **Generalist approach.** The NAC is a centralized contracting organization that has historically operated as a team of generalists. Several interviewees believed that the perceived "one-size-fits-all" approach to contracting limited the NAC's ability to tailor response times to clinical priorities. Interviewees believed there was a lack of category prioritization (for example, for critical supplies that are close to contract expiration) and little familiarity with local needs or preferences (due to Veteran demographics or geographical differences in drug utilization, for example). Recently, FSS contractors have aligned with schedule categories, but it is too early to judge the effectiveness of this transition.

- **Perceived lack of responsiveness.** One hundred and twelve out of 182 interviewees reported instances when the NAC's responsiveness to contracting requests and its communication did not meet expectations. There was also a perception among field

procurement teams that the NAC does not have, or cannot demonstrate, a sense of urgency for contract renewals and emergency sourcing (for example, during drug shortages). According to leadership, there are long backlogs of contract packages and an average time of 283 days from receipt of completed packages until FSS contracts are in place. VA standard is 180 days for new FSS contracts. FSS contracts are awarded on a five-year base period with an optional five-year extension. Contracting leadership emphasized that it was a "*vendor's responsibility for them to submit extensions early and appropriately to avoid contract lapses. This does not happen frequently – leading to products falling off contract.*" It was unclear from leadership interviews what supplier management tools (for example, notifications) were in place to help suppliers maintain continuity of coverage.

In October 2013, certain components of CMOP contracting were transferred to the NCO 15 contracting offices as leaders sought to improve contracting speed and responsiveness for procurements requiring Requests for Quotes (RFQs) in open market solicitations. Since the transition, pharmacy leaders report higher satisfaction with contracting, driven by better customer service and efficiency in contracting processes. Interviewees suggested that NCO 15's performance is related to its relative category expertise, clear roles and responsibilities (e.g., single focus on CMOP contracting), and commitment to customer responsiveness. NCO 15 is also located directly opposite Leavenworth CMOP, which likely supports alignment, effective communication, and drives greater accountability.

3.2.2 VA's Distribution of Pharmaceuticals is Efficient and Effective

VHA has established an advanced distribution model to its facilities and onwards to Veterans. It receives the vast majority of its pharmaceuticals from its prime vendor – a distributor that sources medications from suppliers and delivers them to VHA's facility-based pharmacies and Consolidated Mail Order Pharmacies (CMOPs). Drugs are then distributed to Veterans from VA's CMOPs or from "windows" at pharmacies in VA's medical centers and clinics. Overall, VA's pharmaceutical organization performs well on distribution and its distribution model received near uniform praise from interviewees at all levels.

Specific findings include the following, which are described in more detail below:

a. VA's Consolidated Mail Outpatient Pharmacies (CMOPs) and outpatient pharmacies are efficient and achieve high Veteran satisfaction scores, but there may be opportunity for ongoing efficiency improvement.

b. VA's pharmaceutical prime vendor is well utilized and the model provides a good level of service to VHA's facility-based pharmacies and CMOPs.

a. VA's Consolidated Mail Outpatient Pharmacies (CMOPs) and outpatient pharmacies are efficient and achieve high Veteran satisfaction scores, but there may be opportunity for ongoing efficiency improvement.

Around 80 percent of VA's outpatient prescriptions are dispensed by VA's network of CMOPs (VA, 2015b). This represents around 128 million prescriptions annually. The remaining 20 percent are dispensed from outpatient window pharmacies in VA medical centers (VAMC) and clinics.

Veteran satisfaction with VA's CMOPs is high; VA's CMOPs received the highest overall customer satisfaction score of all mail order pharmacies in the 2014 J.D. Power survey (Figure 3-9) (J.D. Power, 2014).

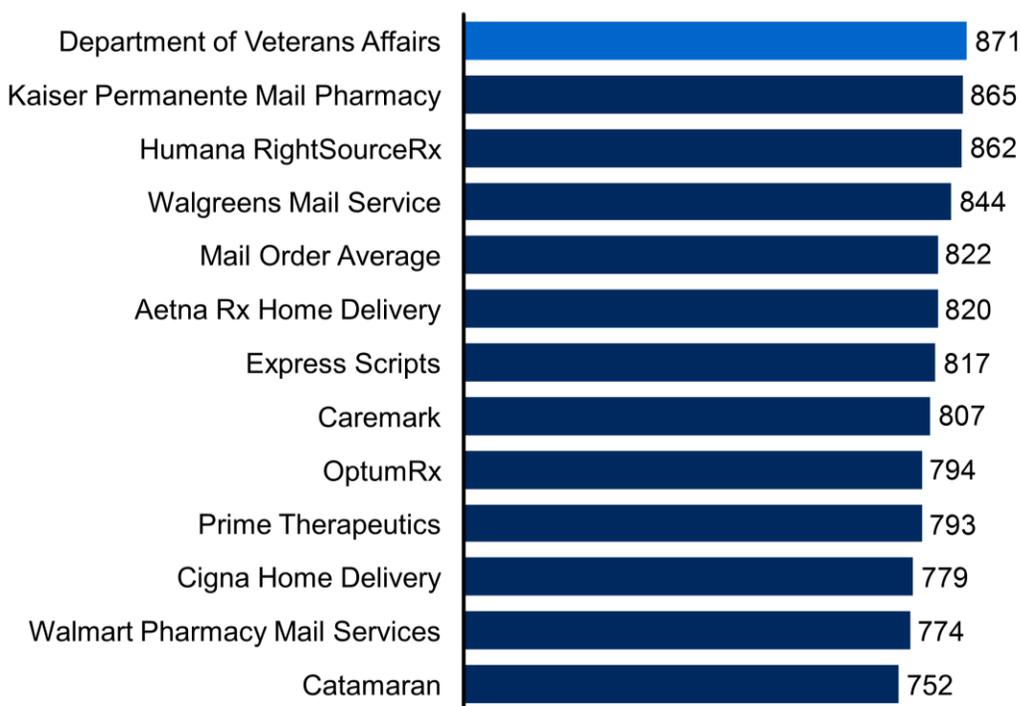
Catamaran	752


SOURCE: J.D. Power. (2014). *2014 Retail Pharmacy Study – Mail Order*

The assessment team visited two CMOPs during this assessment. Both were impressive in their scale, degree of automation, and low error rates. The CMOPs' annual operating budget is ~$191 million and they typically spend around $1.53 on average to fulfill a prescription (excluding drug and shipping cost) (VA, 2015c). Benchmarks from other mail order pharmacies are not published but expert interviews suggest this cost is comparable to the private sector.

However, total operating costs and cost per prescription varies across CMOPs and data would suggest there may be some economies of scale (Table 3-3); the two CMOPs with the highest volume have the lowest fulfillment cost. Also, expert interviews suggest that private sector mail order pharmacies typically process 25-30 million prescriptions per facility annually (Expert interviews, 2015) vs. VA's 9.4 – 26.5 million prescriptions per facility annually (VA, 2015c). Therefore, there may be an opportunity to consolidate VA's CMOPs to achieve greater scale and increase each remaining CMOP's utilization. This should be weighed against the potential impact on mailing costs, delivery times, and redundancy needed in the system to accommodate downtime or emergency preparedness plans.

Table 3-3. CMOP Operating Performance

CMOP	FY2014 prescriptions (M)	Total operating cost ($ M)	Non-drug cost per prescription[6] ($)	Time to fill (hours)	Time to deliver (hours)	Total time to Veteran (days)
A	26.5	36.4	1.37	38	49	3.6
B	25.5	36.7	1.44	40	54	3.9
C	18.5	31.7	1.72[7]	36	51	3.6
D	14.9	23.6	1.59	39	51	3.8
E	13.0	21.0	1.62	41	50	3.8
F	11.3	17.6	1.55	35	51	3.6
G	9.4	14.7	1.57	31	55	3.6

Overall, the delivery of medications to Veterans is near best-in-class (J.D. Power, 2014). Average order to Veteran times across all CMOPs is ~89 hours (range of 86-94 hours) or nearly four days. Industry research suggests that major mail order pharmacies take three to five days to refill prescriptions once received electronically.

Finally, while the assessment team believes CMOP error rates are low, there is scope to increase automation to further reduce error rates. The primary area for increased automation is at the end of the mail order process – packing and shipping. CMOP leadership already have plans in place to automate those steps and also to gradually upgrade the existing automation, and we would recommend they continue implementing those improvements.

Interviews and site visits also suggest that VA's outpatient pharmacies provide effective and timely distribution of pharmaceuticals to Veterans. While central data for window wait times was unavailable, pharmacists at VAMCs visited stated Veteran wait times for prescriptions were usually below their 30-minute target, on average. Our observations and interviews in eight pharmacies confirmed that, at any point in time, only a handful of Veterans were waiting for medications, if any were waiting at all. However, pharmacists said that wait times can rise during busy periods, which may represent an opportunity to improve service levels by, for example, establishing more flexible staffing models to meet demand or by improving the physical layout of pharmacies. There is also an opportunity to take pressure off outpatient pharmacies by directing more prescriptions to the CMOPs, particularly for non-urgent refills, as at least 18 percent of window prescriptions are for refills (VHA Pharmacy Benefits Management, FY2014). The actual number is likely larger, as physicians often write new

---

[6] Excludes mail cost

[7] Operating costs for this CMOP are temporarily higher as it transitions to a new facility and receives needed technology upgrades. Also reflected are additional costs for packaging slip printing that is outsourced because of space constraints in the existing facility.

---

prescriptions for existing medications during visits to ensure patients have an adequate number of refills. These are not counted in the system as refills.

In addition, a small volume of prescriptions is mailed to Veterans from VA Medical Center pharmacies. This practice is typically for medications that are not stocked at the CMOPs, such as certain controlled substances and specialty medications. There may be an opportunity to centralize dispensing and mailing of these prescriptions within a region to improve efficiency. We observed this practice on one site visit, which could be evaluated for its applicability more broadly across VHA.

b. VHA's pharmaceutical prime vendor is well utilized and the model provides a good level of service to VHA's facility-based pharmacies and CMOPs.

VA's prime vendor is a distribution company that is contracted with VA to source required pharmaceutical products from suppliers and distribute them to VA facilities. VA's current prime vendor contract was signed into effect in May 2012 for two years with options for three additional two-year renewals (eight years total). VA purchases around 90 percent of all pharmaceuticals through its prime vendor (around $4.5 billion of the more than $4.9 billion pharmaceutical budget) (VA, 2012-2014; VA, 2015a). Throughout site visits and interviews, VA personnel provided consistent feedback that they believed the current prime vendor provides high levels of service, accuracy, and satisfaction. Furthermore, stakeholders reported that the prime vendor consistently meets its contractual expectations in the following areas:

- **Standardized data:** VA has access to a standardized purchase order database that is provided by the prime vendor. This data provides VA with a structured and minable dataset that is used to inform purchasing decisions and contracting, and to monitor / track utilization.

- **Automated purchasing software:** The prime vendor's ordering system allows VA to consolidate purchasing to a limited number of suppliers while also locking-out sub-optimal pricing. This software also ensures that pharmaceuticals are ordered on-contract whenever possible.

- **Logistics support:** The prime vendor provides barcode scanners to support management of inventory in CMOPs and VAMCs while also providing purchase recommendations (for example, through predictive analytics) for pharmacy purchasing teams.

- **Performance management:** VA receives standard performance reports for both vendor service levels (self-reported by the prime vendor) and VA utilization patterns which are consistently reviewed and used by VA PBM to manage pharmaceutical spend.

- **Quality assurance:** VA's prime vendor contract ensures that all drugs provided are both FDA approved and TAA compliant. VA maintains the right to return, at no cost to the government, any drugs with expiration dates that fall within six months of delivery, are incorrectly shipped, or are damaged.

Throughout the pharmaceutical organization, purchasing processes are largely centralized and standardized. The prime vendor's ordering system provides a handheld device that is used at the point of ordering which is compatible with barcoded labels on nearly all pharmaceuticals. This system enables web-based ordering which is transmitted directly to the distributor. Under

its contractual obligations, the prime vendor provides maintenance and training for VA pharmacies (both CMOP and VAMC) to support its ordering system. Additional features of the prime vendor's ordering system include real-time pricing, accurate information regarding quantity available for purchase by vendor, and IT-supported approval processes for satellite facilities.

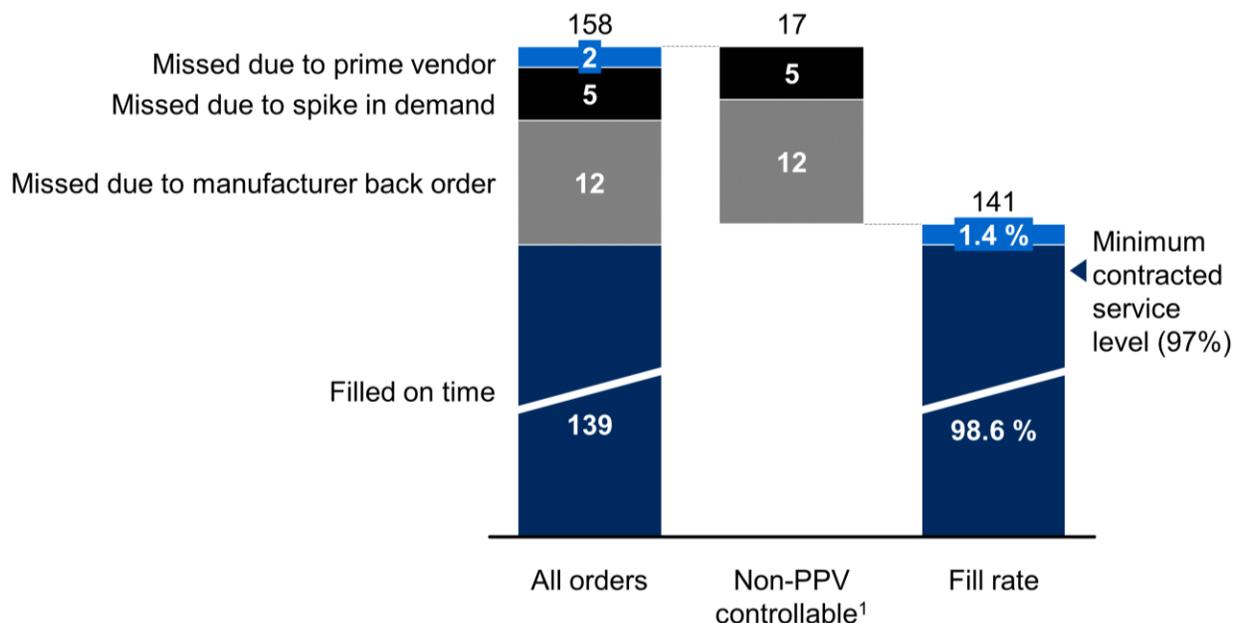
As per VA's contract, the prime vendor must perform next-day delivery for orders made before 6 p.m. and ensure a 97 percent fill-rate for indefinite delivery, indefinite quantity (IDIQ) of pharmaceutical products. The prime vendor does have exception clauses for manufacturer backorders (MBO) and spike volume requests (defined as orders exceeding 150 percent of prior month's total volume). However, it cannot divert product intended for VA to gain profit from price arbitrage within the market. Upon review of the VA's most recent prime vendor business metrics, it appears that the VA's prime vendor relationship provides high quality, reliable, on-time, and accurate delivery of pharmaceuticals with fill-rates of more than 98 percent (Figure 3-10).

In addition to efficient delivery, the prime vendor provides high quality customer service to CMOPs and VAMCs. Interviewees in both locations cited their ability to receive same-day emergency shipments (often within four hours) which supports timely delivery of care to Veterans. It is important to note that this delivery time can be met for both on-formulary as well as off-formulary medications.

VA's inventory management system benefits from VA's ability to receive reliable delivery of pharmaceuticals and is able to operate a near just-in-time inventory management system. During VAMC interviews, pharmacists reported having an average of approximately three to four days of stock on hand at most facilities. They cited robust visibility into inventory as a key driver, facilitated by the prime vendor's inventory system. Interviewees reported that stock-outs occur rarely at VAMCs and are largely driven by manufacturer and / or national shortages rather than distributor deficiencies.

Figure 3-10. Pharmaceutical Prime Vendor Service Levels for 2Q2013 – 1Q2014

The pharmaceutical prime vendor's fill rate is 98.6%

Millions of orders


1 Contractually, manufacturer back orders and quantities in 150% in excess of previous month's demand do not count towards the PPV fill rate

3.2.3 VA has Developed Effective Mechanisms to Drive Appropriate Utilization Such as its Formulary, Clinical use Guidelines, and Involvement of Clinical Pharmacists

Overall, VA is a leader in formulary decision-making and evidence-based clinical usage of pharmaceuticals. Specific elements supporting this finding include the following:

a. VA's use of pharmaceuticals is guided by a robust, evidence-based formulary that has achieved widespread buy in.

b. VA has established an effective two-way cascade of decision-making, feedback, and implementation throughout the organization.

c. VA clinical pharmacists are well integrated into the care team.

d. VA's formulary process is sufficiently flexible to give Veterans access to all FDA-approved medications if clinically indicated.

e. VA's utilization of generic medications is high overall, but there may be opportunity to increase generic utilization and better standardize drug choice in certain drug classes and geographies.

a. VA's use of pharmaceuticals is guided by a robust, evidence-based formulary that has achieved widespread buy in.

A formulary is a list of medications that have been approved by an organization to be used to treat specific conditions in a particular patient population. Decisions on which medications to list on a formulary are typically based on factors such as efficacy, safety, and cost effectiveness. Therefore, formularies help to drive high-quality high-value prescribing.

Interviews and site visits demonstrated a strong belief in the value and relevance of the VA's formulary from stakeholders along the entire pharmaceutical value chain (physicians, pharmacists, PBM leaders, and contracting). Most physicians interviewed did not believe the formulary was too restrictive and one psychiatrist said VA's formulary was actually significantly less restrictive than the formulary she had used previously in a large Midwest municipal health system. Even 14 years ago, an Institute of Medicine report supported this less restrictive view of VA's formulary and gave favorable reviews overall of the formulary management, utilization, and clinician buy in (Blumenthal & Herdman, 2001).

b. VHA has established an effective two-way cascade of decision-making, feedback, and implementation throughout the organization.

VA formulary decisions and implementation are driven by three groups (Figure 3-11): (a) VAMC Pharmacy and Therapeutics (P&T) committees, (b) VISN P&T committees with membership from VAMC committees led by a VISN Pharmacy Executive, and (c) a national P&T committee composed of the national Medical Advisory Panel (MAP) and the VISN Pharmacist Executive Committee (VPE). The extensive governance structure with high physician and pharmacist engagement, together with evidence-based reviews, drives stakeholder alignment. Contract adherence for "closed" drug classes is reported to be rapid and extensive, reaching 90 percent in three months and greater than 98 percent within six months (Good & Valentino, 2014).

Site visits confirmed that Pharmaceutical and Therapeutics (P&T) committees meet at each site to help support adherence to standard processes and protocols implemented by the VA's PBM organization. P&T committees convene monthly at VAMCs to discuss treatment protocols, develop facility-level initiatives, and make recommendations to VISN and national-level PBM committees regarding formulary modifications. Facility-level proceedings and successful initiatives are effectively raised to VISN and national leadership through structured committees at all levels (Figure 3-11).

c. Clinical pharmacists are well integrated into the care team.

VA pharmacy practice is recognized by industry leaders as being among the best in the nation: *"Overall from a pharmacy practice perspective, generally the pharmacy practice in the VA is more advanced than other practices within the public and private sectors in terms of delivery of care and utilization of pharmacist professionals in the care and treatment of patients"* (American Pharmacists Association, 2015). Recruitment and development of talent is a critical component of this success, exemplified by VA's hiring of talent with PharmD degrees, support for 500 paid residencies (VA Pharmacy Benefit Management, 2015), credentialing, and additional training such as scope of practice boot camps that enable VA pharmacists to work at the top of their licenses to provide relief to doctors and other clinical staff.

PBM also supports clinicians with key initiatives such as an Academic Detailing Service that spreads best practices and improves health care by combining the interactive, one-on-one communication used by medical salespeople with the evidence-based, noncommercial information generated by medical experts. The current focus of VA academic detailing is on opioid drug usage and pain management, and PBM has developed a physician outreach plan and prepared a packet of information to educate clinicians and patients with the latest guidelines and evidence on therapies (VA Pharmacy Benefit Management, 2015). These efforts should further impact trends seen in section 3.2.5. Other best practice sharing tools include a

national clinical pharmacy file and information sharing site that includes content for over 50 job areas (VHA Pharmacy Benefit Management, 2013).

VA has moved to a Patient Aligned Care Team (PACT) model in which clinical pharmacists are core members of a multidisciplinary team, and often bridge primary and specialty care teams. Of the approximately 6,700 pharmacists examined by VHA, over 2,600 have a scope of practice allowing them to assist physicians in certain clinical activities such as initiating, managing, and monitoring a patient's drug therapy for specified chronic diseases. More than two thirds of those pharmacists spend the majority of their time on these clinical duties (VHA Pharmacy Benefit Management, 2013). Site visits, observations, and interviews with physicians and pharmacists confirmed that clinical pharmacists play a key role in decision making around prescribing and patient education. Several physicians commented that VA pharmacists play a more integral role in providing care than they have seen in other health care settings. In addition, pharmacists reported that they value the clinical role and potential for expanded scope of practice at VA relative to opportunities they may have elsewhere. VA pharmacists improve patient outcomes through their interventions, such as reducing costs and reducing cardiovascular events, foot ulcers and other complications for chronic disease management of patients with diabetes (Ourth, Morreale, & Groppi, 2015; VHA Pharmacy Benefit Management, 2013).

d. VHA's formulary process is sufficiently flexible to give Veterans access to all FDA-approved medications if clinically indicated.

While the formulary is strictly controlled by VHA's PBM organization, off-formulary drugs are available when needed for Veteran care through a standardized off-formulary request process that takes into account the clinical needs of each individual patient. Non-formulary approval requests are submitted electronically by prescribing physicians and are reviewed by pharmacists dedicated to specific therapeutic classes, with further expert involvement as needed. Nearly 99 percent of decisions are made in under 96 hours and, on average, 80 percent of non-formulary requests are approved (VA, FY2014b). For the 20 percent that are not approved, an appeal process is in place to escalate to the VISN Chief of Pharmacy. Therefore, Veterans have access to all drugs approved by the FDA whether those drugs on or off formulary; the formulary simply acts as a mechanism to steer physicians towards medications that are deemed by VA to be the most clinically effective, safest, and highest value drugs available on the market.

As a result of this process, 4.8 percent of outpatient prescriptions dispensed by VA are for non-formulary medications on average across VA overall (Figure 3-12), although this ranges from 2.5 to 9.1 percent among VAMCs (VA, 2010-2014b). Data was not available for inpatient prescriptions.

SOURCE: VA. (2010-2014b). Outpatient prescription data.

e. VHA's utilization of generic medications is high overall, but there may be opportunity to increase generic utilization and better standardize drug choice in certain drug classes and geographies.

Generic medications are typically significantly less expensive than their branded equivalents. Higher generic utilization is important because it helps VA control its drug costs while still ensuring Veterans get access to high quality, FDA-approved medications.

Ninety-seven percent of all pills or pill equivalents bought by VA are generic formulations when a generic exists (VA, 2012-2014), which the assessment team believes is high relative to other integrated health care delivery organizations. For example, Kaiser Permanente claims it dispenses 99 percent of its prescriptions as a generic when a generic exists (Kaiser Permanente, 2015), and its generic purchasing rate will likely be similar. Unfortunately, VA cannot accurately measure or report the generic dispensing rate as does the rest of the industry (generic prescriptions dispensed divided by total prescriptions), as pharmacy dispensing data is not specific for individual National Drug Codes. Therefore, we are unable to do a fair and true comparison to the industry standard benchmark. In general, however, a generic dispensing rate

of around 80 to 90 percent would be considered normal in the industry.[8] VA's "true" generic dispensing rate (total generic prescriptions per total prescriptions) is likely to be as good as or better than that benchmark, given its high generic purchasing rate (91 percent of all pills or pill equivalents purchased are generic) (VA, 2012-2014).

VA's generic utilization is supported by strong adherence to the formulary (as described above), policies that automatically dispense a generic formulation when available, and dedicated pharmacist clinical decision support (through non-formulary review, involvement in inpatient clinical decision-making, and outpatient pharmacy dispensing, for example).

There is remarkable consistency in the generic purchasing rate across VISNs, with only around a four percentage point difference from the lowest to highest generic utilizer. More variation in generic purchasing is seen when comparing individual facilities. Much of this variation will be due to differences in case mix and usage of different drug classes with different levels of generic availability. For example, facilities that serve a large oncology population are likely to spend relatively more on branded medications because many oncology drugs are not yet available in a generic formulation.

However, data analysis also highlighted that geographic differences exist in prescribing patterns within drug classes (Figure 3-13) that not only reflect the generic dispensing rate, but will also lead to different costs to treat the same condition depending upon where a Veteran receives care.

As a concrete example, VA's drug purchase data showed that in 2014, several VISNs used significantly more of a branded medication than other VISNs within one drug class (Figure 3-14). The choice of the branded drug led to a significantly higher cost to treat a patient with a drug in that class – $70 per patient annually for the branded drug versus around $20 for the generic. Interviews revealed that VISNs have authority to drive prescribing towards specific drugs within a class within their VISN, provided those drugs are on formulary. In this case, pharmacy leaders believed the VISNs that used more of the branded drug may have been slower to drive towards the generic substitute than other VISNs because of practices established when both drugs were branded and on contract.

---

[8] Industry PBMs ~84% (CVS Caremark, 2015; Express Scripts, 2015), 77.7% national average in 2012 (Martin, Hartman, Whittle, & Catlin, 2014), 80% for Medicaid in 2012 (Bruen & Young, 2014), 88% for health exchange plans (Brennan, et al., 2014).

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

3.2.4 VA has Implemented Policies and Processes to Improve Patient Transitions from the Department of Defense to VHA but Challenges Remain

Several prior reports have highlighted some of the challenges Veterans face when transitioning directly from DoD care to VA care, including:

- Potential gaps in transitioning servicemembers' medication coverage due to formulary differences
- Poor interoperability between DoD and VA electronic medical records

A number of guidelines, directives, and programs have been developed over the last decade to improve Veterans' transitions from DoD, which are summarized in the following table (Table 3-4).

Table 3-4. Timeline of Developments Related to Transitioning Servicemembers

Year	Developments related to servicemembers transitioning to VA care
2007	▪ VA and DoD release the CHDR (Clinical Health Data Repository) interface that all DoD sites and 102 of 128 VA sites can access, with limited medical info exchange (outpatient pharmacy meds and allergies)
2008	▪ National Defense Authorization Act issues requirements for DoD and VA to increase health information sharing and reach full interoperability
2009	▪ VA establishes procedures for transitioning care of OEF/OIF Veterans ▪ VA and DoD begin work on the Virtual Lifetime Electronic Record initiative
2011	▪ VA and DoD release Integrated Mental Health Strategy ▪ *inTransition* program implemented (referral required for enrollment) ▪ VA and DoD Secretaries commit to developing an integrated electronic health record system by 2017
2012	▪ President signs Executive Order expanding VA services for suicide prevention, mental health, and substance abuse treatments ▪ Interagency Taskforce established to review Departmental activities for improvement
2013	▪ VA and DOD begin work on the Joint Legacy Viewer – a program to improve access to health information for transitioning servicemembers to include medications, progress, and discharge notes
2014	▪ VA and DoD sign MOU for complex care coordination teams and to improve policies and procedures for transitioning servicemembers ▪ President announces 19 new executive actions to improve medication continuity during transitions between DoD/VA care, including automatic enrollment into VA's *inTransition* program

Year	Developments related to servicemembers transitioning to VA care
2015	▪ VHA issues Directive 2014-02, mandating mental health medications for transitioning servicemembers not be switched solely due to differences between VA and DoD formularies, VA Criteria-for-Use, or cost ▪ Non-formulary justifications are not required for processing if a designation of "Transitioning Veteran" is made

Specific findings of this assessment include the following, which are detailed below:

    a. Veterans have long wait times to see a primary care physician

    b. There is limited interoperability between DoD's and VA's health information

    c. Differences exist between DoD and VA formularies that can lead to challenges ensuring continuity of care

a. Veterans have long wait times to see a primary care physician.

Data released by VA in October 2014 show new VA patients wait on average 43 days to see a primary care physician, with a range of 2 to 122 days across facilities (VA, 2014c). A 2012 GAO report found that the average time between servicemember discharge date and first VA appointment was 81 days (GAO, 2012). Many prescriptions are written for less than the 81 day average, as evidenced by 54 percent of VA's own prescriptions being for 30 days or less (VA, 2014d). Even in the case where patients are given refillable prescriptions for up to 90 days, patients could run out of medication while they are waiting to see a VA physician if the DoD prescription is dispensed with some time prior to discharge, followed by a period for VA care enrollment, followed by the average new patient wait time. VA has procedures and policies in place to provide transitioning servicemembers and other Veterans with medications in case of shortages (GAO, 2012; Staff interviews, 2015), but improving access may make them less necessary. Access to physicians is beyond the scope of this assessment but is covered in detail in Assessment B and scheduling practices in Assessment E.

b. VA physicians cite poor access to DoD medical records as the primary challenge related to patient transitions.

In line with findings from previous reports (IOM, 2010; GAO, 2012), physicians and administrators consistently said that one of the biggest challenges they face when patients transition directly from DoD is getting access to their medical records and medication history.

Without access to previous medical records, they reported challenges understanding why patients were taking certain medications. Access to such information can be critical to ensure Veterans continue to receive their medication. For example, a physician may need a patient's medical history to be comfortable prescribing a medication such as a high risk or high potency drug or to prescribe an off-formulary medication (which requires a physician's clinical justification).

While a detailed assessment of data sharing capabilities for electronic health records was not in scope of this assessment, we did research initiatives VA and DoD have implemented to improve interoperability and information sharing. Table 3-5 highlights some of those programs

(Modified from: Defense Medical Information Exchange Program Office, 2014). The DoD and VA have been working on systems for interoperability since 1998 (Congressional Research Service, 2013). Many of the older tools provide only limited data and records (for example, only an outpatient medication list and not inpatient medications or clinical history). In 2008, the National Defense Authorization Act (NDAA) required DoD and VA to increase health information sharing and reach full interoperability between their medical record systems. While DoD and VA committed to developing a single integrated electronic health record in 2011, they have since developed plans for separate systems (a commercial off the shelf system for DoD and the VistA Evolution program for VA which includes the electronic Health Management Platform [eHMP]) due to cost and timing estimates (GAO, 2014). Common capabilities and interoperability are to be jointly developed by the Departments despite having separate systems.

Table 3-5. Data Sharing Programs between VA and DoD

Data sharing program	Year started	Intended purpose	Examples	Scale
Federal Health Information Exchange (FHIE)	2002	Monthly transfer of discharged servicemembers' clinical data from DoD to VA	Pharmacy, radiology, lab results	6.1 M service-members' clinical data transferred
Clinical Data Repository/ Health Data Repository Exchange (CHDR)	2003	Two-way exchange between DoD and VA of actionable outpatient pharmacy medication, allergy, and allergy reaction data for beneficiaries that use both DoD and VA health facilities, allowing the information to become part of the patients' permanent medical records	Outpatient Pharmacy, Allergy, and Allergy Reaction	2.1 M beneficiaries
Bidirectional Health Information Exchange (BHIE)	2004	Real-time read-only viewing of DoD and VA patient clinical data	Consultations, patient history and physical reports, theatre clinical data	5.1 M patients
Virtual Lifetime Electronic Record (VLER)	2009	Intended to allow public sector (VA, Social Security Administration) and private sector health care providers'	Continuity of care documents	

Data sharing program	Year started	Intended purpose	Examples	Scale
		secure access to a patient's health record		
Joint Legacy Viewer (JLV)	2013	Intended to provide easy access to integrated view of patient information, including information required for most clinical decisions	Medications, progress, and discharge notes	Currently available at all VAMCs with limited user access

As a bridge to eHMP development and to support interoperability, VA and DoD launched the Joint Legacy Viewer (JLV) program which includes mapping of data to national standard codes, access to more information (such as full exam reports), and a user friendly graphical interface. The JLV pilot program is being expanded to meet the full interoperability requirements issued again in the 2014 NDAA. During the pilot period there were ~700 test users across seven VAMCs and three DoD facilities. It is available at all VAMCs and was offered to all Chiefs of Staff or their designees as of October 1, 2014, but it is unclear how it is being received and used given the limited user access. Additional technical capacity is expected to be added to increase the user base across the enterprise on a rollout schedule (DoD and VA, 2014).

Given the early phase of JLV's rollout, it is unclear whether it will successfully address physicians' and administrators' needs to access clinical information from DoD systems. Previous programs had difficulties due to poor strategic planning, program management, and investment management (Congressional Research Service, 2013; GAO, 2014). Assessment H section 12.3 discusses these issues in more detail. Additionally, Assessment H found the JLV program rollout includes a lack of engagement and stakeholder awareness that raises concerns about its eventual success.

c. Differences exist between DoD and VA formularies that can lead to challenges ensuring continuity of care.

DoD's and VA's formularies and formulary processes are different. For example, DoD has a three tiered formulary, of which the third tier is considered non-formulary and not stocked on military bases. Instead, these non-preferred medications are only available through community pharmacies or mail order, and a large co-pay applies. All FDA-approved medications, until reviewed, are required by law to be placed in the second tier. On the other hand, VA has one national formulary and no tiers, and almost all medications are dispensed by VA pharmacies or CMOPs. While different, there is substantial overlap in the formularies, particularly for commonly prescribed mental health and pain medications (GAO, 2012). The DoD and VA both have mechanisms to provide access to off-formulary medications however, if clinically indicated.

Recent reports in the media have raised concerns that formulary differences may lead to VA physicians switching transitioning servicemembers' medications inappropriately. Accurately understanding the rate in which transitioning servicemembers' medications are changed due to

formulary differences would require a prospective study (which is beyond the scope of this report). However, an internal VA audit of 2,000 new patients showed only 21 patients transitioning from DoD had a medication switched by VA physicians without documented clinical justification if they received VA care within a year of discharge (759 patients in the examined cohort) (VHA Pharmacy Benefits Management, 2015a). Deeper analysis of those cases was not available, but several factors could have driven the switch, including undocumented clinical reasons, a patient's request to try a new medication, or a physician's desire to adhere to VA's formulary.

Several initiatives have been implemented to help facilitate smoother transitions. As noted in Table 3-4, VHA issued a directive in January 2015 that clinicians should maintain transitioning servicemembers' behavioral health medications if clinically appropriate (VHA, 2014). This formalized a policy that PBM leadership states was in effect since 2006. The directive states:

> *"A VA provider must not discontinue mental health medications, initiated by a DoD authorized provider, solely because of differences between the VA and DoD drug formularies, VA Criteria-for-Use, or the cost of the drug."*

It further allows physicians to switch medications if it is no longer safe, clinically appropriate, or effective based on the servicemember's current condition. If a switch occurs, clinical reasons must be documented.

In addition, on August 26, 2014, President Obama issued executive actions that mandated increased support for soldiers transitioning from the DoD to VA. The executive actions served to ensure that all servicemembers with mental health conditions are automatically enrolled in the DoD's *inTransition* program which provides dedicated support by mental health professionals during the transition period. Prior to this announcement, servicemembers were either referred by their providers or self-enrolled in the program. This passive enrollment led to potential gaps in clinical care which resulted in adverse outcomes for some transitioning servicemembers. In addition to the changes to the *inTransition* enrollment process, the executive action aimed to increase the continuity of all mental health medications during the transition period if clinically appropriate, regardless of the VA formulary status of a servicemember's medications. Prior to the executive action and the January 2015 directive promulgating the policy within VA, prescribers were required to seek formulary waivers for active mental health medications, which some prescribers may have found cumbersome.

All physicians interviewed during site visits said it had been their practice for many years to keep transitioning patients on DoD-initiated behavioral health medications regardless of formulary status unless there was a clinical indication to change. They believed that was also the practice of most of their colleagues. Interviews with pharmacists suggested that this was the most common practice, although it was not yet universal. Physicians who did report transitioning patients to on-formulary medications said they did so for clinical efficacy and safety reasons, not for cost or convenience, which is largely consistent with PBM's internal audit.

However, some physicians did cite examples of when medication switches had been made for clinical reasons that had been poorly explained to patients. This represents an opportunity for

---

VA to improve the training of its physicians and to involve clinical pharmacists more proactively with transitioning Veterans to ensure any changes to medication regimens are fully understood and agreed with.

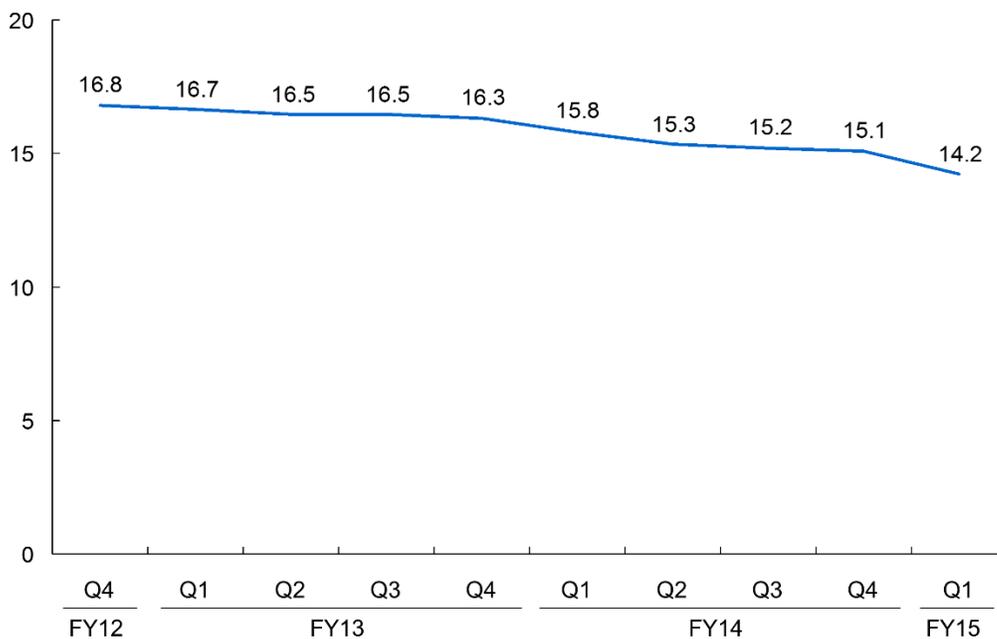
To support implementation of the directive above and to help improve the efficiency of Veterans' transitions, some VAMCs have also implemented changes to prescribing systems to make it easier for physicians to prescribe off-formulary medications. For example, some VISNs have enabled physicians to bypass the off-formulary prescribing process for psychiatric medications if a patient is known to be a recent transition from DoD.

3.2.5 VA has Implemented Programs to Reduce Utilization of High Risk Medications and Early Results are Promising

Narcotics and sedatives such as opiates and benzodiazepines are drugs at high risk of abuse and complications, particularly when used in combination. VA's patient population is known to have relatively high utilization of opiates and benzodiazepines, and several reports have highlighted the need to better manage the utilization of those classes of drugs (Wu, 2010; VA OIG, 2014a).

In response, VHA's PBM developed and implemented an opioid reduction program and physicians interviewed also reported a greater focus on benzodiazepines. The opioid reduction program has achieved widespread reduction in opioid utilization as measured by the percent of unique patients dispensed an opioid (VHA Pharmacy Benefits Management, 2015b). Figure 3-15 shows how the overall rate of prescriptions has fallen by 2.6 percentage points since 2012 for opioids. A similar decline was also seen for opioids with benzodiazepines (not shown).

Figure 3-15. Percent of VA Patients Prescribed an Opiate

Opioid use has fallen over the last two years
Percent of patients dispensed a prescription


SOURCE: VHA Pharmacy Benefits Management. (2015b). VISN Opioids over time Q4 Fy 12 to Q1 Fy 15.

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

This clearly highlights the organization's ability to drive changes in prescribing patterns and treatment paradigms. However, the metric used to measure opioid utilization is blunt. It does not take into account the type, strength, or dosage frequency of the opioids given, or whether an opioid is prescribed acutely (after a dental procedure, for example) or chronically (like for long-term pain). A more sensitive measurement approach that takes these factors into account (for example, converting all opioid regimens to a "morphine equivalent" to enable accurate comparisons) could help VA better understand and manage the titration process associated with opioids and other higher-risk drugs more effectively. Furthermore, programs similar to the opioid reduction program could be developed and implemented to improve safety in other drug classes that have adverse side effects or potential for abuse.

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

4   Clinical Supplies, Medical Devices, and Related Services

4.1   Context

4.1.1   Context & Key Trends

In FY2014, VA spent approximately $3.4 billion on clinical supplies, medical devices, and prosthetic appliances (Figure 1-1, page 4). From FY2012 to FY2014, spend in those categories grew by 5.9 percent per year in total, with 5.4 percent growth in clinical supplies and 6.3 percent in prosthetic appliances and medical devices (VA, 2014a; VA, 2015a). In contrast, health care spending on clinical supplies in the U.S. increased by 2.9 percent per year, while medical devices grew by 3.6 percent per year and durable medical equipment (a major component of prosthetic appliances) grew at 4.9 percent over a similar time period (Donahoe & King, 2014).[9] One possible explanation for VA's faster growth in these categories is Assessment A's finding that Veterans who use VA health care are older and sicker than non-Veterans or Veterans who do not use VA health care.

Clinical supplies is a diverse category that contains products ranging from commodity supplies such as exam gloves, syringes, gauze, and bandages, to higher physician preference items such as endoscopic staplers and surgical clips. Clinical supplies are typically single use and tend to be disposed of or go through reprocessing after use.

For the purposes of this report, medical devices are defined as items that directly interface with or are implanted into a patient's body and would only be used by those to whom they were prescribed (for example, surgical implants, limb prostheses, sensori-neuroaids, and orthotics). Durable medical equipment, such as wheelchairs, crutches, and CPAP / BiPAP machines are excluded from this assessment because they are a category that is distinct from the industry's typical definitions of medical devices and clinical supplies. Under this definition, medical devices account for ~$1.2 billion, or 62 percent, of the prosthetic appliance budget and 37 percent of the total supply spend (Figure 4-1).

VA's Prosthetics and Sensory Aids Service (PSAS) is responsible for procuring[10], distributing, and facilitating use of medical devices, prosthetic appliances[11], and certain Veteran benefits such as home or vehicle modifications and VA's clothing allowance. These items and benefits are ordered by clinicians for specific patients and those orders are tied to specific cases.

---

[9] Medical device growth based on a constant share of National Health Expenditures as found in Donahoe and King (2014). Note that in this time period National Health Expenditures overall grew at 3.6 percent, non-durable medical supplies grew by 2.9 percent and durable medical products grew by 4.9 percent (Centers for Medicare and Medicaid Services). 2013 is the most recent year available as of the time of writing.

[10] PSAS only procures prosthetic appliance items less than $3,000. Other procurements are done by NCOs.

[11] VA defines "prosthetic appliances" as artificial limbs and any devices that support or replace a body part or function, including sensory aids and mobility aids such as wheelchairs and walkers.

Figure 4-1. VA Spend on Clinical Supplies and Devices (FY2014)

Percent of FY2014 spend

100% = $3,462 M

Example categories

Clinical supplies — 40%
- Gloves
- Catheters
- Gauze, dressings, and bandages
- Wound closure devices
- Drapes and gowns

Medical devices — 37%
- Surgical implants
- Artificial limbs
- Sensori-neuro aids
- Orthotics / orthoses
- Biological implants
- Respiratory accessories

Prosthetic appliances

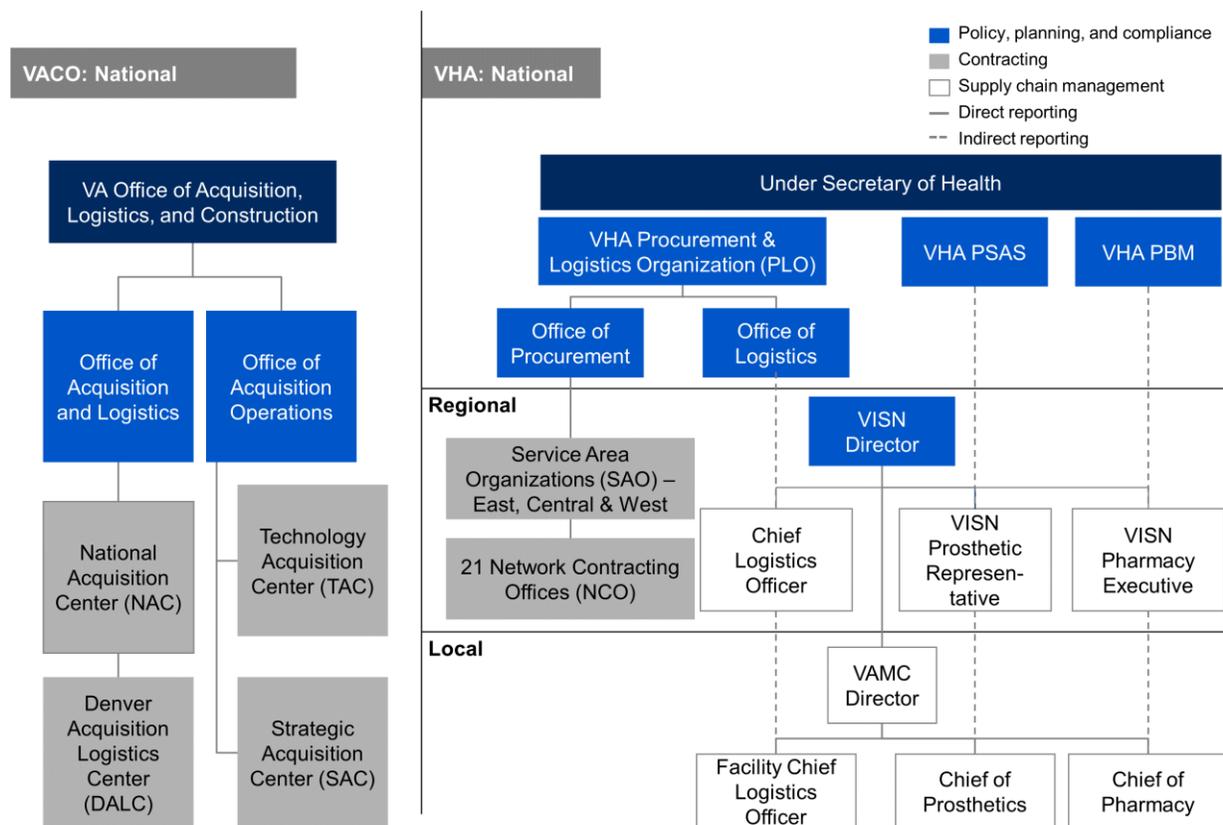
Other spend (out of scope of this assessment) — 23%
- Durable medical equipment
- Home dialysis program and equipment

SOURCE: VA. (FY2014c). Prosthetic appliance purchase orders (VistA Table 660); VA. (2014a). Congressional budget submission. Volume II - Medical programs and information technology programs.

Health care-related services are defined as services that are directly related to the purchasing, distribution, and use of the product categories within scope. Physician services and other services directly related to the delivery of clinical care are not covered in this report.

Within the context of clinical supplies and medical devices, the most important services are those provided through VA's Medical Surgical Prime Vendor (MSPV) program. MSPVs are distribution companies that are responsible for sourcing products from suppliers and distributing them to VA's facilities. They also provide value-added-services such as data reporting, just-in-time inventory management services, electronic ordering platforms, and warehousing.

The structure of VA's supply chain management organization that is responsible for clinical supplies and medical devices is complex (Figure 4-2). VA and VHA both contain organizations that play a role in the management of VA's medical supply chain. VA's Office of Acquisition, Logistics, and Construction (OALC) is subdivided into two organizations – the Office of Acquisition and Logistics (OAL) and the Office of Acquisition Operations (OAO). VHA's medical supply chain consists of three organizations – the Procurement and Logistics Organization (PLO) that is responsible for clinical supplies, Prosthetics and Sensory Aids Service (PSAS) that is responsible for medical devices, and the Pharmacy Benefits Management (PBM) organization that is responsible for pharmaceuticals. These three organizations are responsible for additional product categories that are outside the scope of this assessment.

Figure 4-2. Organizations Comprising VA's Supply Chain


Note: Some VISNs may have different reporting relationships with facility prosthetics staff

SOURCE: Staff interviews. (2015). Site visits.; VA. (2014f). *VA Functional Organization Manual v2.0a.*

Within PLO, the procurement and logistical management of clinical supplies are managed by two separate groups – the Office of Procurement and the Office of Logistics respectively – and the reporting structure is different for each group. Procurement personnel report through VHA's regional contracting offices – the Network Contract Offices (NCOs) and Service Area Organizations (SAOs) – to the VHA's national Office of Procurement. In contrast, facility-based and regional logistics personnel do not report up to VHA's national Office of Logistics. Instead, they report into their local VAMC or VISN Director respectively.

Purchasing

Together, VA and VHA have 28 entities involved in aspects of contracting in some way (Figure 4-2). There are 4 contracting entities within VA – the National Acquisition Center and Denver Acquisition and Logistics Center that sit within OAL, and the Strategic Acquisition Center and the Technology Acquisition Center that sit within OAO. There are 24 contracting entities within VHA's medical supply chain – 21 Network Contracting Offices and three Service Area Organizations. The key roles of each of these contracting organizations in the procurement of clinical supplies, medical devices, and related services is summarized below:

- National Acquisition Center (NAC): Responsible for managing the Federal Supply Schedule (described below), establishing VA national contracts, and facilitating VAMC ordering of pharmaceuticals, clinical supplies, and medical equipment.

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

- Denver Acquisition and Logistics Center (DALC): Responsible for establishing contracts for and procuring select clinical supplies and health care services, and distributing some items direct to Veterans, such as hearing aids and hearing aid batteries.

- Strategic Acquisition Center (SAC): Responsible for acquisition of supplies, equipment, and services.

- Technology Acquisition Center (TAC): Responsible for procuring enterprise-wide information technology systems.

- Service Area Organizations (SAOs): Responsible for regional contracting by establishing contracts on behalf of multiple VISNs. SAOs are geographically aligned to the western, central, and eastern regions of the country. In 2009, VHA centralized its contracting organization into this structure.

- Network Contracting Offices (NCOs): Responsible for local contracting by establishing contracts on behalf of VISNs or individual VAMCs. Contracting officials in the NCOs and SAOs are sometimes physically located within VAMCs.

The basic instrument for government-wide purchases is the Federal Supply Schedule (FSS). The FSS is an indefinite delivery, indefinite quantity contract that, by statute, requires the supplier to provide the government with pricing at least equal to its most favored customer. However, as an indefinite quantity contract, those prices are often determined on a single unit quantity. FSS is an open solicitation and vendors can apply at any time. Terms are generally five years, with an optional five year extension. The federal government has delegated authority to the NAC to manage nine multiple award schedule programs for medical equipment, supply, and other health care-related contracts.

There can be multiple vendors on FSS for any given item. Purchases for items on FSS may be bid out among several FSS vendors to negotiate further price reductions. Additionally, blanket purchase agreements (BPAs), can be established by both national and regional contracting organizations based on FSS contracts to secure additional price reductions with definite quantity terms or other tools. BPAs can also enable streamlined purchasing. Finally, for items not on FSS, national, regional, or local contracts may be established for repetitive purchases. VA purchasing agents can also access non-VA government contracts such as those from the Defense Logistics Agency within the DoD.

VAMCs order supplies through three primary methods:

- **Request for Quotations (RFQs):** Purchasing agents use IFCAP and Electronic Data Interchange (EDI) functionality to electronically send an RFQ to one or many vendors and receive bids electronically, evaluate bids, award the order, and generate the purchase order. RFQs are almost all exclusively for purchases over $3,000.

- **Direct supplier order with purchase cards:** Service level and logistics staff place orders using phone, fax, or supplier websites, then generate purchase orders against assigned purchase cards. Charges are passed electronically from the Austin Credit Card System to IFCAP and users reconcile payments. The assigned Approving Official then approves reconciled orders. Approximately 98 percent of clinical supplies purchases are made this way (VA, FY2014a).

- **Delivery orders:** Service users generate purchase orders for on-contract items which, if configured at the site, allows orders to be expedited by bypassing VA's manual obligation process and obligated at time of signing by service-level staff (logistics or prosthetic purchasing agents for example). Invoices are sent directly to the Austin Financial Service Center and are reviewed against the inventory record when received. Payment is made through electronic funds transfer.

Orders that exceed $3,000 (the "micro-purchase threshold") must be submitted to contracting – typically to the NCOs initially. If the item requested is not already on contract, it must be competitively sourced by a VA contracting organization. VHA Procurement and Logistics Organization (PLO) manages the majority of these purchases using contracting vehicles it has established locally or regionally, or by accessing national contracts established by VA national-level organizations (NAC, SAC, DALC, and TAC). VAMCs are responsible for developing and submitting packages to contracting that contain, among other things, the specifications of the products they would like to buy. These packages and the subsequent contracting activities are processed and managed by Contracting Officers (COs).

The scale of VA and the breadth of services provided gives it a unique potential to negotiate prices paid for clinical supplies, medical devices, and related services. In essence, it acts as its own group purchasing organization (GPO). Instead of paying fees to an external GPO, VAMCs pay fees internally to the national contracting organizations with every purchase made on national contracts. These cover the costs associated with negotiating and securing contracts and managing the contracts thereafter. Those fees are typically paid from appropriations to VAMCs to the national contracting entities via the supply fund, as a percentage of the value of items procured. The percentage paid is dependent upon contract type but ranges from 0.5 to 4 percent, which is in line with fees levied by third party GPOs. VHA contracting organizations have a fixed budget and receive little funding from the supply fund.

Distribution

In the past, VA had an extensive network of depots that received goods and distributed them to VA facilities. VA has largely abandoned its depot model and has moved to a direct-to-facility distribution model. Currently, VA facilities receive clinical supplies and medical devices from two primary sources: direct from manufacturers or from third party distributors.

At any facility, its primary distributor is its Medical Surgical Prime Vendor (MSPV). Approximately 22.5 percent (by value) of clinical supplies are delivered to facilities by the MSPV (VA, FY2014a).[12] VA currently has six MSPVs that each cover different parts of the country. Their geographic coverage and contractual arrangements are summarized in Figure 4-3 and Figure 4-4.

---

[12] Based on full FY2014 purchase data for five VISNs (range 16 to 32 percent) and budget object code 2632. Note that VHA typically measures MSPV utilization in only four cost centers that cover 79 percent of BOC 2632 spend and only for items with a contract number (37 percent of BOC 2632 spend). Additional discussion can be found in Section 4.2.3.

SOURCE: VA. (2010, 2011). Medical Surgical Prime Vendor Contracts, VA797P-0188, VA797-P-0189, VA797-P-0190, VA797-P-0191, VA797-P-0192, VA797P-0193, VA797-P-0195.

In private industry, primary distributors such as VA's MSPVs offer many value added services including those that support:

- Purchasing: web-based, user friendly ordering tools with integrated catalogs; invoicing services; and automated re-ordering through systems integration

- Distribution: warehousing of commonly used items for just-in-time replenishment and lean facility inventories; low unit of measure or unit of use repackaging; distribution and management of inventory on service wards; and advanced tracking and item management tools

- Use: custom labeling to support use and tracking; standardized purchasing data reports and product nomenclature; and advanced analytical tools for understanding utilization patterns

VA currently only takes advantage of a limited number of these value added services (barcode labeling, just-in-time replenishment, and low unit of measure deliveries in some facilities).

VA also has some capacity to distribute clinical supplies and medical devices to Veterans. For example, the Denver Acquisition and Logistics Center distributes hearing aids and batteries to Veterans around the country.

Use

In contrast to pharmaceuticals, usage of clinical supplies and medical devices is not strictly monitored or managed in VA. In general, clinical staff (typically physicians and nurses) can choose whichever products they believe are best for patients and the supply chain organization's role is to make those items available.

There are some efforts underway to standardize towards a smaller set of products or to an individual product within a category. These efforts are described below.

4.1.2 Previous Assessments and Reform Efforts

The purchasing, distribution, and use of medical products by VA has been the subject of numerous reports by the Office of the Inspector General (OIG), the Government Accountability Organization (GAO) and other third parties. These reports are listed and summarized in Appendix B.1. Common themes that cut across these reports include:

- Inefficiencies due to fragmented oversight, systems, and processes
- Archaic IT systems that are inadequate for effective supply chain management
- Inadequate policies, training, and oversight related to procurement and inventory management
- Poor history of implementing recommended changes

These past assessments have tended to focus on specific issue areas and/or individual facilities, separately developing recommendations for improvement in discrete areas. In contrast, we tried to take an end-to-end view of inpatient clinical operations across five key sub-assessment areas and all high- and medium-complexity VAMCs.

4.2 Findings

The performance of VA's supply chain management of clinical supplies, medical devices, and related services is poor, particularly when compared with VA's pharmacy organization and best practice supply chain management organizations. The findings of this assessment can be summarized by the following seven themes:

1. The organizational structure of VA's supply chain enterprise is unduly complex and duplicative.

2. VA's current IT systems, data systems, and analytical capabilities related to finance, inventory management, and purchasing are major impediments to effective supply chain management.

3. The performance of VA's contracting organization does not meet customers' expectations, so frontline staff have developed workarounds.

4. VA has not taken full advantage of its scale or potential for standardization to achieve optimal pricing and efficiency.

---

5. Inventory management process, practices, and systems are neither integrated nor optimized.

6. VA struggles to attract, hire, and retain high caliber supply chain talent.

7. There are pockets of good performance and innovation in VA that could be replicated across its supply chain.

Each of these seven themes is outlined in more detail below.

4.2.1 The Organizational Structure of the VA's Supply Chain Enterprise is Unduly Complex and Duplicative

A major barrier to VA's supply chain management is the siloed and duplicative nature of its organizational structure. In contrast to best-in-class supply chain organizations:

a. The organization is fragmented and consists of multiple, overlapping entities, which leads to duplication of efforts and lack of role clarity.

b. Medical devices and clinical supplies are managed separately, which adds unnecessary complexity.

a. The organization is fragmented and consists of multiple, overlapping entities, which leads to duplication of efforts and lack of role clarity.

All the senior leaders in VA's and VHA's supply chain organizations who were interviewed said that the current organizational structure is too complex and should be simplified. Many field-based supply chain personnel agreed. In addition, national supply chain leaders expressed lack of clarity regarding the scope of responsibilities of the entities for which they are responsible, which had led to some tension and what one leader described as a "turf war." Others described a vacuum of ownership and accountability, and lack of clarity on roles and responsibilities.

Over the years, however, the number of national, VA-level contracting organizations has grown. VA now has four national-level contracting bodies – the SAC, NAC, TAC, and DALC. They were established to fulfill strategic sourcing, GPO-like functions by consolidating spend and establishing national contracts from which VHA could procure goods and services at optimal prices. However, there is overlap in the products and services covered by those national contracting organizations and there is overlap between them and the regional VHA-level contracting organizations, as shown in Figure 4-5. There is little (if any) overlap between the DALC's contracting responsibilities and those of other organizations. This clarity and independence likely plays a role in the DALC's success.

Figure 4-5. Acquisition Organization Areas of Responsibilities and Activities

SOURCE: Principal Executive Director, OALC. (2013, March). Strategic Sourcing Contracting Support (VAIQ 7277508).

Many interviewees expressed lack of clarity on the purpose, function, roles, and responsibilities of the NAC and the SAC in the course of this assessment. This included both users (PLO, VISN, and VAMC) and members of leadership in the acquisition centers themselves. The TAC's scope was relatively well understood by interviewees – procurement of IT products and services. The DALC – a small and specialized group that manages national procurement and direct-to-Veteran distribution of a handful of product categories – was regarded as the most well-managed and effective national contracting entity by field logistics personnel as well as senior VA and VHA supply chain leaders for the integrated approach it takes. More depth on the DALC can be found in section 4.2.7.

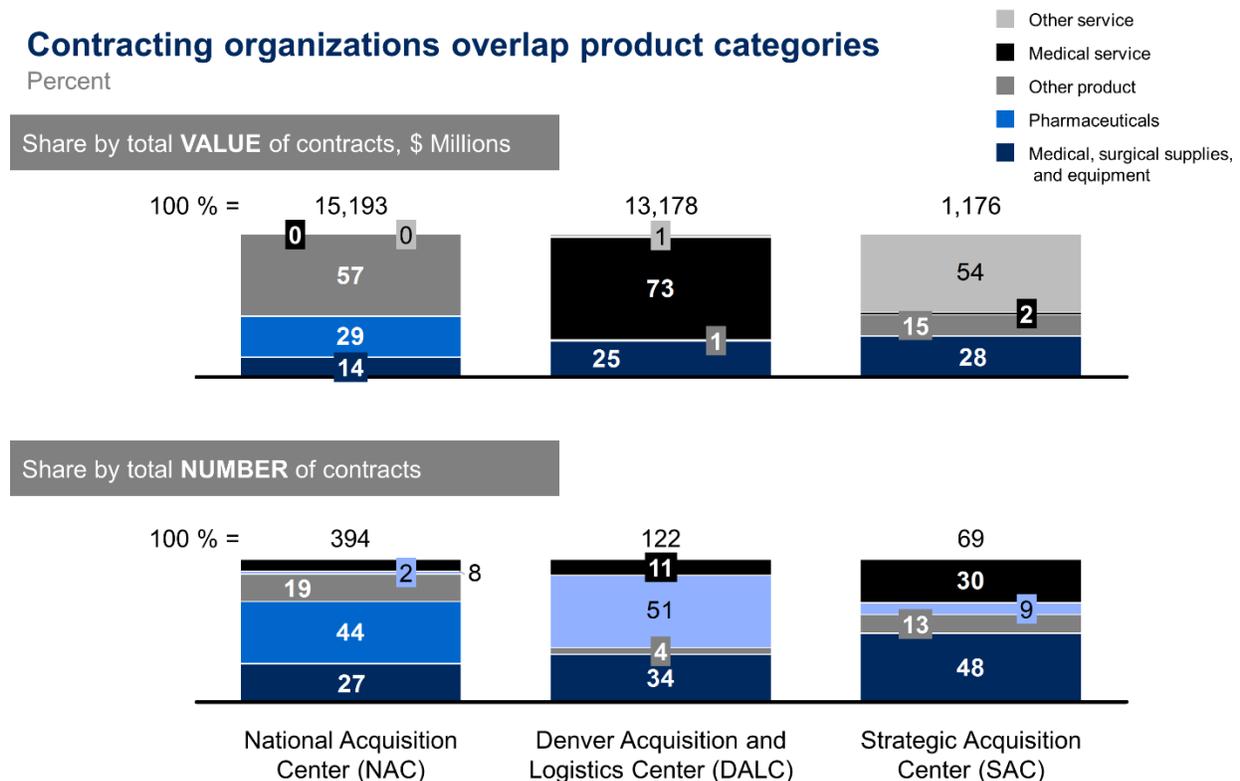
The SAC is a relatively new office established in 2011 with a similar mission to that of the NAC. In a memo to VA leadership in March 2013 from the OALC (Principal Executive Director, OALC, 2013), a number of procurement responsibilities formerly handled by the NAC were transitioned to the SAC, including general and specialty clinical products and services. However, as of March 2015, the NAC's leadership and website (VA, 2015h) still described its responsibilities as awarding national committed use contracts and BPAs for clinical supply commodities, and for managing these products' standardization. Contracts published in the Federal Procurement Data System (FPDS) and NAC leadership confirmed that it still participates in these activities. In the four years since the SAC was established, it has awarded 69 contracts worth $1.2 billion, the NAC has awarded 394 contracts (excluding FSS contracts) worth $15

billion, and the DALC has awarded 122 contracts worth $13 billion. Clinical supplies and device contracts make up 14 percent and 28 percent of NAC and SAC awards respectively by value, but 27 percent and 48 percent by volume (Figure 4-6).

Examples of the overlap between the NAC and SAC include the following:

- Urinary supplies: The SAC established contracts for urinary catheters and catheter trays, while the NAC has established contracts for urine collection bags and urinary closed drainage systems (containing a catheter and bag).
- Operating room supplies: The SAC has contracted for operating room towels, while the NAC has contracts for other disposables used in operating rooms including surgical gloves, masks, scrubs, and blades.

Figure 4-6. Share of Contracting Activity by Product Category

Contracting organizations overlap product categories


SOURCE: VA Contracts in the Federal Procurement Data System. (2010-2015). Retrieved June 2015, from http://www.fpds.gov. Excludes FSS contracts, categories determined by PSC code (6515, 6520, 6532, 6545 for Medical, surgical supplies, and equipment); Imaging (6525) placed in "other product" as it was mainly large capital equipment, ceiling price was taken as contract value

The OALC has embarked on a transformation program to build a strategic sourcing capacity (Haggstrom, 2014), which includes hiring more staff and providing additional professional development. This overlaps somewhat with the original intent of the SAC. This may exacerbate role confusion further.

Best-in-class supply chain organizations typically have a single group responsible for the strategy, sourcing, procurement, and logistics of clinical supplies and medical devices. The organization is typically led by an executive-level leader, and personnel are aligned along

product categories to develop and utilize deep expertise in the products and suppliers they manage. Furthermore, to be effective, there is strong engagement with the users of the goods they procure. In this way, the needs of users are incorporated into strategic sourcing plans and integrated sourcing initiatives (standardization, for example) gain traction with clinicians.

b. Medical devices and clinical supplies are managed separately, which adds unnecessary complexity.

In most health care organizations, the integrated supply chain group described above manages the procurement and distribution of all clinical supplies and medical devices (as well as other supplies). However, in the VA, clinical supplies are managed by the logistics organization while medical devices are managed by the Prosthetics and Sensory Aid Service (PSAS).

VA's separation of clinical supplies and prosthetics/medical devices causes issues within VAMCs, particularly in relation to coordinating products needed for procedures. Several examples of issues were shared during site visits (Staff interviews, 2015). For example, if a patient undergoes a coronary stenting procedure in the catheterization (cath) lab, PSAS procures the stents and makes sure they are available when needed, while logistics procures and manages almost everything else that is used in the procedure (e.g., the gloves, gowns, drapes, introducer, guide wire, catheter, and other supplies for the procedure). PSAS typically operates an "office hours" schedule, and every site visited stated that getting implants such as cardiac stents in an emergency can be challenging. Cath lab directors reported that this had led to a culture of carrying as many sizes of everything as they could "just in case" and, in some cases, needing to "borrow" supplies from a nearby facility (often the local academic medical center) to deliver the required medical care. Several VA personnel who work in cath labs and ORs cited recent examples of when they, or one of their colleagues, had to do that so that a Veteran could receive timely and appropriate care. However, VA does not track stock outs nor delays in care due to such events, so the assessment team was unable to quantify these occurrences.

In the private sector, many health care organizations are moving to consignment stock for high cost medical devices. Under a consignment stock model, items remain the property of the supplier but are stored on hospital shelves so are easily accessed by clinical staff. Items are paid for only when they are used. In this way, suppliers ensure hospitals are adequately supplied with all the sizes they may need of a given product and hospitals avoid managing expensive inventory.

We observed a handful of consignment situations within VA (all in cath labs) but the range of products under consignment was small. Cath lab directors said they would like to have more inventory on consignment but reported challenges establishing the consignment agreements with suppliers because of contracting complexity.

In addition, PSAS' current role does not appear to be fully in line with its core mission, which *"is to provide comprehensive support to optimize health and independence of the Veteran"* (Prosthetic & Sensory Aids Service, 2015). A substantial amount of work in PSAS involves procuring and managing inventory, which is typically not a core competency of prosthetic techs. Indeed, in 2012, the OIG published a report (VA OIG, 2012b) detailing problems in prosthetics

inventory management including over stock and shortages, partly due to poor training and system integration (see section 4.2.5 for more discussion on inventory management practices and system integration).

During site visits and interviews, most facility prosthetics staff stated that keeping up with the backlog of requests for prosthetic appliances, particularly commodities such as eyeglasses, was challenging. The workload of procuring and managing prosthetics inventories takes valuable resources from activities such as advising clinicians, managing specialized programs, and providing personalized customer service to Veterans. Particularly for commodity prosthetic supplies, it also creates duplication of efforts, infrastructure (for example, separate inventory control points), and systems (like two inventory management databases and software packages).

Recently there have been pilots to streamline and consolidate management of the prosthetics and clinical supply chain. In VISN 20, logistics now manages prosthetics commodity items. The program was rolled out to eight facilities over a period of two and a half years, with facility logistics adding ~300 items directly to existing inventory control points. Fiscal transparency was increased through use of the General Inventory Package (GIP; inventory management software) and, as the existing inventory points were managed with point of use technology cabinets, the reordering of many prosthetic commodity items became automated. Logistics and PSAS developed a core list of standardized items during this period based on usage patterns and worked with the MSPV to optimize supply.

The VISN also established a VISN mail out center (VMOC) to distribute prosthetics directly to Veterans. This was to ensure that Veterans get timely access to their prosthetics if they are not able to pick them up in person. Prior to the pilot, PSAS had to pack and send items to patients, usually by shipping them or, in extreme cases, dropping them off themselves on their way home from work. This increased the burden on PSAS resources at facilities and took them away from patient-facing activities. Prior to the VMOC, each site mailed out items individually with mail out times taking an average of 13 days, a significant portion of which was due to delays in receipt of the initial request for mail out (VISN20 Logistics, 2015).

The impact of these pilots in VISN 20 has been substantial. With the VMOC, requests are printed at the facility immediately upon physician approval, and items are picked, packaged and mailed within 3 days (VISN20 Logistics, 2015). Centralization of prosthetic purchasers at the VISN allowed 17 additional Prosthetic Representatives to be staffed within facilities, increasing customer service and decreasing Veteran and Congressional complaints received by the Patient Advocate by 27 percent from FY2013 to FY2014 for one facility. Open prosthetic requests fell from 9,111 in December 2012 to 5,467 in May 2015 and prosthetic inventory management has seen a reduction in inventory space required (27 percent), stock on hand (21 percent), and purchase issues (17 percent), all while increasing issues from stock (23 percent).

Additional pilots to consolidate management of prosthetic supplies with clinical supplies are underway in two other VISNs.

4.2.2 VA's Current IT Systems, Data Systems, and Analytical Capabilities Related to Finance, Inventory Management, and Purchasing are Major Impediments to Effective Supply Chain Management

It is commonly said that an organization cannot manage what it cannot measure. This is largely true of VA in relation to clinical supplies, medical devices, and supporting services. VA lacks visibility into supplies and devices spend at the level of granularity typically seen in the private sector. For example, in the private sector, it is typically possible to measure clinical supply spend and utilization at the service, patient, or physician level. However, this is not possible in VA because it does not capture such data. Therefore, supplies spend per case can only be calculated in aggregate, which is relatively meaningless and does not allow for fair comparison across hospitals, services, or physicians. This inhibits VA's ability to manage utilization and to understand fully the impact of product standardization efforts.

System fragmentation and lack of data standardization are primary drivers of VA's lack of data transparency. VA has at least 130 instances of VistA across the system (VA, 2015e), each with its own product nomenclature and numbering system (also known as the Item Master File [IMF]). This situation is a massive impediment to effective management of VA's purchasing, distribution, and use of supplies and devices.

Specific findings in relation to these topics are the following, which are described in more detail below:

a. VA's supply chain management systems are antiquated and are neither integrated with one another, nor into the clinical and financial systems.

b. VA's supply chain data related to clinical supplies and devices is not standardized and is incomplete.

c. VA has limited ability to analyze its data centrally to generate insights that will inform strategic decisions.

d. Recent investments in supply chain IT do not appear to be aligned with a broader strategy.

a. VA's supply chain management systems are antiquated and are neither integrated with one another, nor into the clinical and financial systems.

The underlying information technology at VA is the Veterans Health Information Systems and Technology Architecture (VistA). It is an open source, modular software system developed in the 1970's and was a pioneer in electronic health record systems. Nearly all VA facilities have their own instance of VistA. As a result, there are at least 130 separate and independently maintained databases across facilities (VA, 2015e). While data is pooled centrally, there is limited ability to push changes to item master files, synchronize data across facilities, and maintain control over the quality and consistency of data. There is more information on the data challenges associated with this fragmentation in the next section.

Several core modules sit on top of VistA. Those that are relevant to the supply chain include:

- **Integrated Funds Distribution, Control Point Activity, Accounting and Procurement (IFCAP) system**: module for requesting and establishing purchase orders, obligating funds, managing payments, and recording the receipt and acceptance of goods.

- **General inventory package (GIP)**: IFCAP Module used to manage inventory stock. It can establish and track primary and secondary inventory control points for medical and surgical supplies, dental, imaging, laboratory, environmental management service, and engineering. Supports barcode reading and automated inventory reordering through IFCAP

- **Prosthetic inventory package (PIP):** Graphical user interface software to track quantities of prosthetic items located in the PSAS inventory of each facility.

Additionally, VA has other systems relevant to the supply chain, including:

- **Financial Management System (FMS):** VA's legacy core accounting system

- **Electronic Contract Management System (eCMS):** A commercial, off the shelf system used by VA to manage requirements packages, proposals, solicitations, contract execution tracking, and other contracting activity

These systems are not integrated and have limited interoperability with one another. This is a major impediment to effective supply chain management. For instance, IFCAP is not integrated with FMS nor eCMS. This limitation results in significant operational challenges and manual work, including:

- Inability to perform commitment accounting: For example, budgets are not debited when a procurement request is made nor while that request goes through contracting. Therefore, a purchase order may not have funds available to be obligated to buy anything off the contract that is awarded.

- Clerks check fund availability in FMS and obligate funds if available (they receive nightly batch transmissions from contracting officers of obligation requests). Additional steps increase processing time and chance for errors.

- Manual linkage of obligations with contracts: On some contracts, VA is limited in the number of items it can purchase in a given timeframe. Any additional orders or funds obligated above this threshold are unauthorized and should be ratified. However, there is no mechanism to inform contracting that it should decrement a contract ceiling when an invoice is received.

Moreover, the text console display and free text entry format make performing tasks time consuming and training intense.

As described above, PIP and GIP manage prosthetics and other inventory respectively. Both IT systems are fragmented, archaic, and interoperability between them and other systems is limited. They require manual inventory tracking and neither integrates with FMS, requiring additional manipulations. PIP does not integrate with IFCAP or CPRS (VA's electronic medical record), and when supply staff record receipts in IFCAP, or clinical staff record use of prosthetic inventory, PIP is not automatically updated. A 2012 OIG report found evidence that this additional manual work led to oversupply and shortage errors (VA OIG, 2012b).

In addition, GIP does not capture performance measurements such as perfect order fulfillment, stock outs, or wastage. Cross-leveling inventories can only occur through phone, fax, or email communications. Free text entry and lack of data standardization across facilities complicates system-wide tracking of inventories as well.

Some VAMCs have explored add-on technologies to improve the user interface of the inventory management system and to add much needed functionality to help logistics leaders manage inventory more effectively. Broader deployment of such software could increase the system's user-friendliness and utility at each site, but the issue of disparate nomenclature and SKU numbering would remain.

Many health care systems today either have or are moving towards operating with integrated Enterprise Resource Planning (ERP) systems, which give them end-to-end visibility into the operational and financial performance of their supply chains. High performing health systems integrate their clinical and supply chain systems such that it is seamless to the end user, increasing the accuracy of supply utilization, capture, and accuracy of both billing and inventory on hand (High performing health system interviews, 2015). This enables more effective budgeting, forecasting, and inventory management, as well as automation of key supply chain processes such as ordering. Best in class health care systems build advanced business intelligence capabilities on centralized and standardized data systems, allowing them to perform sophisticated analysis on spend and utilization.

Better IT and data will be critical enablers of many of the improvements outlined in this report.

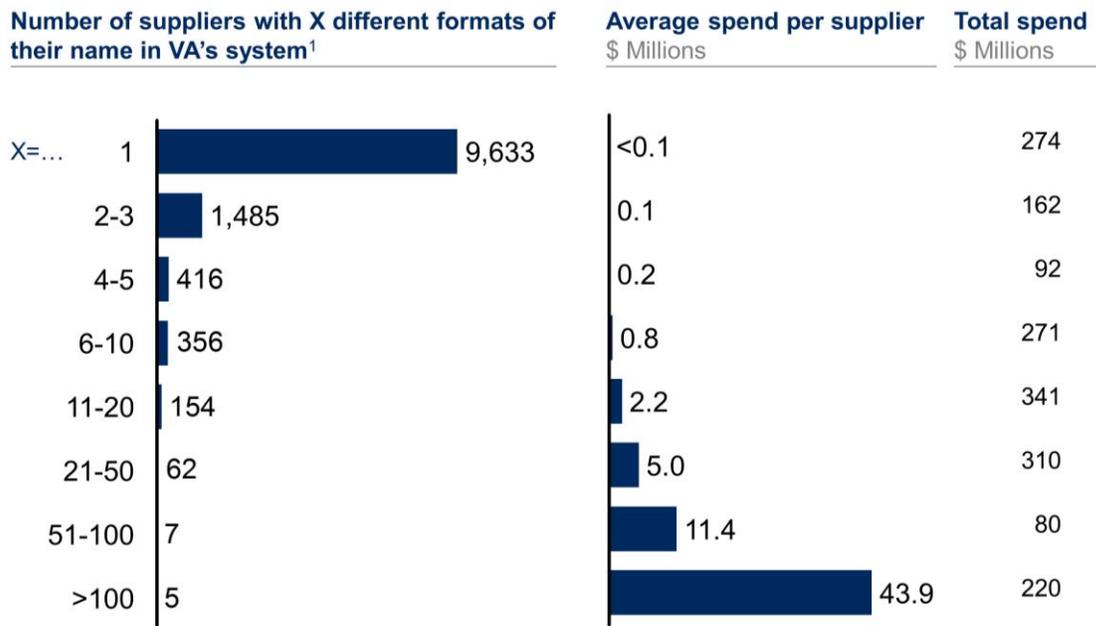
b. VA's supply chain data related to clinical supplies and devices is not standardized and is incomplete.

The data provided by VA's supply chain management systems is not standardized across VA, making cross-site comparisons and generation of other business intelligence almost impossible. This is critical for modern day supply chain and utilization management. With more than 130 databases, there is a proliferation of naming formats, incomplete data records, and essential data that is not tracked. Effective supply chain management, sourcing, and utilization management depends on reliable data to generate insights that create sustained value, efficiency, and quality improvements. VA is far behind the curve, which limits its ability to manage its supply chain in a modern way.

IFCAP (the purchasing module of the VistA system) is based on free text entry in a console. Each facility maintains its own locally-hosted architecture and there are no standards for data entry. As a result there is a proliferation of field entry formats (Figure 4-7) that make tracking purchases and analyzing spend particularly difficult (VA, FY2014c). Furthermore, while contract numbers are supposed to be entered for every item, this field was empty for 63 percent of the FY2014 transactions across the five VISNs examined (VA, FY2014a).

Figure 4-7. Number of Supplier Name Variations in IFCAP across VA

Poor data entry standards have led to vendor name proliferation

Number of suppliers with X different formats of their name in VA's system[1]	Average spend per supplier $ Millions	Total spend $ Millions
X=... 1 — 9,633	<0.1	274
2-3 — 1,485	0.1	162
4-5 — 416	0.2	92
6-10 — 356	0.8	271
11-20 — 154	2.2	341
21-50 — 62	5.0	310
51-100 — 7	11.4	80
>100 — 5	43.9	220


1 Equivalent pairs of vendor names from FY2014 prosthetic purchases were identified with fuzzy string matching, clustered and manually inspected to produce sets of equivalent vendor formats. >23,000 entries were reduced to ~12,000, some additional redundancy likely remains

SOURCE: VA. (FY2014c). Prosthetic appliance purchase orders (VistA Table 660).

Data completeness and format proliferation make analysis of spending patterns and matching of equivalent items nearly impossible. The example in Table 4-1 highlights how multiple purchases are made across the system for the same item through different vendors. Each site had its own product code (vendor stock number) used for purchases. Some have more than one. Some vendors (E and F, in the example) are actually equivalent but have differing names because one may be a subsidiary of the other. These variations in data make it difficult to identify price variations like that shown below, or to analyze total spend through a vendor to support price negotiations. Moreover, compliance with contract usage is nearly impossible to track.

During our analysis of pricing for like items across VA, we also evaluated the integrity and cross comparability of the data we received from VA's systems. In an effort to compare like items and the price paid for them both within and between VISNs, we applied a data normalization and matching algorithm to clinical supplies purchases, as well as medical devices within prosthetic purchase data for two VISNs (see Appendix A.2.3 for methodology). During this analysis, 68 percent of prosthetics spend data was excluded because of missing data fields (primarily manufacturer or vendor item codes), while 3.4 percent of clinical supply spend was excluded (primarily due to a line item being non-medical in nature). In other health care organizations, typically less than 1 percent of data needs to be excluded because of issues with missing data when this analysis is run.

Table 4-1. Example: Purchases of the Same Supply from Multiple Vendors, Using Different Product Codes and Prices

Example vendor stock number[13]	Vendor	Contract # present	Relative price point
NE-SDQ-CMP-QFP	A	Yes	1.00
NEDSDQCMPQFP	B	No	0.82
	C	No	0.82
BAY-SDQ-CMP-QFP	B	No	0.82
SDQ-CMP-QFP	A	Yes	1.00
	B	No	0.82
	D	Yes (but non-covered item)	1.35
	E (= F)	No	0.97
	F (= E)	No	0.97
	G	No	1.48
SDQCMPQFP	E	No	0.97
643129	H	No	1.09 – 1.14 (4 prices)

Despite the data normalization and matching algorithm, 48 percent of products and 19 percent of spend had no match between facilities compared (Figure 4-8). We typically see a match of 90-95 percent of the spend between facilities in other health care organizations. Of the matched data, most matches were found between facilities within VISNs. Some of the matching challenge was due to variations and omissions in the data, which exceeded the algorithm's tolerance.

---

[13] Items were determined to be equivalent based on item description and other descriptive fields in purchase order data. This item was purchased by four of the five VISNs in the data. Price per unit was indexed to the item on FSS contract. Stock numbers and prices are examples of actual variation observed, however they have been blinded and do not correspond to a specific product given sensitivity of pricing data.

1 For medical and surgical supplies, all BOC 2632 spend was included. For Prosthetics, only surgical implants, prosthetic limbs, neurosensory devices, biological implants, orthoses/orthotics, and respiratory accessories were considered; DME and equipment were excluded; 64% of in scope prosthetic spend was excluded due to missing data fields (primarily manufacturer and vendor SKU codes)

SOURCE: VA. (FY2015, October - January). IFCAP purchase data for clinical supplies with an IMF number; VA. (FY2014c). Prosthetic appliance purchase orders (VistA Table 660).

The variability in data is a substantial barrier to understanding purchasing patterns, identifying opportunities, and making strategic sourcing decisions at VA. However, some of the mismatch is also likely because different VISNs buy different products (due to regional contracts and preference), which reflects the lack of product standardization as highlighted below.

VA has attempted to standardize product nomenclature and numbering centrally through the National Item File (NIF) program. Under this program, VA established data standards for select items and started to push standardized data onto each instance of the inventory database. Over time however, the standardization has been lost as each facility has manually changed data entries. Logistics subject matter experts gave examples of data elements that had been locally modified after the NIF standardization process. In some cases, those modifications were justified because local data instances were automatically identified by fields that incorrectly matched the NIF item. Frontline interviewees also reported that the NIF field was not helpful to them as they could not search or cross reference data based on that field. This reduced the incentive for them to ensure the field was complete and accurate.

c. VA has limited ability to analyze its data centrally to generate insights that will inform strategic decisions.

VA lacks visibility into supplies and devices spend at the level of granularity typically seen in the private sector, which further limits its ability to measure and manage utilization. For example, in the private sector, it is typically possible to measure clinical supply utilization at the service, patient, or physician level. However, this is not possible in VA because it does not capture such

data. Therefore, supplies cost per case can only be calculated in aggregate, which is relatively meaningless and does not allow for fair comparison across hospitals, services, or physicians.

Measurement of prosthetics utilization at the patient level is possible, but the VA's data systems and analytic capabilities limit the organization's ability to use it to generate meaningful insights. For example, we tried to calculate individual orthopedic surgeons' average hip implant cost per case in the hip replacement cases they performed, to understand the degree to which each surgeon's clinical choice and utilization drove cost. However, we were unable to complete the analysis because, while purchase data can be tied to individual patients and episodes, physician identifiers are not captured. This is a routine analysis in high-performing health systems that enables significant savings by standardizing utilization practices while maintaining clinical quality.

d. Recent investments in supply chain IT do not appear to be aligned with a broader strategy.

Substantial changes will be required to VA's IT systems, data quality and integrity, and analytic capabilities to effectively measure and manage spend on supplies and devices. To that end, VA has piloted the use of a new strategic asset management system for inventory management and procurement (SOARD project). Substantial development is needed to make it operational to manage clinical supplies and to integrate it with the VA's FMS. Two previous projects, CoreFLS and FLITE, were based on the same platform as SOARD, and both were unsuccessful. Factors contributing to failure have been reported by GAO and VA Office of Inspector General, and include weak program management, poor oversight, and problems modifying the software for existing data and infrastructure (VA OIG, 2010; VA OIG, 2004; GAO, 2009). While significant resources have been devoted to development of this new system for use in the VA, the assessment team was not aware of any health care facilities outside VA using this software for tracking supply inventories. Funding for continuing the development and rollout of the system to other facilities is also lacking.

Other IT system improvements are underway as well, but are not being considered as part of a broader strategy. Implementation of Real Time Location Service (RTLS) and Point of Use (POU) inventory management systems are being piloted. VAMC facilities are preparing for RTLS through the installation of wireless technology. POU weight-based bin technology is being piloted in 11 facilities with an inventory segmentation approach and system integrator. These are improvements to address select, long-standing inventory management issues, but their development and implementation have been ad hoc, and not part of an integrated strategy or implementation plan. Including SOARD, these IT projects are being managed by three different program offices.

4.2.3 The Performance of VA's Contracting Organization Does not Meet Customers' Expectations, so Frontline Staff Have Developed Workarounds

Veterans' access to clinical supplies and devices depends on frontline staff procuring products in a timely manner. However, government acquisition regulations and the contracting organization present challenges to efficient management of the supply chain:

a. Service levels provided by contracting entities do not meet customers' expectations.

b. Systems used to measure and manage contracting performance are not transparent and data can be changed manually by contracting staff.

c. Frontline staff have developed practices that reduce the need to use contracting services.

a. Service levels provided by contracting entities do not meet customers' expectations.

Largely unprompted, 77 out of 101 interviewees for clinical supplies and medical devices, expressed concerns about VA's contracting capability. Those who voiced concerns were typically individuals directly involved in the procurement process, such as logistics personnel, or staff who were directly impacted by product availability, such as cath lab directors. In most interviews with front line staff, the time it takes to procure simple items through contracting (one to three months) was cited as an issue. For example, a surgical nurse commented that heart valve surgery can be delayed because of the need to go through contracting. Some heart valves cost more than the micro-purchase threshold ($3,000) which therefore requires the use of contracting. Hospitals need to have multiple sizes on hand to ensure the patient gets the valve that is the best fit relative to their anatomy.

Purchases above the micro-purchase threshold must go through contracting to be competitively bid and contracted. In FY2014, VHA network contracting offices placed more than 66,000 orders and $1.75 billion in medical, surgical supply and device orders for more than $3,000. These include delivery orders placed against FSS and blanket purchase agreements (BPAs), definitive contracts, and purchase orders made on the open market.

The key metric used by contracting to measure its performance is the Procurement Administrative Lead Time (PALT), which is defined as the time from contracting's receipt of a complete package to ultimate contract award with a supplier. This is similar to the definition used by other government agencies such as DoD and the U.S. Coast Guard (US Department of Defense , 2014; US Department of Homeland Security – US Coast Guard, 2010).

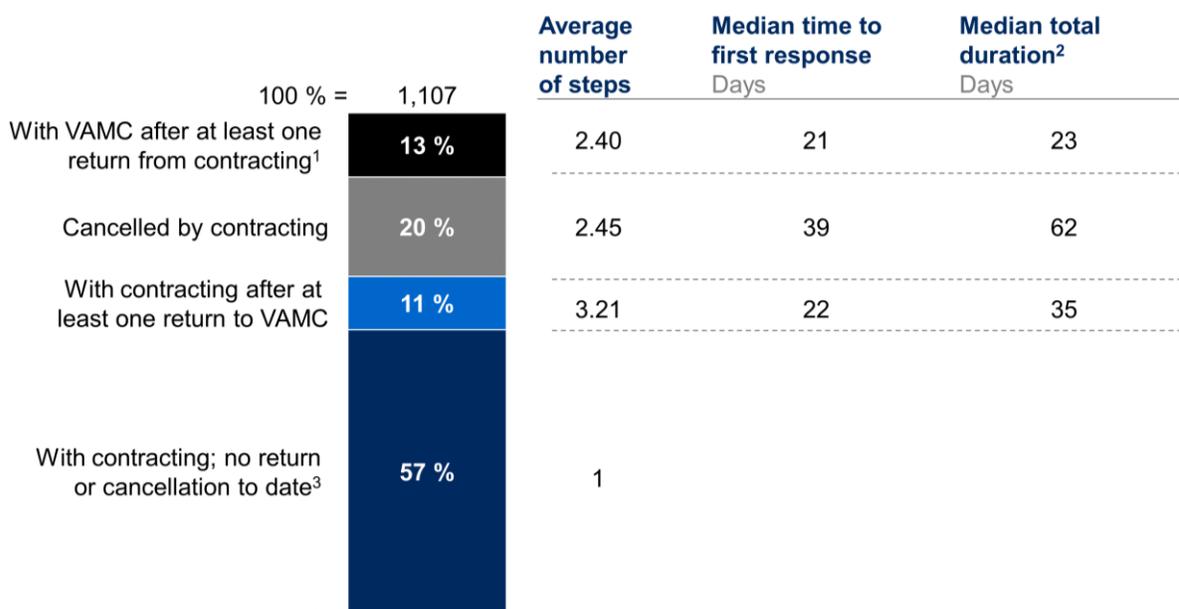
In general, VA's PALT target is 30 to 60 days, although this can be higher for different contract types or larger awards (see below). Private sector organizations also release Requests for Proposals to get bids from suppliers and industry experts who were interviewed in the course of this assessment stated that PALT times in the private sector were around the same as those reported by VA. It is worth noting that VA's acquisition process is more complex than most private sector organizations because of acquisition regulations.

However, it is also likely that the 30-60-day PALT times quoted by VA's contracting organization substantially underestimates the end-to-end time to complete a purchase. PALT does not include any time associated with the market research, preparation, and review of the acquisition package (developing specifications, for example). Multiple interviewees stated that end-to-end lead times for simple procurement actions could take significantly longer than 60 days, such as in the case of heart valves described above. Furthermore, they pointed to frequent return and cancellation of procurement requests as a problem to getting what Veterans need.

To validate the issue, we reviewed 12 months of the electronic Contract Management System (eCMS) procurement request transmissions for one facility (VAMC site visit, 2015). The review revealed that, of 1,100 packages submitted to contracting during that timeframe, 43 percent were returned at least once or were cancelled by contracting. When a package was returned, its initial return happened on average ~20 days from the date of initial submission. For those that were ultimately cancelled, the initial response (whether a cancellation or return) was 39 days after submission. Several submissions incurred significant back and forth between contracting and the facility. Figure 4-9 shows the point-in-time findings of the review (final status after February 2015 is unknown).

Figure 4-9. Point in Time Status of Procurement Packages Sent to Contracting Over 12 Months from One Facility

There are long response times for procurement requests with issues

	100 % =	1,107	Average number of steps	Median time to first response Days	Median total duration[2] Days
With VAMC after at least one return from contracting[1]	13 %		2.40	21	23
Cancelled by contracting	20 %		2.45	39	62
With contracting after at least one return to VAMC	11 %		3.21	22	35
With contracting; no return or cancellation to date[3]	57 %		1		


1 Returned to Accountable Officer or Control Point in VAMC
2 From first submission to final status
3 Final disposition (awarded or not) was not determined

SOURCE: VAMC site visit. (2015). IFCAP/eCMS transmission log received during site visit.

We also evaluated a snapshot of the outstanding procurement actions in eCMS across VA. Of the total 117,163 procurement actions in eCMS as of February 17, 2015, 2,468 (2.1 percent of total) were marked as draft or in error status (VHA, 2015a). One third of those were more than 30 days outstanding.

Interviewees at facilities consistently expressed concern about the NCOs' and SAOs' ability to be as responsive as they believe is required of a health care delivery organization and also expressed concerns about the quality of contracting's communication with them. They said that the reason for return or cancellation of submissions was not always clear and expressed frustration that it took several weeks, on average, after submission to find out that a package

was incomplete, as described above. Lack of clarity regarding contract status was a complaint shared by many facility staff.

Customer satisfaction surveys confirm the organization's dissatisfaction with contracting's communication. Overall communication effectiveness, and whether procurement staff keep requestors informed of their packages statuses, received the lowest scores (3.3 average score out of 5, ranging from 2.7 to 4.0 for overall effectiveness and 2.8 to 3.8 for status updates for NCOs) (VHA, 2015a).

NCO contracting staff also expressed frustration, particularly with regard to workload and quality of submitted packages they received. They also sympathized with the facility-based staff who had to complete the requirements and paperwork prior to a contracting submission, realizing that for many, this requirement was in addition to their core role.

External audits, and an internal PLO study on acquisition operations (summarized below), also highlighted issues in the acquisition process (Table 4-2) (GAO, 2013a; VA OIG testimony, 2010; VHA Procurement and Logistics Office, 2015a).

Table 4-2. PLO Identified Issues in Contracting Process

- Lack of certified Contracting Officer Representatives (CORs) to meet facility needs
- Lack of resources to aid staff with procurement packages
- Failure to address needs and contract renewals in timely fashion
- Lack of standardized tools and templates
- Lack of performance standards that address COR responsibilities
- Lack of standardized procedures and processes
- CORs not adequately reviewing invoices prior to certifying payment, systematic poor acquisition planning and inadequate contract monitoring, by ineffective performance monitoring controls
- Lack of communication between services and contracting product lines
- Poor procurement packages, frequent errors and omissions
- Increase in administrative time required when serving as COR
- eCMS technical difficulties
- Guidance, training, and oversight needed to improve clinical contract monitoring

These audits identified the root cause as poor standards, training and capacity of Contracting Officer's Representatives (CORs) at facilities. CORs are line chiefs, business managers, or administrative officers who help develop acquisition packages, submit into the eCMS planning module and are responsible for the ongoing contract monitoring.

Evidence suggests that the PLO has taken some steps to address issues by (VHA Assistant Deputy Under Secretary for Health Administrative Operations, 2014; VHA Procurement and Logistics Office, 2015b; VHA Procurement and Logistics Office, 2015c; VHA Procurement and Logistics Office, 2015d):

- Recommending contract liaison positions in each facility that can provide the process expertise and best practice sharing to reduce errors and improve the quality of submissions
- Establishing Customer Relationship Management Teams within NCOs to offer strategic advice and tactical acquisition consulting services
- Implementing customer service agreements between contracting offices and some organizations within VHA (e.g., Office of Informatics and Analytics)
- Developing the VA Acquisition Business Intelligence Tool (VABIT) to document and codify best practices for contracting (e.g., with product line-specific templates, example contracting documents)
- Organizing "Acquisition Planning Days" in SAO East to educate, train, and gather feedback from contracting customers

The effectiveness of these changes is unclear so far, although contract liaisons appear to be effective in pilot sites (during some site visits they were highlighted as improvements). However, we believe VA should consider how to streamline and error-proof the acquisition process rather than add personnel to manage the system.

b. Systems used to measure and manage contracting performance are not transparent and data can be changed manually by contracting staff.

PALT is defined as the time from which a complete package is received to when the contract is executed. Each contract action type has a defined PALT (Table 4-3) (VA, 2013), and for FY2015 through January 31, overall PALT for VHA was 99.1 percent on time or within five business days of on time.

Table 4-3. Procurement Administrative Lead Time (PALT) Guidance from Contracting

Acquisition Type	Action	Dollar Value	PALT Range
Blanket Purchase Agreements (BPA)	Off Existing FSS or GSA Contracts	ANY	30 – 90 days
	New	ANY	120 – 180 days
	Orders	ANY	30 – 60 days
Commercial Contracts	Competitive Proposals	<$150,000	30 – 60 days
		>$150,000 but not to exceed $6.5M	60 – 120 days
		>$6.5M	120 – 240 days
	Noncompetitive Actions (Sole Source)	< $150,000	30 – 60 days
		≥ $150,000	60 – 90 days
Indefinite Delivery Indefinite Quantity (IDIQ) Contracts	OAO Enterprise Contract Basic	< $50M	120 – 180 days
		≥ $50M	180 - 240 days

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

Acquisition Type	Action	Dollar Value	PALT Range
Task or Delivery Order	FSS	< $150,000	30 days
		≥ $150,000	45 – 60 days
	OAO Enterprise Contract	<$150,000	30 days
		≥ $150,000	45 – 60 days
	GWAC	<$150,000	30 days
		≥ $150,000	45- 60 days
Negotiated Procurement	Competitive (Full and Open) includes 8a set asides	>$150K but not to exceed $6.5M	153 days
	Competitive (Full and Open) includes 8a set asides	>$6.5M	180 – 215 days
	Negotiated Sole Source, includes 8a set-asides	>$150K but not to exceed $6.5M	149 days
Simplified Acquisition Procedures	Purchase Order	<$25K	40 days
	Purchase Order	>$25K but not to exceed $150K	51 days

Frontline interviewees and PLO leadership agreed that PALT does not capture the end-to-end process that is relevant to meeting users' needs. They believed it should reflect the time from initial submission of a package to when the required product is received, which would be more customer-centric. VA does not currently capture data in this way. For prosthetics acquisitions, however, PLO has developed a tool in conjunction with PSAS which measures the end-to-end process from initial request for the item to eCMS award, and has the ability to analyze the data by facility and by PSAS category. Due to its recent development, the assessment team was unable to assess the impact, if any, the tool may be having on the acquisition process.

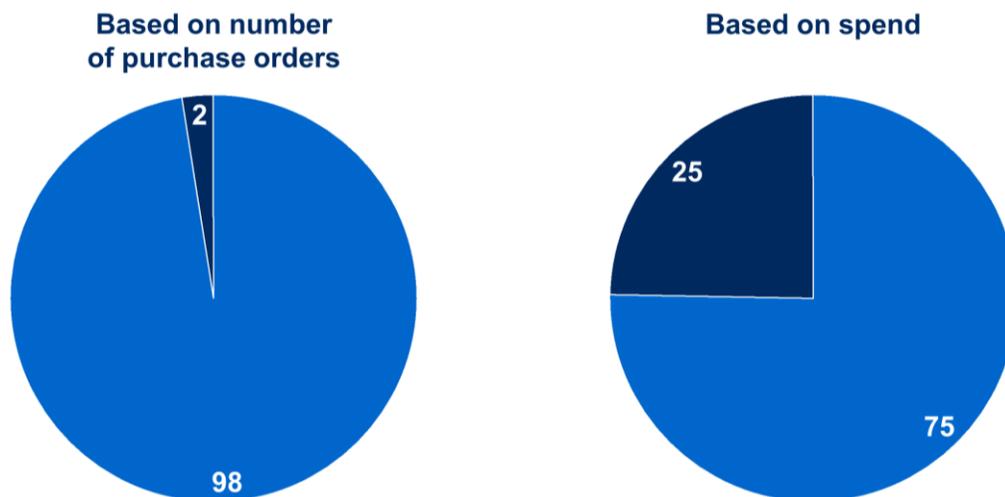
Contracting leaders did report that there were issues in the contracting data collection systems that could lead to inaccurate reporting of PALT. For example, in the current system, contracting staff have the ability to change dates manually. Doing so could impact the accuracy of the PALT that is reported. Contracting leaders are working on both improving the system as well as the metric definitions used to improve the accuracy of reporting and, therefore, contracting's accountability for its performance.

c. Frontline staff have developed workarounds to avoid purchasing through contracting.

Because of the issues described above, frontline staff reported that they had developed practices that minimize their need to use contracting, primarily the extensive use of VA-issued purchase cards to buy supplies and devices.

VA purchasing is highly dependent on government purchase cards – $8.4 billion was spent using VA purchase cards in FY2014 (GSA, 2015). Analysis of five VISNs showed that approximately 98

percent of their purchases of clinical supplies and medical devices were made on purchase cards, which accounted for around 75 percent of their spend on those categories (Figure 4-10) (VA, FY2014a).

Figure 4-10. Supplies Purchasing by Method of Processing


SOURCE: VA. (FY2014a). IFCAP Purchase Data for Five VISNs. Represents transactions for BOC 2632 across 5 VISNs; FY2014

It is government policy to maximize the contracting officers' use of purchase cards to the extent possible to receive refunds and reduce administrative costs.[14] In VA's context, the use of purchase cards does deliver those benefits. VHA receives a substantial refund on their government purchase card use (estimated at 1.65 percent in FY2007) (VA OIG, 2008). However, industry experts report that suppliers typically increase prices for customers who pay primarily with purchase cards because of the fees levied by credit card companies. This could offset rebates provided by the purchase card companies.

Purchase card use also helps expedite purchases and reduces the workload demands on contracting. The greatest downsides of widespread purchase card use relate to the challenges associated with driving and monitoring compliance with purchasing regulations (such as buying products on the correct contract at the optimal price) and managing spending. These challenges have been presented previously in several Inspector General audits, GAO reports, and Congressional hearings (VA OIG, 2014b; GAO, 2004; US House Committee on Veterans Affairs Subcommittee on Oversight and Investigations , 2015). As an example of this issue, prior to 2013, PSAS purchasing agents with authorized purchase cards were allowed to buy prosthetic

---

[14] FAR Subpart 13.301 – Simplified Acquisition Methods, Government Purchase Cards

inventory and medical devices up to $25,000. Due to concerns of non-compliance with contracting guidelines, however, their warrants were rescinded and purchases above the $3,000 micro-purchase threshold are now managed by PLO and facility logistics.

Part of this challenge relates to the complex process associated with any purchase card purchase. Purchase card holders are required to verify receipt of goods, reconcile transaction charges, and maintain documentation that purchases were for official government use. An internal VA study estimated that the total processing time for order generation to reconciliation of a standard purchase card order places a large administrative burden on purchasers (Coates, 2014) and takes time and resources away from more value-added activities. The prohibitive complexity of this process, the time required to complete it, and the difficulty in monitoring it also likely contributed to past compliance challenges.

In contrast to the inefficiencies of purchase card ordering, the internal VA study found that ordering through electronic data interchange (EDI) from the MSPV and other equipped vendors was about six times faster. Processing, payment, and reconciliation occur electronically and do not involve the purchaser. Additionally, EDI improves data accuracy and fiscal oversight, and reduces overall order cycle time, paper handling and storage. At the end of each month, purchase card holders are required to reconcile purchases and validate their bank cards, which can take significant time.

Electronic ordering can deliver significant savings. A study funded by the Health Industry Distributors Association found that processing costs to order through distributors were three times less per line item, mainly due to EDI integration (HIDA, 2012).[15] This is similar to the findings of a study on processing costs for DoD's MSPV as compared to local purchases (LMI, 2008).[16]

Across industries, best-in-class organizations use purchase cards on only ~1.7 percent of their total spend (CAPS research, 2014) and typically maximize EDI usage to the extent possible (High performing health system interviews, 2015). However, to do so requires significant technology enablement. In the private health care sector, use of purchase cards has declined sharply as hospitals have moved to more electronic and automated purchasing and inventory management systems.

Currently in VA, EDI is used mainly for larger entities such as the MSPV. While VA may be limited in its ability to approximate the EDI utilization seen in the private sector due to small business requirements[17], there is scope to expand this ordering method by: (a) ordering more items from EDI equipped vendors such as the MSPV, (b) increasing staff usage of EDI ordering methods over manual methods for those vendors already equipped, and (c) increasing the number of vendors with EDI capabilities.

---

[15] HIDA (2012). Hospital Procurement Study

[16] LMI (2008). Summary Slides: Task # DL733, "Comparing the Cost of Medical Materiel Acquisition Procedures" presented to Directorate of Medical Materiel, Defense Supply Center

[17] Small businesses may have difficulty implementing EDI due to financial barriers and technological sophistication. The extent to which this is true for health care suppliers is unclear.

To evaluate the first opportunity in VA, we analyzed purchasing data from five VISNs that showed they currently buy 22.5 percent of their clinical supplies through their MSPV (based on total clinical supply spend in five VISNs, ranging from 16 to 32 percent) (VA, FY2014a). Industry experts who were interviewed stated that typical MSPV utilization in the private sector is around 30 percent, although this can vary based on individual health system supply chain strategies. Increasing spend through VA's MSPVs in regions where MSPV utilization is low could be a relatively easy first step towards greater electronic purchasing and lower use of purchase cards.

However, VA's methodology for measuring MSPV utilization creates challenges in accurate reporting. VA currently measures MSPV utilization based only on line items with a contract number (~40 percent of total clinical supply spend) and only for certain cost centers and fiscal control points (~80 percent of total clinical supply spend). Using this methodology, reported MSPV utilization rates for VISNs are in the range of 61 to 82 percent (VHA, 2015c). However, because of data integrity issues in the contract number field, the utilization metric is not comparable across facilities, nor is it something that can be compared with the private sector.

The final finding relates to the micro-purchase threshold and how it drives certain purchasing practices to avoid using contracting. As context, government employees who do not have a contracting warrant to use a purchase card can only make purchases below the $3,000 micro-purchase threshold[18]. In cases where purchases would be just above the micro-threshold limit, the item would have to be competitively sourced through contracting, as described above.

The micro-purchase threshold was cited as a problem in numerous interviews. Frontline staff almost unanimously wanted VA to increase the threshold to make the process easier than going through contracting. Several interviewees who made purchases on purchase cards also suggested they deliberately place multiple orders close to but under the $3,000 threshold to avoid involving contracting.

To validate this, the team analyzed purchasing data from five VISNs (VA, FY2014a). In FY2014, 237,829 purchase orders for clinical supplies totaling $274 million were generated, which were paid on purchase cards. Of these purchases, a disproportionate number of transactions appeared to occur near the micro-purchase threshold (Figure 4-11), two to three times what is expected, suggesting that staff were indeed optimizing purchase orders to be just under the threshold. Due to data limitations, the total extent to which order splitting may be occurring is unknown. However, the assessment team believes that some commonly used items may be purchased more frequently and in smaller batches than is ideal to avoid exceeding the threshold.

SOURCE: VA. (FY2014a). IFCAP Purchase Data for Five VISNs. Represents transactions for BOC 2632 across 5 VISNs; FY2014

In numerous interviews with frontline staff, interviewees asked that the micro-purchase threshold be increased to at least $5,000, so that they could avoid the complex, time-consuming and restrictive contracting policies for critical supplies and devices. The micro-purchase threshold has been at $3,000 since 2006. Given the cost of medical care commodities has grown at 2.6 percent per year since 2006 (US Department of Labor, Bureau of Labor Statistics, 2015), the purchasing power of the government purchase card has declined by approximately $550 or 18 percent in the last nine years. Thresholds for acquisitions are reviewed every five years to adjust for inflation. The FAR micro-purchase threshold will increase in October 1, 2015 as a result of the most recent review to $3,500 (Federal Register proposed rule change, 2014).

Regardless, the assessment team believes that VA's widespread use of purchase cards is a workaround that is symptomatic of its manual ordering processes and slow, burdensome contracting process. As one VA leader stated, purchase cards are "*the easy button*" (Staff interviews, 2015). It is likely that if contracting was to be rationalized and streamlined, and ordering and purchasing was to be more automated, use of purchase cards would decline, the micro-purchase threshold would become less relevant, and management of spend would be easier and more effective.

VA is taking steps to facilitate the ordering process through its next generation MSPV program which is currently out for solicitation. The statement of work requires EDI ordering and

electronic fund transfer payments. This will be facilitated by an electronic catalog component and supply chain management tools to be provided by the MSPV. These are elements which are key success factors for VA's pharmaceutical purchasing.

4.2.4 VA has not Taken Full Advantage of its Scale or Potential for Product Standardization to Achieve Optimal Pricing and Efficiency

The consequences of organizational dysfunction, and variable and suboptimal purchasing practices, have contributed to the following findings:

   a. VA does not consistently access the lowest prices available.

   b. Limited product standardization has been achieved across VA to date.

a. VA does not consistently access the lowest prices available.

Unlike pharmaceuticals, no external unit price benchmarks exist for clinical supplies, medical devices, and related services. Therefore, as a proxy, the team evaluated two key components of VA's purchasing performance to understand the likely opportunity related to prices paid for these items:

   • Variation in unit prices paid for like items across VISNs and VA facilities

   • Share of purchases made on government contracts

To understand price variation, we used a proprietary product matching tool to analyze the product purchases for two VISNs during FY2014. Detail on the methodology is provided in appendix A.2.3. In short, VA had to extract purchasing data from each hospital's system and collate it into one file. We then evaluated and cleaned the data so we could run as much of it as possible through the matching algorithm. The data was matched using a proprietary algorithm that took into account several data elements related to each product, in an effort to match products used at one facility to identical products at other facilities. Examples of the elements taken into account include name, catalog number, and unit price. For some items, data sets had to be manually reconciled to make them comparable.

The analysis showed significant variation in the prices paid for like items. If all facilities included in the analysis were to access the lowest price in those two VISNs more of the time, a conservative estimate suggests that they could yield savings around three percent of examined spend. Some of the variation in prices paid for like products is shown in Figure 4-12.

1 Some products had more than one mid-price point; the total spend for all middle prices is shown
SOURCE: VA. (FY2014a). IFCAP Purchase Data for Five VISNs. Represents IFCAP FY14 medical and surgical supplies purchases for one VISN (total spend in FY14 of $91 M)

An example of this variation is the price paid for one type of disposable blood pressure cuff (third product in Figure 4-12). In one of the VISNs evaluated, that disposable blood pressure cuff was purchased from six different suppliers. The prices paid to those suppliers varied significantly – the highest price paid was 207 percent higher than the lowest price paid. More than 35,000 cuffs were purchased from suppliers at prices above the lowest available price. This represented a total potentially avoidable spend of $149,300 on this one item alone across five facilities. While the vendor stock codes were identical to each other and an identifiable manufacturer part number, the assessment team was unable to determine the potential impact (if any) of brand substitution by distributors on price variability. However, this finding is illustrative of the opportunity that is present from price variations on functionally identical products across facilities.

Therefore, the assessment team believes there is significant opportunity for VA to establish mechanisms to help it identify and access its lowest available price more consistently. In part this could be achieved by improving compliance with the contract hierarchy as discussed below. This would reduce supply costs in the short term and in the longer term could potentially help support future negotiations, by driving more volume to the supplier that is willing to offer the most attractive price.

Secondly, the team undertook an analysis to understand the share of purchases that were made on or off contract and, for those that were made on contract, which contract was used.

As context, the government has a contract hierarchy that should be followed when making purchases (Table 4-4).[19] Buyers are required to use the highest priority contract that exists for a given product. Purchasing on higher-priority contracts enables the government to consolidate spend on the most attractive purchasing vehicle which, in turn, supports future price negotiations. Purchasing at open market prices should be the option of last resort.

Table 4-4. Priorities for Use of Government Supply Sources

In order of priority:

1. National committed use contracts
2. Blanket purchase agreements on FSS contracts awarded by NAC
3. Regional or local BPAs issued against FSS contracts
4. FSS contracts without BPAs
5. Regional IDIQ awards
6. Local IDIQ award
7. Open market purchases

Note: Contracting officers have ability to use lower priority arrangements when there is unusual or compelling urgency, but must provide justification

Figure 4-13 shows the share of clinical supply purchases that were made through each contracting vehicle during the first 4 months of FY2015. The largest share of clinical supplies are purchased through FSS awards, which are indefinite delivery, indefinite quantity (IDIQ) contracts based on "most favored customer" pricing. Under this arrangement, suppliers must reveal to VA the prices they charge other customers for their products and must make a price available to VA that is equal to or better than the lowest of all its other prices. However, the prices revealed and offered to VA are based on a unit size order of one – i.e., the price a customer would pay if he/she bought only one item, with no volume discounts applied. Therefore, the "lowest" price revealed to VA likely does not reflect the true price paid by customers, because those customers would likely buy multiple units and negotiate a discount based on that.

Because of that, the FAR and VAAR require FSS contracts to be competed against one another for additional savings unless there is an existing national contract or blanket purchase agreement (BPA) in place.

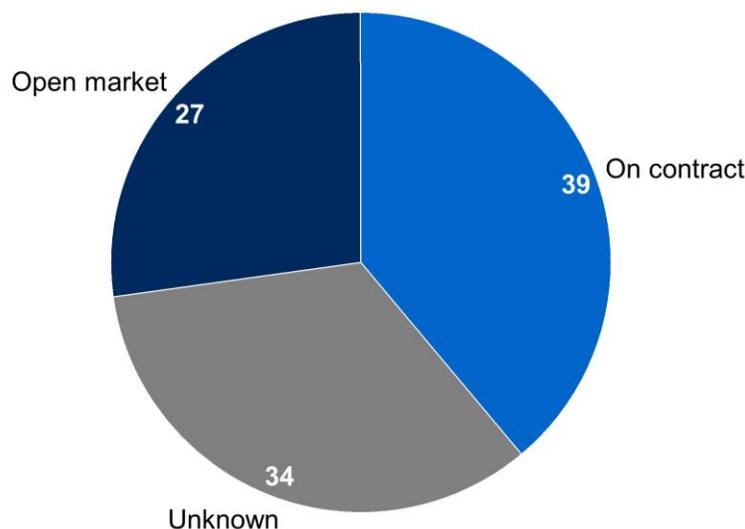
However, our analysis showed that at least one-quarter of spend on clinical supplies was at open market prices (VA, FY2015), with the majority of those purchases made using government purchase cards (Figure 4-13). An audit of open market purchases by OIG in 2009 found a similar rate of open market purchases and showed that the same or similar items that were bought at

---

[19] VAAR Subpart 808.002

open market prices were also available on a FSS contract (VA OIG, 2009). A waiver is technically required for open market purchases, even if below the micro-purchase limit, yet the OIG report found only a single waiver filed in the time period they examined. To put this into context, high performing private sector health care providers aim to make 80-90 percent of their clinical supply purchases through some type of negotiated contract (High performing health system interviews, 2015).

Figure 4-13. Sources of Clinical Supply Purchases

At least 27% of clinical supply purchases are made on the open market


Note: BOC 2632 spend for line items with IMF number, and cost centers associated with medical/surgical supply spend, but excluding pharmacy control points, all facilities October 1, 2014 through January 31, 2015

SOURCE: VA. (FY2015, October - January). IFCAP purchase data for clinical supplies with an IMF number.

Interviews and observations revealed that there are two primary reasons for VA's relatively high share of open market purchasing in these categories. First, VA's purchasing processes rely on buyers to do the work of finding out whether an item is on contract, and through which contract the purchase should be made based on the mandated hierarchy. To that end, buyers must search the NAC's Contract Catalog Search Tool (CCST) in a web browser to identify the latest pricing and national contract information for the items of interest. The purchase information then must be separately entered into IFCAP systems to make the purchase. It is also easy to simply repeat previous purchases that were made in IFCAP. This can create additional problems, as it is easy to avoid looking up contract information and there is no mechanism to inform when products fall off contract or purchasing instruments change, so users may repeat previous transactions that are no longer optimal. The CCST also only includes national contracts and FSS schedule items managed by VA. Even in VA's electronic ordering system, and in contrast to the system used for pharmaceutical purchasing, there is no mechanism to lock-out off-contract purchases or to direct a buyers to the most optimal price, because contracts and pricing data are not linked to IFCAP.

Second, VA has limited ability to monitor and drive compliance with the contract hierarchy described above. Free text data entry and the ability to not enter certain information such as contract numbers makes evaluating whether product purchases were made under an appropriate contract very difficult.

Driving higher contract compliance and strategically negotiating national volume-based contracts for specific products represents a significant opportunity for VA. The national contracting entities have been able to negotiate significant discounts for the contracts they manage. As examples, the NAC and DALC collectively manage 178 national contracts and BPAs across 133 categories as part of the National Contract Service standardization program (VA, 2015i). Categories range from adult diapers to coronary drug eluting stents. The NAC establishes BPAs with lower prices for items on FSS through defined quantity agreements. For the items covered under 49 BPAs in the MedSurg National Contracting Catalog Search Tool (CCST), the average discount off FSS pricing was 15.1 percent (VA National Acquisition Center, 2015)[20], highlighting this as an effective tool to negotiate better pricing based on defined quantities.

However, poor contract compliance and VA's lack of rigor to identify products for which national contracts should exist would suggest that VA is not achieving optimal prices for its clinical supplies or medical devices, and therefore, there is likely opportunity to negotiate additional discounts.

To achieve the target of 80-90 percent of purchases on contract, best-in-class strategic sourcing functions identify products and categories that would benefit most from central contracting. This is typically done by analyzing purchasing data to identify products with high aggregate cost that are currently being bought off contract, and collaborating closely with clinical teams to understand evolving clinical practice and prospectively identify the supplies and devices that will be needed to support patient care.

In VA, development of national contracts is usually initiated by program offices and services (for example, PLO and PSAS) who partner with acquisition centers for the development of requirements and the solicitation process. However, in VA there is no robust mechanism for programmatically identifying key categories that should be targeted for national contracts. Several efforts to address this have been initiated, including within SAC and the PLO's Program Executive Office (PEO). However, leadership interviewed cited staffing issues and policy constraints (PLO cannot create its own national contracts, for instance) as barriers to effectiveness. Also apparent in the interviews was the distrustful and non-collaborative relationship between organizations at VA and VHA (see Finding 4.2.1). A strong relationship is needed for a best-in-class approach with integrated product teams. Poor relationships could also lead to poor output. Indeed, of three product categories highlighted in a 2007 OIG report as potential targets that could benefit from a national contract, only coronary stents currently

---

[20] Price discount from FSS for items on BPAs were calculated. The median discounts for each contract were averaged to find the average per contract discount

have a national contract and the initial solicitation occurred nearly three years (in 2010) after the report was published (VA OIG, 2007).

Local and regional systems in VA also have the ability to negotiate prices with suppliers. In our experience, these local contracts can, at times, yield better prices for some products than nationally negotiated contracts. High performing organizations are typically very thoughtful and strategic in defining which products should be negotiated nationally versus regionally. In general, national contracts achieve the most favorable pricing, hence VA's contract hierarchy above. However, under certain circumstances and for certain products, organizations can negotiate more favorable pricing by adopting a regional approach. For example, a supplier may be unwilling to provide large, widespread price concessions to a customer that represents a significant share of its business because of the dramatic impact that might have on earnings, but may be willing to offer deeper discounts in certain regions. In addition, suppliers that have multiple manufacturing or distribution locations around the country may have geography-specific pricing that reflects their cost structure in each location.

To that end, VISNs 17-22 established the Western States Network Consortium (WSNC), which is a regional purchasing organization aligned with SAO West. It was established in the 1990's to facilitate collaboration to reduce costs and increase efficiencies across all of its VISNs. WSNC seeks to award BPAs off existing FSS contracts with additional price discounts based on projected usage. When FSS contracts are not available, the WSNC will award open market BPAs and/or IDIQ contracts in order to meet the region's needs. In FY2014, 10 WSNC BPAs saved nearly nine million dollars compared to FSS pricing for supplies, prosthetics, diagnostics, lab services, and engineering supplies (WSNC Program Officer, FY2014).

While the WSNC has delivered savings, its genesis was opportunistic, and driven through necessity, versus the result of a more national strategic sourcing strategy. Therefore, its existence likely adds to VA's organizational complexity and results in WSNC negotiating prices for some items that should be negotiated nationally, to deliver benefit beyond the western region.

b. Limited product standardization has been achieved across VA to date.

In 2001, VHA Directive 1761.1 and its associated 2003 published handbook established procedures for a national Standardization User Group to identify items for standardization based on national procurement data for more focused user-based groups to review. To date however, national product standardization for commodity medical supply products has been achieved in only a limited number of categories, through 61 single award medical/surgical national contracts, BPAs, and Blanket Order Agreements (BOAs) (VA, 2015i).

In 2011, VHA required that VAMC facilities establish Clinical Product Review Committees (CPRCs) to: (i) Review and approve new clinical items and reusable medical equipment (RME) prior to use at the Medical Center; (ii) Maintain a list of approved expendable clinical supplies and RME by establishing and maintaining a Medical/Surgical Supply Formulary, and (iii) ensure compliance with nationally standardized contracts and BPAs. In all sites visited, CPRCs exist and meet regularly to review and approve items. CPRC interviews and data review revealed that CPRCs typically review around 30 genuinely new item requests per month. Reviews were

generally formalities as long as the products were replacing existing items and/or budget neutral.

The 2011 changes also required that VISN offices establish commodity standardization committees with relevant subcommittees to review the actions of VAMC CPRCs and take further standardization activities. These include identifying new opportunities, facilitating standardization within the VISN, and tracking and reporting benefits of standardization. However, no evidence for VISN level standardization activity was found in any interviews conducted with CPRC participants. A similar finding was reported by the GAO in 2013 (GAO, 2013b).

High physician preference items such as medical device implants are high cost items that can vary substantially in price. VA currently spends $525 million on surgical implants. In some categories, vendors are consolidated, but this may correspond to the structure of the industry. There are opportunities for vendor rationalization in many other categories (Figure 4-14). Standardization of these types of items requires strong physician engagement and education, supported by robust data collection and analysis on case-based usage patterns. VA's fragmented and complex organizational structure and the history of poor collaboration is a substantial barrier to achieving this level of physician engagement, and its data systems are inadequate to provide the insights needed to support standardization.

Figure 4-14. Vendor and Product Fragmentation for Key Medical Device Categories

VA has a large number of suppliers in many implant categories

	Spend on surgical implants by category $ Millions FY14	Number of suppliers[1]	Share of top supplier Percent
ICD/leads	113.4	18	50
Screws, plates, anchors, etc.	82.5	407	20
Knees	51.3	71	28
Thoracic stents	35.6	56	31

Arm	1.2	37	30
Other upper extremity	0.3	56	14
Foot	0.2	21	18
Hand	0.1	14	47
Neck	0.1	15	41

1 Vendor name formats were standardized from >23,000 entries to ~12,000. However, some redundancy may remain.
SOURCE: VA. (FY2014c). Prosthetic appliance purchase orders (VistA Table 660).

High performing health care organizations have typically taken a two-pronged approach to product standardization, treating commodity clinical supplies and devices differently than high physician preference ones. For commodities such as gloves, gowns, drapes, gauze, etc., they have pushed regional or, in some cases national, standardization towards one supplier – often the private label products available from their prime vendor. For high preference supplies and devices, such as surgical implants and disposable endoscopic surgical instruments, they have taken one of two approaches depending upon their culture and the degree of alignment between the procurement organization and physicians.

- One approach is to establish multi-disciplinary teams within a specialty that decide on the one or two products within a category they will use across the system. For example, they might consolidate down to a limited number of manufacturers, and aim for high utilization (such as 80 percent) of the highest priority manufacturer. (Lyden, 2015; High performing health system interviews, 2015)

- The second approach is to allow all manufacturers to participate, but use mechanisms such as price transparency or ceiling pricing to drive behavior. For example, a hospital system might make surgeons aware of the price of each high preference product and rely on their good will to select the product that delivers the best quality for the price for each individual patient. Alternatively, they might set tiered price ceilings for a product category of different types, and invite suppliers to participate, such that all products of a given type are roughly the same price and surgeons can continue to use what they have always used. (Okike, et al., 2014; High performing health system interviews, 2015)

Clearly, either of the approaches to standardization outlined above requires deep product expertise, not only on the part of the users (for example, nurses, physicians, sterile processing), but also on the part of those involved in contracting, purchasing, and supplier management. High performing strategic sourcing teams typically align their resources to product categories so that their personnel develop the category and clinical expertise needed to understand the product market landscape and clinical utilization to best drive value. Procurement and contracting personnel in organizations that are truly distinctive at strategic sourcing often understand their product categories more deeply than the suppliers' representatives who serve them.

Other than the DALC, VA's procurement group is limited in its degree of product or category specialization. This represents a real opportunity for VA to support its move to product standardization and strategic sourcing. Developing this capability would also likely reduce the burden on clinical staff to develop and submit specifications to contracting because, in such a system, the contractors would have significantly more knowledge and understanding of the products and suppliers they are evaluating and procuring.

4.2.5 Inventory Management Process, Practices, and Systems are Neither Integrated nor Optimized

VA uses two separate inventory management systems. The Prosthetic Inventory Package (PIP), which is used to manage prosthetic inventory, and the General Inventory Package (GIP), which

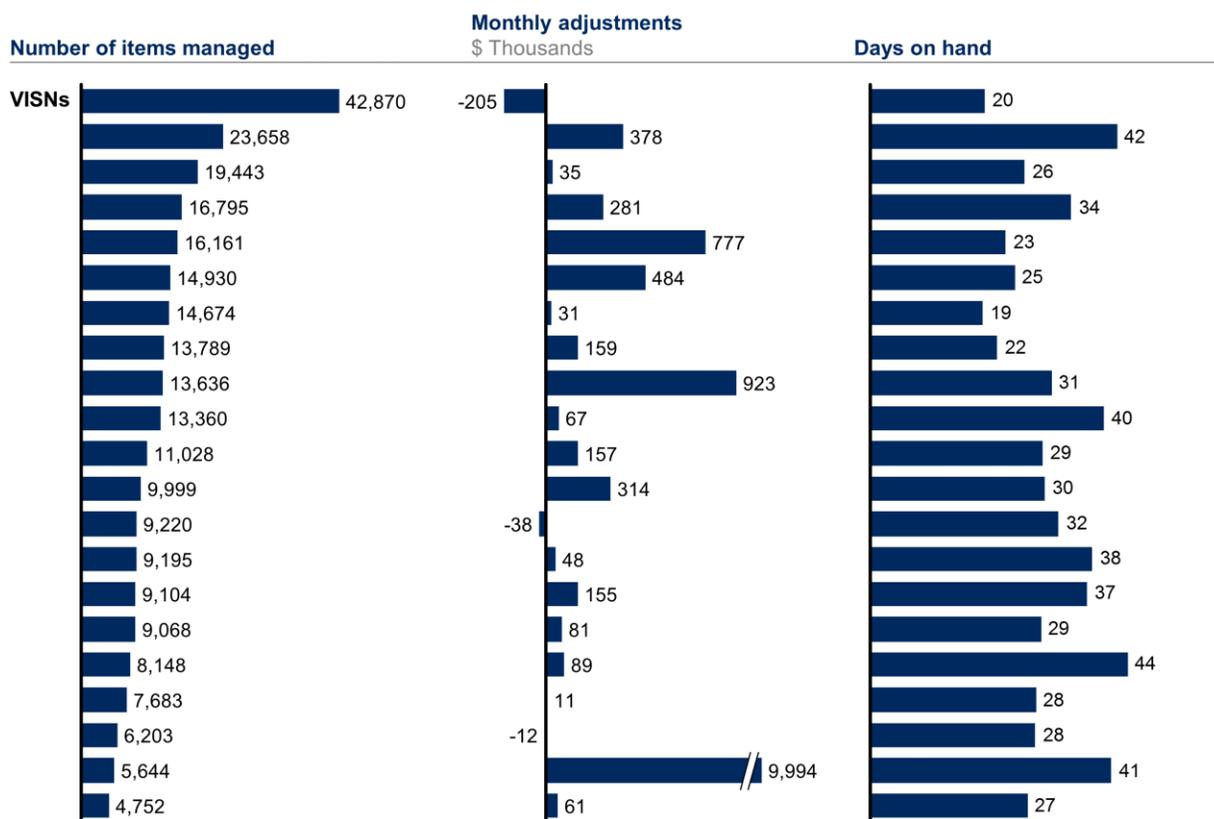
is used to manage inventory of everything else.[21] Each site has its own instance of PIP and GIP, making central analysis of inventory or system-wide inventory optimization almost impossible. Inventory control metrics such as inventory accuracy (percentage of correct items and quantities present per count) and stock out percentage are not routinely captured by GIP.

Site visits, interviews, and data analysis also showed that VA's inventory management practices vary significantly from site to site. The number of items managed in GIP ranges from a few hundred at small community based facilities to over 10,000 at large high complexity medical centers (VA, 2015f). However, system limitations in GIP may exaggerate the variation observed. For example, in GIP, a secondary inventory control point (like a supplies closet on a nursing unit) can only receive inventory from one primary control point (for example, a central store room), leading to situations where five secondary inventory control points may be present in GIP but those inventories are in the same room. To deal with this, some VISNs and facilities have created one "super" primary inventory for all clinical items in GIP. These limitations and differences in practice could lead to some of the variation observed in inventory metrics.

VA aims to maintain an average of 36 days of inventory on hand with a turnover rate of 10 times per year (VHA, 2009b). While the VA weighted average meets this target (32 days), the performance across VISNs varies (Figure 4-15) and the range for individual facilities is considerable. Despite an Inspector General report from 1999 recommending VAMCs should maintain less than a 30-day supply, and optimally a seven-day average supply (VA OIG, 1999), 47 percent of facilities have more than a 30 day supply. However, given the current supply chain systems and processes, such a reduction in inventory would create significant risks of shortages and stock outs.

---

[21] VISN 20 does use GIP for prosthetic commodities as discussed in Section 4.2.1

Figure 4-15. Inventory Management Metrics by VISN


SOURCE: VA. (2015f, February). GIP Inventory Days of Stock on Hand Report.

Manual adjustments also limit the ability to interpret the data with any one point in time comparison, given that inventories may not correctly reflect reality. In any given month, there is a gap in some facilities' closing balance after accounting for the items purchased and distributed. Monthly adjustments are not problematic per se, but they are symptomatic of larger system issues that create inefficiencies and rework. Adjustments are made throughout the month due to errors, process failures, and system challenges, including:

- Adding items back into a primary inventory that were no longer needed in a secondary inventory point
- Providing clinicians with items not stocked in their secondary inventories, and then manual adjustment of GIP primary inventory numbers rather than adding the item to the secondary inventory and creating a picking ticket
- Counting inventory manually and adjusting primary inventories that are points of use (the only way these inventory supplies get decremented in GIP)
- Correcting inaccuracies within GIP which occur for a variety of reasons (like manual entries and calculation mistakes)

Many best practice hospital systems utilize Low Unit of Measure (LUM) or Unit of Use (UOU) shipments five days per week to cut down inventory carrying costs. They also integrate their inventory management systems with POU technology or other utilization tracking mechanisms

---

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

to automate reordering as much as possible. VA established the MSPV program in 2002 to move from a supply depot driven logistics organization to a leaner, just-in-time supply chain. Logistical support is provided through frequent conventional bulk or LUM shipments, three or five days a week respectively, although VAMCs do have flexibility in arranging more or less frequent deliveries. A core list of products is set by each facility, which MSPVs must be able to provide routinely. This was intended to reduce the number and stock of items being managed on site, saving inventory space, reducing wastage from expirations, and simplifying staffing.

During interviews, staff generally reported that the performance of their MSPVs had generally been good in this regard. As discussed above, 22.5 percent of clinical supply spend is through the MSPVs (VA, FY2015). Over 85,000 orders (922,000 line items) were placed with the largest MSPV in the twelve months from Feb 2014 – Jan 2015, with 60 percent of purchase spend on VAMC core items (VA MSPV, 2015). The prime vendor was also able to meet or exceed their fill rate requirements with over 97 percent of core line items filled in the twelve months (95 percent is required for conventional orders).

To date, only one VISN is currently operating with LUM deliveries five days per week. This VISN, as well as a few others, utilize Point of Use (POU) cabinet technology to track inventory and automate re-ordering. However, we observed that cabinet technology is being used for commodity items such as gauze and IV fluids in high-paced environments such as Intensive Care Units and Emergency Departments. This can cause challenges and delays for clinical staff because the cabinets require keypad entry of codes for access and pushbutton tracking of inventory use. In such situations their controls may be circumvented (for example, by leaving cabinets unlocked, and not pushing the usage button appropriately) and the assessment team received several reports from staff that this behavior happened frequently. The assessment team also directly observed such behavior more than once during the assessment. In such situations, inventory levels in the system will be inaccurate and automatic reordering will likely not occur as intended. VHA has plans to roll out newer, scale-based POU technology for frequent, "A" class, inventory and a Kanban card reordering system for less frequently used, "B" class, items.

4.2.6 VA Struggles to Attract, Hire, and Retain High Caliber Supply Chain Talent

A key success factor for best-in-class sourcing and supply chain organizations is the talent they employ. Talent management in VA's supply chain organizations is challenging because:

a. There are many unfilled positions in the procurement and logistics organization.
b. VA struggles to fill positions and retain supply chain talent.

a. There are many unfilled positions in the procurement and logistics organization.

Interviewees at the sites visited estimated that 20-30 percent of positions in logistics were currently unfilled, which required higher staff overtime to ensure timely delivery and distribution of supplies. In some interviews with staff in smaller clinics, nurses noted that the move towards a leaner inventory management model has led to some issues getting required product because of staffing shortages amongst item managers. The team did not have data to evaluate this claim. One outpatient clinic manager reported that there was one item manager

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

86

and supervisor to cover three clinics, and that they were therefore short of two item managers. In that clinic, three-day inventory levels were set, but because of short staffing, the item manager could only restock every seven days, leading to shortages about once per week. The clinic would manage such shortages by driving to the nearest VAMC or borrowing from another clinic.

VA Medical Supply Aides & Technicians (Series 622) are designated as a critical occupation in VHA as they provide wards, clinics, operating rooms, and other hospital facilities with clinical supplies, instruments, sets, and equipment. As of May 22, 2015 there were 563 vacancies (VHA, 2015d) which is three to four per VAMC on average, or roughly 20 percent of all Series 622 positions in VA (VA, 2014e). The number of vacancies in these positions varies across VISNs from two to 45 positions currently unfilled.

It should also be noted that VA's high staffing needs are driven in part by cumbersome systems and processes. In addition, the assessment team could not find guidelines to help leaders determine appropriate staffing given the workload at their facilities. This was reflected in data. The number of logistics staff in each facility varied widely and the team could not find a correlation between the number of logistics personnel and number of hospital admissions, number of inpatient days, or the number of outpatient visits.

b. VA struggles to fill positions and retain supply chain talent.

Logistics leaders voiced concern about their ability to fill positions in a timely way and to retain those they recruit. They highlighted three potential contributing factors:

- Recent downgrades: Several supply chain positions were recently downgraded by the Office of Human Resources Management (OHRM) or not approved at a level requested. For example, logistics leadership designed a Business Program Coordinator to be a high level facility position to aid in contract and procurement management, but the position was classified at a lower level. At various facilities, supply chain positions that were downgraded within the last year included Supply Technician, Mail Manager, Draft Administrative Officer, and Materials Handler. It is beyond the scope of this work to determine the appropriate classification of these positions. However, supply chain leaders have the perception that the downgrades impacted morale and made certain positions less attractive to potential recruits.

- Variable responsiveness of HR: Sixty percent of interviewees across supply chain management and contracting also expressed concerns about the time it takes HR to fill open positions. They cited both long lead times from HR and a small eligible applicant pool. Data on speed of hires received by the assessment team did not break out supply-chain-specific positions to enable an evaluation of interviewees' claims, nor is it the scope of this report to evaluate HR processes. However, interviewees mentioned VA recruiting regulations preference Veteran and internal hires, which can restrict VA's access to a potential pool of talent who do not meet those criteria. Supply chain leaders also said they would like to bring fresh perspectives and experience into the organization to fill increasingly specialized positions in the supply chain organization.

- Lack of clear supply chain career paths: Several Chiefs of Logistics described individuals who had left the supply chain organization because there was no clear path for career progression within it. Because of that, two Chiefs of Logistics described ways in which they had created career paths and training programs to help retain their high performers. Succession planning was also an issue in some VAMCs visited. For example, one VAMC said that nearly a quarter of its supply chain workforce (including logistics leadership positions) was eligible for retirement (see Assessment L section 3.2 for more information).

It is well known in the health care industry that there is a shortage of supply chain talent currently. The private sector organizations interviewed during this assessment stated that they are recruiting more highly trained individuals than they did in the past and, because of competition for talent, are paying them more than they used to. This may be contributing to VA's recruitment and retention challenges.

4.2.7 There are Pockets of Good Performance and Innovation in VA That Could be Replicated Across its Supply Chain

The Denver Acquisition and Logistics Center (DALC) is a bright spot within VA's supply chain organization. It has developed an integrated operating model that brings together clinicians, contracting, finance, logistics, and program management. That integrated team makes decisions on product and vendor selection based on a holistic view of what is best for Veterans and for VA. In addition, VA medical centers and VISNs have a degree of autonomy to test and pilot new processes, management approaches, and technologies.

The DALC sources select prosthetic items and deliver them directly to Veterans. Its scope includes hearing aids and batteries, telehealth equipment, prosthetic socks, and a number of other goods. In total, the DALC manages around 3,750 line items and achieves average turn times of 1.7 business days for its commodity products (VA, 2015g). The DALC is also responsible for securing certain ancillary services at a national level such as dialysis services. Veterans have several options for how to place their orders; its call center staff field more than 20,000 orders per month for batteries, hearing aid accessories, and prosthetic socks.

To support its mission, the DALC has recruited and developed sourcing personnel who have expertise in telehealth and neuro-assistive devices such as hearing aids and cochlear implants. With category-aligned contracting officers and a close relationship with all stakeholders along the value chain (program office, logistics, finance, IT and clinical users, for example) using integrated product teams (IPTs), the DALC has been very successful in developing, negotiating, and executing programs that drive value while delivering high quality services, devices, and supplies to Veterans. As an example, the DALC reported that it saved Veterans $106 million on hearing aid batteries relative to typical retail prices Veterans would otherwise have had to pay. The dual functions of the DALC – contracting and logistics – work closely together to develop their products and services and also interact directly with clinicians and Veterans. Staff were very proud of their customer service and interactions with Veterans, including with those who choose to come to the Denver facility in person to pick up battery refills rather than receive them by mail.

The benefit of integrating sourcing decisions with logistics and other functions is highlighted by the DALC's ability to develop new contracts that address issues in the services they provide. A February 2014 OIG report highlighted long wait times for hearing aid repair service offered by the DALC (VA OIG, 2014c). To address the issue, the DALC negotiated new contracts with its hearing aid repair vendors that required them to handle earmold service with the repair of a hearing aid. This significantly reduced the workload on DALC repair staff and brought DALC's repair time down from 24 days in FY2012 to 5 days in FY2014 (VA, 2015g).

The success of the DALC's programs is due not only to its integrated project team planning, but also to its ability to develop and implement customized IT and financial solutions that make ordering and billing of its goods and services transparent and easy for the customer. They have developed a web-based Remote Order Entry System (ROES) as the cornerstone of their information management system. DALC customer, order, and inventory data is centralized such that standardization is not an issue. They are able to provide patient order history information, provide an integrated catalog, prevent inappropriate ordering off contract, and track accurate inventories.

Best-in-class sourcing organizations take several approaches to strategically acquire and deliver value for their organizations, which have been replicated in the DALC:

(a) They support their mission with deep category expertise.
(b) They ensure value with an integrated approach to meet the needs of the end user.
(c) They manage an ecosystem of suppliers to improve relationships and contracts over time.

While there are elements of the DALC model that may not be scalable to other parts of VA (like in-house IT development to support ordering and logistics), their integrated working model and category specialization are concepts that should be shared. The use of IPTs has been mandated by OAL for all contract programs valued at more than $5 million (VA Deputy Assistant Secretary for Acquisition and Logistics, 2013). However, several interviewees questioned their effectiveness, in part because of lack of space and challenges getting the required individuals in the same place at the same time to physically "touch and feel" new products.

In addition to the DALC, VA's ability to innovate locally is a strength that could be leveraged. VA medical centers and VISNs have a degree of autonomy to test and pilot new processes, management approaches, and technology. The assessment team observed several examples of local innovation that could deliver value across VA. Examples of these pockets of innovation include the following:

• Just-in-time (JIT), low unit of measure (LUM), and unit of use (UOU) inventory management that leverages automated technology and prime vendor relationships to improve purchasing and logistics service while reducing inventory holding costs

• Software and advanced point-of-use technology to improve logistics IT and data quality and availability to better manage inventory

- Pilots to integrate purchasing and inventory management of prosthetics appliances with clinical supply logistics, which allows Prosthetic Representatives to focus on patient-facing activities rather than on ordering, inventory management, and other administrative tasks

The willingness and ability to experiment locally is a VA source of strength, particularly because it is built upon a desire to deliver better service to Veterans. This represents a real opportunity for VA to learn from within.

However, the assessment team saw little evidence that findings from such experiments were systematically captured, codified, prioritized, and if appropriate, scaled across VA. Observations and interviews highlighted two primary reasons for this. First, no formal mechanism exists to collect and synthesize findings of these experiments and develop a plan for scale-up, nor is there a mechanism to evaluate, prioritize, and coordinate the pilots that are running across VA at any given time. Second, some individuals responsible for developing and implementing some of the innovations said they did not want to "advertise" their innovations too broadly because they thought the new practices may be deemed non-compliant or misaligned with a VISN or national objective.

5 Recommendations and Implementation Considerations

We would recommend VA considers the recommendations below. As VA further develops these recommendations, special attention should be given to the impact of each one on the rest of the organization to ensure that high performing areas are not negatively impacted. This is most relevant for any recommendations related to organizational structure, roles and responsibilities, IT, and data systems, because any changes will likely span pharmaceuticals, clinical supplies, medical devices, and health care-related services.

5.1 Pharmaceuticals and Related Services

Overall, VA's ability to efficiently and effectively purchase, distribute, and use pharmaceuticals is high. However, there are some areas where VA could build upon its strengths and address some weaknesses to further improve its performance. Specifically, we would make the following recommendations:

1. Establish mechanisms to ensure VA secures a reliable supply of pharmaceuticals and accesses the lowest possible pricing more consistently.

2. Continue driving efficiency through VA's CMOP network.

3. Develop strategies to improve the transition of patients from the Department of Defense to VA care.

4. Continue building more sophisticated approaches to drive appropriate utilization of pharmaceuticals.

5.1.1 Establish Mechanisms to Ensure VA Secures a Reliable Supply of Pharmaceuticals and Accesses the Lowest Possible Pricing More Consistently

a. Modernize VA Acquisition Regulations to enable access to lower priced commercial sources when possible.
b. Identify pharmaceuticals at highest risk of shortages and price spikes, and develop specific strategies to limit impact.
c. Improve lifecycle management of contracts to prevent lapses.

a. Modernize VA Acquisition Regulations to enable access to lower priced commercial sources when possible.

Currently the VAAR requires the use of FSS sources before considering commercial/open market sources. In some cases where only a single supplier may be on FSS contract, the supplier's prices may meet the FSS's "most favored customer" requirements, but the supplier could still charge VA higher prices than its open market competitors. The FAR upon which the VAAR is based were modified in January 2014 to allow GSA, DoD and NASA to allow open market competition in such situations. Other contracting rules in the VAAR may also be outdated as compared to the FAR. While a full legal review of FAR and VAAR differences is beyond this assessment, such conflicts are likely to cause confusion among VA contracting

---

officers. VA should consider updating the VAAR, including options to update VAAR 808.002 "Priorities for use of government supply sources" to ensure fair competitive prices are obtained. Options such as a class deviation for purchasing supplies (e.g., specific exemptions for generic drugs) when commercial source prices are lower than FSS contract sources, or aligning the language of the VAAR with the updated FAR should be explored.

b. Identify pharmaceuticals at highest risk of shortages and price spikes, and develop specific strategies to limit impact.

VA should use fact-based criteria to categorize drugs based on how likely VA is to experience price spikes or shortages over time, and the likely impact of those events. Based on that, VA should then develop strategies to secure supply at current price or as-close-to-current-price as possible for the highest risk drugs. Depending upon need, such strategies could include securing contracts with alternative suppliers, seeking permanent exemptions from TAA restrictions for certain drugs, establishing a safety stock, or balancing internal inventory.

VA's pharmaceutical prime vendor may be able to offer value added services such as more sophisticated inventory management, inventory balancing across sites in shortage situations, as well as more granular reports and information to support VA's risk-stratification of pharmaceuticals.

c. Improve lifecycle management of contracts to prevent lapses.

VA should view any lapse in contract on any drug as a system and process failure, because such lapses can lead to unnecessary expenditures and potentially impact Veteran access to medications. Therefore, VA should establish mechanisms to more proactively and strategically manage contract lifecycles.

Tactically, that could include developing an automated contract lifecycle management calendar that alerts contracting personnel when key activities need to take place based on an expected timeline. It could also include building strategic partnerships with suppliers, automated reminders, and establishing special bridge arrangements in the case of specific changes (like when a medication changes from a tablet to a capsule).

5.1.2   Continue Driving Efficiency through VA's CMOP Network

   a.   Drive more volume through CMOPs, particularly for prescription refills.
   b.   Continue to automate processes in the CMOPs.
   c.   Evaluate consolidation of CMOPs to drive efficiency and higher utilization.

a. Drive more volume through CMOPs, particularly for prescription refills.

While VA already delivers 80 percent of its outpatient prescriptions via its CMOP network, there is scope to increase that further, particularly for repeat prescriptions. Therefore, VA should push for greater utilization of CMOPs for repeat and non-urgent prescriptions to reduce demand on window pharmacies. This could include implementing a policy whereby refills are automatically sent from CMOPs unless a patient specifically requests that it be filled at a window pharmacy.

b. Continue to automate processes in the CMOPs.

VA should continue its drive to increase automation in its CMOPs. While the CMOPs' error rate is low overall, automation of steps in the process that are currently manual (like packing and labeling) could reduce the error rate further. Automation may also reduce costs over the longer term.

c. Evaluate consolidation of CMOPs to drive efficiency and higher utilization.

VA should evaluate the pros and cons of consolidating its CMOP network to fewer sites. Consolidation may enable VA to reduce costs associated with mail order and run the CMOP network to a higher level of utilization. CMOPs are equipped with different levels of automation and facilities at different ages. Consolidation options should be part of the evaluation process when considering equipment upgrades that may be needed.

5.1.3 Develop More Robust Mechanisms to Improve the Transition of Patients from the Department of Defense to VA Care

a. Improve access to primary care for transitioning Veterans as per Assessment B and Assessment E.
b. Improve sharing of medical records and medication history between DoD and VA and make it a strategic priority (see Assessment H).
c. Explore opportunities to align and integrate formularies taking into account clinical evidence and economic impact.
d. Develop drug-class-specific guidance for medication changes related to transitions.
e. Develop mechanisms to track transitioning DoD servicemembers.
f. Improve communication with Veterans about their medications during transitions.

a. Improve access to primary care for transitioning Veterans.

Access standards are covered in Assessment B and scheduling improvements that might improve access are found in Assessment E. The assessment team recommends VA considers the recommendations contained in those assessments and ensures that any changes to primary care that are implemented as a result improve transitioning Veterans' timely access to primary care.

b. Improve sharing of medical records and medication history between DoD and VA and make it a strategic priority.

VA and DoD should continue working together to improve information sharing between the two health systems through interoperability of their electronic medical records. In the meantime, they should develop a more robust bridge between the two systems. In particular, mechanisms should be established such that VA physicians and administrators have real-time access to Veterans' medical records for care provided in the DoD system and, as a matter of routine, have a patient's DoD medication history available to them prior to that patient's initial VA appointment. This should include the list of current medications, the indication for each medication, and any medication history that might exist. Improvements could be based upon

existing systems such as the CHDR or the newer JLV, and ultimately should be integrated into a broader IT strategy. There should be robust stakeholder engagement and education to ensure the success of these initiatives as well as implementation of the recommendations found in Assessment H section 5.2.

c. Explore opportunities to align and integrate formularies taking into account clinical evidence and economic impact.

VA should carefully examine the differences between formularies and, where alignment can be justified by clinical evidence, the needs of the population served, and the realities of the budget met, it should be pursued. This may also support the recommendations above.

d. Develop drug-class-specific guidance for medication changes related to transitions.

VA should formalize local clinical practices and continue to develop clearer guidance for prescribers on how to effectively transition patients from DoD into VA. Specifically, it should lay out, by drug class, the criteria prescribers should use to make a determination as to whether it is appropriate to keep a patient on a non-formulary medication that was started in DoD or to make a switch to an on-formulary medication.

e. Develop mechanisms to track transitioning DoD servicemembers.

VA should establish formal mechanisms to collect data on the transition of former servicemembers to its care. This could take advantage of the existing non-formulary approval process for those designated "Transitioning servicemembers," as well as linkages to OEF/OIF/OND transition programs and patient care teams to monitor when, where, and why medication switches occur. This data could help target areas where clinical guidelines might be most appropriate and effective, as well as provide a fact base for improving continuity of care with DoD.

Such data collection would also support a more fact-based determination about whether greater alignment between DoD and VA's formulary would materially improve transitions or whether other strategies such as process improvements, more robust tracking of transitions, and better communication with Veterans would have the most impact.

f. Explore opportunities to improve communication with Veterans about their medications during transitions.

Although anecdotal, it is likely that communication with Veterans could be improved to smooth Veterans' transitions. In particular, VA should improve communication with Veterans prior to or immediately upon entering the VA system about VA's pharmacy benefits, the role of the formulary, and how to access medications (CMOPs and window pharmacies). This would be prudent in any transition from one health system to another.

This recommendation may require more involvement of clinical pharmacists early in a Veteran's transition to educate him/her about how to navigate the VA system and how to ensure no gaps in care during that transition.

5.1.4 Build Sophisticated Approaches to Drive Appropriate Utilization of Pharmaceuticals

a. Incorporate evidence-based prescribing guidelines into clinical protocols and pathways, building upon recommendations in Assessment F.
b. Invest in IT and analytic capabilities to support outcomes-based data analysis.
c. Drive appropriate data interpretation and utilization through peer review.
d. Build utilization rules into prescribing system to facilitate appropriate use.

a. Incorporate additional evidence-based prescribing guidelines into clinical protocols and pathways, building upon recommendations in Assessment F.

In line with best-in-class integrated health systems and with the recommendations in Assessment F, VA should continue to build evidence-based prescribing guidelines into existing and new clinical protocols and treatment pathways for the most common conditions in the Veteran population (for example, COPD, hypertension, diabetes, heart failure, chronic pain). Given VA's scale and integration, it could monitor response to changes in clinical pathways and protocols and make adjustments accordingly.

b. Invest in IT and analytic capabilities to support outcomes-based data analysis.

Significant investments in IT, data capture and management, and analytics will be required to enable some of the recommendations outlined above, such as physician-level reports of prescribing patterns, particularly around inpatient drug utilization.

Therefore, VA should develop an integrated IT strategy that includes elements of what will be required to deliver against the recommendations outlined above. This will need to be aligned with the more specific recommendations made later in this report in relation to clinical supplies and devices, where the IT and data challenges are similar.

c. Drive appropriate data interpretation and utilization through peer review.

VA should establish a mechanism to have local physician peers evaluate drug utilization data that is made available by implementing the recommendation above. This could consist of new specialty-specific peer review committees or could build upon existing P&T committees. Those committees should use their understanding of the local patient population and individual physicians' circumstances (for example, subspecialty, specific patient populations treated) to evaluate the appropriateness of any variability in formulary compliance and adherence to clinical use guidelines seen in the data. Based on that understanding, those committees should deploy strategies to address inappropriate variability, such as physician education, best practice sharing, distribution of physician-level performance reports, and updates to the prescribing system to limit inappropriate prescribing. The high risk drug initiatives for opioid and benzodiazepines are good examples of programs driving behavior change. Implementation and outcomes should be studied for lessons learned and application to other areas.

d. Build utilization rules into prescribing system to facilitate appropriate use.

Longer term, VA should pursue the possibility of building its formulary and clinical use guidelines into VA's prescribing system to facilitate appropriate prescribing. This will require

updates to VA's current systems, which should be made in parallel with the updates described later in this report in relation to clinical supplies and devices.

5.2 Clinical Supplies, Medical Devices, and Related Services

To improve VA's ability to both meet procurement compliance requirements and ensure timely and cost effective delivery of product to Veterans, we would recommend the following:

1. Transform and consolidate VA's entire supply chain organization.
2. Improve key enablers required to support the transformation, including IT systems, data integrity, and HR.
3. Streamline, standardize, and integrate key supply chain management processes.

Each of these recommendations is described in more detail below and largely fall into the "people, processes, systems" model, for which key success factors are briefly described for the pharmaceutical supply chain in Table 3-1.

5.2.1 Transform and Consolidate VA's Entire Supply Chain Organization

We would recommend a full organizational transformation for the VA's supply chain, which should include the following:

a. Rationalize the organizational structure by consolidating VA and VHA entities into one integrated supply chain organization that manages all VA contracting and logistical management of clinical supplies and medical devices.
b. Establish robust performance management on supply and device procurement that is focused on Veteran outcomes.
c. Develop deep category-level expertise within the organization.

a. Rationalize the organizational structure by consolidating entities into one integrated supply chain organization that manages all VA contracting and logistical management of clinical supplies and medical devices.

As a first step, VA should fundamentally restructure its supply chain organization by rationalizing and consolidating its structure. It should bring together all VA and VHA's procurement entities and those responsible for the logistics management of clinical supplies and medical devices into one integrated entity that is accountable for the performance of VA's supply chain management of those products end-to-end – from product selection, contracting, and purchasing, to inventory management, distribution, timely delivery to end users, and ultimately, value for money. This would eliminate or greatly reduce the duplication that currently exists between VA and VHA. It would also help optimize between VA's need to drive compliance with federal and VA acquisition requirements while also delivering the responsiveness and flexibility required to meet the needs of Veterans and their caregivers.

This will likely require a "clean sheet" approach for developing a blueprint of what the ideal organizational structure must be to effectively meet the needs of VA's supply chain's customers, based on a set of guiding principles, including but not limited to:

- One leader who is accountable for the end-to-end effectiveness of its supply chain related to clinical supplies and medical devices (cost, quality, efficiency)
- Governance that includes each element of the supply chain, including contracting, logistics, and program management
- Service level agreements between supporting functions (such as IT, finance, and HR), VAMCs and the supply chain organization
- Commitment to delivery against the expectations laid out in the service level agreements
- Personnel aligned by product category

VA should then develop an organizational transformation plan to get from its current state to the blueprint in a defined timeframe. Careful consideration of sequencing based on organizational readiness for new capabilities and responsibilities will be essential.

It should also be noted that only contracting for the medical supply chain was considered in this assessment. However, the organizational transformation and guiding principles outlined here should also be considered in light of other specialized contracting activities. For instance, Assessment K (facilities) identified similar issues with respect to contracting performance and facility relationships, and organizational restructuring. The specialized needs of construction and leasing activities should be considered in any transformation effort, in line with the recommendations outlined in Assessment K.

The DALC has developed a number of practices, processes, and systems that could be of value across VA and which are highlighted throughout these recommendations. VA should evaluate each of these to determine how they could be replicated and scaled across VA to enhance the performance of its supply chain. In relation to organizational structure, we would recommend focusing on DALC's integrated operating model, where contractors work shoulder-to-shoulder with buyers and logisticians, while supply chain personnel work with finance, program management, clinicians, and customers, to select products and negotiate contracts with suppliers. This integrated operating model is very different to how the rest of VA operates currently, but it could inform how the integrated organization could operate going forward.

b. Establish robust performance management of supply and device procurement that is focused on Veteran outcomes.

VA should develop a more robust performance management approach that builds upon the integrated organizational structure outlined above, and takes into account the relative contributions of each function in delivering against the supply chain organization's end-to-end objectives.

This should include clear performance expectations of each function and each role within each function, including guidelines and expectations around productivity.

In addition, VA's supply chain should develop service level agreements between itself and its end users, based both on end users' service-level expectations and what is feasible within the constraints in which VA operates. That service-level agreement should define roles and responsibilities of major functions and personnel; turnaround or delivery times and other service-related targets for core actions; customer oriented performance metrics (like customer

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

97

satisfaction scores); and communication channels to manage to the service level agreements (how feedback from customers will be received and acted upon, for example). Care should be taken however, that auditing and compliance monitoring with these agreements do not become burdensome or damage relationships further.

The DALC represents a customer-centric model that could be built upon to develop these service-level agreements. DALC personnel have frequent, direct contact with customers – internal and external. This enables the organization to respond quickly to feedback and better meet the needs of Veterans. VA should explore the genesis and evolution of this customer-centric culture and develop a plan to replicate it in the new, integrated, end-to-end supply chain organization.

Enhancing VA's performance management system will require a level of standardized data capture and reporting that is not be possible with VA's current data systems. Therefore, system upgrades and/or replacements should be considered as per the recommendation below.

Once the integrated performance management system is in place, incentives and penalties should be established to ensure supply chain functions are held accountable for their performance relative to the agreed targets. Accountability measures should be carefully sequenced and matched to ensure responsibilities align with maturity of the new organization's capabilities.

c. Develop deep category-level expertise within the organization.

The DALC has successfully developed technical and contracting personnel with deep category expertise. Those individuals play a key role in product selection, contracting, and purchasing decisions. This is becoming standard practice in other high-performing health care organizations and has been standard practice beyond health care for many years. As VA restructures and reforms its supply chain organization, it should clearly lay out a plan for how category-level expertise will be built into the organization and how that expertise will be used. This may require that VA takes a more structured approach to professional development and/or considers recruiting category-level experts from outside VA.

In addition, we would recommend organizing the strategic sourcing functions of VA's new supply chain organization (for example, product selection, contracting, purchasing) by product category, to maximize the benefit of category-level expertise. This would likely result in higher levels of sub-specialization at the national level given the volume of purchases and value of each contract, with lower levels of specialization at the local level. For example, at the national level, the volume of items purchased and the potential for savings would likely justify investment in individuals with deep specialty-level expertise (for example, cardiac rhythm management devices). At the regional level, the specialty-level expertise may need to be rolled up into higher-level categories (like surgical implants). In that way, local specialists, service line leaders, and leaders of product standardization committees could have a more constructive and peer-like dialog with their strategic sourcing colleagues about product and supplier selection and subsequent contracting and purchasing.

5.2.2 Improve Key Enablers Required to Support the Transformation, Including IT Systems, Data Integrity, and HR

VA currently lacks critical enablers that will be required to achieve the level of transformation outlined above. Therefore, we would recommend VA does the following:

a. Update or replace supply chain IT systems to make them fit for purpose.
b. Standardize supply chain data and overlay user-friendly interfaces that enable robust and timely decision making.
c. Revise VA's approach to supply chain talent management.

a. Update or replace supply chain IT systems to make them fit for purpose.

VA's current supply chain management technology was developed in-house several decades ago; VA personnel report that it was considered to be state of the art when it was implemented. However, technology has evolved and the systems used by health systems across the country have evolved in concert. The software used by VA to manage its supply chain is no longer fit for purpose and needs to be upgraded and/or replaced.

In addition, health systems rarely claim that software development and IT implementation are their core competencies. As such, the majority of health systems around the country use third party software to manage their supply chain and rely on outside agencies to support the implementation of that software.

Therefore, we would recommend that VA carefully monitors the pilot and plans for SOARD given the track record. If there is evidence that the program is not going to meet VA's needs, VA should further evaluate the options that are available from third party software and IT companies to see if any of those would meet its needs. Any evaluation should include an assessment of the system's functionality relative to VA needs, its ability to integrate with existing systems, and its scalability.

As VA evaluates IT systems and data formats, VA should also ensure that any decisions are made in line with VA's overarching IT strategy and in full consideration of the interoperability and interdependencies between supply chain, financial, and clinical systems.

Ideally, VA would move towards a fully integrated system whereby, for example, product ordering and delivery is automated based on utilization; utilization automatically adjusts the value of inventory in the financial system; and any product that is used for a given patient is automatically captured in the clinical system. The VA's systems are a long way from this level of functionality and automation at the current time.

b. Standardize supply chain data and overlay user-friendly interfaces that enable robust and timely decision making.

VA's lack of data standardization is a major impediment to effective monitoring and management of its supply chain. Achieving data standardization across the enterprise should be a high priority.

As a first step, VA should evaluate near-term options to standardize the critical data elements to enable some level of cross comparability. This should include establishing a central item master file that contains standardized nomenclature and numbering of the most commonly used items across VA. It could also include mechanisms to ensure that any updates to nomenclature and numbering cannot be made by personnel in the field, and only by authorized personnel who manage the item master. In addition, VA should work to limit or prevent free text entry into any field by, for example, establishing drop down menus from which users can select the category of best fit.

Longer term, VA should fully standardize and centralize data management across VA. This could include moving to an international data standard such as GS1 or an internally developed system. VA should then develop a roadmap to consolidate databases based on this centralized and standardized data system.

In addition, VA's contracting system should be modified such that contracting staff cannot change dates in the system. Data on contracting timeliness should be automatically captured and reported and should reflect a true picture of contracting's performance relative to the agreed standards to enable fair and accurate performance management.

c. Revise VA's approach to supply chain talent management.

VA should evaluate whether current grade classifications are consistent and fairly applied across supply chain personnel given their current roles, responsibilities, workload, and criticality in providing service to Veterans.

VA should also explore waivers on federal or VA-imposed recruitment restrictions if positions are not filled within a pre-defined time period. In that way, VA may get access to a larger pool of highly-talented professionals who would otherwise have been deprioritized under the current recruiting restrictions.

VA should also continue to work on building expertise within the supply chain workforce, as other high performing organizations have done. In particular, VA supply chain leaders should establish clear career paths within supply chain management to help retain high caliber talent by providing opportunities for them within the organization. VA should also create opportunities for specialization such as category expertise described below.

The assessment team would also recommend fully implementing the recommendations laid out in Assessment L.

5.2.3 Streamline, Standardize, and Integrate Key Processes

Inefficiencies and lack of standardization in key processes inhibit VA's ability to be sufficiently flexible and responsive, and may also have led to some of the workarounds and practices that have developed, particularly around purchasing. Therefore, we would recommend that VA does the following in relation to specific processes:

a. Expedite product selection and standardization in key product categories.
b. Rationalize contracting requirements wherever possible and provide VAMC-level staff with access to contracting status.

    c. Standardize and simplify purchasing processes by automating wherever possible, linking inventory management systems to ordering systems, and driving greater use of electronic order entry.

    d. Identify, collect data from, and propagate innovations across VA.

a. Expedite product selection and standardization in key product categories.

VA should develop an approach to prioritize categories and/or products for standardization and an approach to select specific products that integrates the national Standardization User Group, VISN standardization committees, and Clinical Product Review Committees.

To do this, VA should build upon learnings from VA's Pharmacy Benefits Management organization's Pharmacy and Therapeutics committee structure, whereby VA has developed an integrated cascade of testing, review, feedback, and decision making related to selection and use of pharmaceuticals.

As with pharmaceuticals, utilization of products on the standardized list should be monitored and mechanisms established to drive compliance (like incentives and penalties). Physician engagement and a data driven approach is essential to Pharmacy's success. CPRC and VISN standardization committees should be tightly integrated with each other and the National Standardization Committees through cascading and overlapping representation (as in P&T committees) and participation should be made a core responsibility of clinicians.

b. Rationalize contracting requirements wherever possible and provide VAMC-level staff with access to contracting status.

The assessment team believes that process mapping has been underway for some time to identify bottlenecks and areas for improvement in contracting but that findings and recommendations have not yet been delivered to VA. VA should expedite this process.

However, it should also look more holistically at all the bureaucracy and regulations related to contracting and purchasing to identify opportunities to make the process more user-friendly for contracting personnel and the turnaround time faster for supply chain customers. It is likely that the process can be streamlined (fewer steps) and bureaucracy reduced (less work at each step). At the very least, it is likely that workload can be better tailored to the complexity of the contracting need and that contracting status could be more transparent to customers. To that end, VA should do the following:

- Develop a database of previous contracts and make it readily available and easily searchable so contracting personnel can avoid unnecessarily duplicative work.
- Develop a mechanism to aggregate contracting requests to identify opportunities where VA should develop a national contract. This would reduce workload on local contracting personnel and potentially enable VA to achieve more competitive pricing on frequently bought items.
- Enable customers to view the status of their contracting request. This does not necessarily mean that customers need read-only rights to eCMS as this could lead to inappropriate access to sensitive information. Instead, VA should evaluate whether it

---

might be possible to layer onto eCMS software that might provide high-level visibility into where each request is against key milestones, similar to how online shopping vendors and delivery companies provide their customers with information on order and delivery status.

c. Standardize and simplify purchasing processes by automating wherever possible, linking inventory management systems to ordering systems, and driving greater use of electronic order entry.

VA should streamline and update its electronic ordering system to encourage VAMCs to use it and to ensure better capture and tracking of purchasing data. VA should also build its contract catalog, usage hierarchy, and current pricing into the system so that orders are automatically placed on the correct contract and at the best price available to VA.

VA should establish mechanisms to automate the re-ordering of commonly used items based on electronic utilization triggers (like point-of-use technologies).

VA should explore opportunities to have specialized services, such as components of inventory management, provided by third parties whose core competency it is to provide such services. In particular, VA should explore the opportunity to have their MSPV(s) support inventory management across VA.

An internal example that could be leveraged is the DALC's web-based remote order entry system. It contains an integrated catalog with up-to-date contracts and prices, and it prevents inappropriate off-contract purchasing (if a contract is already in place, for instance). VA should explore whether this system or an off-the-shelf equivalent could support VA's desire to drive more on-contract purchasing through its prime vendor, improve compliance with purchasing regulations, and streamline the purchasing process for end users.

d. Systematically identify, collect data from, and propagate innovations across VA.

This report highlighted only a sub-set of innovations that are currently taking place across VA. However, among the innovations that were observed, several were relevant for the challenges VA is facing more broadly. Therefore, VA should build upon the organization's ability and willingness to experiment by establishing an approach to more systematically capture, codify, prioritize, and if appropriate, scale these innovations across VA.

Mechanisms to collect and propagate best practices could include a more robust two-way cascade of standardization committees discussed above. Lessons from the pharmaceutical committees should be leveraged, possibly including a national level Chief Logistics Officer Committee analogous to the Pharmacy Executive Committee, a national file and information site, and other activities such as those practices described in section 3.2.3.

5.3   Implementation Considerations

As previously noted and in alignment with Section 201 of the Choice Act, our recommendations were developed independently of VHA leadership to ensure an objective perspective. As a result of this approach, it will be incumbent upon the Commission on Care to further refine the

recommendations and collaborate with VHA and other stakeholders to incorporate these recommendations with current and planned initiatives.

This page intentionally left blank.

Appendix A Detailed Methodology

To ensure a broad range of sources, our assessment draws upon national data sets, national surveys, expert interviews, and visits to select VAMCs across the country, at which we conducted interviews, focus groups, and observations.

A.1 Data Sources

It should be noted that we did not conduct an audit to validate the accuracy of data that was provided, although, where applicable, we did note potential data integrity issues highlighted during site visit interviews.

A.1.1 Pharmaceuticals

- **Purchase order data**: (VA, 2012-2014) Data for prime vendor purchases was provided for calendar year 2012 – 2014 at the line item level for the entire VA system. Data fields included:
  - National drug code (NDC) number, active pharmaceutical ingredients, form, dosage, and unit for each purchase
  - Package size based on manufacturer units (number of pills in package or milliliters in a vial, for example)
  - Package size based on the prime vendor's selling units, but may represent more the typical unit of use (this may differ from manufacturer units, particularly for injectable forms)
  - VISN and station where purchased
  - VA class code
  - Average Wholesale Price (AWP) downloaded from Medi-Span® (a unit of Wolters-Kluwer), converted, where necessary, to present the Medi-Span AWP values consistent with the sizes of the prime vendor's selling units.
  - Total cost, units, contract number, and contract type from which prime vendor calculated price (such as Big 4, FSS, national contract, or WAC based generic pricing)
  - Flag field for whether purchase came from an open market account (note that some on contract purchases may be marked open market, and vice versa, due to late notifications or credit/rebills)
- **Prime vendor reports**: Standard prime vendor service reports were provided and include the following:
  - Total pharmacy purchases (both spend and volume) from the prime vendor by quarter for brand, generic, and over-the-counter drugs overall and by channel (e.g., CMOP versus VAMC)
  - Overall service level (e.g., fill rates) by channel
  - Customer service activity by type and by channel

- **PBM reports**: The VA PBM team provided standard reports that are currently used to manage the pharmaceutical supply chain. Reports included:
  - Drug volume and cost per unique patient and per 30 day prescription (VA, 2010-2014b)
  - Opioid utilization, opioid drug testing, and opioid + benzodiazepine rates by VAMC and VISN (VHA Pharmacy Benefits Management, 2015b)
  - Dispensing rates by CMOP and VAMC window pharmacy (VHA Pharmacy Benefits Management, FY2014)
  - Formulary compliance metrics (e.g., percent of prescriptions on-formulary, volume of non-formulary requests) (VA, FY2014b)

- **CMOP operational data**: (VA, 2015c) Core operational metrics were provided for each CMOP for FY2014, including:
  - Throughput times
  - Volume of prescriptions processed
  - Cost per prescription processed
  - Mailing cost per prescription sent
  - Error rates

- **Data calls from site visits**: VAMC-level data was collected during each site visit for metrics that were not readily available through system-wide data pulls
  - Minutes from recent Pharmaceuticals and Therapies (P&T) committee meetings
  - Annual volume of prescriptions returned to the VAMC by the CMOP
  - Annual volume of prescriptions written by an external Choice Act provider
  - Total pharmaceutical spend on purchase cards

- **National Average Drug Acquisition Cost (NADAC):** (Centers for Medicare and Medicaid Services, n.d.)Data for the weekly survey of community pharmacies was downloaded from the Centers for Medicare and Medicaid Services.

- **Wholesale Acquisition Cost (WAC) data:** Quarterly price data obtained from PriceRx was obtained for branded and generic drugs.

A.1.2 Clinical Supplies and Medical Devices

- **Purchase order data:** (VA, FY2014a) All obligation data from the Integrated Funds Distribution, Control Point Activity, Accounting And Procurement (IFCAP) system was provided for FY2014 – March FY2015 at the line item level for VISN 1, 8, 21, 22, and 23 (IFCAP Table 442); These five VISNs were chosen because they represented a geographically diverse set and covered the majority of medical and surgical prime vendors. Received data contained fields for (not necessarily complete):
  - Purchase order information including, date, PO number, method of processing (Purchase card, Invoice/requisition, and so on), supplier, total amount, cost center,

budget object code, financial control point, requesting service, and number of line items

- o Line item data including: contract number, vendor stock number, manufacturer stock number, long item description, NIF number, IMF number, total line cost, units, and unit size

- **Medical and surgical supplies data with an item master file number:** (VA, FY2015) Supplemental clinical supplies data (budget object code 2632) was provided for the entire system for FY15 transactions through February if they contained an item master file number, were charged to four relevant cost centers, and were not pharmacy fund control points. Data contained additional fields not present in full IFCAP data, including:
  - o Source code (Federal supply schedule, Decentralized VA schedule, Open market, or some combination of the previous, for example)
  - o Local procedure code which gave justification for certain purchases (like open market purchases)

- **Prosthetics order data**: (VA, FY2014c) Data was provided for FY2014 at the individual order level for the entire VA system (IFCAP Table 660) with any patient identifying information removed

- **Inventory days on hand**: (VA, 2015f) Monthly average metrics on clinical supplies inventories by inventory point were provided from 10/1/2014 through 1/31/2015

- **Data calls from site visits**: VAMC-level data was collected during each site visit for metrics that were not readily available through system-wide data pulls
  - o **Denver Acquisition and Logistics Center***: Cost savings reports, performance metrics (VA, 2015g), integrated project team charters and templates
  - o **Acquisition and logistics metrics books***: (VHA, 2015c; VHA, 2015a) (VHA, 2015c; VHA, 2015a) Monthly metrics reports and metric definitions
  - o **eCMS transmission communications**: (VAMC site visit, 2015) One facility visited by the team provided a log of all status transmissions for procurement requests from contracting (February 2014 – February 2015). It included the 2237 number, timestamp, status of transmission (Sent, Return, Cancel), and limited comments on cancellation or returns by contracting.
  - o **Logistics organization FTEs and examples of downgraded positions**

- Publically available data: Relevant VA data was downloaded from various Federal government websites for analysis

  - o **Federal Procurement Data System (FPDS):** (VA Contracts in the Federal Procurement Data System, 2010-2015) Contract information was downloaded for the Department of Veterans Affairs

A.2 Data Analysis

A.2.1 Pharmaceutical Pricing Analysis

Comparison of overall prices paid to industry: Only tablet and capsule form drug purchases were considered. Average price per pill (total cost divided by pills purchased; pills calculated as units multiplied by manufacturer package size) were calculated from VA prime vendor purchase data for the month of April 2014 at the NDC level separately for generic and branded products. NADAC prices for the month of April 2014 were cross-matched to VA data using the NDC number. Drugs whose prices changed in the month of April according to NADAC were excluded from the analysis. All prices were indexed to the AWP included in the prime vendor purchase data. The unweighted average price is reported.

Prices paid by VA on different contracting vehicles: Average price per pill or pill equivalent (as calculated in previous paragraph) were determined for all VA products purchased through different pricing types (as labeled in the prime vendor purchase data) in CY2014. For products purchased through more than one pricing type, prices were indexed to the FSS average cost paid. Brand and generic purchases were considered separately and pricing instruments with less than nine data points were excluded (blanket purchase agreements and generic FSS restricted contracts, for example). The median indexed price was reported.

A.2.2 Vendor Name Format Reduction

All vendor names were extracted from prosthetic purchase data for FY2014 and duplicate entries were removed. The unique list, containing 23,725 unique name formats, was matched with itself using the Microsoft Excel Fuzzy lookup plugin to create 33,799 pairs at a 95 percent confidence level. These pairs were then clustered into unique sets using an automatic algorithm that joined pairs based on a common member. These sets were then manually inspected and grouped to form 2,661 sets, leaving 9,523 vendor formats from the initial list unpaired.

A.2.3 Price Arbitrage Analysis

Medical and surgical supplies equivalent item analysis: Purchase order and line item data from VISN 8 and VISN 22 were provided separately for each facility and combined based on the station number and database row id (VistA Table 442). Combined data was filtered for budget object code 2632 and CY2014, and then manually inspected to remove non-medical and surgical supply spend. The cleaned data was then constrained to the six months from July 2014 to December 2014 to negate the impacts due to price inflation on product SKUs. A proprietary algorithm was used to identify equivalent products, largely based on manufacturer or vendor stock numbers and unit size information within the file.

Medical devices equivalent item analysis: Prosthetic appliance request data (Table 660) was filtered for relevant medical device spend using the National Prosthetics Patient Database (NPPD) code (Artificial legs - 200*, Artificial arms - 300*, Orthosis/Orthotics - 400*, Shoes/Orthotics – 500*, Sensori-neuroaids – 600*, Oxygen supplies – 800D, Respiratory supplies – 800H, Surgical implants – 960*, Biological implants – 970A) within VISN 8 and VISN

22. Requests were matched to IFCAP purchase order data using the transID and station codes to reconstruct the PO number. Lines with no manufacturer or vender stock number were excluded from analysis (68 percent of the data by spend). Remaining data were matched similarly to the medical and surgical supplies analysis.

Arbitrage opportunity calculation: A list of price points were identified for each equivalent purchase. As the lowest price point is not always achievable for a number of reasons (such as temporary price reductions on expiring stock), a conservative estimate of minimum price achievable was calculated by taking the lowest price to fall within the average price point and average price point divided by a sensitivity factor (150 percent, 200 percent). If no price point fell within that range (such as if there were only two, widely separated price points) no arbitrage opportunity was assigned for that product. Total arbitrage opportunity was calculated as the difference in price paid from the arbitrage price, multiplied by the volume paid at the price point considered.

A.3   Site Selection

To increase consistency and generalizability of findings, assessment teams have coordinated our sampling methods to the extent possible while ensuring sampling the methodology reflected assessment-specific considerations. We have selected a core set of VAMCs to visit, which are representative of the VAMC system as a whole across critical facility demographic and performance outcome metrics.

The VAMC site selection process followed the following steps:

1. **Stratification of facilities:** Stratified random sampling, with VISN as strata, was used to select an initial long-list of facilities. To reduce sample size, a subset of VISNs was randomly selected, from which one of the two initially selected sites was randomly de-selected.

2. **Review of distribution:** Chi-square testing was used on each of the key facility profile and performance variables to ensure the distribution of scores in the sample is representative of the population. Variables were chosen to reflect anticipated drivers of facility performance, and included: VISN, rurality, adjusted admissions, complexity level (on VHA rating scale), adjusted LOS, patient satisfaction, cumulative access score, and facility age

3. **Refinement of facility selection:** Initial facility list was vetted with internal and external SMEs and augmented as needed, to include facilities that are considered critical for inclusion (e.g., a Polytrauma Center, facilities with innovative tools/practice) and ensure that all selected facilities had the range of services being assessed.

This method resulted in a sample of 25 facilities that is representative across each of the criteria used in selection.

A.3.1 VAMC Site Selection Variables

Variables were selected based on criteria relevant to each assessment area and assumed impact on facility performance. Variable definitions are given below:

- VISN: used VHA Support Center (VSSC) classification of VAMCs by VISN

- Rurality: used VSSC 2014 categorization of facilities as rural or urban

- Adjusted admissions: relied upon American Hospital Association (AHA) 2014 data (American Hospital Association, 2014). Adjusted admissions = Total admissions *(Admissions*(OP revenues/Total revenues)). VHA reports revenue data (gross billed revenue) to AHA to calculate this metric. Adjusted admissions scores were divided into quartiles, with the middle quartiles grouped, to produce low (<2881.75), medium (2881.75-6081.00), and high (>6081.00) adjusted admissions categories

- Complexity level: used VSSC 2014 categorization of facility complexity. Level 1 facilities were grouped, to produce selection criteria of high complexity (levels 1a, 1b, and 1c), medium complexity (level 2), and low complexity (level 3).

- Adjusted LOS: used VA SAIL data. As only Q3 FY2014 was available to us at the time of selection, we were only able to use that quarter's results. LOS data was divided into quartiles, with the middle quartiles grouped, producing three variables: low LOS (<4.19), medium LOS (4.19-5.14), and high LOS (>5.14)

- Patient satisfaction: used VA SAIL data. As noted above, as only Q3 FY2014 was available to us at the time of selection, we were only able to use that quarter's results. Patient satisfaction data was divided into quartiles, with the middle quartiles grouped, resulting in low (<249.83), medium (249.83- 264.02), and high (>264.02) satisfaction categories

- Cumulative access score: used VA SAIL data. As noted above, as only Q3 FY2014 was available to us at the time of selection, we were only able to use that quarter's results. The eight access scores included in the VA Q3 FY2014 SAIL report were assigned quartiles and added together to produce a single cumulative access score, which was then divided into quartiles. This process resulted in cumulative score quartile categories of low (<17), medium-low (17-20), medium-high (20-23), and high (>23) access

- Facility age: relied upon VSSC 2014 operational date data for each VAMC (U.S. Department of Veterans Affairs, 2014). Operational dates were divided into quartiles, with the middle two quartiles grouped, producing categories of early (prior to June 4, 1929), medium (June 4, 1929 – April 7, 1952), and recent (after April 7, 1952) establishment

In several instances, variable data was not available for each VAMC. To ensure that these cases were not excluded from the sample, we scored absences with -1 and included the -1 score as a category for each selection criterion where there were absences.

A.3.2 VAMC Core Site Selection Representativeness

Results for Fisher's exact test demonstrate that the sample is not significantly different from the population of VAMCs (Table A-1):

Table A-1. Fisher's Exact Test Results

Appendix B   Previous Assessments

B.1   Summary of Previous Assessments

Table B-1. Summary of Major Themes and Findings from Select Previous Assessments Relevant to the VA's Pharmaceutical Organization

Year	Title	Agency	Main findings and recommendations
2002	VA Health Care: Expanded Eligibility Has Increased Outpatient Pharmacy Use and Expenditures	GAO	▪ After VA implemented eligibility reform in 1999, the use of the pharmacy benefit by Priority 7 Veterans increased from 11 million 30-day equivalents in 1999 to 26 million in 2001 and resulted in a doubling of net pharmacy expenditures for that population
2002	VA and Defense Health Care: Increased Risk of Medication Errors for Shared Patients	GAO	▪ Patients that are receiving care from both DoD and VA providers face an increased risk of medication errors, mostly due to the presence of separate, uncoordinated information and formulary systems ▪ There is additional risk due to lack of inter-accessibility between medical record systems and resulting inability to automatically check for drug allergies and drug-drug interactions ▪ Joint care facilities are implementing changes to address this increased risk, which include: o Creation of joint P&T committees o Increasing accessibility to EMRs o Creating a platform to support electronic (rather than handwritten) prescriptions for all providers ▪ Recommendations included creating a standard platform for sharing electronic information between systems, developing a comprehensive system to check drug interactions, and establishment of a joint P&T committee at all sites
2005	Mail Order Pharmacies: DoD's use of VA's mail order	GAO	▪ DoD could achieve savings of ~$1.39 per prescription in drugs costs if it used the

Year	Title	Agency	Main findings and recommendations
	pharmacies could produce savings and other benefits		VA's CMOPs to dispense its outpatient refill prescriptions ▪ Non-financial benefits from this arrangement could also be realized including reduced traffic / congestion at military treatment facilities, shorter pharmacy waiting times for active servicemembers, and increased satisfaction resulting from the VA's accurate and timely distribution of pharmaceuticals
2010	VA Drug Formulary: Drug Review Process is Standardized at the National Level, but Actions are Needed to Ensure Timely Adjudication of Nonformulary Drug Requests	GAO	▪ According to the VA PBM, reviews for the majority of the drugs that VA considered adding to its formulary in 2008-20009 were completed within a year of FDA approval ▪ There is variability at the VISN and VAMC level in the non-formulary drug request process is handled ▪ VA requires that non-formulary drug requests are handled within 96 hours, but VA is unable to determine the number of requests that exceed this time limit due to limitations in data collection and process differences
2012	Review of open market purchases under VA's pharmaceutical prime vendor contract	OIG	▪ Policy changes instituted in November 2011 did not prohibit open market purchasing, but instead led to decreased visibility into purchasing practices ▪ Major recommendations to VA included: o Block drug purchases for items where generic products are on contract o Require the prime vendor to update its ordering system to more effectively interface with the VA's CMOP ordering system o Ensure VA facilities purchase all products available on FSS at or below FSS pricing if not purchased through prime vendor

Year	Title	Agency	Main findings and recommendations
			○ Retrain ordering officers on allowable practices and revoke warrants from non-compliant officers
2012	DOD and VA Health Care: Medication Needs during Transitions May Not Be Managed for All Servicemembers	GAO	▪ The DoD does not have a formal policy for transitioning medication needs for all servicemembers ▪ The current DoD medical assessment has gaps compared to best practices for medical transitions (e.g., no plan is developed for how to obtain medications during the transition, medication lists are not provided at point of discharge) ▪ While VA and DoD do have programs for a select group of servicemembers (e.g., individuals with complex care needs), the programs are not available at all facilities ▪ GAO recommended that VA and DoD identify and implement best practices to improve continuity of care and reduce potential for misusing or discontinuing psychiatric or pain medications
2013	Prescription drugs: Comparison of DoD and VA Direct Purchase Prices	GAO	▪ For a sample of 83 drugs purchased by both VA and DoD in Q1 2012, the average unit price for VA was 31.8 percent lower than the DoD's price. For a subset of generic drugs, VA was 66.6 percent lower than the DoD. ▪ Differences in prices paid were related to drug utilization differences, formulary design, price and rebate negotiations by both organizations,

**Table B-2. Previous Assessments of Medical/Surgical Supplies
and Devices Considered for This Report**

Year	Title	Agency	Main findings
1999	Audit of VA Medical Center Management of Medical Supply Inventories	OIG	▪ VHA holds too much inventory on hand, in large excess over 30 days. Reasons for high levels: Improper stock levels set ▪ Normal stock levels not reviewed and updated ▪ Quantities on hand are not monitored ▪ Reductions in demand not effectively managed
2007	Audit of the Acquisition and Management of Selected Surgical Device Implants	OIG	VHA could reduce its procurement costs for aortic valves, coronary stents, and thoracic grafts and should strengthen key SDI management controls in the areas of inventory, patient privacy, and recalls
2008	Audit of VHA's Government Purchase Card Practices	OIG	VHA purchase card controls were generally effective at preventing or detecting improper or fraudulent medical facility purchases. All purchases reviewed (707) were for medical facility needs, although price reasonableness could not be documented for 126. Of the 126 transactions, 65 were for open market purchases and cardholders did not maintain documentation showing multiple quotes were sought or justification for using non-competitive sourcing.
2009	Audit of VHA's Undelivered Orders	OIG	Internal controls to identify invalid undelivered orders need improvement. There was inadequate follow up by Fiscal Service staff because of policy to follow up after the order's end-date rather than after 90 days of inactivity. Fiscal Service staff did not perform reconciliations between FMS and source documents
2009	Audit of Veterans Health Administration Open Market Medical Equipment and Supply Purchases	OIG	VHA ineffectively uses FSS for medical equipment and supply purchases, and it has weak internal controls over open market purchases. Found $8.2M opportunity if open market purchases were made on existing FSS contracts.

Year	Title	Agency	Main findings
2010	Spending for and Provision of Prosthetic Items	GAO	VA spending for prosthetic items varied both over and under budget estimates from FY2005 through FY2009. Analysis of trends is limited for budget purposes and relies mostly on local services to identify more up-to-date estimates. Provision of products to Veterans met performance goals, although timeliness measures had flaws that did not capture the full time it may take for a Veteran to receive their prosthetic appliance. Seven out of 21 VISNs had centralized PSAS management allowing some to share resources, reduced competition with other services for staff resources at VAMCs, and freed local PSAS staff from some administrative tasks to focus more time on meeting Veteran needs.
2010	Inadequate Controls over Miscellaneous Obligations Increase Risk over Procurement Transactions	GAO	In FY2007, VHA used $1.4 billion in miscellaneous obligations to acquire pharmaceuticals and hospital supplies when specific quantities and time frames are uncertain. GAO found inadequate controls and oversight which increased the risk of fraud, waste, and abuse for miscellaneous obligations. This included lack of segregation of duties and supporting documentation.
2011	Audit of Veterans Integrated Service Network Contracts	OIG	Changes instituted in 2009 were not effective: 1) VA did not follow the new review processes consistently; 2) VA and VHA acquisition management did not provide adequate guidance and oversight on IOP implementation
2011	Weakness in Policies and Oversight Governing Medical Supplies and Equipment Pose Risks to Veterans' Safety	GAO	Selected requirements for tracking and reprocessing medical equipment are inadequate to help ensure Veterans' safety
2011	Protests Concerning Service Disabled Veteran Owned Small	GAO	GAO determined that the Veterans Benefits, Health Care and Information Technology Act of 2006 requires VA to set aside procurements,

Year	Title	Agency	Main findings
	Business Preferences Sustained		even if they are on FSS, for SDVOSB concerns if the contracting officer has a reasonable expectation of receiving offers from two or more SDVOSB concerns and that the award can be made at a fair and reasonable price
2012	Audit of Prosthetics Supply Inventory Management	OIG	- Inefficiencies from using two inventory systems - Inadequate staff training on inventory management principles and techniques - Insufficient VHA Central Office and VISN oversight of VAMC inventory management practices - Inadequacies in the VHA Inventory Management Handbook
2012	Audit of the Management and Acquisition of Prosthetic Limbs	OIG	VHA overpaid prosthetic limb vendors by $2.2 M (4 percent) in FY2010 largely because vendor invoice included higher prices than quoted - improved review by Contracting Officer's Technical Representative was needed Additionally, contracting practices were variable between VISNs, including negotiation practices and interpretation of guidance on the number of vendors to establish contracts with
2012	Strategic sourcing: Improved and Expanded Use Could Save Billions in Annual Procurement Costs	GAO	DOD, DHS, DOE and VA accounted for 80% of $537 billion in federal procurement spending (FY2011), but only 5 percent was strategically sourced. VA spent 1.4 percent of $17.4 billion in FY2011 through strategic sourcing, and had no utilization targets. In response to proposal from VHA, VA has committed to hiring 150 FTE to establish commodity management teams to identify department wide strategic sourcing opportunities and develop improved requirements packages. VA also cites lack of strategic sourcing expertise and cited a training program to address this challenge
2012	Audit of Savings Reported Under the Office of Management and Budget's	OIG	VHA inaccurately report $710 million (65 percent) of its savings target under the OMB acquisition savings initiative for its FY2010-11 plan. The majority of savings were to come from

Year	Title	Agency	Main findings
	Acquisition Savings Initiative		consolidating contracting using VISN, regional, and national contracts; increased competition for contracts; and by canceling Army Corps of Engineers contracts and using VHA's in-house contracting resources. $562 million were not reportable under OMB guidance because new actions (such as negotiating more favorable pricing or improving contractor performance) were not taken on existing contracts since FY2008. A further $129 M did not have supporting documentation (including $107 from PBM). VHA did not issue appropriate guidance or provide oversight for reporting savings
2013	VHA Has Taken Steps to Address Deficiencies in Its Logistics Program, but Significant concerns remain	GAO	VAMCs and networks have partially complied with new VHA requirements to address deficiencies in its logistics program. VHA has additional efforts underway to further improve its logistics program, but they face uncertainty about implementation.
2014	Oversight of Tissue Product Safety	GAO	Poor inventory management practices challenge VA's ability to track product recalls. Systems are inadequate and contain accuracy issues that make searching inventories for products difficult.

B.2   Key Questions to Guide Assessment Approach

To ensure that a comprehensive assessment of the VA pharmaceutical supply system was achieved, a series of guiding questions were developed and tested with supply chain experts. These questions are summarized below in (Table B-3, Table B-4).

Table B-3. Key Questions for Assessment J

Purchasing	- How do the VA's drug costs compare to industry benchmarks? - How effectively does VA use group purchasing arrangements (e.g., percent of purchases made through open sources, percent of purchases on-contract)? - What are the roles of and relationships between national, regional, and local purchasing groups? - How is the value of new drugs assessed by VA and how does that compare to industry best practice?

Distribution	• How efficient and effective is the VA's drug distribution, inventory management, and mail-order pharmacy relative to standards? • How often do stock-outs or shortages occur and what does VA do to prevent them? • To what degree is shrinkage, wastage, expiration an issue, and why?
Use	• How does VA compare to industry benchmarks on key utilization metrics (e.g., formulary compliance rate, generic dispensing rate, annual drug spend per patient)? • How do the VA's policies, practices, and processes impact those performance metrics (e.g., formulary development and override policies, therapeutic interchange)? • What is the level of Veteran satisfaction with the current VA pharmaceutical system?
Cross-cutting	• How is the pharmacy division structured and resourced? • How does the structure, membership, operating model, and bylaws of the pharmacy and therapeutics committee(s) compare to industry best practice? • Who is accountable for purchasing decisions?

Table B-4. Guiding Questions for the Assessment of VA Purchasing, Distribution and use of Clinical Supplies and Devices

Purchasing	• How do the VA's supplies and devices costs compare to industry benchmarks? • How effectively does VA use group purchasing arrangements? • What are the roles of and relationships between national, regional, and local purchasing groups (e.g., feedback loop from local groups to national groups)? • How is the value of new supplies and devices assessed and how does that compare to industry best practice?
Distribution	• How efficient and effective is the VA's supplies distribution and inventory management? • How often do stockouts / shortages occur and what can be done to prevent them? • To what degree is shrinkage, wastage, expiration an issue, and why?

Use	- How does VA compare to industry benchmarks on key utilization metrics (e.g., supplies spend per patient)? - How standardized are utilization practices across the VA? - How does the VA's policies, practices, and processes key performance metrics?
Cross-cutting	- Where are decisions around supplies made and who has accountability for those decisions (e.g., new product introductions, inclusion in standardized care pathway)? - How do VA systems, processes and talent management support a Veteran's care with respect to delivering needed clinical supplies, devices and services?

Prepared for CAMH under:

Prime Contract No. HHS-M500-2012-00008I

Prime Task Order No. VA118A14F0373

This page intentionally left blank.

Preface

Congress enacted and President Obama signed into law the Veterans Access, Choice, and Accountability Act of 2014 (Public Law 113-146) ("Veterans Choice Act"), as amended by the Department of Veterans Affairs (VA) Expiring Authorities Act of 2014 (Public Law 113-175), to improve access to timely, high-quality health care for Veterans. Under "Title II – Health Care Administrative Matters," Section 201 calls for an Independent Assessment of 12 areas of VA's health care delivery systems and management processes.

VA engaged the Institute of Medicine of the National Academies to prepare an assessment of access standards and engaged the Centers for Medicare & Medicaid Services (CMS) Alliance to Modernize Healthcare (CAMH)[1] to serve as the program integrator and as primary developer of the remaining 11 Veterans Choice Act independent assessments. CAMH subcontracted with Grant Thornton, McKinsey & Company, and the RAND Corporation to conduct 10 independent assessments as specified in Section 201, with MITRE conducting the 11th assessment. Drawing on the results of the 12 assessments, CAMH also produced the Integrated Report in this volume, which contains key findings and recommendations. CAMH is furnishing the complete set of reports to the Secretary of Veterans Affairs, the Committee on Veterans' Affairs of the Senate, the Committee on Veterans' Affairs of the House of Representatives, and the Commission on Care.

The research addressed in this report was conducted by McKinsey & Company, Inc., under a subcontract with The MITRE Corporation.

---

[1] The CMS Alliance to Modernize Healthcare (CAMH), sponsored by the Centers for Medicare & Medicaid Services (CMS), is a federally funded research and development center (FFRDC) operated by The MITRE Corporation, a not-for-profit company chartered to work in the public interest. Executive Summary

Scope

Assessment K examined "the process of the Department for carrying out construction and maintenance projects at medical facilities of the Department and the medical facility leasing program of the Department." Specifically, the team was required to (i) review the processes for identifying and designing proposals for leases and capital projects, (ii) assess the process for determining the necessity and size of a lease or capital project, (iii) assess the processes and project management of the design, construction, leasing, and activation of medical facilities, and (iv) assess the medical facility-leasing program of the department. The Assessment K team also considered two additional areas that are critical to addressing VHA's facility needs, facility management and the long term capital funding needs of VHA.

Findings

We have found that VHA is expected to face accelerating and likely unfunded capital requirements driven by maintenance to aging infrastructure, projected workload needs to serve the Veteran population, and inefficient capital management. Moreover, we observed that VA performance in capital management, design and construction, leasing, and facilities management is on par with public sector performance in most cases, yet well below private sector performance, particularly in the cost to deliver major construction projects. Consistently deploying world class practices in capital management has the potential to improve performance significantly and address some of the capital constraints VA faces, but would require a further overhaul of VA's capital program and supporting organization. However, even if VA is able to meet the significant challenge of achieving best practice performance in capital management, VA would still likely experience a significant capital funding gap that will require strategic changes in operations and additional funding to close the gap.

The capital requirement for VHA to maintain facilities and meet projected growth needs over the next decade is two to three times higher than anticipated funding levels, and the gap between capital need and resources could continue to widen.

VA has identified more than $51 billion in total capital needs over the next 10 years through its capital planning methodology.[2] These requests cover current ten-year projections; however, new projects may be added as needs change and could change the total capital requirement. Provided that average funding levels remain consistent over the next 10 years, the $51 billion capital requirement would significantly exceed the anticipated funding level of $16-26 billion.[3]

---

[2] The $51 billion capital requirement combines $46 billion in projects submitted through the Strategic Capital Investment Plan (SCIP) and $5 billion in anticipated outstanding funding needs for on-going major projects projected in the FY2016 VA Budget Submission. While our team did not independently verify the cost estimates for the 8,038 capital requests that make up the $46 billion requests through SCIP, we did review the process by which these requests are identified and developed. See Section 3.1 and Appendix B.3 for additional detail.

[3] Over the last four years, VA's capital funding budget has ranged from $1.6 billion to $2.6 billion each year, averaging $2 billion.

Multiple factors drive the scale of the capital need. VHA facilities are older buildings, with significant repair needs, and some are poorly suited to emerging models of care. The average VHA building is 50 years old, five times older than the average building age for not-for-profit hospital systems in the United States.[4] While many facilities have been extensively renovated, the renovations themselves have aged, and the condition of buildings shows this strain. Independent assessments of infrastructure and facilities through the VHA Facilities Condition Assessment (FCA) found that VHA facilities average a "C minus" score, meaning that much of the total facilities portfolio is nearing the end of its useful life.[5] More than 70 percent of VHA facilities correction costs result from infrastructure and facilities that are D rated, meaning that they are at the end of their useful life.

Current facilities, whether they have been maintained adequately or not, often do not match current models of care. The overwhelming majority of VHA hospitals were designed when care was focused more heavily around inpatient hospital treatments. Over the past eight years, Veteran inpatient bed days of care have declined nearly ten percent while outpatient clinic workload has increased more than 40 percent.[6] Space for outpatient care is typically housed in converted inpatient spaces or VHA's growing number of clinics. As a result, VHA's capital needs fall into a broad range of categories, including ensuring adequate facility condition, providing sufficient and appropriate space for Veteran care, and upgrading infrastructure. As facilities age further and care continues to shift to the outpatient setting, the size of the capital need could continue to grow.

Shortfalls in overall accountability, role clarity, personal ownership, internal communication, and proactive problem solving approaches limit the ability of VA and VHA to deliver the correct projects consistently on time and on budget. Facilities functions are dispersed through VA, resulting in a lack of accountability for facilities outcomes, a mismatch between planning efforts and funding decisions, and the separation of project execution and facilities management. Additionally, internal VA directives, federal procurement requirements, and stakeholder involvement impact VHA's ability to deliver and operate medical facilities at the level of private sector benchmarks.

Capital is not being consistently allocated to projects that address the greatest areas of Veteran need in the most cost effective and timely manner. Lengthy approval and funding timelines hinder the ability of VHA to meet the identified space requirements to keep up with Veteran demand and invest in facilities updates that align with changing models for care. VA has recently established the Strategic Capital Investment Plan (SCIP), a systematic approach to approve capital projects and allocate funding. However, the process does not yet ensure full

---

[4] The age of VHA facilities is calculated by taking the year built recorded in the Capital Asset Inventory and weighting it by the gross square footage of each property. 2013 analysis of 139 not-for-profit hospital systems in US, encompassing 1,362 hospitals (Soule & Keller, 2013). See Section 5.2.1.4 for additional detail.

[5] FCA assessments are conducted by independent evaluators at each facility every three years. More than 180,000 individual items are scored across VHA facilities, using a scale of A (like new) to F (critical condition) scale. Average score was calculated using the aggregated reports in VA's Capital Asset Database, accessed March 2015.

[6] Workload reported by VAMCs in the 2015 VSSC Trip Packs, aggregated by VISN.

alignment with VA strategy, include rigorous business case scrubbing, or incorporate feedback on past project outcomes into the capital program assessment.

VA construction costs are similar to other public agencies in most cases, but double private industry best practice, and VA time-to-complete exceeds both public and private peers. Increased design requirements resulting from resilience, energy, security and community mandates increase the initial cost of projects over the private sector. Frequent design changes driven by users before construction contract award and during construction further increase the costs of projects and contribute to construction delays. Additionally, project teams are designed and staffed to support compliance requirements but these structures have resulted in reduced accountability for project delivery outcomes and a limited ability to develop solutions to manage cost overruns and schedule delays.

The leasing program is not effectively enabling VHA to provide facilities where and when they are required or at a reasonable cost for major leases. Lease timelines preclude VHA from benefitting from the speed and flexibility that leasing typically provides, often taking more than twice as long as private sector benchmarks. The leasing program typically achieves per square foot costs comparable to market prices for small and medium sized facilities, however, for larger build-to-suit facilities which are impacted by the same type of design and construction challenges seen in owned facilities we observed rents clustered at 40 to 50 percent higher than private sector benchmarks.

Facility management costs across VHA exceed those at comparable medical facilities. Facility management costs, including recurring maintenance and environmental services, are on the average two to three times higher than comparable private medical facilities, largely due to in-house management of these services rather than utilization of lower cost external service contracts. Facility management costs and practices are also highly variable across VHA facilities, with little incentive for individual stations to adopt cost effective measures.

Recommendations for consideration

Achieving best practice levels of performance in each of the assessment areas would require an overhaul of VA's capital program and supporting organization. Through our research, we have identified best practices from capital management organizations around the world that could be deployed to improve the total performance of capital programs of the scale and complexity of VA's. The cumulative improvement value of deploying all of these best practices in a single organization could result in savings up to 40 percent.[7] However, even world class capital management organizations do not succeed in deploying all of these best practices consistently across their organizations, which illustrates the scale of the challenge. Shifts in the model of care delivery, lengthy approval processes, organizational health concerns, and strained budgets have combined to make capital management and delivery a formidable task for VA, and even the most ambitious transformation effort at VA may not achieve this total potential. As a result,

---

[7] "Infrastructure Productivity How to save $1 trillion a year," by McKinsey & Company (January 2013). This report includes more than 400 case examples from around the world. For this assessment, estimated savings have been adjusted to reflect requirements and constraints specific to VA.

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

we have estimated the total potential improvement opportunity for VA to be up to 25-35 percent.

Detailed recommendations for improving the capital program can be found in Sections 5 through 9, for each of the deep dives on core assessment areas. These recommendations fall into the following main opportunity areas:

VA should improve project selection and refine its project portfolio. VA should refine the SCIP process to rationalize and prioritize capital requirements by ensuring that space, energy, and condition criteria are reflective of the most critical items that contribute to Veteran care. The SCIP process, initiated four years ago, advanced VA capital project selection by creating a standardized methodology to review and approve projects which did not previously exist, but further steps are needed to improve the approach. These include a careful assessment of standards and a modification of the criteria for project selection. By focusing the criteria and approval processes for capital projects, VA could concentrate capital spending on strategic priorities and accelerate approval timelines. Capital project planning should also incorporate feedback on performance and outcomes from past projects to determine which capital programs respond to Veteran needs in the most cost effective manner possible. This would help enable a vital link between portfolio planning, project execution, and achievement of the desired outcomes in Veteran care.

VA should streamline project delivery across all construction types and leasing. VA should comprehensively address the root causes (for example, specifications, approval processes, project governance structures, team capabilities and composition) currently leading to consistent overruns in cost and schedule for construction projects and lengthy timelines for leases. This begins with modernizing and rationalizing design standards in keeping with current innovations in health care. A clear stage-gate process should be implemented to manage scope and design changes in the planning and design phases of projects and to limit scope and design changes that occur after a project receives funding and during construction. The recently launched Capital Program Requirements Management Process (CPRMP) introduced reviews during the design process to manage scope changes, another positive step which should be further developed and rolled out. To increase ownership and accountability, project delivery teams should be restructured with clear roles and responsibilities, well-defined handoffs, and adequate staffing levels. Additionally, contracting and other supporting entities should be accountable and equipped to support a fast-paced project environment and facilitate the needs of construction projects and leases.

VHA should ensure proposed projects make the most of existing infrastructure. VHA could improve the effectiveness of its infrastructure through incorporating a total cost of ownership assessment approach into design, capital planning, and facility management. This requires evaluating the operational cost implications of design choices and pursuing opportunities to optimize capital and operating costs simultaneously. Space planning programs should regularly evaluate underutilized and vacant space to identify opportunities for increased utilization or to actively divest unusable properties.

In addition to taking steps to address the above recommendations, VHA should consider more transformative options as needed to address the remaining unfunded capital

requirement. If VA is able to successfully implement current improvement initiatives, act on the additional recommendations listed above, and demonstrate best practice performance, VA could potentially reduce its total capital need to $33 to $38 billion over the next 10 years. Based on average funding of $16-26 billion over 10 years, an unfunded gap of $7 to 22 billion would still exist. To close this remaining gap, funding would have to increase and VA will need to consider more transformative options. When other institutions have faced similar capital shortfalls, they have considered a range of strategic and business model redesign options in addition to implementing best practices in capital project delivery. This report lays out several strategic approaches for further consideration by VHA, including:

- *Maximize operational efficiency*. Operating improvements, such as extending operating hours, improving scheduling efficiency, increasing tele-health options, and reducing average length of stay, can provide non-capital solutions to meeting workload needs. The operating recommendations in Assessments E, F, G, and H may contribute to addressing VHA's capital need.

- *Reassess how and where to best serve Veterans*. When facing similar circumstances to VA, other health care organizations have considered strategic operating changes that result in a realignment in their capital portfolios. This could potentially include geographic realignment, community partnerships, or a shift in service offerings. Assessments B and C may offer some further insights.

- *Explore alternative vehicles for capital delivery*. Alternative models of providing facilities have proved productive for some organizations. These models include contracting out capital investment, outsourcing facility management, and establishing innovative public-private partnerships.

In summary, VA has taken steps to improve its capital program, but much more is required given the scale of the capital need and the gap between current performance and best practice. Even with the most ambitious expectations for improving the capital program, VA will likely face a major funding gap over the next decade that will require a combination of additional funding and transformative changes to operations in order to ensure that Veterans receive the level and quality of care VA has committed to provide.

1 Introduction

1.1 Purpose

With the goal of improving access, quality, and effectiveness of health care delivery for Veterans, the Veterans Access, Choice, and Accountability Act of 2014 ("Veterans Choice Act"), Section 201 mandated a forward-looking, independent assessment of current practices and opportunities for improvement. Assessment K of the Veterans Choice Act requires the review of the processes of VA for carrying out construction and maintenance projects at medical facilities and the medical facility-leasing program of the department.

Cross-cutting findings and recommendations for consideration are discussed in Sections 3 and 4 of this assessment. The specific elements of the legislation are discussed in depth in the following sections, as detailed in Table 1-1:

Table 1-1. Elements of Veterans Access, Choice, and Accountability Act

Veterans Choice Act Section 201: Assessment K	Assessment K Section
(i) Review the processes of the Department for identifying and designing proposals for construction and maintenance projects at medical facilities of the Department and leases for medical facilities of the Department.	**"Section 5: Capital Planning Assessment"**: The capital planning section of this report addresses how the Department identifies and designs proposals for new capital projects, including leases
(ii) Assess the process through which the Department determines the following: - That a construction or maintenance project or lease is necessary with respect to a medical facility of the department. - The proper size of such medical facility or proposed medical facility with respect to treating Veterans in the catchment area of such medical facility or proposed medical facility.	**"Section 5: Capital Planning Assessment"**: The capital planning section of this report reviews the means by which the necessity and size of a facility is evaluated **"Section 6: Design and Construction Assessment for Major Projects"** and **"Section 7: Design and Construction Assessment for Minor and Non-recurring projects"**: the design and construction sections address the means by which plans and designs for new and existing facilities are determined
(iii) Assess the management processes of the Department with respect to the capital management programs of the Department, including the processes relating to the methodology for construction and design of	**"Section 5: Capital Planning Assessment"**: The capital planning section of this report reviews the management processes of the capital management programs of the

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

Veterans Choice Act Section 201: Assessment K	Assessment K Section
medical facilities to the Department, the management of projects relating to the construction and design of such facilities and the activation of such facilities.	Department **"Section 6: Design and Construction Assessment for Major Projects"** and **"Section 7: Design and Construction Assessment for Minor and Non-recurring projects"**: The design and construction sections of this report address management processes involved in the design and construction of facilities and the activation of facilities
(iv) Assess the medical facility-leasing program of the department.	**"Section 8: Leasing Program Assessment"**: The leasing section of this report reviews the processes behind the medical facility leasing program, including both major and minor leases

1.2   Scope

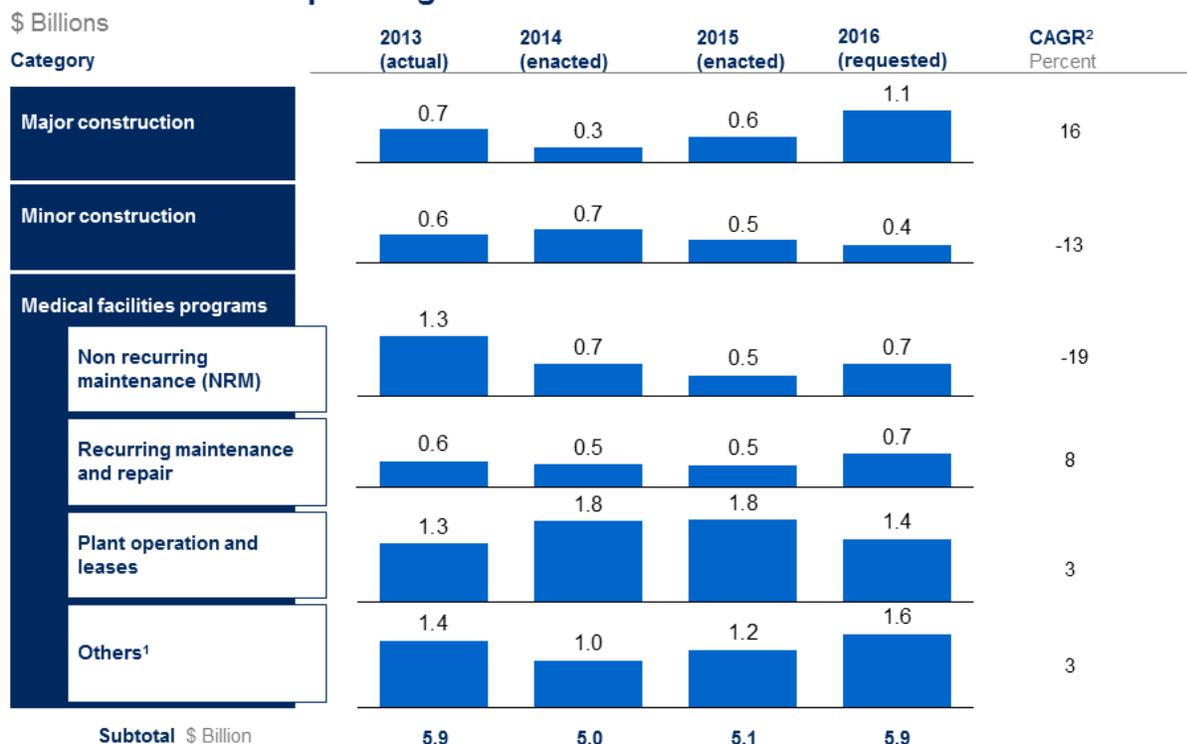
This assessment includes each element addressed in the legislation and two additional areas that are critical to addressing VHA's facility needs: facility management and the long-term capital funding needs of VHA.

Assessment K reviews the current processes that VA and VHA use to deliver medical facilities and identifies process improvement options to maximize access and quality of health care for Veterans at optimal cost. The overall capital program accounts for nearly $6 billion annually, approximately 10 percent of VHA's total budget request (see details in Figure 1-1).

Figure 1-1. VA 2015 Budget

Assessment K scope budget 2013-16 evolution

$ Billions

Category	2013 (actual)	2014 (enacted)	2015 (enacted)	2016 (requested)	CAGR[2] Percent
Major construction	0.7	0.3	0.6	1.1	16
Minor construction	0.6	0.7	0.5	0.4	-13
Medical facilities programs — Non recurring maintenance (NRM)	1.3	0.7	0.5	0.7	-19
Recurring maintenance and repair	0.6	0.5	0.5	0.7	8
Plant operation and leases	1.3	1.8	1.8	1.4	3
Others[1]	1.4	1.0	1.2	1.6	3
Subtotal $ Billion	**5.9**	**5.0**	**5.1**	**5.9**	


1 Includes Engineering and Environmental management services, Engineering Service, Grounds maintenance and fire protection, and Other Facilities Operation Support. Within the medical facilities budget, given the scope of Assessment K, it excludes Transportation Services, Textile Care Processing and Management, and Operating Equipment Maintenance and Repair
2 Compound Annual Growth Rate
SOURCE: VA Budget requests, FY13-FY16

Of the $6 billion medical facilities budget, an average of $2 billion each year is dedicated to major, minor, and non-recurring maintenance (NRM) construction. Nearly $0.5 billion additional covers annual operational lease obligations, paid out of Veterans Affairs Medical Center (VAMC) budgets to sites of care approved through VHA. The remaining $3.5 billion budget covers recurring maintenance, plant operations, and other facility management categories from VAMC operating budgets.

We have structured the assessment to focus on four main areas: capital planning, design and construction, leasing, and facility management:

Capital planning assessment: Review VHA processes for planning and budgeting, identifying best practices and potential levers to improve capital allocation to address Veteran needs. Planning efforts are conducted independently by stations (i.e., the administrative structure of a medical center and associated clinics under the same leadership) and Veterans Integrated Service Networks (VISN), supplemented by integrated planning efforts between VHA, Veterans Benefit Administration (VBA), and the National Cemetery Administration (NCA), facilitated by VA's Office of Construction and Facilities Management (CFM), and consolidated with a planning tool managed by VA's Office of Asset Enterprise Management (OAEM).

Design and construction assessment: Understand VA processes for design and construction of medical facilities and identify best practices and potential levers to prevent project overruns while ensuring required quality. Analyze outcomes and processes across all three construction programs:

- **Major construction program (9 projects, 51 percent of total[8])**: Projects that address construction, alteration, extension, or improvement of any facility, campus, or integral service, including parking construction and site acquisitions above $10 million. The program primarily includes two informally defined types of projects, discussed further in Section 6, both of which are managed by CFM and are specifically appropriated by Congress. These are (1) mega projects, typically replacement medical facilities or new medical facilities construction, and (2) major projects, normally expansions or major area renovations to existing medical centers, structural reinforcing, or supporting structures.

- **Minor Construction program (174 projects[9], 13 percent of total)**: Projects that address construction, alteration, extension, or improvement of any facility, including parking structures, site acquisition, and demolition by replacement, with costs equal to or less than $10 million, managed by local VHA engineering staff.

- **Non-Recurring Maintenance (NRM) program (866 projects, 36 percent of total):** Projects that renovate existing facilities and associated infrastructure with expansion of space not to exceed 1000 square feet. The program primarily includes three types of projects, Infrastructure Improvement, Sustainment, and Green Management, all managed by local VHA engineering staff.

Leasing assessment: Understand VA processes on facilities leasing and identify best practices and potential levers to maximize lease process agility and competitiveness. VA manages leasing through two main programs:

- **Major Leasing program (63 leases, $154 million annual rent obligations)**: Leases with annual unserviced[10] rent greater than $1 million. These leases are procured centrally through Real Property Services (RPS) in the VA Office of Construction and Facility Management and managed by VHA.

- **Minor Leasing program (1591 leases, $267 million annual rent obligations)**: Leases with annual rent obligations less than $1 million. These leases are managed by the medical centers and the VHA's Office of Procurement and Logistics.

Facility management assessment: Although not explicitly identified in the Veterans Choice Act, the extensive capital investment and interdependence of facilities operations with the capital management, design, construction, and leasing of facilities necessitated that facility management conducted by local VHA stations be included in our assessment. This aspect of the assessment is meant to understand VHA processes for conducting minor preventative and

---

[8] Total by amount requested in the 2016 VHA capital program of NRM, Minor, and Major construction.

[9] Per 2015 budget; 2016 plan still in progress.

[10] Unserviced rent is the base rent, including real estate taxes, insurance, and any amortized build-out, but excluding operating expenses.

recurring maintenance of facilities. We identify best practices and potential levers to increase cost monitoring and control and ensure timely completion of activities.

1.3   Terminology

VHA's capital program is overseen and partially executed by offices elsewhere in VA. As such, this report will use "VHA" when referring to offices located under the Under Secretary of Veterans Affairs for Health, and "VA" when referring to or including any other Veterans Affairs office. "Facility" will refer to the physical structure. "Station" will be used to refer to the administrative structure of a medical center and associated clinics under the same leadership, as currently defined by VHA. "Station leadership" refers to senior leadership, including: Director, Associate Director, Chief of Staff, Assistant Director for Patient Care Services, and Assistant Director for Operations, as well as the senior facilities leadership, including the Chief Engineer and Facility planner.

This page intentionally left blank.

2 Methodology

2.1 Approach

To address the mandate of the Veterans Choice Act, we have taken the following approach to develop a holistic view of VHA current needs, performance, main challenges, and areas for improvement.

- **Understand the current VHA capital need:** Leverage existing VA databases to evaluate capital need over the next ten years for VHA, holding constant their current planning assumptions, portfolio of assets, and operating model.

- **Assess performance of VA facilities program:** Evaluate how VA plans, builds, leases, maintains and operates medical facilities by assessing (i) outcomes, (ii) processes, (iii) people, and (iv) systems in each of the core assessment areas.

- **Identify and propose capital efficiency levers to reduce capital need:** Within the current operating model, understand the potential efficiency levers to reduce current capital need by optimizing project portfolio and improving project delivery.

- **Review potential strategic options to fully close the funding gap:** Explore strategies similar organizations have used when facing capital shortfalls. Include a range of strategic options which go beyond efficiency gains within the current system and could help close current VA capital funding gap.

In assessing the core areas of the VA facilities program (capital planning, design and construction, leasing, and facility management), we considered the following key processes:

Capital Planning Assessment (Section 5):

- **Integrated Planning:** Launched in FY11, the Integrated Planning effort looks holistically at VHA, VBA, and NCA strategic needs over the next ten years with a focus on capital implications. Now being rolled out at the VISN level, this effort is facilitated by planners in CFM and involves heavy input from regional and local leadership as well as outside consultants. Our team interviewed national and regional CFM planning staff and VISN and station planners at the participating pilot locations and reviewed draft documents from the process provided during those interviews.

- **SCIP gap development:** The Strategic Capital Investment Plan (SCIP) is the foundational process for capital planning. This process contains several subcomponents. The first of these is gap development, where the office of Capital Assessment Management Service, located at OAEM, compiles data from across VHA to determine the gap between current status and strategic capital goal. These gaps, updated annually, are reviewed and distributed to local staff for the development of their gap-closing Action Plans. Our team conducted interviews at the national, regional, and local levels on the gaps, with particular focus on national interviews. We reviewed the methodology, metrics, and data sources involved in gap development (e.g., functional surveys, condition assessments), but did not independently evaluate the data incorporated in the gap development process.

- **Facility Condition Assessments (FCA):** FCAs are a key component of the SCIP gap development process. While our team did not replicate these assessments, we conducted interviews at the national, regional, and local level on the process by which they are developed and the manner in which assessments are used. This included interviews of 25 Chief Engineers across the VAMC site visits regarding how their assessments were conducted. We also reviewed the output of FCAs, as compiled in VA's Capital Asset Inventory Database.

- **Health Care Planning Model (HCPM):** HCPM provides planning tools for station use, including mapping tools, Enrollee Health Care Projection Model inputs, information on affiliated institutions, cost estimates on purchased care, and tools for considering capital and non-capital planning alternatives in advance of SCIP Action Plan development. Our team conducted interviews with the national VHA Office of the ADUSH for Policy and Planning, which manages the tool, as well as with facility planners at stations who utilize the tool. We also obtained sample outputs provided by VHA Office of the ADUSH for Policy and Planning, including 82 market reports, the instruction manual for HCPM, databases with enrollment and rurality data, and unit cost data by strategic planning category (SPC).

- **SCIP Action Plan development:** The SCIP Action Plan is compiled by every station to provide a ten-year approach to closing identified gaps. Our team conducted interviews with OAEM, which manages the plan, the Office of Capital Asset Management and Engineering Services (OCAMES), which provides key inputs and feedback into the process, and discussed the development of the plan with capital asset managers and VISN planners across 13 VISNs and engineering and station leadership across 25 VAMCs. Our team reviewed documents and databases provided by OAEM staff, including: SCIP training presentations, SCIP call memos, SCIP directives, Action Plan databases for FY14-FY16, and the space planning and space calculator spreadsheets for FY15-FY17.

- **SCIP business case development:** SCIP business cases are submitted for each project on the Action Plan requested for the first fiscal year following the planning cycle. These business cases are developed at the station level and submitted to OAEM for centralized review. As part of our review of this process, our team utilized the SCIP business case databases for FY14-FY16, the Cost Effective Analysis (CEA) template, CEA factors list, the cost estimating guides developed by CFM, and interviews with national, regional, and local staff involved in the review or development of business cases.

- **SCIP scoring:** Submitted business cases are reviewed and scored by the SCIP Board and associated panels in order to develop a prioritized list of projects for funding. To review this process, we conducted interviews at OAEM and CFM on the scoring process and regional and local interviews regarding the output of the scoring process. Our team also reviewed the SCIP scoring guides for FY14-16 and the scoring outputs for FY13-FY16 as well as internal guidance on strategic SCIP priorities.

- **Allocation of NRM funds:** After SCIP scoring establishes a prioritized list of projects for centralized funding or the allocation of design funding, funding for projects categorized as NRM are allocated at the VISN level. Because this process is decentralized, there is some

variation in the processes used. In assessing this process, our team conducted interviews at 13 VISNs and 25 VAMCs and analyzed budget data on the obligation of NRM dollars by VISN and station. Select VAMCs also provided supplementary data on the processes used to allocate NRM dollars, and all site visits locations provided data on in-process NRM projects at their facilities.

Design and Construction Assessment: Major Projects (Section 6):

- **Project Development process:** The project development process spans from the approval of project through the SCIP process to contractor selection. This phase is critical in developing the design of the facility and involves key activities such as the schematic design, design development, development of construction documents, and contractor selection. Our team interviewed CFM Project Managers across the regions who lead the Project Development phase for Major projects. We also interviewed support function providers, such as contracting officers and cost estimating departments, to gain further insights into the process. Finally, we conducted deep dive on select projects, where detailed data during the project development phase was documented.

- **Contract modifications (change order) process:** The contract modification process, typically known in the industry as the change order process, is the procedure to approve changes in project once the construction contract has been signed. To understand the contract modifications process, our team interviewed contracting officers who lead the process. Our team also reviewed internal directives to map the approval thresholds and processes. Finally, our team analyzed the public (Federal Procurement Database System) and private (VA's internal electronic Contract Management System) databases that manage the contract related information throughout the project.

- **Activation process:** The activation process involves activities required to make a facility operational between construction completion and day one of operations. Key activities include functional performance testing of key systems, training of facility operations teams, procurement and installation of medical equipment not included in the construction contract, and creation of a systems manual for use during the maintenance phase of the facility lifecycle. To evaluate the process, our team reviewed the latest Activation Process Guide (February 2015 version) and interviewed facilities personnel, equipment procurement personnel, and contractors at on-going projects.

- **Capital Program Requirements Management Process (CPRMP):** The CPRMP process is a recently implemented process (February 2014) to manage changes in projects at key milestones during project development and construction. The process is critical to managing changes in cost, scope, and schedule as a project evolves from project development to execution and finally to activation. Our team interviewed key personnel at VAMCs and CFM to map the adherence and applicability of the new CPRMP process. The team also compared the process to best practice stage-gate processes in the industry to understand the key differences in the process for managing changes throughout the project lifecycle.

Design and Construction Assessment: Minor Projects and Non-Recurring Maintenance (Section 7):

- **Contractor selection process:** For Minor and NRM projects, the selection of the contractor often overlaps with VA's mission of meeting certain contracting requirements for Small Disabled Veterans Owned Businesses (SDVOB). Our team interviewed contracting officers, key members of the Technical Review Committee and the Contracting Officers, and SDVOB contractors (when available) during construction site visits to assess this process.

- **Project tracking process during construction:** The Minor construction and NRM program is managed within VA's OCAMES office with execution support from VAMCs facilities personnel. The project tracking processes during construction were assessed to understand how projects evolve over time. Key activities in this process included tracking cost and schedule for project development and construction phases.

Leasing Program Assessment (Section 8):

- **Major leasing program**: To assess the major leasing program outcomes, we conducted a detailed benchmarking of major lease rental rates, retained an independent expert real estate broker who compared the terms of VA's major lease contracts against typical lease terms of comparable properties, and conducted a detailed analysis and benchmarking of the time taken to execute major leases. We then conducted a range of interviews, visits, and analyses of available data to evaluate how the people, processes, and systems of VA's major leasing program could be changed to improve the program outcomes. This included a detailed analysis of the major leasing process, which identified both strengths and pain points of the existing process.

- **Minor leasing program:** We assessed the minor leasing program using a similar approach as the major lease program, described above. This included benchmarking the lease costs, and conducting a detailed analysis of the processes used by all stakeholders (e.g., VAMCs, VISNs, the procurement and contracting organization) to execute minor leases.

An independent Blue Ribbon Panel, consisting of high-level health care industry leaders, was formed to provide expert input throughout the assessment process. The panel members possessed a thorough understanding of health care industry best practices and leading edge practices. The Blue Ribbon Panel provided advice and feedback on the emerging findings and recommendations for the assessment.

Due to the required independence of the Choice Act, Section 201 assessments, findings and recommendations were developed independently. We therefore expect these recommendations would be refined by VHA leadership and the Commission on Care.

2.2   Data Sources and Analysis

We have leveraged analysis of internal and external databases, survey data, and internal and external interviews to develop a comprehensive understanding of the current state of project planning, programming, design, construction, facilities maintenance, and leasing across the VA health system. This included more than 50 site visits and 350 interviews.

We have also contacted leading health care entities and other federal agencies to understand how VA compares to best practices across public and private sector health systems in the United States and globally.

2.2.1 External Data Sources

External (non-VA) data sources used include:

- **Health care industry references**: Two leading health care systems in the United States covering more than 450 hospitals and medical centers
- **Leasing agencies**: A leading real estate brokerage and advisory firm
- **Federal agencies with large capital programs**: US Army Corps of Engineers (USACE), Naval Facilities Engineering Command (NAVFAC), and General Services Administration (GSA)
- **Industry benchmarks**: RS Means, Medical Construction Data, Design Build Association of America, CoStar lease database, Design Cost Data, 2013 Building Owners and Managers Association survey, and a proprietary health system database
- **Existing Reports**: Government Accountability Office (GAO), VA Office of Inspector General, OMB Circulars, "Infrastructure productivity: How to save $1 trillion a year," (McKinsey & Company, January 2013), Congressional Research Service, VHA: Community-Based Outpatient Clinics, 2010
- **Federal Procurement Database System (FPDS)**: Public database of contracts and award modifications for large capital agencies

2.2.2 Internal VA and VHA Data Sources

In order to complete several of the analyses, we used primary source data from VA taken from both centralized repositories and data collection as part of the site visit process. The source for each analysis is listed with the specific analysis. It should be noted that we did not conduct a review to validate the accuracy of data that were provided, although, where applicable, we did note potential data integrity issues highlighted during site visit interviews. If the requested data could not be provided because VHA personnel reported that the data did not exist, or did not exist in an internal consolidated data tracking system, desired analyses were replaced by interviews and other sources of data.

Some of the internal data sources used include:

- **Project field-based data**: Project Tracking Reports for NRM and Minor program; CFM internal tracking database and reports for Major Project
- **Projects contracting data**: Contract awards and modifications from internal VA contracting database
- **Projects financial data**: Financial obligations data for major projects from financial database
- **Station level data:** Station-level operating budgets; AEMS/MERS facilities management ticket data; Lease contract documents for site visit stations

---

- **Internal planning tools:** Planning tools distributed to Stations, including the Health Care Planning Model (HCPM) and SCIP tools, as well as databases of proposed capital projects; VA Design Guide for Lease Based Outpatient Clinics (2005); Space and Equipment Planning System (SEPS) planning tool

- **Internal databases:** Capital Asset Inventory, Facility Condition Assessments, Federal Real Property Profile submission (2014)

- **Internal training handbooks and publications**: Latest available internal publications for processes, roles, and responsibilities (for example, Resident Engineer Handbook); VA Directives and Policy Handbooks (numbers 7815, 7816)

- **VA-sponsored efforts:** VA-funded studies such as the U.S. Department of Veterans Affairs Construction Cost Benchmarking Study, 2009

2.2.3   Survey Data

In addition to the Organizational Health Index (OHI) survey conducted by Assessment L (Leadership), this team launched an identical OHI survey for personnel in the Office of Construction and Facilities Management (CFM). The OHI survey was used to assess organizational practices at VHA in order to evaluate how they contribute to the organization's health and performance. The OHI is a rigorously validated tool that is independent and proprietary to McKinsey. The survey measures nine organizational outcomes and the 37 management practices that lead to those outcomes. The OHI survey is not an employee satisfaction survey. As of March 2015, the survey has been used with over 1000 organizations, 18 of which are construction organizations and 27 of which are public sector organizations. These organizations provide the benchmarks used during the course of the Assessment K analysis.

2.2.4   Interviews and Overview of Major Facility Related Organizations

Assessment K has conducted over 50 site visits and over 350 interviews including both internal and external entities:

- Internal VA entities: 25 VA medical centers, 13 VISNs, six active major construction sites, CFM headquarters, three CFM regional offices, the Office of Capital Asset Management and Engineering Services, the Office of Asset Enterprise Management, and The Office of Operations – Real Property Service.

- External entities: Two leading health care systems in North America, two federal agencies with large capital programs including medical facilities, federal agencies administrating leases, facility management organizations, and leading contractors with significant experience in medical facility construction.

Our assessment conducted interviews across VA and VHA in order to map the organizations that have any role in the delivery of medical facilities (see Figure 2-1) and develop an understanding of their specific roles and input to the process. Responsibility for delivery of the medical facilities program including capital planning, design and construction, facilities,

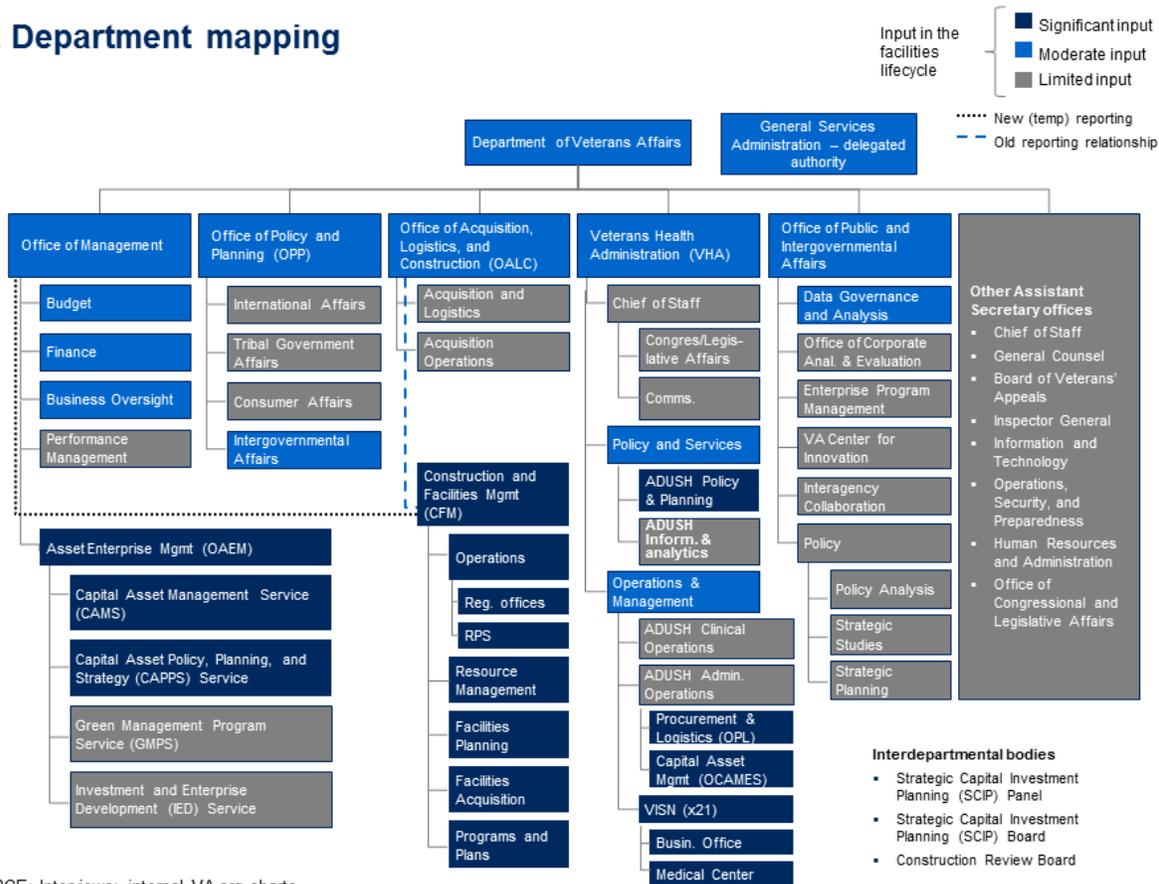
management, and leasing is distributed across VA and VHA organizations. Some of the key areas and departments identified were:

- **VA Office of Asset Enterprise Management** (OAEM): OAEM develops capital asset policies, consolidates the identification of capital needs, reviews proposed investments, oversees the capital asset performance management system, and evaluates the effectiveness of VA's implementation of capital asset management policies, principles, standards, and guidelines.

- **VA Office of Construction and Facilities Management** (CFM): CFM is responsible for the planning, design, and construction of all major construction projects greater than $10 million. In addition, CFM acquires property for use by VA through land purchases and leases. CFM also manages facility sustainability, seismic corrections, physical security, and historic preservation of VA's facilities.

- **VA Office of Operations – Real Property Services** (RPS): A subset of CFM, RPS oversees administration of lease acquisition for medical facilities and reviews GSA's occupancy agreements on behalf of VHA. RPS also provides support for independent negotiations as well as negotiations with GSA on issues pertaining to leasehold interests, land and building acquisitions, disposal of buildings and/or land, demolitions and related activities, licenses and permits, out-leasing, VA quarters management, parking, and compliance with the Randolph-Sheppard Act and the McKinney-Vento Act.

- **VHA Office of Capital Asset Management and Engineering Services** (OCAMES): Within VHA, OCAMES provides VHA's guidance, oversight, and technical support for capital initiatives and engineering operations. Programs supported include major construction, minor construction, non-recurring maintenance (NRM), clinical specific initiatives (CSI), leasing, sharing use of space, enhanced use leasing, energy, fleet, engineering operations, and state home construction.

Figure 2-1. Facilities Function Across VA


2.3 VAMC Site Selection

To increase consistency of findings, the Veterans Choice Act Assessment teams have coordinated our sampling methods to the extent possible while ensuring the methodology reflected assessment-specific considerations. We selected a core set of VAMCs to visit, which are representative of the VAMC system across critical facility demographic and performance outcome metrics. (Please see Appendix A for further detail.)

The VAMC site selection process followed the following steps:

- **Stratification of facilities**: Stratified random sampling, with VISN as strata, was used to select an initial long-list of facilities. To reduce sample size, a subset of VISNs was randomly selected, from which one of the two initially selected sites was randomly de-selected.

- **Review of distribution**: Chi-square testing was used on each of the key facility profile and performance variables to ensure the distribution of scores in the sample is representative of the population. Variables were chosen to reflect anticipated drivers of facility performance, and included: VISN, rurality, adjusted admissions, complexity level (on VHA

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

rating scale), adjusted length of stay (LOS), adjusted patient satisfaction, cumulative access score, and facility age

- **Refinement of facility selection**: The initial facility list was vetted with internal and external subject matter experts (SME) and augmented as needed, to include facilities that are considered critical for inclusion (for example, a Polytrauma Center, facilities with innovative tools/practice) and ensure that all selected facilities had the range of services being assessed.

This method resulted in a sample of 25 VAMCs that is representative across each of the criteria used in selection. (Please see Appendix A for results of the chi-square testing, demonstrating representativeness.) While the method is not as rigorous as using stratified random sampling (SRS) alone, given our goal of including sites across VISNs and other variables and the need to limit the sample to a size that can be feasibly visited, SRS alone would have resulted in a sample representative across multiple dimensions. The Assessment K team also visited 13 of the 21 VISN headquarters, as the VISNs play a significant role in the allocation of NRM funds and the capital planning process. These VISNs were selected based on their proximity to planned VAMC site visits.

2.4   Construction Site Selection

To assess execution performance for major construction projects, the team selected a sample of active construction project sites. The design principles for site selection criteria were the following:

- The selected sample includes sites from all three CFM regions (West, Central and East)
- The selected sample includes a range of project sizes within the Major Construction program
- The sample includes projects where construction activities in the field could be observed (if possible)

Based on the criteria above, the following Major Construction projects were selected for construction site visits within the time frame of the assessment.

Figure 2-2. Construction Site Visits

Sites visited during Assessment K

City	State	Project detail	Total estimated cost[1] $ Millions	Percent of funding before 2011[2]	Sq. ft.	Region
Palo Alto	CA	Ambulatory Care / Polytrauma Rehab	717	31	681,000 (New); 13,500 (Alt)	Western
Long Beach	CA	Seismic Corrections – Bldgs 7 and 126	130	100	191,000	Western
Denver	CO	New Medical Facility	1,730	Unknown	1,035,000	Western
Dallas	TX	Spinal Cord Injury	142	5	164,000	Central
New Orleans	LA	New Medical Facility	995	90	1,600,000	Central
Biloxi	MS	Restoration of Hospital / Consolidation of Gulfport	286	100	417,000	Central
Bay Pines	FL	Improve Inpatient / Outpatient	158	72	135,000 (New); 186,000 (Alt)	Eastern

3   Cross-Cutting Findings: Assessing VHA's Capital Need

3.1   VA Capital Need and Anticipated Shortfall

VA has identified more than $51 billion in total capital needs over the next 10 years through its capital planning methodology. Provided that average funding levels remain consistent over the next 10 years, the $51 billion capital requirement would significantly exceed the anticipated funding level of $16-26 billion.

As part of its capital planning and allocation process, VHA undertakes an annual process, the Strategic Capital Investment Plan (SCIP), to forecast capital needs over the next ten years. Through SCIP, stations identify projects to address recognized facility deficiencies, anticipated workload changes, access gaps, and other key metrics for health care delivery.

Based on submissions as part of the Strategic Capital Investment Plan (SCIP), VHA has determined that it will require approximately $46 billion in capital investment over the coming ten years for new projects plus $5 billion to complete on-going major construction projects.[11] This number is calculated as each station develops proposals to address the gaps identified by VA managed databases. Each station identifies a series of projects which are expected to allow them to close their currently identified gaps within 10 percent over the next ten years. These projects include near-term projects intended to start in the first fiscal year of the next planning cycle, for which detailed business cases are submitted. They also include mid-term projects planned to start in the next 3-5 years for which the scope is clearly defined. Finally, they contain out year funding estimates, calculated by facilities based on the remaining gap to be closed.

Over the next ten years, it is likely the $46 billion SCIP request could increase to address needs not currently identified, as new facility assessments are completed or there are shifts in standards or Veteran demographics (see Assessment A for discussion of potential demographic shifts). Nonetheless, the combination of the top down gap analysis and the bottom up project cost estimating, all within clearly defined guidelines, offers a robust methodology for calculating the size of the capital need. While the assessment team did not independently verify the 8,038 capital requests submitted through SCIP, we have reviewed the process for arriving at the $46 billion in capital need and believe it to be the best available calculation of the scale of the capital requirement.[12]

Additionally, the VA FY2016 Budget Submission anticipates an additional $5 billion in funding for major construction projects which are already in process (see Figure 3-1).[13] Together, this $51 billion investment would enable VA to improve facility conditions and address anticipated needs in space, energy, and other key areas.

---

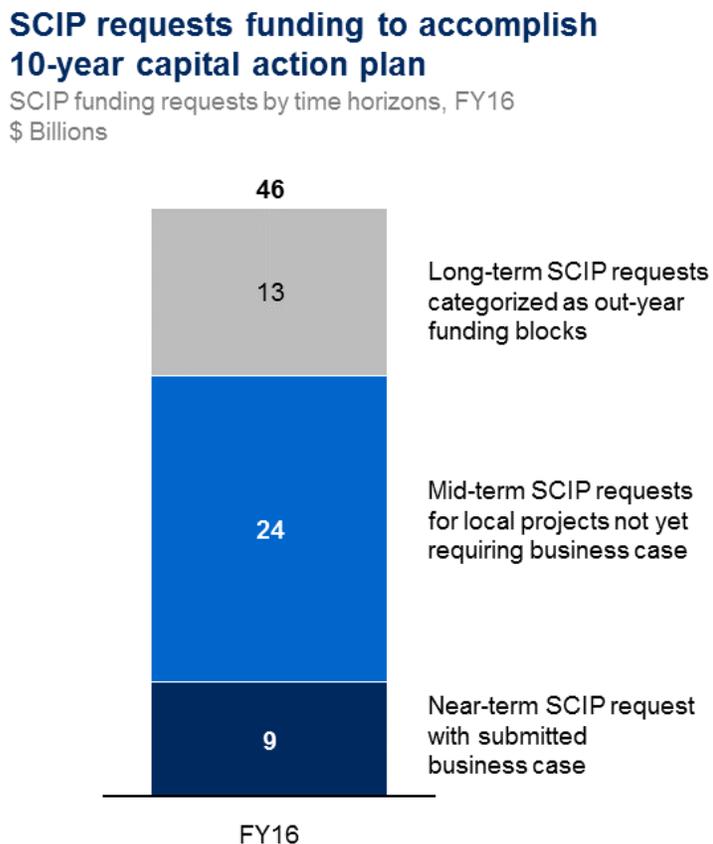
[11] SCIP funding levels taken from data provided by VA for the FY16 planning cycle, the most recent data available as of the writing of this report.

[12] The full SCIP process is discussed and assessed in detail within Section 5 (Capital Planning Assessment).

[13] Details of the SCIP request and the FY2016 Budget Submission are contained in Appendix B.3.

Over the last four years, VA's capital funding has ranged from $1.6 billion to $2.6 billion each year, averaging $2 billion. Given current objectives and current levels of program delivery effectiveness and provided that funding levels remain consistent with recent years, the $51 billion capital requirement would significantly exceed the anticipated funding level of $16-26 billion over the next 10 years. Furthermore, above the $51 billion capital requirement identified in SCIP and outstanding major construction budget requests, VA historically has experienced overruns in their major construction performance, as discussed in depth in Section 6 (Design and Construction Assessment: Major Projects). These overruns, if not averted through efficiency gains and process improvements, could increase the total need based on observed past performance. While this analysis focuses on specifically identified needs, our recommendations also identify the steps necessary to avoid additional cost from construction overruns.

Figure 3-1 details ten-year SCIP funding requests for FY 16.

Figure 3-1. 10-Year SCIP Action Plan Funding Request


SOURCE: (FY16 SCIP Action Plan, 2014).

This ten-year forecast incorporates:

- Condition deficiencies (for example, maintaining current assets to desired quality and condition levels, including seismic concerns)

- Space needs (for example, ensuring adequate space increases or decreases given changing Veteran demand)

- Energy goals (for example, ensuring VHA facilities comply with energy standards for federal buildings)

- Other (for example, additional areas such as ensuring sufficient Veteran access or medical functionality)

Figure 3-2 details the breakdown of different needs within the submitted requests.

Figure 3-2. 10-Year Capital Need

VHA estimates ~$51 billion funding need for the next 10 years from FY16 SCIP requests and outstanding major construction budget requests

VHA funding requests for FY2016-FY26[1]

Billions

Condition deficiencies	14

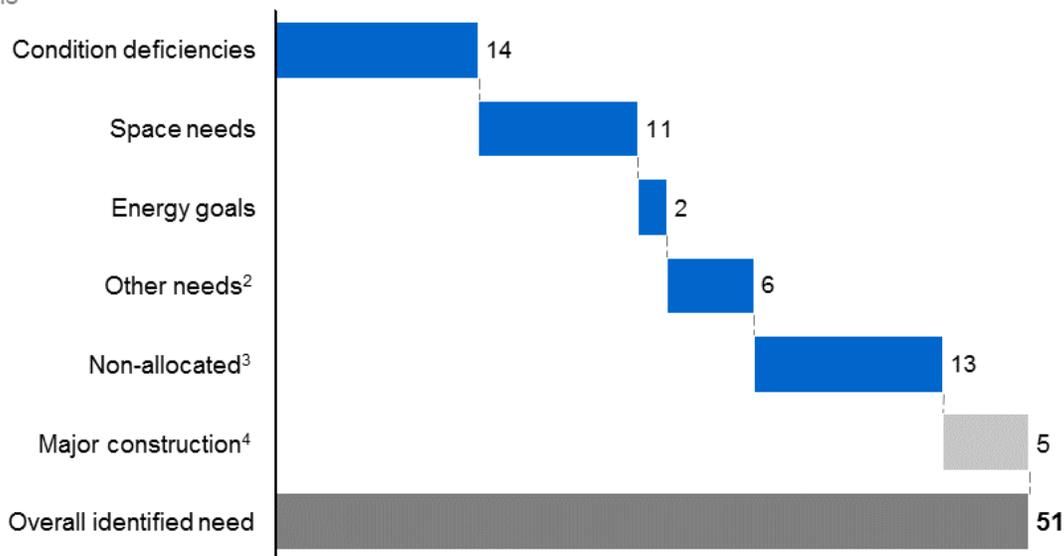
Energy goals	2
Other needs[2]	6
Non-allocated[3]	13
Major construction[4]	5
Overall identified need	51


1 Funding requests aligned to primary gap identified in SCIP submission
2 Including functional, access, and utilization needs, as defined in SCIP
3 Anticipated needs currently defined by out year funding amounts which will allocated across need types as projects are designed
4 Request for on-going major construction projects for FY16 and beyond, as reported in FY16 VA Budget
SOURCE: FY16 SCIP submissions, OAEM; FY16 VA Budget   7

These estimates showcase a representative view of the breakdown for the ten-year capital needs of the VHA system. While out year funds, which fall into the non-allocated $13 billion, are not broken out in detail, they have historically followed the same trends as the specifically identified projects, heavily driven by condition and space deficiencies. As such, they are instructive in the ability to understand the overall viability of the VHA system over the coming years. We believe it is critical for VA, VHA, and Congress to look beyond the typical short term,

year-by-year funding horizons to understand whether VHA will be able to maintain and increase standards of Veteran care and access over the ten-year planning horizon and beyond under its current model of health care delivery. As we have examined these needs, we find that, even with ambitious targets for improved effectiveness in managing and delivering the VHA facility portfolio, there remains a need for increased funding and changes to VHA's model of delivering facilities and health care to Veterans.

3.2 Key Findings of VA Observed Performance on Core Assessments

Performance by VA in the four core assessment areas has been on par with public sector performance in most cases, but well below private sector performance.

Without substantial changes, VA will not be able to address the existing facility requirements and the evolving Veteran needs effectively. However, we have observed opportunities for VHA to capture value and reduce their capital need in each area of the facilities program. Throughout our assessment, we have identified a number of challenges that apply across the various aspects of VHA's facilities program, as well as challenges that are specific to each aspect of the facilities program (capital planning, design and construction, leasing, facility management). These are summarized below:

3.2.1 Shortfalls in Overall Accountability, Sense of Ownership, and Proactive Problem Solving Approaches Limit the Ability of VA and VHA to Deliver the Correct Projects on Time and on Budget

- **VA's facilities program is dispersed throughout the Department, limiting oversight, accountability, and controls.** Of the $6 billion medical facilities budget, approximately $2 billion each year ($1.6 billion to $2.6 billion per year from FY13-FY16) is dedicated to major and minor construction and non-recurring maintenance (NRM), the oversight of which is split between VA's Office of Construction and Facilities Management (projects over $10 million) and VHA engineering staff (projects under $10 million). Nearly $500 million additional covers annual operational lease obligations, paid out of VAMC budgets to sites of care approved through VHA. The remaining budget covers recurring maintenance, plant operations, and other facility management categories from VAMC operating budgets. Facilities functions are dispersed through VA, resulting in a lack of accountability for facilities outcomes, a mismatch between planning efforts and funding decisions, and the separation of project execution and facilities management. (See Section 6.1)

- **The broader culture of facilities functions are characterized by silos, risk-aversion, and ambiguity of roles, often resulting in an inability to consistently advance projects in an efficient manner.** On the Organizational Health Index (OHI), VA facilities staff at CFM and in engineering departments scored their organization in the bottom quartile of all organizational health outcomes apart from motivation. This is discussed in greater depth in Appendix B. "Bureaucracy" and "fear" were among the defining organizational attributes identified by CFM staff. Despite high levels of motivation in caring for Veterans, these cultural attributes can put employees in a defensive posture and stifle innovation

and entrepreneurship. A fuller discussion of these cultural dynamics across VHA can be found in Assessment L. (See Section 5.2.3.1).

- **External constraints limit VHA's ability to deliver and operate medical facilities at the level of private sector benchmarks.** Directives regarding the services provided within VHA medical centers, federal and VA procurement requirements, and approvals and procedures required by external parties contribute to increased costs and delivery duration for medical facilities. (See Section 6.2.2)

- **The contracting organizations are overwhelmed and burdened by complex approvals and struggle to effectively manage construction and leasing contracts.** Interactions between the contracting organizations and their customers (for example, VAMCs) are reported as ineffective by both parties, as also discussed in Assessment J. CFM contracting officers (COs) manage contracts for major construction and leases, while all other construction, leasing, and maintenance contracts are executed by VHA Network Contract Offices (NCOs) which are aligned with, but do not report to, VISNs. Both of these organizations face challenges including a heavy workload, a lack of training for the complexities of construction and leasing contracts, and lack of integrated involvement of the contractor and customer throughout the process. Some interviewees cited that COs cover double the contract volume as counterparts in the government, have not been effectively trained to cover the complexities of construction and leasing contracts, and due to the low approval authority given to most COs must pass leases through high levels of oversight which delay programs. (See Sections 5.2.2.4, 6.2.3.4, and 7.2.3.1)

3.2.2 Capital Is not Being Consistently Allocated to Projects That Could Address the Greatest Areas of Veteran Need in the Most Cost-Effective and Timely Manner

- **Lengthy approval and funding timelines hinder the ability of VHA to meet the identified space requirements to keep up with Veteran demand and invest in facilities updates that align with changing models of care**. The time from submission to approval typically lasts several years, and may be even longer for major construction projects, during which, Veteran needs may change and new standards of care could be established, possibly changing facility requirements. VA has several different planning cycles that stretch across multiple levels, with staggered approval at the facility, VISN, and Veterans Affairs Central Office (VACO) levels, each step adding time to the process and impairing the link between VHA strategy and execution. These delays can be costly both in delivering against identified need and in ensuring projects are delivering the most current medical designs and technology. (See Section 5.2.2.4)

- **The lack of a mechanism to evaluate achieved outcomes versus promised outcomes limits accountability during project execution.** After project completion, there is no formal feedback loop to verify performance versus originally-stated goals; moreover, project outcomes are not considered in subsequent planning efforts. (See Section 5.2.2.5)

- **Capital management in VA lacks a 'scrubbing' system to ensure business cases for submitted projects contain necessary analytic rigor and economic analysis**. The sheer

---

volume of project requests, compared to the limited staff resources to review projects, prevents an effective review of business cases and potential alternatives prior to project scoring. This hampers the ability of VA to ensure an effective comparison and prioritization of projects with full consideration of the strategic merits. (See Section 5.2.2.3)

- **Capital project requests are often developed to optimize for non-strategic approval mechanisms over optimized project selection and delivery.** Competition for limited funds has led stations to make choices in developing their projects on the basis of perceived approval criteria rather than on optimal scope and execution plans, limiting the efficiency of the SCIP program. For example, VAMCs tend to combine smaller projects to address more scoring criteria in NRM and minor projects, "phase" larger construction efforts into several pieces, and focus on "hot button" issues that receive extra points rather than defining the most efficient projects to achieve specific objectives. (See Sections 5.2.2.2 and 5.2.2.3)

- **There is a significant disconnect between identified needs and funding levels.** Less than 30 percent of projects with business cases are funded each year, leaving more than 1,000 scored projects postponed for later years. Developing a competitive project submission requires significant staff resources from stations in order to develop a proposal which has a low probability of being funded and may not even receive a substantive review or feedback for improvement on merits. (See Sections 5.2.2.1 and 5.2.2.2)

3.2.3 VA Construction Costs Are Similar to Other Public Agencies in Most Cases, but Double Those of Private Industry Best Practice, and VA Time-to-Complete Exceeds Both Public and Private Peers

- **Project teams are designed and staffed to support compliance requirements but these structures have often resulted in reduced accountability for project delivery outcomes.** Particularly for major construction, project managers are responsible for overall project goals yet they lack authority over project teams (for example, resident engineers and contracting officers) to make decisions necessary to manage their teams and counterparties effectively (for example, architects, engineers, contractors). (See Sections 6.2.3.1 and 6.2.3.2)

- **Scope and design criteria for major projects are frequently subjected to major changes, especially during the design phase, affecting overall cost and schedule.** Project staff indicated that there are not clear guidelines to manage project modifications that may affect delivery timing. Station leadership often seeks to introduce changes in ongoing projects, even after construction has begun. These combine to increase time to completion, which carries secondary costs, such as Veteran access delays and outdated designs. (See Section 6.2.5.3)

- **VA design standards are perceived as a critical barrier to achieving private industry best-in-class cost and schedule.** Certain technical specifications and design standards are no longer applied in private industry and are not considered cost efficient. Also, design requirements resulting from resilience (for example, backup water supply, alternative

sources of power, progressive collapse designs), energy, security and community mandates can increase the initial cost of projects over the private sector. These requirements are consistently applied, rather than through a specific evaluation of the site and corresponding need for emergency preparedness. Federal design standards outside of VA's control add further construction requirements. (See Sections 6.2.2.1 and 6.2.2.2)

3.2.4 The Leasing Program Is not Effectively Enabling VHA to Provide Facilities Where and When They Are Required or at a Reasonable Cost for Major Leases

- **VA's lease timelines preclude it from benefitting from the speed and flexibility leasing typically can provide**. For large facilities, the time from identifying a need to having an operational leased facility is substantially longer than comparable public and private sector organizations. While the process to secure a large leased facility often takes VA up to nine years, private sector organizations can complete leases of similar complexity in approximately three years. These timelines are driven in part by the extensive approvals required by VHA – both internally and externally – and the length of the procurement process. (See Section 8.2.1.2)

- **VA lease rates for smaller facilities are close to benchmark costs, but higher than benchmark costs for major facilities.** While VA is performing on par with benchmark rates for smaller leased clinics, it pays significantly more than benchmark rates for the larger, build-to-suit clinics. Similar to the higher costs of hospital construction, this is likely largely due to the higher design standards and stricter requirements of VA facilities. (See Section 8.2.1.1)

- **VA leasing contracts are typically favorable to VA, but are often not enforced.** While VA does an excellent job negotiating tenant favorable terms while typically remaining within benchmark rental rates, these favorable terms are often not enforced. When VHA staff identify concerns about the quality of a facility, contracting staff may not enforce these terms with lessors, given skill and capacity constraints. (See Section 8.2.1.3)

- **External influence to VHA can further limit the effective use of leasing to promote agility in delivering health care.** There are real or perceived external influences that can affect the time it takes to execute a lease. When interviewees with knowledge of major lease timelines were asked a general question about the factors influencing delays in leases, 100 percent indicated that external influence had contributed to these delays. They described the nature of these delays as typically due to pressure to consider additional sites to locate a new-leased facility, expanding the time taken in the initial market research and related early stages of the leasing process. Documents shared with the assessors during the course of this assessment indicated higher levels of approvals required for leases that were relocated from one Congressional district to another. (See Section 8.2.2.2)

3.2.5 Facility Management Costs Across VHA Exceed Those at Comparable Medical Facilities

- **VA does not effectively manage the total cost of ownership of facilities.** Best practice facility management organizations take a total cost of ownership perspective towards critical facility decisions. VA does not incorporate a total cost of ownership perspective into planning decisions, sufficiently involve operational staff and perspectives in design decisions that have an impact on operating costs, or ensure dynamic adjustment of operational costs as facility conditions change. (See Section 9.2.2.1)

- **VA conducts more facility management activities in-house than comparable organizations.** Facility management costs (for example, recurring maintenance, environmental services) are on the average 2 to 3 times higher than comparable private medical facilities, largely due to in-house management of these services rather than utilization of potentially lower cost external service contracts. Facility management costs and practices are also highly variable across VHA facilities, with little incentive for individual stations to adopt cost effective measures. (See Section 9.2.3.1)

- **Space-adjusted facility management costs vary widely within VHA.** VHA facilities vary widely in the amount they spend to manage facilities, even after adjusting for factors such as space and age of the facility. There is also a significant gap between average VHA costs to manage and maintain hospitals and industry comparables, with VHA paying as much as two times comparable benchmarks. (See Section 9.2.1.4)

4   Recommendations and Implementation Considerations

4.1   Opportunities to Increase Capital Efficiency

If VA's capital program were to achieve best practice in capital efficiency, the $51 billion capital need could potentially be reduced by approximately 25 to 35 percent.

A study of major capital programs from around the world, drawing on more than four hundred case examples, has observed a potential aggregate savings in total capital investment of up to 40 percent when all proven best practices are implemented across a capital program.[14] However, no single entity in the study was able to demonstrate this level of performance improvement across the board, which illustrates the scale of the challenge. Given the difficulties in meeting this level of improvement and having considered the structural barriers which VA faces as a public entity, we identified a potential reduction of 25 to 35 percent for VA. These potential reductions are discussed in greater depth in Appendix B.3. Achieving this reduction would require a transformative realignment throughout the capital program to deploy best practice tools. These tools can be grouped under three capital efficiency levers.

- **Improve project selection and refine infrastructure portfolio.** Experience with other public and private facility portfolios has shown an opportunity to achieve a 10 to 15 percent reduction in costs through enhancing project selection criteria and rationalizing the portfolio of projects and facilities. For VA, this would involve optimizing standards and expectations for condition, space, and energy gaps. Additionally, the SCIP process and criteria should be reevaluated to include such changes as bolstering proposal reviews, refining capital project selection, improving alignment with workload, strengthening business cases, and enhancing assessment of outcomes.

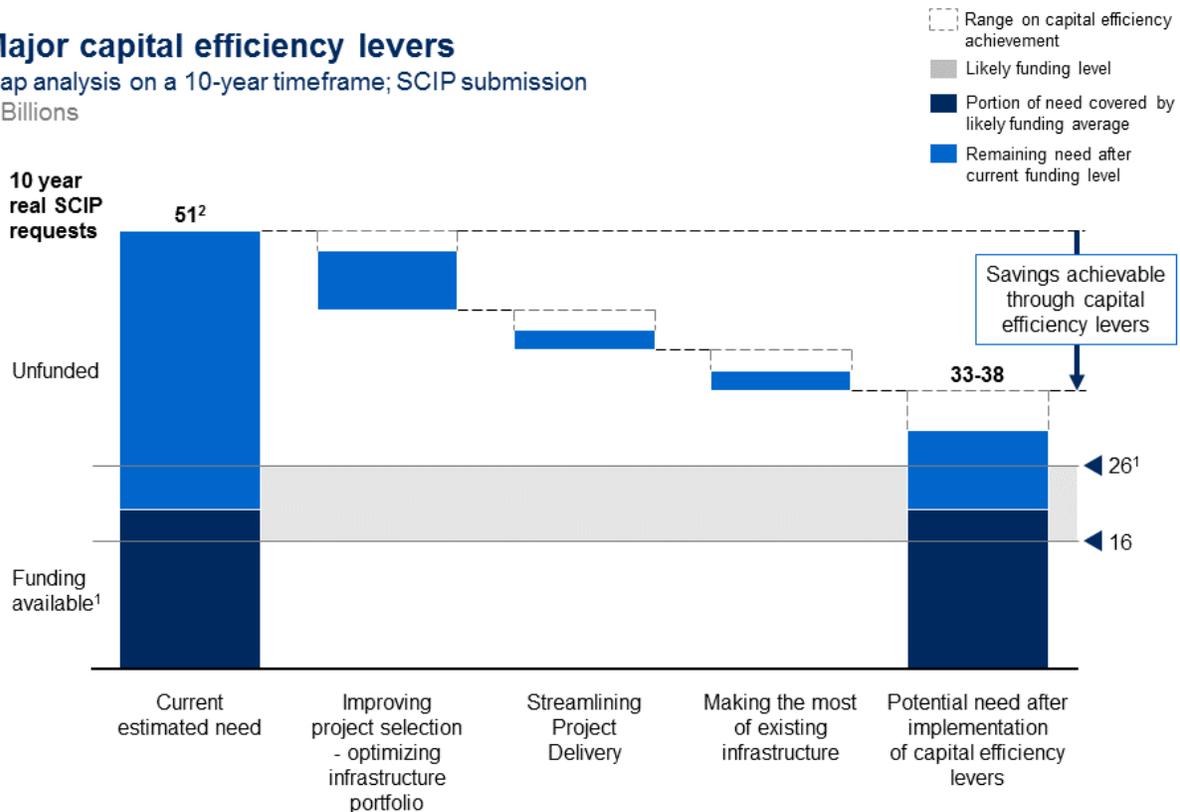
- **Streamline project delivery.** A 15 to 20 percent opportunity exists in improving the delivery of facilities. Steps such as improving project controls, especially for the design stages, increasing accountability for projects through enhancing performance management systems, and potentially outsourcing certain capital projects to other organizations could both reduce costs and increase the speed of project delivery. A clear stage-gate process should be implemented to manage scope and design changes in the planning and design phases of projects and to limit scope and design changes that occur after a project receives funding and during construction. To increase ownership and accountability, project delivery teams should be restructured with clear roles and responsibilities, well-defined handoffs, and adequate staffing levels. Additionally, contracting and other supporting entities should be accountable and equipped to support a fast-paced project environment and facilitate the needs of construction projects and leases.

- **Make the most of existing infrastructure.** Experience shows additional savings opportunities can be achieved by maximizing the use of existing facilities. This requires

---

[14] "Infrastructure Productivity How to save $1 trillion a year¨, January 2013 by McKinsey & Company. For this assessment, estimated savings have been adjusted to reflect requirements and constraints specific to VA.

incorporating a total cost of ownership assessment approach into design, capital planning, and facility management which evaluates the operational cost implications of design choices and pursuing opportunities to optimize capital and operating costs simultaneously. Additionally, it may be possible to better use existing underutilized space to fill projected space needs. By either refitting or shifting existing underutilized space, VHA could address projected space needs or provide a lower-cost alternative to proposed projects. A detailed analysis should be completed by VA to determine what possibilities exist to better utilize existing infrastructure. We did not include a size of the opportunity in the estimates.

Figure 4-1. 10-Year Capital Funding Request


1 Based on four year average funding levels of $1.6 to $2.6 billion per year
2 Capital need calculated from FY16 SCIP requests ($46 billion) and outstanding major project commitments ($5 billion)

Provided that an extensive transformation of the VA capital program is undertaken to implement best practice processes, savings between 25 to 35 percent are possible. This would result in reducing the total capital need over ten years from $51 billion to between $33 billion to $38 billion. These are extremely challenging but necessary efficiency initiatives which should be implemented before spending additional resources to address the capital need. While this would require an intensive effort to accomplish, the extent of the capital gap necessitates sweeping action.

4.1.1 Improve Project Selection and Optimize Infrastructure Portfolio

VA could reduce its total capital requirement by reviewing which infrastructure projects are selected and rationalizing the overall capital allocation. We have identified two areas of opportunity:

Refine capital allocation. By setting strategic goals and funding limits, conducting regular performance assessments, and strengthening the quality of the business cases that are a part of SCIP submission, VA could ensure it is allocating capital to the right projects and removing unnecessary capital needs from the system. Specifically, we have identified the following options in which VA could optimize its capital planning process to focus effectively on the highest priority capital needs:

- **Refine capital allocation process (SCIP processes) to better align with VA strategic goals and realistic funding levels.** The current process is a significant step forward over past capital allocation systems, but should be refined to (i) increase transparency, (ii) simplify scoring to improve connection between results and strategic priorities, and (iii) utilize scenario modeling of the portfolio in addition to individual project assessments.

- **Strengthen business case submission process.** By increasing the analytic rigor and financial expertise involved in the development of business cases, projects could be more effectively compared and prioritized. Additional resources should be devoted to provide an independent scrubbing of project scopes and underlying assumptions as well as a deeper consideration of a project's strategic merits.

- **Develop accountability mechanisms to ensure projects meet promised objectives.** In order to ensure projects fulfill their originally stated goals, VA should develop a feedback loop in the SCIP processes whereby the performance of completed projects relative to closing identified gaps is included in subsequent capital planning efforts.

Optimize capital requirements. The overall capital need is determined by SCIP submissions that fall into condition, space, energy, or other categories. By adjusting the standards or expectations in each of these areas, VA can potentially lower the capital need. We have identified specific options in the three primary areas of capital need:

- **Shift from a focus on condition assessments of individual sub-systems to the condition of overall facilities.** Current VA expectations are that every subsystem or component in a facility receiving a D or F condition assessment be repaired or replaced to achieve an A level. Across VHA, scored components received an average grade of C minus (see Figure 4-2). By creating an overall facility score as well as evaluating the condition of individual components, VA could reprioritize and streamline condition assessments to highlight areas of greatest need. Introducing an average facility grade for consideration would make it easier to identify facilities, which, on average are scoring below a B and focus on bringing those averages to a sustainable level. This score, combined with a careful comparison to the replacement costs of the facility, would allow VA to identify structures which are no longer of sufficient condition to justify further capital investments. System critical and failing components in all other facilities should receive first priority. Further

discussion on these recommendations can be found in Section 5 (Capital Planning Assessment).

Figure 4-2. Facility Condition Assessment Gaps

FCA correction costs are concentrated in Grade D ratings
Facility Condition Assessment Ratings

Grade	Definition	Number items	Total correction cost $ Billions
A	Like-new condition	24,337	n/a
B	Over half of useful life remains	33,203	<1
C	Avg. condition, less than half of useful life remaining	55,841	<1
D	Poor condition, at the end of its useful life	59,919	13.5
F	Critical condition, requires immediate attention	8,574	2.4

SOURCE: Facility Condition Assessments taken from VA Capital Asset Database, March 2015

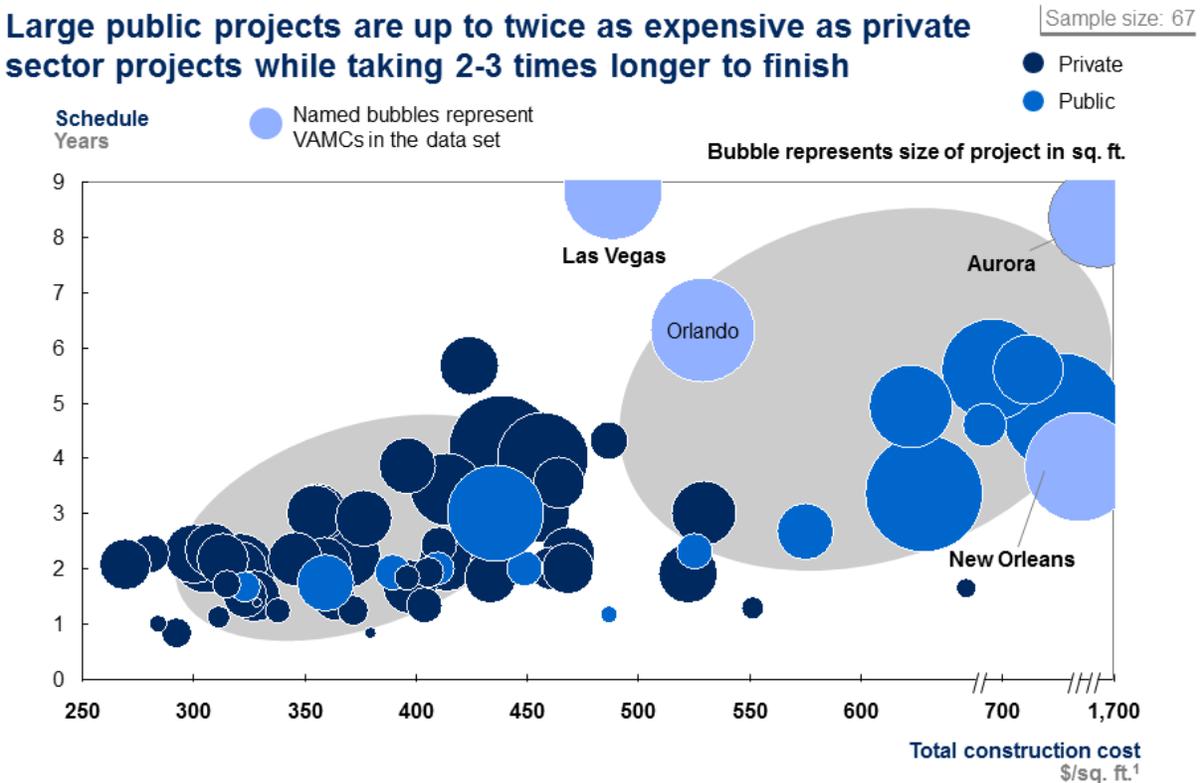
- **Focus on energy efficiency improvements that have a positive return on investment.** Utility costs are some of the largest ongoing facility operation expenses. A number of facilities have shown that utility costs can be reduced through a combination of demand reduction, efficiency, and innovative contracting methods. However often economically positive investments in efficiency (for example, LED lights, or a new cooling system) are reportedly overlooked in favor of more high profile or symbolic energy efficiency investments. VHA could remove obstacles to investing in economically positive efforts and enable extensive sharing of innovative approaches to reducing energy costs. These savings could then be used to cover capital needs. Additionally, slowing adoption of capital-intensive energy-efficiency measures with low or unclear returns in capital invested would reduce the overall capital needs associated with energy upgrades.

- **Optimize space requirements in line with current innovations in health care.** New space designs could improve the patient experience for Veterans through enhancing inpatient room designs, incorporating new medical technologies, and potentially improving nursing response times (Healthcaredesignmagazine.com, 2015). Additionally, reassessing the

assumptions used in planning required space needs (for example, the number of square feet required for a certain type of medical unit as projected by the Enrollee Health Care Projection Model[15]) and reducing those expectations that are above industry best practice could reduce overall capital needs associated with expanding VHA's physical space.

4.1.2 Streamline Project Delivery

Once the need for a particular project is determined, VA has an opportunity to limit the capital investment required by delivering projects more effectively. As described in Section 6 of this report, VA facilities are up to 70 percent more expensive than planned, which is in turn up to 50 percent more expensive than comparable private sector benchmarks on a square foot basis (see Figure 4-3 and Figure 4-4).

Figure 4-3. Health Care Facilities Construction Costs Benchmark (I of II)


1 Dollars / sq. ft. adjusted to 2015 via internal factors for Design Cost Data Factors and ENR indices for others; adjusted to U.S. Nat'l avg. via RS Means CCI (2014 & 2013)

SOURCE: Internal cost benchmarking studies, proprietary construction databases, public websites (contractors, owners, designers)

Under the current model of a VA-specific construction management function for facility delivery, there are a number of opportunities that would enable it to reduce costs:

---

[15] The Enrollee Health Care Projection Model (EHCPM) is the primary tool utilized by VHA for workload projections based on Veteran demographic trends. It was not within the scope of this assessment to evaluate the validity of EHCPM forecasts; however, a deeper analysis of Veteran demographic trends can be found in Assessment A.

Enhance the use of early warning project controls. By improving controls to catch problems earlier rather than later in the process, the design changes and scope increases that lead to increased costs could be mitigated or reduced. A stage-gate process should be implemented to manage scope and design changes in the planning and design phases of projects and to limit scope and design changes that occur after a project receives funding and during construction. Additional details on potential specific project controls are described in Section 6 of this report, regarding major projects.

Address current facilities relationships to reduce the distributed accountability that exists today and ensure full visibility and coordination of the overall capital program. The current functional structure and its dispersed responsibilities across the organization create multiple interfaces that need to be managed, favoring the creation of silos and limiting accountability within the organization.

Review resilience requirements. Current mandated resilience requirements (for example, ability to continue to operate in the case of disasters or attacks) increase the costs of constructing and operating VHA facilities. Because of the added cost, it is important for VA to carefully evaluate the application of critical resilience standards to ensure they are consistent with its mission and disaster preparedness needs while balancing capital constraints.

Review design standards for inefficiencies. There are a number of design standards (for example, interstitial floors, progressive collapse, green energy mandates) that increase the costs of delivering construction or major maintenance projects. These standards should be reviewed to remove outdated standards or those for which the costs exceed projected benefits.

Increase contracting efficiency. The interactions between the project and contracting organizations have often been cited as sources of delays – and thus cost increases – within VA. We have detailed a number of recommendations as to how this could be improved. Implementation of these recommendations could lead to further cost reductions for capital projects.

Develop a structured approach to best practice sharing. Ensure that the rich knowledge and innovative approaches distributed throughout the VHA network are surfaced and shared through a culture and system of continuous improvement.

3 Accounts for FAR/BAR regulation impacts
3 Excluding Aurora (approximately $1,700 / square feet)

4.1.3 Make the Most of Existing Infrastructure

By improving the utilization of its existing infrastructure, VA could address projected space needs or provide lower cost alternatives to proposed projects, reducing the overall capital need. Specifically, we have identified the following options:

Incorporate total cost of ownership (TCO) evaluations into facilities management activities to identify optimal balance between long-term renewal and short-term maintenance. By evaluating the business model of facility operations (in-house versus outsourced functions), more effectively managing operations, and sharing best practices across facilities, ongoing facility operations costs could be reduced while increasing facility quality.

Reduce lease costs both within and beyond lease term. Through rationalized geographic and technical specifications, improved contract terms, and on-time lease renewal, VHA could potentially reduce lease rental rates.

4.2 Opportunities to Reduce the Capital Gap

Even if VA were to achieve best in class operations, an unfunded gap of $7-22 billion is expected, requiring increased funding and more transformative changes.

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

All of the recommendations above represent VA's opportunity to reduce its overall capital needs. By optimizing the portfolio of projects, delivering these projects more effectively, and making the best use of existing space, VA may be able to reduce its capital needs by 25-35 percent. However, this leaves $7 to $22 billion in remaining capital needs, even after the most aggressive assumptions of VA's ability to close the capital gap using the above levers. Fully closing the capital gap would require a combination of two things. Funding to VA must substantially increase over the coming decade and more fundamental changes in VHA's operating model will need to be considered.

When other institutions have faced similar capital shortfalls, they have considered a range of strategic and business model redesign options in addition to implementing the best practices in capital project delivery. This report highlights several strategic approaches for further consideration by VHA.

4.2.1   Maximize Operational Efficiency

In addition to optimizing the overall portfolio of infrastructure projects and ensuring that these projects are delivered effectively, operations should serve to maximize the efficiency with which existing space is used. By more effectively using existing space, VHA could reduce the need to expand existing facilities, or build or lease new facilities. Assessment K focused on the opportunities for improving capital efficiency, but Assessments E, F, G, and H offer recommendations on operating improvements which could reduce VHA's capital need. While VHA would need to further investigate the potential that these operating improvements could have on the capital need, other institutions have seen favorable results.

Four specific opportunities could be considered to more effectively use existing space:

Increase operating hours to balance workload requirements. Select VAMCs and Community Based Outpatient Clinics (CBOC) have already explored the use of expanded operating hours to meet heavy patient demand. Currently, VA planning assumptions are based on eight-hour days and five-day weeks for clinical operations. From the perspective of modeling capital need, this system is highly sensitive to changes in these assumptions, such as increasing the days of operation (for example, opening on Saturdays) or the hours of operation (for example, 10- or 12- instead of eight-hour days). Expanding this practice in areas with high demand for services or where Veterans desire additional flexibility in scheduling could provide an opportunity to reduce the space need. Expanding the use of this lever should be balanced against increased operating costs and staff availability and correspond with Veteran demand for and interest in expanded hours of service.

Improve scheduling efficiency. Assessment E has also identified opportunities to improve effectiveness through measures such as schedule and demand management (Assessment E [Clinical Scheduling], Section 6.2.1). More effective scheduling could increase the utilization of exam rooms and have implications on the space requirements and wait time assumptions utilized in space planning. Assessment G also discusses the implications of space on provider throughput (Assessment G [Clinical Staffing], Section 3.4.1)

Increase telehealth options. Opportunities are increasing to expand telehealth directly to the home. While a portion of VHA telehealth offerings still requires dedicated patient spaces, there is a potential to reduce the need for physical spaces in VAMCs and clinics. Assessment H (Health IT) discusses the potential of telehealth for Veteran health care.

Reduce or shift the average inpatient stay. Assessment F has identified opportunities to shift patient care from the acute setting and potentially decrease the overall length of stay (Assessment F [Clinical Workflow], 7.2.1, 7.2.3). While the full capital ramifications of this opportunity have not been explored, it will be important to assess how implementing these changes could affect capital needs, for example, decreasing the number of acute inpatient beds or increasing alternative space needs. It should be noted that reducing the number of beds requires Congressional approval.

4.2.2 Reassess How and Where to Best Serve Veterans

In similar circumstances, other organizations have considered strategic operating changes which result in a realignment in their capital portfolios. There are several different examples VA could investigate further, including geographic realignment, community partnerships, or a shift in service offerings.

Realign geographic footprint of facilities. By limiting investment in older facilities where new needs are more than a targeted percentage of replacement costs, organizations can save considerable costs from expensive investments in aging facilities. Hospital systems traditionally replace medical facilities more rapidly than VHA, whose buildings are five times older than the typical not-for-profit hospital.[16] These replacements can allow hospital systems to shift with emerging trends, such as smaller inpatient settings, and then eliminate redundancies such as dual campuses or locations in low-demand settings. As outpatient clinics can be constructed at a lower cost per square foot than full-service hospitals, they have proved an attractive alternate construction model to larger settings with an inpatient focus. Additionally, there may be places where Veterans would be more effectively served through a combination of an outpatient clinic and community-based care rather than the traditional VAMC. VA has faced resistance in the past when seeking to close VAMCs (Nettinga, 2015; von Zielbauer, 2003; Bruce, 2012). These discussions introduce additional factors into the facilities decision making process and may reduce VA's flexibility in assessing the benefits and costs of retaining facilities, some of which may be underutilized or in too poor of condition to justify continued capital investment.

Enhance community partnerships. Within VHA, some stations have already begun piloting projects which place VHA physicians in community hospitals for Veteran care. Under this model, medical procedures such as surgeries are provided by VHA staff, while the nursing is provided by the community hospital, and the equipment and space needed are effectively rented to VHA. Additionally, VA and DoD have initiated partnerships to share medical resources and facilities. VA and DoD currently have more than 200 health care resource sharing

---

[16] 2013 analysis of 139 not-for-profit hospital systems in US, encompassing 1,362 hospitals.

Soule, J., & Keller, C. (2014). U.S. Not-For-Profit Health Care Systems Ratios: Operating Performance Weakened in 2013. RatingsDirect.

---

agreements between their hospitals and nine joint ventures where both authorities directly provide health care services, such as those in Anchorage, Albuquerque, and Honolulu (Military Health System, 2015). In an even closer partnership started in 2010, VA and DoD established the Captain James A. Lovell Federal Health Care Center in North Chicago (Captain James A. Lovell Federal Health Care Center, 2015). The medical center integrates facilities, services and resources from the North Chicago VAMC and the Naval Health Clinic Great Lakes into a single medical center, which is jointly led by VA and DoD leadership. The health care center provides care for nearly 40,000 Navy recruits and 67,000 eligible Veterans.

Shift service offerings. Hospital systems have experienced success by specializing in select types of care and relying heavily on referrals to redirect types of care which are easily provided by other institutions in the community. VHA already relies on purchased care for certain services based on local demand and community options. Increased specialization could intensify the use of this approach.

4.2.3 Explore Alternative Vehicles for Capital Delivery

Alternative models of providing facilities have proved productive for some organizations. These models include contracting out capital investment, outsourcing facility management, and establishing innovative public private partnerships.

4.2.3.1 Contracting out Capital Investment

Currently, VA relies on leasing as a way of reducing its capital burden and shifting costs to an operating model. If VA were able to achieve best practice performance levels in capital delivery, it would also have a natural advantage in owning facilities, because of the low cost of borrowing and favorable tax structure available to government entities. However, given current levels of performance, VA is not able to fully capture these benefits and could consider pursuing different alternatives which would reduce the upfront costs to revitalize strained VHA infrastructure. Several different models exist:

- **Private entity construction and ownership facilities.** A private entity can be contracted to finance, design, build, operate, and maintain a facility through a public-private partnership. A variation of this model is already being used for build-to-suit leases within VHA. Specific financial and operating arrangements for such a model vary, however, these generally involve facility condition and service level commitments by the private entity in exchange for either upfront funding or annual payments committed over a period of time. Potential benefits of such a model include reduced capital expenditures through both efficiency and shifting capital expenditures to operating expenditures, as well as increased flexibility. This approach could be piloted for one or two facilities before being adopted in full.

- **Sale and lease-back.** Existing facilities can also be sold and then leased back from a private provider in order to raise capital and transfer the risk and responsibility for capital improvements and achieve operational savings. The new owner is then responsible for ensuring a specified condition of the facility over a given time period, operating the facility (for example, functions such as environmental services, maintenance, engineering,

would be operated by the new owner), and would lease the facility to the public entity to continue control over areas of core competency. This model is more common for administrative and clinic spaces.

- **Selectively outsource facility construction management, ownership, or operation**. A more narrow approach involves the outsourcing of a portion of the facility program, for example, by outsourcing construction or facility operations. This could reduce operating costs required to maintain in-house management capabilities of construction, and may reduce capital costs if contracted to a private sector entity who can more effectively deliver capital projects. There are a number of models for outsourcing construction and non-recurring maintenance, ranging from simply contracting the construction management function of certain projects to contractors, to fully outsourcing the construction management function to another agency or private sector entity. While outsourcing also raises potential concerns regarding staffing, it may provide sufficient cost savings to justify consideration.

While our assessment was in progress, the Senate passed an amendment to the National Defense Authorization Act, directing the Secretary of VA to "seek to enter into an agreement…with the Army Corps of Engineers or another entity of the Federal Government to serve, on a reimbursable basis, as the construction agent on all construction projects of the Department of Veterans Affairs specifically authorized by Congress." The Deputy Secretary for Veterans Affairs has stated, "turning everything to [the US Army Corps of Engineers] (USACE) would be a very big decision, and it would be a decision we would want to make on a very well informed basis" (Building a Better VA, 2015). At the completion of our assessment, this amendment had not been adopted by the House. Evaluating the delivery of facilities services by another agency was outside the scope of this assessment, and no resources or assessment activities were spent considering this directive.

4.3   Holistic Options to Reduce Current VA Capital Need

Following capital excellence best practices, we have identified a number of recommendations that can be used to close VA's capital funding gap. Research on a wide range of infrastructure portfolios shows that by applying these levers, there is substantial opportunity for savings. For each of these levers, we propose a set of approaches that would close the capital funding gap, and provide a high-level approach to quantifying the potential savings associated with that lever.

It is important to note that many of these recommendations are not independent and also present different capital impact, timing, and ease of capture. Some of them could also require statutory changes to be implemented. The extent of savings that could be captured by applying each lever is linked with the range of other actions that VA could take. For example, the savings associated with delivering projects more efficiently changes depending on how many projects are prioritized. As such, later in this section we present levels of performance improvement that represent internally consistent and quantified options for VA moving forward.

In order to translate the levers into actionable transformation plans, we followed a sequential process that included prioritizing the levers across impact and ease of capture and developing

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

35

integrated sets of levers and associated quantified savings that represent different levels of transformation that VA could pursue.

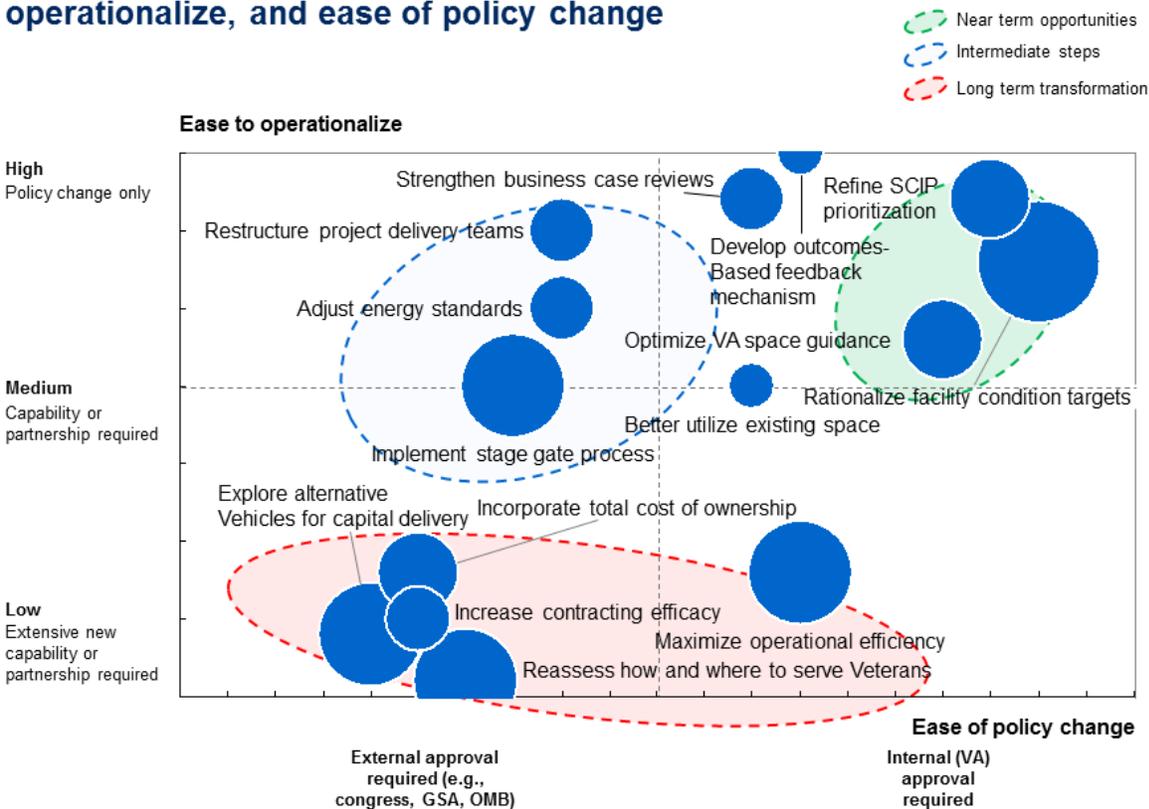
4.4   Individual Lever Prioritization

As a first step, the levers were prioritized along three major dimensions:

- **Ease to operationalize**: Understand whether the proposed lever requires new capabilities or partnerships to be implemented increasing the difficulty to capture the estimated impact.

- **Ease of policy change:** Consider whether the proposed initiative could be carried out just with VA internal approval or requires external stakeholders consent (for example, Congress, GSA).

- **Overall capital Impact:** Estimate the overall impact over a 10-year period for the proposed lever.

Figure 4-5. Individual Lever Prioritization


The prioritization exercise allowed the classification of the levers in three major categories that are illustrated in Figure 4-5 and described below:

- **Near term opportunities**: Levers that could be easier to implement and represent significant capital improvement , such as rationalizing SCIP criteria, optimizing space design ratios, and outsourcing facilities management.

- **Intermediate capital efficiency opportunities**: Levers with significant interdependencies or which may be difficult to institutionalize across the entire portfolio, such as restructuring project delivery teams, deploying a portfolio wide stage gate process, and revising design standards.

- **Long term transformative opportunities for consideration**: Levers that require significant capabilities and external stakeholder involvement needed such as selling and leasing back facilities, reducing footprint of underutilized facilities, or changing operating approaches.

4.5 Estimating Scale of Capital Efficiency Transformation

Given this prioritization, we then estimated the size of the opportunity if maximum capital efficiency was achieved. The potential value from each of these levers cannot be calculated independently and then added together in different combinations to identify the potential savings because of interdependencies in implementation, but we have developed a sizing which represents internally consistent combinations of savings levers and the potential value associated with these levers being used in conjunction. We have selected these levers based on a combination of their ease of implementation, the authority VA has to implement the change, and the potential value from making the change.

4.5.1 Sizing Savings From Capital Efficiency Levers

In the short term, and regardless of the strategic choices VA might make, VA and VHA should undertake a holistic effort to maximize the efficiency of their capital program. This effort could have the potential to reduce the capital requirement by $13 billion to $18 billion against the current estimated VHA capital needs (from $51 billion to between $33 and $38 billion).

A high level description of the associated potential savings is provided in chapters 4.5.1.1 to 4.5.1.3 while an in depth explanation of the sizing methodology is provided in Appendix B.3 of the report.

4.5.1.1 Improve Project Selection and Refining the Project Portfolio to Reduce Total Forecasted Capital Requirements by $7 to $8.5 Billion Over 10 Years

To size the potential impact of project selection and portfolio optimization in VA, we focused in three main areas:

- **Refine project prioritization:** By focusing the criteria and approval processes for capital projects, VA could concentrate capital spending on facility condition strategic priorities in order to invest first in critical repairs and high risk facilities reducing the capital need by $5.5 to $6.5 billion.

- **Increase scrutiny and scrubbing of projects:** We assumed that the top priority projects in the access, energy or functional need can be optimized by extensive review and refining

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

37

processes to achieve improved project design and scoping, leading to a 10-15% reduction in capital need in these areas.

- **Space planning criteria:** By optimizing design standards to current industry design standards for medical rooms and improving the architectural design at the department level, square footage requirements could be reduced by 10 to 15% from current VA standards.

4.5.1.2 Streamline Project Delivery to Reduce Planned Capital Costs by $6 Billion to 9 Billion Over 10 Years and Avoid Potential Cost Overruns

We assumed the following efficiencies from the different construction programs if best practice efficiency levers are adequately deployed:

- **Major construction program:** Public and private sector case studies and expert interviews suggested an improvement potential from up to 50%. We assumed a range of approximately 25-30% improved cost performance for VA, which would bring their performance in line with their current internal cost objectives.

  Additionally, we assumed a decrease of historical overruns in major projects over the last five years as a result of the improved process and recommendations, generating an overall cost avoidance of $5.5 to 9 billion, over the $51 billion of capital need estimates.

- **Minor Construction program:** Based on existing research and expert interviews we assumed a conservative reduction of 10 to 15 percent of the final project cost, which would partially address the observed cost increases in the minor project program.

- **Non-Recurring Maintenance:** Similar to minor projects, we assumed a partial reduction in the observed average cost increases for NRM projects which would achieve an overall optimization of 5 to 10 percent in the overall portfolio over the next 10 years.

4.5.1.3 Make the Most of Existing Infrastructure and Capture Potential Savings in the Operating Budget by Reducing the Ongoing Operational Expenses in Line With Industry Standards

VHA could improve the utilization of its infrastructure ensuring that space planning programs regularly evaluate underutilized and vacant space to identify opportunities for increased utilization or to actively divest unusable properties. While most of these potential levers would fall outside the scope of Assessment K, experience shows that 10-20% opportunity capital reduction may exist from associated levers. We have not included this reduction in our sizing.

In summary, we estimate that the $51 billion capital requirement for VA could be reduced by $13 to $18 billion, or 25 to 35 percent of total need.

2 Final capital requirements shown in rounded numbers

4.6   Strategic Levels of Transformation

If VA is able to successfully implement current improvement initiatives, act on these additional recommendations listed above, and demonstrate best practice performance, VA would have a total capital need of $33 to 38 billion over the next 10 years. Based on average funding of $16 to $26 billion over 10 years, an unfunded gap of $7 to $22 billion would still exist. To close this remaining gap, funding would need to be increased and VA will likely need to consider more transformative options. Applying many of these strategic changes would require external approvals and significant, multi-stakeholder conversations around the future of VHA. While sizing the opportunity of these levers is not within the scope of Assessment K, we believe that the case studies discussed offer a real opportunity to close VHA's capital shortfall while still providing quality care to Veterans.

4.7   Implementation Challenges to Achieve Quantified Impact

Achieving the identified savings requires concerted leadership efforts at every level and a comprehensive effort to implement recommendations at scale. VHA is a massive organization composed of multiple capital programs which currently operate at varying levels of

sophistication. Many of the challenges we and other assessment teams have observed are interrelated and highly complex. Implementing solutions to long-standing challenges will require collaboration among Congress and the Executive Branch, VA leadership (VACO, VISN, and VAMC) and staff, as well as external stakeholders. This assessment should be seen as an opportunity for improvement, to be achieved by all stakeholders through a combination of local, regional, and national action. Addressing these challenges will require sustained commitment as a part of an integrated transformation effort for the system as a whole.

While some changes may be more quickly enacted than others, it is important to develop an integrated, thoughtful approach to implementing the recommendations in this report. As previously noted and in alignment with Section 201 of the Choice Act, Section 201 assessments, findings and recommendations were developed independently. We therefore expect these recommendations will likely need to be refined and integrated by VHA leadership and the Commission on Care into the ongoing efforts. In order to effect the necessary change, the following enabling factors would need to be addressed.

- **Empower VA and VHA leadership to implement necessary changes.** Under current law, VA is not empowered to carry out all of the recommendations contained in this report. For example, changes to the appropriation mechanisms for NRM, minor, and major construction projects, described in Section 4, require Congressional action. Additionally, major alterations to VHA's operating model require Congressional support. This support goes beyond statutory changes. Real or perceived external influence is such that VHA, VISN, and station leadership feel constrained in making strategic choices around opening, moving, and closing facilities. As one example of the heightened external sensitivity around such issues, internal VHA guidelines[17] requires any changes that shift the services of an outpatient clinic across Congressional boundaries be approved by the Undersecretary of Health, adding another layer of complexity and extending the timeline needed to make changes in response to shifting Veteran needs.

- **Clarify strategic priorities.** Capital decisions should serve as an extension of a clear and consistent VHA mission. Historically, capital projects at VHA have suffered from the multitude of priorities layered into the process. Stations alter projects in order to achieve perceived priority criteria, shifting between security, access, and patient experience to respond to changing priorities. Without greater clarity and consistency of strategic priorities, project development may continue to be reactive, leading to jumbled and inefficient projects and capital plans. Assessment L covers the importance of mission alignment in greater depth.

- Promote a culture of innovation. Across VHA's capital program, transformative change is stifled by a culture oriented around compliance. Reliance on the status quo consistently trumps new approaches. Without best practice sharing or capability building, local leaders have little insight into new practices for their capital management program and little incentive to better their performance. Instead of focusing on opportunity, local leadership

---

[17] Guidelines for Notification for Community-Based Outpatient Clinics (CBOC) Changes.

becomes concerned with the risk of failure. In order to reorient the capital program, local innovations should be encouraged, endorsed, and shared.

- **Implement recommendations on an integrated timeline.** The different levels of transformation discussed above can be understood as steps along a process towards transforming VHA's approach to capital assets and management. Levers should be implemented as the groundwork is laid through policy changes, capability building, and stakeholder consensus. Relying only on quick wins or attempting to rush through the transformation could result in confusing an already complicated capital management program.

- **Develop systems and structures for accountability.** While performance management systems exist for leaders across VHA, those systems are typically focused on specific tactical metrics rather than outcomes, limiting flexibility for creative and innovative approaches. Instead of these narrow performance metrics, leaders and systems should be held accountable for comprehensive outcomes. In order to motivate leaders to accomplish the sort of systemic transformation discussed in this assessment, leadership evaluation would need to be tied to key milestones and outcomes, and leadership could be empowered to accomplish those goals. Under the current system, outcomes are difficult to track and responsibility is unclear.

Implementing systemic efficiency improvements and strategic changes requires an investment of time, resources, and energy. The potential to close the gap in capital need will be proportionate to VA's ability to address the challenges facing implementation.

5 Capital Planning Assessment

5.1 Preface

The capital planning process creates the structure by which VHA can strategically allocate resources to capital projects in order to enhance the capabilities, capacity, and quality of a medical facility to deliver care to Veterans. At its best, capital planning is deeply linked to broader strategic planning efforts which incorporate non-capital solutions as well. This process stretches across all levels of the agency.

Capital planning begins with the systemic identification of patient needs through VHA's Health Care Planning Model (HCPM). In coordination with Veterans Benefits Administration (VBA) and National Cemeteries Administration (NCA), the Integrated Planning effort, launched by the Office of Construction and Facilities Management (CFM) in FY11, takes a 10-year view of needs across each region, the current ability to respond to those needs, and the potential projects to execute against those needs. Stations and networks have also historically developed their own strategic and capital master plans in order to provide a long-range view towards effective project development. The Integrated Master Planning effort has been piloted in four VISNs so far and will replace the more ad hoc planning process as it is rolled out across the country.[18]

These planning efforts are coordinated across the country through the Strategic Capital Investment Plan (SCIP), by which stations across VA (including VBA and NCA as well as VHA) submit 10-year Action Plans in response to identified gaps in the system, such as access, condition, utilization, and space. These gaps pull from data collected throughout the year, including Facility Condition Assessments (FCA) which are completed by independent assessors every three years and measure what it would take to bring all aspects of current facilities up to like-new condition. These Action Plans are supplemented with business cases for projects within the first fiscal year, all of which are evaluated and scored for funding.

These funding needs are then weighed against other needs within VA and across federal agencies for submission as part of the budget package. Funds are allocated through various mechanisms, including: (1) major construction projects coming from line-item Congressional allocation and held at VACO, (2) funds for minor construction projects allocated as a lump sum and distributed through VACO, (3) funds for non-recurring maintenance (NRM) distributed to VISNs through Veterans Equitable Resource Allocation (VERA) funding allocations, (4) major leases authorized by Congress and funded through station operation dollars and (5) funds for leases coming from station operating dollars allocated by VERA funding.

Figure 5-1 illustrates some of the key phases of capital planning, and who plays a key role at each stage.

1 Primary entity leading effort

This assessment looks across all of the capital planning phases and is structured to address the following set of questions:

- **Outcomes:** How effectively do capital planning efforts respond to Veteran needs? Are capital funds effectively allocated to areas of greatest need within an adequate window? Does the current quality and capacity of facilities reflect this strategic allocation?

- **Process:** What are the processes for capital allocation? How are these processes integrated across regions and organizational levels? What are the key pain points or sources of inefficiency in the current process? Where are best practices or areas of strength evident?

- **People:** Are the right people involved in capital planning responsibilities? What training are they given to execute these responsibilities? Do people have sufficient time, resources, and authority to execute their responsibilities?

- **Systems:** Are the right tools in place for developing capital projects? What are the current limitations of those tools, and how might they be enhanced?

5.2 Findings

5.2.1 Outcomes

For VHA facilities, the gap between needs and resources continues to widen. The current 10-year capital need for VHA is approximately $51 billion. Over that time period, if additional needs are identified, the capital requirement could grow. Of the total, approximately $46 billion comes from the 10-year action plan developed through the SCIP process, and $5 billion comes from commitments to ongoing major capital projects. Average annual funding levels are well below that, at approximately $2 billion, leaving a $31 billion deficit from anticipated funding to 10-year identified need. Additionally, above the $51 billion identified in SCIP and outstanding major construction budget requests, VA historically has experienced significant overruns in their major construction performance, as detailed in-depth in Section 6. These overruns, if not averted through efficiency gains and process improvements, could escalate the total capital requirement to $56 to $64 billion.

Even with recent infusions of funds from the American Recovery and Reinvestment Act and the Veterans Choice Act, the scale and condition of facilities, combined with emerging needs, is such that VHA may not be able to construct, lease, and maintain medical facilities at a level to serve the entire Veteran population. Were VHA able to improve to best practice levels in each of these areas, there would still be a substantial funding gap unless there is a significant strategic shift and a marked increase in resources. As is illustrated by the four key findings below, the current capital management program does not keep pace with reported needs.

5.2.1.1 Investments in Facilities Are not Effectively Linked to Workload Growth

Facility needs are changing rapidly across VHA, with trifold pressures of shifts in care models, population centers, and medical standards. First, for both VHA and the health care industry, the model of care is shifting from intensive hospital treatments to outpatient care, often housed in the growing number of Community Based Outpatient Clinics (CBOCs). Between 2007 and 2014, outpatient visits increased 41 percent while inpatient Bed Days of Care (BDOCs) declined nine percent, see Figure 5-2. HCPM projects these trends to continue across the board. Some VISNs have experienced these swings even more dramatically. Outpatient clinic visits have increased as much as 70 percent (VISN 6), with five VISNs seeing growth rates above 50 percent. Inpatient bed days, however, have dropped as much as 21 percent in some VISNs.[19] Over the next twenty years, inpatient BDOC is expected to decline an additional 50 percent or more.[20]

SOURCE: VSSC Trip Packs, March 2015

Second, Veteran population shifts have mirrored shifts in the greater population, concentrating growth in the southern and western United States, while VISNs 1-4, located in the northeastern United States, are projected to face declining enrollment over the next 20 years.[21] Third, advances in medical equipment and facility standards across the industry, such as the move to private patient rooms, require corresponding changes within facilities in order to ensure Veterans receive the highest quality of care. Space requirements have gradually increased to reflect these changes. As the workload mix has adjusted, space within medical centers has been repurposed from inpatient to outpatient uses, often requiring significant remodeling.

This level of change would challenge the capital planning efforts of any medical system, but lengthy approval processes, construction delays, and modest budgets have combined to make this a formidable task for VHA. Capital investments significantly lag behind workload increases, or may be out of sync entirely. Projects currently in the pipeline to increase clinical space for outpatient needs, approved and under construction projects of all types, are not expected to meet the emergent growth in outpatient care. Figure 5-3 illustrates the mismatch between

---

[21] Enrollee Health Care Projection Model Figures, 2014.

facility growth (in square feet) and workload growth (in clinic stops). Some of this mismatch may be attributable to delayed responses to long-standing needs.

Figure 5-3. Outpatient Capacity Mapping Versus Projected Workload Increase

SOURCE: Outpatient workload projects (BDOC) taken from Healthcare Planning Model, June 2014; Space increases calculated as funded projects in the pipeline which were approved after the institution of the SCIP process (FY13-FY15)

At the same time, inpatient space is still being added to stations, despite consistently declining inpatient workloads. As seen in Figure 5-4, across the system, in-process inpatient space averages a five percent increase over existing inpatient space. Some of this is the result of changing space standards, such as the emphasis on private rooms and bathrooms for patients. More than 35 percent of the increase in inpatient space is driven by new or expanded Community Living Centers to provide long-term care.[22] Even with these considerations, the contrast between inpatient and outpatient workload and space expansions is striking.

---

[22] Data regarding in-pipeline projects taken from SCIP database for all projects which have been funded for design and/or construction. Only projects approved for funding after the induction of the SCIP process in FY13 were consider in the analysis, in order to ensure only the consequences of the current planning process were considered.

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

SOURCE: Inpatient workload projects (BDOC) taken from Health care Planning Model, June 2014; Space increases calculated as funded projects in the pipeline which were approved after the institution of the SCIP process (FY13-FY15)

A portion of the planned construction has a justification apart from workload increases. For example, VISN 22, an obvious outlier, has multiple on-going major construction projects and is also responding to seismic concerns, which are scored highly in the SCIP process. Nonetheless, the system-wide trend of significant construction efforts appears at odds with significant workload growth needs. Figure 5-5 illustrates the relationship between current station level space needs, based on currently acceptable medical square footage requirements, and pipeline projects to add square footage. While a slight connection between the space deficit and the in-process pipeline at a station exists, that correlation accounts for less than 30 percent of the planned construction. Moreover, major construction projects, expansion projects costing more than $10 million are even less connected with space needs than other construction and leasing types.

Figure 5-5. Project Pipeline Correlation with Space Deficit

Facilities with high space deficits are not more likely to have projects approved

5.2.1.2 Existing Space Is not Being Used at Its Highest Efficiency

Using VHA space guidelines for medical facilities, VHA records indicate a current need of 44 million additional square feet, while simultaneously recording 25 million square feet of underutilized space and 6.5 million square feet of vacant space (FRPP, 2014 and CAI, 2015; see Figure 5-6). The bulk of the underutilized space is administrative space. Some of the underutilized space is not easily repurposed because of age, condition, layout, or location. In many cases, one station will record excess space while another records a need. Sometimes this occurs even between two facilities in a dual campus station, meaning the existing excess space cannot be easily matched to patient needs.

In many instances, underutilized and vacant space may simply be unusable. The buildings currently being left vacant are, on average, ten years older than the typical VHA building and are typically non-medical space (VA Capital Asset Inventory, 2015). Older buildings, not designed to current medical standards, may be difficult or impossible to remodel to effectively meet current needs. Even where there are good reasons for not using this space, however, keeping vacant or heavily underutilized buildings within VHA's portfolio requires an unnecessary investment in upkeep which could be avoided by divesting these properties (Federal Asset Management, 2011).

5.2.1.3   Facilities Are Being Pushed Well Past Their Useful Lifespans

VHA's system is dominated by older structures which require significant investment to maintain. The ability of the system to adjust to shifting needs is currently constrained by the cost of more basic upkeep demands. Moreover, the scale of the updates and repairs needed is such that funding levels are insufficient to meet the existing need. As a result, the gap between needs and investment is widening, and already aging facilities are only deteriorating further.

According to Facility Condition Assessments (FCAs), VHA systems average a C- on an A to F scale, as detailed in Figure 5-7 (Capital Asset Database, 2015). These independent assessments are completed on a rolling basis, with each facility being inspected every three years. Nearly 40 percent of scored components received a D or F rating. VHA facilities do not receive an overall grade, but their component parts are scored with accompanying costs to upgrade components. These inspections have identified $15.9 billion dollars in needed repairs to bring all facilities back to like-new condition. Executing these repairs would include additional costs, such as contractor fees, and raise the total dollar number needed to correct FCA deficiencies.[23]

---

[23] Project costs include the labor, overhead, and associated costs.

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

Figure 5-7. Major Deficiencies Identified in FCA

FCA correction costs are concentrated in Grade D ratings
Facility Condition Assessment Ratings

Grade	Definition	Number items	Total correction cost $ Billions
A	Like-new condition	24,337	n/a
B	Over half of useful life remains	33,203	<1
C	Avg. condition, less than half of useful life remaining	55,841	<1
D	Poor condition, at the end of its useful life	59,919	13.5
F	Critical condition, requires immediate attention	8,574	2.4

SOURCE: Facility Condition Assessments taken from VA Capital Asset Database, March 2015

While some of these deficiencies are more superficial, many address critical infrastructure needs. Figure 5-8 illustrates the number of deficiencies across systems and the key drivers of cost.

While architectural and mechanical deficiencies make up the bulk of the cost, nearly $2.8 billion of the structural costs are driven by seismic concerns. Many of the other top-dollar categories, such as air handling equipment, consist of high-dollar projects, which can be challenging to work through the approval process because they hit a very narrow subset of the approval criteria for capital projects and therefore may not score high enough to be funded, as discussed further in Section 5.2.2.2.

5.2.1.4 Aging Infrastructure Negatively Affects Veteran Care

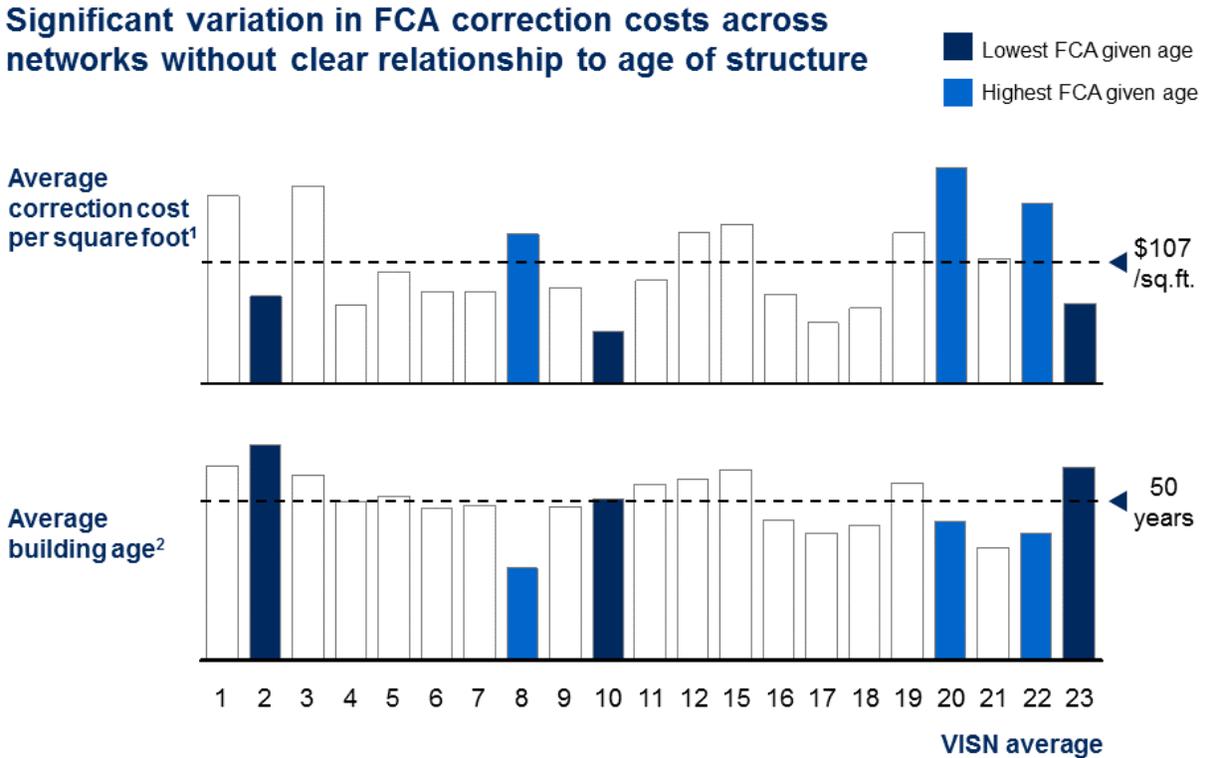
The average year of construction for VHA properties was 1965. The average building age in VHA is 50 years (Capital Asset Database, 2015).[24] In comparison, the building average of not-for-profit hospital systems in the United States is 10.5 years (Soule and Keller, 2014).[25] While most facilities have been extensively renovated, the renovations themselves have aged, and often

---

[24] In order to control for varying facilities sizes, data on year built was weighted by square footage on a building level. This avoids skewing the data by given the same weigh to small, older structures, such as guard buildings or storage buildings, as to large hospital campuses. Year built, square footage, and historic designation were taken from VA Capital Asset Database, accessed March 2015.

[25] 2013 analysis of 139 not-for-profit hospital systems in US, encompassing 1,362 hospitals.

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

were directly towards cosmetic rather than structural updates. Even when incorporating the renovation dates listed in the Capital Asset Inventory (CAI), the average age is still estimated to be approximately 41 years.[26] More than simply an issue of structural integrity, dated hospitals are built with designs which do not incorporate new models of care and cannot be easily adjusted to new approaches, such as the Patient Aligned Care Team (PACT) model.


A large percentage of VHA properties are further restricted. More than 20 percent of the square footage owned by VHA is designated as either a National Historic Landmark or a National Register Listed property, limiting the manner of renovations which can be done to the property and the potential for resale or demolition. As a result, when these properties are no longer usable for clinical purposes, VHA may be obligated to maintain these properties or go through a burdensome process to dispose of them.

The age of a facility is not a clear proxy for condition. While there are some clear relationships between younger facilities and fewer condition deficiencies – VISN 17's relatively recent facilities have lower than average correction costs – there is not a consistent relationship. Age contributes to the facility condition, which is also exacerbated by such factors as neglected or underfunded maintenance needs, unfavorable climate, and building typologies. Figure 5-9 evaluates the connection between facility age and FCA correction costs per square foot on a VISN level.

---

[26] Renovation years are often inconsistently applied in the CAI, and so should not be taken as a replacement for the year constructed when evaluating the age of the building.

Figure 5-9. Correlation Between FCA Costs and Average Building Age

Significant variation in FCA correction costs across networks without clear relationship to age of structure

Legend:

- Highest FCA given age

Average correction cost per square foot[1] — $107/sq.ft.

Average building age[2] — 50 years

VISN average: 1 2 3 4 5 6 7 8 9 10 11 12 15 16 17 18 19 20 21 22 23

1 Sum of total FCA correction costs across all facilities in VISN, divided by total owned square footage from CAI
2 Year built, as reported in CAI; age weighted by relevant square footage

Under FEMA guidelines, buildings are considered eligible for replacement when the fully-loaded correction cost is more than half of the replacement value of the facility (OIG-14-123-D, 2014).[27] VHA calculates a replacement value for each building in their inventory as part of the CAI. This replacement cost does not include the cost of land, but does include the full project costs of constructing the building, as determined by estimates developed by CFM. The correction costs used for the CAI, however, do not include these project costs, but are based on the value of replacement systems, or construction dollars only. Because of this, these estimates underestimate the ratio of correction to replacement. The design and execution of those projects typically adds an additional 25 to 35 percent to the total cost.[28]

The differing calculation methods makes it difficult to fully apply the 50 percent of replacement value principle, but we can use the inventory numbers to arrive at a conservative estimate for the number of buildings which are in too great a state of disrepair to justify further repair.

---

[27] This guideline is applied for public assistance grants to properties damaged by disasters. While the Office of the Inspector General (OIG) has identified challenges to effectively implementing this guidance, the general principle is widely held.

[28] The delta between construction costs and project costs is discussed more fully in the design and construction chapters.

According to the 2014 Federal Real Property Profile (FRPP), 508 buildings owned by VHA have correction costs exceeding 50 percent of their replacement value, totaling approximately seven million square feet, or 5 percent of the property owned by VHA. An additional 198 properties are borderline, with correction costs totaling more than 40 percent of the building's replacement value, which brings the total to nearly 7 percent of property owned by VHA. For these buildings, 11 of which are active hospital buildings larger than 50,000 square feet, these data suggest that investing in minor improvements, or even significant renovation, is no longer cost-effective. This is a significant concern across the system as the fully loaded replacement value of all VHA structures at $86 billion, correction costs system-wide stand at 19 percent of that total, and goes as high as 25 percent when considering full project costs (FRPP, 2014).[29]

5.2.2   Process

5.2.2.1   Expected Funding Levels Do not Support Identified Capital Needs

While the forecasted need for capital investment is $51 billion over the next 10 years, actual funding levels for capital projects remain far below requested levels, with current funding levels likely providing approximately $16 to $26 billion over the next 10 years (VA Budget, FY13-FY16). As a result, stations compete for limited funds. Different project types are funded through different mechanisms, but all project types are evaluated through SCIP process conducted annually at a national level.

Through SCIP, stations develop 10-year action plans to close identified gaps in such categories as access, condition, and space and provide detailed business cases for all projects applying for funding in the first fiscal year. The sizing of these gaps comes from centrally managed databases, including the Facility Condition Assessments discussed earlier. Every year, stations are given new workload projections, based on EHCPM, which projects workload at the 5-, 10-, 15-, and 20-year marks. Additionally, stations can access planning tools such as a mapping database and the Healthcare Planning Model (HCPM) and capital asset inventories (including the facility condition assessments discussed earlier) throughout the year in order to help develop their projects and business case justifications. Figure 5-10 provides an overview of the process.

---

[29] Of the FRPP database, only VHA properties considered.

Business case development
Detailed development of Year 1 projects through use of planning and cost estimating tools

Local Prioritization
Facility and VISN leadership prioritize and refine projects (local prioritization not reflected in final score)

Scoring Methodology
SCIP panel scores and ranks projects based on predetermined criteria, including data and narrative

Budget requests submitted
Ranked projects are submitted for funding based on project type and funding source

Projects funded
Scored minor/NRM projects are funded through VISN VERA allocation; Congress appropriates money for major projects

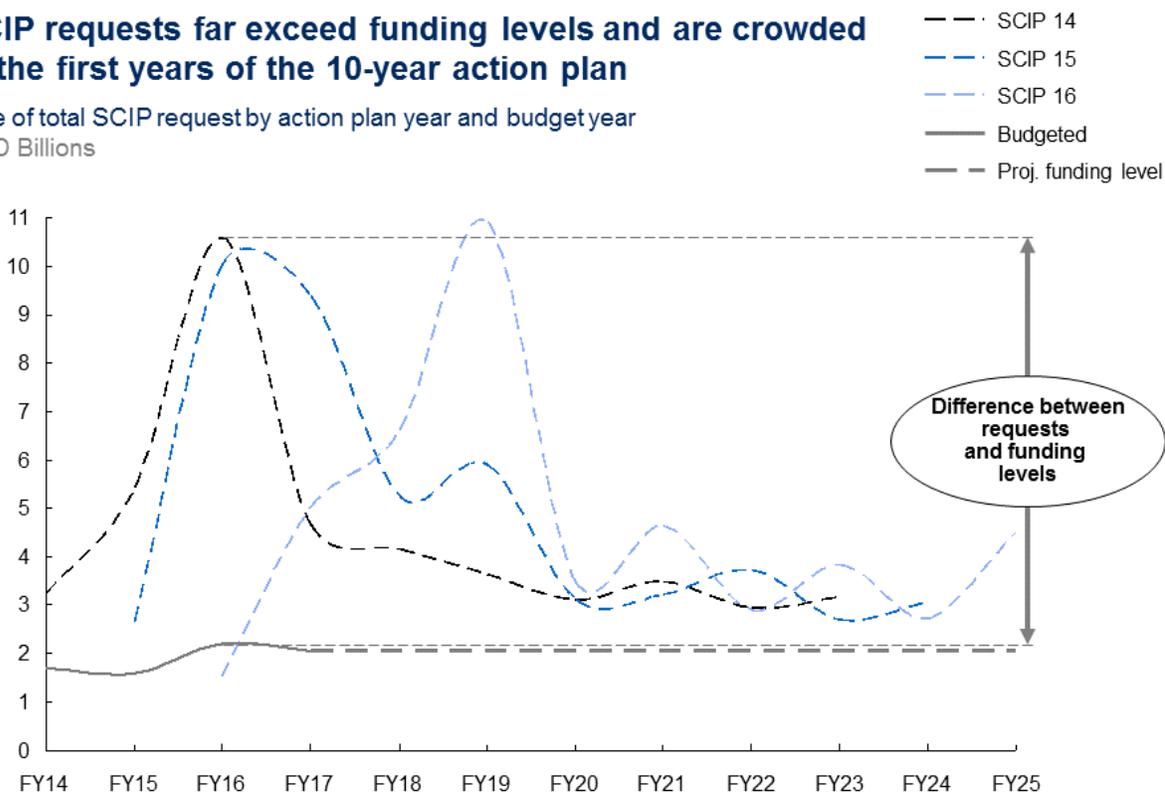
SOURCE: FY17 SCIP call memo; multiple interviews

The SCIP process, instituted for FY2013, offered a significant improvement in the level of data-based decisions used in the capital allocation process. Nonetheless, the evolving prioritization criteria and the resulting culture and process changes have created challenges throughout the system. Significantly, the lengthy time horizons from project delivery complicate any capital planning efforts, as advance planning efforts cannot be consistently implemented in time to respond to the needs they are designed to address.

While the Action Plans are designed to cover a 10-year time window, the submissions illustrate the challenges of effectively planning over a 10-year window during which facilities must compete for funds. All major and minor projects, as well as all NRM projects above $1 million, are scored and ranked across VHA. While roughly two billion dollars annually is given towards construction and maintenance projects, funding requests are consistently above this mark. This is particularly true in the first years of the Action Plan, for which facilities are developing more detailed projects (Figure 5-11).

Figure 5-11. SCIP Funding Requested by Year

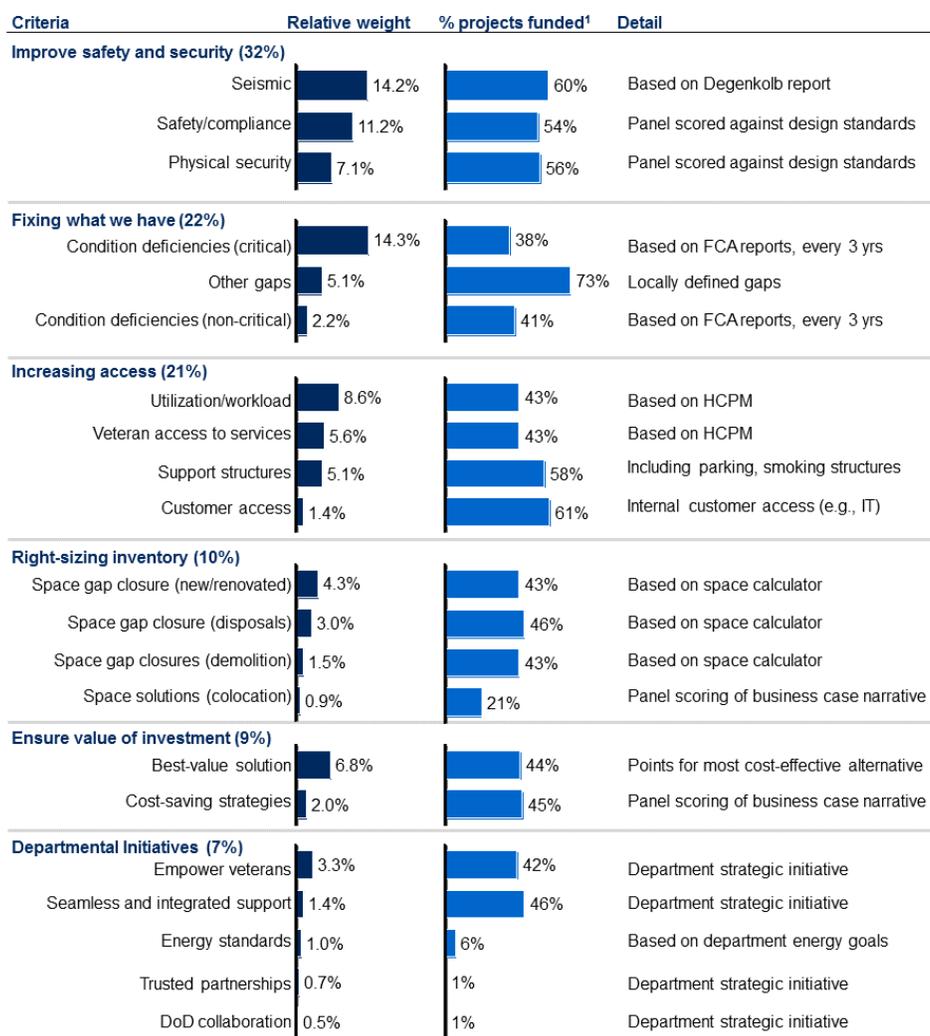
SCIP requests far exceed funding levels and are crowded in the first years of the 10-year action plan

Size of total SCIP request by action plan year and budget year
USD Billions


SOURCE: FY14-16 SCIP submissions; interviews

Less than 30 percent of projects are funded each year, leaving more than 1,000 scored and approved projects on the shelf at the end of each planning cycle (SCIP requests, FY14-FY16).[30] As each new planning cycle arises, unfunded projects and low approval rates cause stations to crowd lingering plans into the early years, diminishing the effectiveness of SCIP as a planning tool. Current estimates for fund requests four or more years out from the current fiscal year are largely based on block sums calculated as "out year funding" based on a calculation of the cost to close the remaining gap (VACO interviews, 2015). As projects remain unfunded in the near-term, those costs are then pushed out to the later years, with the "peak" funding year seen in Figure 5-11 being consistently rolled back with the submission of each new Action Plan. Interviewees reported that the uncertainty surrounding funding levels and the consistent delay of approved projects make it challenging for VAMCs to make realistic planning decisions about the best way to respond to budget constraints (VAMC/VISN interviews, 2015).

---

[30] Applicable in the years for which detailed project proposals exist, typically the first five years of the Action Plan.


5.2.2.2 SCIP Scoring Does not Favor Projects With Highest Impact on Veteran Needs

The current SCIP scoring process also creates challenges in understanding which projects will rise to the top. The number of criteria alone creates a high level of complexity. Figure 5-12 details the 21 criteria used for the FY16 SCIP submission (SCIP Criteria, 2015). While these criteria are grouped into six high level priorities, they are calculated and evaluated on the subcriteria level. Each criterion is given a scoring unit, scoring methodology, and relative weight. Credit is given for the progress of each project against the total identified gap.

Figure 5-12. SCIP Scoring Criteria Details

FY16 SCIP scoring criteria overview

Criteria	Relative weight	% projects funded[1]	Detail
Improve safety and security (32%)			
Seismic	14.2%	60%	Based on Degenkolb report
Safety/compliance	11.2%	54%	Panel scored against design standards
Physical security	7.1%	56%	Panel scored against design standards
Fixing what we have (22%)			
Condition deficiencies (critical)	14.3%	38%	Based on FCA reports, every 3 yrs
Other gaps	5.1%	73%	Locally defined gaps
Condition deficiencies (non-critical)	2.2%	41%	Based on FCA reports, every 3 yrs
Increasing access (21%)			
Utilization/workload	8.6%	43%	Based on HCPM
Veteran access to services	5.6%	43%	Based on HCPM
Support structures	5.1%	58%	Including parking, smoking structures
Customer access	1.4%	61%	Internal customer access (e.g., IT)
Right-sizing inventory (10%)			
Space gap closure (new/renovated)	4.3%	43%	Based on space calculator
Space gap closure (disposals)	3.0%	46%	Based on space calculator
Space gap closures (demolition)	1.5%	43%	Based on space calculator
Space solutions (colocation)	0.9%	21%	Panel scoring of business case narrative
Ensure value of investment (9%)			
Best-value solution	6.8%	44%	Points for most cost-effective alternative
Cost-saving strategies	2.0%	45%	Panel scoring of business case narrative
Departmental Initiatives (7%)			
Empower veterans	3.3%	42%	Department strategic initiative
Seamless and integrated support	1.4%	46%	Department strategic initiative
Energy standards	1.0%	6%	Based on department energy goals
Trusted partnerships	0.7%	1%	Department strategic initiative
DoD collaboration	0.5%	1%	Department strategic initiative

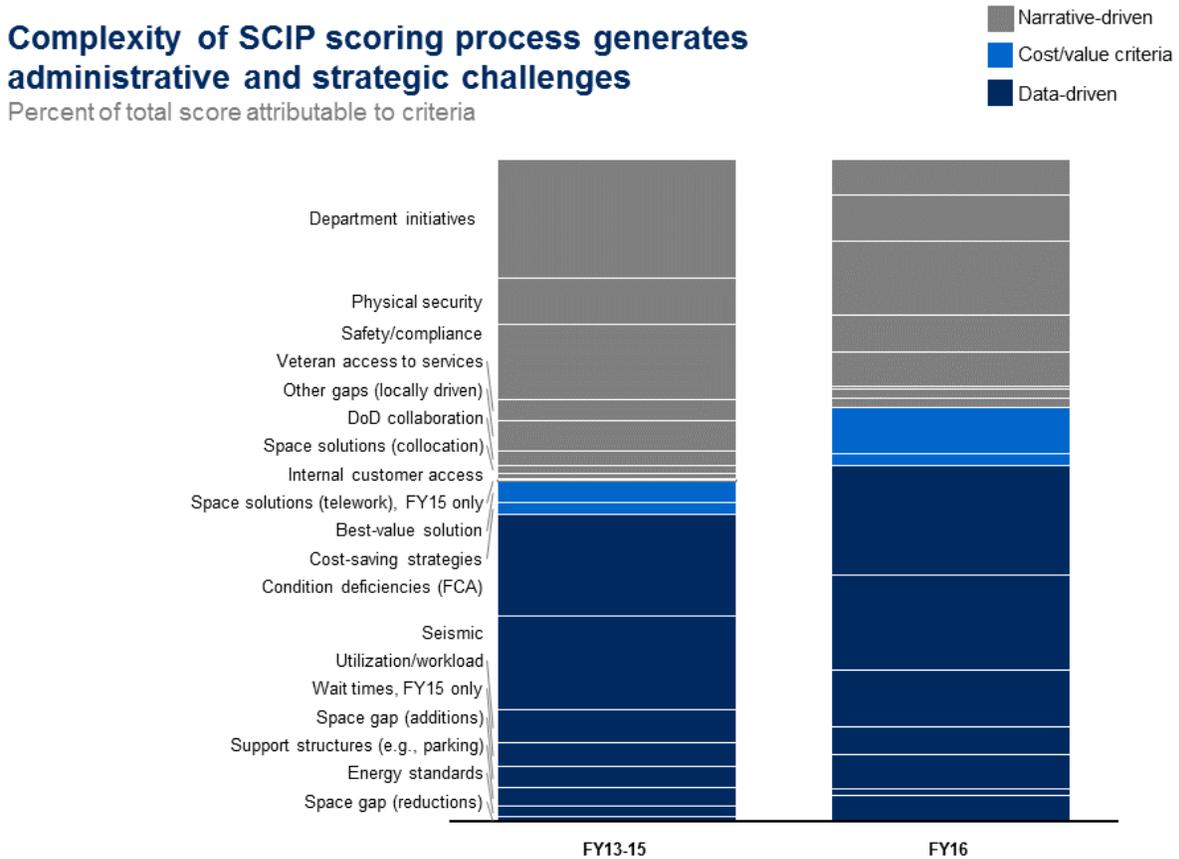
1 % projects which received a score in this category and were then ranked above the funding line, FY16

Because of the dispersed weights of the different subcriteria and the development of projects to hit a broad range of criteria, approval rates for individual projects are not closely related to the ranks of the strategic criteria they emphasize. While this diminishes the impact of the individual strategic criteria, these rankings also provide insight into the project pipeline results discussed earlier. It is not surprising that new expansions are not closely linked to workload growth when the utilization/workload criterion is only worth 8.6 percent of the total score. Similarly, the high levels of construction on the west coast, unlinked to workload, are understandable when seismic concerns are effectively tied for first in strategic terms, being worth 14.2 percent of the total score.

The scoring process is reevaluated annually in order to allow for VA shifting strategic needs and reflect process updates. As illustrated in Figure 5-13, more of the scoring shifts to objective data

inputs in FY16. Roughly 45 percent of the scoring, however, remains scored based on the business case narrative. As a result, stations have learned to place considerable emphasis on the ability to write a business cases tailored to perceived high value criteria, using both in-house staff and consultants to try and maximize these scores. This introduces an unavoidable subjectivity to the process, where presentation affects scoring independent of project merits.

While SCIP criteria and planning tools do push stations to consider cost-effective alternatives and provide a best-value business case, less than 10 percent of the total score relates to ensuring the value of the investment.

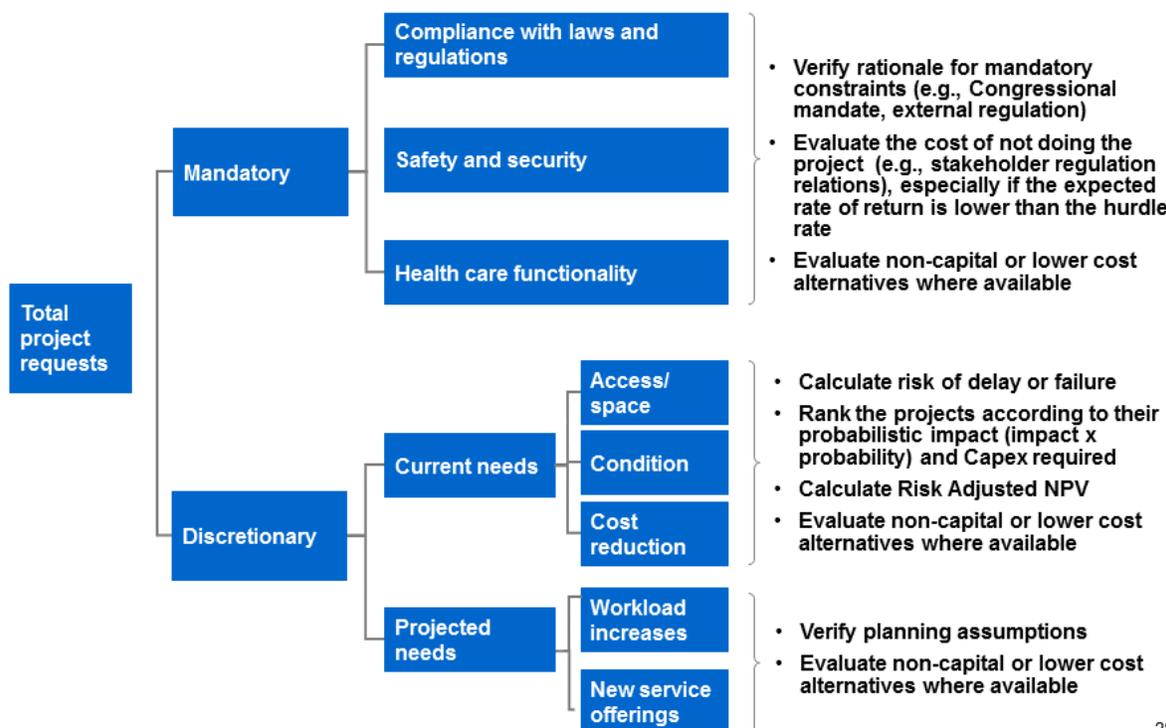
Figure 5-13. Assessment of Different Parameters Weighting in SCIP


SOURCE: Internal SCIP weighting guides, FY15 and FY16

While the current SCIP framework provides a system for evaluating projects and includes several strategic assessment criteria, the system classifies and scores all project using the same methodology. However, best practice capital portfolio optimization processes typically segment projects and apply different evaluation methodologies for each category of project (see Figure 5-14 as an example).

In the sample prioritization breakdown shown in Figure 5-14, projects are divided among two main categories: mandatory and discretionary. Mandatory projects are those directly dictated by laws and regulations and are necessary for the safe operation of a facility. Mandatory

projects should be prioritized over discretionary. However, mandatory projects should not be automatically or immediately approved and their classification should be thoroughly reviewed. Non-capital solutions could be available which would decrease the need for capital investment, and some of the projects can be shifted in later timeframes. More importantly, mandatory projects that have very low return on investment, below the minimal expected rate of return on invested capital, should be intensely reviewed and alternative scenarios should be considered. This segmented approach can lead to reductions in the overall cost of infrastructure investments. Without a robust system of prioritization and segmentation, a portfolio of projects can become misaligned with overall strategic planning or fall short in delivering anticipated outcomes.

Figure 5-14. Features of Best Practice Capital Portfolio Optimization


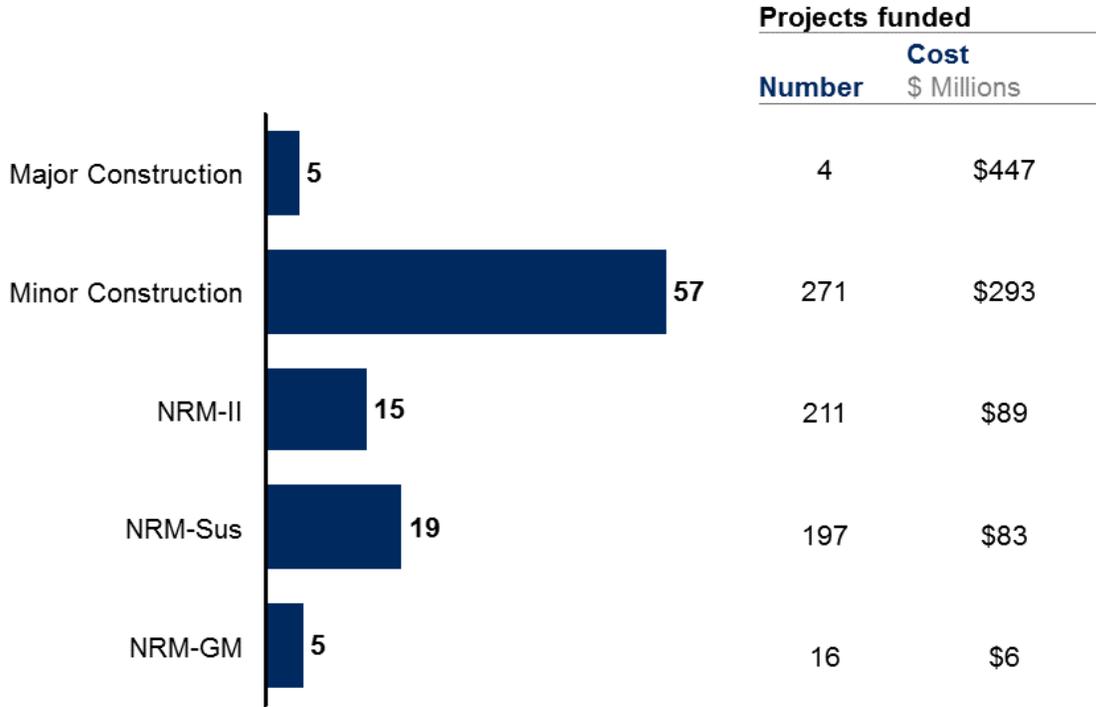
Discretionary projects include operational improvements, maintenance of current facilities, and potential new projects. Discretionary projects for current needs should be prioritized based on the strategic value they provide to the organization, often using their Net Present Value (considering adjustments for risk management and probable impact) or an alternative scoring of other benefits similar to those currently included in SCIP. For discretionary projects, it is also important to verify assumptions and ensure those assumptions are consistent across submitted projects. Non-capital and lower cost alternatives should be considered and discretionary

projects with return on investment below the minimal expected rate of return on invested capital should not be realized.

SCIP does not currently utilize this type of project classification in its scoring process, but evaluates all projects along the same criteria.

5.2.2.3 Stations Develop Projects With a Focus on Approval Criteria and Constraints Rather Than Project Efficiency and Clinical Merits

Competition for limited funds has led stations to make a range of choices in developing projects which favor approval strategies over efficient project delivery. Station leadership and central office administrative staff at VACO and VHA universally expressed awareness that projects are packaged in in order to fit above or below key thresholds, hit perceived high-value targets, and adjust scope. While the adherence to program constraints is commendable, those constraints have had the unintended consequence of shaping projects in inefficient ways.

One threshold with the greatest impact has been the division between minor and major construction projects. Major and minor projects expand the square footage of the facility in some way, but minor projects must cost less than $10 million and are executed by local VHA engineering staff. Major projects are executed by VA Office of Construction and Facilities Management (CFM), with input and coordination assistance from local VHA staff. Even more significant than the different execution arms for these projects, there is a dramatic difference in the approval rates of projects at each level. In the past three years, less than 5 percent of all new major construction projects submitted have been funded. While previously approved on-going major construction projects are still being funded through various design and construction phases, no new major construction projects were approved in either FY14 or FY16 (Figure 5-15).[31] The backlog for major construction projects has reached $10 billion,[32] and it is widely held across VHA that major construction will not be approved, and so there is little value in developing and submitting these projects. As a result, stations work to fit all projects below the minor threshold, even when the scale of the need is greater than that which can be easily accomplished under that limit.


---

[31] Major construction funds were still appropriated during these years for previously approved and on-going projects.

[32] Backlog calculated as the FY16 major construction budget request (~$1 billion), the anticipated future budget requests for current major construction projects (~$4 billion), and major construction projects above the funding line in SCIP scoring, but not yet funded (~$5 billion in FY16).

Figure 5-15. Assessment of Funding Likelihood by Program

Likelihood of project funding by capital program
Percent projects funded by type, FY14-16

	Projects funded	
	Number	**Cost** $ Millions
Major Construction	4	$447
Minor Construction	271	$293
NRM-II	211	$89
NRM-Sus	197	$83
NRM-GM	16	$6

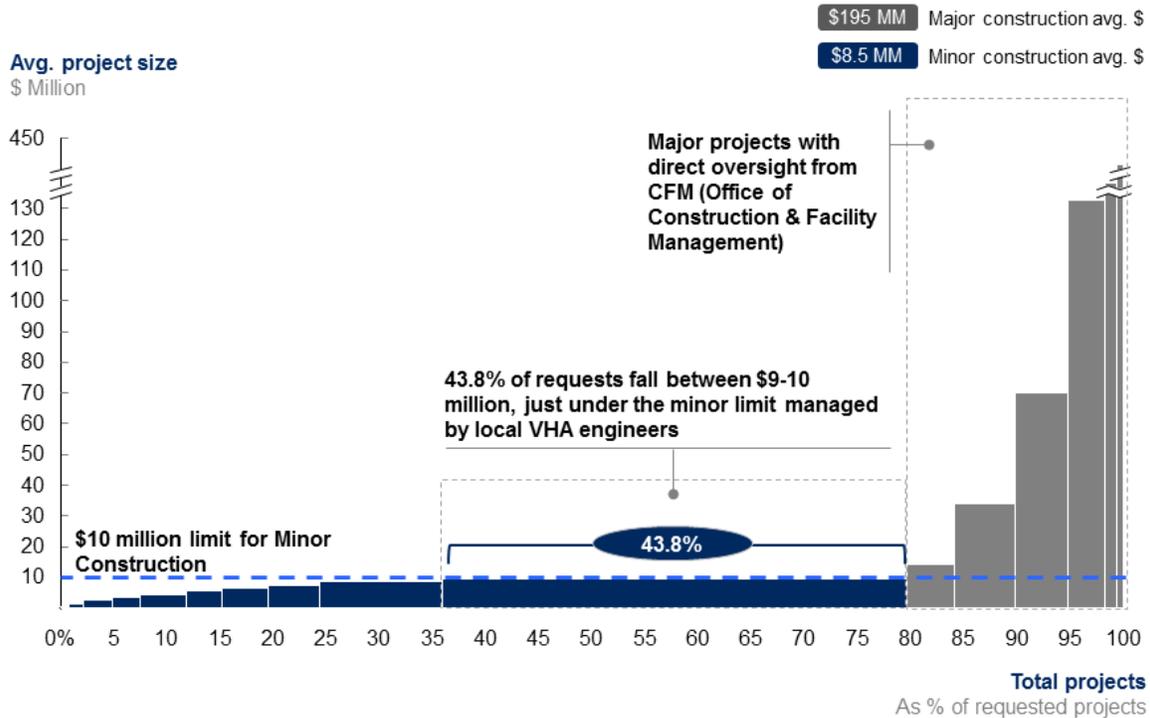
Major Construction: 5
Minor Construction: 57
NRM-II: 15
NRM-Sus: 19
NRM-GM: 5

SOURCE: SCIP submissions and budget requests, FY14-16

Minor construction projects, however, are the most frequently approved project type, with 57 percent of projects receiving funding over the past three application cycles. This gives stations incredible incentive to keep their projects under the $10 million cap, or to break up projects which would typically cost more than $10 million into smaller, stand-alone projects with a better likelihood of approval. In fact, nearly 44 percent of all projects submitted in FY16 had cost estimates between $9-10 million (Figure 5-16).

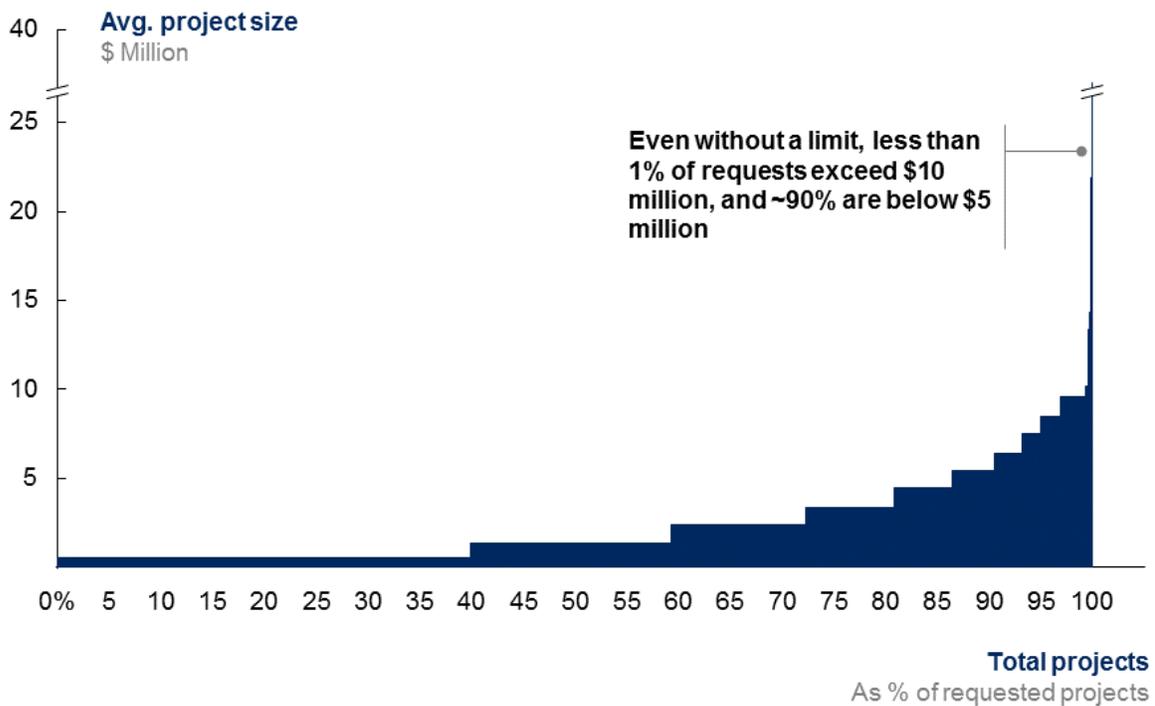
Figure 5-16. Breakdown of Major and Minor Projects by Project Size

Volume of project submissions directly under $10 million Minor Construction threshold illustrates careful project packaging

Average size and number of FY16 SCIP Major and Minor Construction requests


SOURCE: FY14-16 SCIP submissions; interviews

In some cases, projects are reduced in scale to fit under the threshold. Given the low likelihood of approval for projects above the threshold, stations have a strong motivation to ensure their projects fit below threshold. All minor projects are also required to write in a 20 percent potential scale reduction through "deducts," reductions in project scope which can be used to reduce the project cost if bids come in too high. It is also common to phase projects by breaking one larger construction effort into several pieces. In order to discourage phasing, rules require that one project be 95 percent complete before the next can be started, that new construction may not be modified for one year, and that design and construction may not happen in the same year. As a result, two floors of a new building may be added, only for a second, and sometimes third and fourth, separate effort to be launched in order to expand with additional floors. This type of de facto phasing results in duplicate costs (for example, design costs, project management), wasted effort (for example, building a roof to remove it the next year) and inefficient designs (for example, putting mechanical space in the building rather than on the roof).

NRM projects do not experience this same clustering under a threshold (Figure 5-17). This may be in part because NRM projects above $10 million are allowed if they are pure infrastructure projects (for example, a new boiler plant), but also because NRM projects, with the limit on additional square feet, are naturally constrained by project type, rather than by threshold.


There is, however, some evidence of this same phenomenon, as there is a somewhat larger percentage of projects below $1 million – the level at which NRM requests are tracked through SCIP, but not scored for central approval. These projects make up roughly 40 percent of all NRM requests.

Figure 5-17. Breakdown of NRM Projects Requested by Project Size

SOURCE: FY14-16 SCIP submissions; interviews

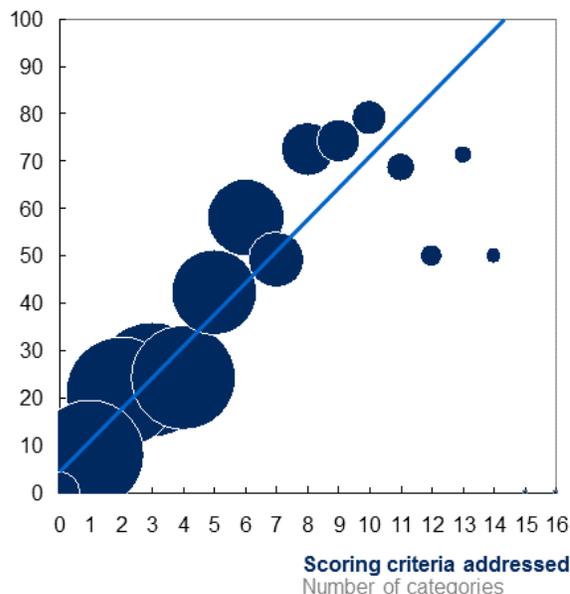
Projects can be strategically repackaged through methods other than managing cost. Owing to the highly distributed weighting of scoring criteria, projects benefit significantly from addressing multiple criteria in their business case. Even relatively low scores in multiple categories contribute to advancing the project. As a result, projects are often designed to aggregate several smaller, related projects which address different strategic needs into one larger package with a higher chance of approval (VACO/VISN/VAMC Interviews, 2015). Figure 5-18 highlights the correlation between approval rates and number of criteria addressed in the SCIP business case. In fact, this correlation becomes even stronger when major construction projects are removed from the dataset. Because major construction projects have such a low likelihood of approval in the face of construction backlog, these projects may not be funded despite their ability to address a wide range of criteria.


Figure 5-18. Correlation on Gaps Addressed and Likelihood of Funding
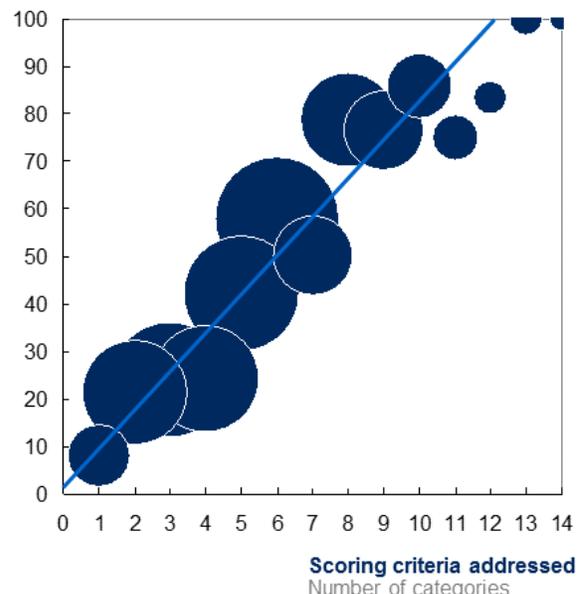
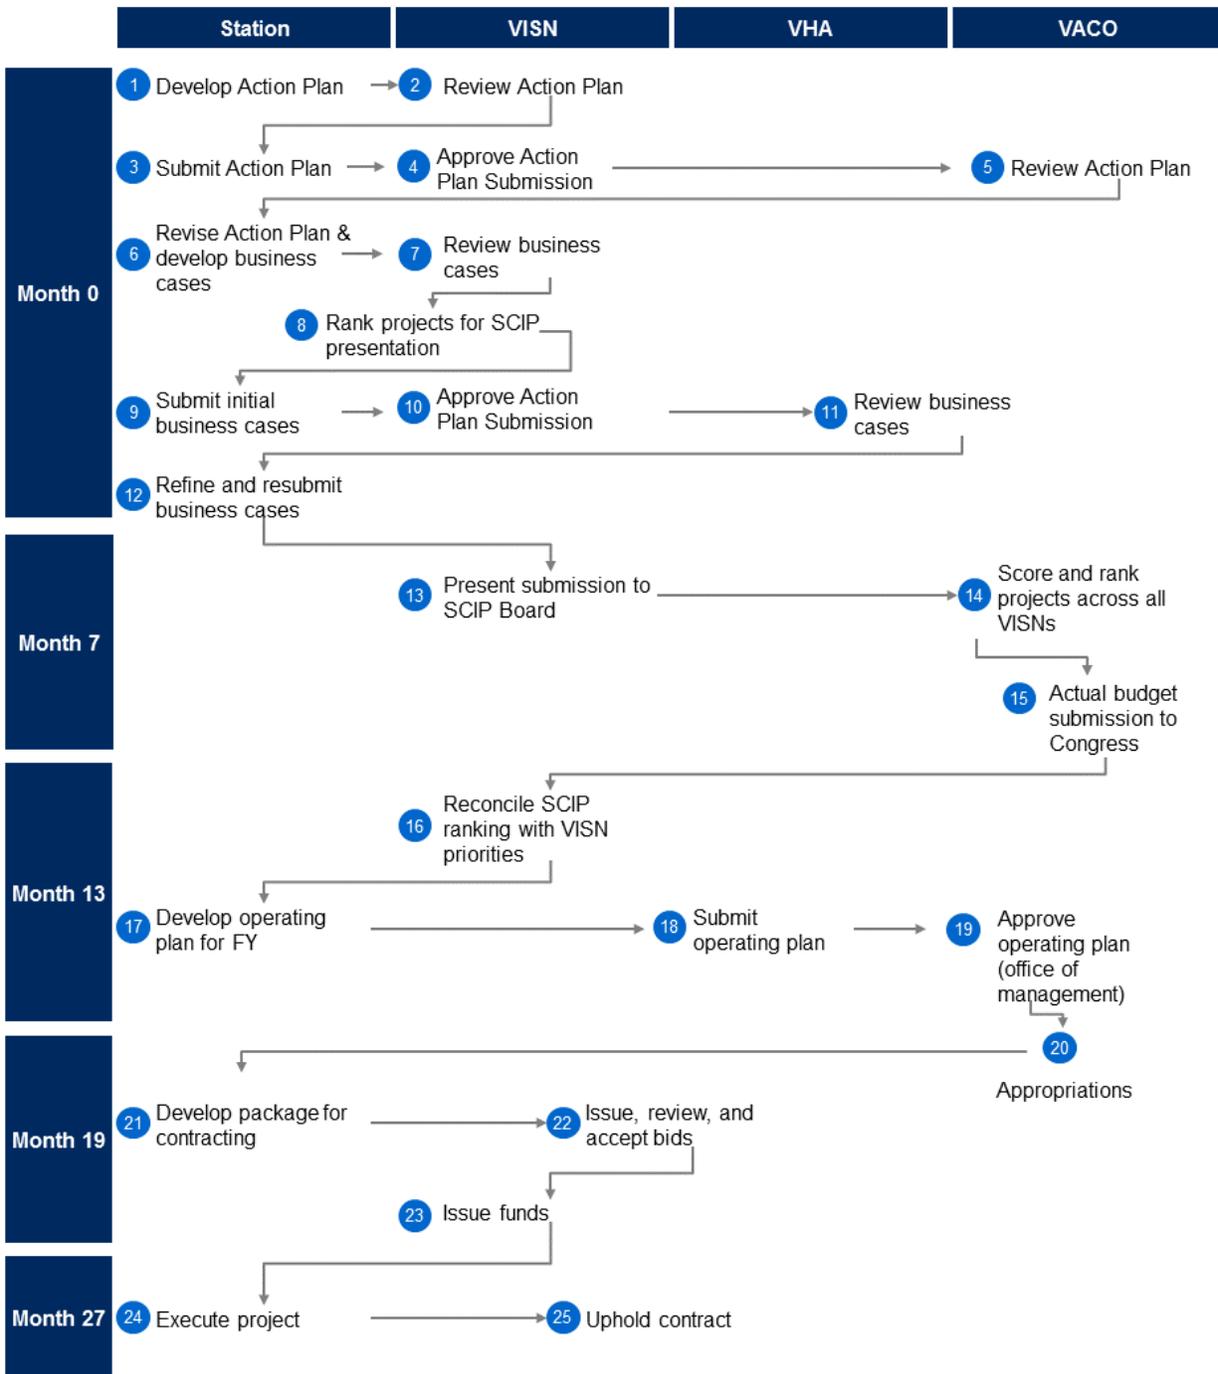


Given that criteria related to cost effectiveness account for less than 10 percent of the total score, projects can benefit when adding additional components to the project, even if they increase the cost of the project. Stations consistently report they have had better success with "hybrid" projects which combine multiple strategic initiatives or proposals into one entity than in having the most targeted projects approved. Charting out SCIP funding rates at different cost levels makes it clear that, up until the major construction threshold, larger projects are actually more likely to receive approval. This scale advantage actually disincentivizes efficient, targeted projects as well as pure infrastructure or preventative maintenance projects. While it is not possible to determine exactly what share of projects suffer for this sort of project packaging, the data indicate it is not uncommon and this conclusion is backed by interviews across VHA.

5.2.2.4 Protracted and Misaligned Planning Calendars Stretch Approval Process Over Multiple Years

Lengthy project approval times currently limit the agility of the system and its response to patient needs. Part of this is driven by delays in the construction and leasing process, but the time from submission to approval typically lasts several years, and for major construction projects may be even longer, during which time, new standards of care or medical technologies could emerge which change project requirements. Limited funding levels force projects into


later years, and these delays are compounded by mismatched planning. VA has several different planning cycles, of which SCIP is the most prominent for capital projects, as well as the development of the operating plan. These multiple calendars stretch across various levels, with staggered approval at the facility, VISN, and VACO levels, each step adding time to the process. The result is the delayed response to workload changes addressed early – the system simply cannot flex quickly enough in response to changes. Figure 5-19 details the handoffs involved throughout the process. Beginning with the development of projects for SCIP submission, one project could be handed between different offices within VA or VHA as many as 25times, even without considering general tracking information and submissions developed for different offices. Whenever the project involves establishing a new site of care, the Access Expansion Plan process increases the handoffs and timeline even further.

Figure 5-19. Key Steps and Handoffs for NRM Projects

Key handoffs during lifecycle of NRM projects

Station	VISN	VHA	VACO

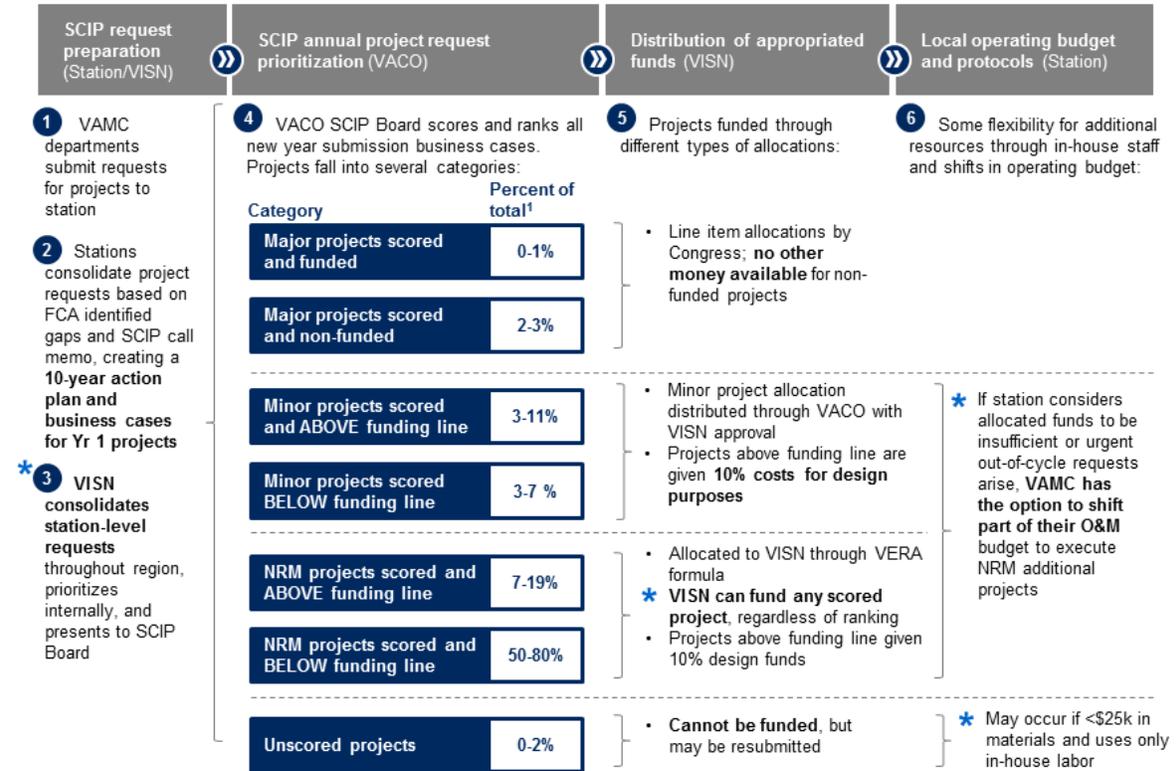
Month 0
1. Develop Action Plan → 2. Review Action Plan
3. Submit Action Plan → 4. Approve Action Plan Submission → 5. Review Action Plan
6. Revise Action Plan & develop business cases → 7. Review business cases
8. Rank projects for SCIP presentation
9. Submit initial business cases → 10. Approve Action Plan Submission → 11. Review business cases
12. Refine and resubmit business cases

Month 7
13. Present submission to SCIP Board → 14. Score and rank projects across all VISNs
15. Actual budget submission to Congress

Month 13
16. Reconcile SCIP ranking with VISN priorities
17. Develop operating plan for FY → 18. Submit operating plan → 19. Approve operating plan (office of management)
20. Appropriations

Month 19
21. Develop package for contracting → 22. Issue, review, and accept bids
23. Issue funds

Month 27
24. Execute project → 25. Uphold contract

The lengthiest portion of the SCIP review process occurs when SCIP priorities are combined with other funding needs across the VA system in coordination with the Office of Management and Budget, highlighted in Figure 5-20 and detailed in Figure 5-21. Each specific type of


---

appropriation comes with specific mandates on how the money can be used and how it will be distributed. Figure 5-21 details the how different capital projects work their way through the funding system.

Figure 5-20. Different Approval and Funding Mechanisms for Projects

Each funding stream carries its own complexity and level of competition for funds. Major projects, even when approved and given design funding, may wait for years before construction funding is issued. Minor project funds are held at VACO, and obligated as station level projects are ready. NRM projects are perhaps the most complex. They fall into two primary categories – (1) projects less than $1 million, which are tracked in SCIP but do not need scoring or approval, and (2) projects above $1 million, which are scored and can receive 10 percent of the total project cost for design purposes through SCIP. In both cases, however, the actual funding for the projects comes not through SCIP, but through VERA allocations for NRM.

The VERA allocation, which can vary significantly from year-to-year, is distributed to the VISN, which develops an operating plan delineating how these funds will be distributed to different stations. Projects above $1 million are expected to have been scored by SCIP before they are included in the operating plan, but do not have to be executed in the order prioritized through SCIP. Each VISN has its own mechanism for determining fund allocation. Some use their own scoring rubric and others allow facility leadership across the network to vote on projects.

Regardless of the mechanism chosen, the number of needed projects consistently outweighs the available funds, leading to competition and negotiations for funds.

VA Best practice case studies – Prioritization of NRM VERA funds

Several VISNs have developed sophisticated methods for evaluating NRM projects for submission to SCIP and funding distribution after scoring. These VISNs offer a best practice starting point for how funds can be effectively distributed at a network level and can provide a template for how to execute against the Section 5 recommendation for fully delegating infrastructure projects to VISN management.

Selected examples:

- **VISN 10** reviews all NRM and minor projects from the VISN well in advance of the SCIP submission, first reviewing for internal validity and consistency and then scoring and ranking against a clearly defined scoring matrix. Particularly with NRM projects, they then look at past years to understand the likely funding cut-off and constrain their SCIP business case submissions to a modest level in relation to the expected cut-off level. These scored and ranked projects are then recommended for funding to the Capital Management Council in the VISN, which includes the VISN Capital Asset Manager, Chief Engineers, and representatives from station senior leadership and select other departments. Only then are projects submitted to SCIP, and after SCIP scoring, the VISN allocates funding according to the approved list from the Council as projects are fully ready for contracting.

- **VISN 6** allocates NRM dollars through a May meeting where station leadership gathers to distribute NRM dollars. Each VAMC Director presents brief slides on their selected projects, and then directors and chief engineers throughout the VISN are each given a vote, and cannot vote for their own projects. Votes are measured against five clearly defined voting criterion, and the results are used to develop the operating plan for the fiscal year.

As an additional layer of complexity, NRM projects also have a narrow window for execution, illustrated in Figure 5-22. Lengthy contracting times and strict parameters for what proportion of funds must be obligated by each quarter can delay or cancel NRM projects altogether. Because of this risk, stations and VISNs are allowed to oversubscribe on projects in their operating plan, so that if one project falls through, another is ready to be executed.

Figure 5-21. Timeline for Projects Funding and Approvals in NRM

## Approvals and funding processes for NRM projects

Overall timeline 2014 2015 — Fiscal Year 16 October 2015 — 2016

- Project request FY16 Jan 2014
- VISN Summit May 2015
- FY16 Operating Plan Jun 2015
- Contracting Packages FY16 Jul 2015
- Design Packages for FY17 execution request Jul 2016

- Regional Project Request Prioritization (2nd Funding round)

- Overall sequence is:
  - January 2014– May 2015: Submission of projects < 200k to complement existing SCIP projects
  - May 2015: Prioritization done at VISN level
  - May – June 2015: Final approval confirmation
  - June – July 2015: Package preparation to send to Contracting Officers (approved & funded projects)

- Initial Contract time (no real project activities can happen before October – fiscal year)

- Award, Design & Package Build for projects in construction FY17

- Missing July 2016 deadline represents project gets delayed to FY 18 construction

Note that PALT[1] is ~180 days (6 months)

1 PALT: Procurement Administrative Lead Time
SOURCE: Multiple VAMC and VISN interviews, 2015

Additionally, NRM funds may be redistributed across the Network or full VHA system later in the year, if it is apparent that some networks will not be able to obligate their allotted dollars in the time allowed. Obligations refer to the contractual commitment to spend funds which happens before the funds are actually expended. Stations then supplement VERA funds through additional money from their operating budget, or through capturing excess dollars after obligation deadlines. This can be seen in the wide variation in how much money different stations obligate each year for NRM projects, detailed in Figure 5-23. In FY14, VISNs spent between $4 and $33 million additional dollars, above VERA, on NRM projects. The consistent supplementing of NRM funds by VISN leadership indicates the depth of the current need over and above existing funding levels.

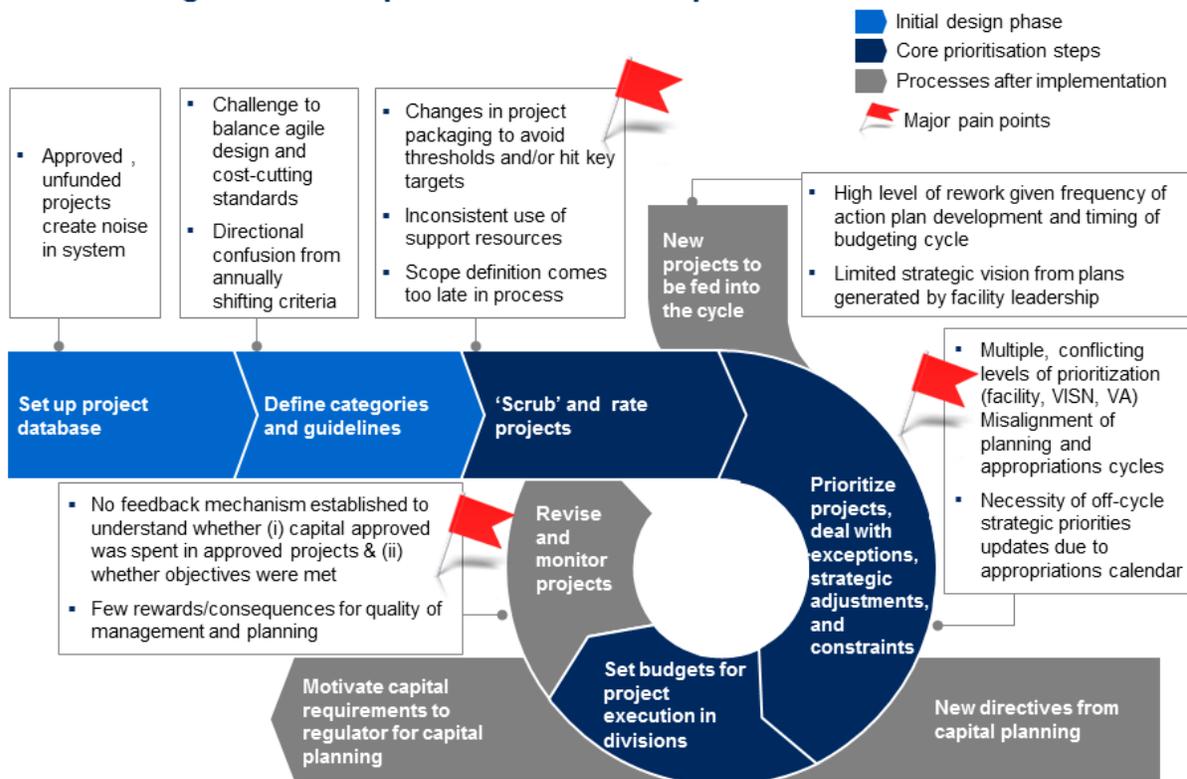
5.2.2.5 Lack of Feedback Mechanisms Results in Uncertainty as to Whether Capital Projects Have Achieved Anticipated Outcomes

The SCIP process itself includes several opportunities for specific feedback on project development, though that is primarily focused on ensuring proposals are complete and compliant, rather than engaging with the merits of the proposal or the outcomes that are ultimately achieved. When it comes to reviewing how project execution has achieved the objectives of the approved proposal, however, no formal feedback mechanism exists, and informal mechanisms are rare. Projects are approved and prioritized on the basis of their ability to close identified gaps, but if projects fall to close these gaps, that failure is not identified or addressed.

Figure 5-23 provides an overview of the key gaps between current VHA processes and best practices across the discussed spectrum, but the largest gap comes with the lack of feedback mechanism. Without accountability for project design, delivery, and operations against stated objectives, it is not possible to understand in real time the effectiveness of the planning and prioritization of projects, whether done at the local or national level. Until addressed, this gap could hinder the effectiveness of any other policy or procedural changes in the capital planning process (SCIP Directive, 2014; VACO/VISN/VAMC Interviews, 2015).

Figure 5-23. Best Practices in Capital Planning Design


5.2.3 People

5.2.3.1 Staff Tasked With Capital Planning Are not Fully Equipped for the Task

Chief engineers and other facilities staff have the needed qualifications for the critical elements of the construction and facility management efforts; however, they may not be the best positioned to challenge the objectives of the project or the effectiveness of alternative, non-capital solutions. Despite stated VA objectives of developing cost-effective, pragmatic capital projects which consider creative methods of cost savings,[33] the responsibility for developing these projects and preparing the business cases for the SCIP process often falls on those who are not well positioned to evaluate strategic and non-capital solutions against typical capital approaches. Stations delegate this task as they choose, with some variety across the system, but most commonly this work is primarily the purview of the Chief Engineer. With an engineering and facilities background, it is natural for these staff to turn to capital solutions as the first recourse to address needs. Chief Engineers have the overall technical profile needed to speak to the practical needs of project development and how proposals would best fit in with

---

[33] As detailed in SCIP call memos and through the HCPM process.

the existing structure, but may not have the training to analyze the return on the investment and the potential alternatives including non-capital solutions. Moreover, besides being outside their natural area of expertise, the addition of this responsibility on top of the numerous other tasks delegated to the chief engineer can pull focus from other important project-based and recurring maintenance responsibilities.

Perhaps reflective of this disconnect, the "capabilities" outcomes on the Organizational Health Index (OHI, discussed further in Appendix B) is the one outcome where VHA facilities staff scored significantly below both VHA as a whole (33 percent lower) and their counterparts in CFM (31 percent lower). This outcome addressed the practices of talent acquisition and development as well as process based capabilities (VHA OHI, 2015).

VA has developed a series of tools to assist in the development of these business cases, including cost estimating guides (CFM), cost effective analysis templates (OAEM), prototype designs (CFM), Space Equipment Planning System (CFM/Department of Defense) and a space calculator (OCAMES/OAEM).[34] These tools, however, would be more effectively utilized with the input of budget analysts, from the facility level through to the VACO review conducted by the SCIP Panel, including staff support from OAEM and OCAMES and input from subject matter expert committees pulled from across VA. Facility planners can also serve a vital role in the development of business cases, but the facility planner position is inconsistently staffed across VHA. At some of the selected site visit locations, the facility planner tasks were an additional responsibility for someone dedicated to another role, another location staffed a small department for this function. Confusion over how and with whom to best fill this responsibility reduces the potential of the business cases to be a truly robust consideration of all options, both capital and non-capital.

5.2.4   Systems

5.2.4.1   Tools for Developing SCIP Business Cases Rely on User Creativity and Capabilities to Consider Creative Alternatives to Capital Solutions

The tools themselves also limit full consideration of creative, cost-effective alternatives. The Cost Effective Analysis template (CEA), a required component of the business case, evaluates new construction, leasing, contracting out, and collaboration for expanded clinical space. Interviews, however, demonstrate that this tool rarely, if ever, genuinely shifts the station's preferred alternative. Some of this can be attributed to user bias – most values and assumption are user inputs at the station level, allowing for a fair level of variation in the specific terms of the analysis. For example, the cost per gross square foot and land acquisition costs included in the analysis are both user generated inputs which are only reviewed at a high level by central office staff.

Another limit to the tool is that the alternatives considered and the funding structures behind those alternatives. For example, the cost of VA purchased care is based on operating budget assumptions which do not consider the capital investment behind patient care, which removes

---

[34] Tools housed on VA intranet, including the Technical Information Library housed on CFM's website.

a significant cost component from the in-house cost estimates (GAO, 2011; discussed further in Assessment B). For a station, the calculation involves losing workload reimbursement for a patient in their system and expending the cost of that care elsewhere.

5.2.4.2   Current Resources Are Inadequate to Provide Robust, Merit-Based Analysis of Business Cases

While facilities are encouraged to consider non-capital alternatives, first through HCPM and then through recommendations on the call memo and the CEA, if a station is not equipped or inclined to fully evaluate those alternate mechanisms, the review is unlikely to enhance their assessment by more than a rough compliance check against the tool and VA standards. While the act of completing the CEA is undeniably beneficial in clearly defining the scope of a project and a rough look at the possibilities, a more robust analysis is called for in order to be truly strategic with capital decisions.

Perhaps more significantly is the shortage of manpower assigned to address the volume of projects. There are nearly 1500 business cases that were submitted for FY16 and only 4-5 full-time people (both staff and contractors) assigned to review the cases in less than one month. In addition while there are subject matter experts who are drawn into the process, they are responsible for a full review of an individual project, focusing only on key themes. The SCIP board, made up of leaders from across VA, meets for 1-2 weeks to review and prioritize the full set of projects (VACO Interviews, 2015). This creates substantive review challenges for the staff tasked with reviewing SCIP requests and has led to a perception in the field that the centralized review process offers little value. While the review process developed by OAEM does involve several checks and a range of experts to consider the cases, limited resources still lead to an abbreviated review process.

5.2.4.3   The Decision to Lease Versus buy a Facility Does not Take Into Account the Full Range of Implications and Costs

There are also limitations to VA's current approach to deciding between leasing or owning a facility when new space is required. There are three default settings that apply to different types of facilities:

- **The default for on-site space expansion is owned construction.** Expansions to space on site, once proposed as construction projects, are not compared to off-site leased facilities, or to alternate on-site options such as partnerships with private sector developers that could build and operate space on-site in return for a lease payment.

- **The default for off-site clinical or administrative space is leasing.** Smaller, off-site facilities are almost always leased, with little consideration of purchasing or building new properties to own. This applies both to small clinics as well as larger, build-to-suit clinics (major leases).

- **The default for large new hospitals is owned construction.** All new major hospitals are constructed for ownership by VA.

While, technically, both leasing and owning options are included in the CEA, which provides stations with a tool for careful cost estimation, no surveyed station reported changing a capital decision (for example, lease, build, renovate) based on the results of this tool. In lease versus buy decisions, facilities have a built-in incentive to pursue capital projects, which are funded upfront through centrally provided funds, as compared to leases which are funded annually though station operating budgets. This process is slightly different for capital leases, for which all funds for a lease must be obligated at the outset and where total rental payments amount to greater than 90 percent of the value of a new property, amongst other criteria. While this approach may make sense from an accounting perspective, in terms of recognizing what should be considered capital cost, it also diminishes the advantage leasing has in allowing projects to be enacted without bearing the capital burden up front. VA does not typically enter into capital leases, as discussed in Section 8.2.2.

Best practice tools for evaluating a lease versus buy decision include a tool for comparing these two strategic options, as well as other options, such as sell and leaseback and subletting excess owned space. Additionally, the tool should include sensitivity analysis for real estate growth rates and discount rates. VA's Real Property Services (RPS), located in CFM, developed the lease scoring template for major leases to facilitate decision making among different offerors for a specific leased project. However, this scoring template does not reflect key elements of this strategic evaluation. Instead, it primarily provides an internal check on lease rates and support compliance verification. Given this focus and the design of the tool, it does not fill the need for an analytically based strategic decision-making tool.

The template inputs include building specific metrics, such as building use, size, stories, location, duration of the lease, and lease acquisition method, and costs, such as annual rents, recurring costs, and site acquisition cost (if any). Using this input data, the NPV of the total rental cost is calculated for all the offers and compared with the fair market value (FMV) of the building, based on construction costs. This comparison allows RPS to compare NPVs across offers and verify that the proposed lease meets the standards for an operating lease, as set forth by OMB and GSA (OMB, Circular No. A-94; GSA Leasing Desk Guide, Appendix F). However, the leasing template does not compare the strategic option between leasing and VA constructing the building. The tool is also limited since it calculates FMV using RSMeans average construction costs, which are significantly lower than VA's average construction cost, and does not assign any resale value to the property.

Most importantly, this approach often does not take into account a net present value calculation of the total cost of ownership, including factors such as the potential positive disposal value of an owned asset, challenges to disposing of assets in the current climate, the costs and benefits of lessor-provided facility management, and the likelihood that VHA will renew the lease, which would increase the ratio of total rent payments to total facility value. While it does make sense to treat leasing as the default option for smaller facilities, VHA would benefit from a more detailed examination of the lease versus buy decision for larger facilities, using a complete total cost of ownership approach.

5.3 Recommendations for Consideration

VHA capital planning efforts are currently shaped to respond to the gap between the size of the capital need and the significantly lower level of anticipated funding. Making only incremental improvements to the project development and prioritization model will be insufficient to address the overall gap and its implications for the planning process. Sections 3 and 4 discuss the full range of capital efficiency improvements and potential strategic changes for further discussion. The following recommendations are concentrated on improvements which can be delivered within the current approach to delivering health care to Veterans.

5.3.1 Reassess Project Thresholds and Authority Levels

5.3.1.1 Separate Pure Infrastructure Projects From the SCIP Scoring Process and Delegate Control Over Funding Decisions Fully to the VISNs

Currently, the definition of NRM projects includes any project which does not increase the square footage of the facility by more than 1,000 square feet. As a result, a project to update the elevators at a VAMC is considered with the same scoring mechanisms as a project to update an imaging suite or expand a waiting area, and both are funded out of the same category of money. These projects should not be evaluated against the same criteria, as they are fundamentally different in nature. Pure infrastructure process, currently categories as Non-Recurring Maintenance Infrastructure Improvement projects (NRM-II) are essential to ensuring the safety and usability of facilities over time. NRM Sustainment (NRM-Sus) and Green Management (NRM-GM) projects are focused on increasing the capability or capacity of a facility. Both are essential, but attempting to compare the two under the same system leads to an inconsistent application of scoring criteria and potentially incoherent project development.

This recommendation would refine how projects are categorized so that they can be reviewed and scored under different systems, tailored to that specific project type. Under the current model, VISNs control funding for all NRM projects, but are subject to SCIP scoring, and therefore longer approval timelines, for all projects over $1 million. This proposal would reduce the overall VERA NRM allocation to a level which reflects only investments in infrastructure projects. This funding level should be carefully set, and consider the age of facilities and major systems, using a usable lifecycle approach to developing NRM budgets.

5.3.1.2 Recategorize NRM-Sus and NRM-GM Projects Over $1 Million as Minor Projects

Following on the last recommendation, the NRM projects which are not geared towards infrastructure improvements, namely NRM-Sus and NRM-GM projects over $1 million, should be shifted into the same review and funding process as currently exists for minor projects. These projects address the same strategic objectives as minor construction projects, with the only substantive difference being the overall change in square footage.

Combining NRM-Sus and NRM-GM and minor construction projects would remove the distinction of whether additional square footage is being added and class all capability and

capacity projects together and evaluate them under the same strategic criteria. Additionally, the two-year money model of minor projects would be extended to include everything in this category, rather than the NRM one-year money approach. Projects would still be executed by station-level engineering staff, but money would flow from VACO rather than through VISNs. This removes some of the challenges of one year money, described in Section 7.2.1.2, and tightens the link between project scoring and funding.

Small rehab projects, including those previously described as NRM-Sus, which fall under $1 million could be completed out of station level ops budgets at the discretion of station leadership. Projects would still be reported through SCIP for tracking purposes, but funds could be obligated and projects initiated on timelines set up at the facility, independent of any national review or approval.

5.3.1.3 Remove Hard Line Threshold Distinction Between Major and Minor Projects

In addition to modifying the classifications of NRM projects, described above, VA should reassess the threshold between minor and major projects. As described in Section 5.2.2.3, these project thresholds significantly impact the development of proposals, the likelihood of approval, and the on-time and on-budget percentage of projects. Given the scale of these ramifications, it is vital to set these thresholds thoughtfully, or to retool the implications of these thresholds so that they do not exert the same level of force throughout the process.

VA is currently reviewing proposals to increase the minor project threshold from $10 million to $25 million. While this may remove some of the constraints in project development, it does not sufficiently address the implications of having such clear thresholds on project design, and VA would likely see the same sort of project clustering under the $10 million threshold to develop under the $25 million threshold in the near future. Instead, thresholds should shift to consider different factors relating to scale and complexity of projects. At minimum, this would involve pegging thresholds to the location factors provided in the CFM cost estimating guides and price changes due to inflation or deflation. More sophisticated analysis would consider the complexity of a project. For example, a $20 million parking garage is a much more straightforward project to design and execute than an $8 million inpatient space conversion or operating room suite. Given this, closer scrutiny should be given to projects given their complexity, rather than emphasizing solely dollar amounts.

By removing the hard line distinction, projects could be optimized to address the identified need rather than to meet a cost threshold. The SCIP process could serve as the mechanism for vetting whether borderline projects should fall into the major or minor category. Accomplishing this would require devoting more manpower to the SCIP review process than is currently available, but that investment in manpower could be returned in improved project efficiency.

5.3.1.4 Assign Project Ownership Based on Capacity and Capability Rather Than Funding Thresholds

The current hard line distinction in funding levels is paralleled by a hard line distinction in managing project execution. This model places a disproportionate emphasize on dollar amounts as a measure of difficulty. While scale is certainly a relevant factor, and large ticket

items should fall to an organization dedicated to construction, the delineation of that line is not as straightforward as current controls imply.

Instead, there should be level of projects where a review process is used to determine whether project ownership should rest with local engineering staff, CFM staff, or under a hybrid model where CFM provides a high level of technical assistance and local staff manage the day to day. This review process could directly parallel the considerations described in funding categorization above or could come as part of a supplementary review which considers the capacity of station level engineering staff to executive projects given their current project pipeline.

5.3.2 Refine SCIP Prioritization With Clear Focus on Cost Effectiveness and Strategic Goals

In order to maximize the strategic impact of SCIP, the criteria at the root of the scoring mechanism should be clear and straightforward. The current reliance on nearly two-dozen subcriteria lowers the impact of highly strategic criteria and creates a system which is perceived as a black box by the field. Additionally, projects should advance based on their ability to help achieve system-wide goals in a cost-effective manner, without reference to scale of the project or ability to address a multitude of criteria. Scenario-based optimization has proven an effective way for large systems to evaluate capital projects. This approach assesses projects by (1) link to strategic goals (focused set of clear targets), (2) likelihood of achieving objective, and (3) cost-effectiveness.

By using a scenario approach to evaluate projects, proposals which score high in 1-2 categories could more accurately be evaluated for their progress against targets. Under the current model, given two projects, (a) a project to replace steam radiators with a FCA score of "F", and (b) a small renovation project which addresses several minor condition items, energy upgrades, and workload increases, project (b) would likely score better under the current model given its ability to address multiple criteria, even though project (a) may be far more urgent and affect a much broader range of Veteran care. A scenario model would allow each project is evaluated with consideration for the overall goal it is advancing rather than a scatter-shot criteria approach and would more effectively acknowledge the criticality of major infrastructure items. Additionally, under a scenario approach, cost-effectiveness is measured by determining which combination of projects most effectively advances the system-wide strategic goals for the same cost.

Whether as part of this change or as an interim step, local priorities should be reflected in the SCIP scoring mechanisms, as well as the integration between the proposal and any existing Integrated Plans (applied as they are rolled out through the system).

5.3.2.1 In the Short Term, Rationalize and Prioritize Capital Requirements at a Sustainable Funding Level and Focus on the Most Critical Items That Contribute to Veteran Care

Before considering more fundamental strategic changes, there are adjustments which can be made to help reconcile the disconnect between current funding levels and identified gaps. Given the funding gap, current targets can only be described as aggressive stretch goals. When developing the focused set of targets described above, VA leadership should be sure to set realistic targets and encourage facilities to develop correspondingly realistic project packages. For example, the current expectation is that all $15.9 billion of FCA gaps will be closed within a 10-year window. At current funding levels, doing so would take every available dollar of major, minor, NRM, and recurring maintenance funding, and do so without any attention to other vital gaps such as access, space, and function. If budgets only allow for these extreme cases to be addressed, then that should be determined and acknowledged upfront.

VA can address this by incorporating an FCA score for the condition of overall facilities, both at a building and campus level, in order to reprioritize and streamline condition assessments to highlight areas of greatest need. Introducing an average facility grade for consideration would make it easier to identify facilities which, on average, are scoring below a B and focus on bringing those averages to a sustainable level. This score, combined with a careful comparison to the replacement costs of the facility, would allow VA to identify structures which are no longer of sufficient condition to justify further capital investments. System critical and failing items in all other facilities should receive first priority.

It is important to point out that any non-critical deficiency, ignored long enough, will become critical. This recommendation should not be treated as a way to simply eliminate all future repairs in certain categories. Instead, focusing on currently-failing items or high-risk building systems (such as fire protection, chillers, and generators) helps to clearly prioritize these projects. Under the current system, non-critical FCA repairs would boost the score of another project directed towards closing a space gap. By eliminating the strategic benefit of non-critical FCA projects, the condition gap would be clearly focused on the highest priority areas, at a level more in keeping with anticipated funding levels.

5.3.2.2 Regularly Assess all Facilities to Determine Their Usable Remaining Lifespan

With the rollout of the Integrated Planning efforts coordinated by CFM, every station should have the opportunity, in partnership with their VISN, to develop a long-range master plan on a five-year rolling basis. This analysis should consistently consider the likelihood that any given facility would need to be replaced in a 10-year window, based on established metrics, such as: (a) ratio of correction cost to replacement cost, (b) percentage of anticipated growth, and (c) adaptability of current floor plans and building envelope. These measures should then be incorporated into all future assessments of major project need on a competitive national basis through the SCIP process. Significant investments in aging or underutilized infrastructure should be limited, and facilities should develop projects with a view towards whether they would be eligible for consideration for a replacement project within a 10-, 20-, or 30-year time horizon.

This goes a step further than the current FCA evaluations, and instead looks a full business case review of VAMCs and clinics on a regular cycle, ideally synched with Integrated Planning.

5.3.2.3 Develop a Feedback Mechanism to Hold Project Leadership Accountable for Effectiveness in Meeting Stated Goals

In order to ensure projects are accomplishing the strategic goals set forward by VA, projects need to be evaluated for their ability to meet targets. VA does not currently have a mechanism to look back and evaluate whether a project successfully delivered its stated objectives. Without this, it is possible for those developing a project to claim achievements, and the corresponding higher score, without delivering. Project outcomes could be linked to additional flexibility or funding in future cycles, thereby increasing incentives for business accuracy. The lengthy lifecycles of project execution make it challenging to use ultimate project outcomes to evaluate staff. In order to facilitate evaluations of personnel, interim milestones can provide a measure of accountability. For example, these measures could include alignment between business case cost estimates or project deliverables and final contract. In keeping with the recommendations on performance management in Assessment L (Leadership), evaluations should be focused on outcomes.

5.3.2.4 For all Projects Addressing Access or Workload Gaps, Conduct Robust Review of the Cost Effectiveness of Different Models of Care

Ensuring the best value and quality for the money spent requires a more demanding cost and alternatives analysis than is currently conducted for capital construction efforts. While existing planning and cost estimating tools have begun moving in this direction, significant enhancement is needed to both tools and process in this area. In order to ensure adequate time and resources are invested in this analysis, this intensified analysis only need apply to potential expansion projects.

First, current tools need to diversify the set of alternatives that facilities are asked to consider when developing a proposal. Investigation of such options as Veterans Choice, extended operating hours, and collocation with affiliates and other community clinics should be standard. In order to facilitate this analysis, users will likely require more directive tools with less user-generated inputs than the current CEA excel template and mechanisms to differentiate by clinical type. Not all of these tools need to be complex financial models. Most stations currently operate with a default choice from the alternatives, at times based in regulation (for example, Freeze the Footprint, limited approval of major construction projects), but also based on with what models leadership is most familiar and comfortable. Internal benchmarks across the country can be leveraged to understand the costs of possible gap closures. Additionally, a simple checklist which ran through the alternatives, most relevant situations, and potential considerations, would provide an important layer of genuine consideration of alternatives before staff focus on the mathematical exercise of putting assumptions into an excel template.

Second, new processes should involve facility leadership and fiscal staff in project development from the earliest stages. To increase accountability and ensure facility leadership has acknowledged the alternatives, a checklist similar to the one above could be signed off on by

facility staff, indicating they have reviewed cost-effective alternatives. This step, particularly if tied to real performance management, would raise the bar on the scrutiny given to capital investments. Developing the economics of the business case and alternatives investigation should not be exclusively the responsibility of the engineering department, but should be proactively supported by a budget analyst, located at either the station or VISN, who can work to provide a comprehensive look at alternatives.

5.3.3 Review and Streamline the Planning Processes and Calendars to Minimize Response Time to Identified Veteran Needs

Myriad planning cycles and approval levels extend the length of time it takes to have a project approved. Stations currently submit non-emergency SCIP requests up to two fiscal years in advance. Combined with contracting and construction timelines, this means the earliest any identified need can be met is 3-4 years, and many take longer to address. Approval times should be reviewed for any and all opportunities to condense approval cycles and eliminate duplicate work.

5.3.4 Execute all Non-Capital Levers Before Proceeding With a Minor or Major Project

Nearly one-third of the $51 billion VHA capital need is driven by space gaps. In some cases, these gaps may be closed without the construction of additional square footage. First and foremost, the clinical and scheduling efficiency recommendations offered by Assessments E and F would reduce the space required for both inpatient and outpatient care, as discussed in Section 4.2.1, could have implications for existing and projected space gaps. While these operational improvements may have varied impact on the space gap, it is important to review potential gains as a first order measure. The cost and time commitment in capital projects is such that it should be the last lever pulled to close a space gap, not the first. Space-related capital projects should not be approved for stations which have not implemented these other efficiency measures.

5.3.5 Increase Best-Practice Sharing Between Stations and VISNs

Across VHA, stations and VISNs have implemented different approaches to strategic master planning, business case development, and project selection/prioritization. Many have independently developed detailed tools to improve their processes, such as detailed guides for including users in project design and development, Veteran advisory boards, project scoring matrices, and comprehensive master planning efforts. These are laudable and proactive efforts which should be encouraged. At the same time, other stations and VISNs can learn from and adopt these approaches. By creating interest groups for engineering leadership, promoting and communicating the excellent work done at high-performing stations, and creating forums for leadership to discuss shared challenges and solutions, the entire system could benefit from existing pockets of excellence.

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

82

6 Design and Construction Assessment: Major Projects

6.1 Preface

VHA, with support from the VA Office of Construction and Facilities Management (CFM), undertakes numerous capital projects to increase and maintain its asset base of owned facilities to meet Veteran needs. Section 201 of the Choice Act calls for assessment of the capital management programs specifically relating to the design and construction management processes. This assessment is structured to address the following four aspects of the design and construction program:

- **Outcomes:** How do VHA hospital construction costs compare to the private sector? How does VHA perform in project delivery outcomes including cost, schedule, and quality across all of its construction programs? To what extent do construction projects and processes affect facility utilization or Veterans' health access?

- **Process:** What processes do VHA and CFM have in place for construction programs? What pain points exist across these processes? Do construction processes address the identified current and future needs in a timely fashion? Can VHA improve the processes or other aspects of construction to improve quality?

- **People:** How do VHA and CFM structure and staff their project delivery teams to deliver projects effectively? How does culture impact project delivery?

- **Systems:** What systems are employed in the delivery of the projects? Do they drive efficiency and enable best practice performance for project delivery?

6.1.1 Overview of the VA Construction Program

6.1.1.1 Construction and Renovation of VHA Facilities Is Executed Through Three Main Programs, Each Defined by Amount and Type of Construction

The major construction program represents approximately half of VHA's 2016 capital program and is managed centrally by CFM. The other half of the capital program is managed locally via VISN and VAMCs (OAEM, 2015; 2016 VA Budget, 2014).[35]

- **Major construction program (9 projects, 51 percent of total[36])**: Projects that address construction, alteration, extension, or improvement of any facility, campus or integral service, including parking construction and site acquisitions above $10 million. The program primarily includes two informally defined types of projects, both of which are managed by CFM and are line item appropriated by Congress:

  - o **Mega projects** (approximately >$500 million, although not formally defined): Typically the largest construction project in each of the three CFM regions, mega

---

[35] 2016 VA Budget Request; NRM and Minor projects include oversubscription, i.e. projects approved but below the threshold of current funding limit; % total is of total budget request for VHA only (not VA).

[36] Total by amount requested in the 2016 VHA capital program of NRM, Minor, and Major construction.

---

projects are given additional on-site support. These are normally replacement medical facilities like Aurora, New Orleans, and Las Vegas or new medical facilities construction, both with greater complexity than an average project.

- o **Major projects** ($10 million-500 million, although not formally defined): These projects are normally expansions or major area renovations to existing medical centers, structural reinforcing (for example, seismic projects), or supporting structures (for example, parking garages).

- **Minor construction program (174 projects[37], 13 percent of total)**: Projects that address construction, alteration, extension, or improvement of any facility, including parking structures, site acquisition, and demolition by replacement, with costs equal to or less than $10 million, managed by local VHA engineering staff.

- **Non-recurring maintenance (NRM) program (866 projects, 36 percent of total):** Projects that renovate existing facilities and associated infrastructure with expansion of space not to exceed 1000 square feet. The program primarily includes three types of projects: Infrastructure Improvement, Sustainment, and Green Management, all managed by local VHA engineering staff:

  - o **NRM sustainment ($25,000 to $10 million):** Projects focused on renovation and modernization of existing facilities and infrastructure (for example, lab renovation). Projects in this category are often driven by national-level mandates instead of station needs (for example, upgrades for the water systems due to legionella).

  - o **NRM infrastructure (Greater than $25,000):** Projects focused on replacing, upgrading or expanding infrastructure systems or focused on facility condition assessment (FCA) deficiency backlog (for example. HVAC replacement).

  - o **NRM green management:** Projects include environmental, energy, green building, and fleet management-related activities in support of reducing energy (for example, upgrade to LED lighting).

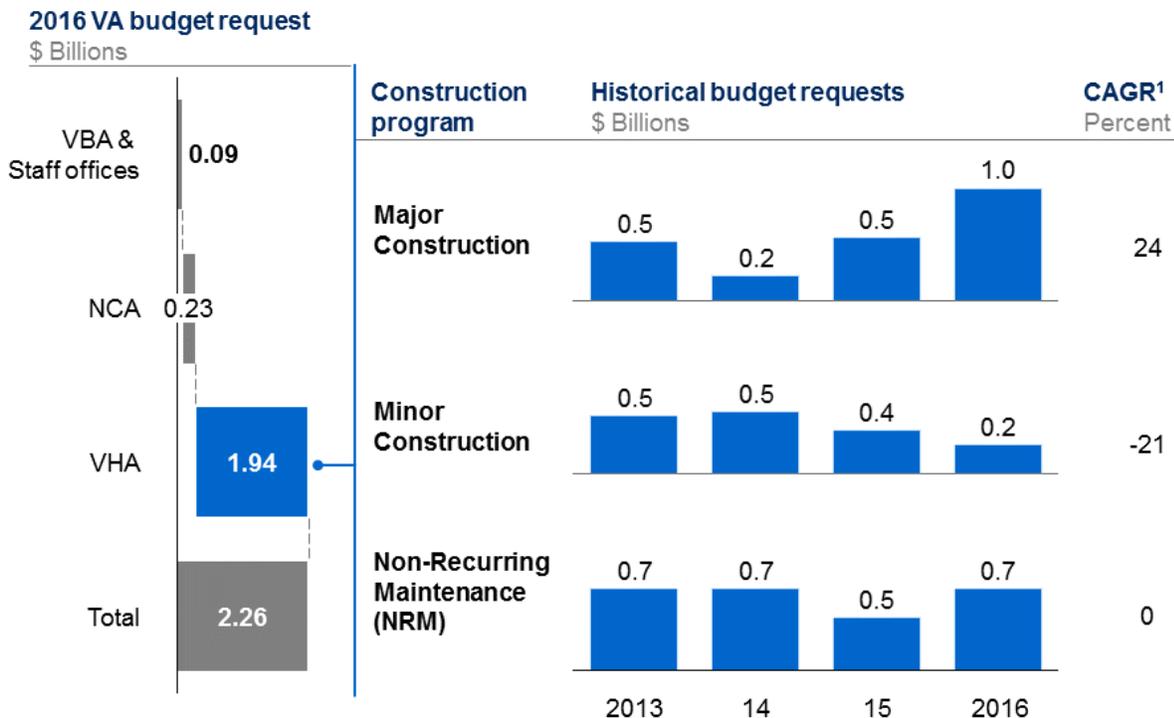
  - o **Clinical-specific initiatives (up to $5 million):** The CSI program is funded out of the NRM budget for up to 10 percent of the budget. The program focuses on high-profile projects that are difficult to plan but require additional space to support care for the Veteran. These projects increase space by more than 1000 square feet. Current approved CSI categories include: polytrauma, mental health, high-tech and high cost medical equipment installations, women's health, site prep for donated space, and others. It should be noted that CSI projects do not go through the SCIP process.


Figure 6-1 shows the variation in budget requests across the construction programs over the past four years. NRM and minor project funds often fluctuate due to special funding initiatives such as the American Recovery and Reinvestment Act of 2009 or the Veterans Access, Choice, and Accountability Act of 2014. For example, the Veterans Choice Act is funding $0.5 billion in minor projects and $1.5 billion in NRM projects over the next few years.

---

Figure 6-1. Breakdown of VA Capital Program

Budget requests for construction programs

6.1.1.2 **Responsibility for the Planning, Financing, Contracting, and Executing Functions of the Three Construction Programs Is Distributed across Various Offices**

- **Office of Asset Enterprise management (OAEM):** OAEM works to facilitate processes that recommend effective capital asset policies, demonstrate improved capital planning and identification of needs, ensure all investments undergo an appropriate level of analysis, oversee the analysis and monitoring of VA's capital asset performance management system, and evaluate the effectiveness of VA's implementation of capital asset management policies, principles, standards and guidelines.

- **Office of Construction and Facilities Management (CFM):** CFM is responsible for the planning, design, and construction of all major construction projects greater than $10 million. In addition, CFM acquires real property for use by VA elements through the purchase of land and buildings, as well as long-term lease acquisitions. CFM also manages facility sustainability, seismic corrections, physical security, and historic preservation of VA's facilities.

- **Office of Capital Asset Management and Engineering Support (OCAMES):** OCAMES provides VHA guidance, oversight, and technical support for capital initiatives and engineering operations. Programs supported include major construction, minor construction, non-recurring maintenance (NRM), clinical specific initiatives (CSI), leasing, sharing use of space, enhanced use leasing, energy, fleet, engineering operations, and state home construction.
- **VISN:** Oversee execution of capital projects and maintenance in coordination with OAEM, CFM, OCAMES and VA Medical Facilities (VAMCs).
- **VA Medical Facilities (VAMCs):** VAMCs are involved in each construction program in defining the source of need for a business case and providing design and construction input as the eventual owner and manager of the facility delivered.

Projects are typically divided into major phases of their lifecycle including: concept and scope definition, capital allocation, design, construction and activation, and facilities management. We can observe the different approaches by type of project. For major projects VAMCs are responsible for project scope definition, business case creation including alternative stress test and cost estimation, and project SCIP submission to OAEM. Once the project is approved and funded for design, CFM is responsible for the overall design, construction and activation process, handing over the project to the station level (VAMCs) for operation and maintenance. Throughout the process, each of these organizations may play a supporting role in each step as outlined in Figure 6-2 (for example, CFM supporting VAMCs in business case definition).

Figure 6-2. Involvement of Different Entities in Major Projects

Responsibility for major construction distributed throughout VA

Legend:
- ☐ Supporting role
- ■ Critical role
- — Direct reporting
- ---- Indirect

Phases: Concept and scope definition → Capital allocation → Design → Construction and activation → Facilities management

OAEM (Office Asset & Enterprise Management)
- Capital allocation: Score business cases & prepare budget request; Receive line-item approval & funds
- Construction and activation: Approve construction funding

CFM (Office Construction & Facilities Management)
- Concept and scope definition: Support business case creation
- Design: Award A/E & use APF to fund design; Provide specifications; Design project to 100% CDs
- Construction and activation: Award contract; Oversee construction

OCAM (Office Capital Asset Management)

VISN
- Concept and scope definition: Review and approve business cases
- Facilities management: Receive O&M and NRM funding via VERA

VAMC
- Concept and scope definition: Create and submit business cases
- Design: Provide input in design as requested
- Construction and activation: Coordinate during construction; Lead activation
- Facilities management: Operate and maintain facility

6.1.1.3 Major Construction Program in VHA Include 37 Active Projects With Approximately $1 Billion Estimated Funding for 2016

VHA reports 37 active projects[38] in various phases from planning to construction including 21 out of the 37 projects in the construction phase. From a regional perspective, there is a high concentration of ongoing major projects (9 out of 21) in the west, primarily driven by the seismicity of the region and the focus on seismic retrofits in the capital planning criteria.

As shown in Figure 6-3, 13 of the 21 projects under construction received funding for more than 50 percent of their total estimated cost before 2011. This shows the status on current projects to understand the current stages, geographic concentration, and sizes of ongoing major projects

---

[38] We consider active projects (37) those in the following stages: planning (1), schematic design (4), design development, construction documents (7) and construction (21).

SOURCE: 2016 VA Budget Request, Volume IV, Appendix F (history of VHA Projects Update)

The VA budget request for 2016 includes funding for nine major projects that are active and entering the construction phase including St Louis, Louisville, American Lake, San Francisco, West Los Angeles, Long Beach, Alameda, Livermore and Perry Point (Figure 6-4). The request also includes funding for design activities on additional projects through the Advance Planning Fund that is used to support the initial phases of design of a major project before projects are approved and appropriated.

> Claims Analysis: $5 MM
> Hazardous Waste: $15 MM
> Judgment Fund: $9 MM

1 Of the 4 projects in 2015 budget request, Long Beach, and West LA are the only ones included in 2016. San Diego and Canandaigua, NY from 2015 are not included for 2016

VA appropriations for major construction vary significantly from year to year, as illustrated in Figure 6-5. Appropriations nearly doubled between FY15 ($548 million in VHA construction) and FY16 ($984 million). This type of variation is typically driven by either the introduction of new major projects or major transitions between projects. Between FY15 and FY16, a number of projects are expected to move into the construction phase, where the bulk of costs are incurred.

6.1.1.4 Five Projects within VHA Are Informally Classified as Mega Projects and Receive Additional Resourcing and Oversight due to Their Scale and Complexity

While there is no formal classification for mega projects within VA, projects are loosely classified in this category based on scale and complexity and receive additional attention. The US Army Corps of Engineers (USACE) defines megaprojects via eight key attributes ranging from size and delivery method of the project to its national significance and uniqueness of scope.

Adapted from the USACE Engineering and Construction Bulletin No. 2014-14, the following reflects some characteristics of mega projects that make them more challenging and warrant additional attention in the VHA facilities program:

- Cost and duration: Large project budgets that usually represent higher risk in achieving project outcomes and longer projects by duration which also indicate performance risk.
- Uniqueness: One-of-a-kind projects or projects involving unique and highly complex systems, processes, and technical challenges may be characteristic mega-projects.

- Acquisition strategy and delivery method: The contract type, solicitation, evaluation, and compensation methods allocate risk between the contracting parties which may drive complexity of project delivery.

- National significance: Projects of national or international significance may be characteristic mega-projects.

- Critical nature of completion date and/or funding constraints: Projects with completion dates established in law or treaty, tight or incremental funding requirements, and/or other requirements which dictate ultimate cost and completion of project

- Coordination of multiple prime contractors, architecture/engineering firms (A/Es), and stakeholders: Multiple general contractors on-site leading to complex coordination efforts. Projects requires the coordination of multiple design agents, multiple public agencies, may be characteristic of mega-projects

- Overlapping or dependent project phases: Projects where authorization, funds, or physical constraints determine the pace of execution may be characteristic mega-projects

Though CFM has not defined the attributes of mega projects, it has been observed that projects above $500 million of total estimated costs are considered large projects that require the appointment of a Project Executive. Of the ongoing major projects, five are considered replacement facility mega projects with costs above $500 million (Aurora, Las Vegas, Orlando, New Orleans, and Palo Alto).

Figure 6-6. Recent VHA Mega Projects

	Description	TEC $ Million	Size Million sq. ft.	Expected completion
Aurora	▪ A tertiary care medical complex including a new inpatient medical center including a Spinal Cord Injury (SCI) Center, an Outpatient Clinic, a Community Living Center (CLC), a Research building, a Central Utility Plant, and parking facilities	1,730[1]	1.0	2017[1]
Las Vegas	▪ A comprehensive Medical Center Complex including up to 90 inpatient beds, a 120 bed Nursing Home Care Unit, an Ambulatory Care Center, administrative and support functions, and space for co-located Veterans Benefits Administration offices	585	1.1	2015
Orlando	▪ New medical center consisting of a 134-bed hospital, a large medical clinic, 120 bed nursing home, 60 bed domiciliary, and full support services on a new site	616	1.2	2015
New Orleans	▪ A new tertiary care medical complex with acute and long term inpatient beds and the full range of ambulatory services. It includes outpatient center, including primary care, mental health, specialty care, surgical capabilities, and expanded treatment, diagnostic, and ancillary services; research facility; and a parking structure	1,035	1.6	2016
Palo Alto	▪ This project will construct Centers for Ambulatory Care and Polytrauma Rehabilitation at VA Palo Alto Health Care System's (VAPAHCS) Palo Alto Division	717	0.6	2015[1]

6.2   Findings

To accurately assess the overall performance of VA's medical facilities program, we conducted a benchmarking exercise to understand the performance of comparable projects across the public and private sector and to identify the drivers of variability between projects. Using the benchmarking database, we conducted quantitative analyses based on cost per square foot and schedule duration in medical facilities construction. We have also carried out qualitative and quantitative assessment of project performance as well as assessed the processes, people, and systems used to carry out projects.

6.2.1   Outcomes

6.2.1.1   VA Construction Costs Are Typically Similar to Other Public Agencies That Deliver Health Care Projects, but Are Double Private Industry Best Practice Cost Levels

An internally conducted cost comparison effort revealed that public sector construction costs are approximately 1.5 to 1.9 times higher compared to private sector. With a 95 percent

confidence interval, based on the 87 projects in the database, we observed that public projects cost $570 to $790 per square foot compared to private sector costs at $370 to $410 per square foot (see Figure 6-7). Furthermore, the private sector experiences a much lower variation in the dollar per square foot costs compared to public sector. The standard deviation for private sector projects was $80 per square foot, whereas the standard deviation for public projects was $320 per square foot.

Figure 6-7. Major Construction Costs Performance

Public sector agencies delivering health care projects that we surveyed experienced similar cost performance, up to twice the cost of the private sector. VA estimates anticipate some of these cost levels and target $500 to $540 per square foot for new medical facilities based on Federal and VA design and construction standards.

For VA, the cost performance data obtained for major project performance ranges from $500 to $750 per square foot based on a sample of publicly available information for latest completed projects excluding Aurora. VA performance for major projects is similar to other relevant public project delivery agencies in North America (for example, USACE, NAVFAC). Data from our set of benchmark projects identified USACE construction costs, ranging from $500 to $900 per square foot, and NAVFAC costs, ranging from $400 to $650 per square foot.

6.2.1.2 VA and Other Public Sector Health Care Projects Generally Take Twice as Long to Finish Compared to Private Sector Projects

From a schedule perspective, public sector projects also take approximately two to three times as long to complete compared to private sector projects. This is partially due to the larger scale of public projects. The majority of the private sector projects in our database were completed within two to two-and-a-half years compared to public sector projects which usually take from 2.7 to 4.6 years. More recent public sector projects have demonstrated somewhat longer construction durations. Interviewees have identified prioritization of projects and the time pressure resulting from previous Base Relocation and Closure (BRAC) schedules as a primary driver which enabled the acceleration of earlier public sector projects in our database.

SOURCE: Internal cost benchmarking studies, proprietary construction databases, public websites (contractors, owners, designers)

6.2.1.3   VA and Other Public Sector Health Care Projects are 2 to 2.5 Times Larger Than Private Sector Counterparts

Public sector projects are generally larger than private sector projects with many of the public projects exceeding one million square feet. On average, public sector projects in the database are approximately 650,000 square feet with some projects close to one million square feet, whereas private sector projects on average are 300,000 square feet. We have observed that the number of medical services provided, the size of individual medical rooms, and the size of the circulation spaces are the main drivers that explain scale difference in public versus private projects.

As an example, public sector medical facilities usually include outpatient services and administrative offices on the same medical campus whereas private sector facilities focus primarily on inpatient services and outsource the administrative functions to locations outside the campus.

The scale of public sector mega health care projects could be a driver of construction costs and time to completion primarily due to the complexity of these larger projects. Our benchmark indicates that larger projects do correlate with longer time to completion timelines both in

public and private sector.[39] However, the private sector is able to maintain similar cost per square foot across projects of all scales, while the public sector delivers larger projects for 30 to 60 percent more on a cost per square foot unit rate compared to smaller projects.

6.2.1.4 Hospitals Constructed Adjacent to VA Hospitals Experience Similar Market Conditions but Have Been Delivered at Significantly Lower Cost and Shorter Schedule Duration

In the course of our benchmarking exercise, we identified several public and private sector hospitals being constructed directly adjacent to VA hospitals. These construction projects should experience similar market conditions and provide a reasonable demonstration of the variability in cost between VA and other hospitals. Details of these projects are included in Figures 6-10 and 6-11.

- The VA New Orleans Medical Center and the Louisiana State University (LSU) Medical Center replacement projects are both replacement projects undertaken in the aftermath of Hurricane Katrina. The projects are similar across many dimensions including size, location, time of construction, and project delivery method. However, the New Orleans VAMC is expected to be completed in 4.8 years at $661 per square foot, whereas the LSU Medical Center is expected to be completed in less than 4 years at $433 per square foot.

- In Denver, both the University of Colorado Hospital (UCH) expansion and the St. Joseph hospital expansion are being completed in close proximity to the Aurora VAMC. The UCH Hospital expansion was completed for $356 per square foot in 1.8 years. The St. Joseph hospital, a privately owned replacement hospital, was recently completed in 2.5 years and under $460 per square foot. In addition, the St. Joseph hospital provided double the bed capacity for less than half the cost of the Aurora VAMC. The Aurora VAMC is still under construction with an uncertain completion date and a current estimated cost of $1730 per square foot range based on the latest information available.[40]

It is valuable to note that both the LSU Medical Center and UCH hospital expansion are university hospital systems. These programs share characteristics of both public sector and private sector hospitals and demonstrate that construction can be completed close to private sector cost and schedule targets.

In each of these cases and as shown in our benchmarking exercise, non-VA hospitals were delivered in similar market conditions at significantly lower costs. The root causes of these differences are explored in the following sections that evaluate the process, people, and systems used to deliver VA projects.

---

[39] We consider large projects medical facilities to be those above 300,000 square feet.

[40] Update provided by VA on March 17, 2015.

6.2.2 Process

To identify the main factors that drive higher construction costs and schedule for public versus private sector, we conducted a review of major cost drivers for capital projects and the processes that contribute to these drivers. We assessed detailed project costs breakdown and identified common themes that explained the observed cost difference.

The factors below were identified from our assessment as the main drivers that result in costs differences between public projects like VA's and private projects:

- **Government resiliency, energy, and security mandates (Section 6.2.2.1):** VA is required to follow public sector mandates for energy performance, green building requirements, physical security, and mission critical facility requirements.

- **VA design specifications (Section 6.2.2.2)**: VA design specifications drive project design from space planning to specific finishes, which impact the overall cost of the project.

- **Pre-construction award changes (Section 6.2.2.3)**: Throughout the planning and design phases of a major project, we identified significant scope changes to projects resulting from input from architect/engineering firms, VAMC Directors, and the CFM Project Managers

---

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

- **Post-construction award changes and inefficiencies (Section 6.2.2.4)**: During the execution phase of the project, we identified cost increases due to scope changes and execution efficiencies.

- **Phased contracts (Section 6.2.2.5)**: Due to limited financial resources based on appropriations, most major projects are phased over several years resulting in less efficiency delivery compared to simultaneous planning, design, execution, and activation of all phases.

- **Contractor risk markup (Section 6.2.2.6)**: Complicated management processes, long lead times to approve invoices and changes, Federal Acquisitions Regulations, and Veterans Acquisition Regulations are perceived by interviewees throughout the industry to require a higher effort in execution than the private sector. Many interviewees and industry experts suggest that this could lead to increased design and construction bid costs for public agencies such as VA.

The approximate scale of each of these drivers is illustrated in Figure 6-12. Private sector targets for hospital construction range from $370-410 per square foot. However, VA guidelines which incorporate government requirements and VA design specifications lead to VA targets from $500 to $540 per square foot. Challenges in VA performance before and after contract award resulted in the observed increases in construction cost. These ranged from $500-750 per square foot (excluding the Aurora project).

VA could address some of the cost difference drivers to reduce the observed gap between private and public sector performance ($370-410 versus $500-750 per square foot). Levers detailed in Section 4.1.2, such as enhancing the use of early warning project controls, reviewing design standards for inefficiencies, and increasing contracting efficiency could address some of the cost difference drivers outlined above. Specifically, VA could reduce cost difference related to design specifications, pre-construction award changes, post-construction award changes and inefficiencies and phased contracts and risk markups.

We acknowledge, however, that if VA aims to completely close the gap versus private sector performance, there are factors such as resilience, energy, and security mandates as well as Federal and VA acquisition regulations that would need to be revisited.

3 Excluding Aurora (approximately $1,700 / sq. ft.)

6.2.2.1   Government Resilience, Energy, and Security Requirements

By mandate, VA design standards exceed those of the private industry. A 2009 study conducted by an outside construction management firm on behalf of VA indicated that energy and security mandates increase construction costs by more than 10 percent compared to similar buildings in the private sector.

Mission critical facilities are required to continue operations during a natural or manmade extreme event. Per Public Law 107-287,[41] Department of Veterans Affairs Emergency Preparedness Act of 2002 enacted November 7, 2002, the Secretary must take appropriate actions to ensure that facilities can fulfill their obligations as part of the federal response to public health emergencies. Currently, VA considers all VA medical centers and long-term care facilities, major outpatient clinics or clinics in locations where these are the only available health care facilities for a locality, research facilities, major data processing centers, and other facilities which serve a unique function for the Department as mission critical facilities. Under such classification, VA hospitals are currently required to be operational and provide shelter to

---

[41] Physical Security Design Manual for VA Mission Critical Facilities (January 2015 edition).

the community in case of extreme events via appropriate planning (for example, water and fuel storage, alternative sources of power, progressive collapse and blast resistant designs) which significantly increases their costs versus comparable private industry projects.

In addition to the mission critical facilities requirements, VA hospitals must also comply with the federal security mandates which drive higher costs for the design and construction of VA buildings. The New Orleans case study below showcases some of the resiliency requirements mandated by the government for VA medical centers.

Finally, VA hospitals are federally mandated to comply with green building and energy performance mandates. VA Sustainable Buildings Program was established to comply with these mandates. Execution of such standards potentially increase construction costs for VA compared to the private sector.

New Orleans case study: Government resiliency requirements

The New Orleans VAMC was severely damaged from flooding following Hurricane Katrina. To replace the medical center, Project Legacy was created to design and construct a new medical center. The project is currently under construction and was one of the active mega project construction sites visited during the assessment.

Key information for New Orleans VAMC replacement project:

- Site size: 30 acres
- Building gross square feet (BGSF): 1.6 million square feet
- Beds: 200
- Type: replacement VAMC
- Delivery method: Integrated Design Construction
- Cost: $1.03B
- Construction start: May 2011
- Construction finish: Feb 2016
- Schedule length: 4.8 years
- $/square feet: $661

In order to meet the resiliency requirements, the New Orleans VAMC included certain features absent in the buildings of the neighboring Louisiana State University (LSU) Medical Center campus. Specifically, the following design criteria were included in the New Orleans VAMC due to the mandates for the emergency preparedness mission:

- Survivability: The campus must be able to accommodate 1,000 people for 5 days in an extreme event. The campus must also be equipped for independent power generation for standby and emergency. Finally, the campus must include a military helicopter landing area.
- Emergency storage: The campus must store fuel for power generation; water for domestic use, fire protection, and process; sewage; and meal and supplies.

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

- Operations: The campus must have flexibility in patient room design to shift to a 2 beds per room configuration to increase capacity. All mission critical functions must be located on or above the 2nd floor level. All buildings must be designed for a facility lockdown scenario in an emergency.

- Hurricane mitigation: The campus is designed to resist 130mph, 3 second gust (a Category 3 Hurricane) as defined by the International Building Code. The mission critical elements are designed above the current CORPS surge model levels (Category 5).

- Physical security: The campus must be compliant with all federal physical security requirements for mission critical buildings. Finally, the campus must also be able to secure its perimeter in the event of civil unrest or national emergency.

6.2.2.2 VA Hospitals Are Designed Physically Larger Than Private and Public Sector Peers

6.2.2.2.1 Mix of Space in VHA Facilities Impacts Overall Size and Has Cost Implications

VA hospitals are larger than comparable private hospitals. Differences are driven in part by incorporation of a large range of functions within a single facility or campus. Whereas private sector facilities focus space allocations primarily on clinical activities and often locate administrative functions at less expensive off-campus sites, VAMCs usually include inpatient services, administrative offices, outpatient units, community living centers (CLCs), and research spaces into the same medical center campus.

The volume of hospital space devoted to non-inpatient services is illustrated by the relatively large amount of medical center space per inpatient bed in VAMCs. The square feet per bed ratio can serve as a rough proxy for percent of space dedicated to inpatient uses. Using VAMC square footage data, compiled at the station level and excluding all off-site outpatient clinics, and authorized beds[42] to compare VHA facilities with for-profit, non-profit, and other public hospitals currently in operation across the US (AHA Hospital Statistics, 2015),[43] our analysis indicated that VHA is using approximately 130 to 140 percent more square footage per bed than private sector hospitals and 85 to 105 percent more than public and non-profit hospitals.

---

[42] Analysis used authorized beds by station, excluding CLC and domiciliary beds, which are not reflective of inpatient hospital care. Authorized beds are defined as "the potential bed capacity of a medical center, which is the sum of the operating beds and beds that are temporarily unavailable" (VHA Handbook, 2010). Authorized beds are likely an overstatement of the beds currently in use at the VAMCs, but as interviews raised questions about the validity of the number of operating beds reports by VAMCs, this analysis used authorized beds as a conservative number. We were not able to fully account for any issues of data integrity in bed count. See Assessment F (Clinical Workflow), Section 6.2.1.1 for a deeper discussion of inpatient bed counts.

[43] This data set includes 1,252 hospitals currently in operation across the US, regardless of year of construction, and reinforces the scale differences discussed earlier in the benchmarking of recently constructed hospitals in Section 6.2.3 and Figure 6-9.

This extra space seen in VAMCs is primarily driven by other uses in the hospital and does not specifically reflect room sizes.

VHA's integrated solution can offers some advantages, such as enhancing the continuity of care, but it also carries disadvantages in terms of cost and ease of construction. Building a hospital unit that includes subunits with significantly different architectural, safety, resilience and medical requirements likely results in building the subunits at higher standards, with their correspondingly higher costs, and can increase the cost of the whole facility. For example, a square foot of medical space costs approximately 45 percent more than a square foot of CLC space and nearly 60 percent more than administrative space (VA Cost Estimating Guide, 2015).[44] It is current design practice to separate buildings with medical use as much as possible from buildings that house less acute medical cases or administration space. For example Kaiser Permanente builds only the functions dictated by the local building code in the main hospital building and all other services and office space are located in an adjacent medical office building (Building Design + Construction, 2015). For VHA, these tradeoffs should be weighed carefully.

6.2.2.2.2 VHA Space Planning Criteria Lead to Larger Hospitals for Similar Service Levels Than Comparable Private Sector Facilities

Differences in size can also be attributed in part to VA space planning criteria and design specifications for the standard square footage of each clinical space VHA hospital designs during the conceptual phase are driven by the Space Calculator – a planning tool maintained by OCAMES. After project approval, the detailed design of the hospital is carried out via the Space and Equipment Planning System (SEPS) – a tool jointly owned by Department of Defense (DoD) and CFM. During the conceptual phase, the planner uses space planning guidelines of the space calculator which is generally aligned with SEPS programming. Planning of a hospital requires conversion of workload into specific departmental net square feet – for example, projected inpatient-days are converted into a specific number of beds for medical inpatient unit department which is then converted into a total square footage per use.

Industry space planning guidelines for the public and private sector are established by the Facilities Guidelines Institute (FGI). FGI publishes guidelines every four to five years in the Guidelines for Design and Construction of Hospitals and Outpatient Facilities. The latest guidelines available to the industry at the time of writing of this report are 2014 FGI Guidelines for Hospitals and Outpatient facilities. Because FGI guidelines are not all inclusive, local building codes also apply for design and construction of facilities.

Local building codes in general are updated every three years via adoption and amendments of the International Building Code published by the International Code Council (ICC). ICC 2015 codes have been published at the time of writing of this report and are in the process of being adopted by local jurisdictions. Similar to building codes, FGI guidelines are amended and adopted by the State in which the facility is located. Agencies such as VA and DOD have

---

[44] These cost estimates are for administrative space located inside a hospital, which is still significantly above typical office space construction costs.

developed their own version of the Guidelines for use in design and construction of their facilities.

VA also publishes its own guidelines on the Technical Information Library (TIL) for designing VA facilities. The TIL guidelines define the space planning requirements for 66 departments that are identified by VA. These guidelines are incrementally updated on a department by department basis every five to ten years to keep up with health care industry and best practice design. At the time of writing of this report, space planning criteria publishing dates ranged from 2006 through 2014 with majority of publications in 2008 in conjunction with a major update of SEPS.

Using these guidelines, we have observed that the current CFM guidelines prescribe approximately 10 percent more square feet on average for medical rooms than FGI guidelines (see Table 6-1). Current industry trends call for smaller, more versatile rooms, where research has validated that the same functionality levels can be achieved in a smaller space and with the same or better patient satisfaction levels. For example, in the last few years, the University of Pittsburgh Medical Center East hospital reduced patient room sizes to 10 percent smaller than the FGI guidelines after a comprehensive design study considering architectural features, medical functionality, and patient satisfaction (Healthcare Design Magazine, 2014).

Table 6-1. Comparison of Medical Room Size Guidelines

Medical Room[45]	VHA (sq. ft.)	FGI (sq. ft.)	% Difference
Medical/Surgical Room	280	250	12%
General Exam Room	120	120	0%
Office	100-120	100	10-20%
Operating Room[46]	660-900	600-800	10-13%
		Average	**10%**

Finally, more efficient architectural design at the department level can lead to significant savings in square footage in the departmental circulation space. Currently, VHA guidelines, reviewed across 24 departments, recommend approximately 4 percent larger department net to gross conversion factors than the DoD guidelines. This 4 percent is over and above any difference in room size. Department net square feet is the floor area within the boundaries of a functional department, as defined by space planning criteria, and department gross square feet is the floor area within the boundaries of a functional department, including the floor area occupied by the rooms, walls defining the spaces, and circulation corridors connecting the different rooms of the department. The department net to gross conversion factors are a measure of the efficiency of the departmental design.

---

[45] Values quoted for general use room only.

[46] FGI prescribes that a traditional operating room should have a minimum of 400 SF, while specialty and hybrid operating rooms can vary between 600-800 SF and we are comparing those with the VHA operating rooms.

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

6.2.2.3   Pre-Construction Award Changes

6.2.2.3.1   Significant Cost Growth in Major Projects Usually Occurs in the Design Phase, Before the Construction Contract Is Awarded

VHA major projects undergo significant cost growth over the course of their lifecycle. On average we have observed that projects undergo approximately a 90 percent increase in costs from their initial total estimated costs (TEC) to completion by the project contractor. More than half of the cost growth is actually incurred before the construction contract is awarded.

Figure 6-13. Cost Growth for Projects Currently Under Construction

21 major projects under construction are expected at +87% of initial TEC

Project location	Project description	Initial TEC $ Millions	Current TEC $ Millions	TEC Variation Percent over TEC
Bay Pines,FL	Improve Inpatient / Outpatient	$174	$158	-9%
Biloxi,MS	Restoration of Hospital / Consolidation of Gulfport	$175	$286	+63%
Dallas,TX	Spinal Cord Injury	$89	$155	+74%
Denver,CO	New Medical Facility	$328	$1,730	+427%
Fayetteville,AR	Clinical Addition	$56	$88	+57%
Las Vegas,NV	New Medical Facility	$325	$585	+80%

6.2.2.3.2 Increases in initial TEC Are Driven by Design Changes Requested During the Project Planning and Design Phase

Typically, a major project evolves significantly from the time of conception to the time of construction contract award. Design changes to ensure that projects most efficiently meet the needs of Veterans and VAMC staff should be anticipated throughout this process. However, our reviews identified significant changes in scope throughout the project development process and after projects were initially planned. These changes include the addition of major clinical uses, increases in square footage of specific uses, and changes requested by A/E firms, VAMC Directors, and Project Managers.

We have also observed that A/E firms are given significant latitude to create their own designs, sometimes converting them into signature projects and limiting the potential for standardization of designs across VHA. Furthermore, A/E firms view VAMC Directors as their client, accommodating requests and changes to initial project design. Without clear guidelines and accountability to manage scope modifications, Project Managers struggle to control costs during the design stages.

Interviewees have also indicated that project scope changes incurred during the construction of one phase can be reflected in the construction contract of a different phase, instead of being reflected in change orders.

Other organizations have mitigated these sorts of design changes through increased standardization. For example, with the development of their in-house standardized hospital design template, Kaiser Permanente was able to achieve faster delivery of new facilities and significantly reduced construction costs, while building efficient and safe hospitals. The template incorporated best practice designs for emergency departments, patient rooms, and other individual clinical spaces into a single configuration for an entire hospital. The buildings consisted of a diagnostic and treatment block, nursing units, and a separate medical office building. The template standardized the hospital from structural elements to furnishings, but allowed the necessary flexibility, such as different sizes of medical inpatient units. Kaiser Permanente simulated all design elements before the actual construction to test for a wide of spectrum of patient experiences and update and improve template as appropriate (Heatlhcaredesignmagazine.org, 2015).

An example of project scope changes during the course of the planning and design phases is included below.

Figure 6-15. Project Development Phase

Project Development Phase

Major painpoints

	Planning and A/E selection	Project design	Contractor solicitation and selection
HQ CFM	▪ Receive approval of project via the SCIP process ▪ Coordinate with regional CFM to define project requirements	▪ Review final costs and request construction funding for project from VA	▪ Receive construction funding approval from VA
Regional CFM	▪ Coordinate with HQ CFM to define functional requirements ▪ Conduct feasibility studies, explore alternative designs, and select single project delivery ▪ Solicit and award A/E contract	▪ Review design and provide input across all 4 phases of design (e.g. value engineering) ▪ Coordinate with HQ CFM on detailed projects costs for funding	▪ Receive construction funding from HQ CFM ▪ Solicit and award contract for GC ▪ Assign Resident Engineers to work on-site to monitor construction processes
VISN / VAMC		Coordinate with Regional CFM to provide input at milestones during the design phases	

A/E firm or Contractor	▪ A/E: Submit bid for A/E contract
	▪ A/E: Coordinate with CFM to finalize A/E contract
		▪ Conduct design in 4 phases
		  – Pre-design
		  – Schematic Design
		  – Design Development
		  – Construction Drawings
		▪ Scope changes lengthen project
			▪ Contractor: submit bids and sign contract if awarded
			▪ A/E: support via RFI's if needed

Sample activities	▪ Conduct a feasibility study to define the location and square footage of the facility	▪ Review schematic design drawings with local VAMC	▪ Review Master Specifications and GC contract
Sample output	▪ RFP for A/E ▪ Contract for A/E	▪ SD drawings, 50% CD, 100% CD ▪ Approval for construction funding	▪ RFP for GC ▪ Contract for GC

Case example for project growth during planning and design phase

In the course of our assessment we observed a number of projects that experienced significant scope increases. We have illustrated one of these cases in Palo Alto Ambulatory Care and Rehab project.

In this example, the project has experienced growth of 59 percent in total estimated costs with the majority of the scope changes occurring before the largest phases of the project were contracted out.

Figure 6-16. Sample Project Showcasing Cost Growth over Project Lifecycle

109

6.2.2.3.3 The Process for Capturing, Approving, and Changing Project Requirements Is not Well Defined, Leading to Drastic Changes After Approval

Many of the changes to project costs that we previously described arise from insufficient scoping and scope management processes during the planning and design process. The business case for projects submitted via the SCIP process is currently not scoped well enough to lead to an accurate cost and schedule estimate. This has resulted in multiple costs overruns as a result of evolving scope and design principles (as detailed in Aurora case example).

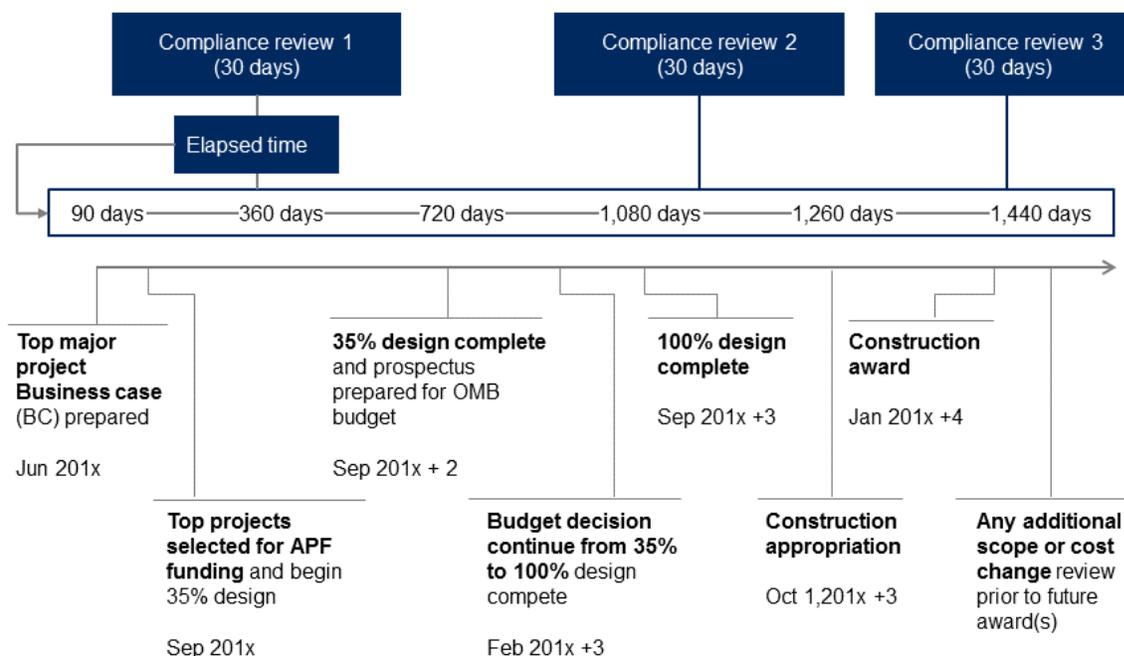
OALC (CFM) and the Office of Management, in a joint effort, recently implemented a stage gate process "Capital Program Requirements Management Process (CPRMP)" that enforces at least three compliance reviews during the project lifecycle and a 35 percent minimum design threshold for project authorization and approval (see Figure 6-17). This process could help to limit the uncertainty in scope and design principles and help control future budget increases for VHA projects.

The recently implemented program should also help manage the changes in scope for major projects after they have been approved via SCIP. The CPRMP process is a step in the right direction however, we have identified a few challenges in the CPRMP process that may limit its effectiveness:

- **Scalability**: The CPRMP process is not scalable based on the size and complexity of the project. All major projects - $10M or $1B – are required to undergo the same process for approval of changes. Hence the process is more prone to being impacted by resource constraints to review all the proposed changes for major projects.

- **Resources and training**: The CPRMP process currently involves the CFM, SCIP Board, Acquisition Decision Authority, and Construction Review Council with support from OAEM as needed. Of all the above organizations, CFM and OAEM are best matched to assess the changes in project scope although they are significantly under resourced to implement the CPRMP process consistently.

- **Implementation**: The CPRMP process was implemented in February 2014 and the in-field adoption has not been fully realized. The relatively slow adoption of the process in the field, especially given all the entities involved, allows for scope changes for on-going Major projects. The process itself is complex and, as reported in interviews, has not always been effectively communicated to the field.

Figure 6-17. CPRMP Details and Requirements for Compliance Reviews


6.2.2.4   Inefficiencies and Changes After Construction Award

6.2.2.4.1   Contract Modifications After Construction Contract Award Still Account for 15 to 20 Percent of Increases in Project Costs

As discussed in the previous section, project cost growth occurs primarily in the design phase. However, post contract award changes are often also a significant source of project cost and schedule increases. In the past 10 years, 25 projects have experienced at least 10 percent cost increases over TEC driven by change orders, with 8 of them experiencing at least 30 percent overruns. Over 60 projects have experience delays as compared to initial plans and almost 10 projects experienced at least 9 months delay.

We define costs overruns as the total increasing funding requests over the initial total estimated costs (TEC), which includes forecasted project contingencies.

Figure 6-18. Completed Major Projects Performance after Construction Contract Award

Cost growth from change orders account for approximately 15-20% above initial TEC

6.2.2.4.2 CFM Has Experienced Similar Performance in Contract Modifications Compared to Its Peers Over the Past Five Years

One of the critical factors to assess in execution of the major projects is contract management. Figure 6-19 shows that CFM is on-par with comparable entities in managing contract modifications, one key aspect of contract management. Contract modifications increased costs by 7.5 percent for CFM, whereas it increased costs by up to 13 percent for its peers. On average, CFM experiences about 1.3 modifications per million dollars of value compared to 0.34 modifications per million dollars for its peers.

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

Figure 6-19. Contract Modification for Hospital Construction

SOURCE: Fpds.gov; NAICS code = 236220; product description = *hospital construction*

6.2.2.4.3 Complexity of Contract Modification Process Results in Cost and Execution Schedule Increases

It was shared during VA stakeholder and expert interviews that the contract modification processes is one of the major pain points for the major project delivery teams given the number of steps and stakeholders involved.

The overall contract modification process for a major project during construction involves multiple stakeholders, many of whom do not reside within CFM or even VA. For instance, as highlighted in Figure 6-20, many levels of approval are needed for relatively small-value change orders (as little as $100,000 on a multi-million dollar project). Lack of in-field approval on such change orders impacts project execution, bringing execution to a halt in many cases due to dependencies on unresolved changes. Delays and stop work orders extend the project schedule and ultimately increase the cost.

Figure 6-20. Contract Modification Process for Major Projects

Change order process (>$100K, 20 days) – Major Construction

	Initiated	Approved	Funded
Duration	Up to 8 weeks if complex	4 -15 weeks	2 days
HQ CFM		▪ Review and approve change order if >$250K	
Fiscal			▪ Upon notification from CO, records the obligation
OGC/CRB/T		▪ Review and approve change order	
Regional CFM — Dir.		▪ Review and approve change order if <$250K	
Regional CFM — CO	▪ Review PNO submitted by SRE and approve for negotiation	▪ Review final docs submitted by SRE ▪ Undergo IOP review process	Upon receipt of admin approval (Regional Director or Central Office), CO awards action
Senior Resident Engineer	▪ Review proposal draft a Price Negotiation Objective to submit to CO ▪ Upon PNO approval, negotiate with contractor		
Contractor	▪ Identify changed condition via RFI (or other means) ▪ Submit proposal per SRE's request		Contractor initiates work (if not already initiated with a small amount earlier)
Sample activities	▪ Conduct estimate if change order is greater than $20K	▪ Address peer review comments	▪ Approve funding
Sample output	▪ SF30, VA Estimate (if >$20K), PMDRI, PNM	▪ Submit to HQ for approval	▪ SF30 signed and funded

6.2.2.4.4 The Activation Phase Encounters Funding Challenges That Drive Schedule Delays

The activation phase encompasses activities that identify, plan, manage, and execute logistical and operational requirements to bring a new facility to full planned operations.

Activation activities include, but are not limited to: equipment and furniture inventory, high cost/high tech equipment procurement, recruitment, selection, staffing, orientation and training, validation of infrastructure and equipment commissioning, move planning, and in-situ simulation testing and hazard mitigation (VA Activation Process Guide, February 2015). The validation of infrastructure and equipment commissioning process in VA is outlined in Figure 6-21. The following factors have been observed which make the activation process difficult to execute, potentially leading to delays in the operation of the facility:

- Activation funding is separate from construction funding and may not be approved in a timely fashion
- Activation funding is often not identified early in the project lifecycle to account for the lead time necessary to drive to "patient day 1"
- The activation team may not be involved early enough in the project lifecycle to define commissioning requirements
- Lack of involvement of the activation team can lead to maintenance issues. Personnel may not be trained well to identify and execute recurring maintenance leading to significant spending on maintenance.

A recent initiative has been launched to establish an activation office that supports commissioning efforts throughout VHA. Based on the interviews conducted during the VAMC visits, significant impact has not been observed yet.

Figure 6-21. Validation of Infrastructure and Equipment Commissioning Phase

Validation of Infrastructure and Equipment Commissioning

	Conduct testing of building systems	Document construction and create operating manuals	Transfer of knowledge to building operations team
HQ CFM	• Monitor progress via updates from Resident Engineer (or Contracting Officer) • Facilitate resolution of any escalated issues		
Regional CFM	• Resident Engineer: facilitate execution of Functional Performance Testing resolution of deficiencies	• Resident Engineer: review and approve Systems Manuals	• Resident Engineer: review and approve training plan • Review and approve Final Commissioning Report
VISN / VAMC	• Review commissioning issues log and provide input as appropriate	• Review and comment on Systems Manuals	• Schedule appropriate personnel in accordance with training schedule
Commis-sioning Contractor Or GC or A/E	• Commissioning: conduct Functional Performance Testing and identify issues / deficiencies in the systems • GC: provide qualified technicians for Functional Performance Testing	• Commissioning: prepare Systems Manuals • Contractor and A/E: provide data and drawings necessary for Systems Manuals	• GC: develop training plan schedule • Commissioning: review and approve training plan; execute Systems Training; create and submit Final Commissioning Report; handover to O&M staff on Day One
Sample activities	• Test fire / safety systems of the facility • Document commissioning activities	• Write detailed procedures for operation of systems	• Deliver Systems Training sessions
Sample output	• Project Systems Manual • Commissioning issues log	• Project Systems Manual	• Systems training presentations • Final Commissioning Report

6.2.2.5   Phased Contracts

VHA Multi-Year Projects Are Executed Under Phased Construction Contracts Limited by Funding Cycles

Funding for major projects is generally phased based on stages such as land acquisition, design, construction, and activation. Even projects in the construction phase do not receive full project funding, but have been phased across multiple years. Phased contracts increase project costs due to multiple interfaces and remobilization efforts.

The phased project approach lends itself to planning multiple projects with limited financial resources driven by appropriations. Hence, a single major project many involve multiple phases each with a different general contractor. Such fragmentation of projects leads to higher costs as general contractors demobilize and remobilize multiple times during each interface of the phase.

Furthermore, phased projects are likely to undergo personnel changes both from CFM and within VAMC, over the course of the project, making central management even more challenging and increasing the likelihood of scope and design changes.

6.2.2.6   Contractor Risk Markup

Contractors Factor in Perceived Risks in Working With VA Charging a Premium in Contract Bids

In the course of our VA contractor and industry expert interviews, it was noted that the contractor community considers VA projects to have higher design and execution risks than other public and private clients. Specifically, VA is considered by the contractor community to have:

- Strict Federal Acquisition Regulations (FAR) and VA Acquisition Regulations (VAR) contract requirements that result in increased costs in the value chain.
- Slower decision making process that impact construction (for example, response to a Request for Information [RFI], change order approvals) resulting in longer execution schedules.
- Outdated design standards and specifications that prevent contractors to maximize cost effectiveness of alternative project designs or constructability approaches.
- Reactive approaches to problem solving and contractor/owner relationship, limiting the potential synergies that could be achieved on a collaborative environment.

Contractors have indicated that they factor the issues identified above into the tendering processes, effectively building an additional contingency to account for higher risks in working with VA. Recent arbitration and litigation between VA and contractors has strongly favored contractors in the recognition of these challenges.

In summary, the main factors highlighted in this section (Government resilience, energy and security mandates, VA design specifications, pre-construction award changes, post-construction award changes and inefficiencies, phased contracts and contractor risk markup) drive public

sector construction costs 1.5 to 1.9 times higher versus private sector. In some cases, specific drivers (for example, pre-construction and post-construction award changes) have caused significant deviations versus initial estimated costs posing significant challenges for the VA major construction program.

While it is not the scope of our assessment to specifically review the replacement VAMC at Aurora, the assessment team visited the Aurora construction site during the week of March 9, 2015 and conducted interviews with members of VA's project delivery team and contractors that were active on site. This visit followed the same review methodology as other construction site visits completed during our assessment. During our review, we observed many of the construction challenges discussed throughout this assessment and highlighted throughout Section 6. More comprehensive reviews of the Aurora project are documented in Congressional testimony, findings of the United States Board of Contract Appeals, and reports by GAO. A brief summary of these findings is provided in Appendix B.2 (Kiewit-Turner, a joint venture, v. Department of Veterans Affairs, 2014; GAO-06-472, 2006; GAO-13-302, 2013).

6.2.3 People

In assessing the organization responsible for delivery we explored the way in which VHA and CFM structure and staff their project delivery teams (PDT) to deliver projects efficiently and what is the impact that culture may have in VHA project delivery.

In CFM, project delivery teams consist of the following key positions for a major projects:

- **Contracting officer (CO):** Responsible for overall contract compliance and approvals. They are normally involved after a project is approved via SCIP and funded
- **Resident Engineer (RE):** Responsible for the technical areas of projects. They are normally involved when projects enter the construction stage. They form different teams to cover specific trades (for example, mechanical, electrical)
- **Senior Resident Engineer (SRE):** Overall responsibility for technical areas of projects, and leading teams of Resident Engineers
- **Project Manager (PM)**: Responsible for cost and schedule oversight of the project. They are normally involved in the design phase and their involvement goes through project activation. In the case of mega projects, the PM still leads the project during the design phase with Project Executive taking the lead in the execution phase
- **Project Executive (PE)**: PE's are typically only staffed in mega projects (>$500 million), PEs are responsible for cost and schedule oversight of the project.
- **VHA VAMC Coordinator**: Responsible for coordinating project execution with the VAMC Director and responsible departments.

The composition of teams varies significantly depending on project type, while every project has a combination of Contracting Officer, Resident Engineer and Project Manager. Only Mega projects normally have a dedicated staff.

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

118

6.2.3.1 Project Teams Are Designed and Staffed to Support Compliance Requirements at Times to the Detriment of Project Efficiency

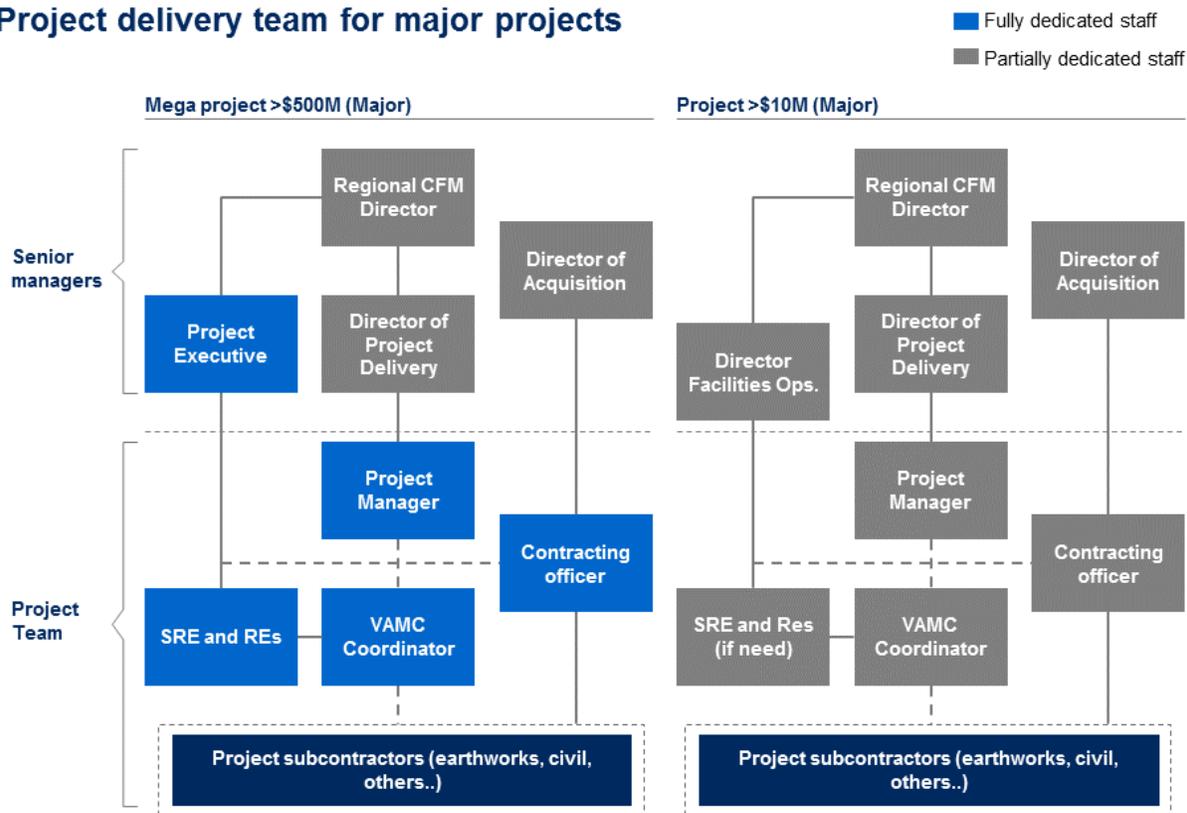
Project team structures, while designed to support compliance requirements, have resulted in reduced accountability for project delivery outcomes and a limited ability to develop solutions to manage cost overruns and schedule delays. On a major project, each of the key roles in a project delivery team (for example, CO, PE, RE) follow different reporting lines (for example, Project Managers to Director of Project Delivery, Contracting Officer to Director of Acquisition and Resident Engineers to Director of Facilities Operations, per Figure 6-22). This situation generates a coordination challenge as it generates three silos (for example, technical, contracting, cost-schedule) within a team with potentially different directions or objectives (VACO/CFM/VISN Interviews, 2015). These silos were created in order to ensure accountability to specific outcomes but result in challenges to overall leadership. For example, contracting officers' order of priorities may not be fully aligned with project execution needs impacting project timelines.

Given the different reporting structures, there are different views in the organization on who is the overall project owner (for example, Project Manager, Senior Resident Engineer, Contracting Officer) and who is accountable in the different project phases (for example, Design, Construction, Activation). Based on CFM manuals, Project Managers are effectively responsible for overall project goals. However, they lack formal authority over the other key figures in project teams (for example, Resident Engineers and Contracting Officers) and according to interviews they do not feel empowered for fast and effective decision making.

6.2.3.2 There Are not Consistent Staffing Guidelines for Major Projects That Consider Size or Complexity of Projects

There is not a clear policy that sets project staffing guidelines for major projects. Currently, there is not visibility on how critical project factors such as volume or project technical complexity are factored in to design project teams.

It has also been shared during VA stakeholder and expert interviews that VA project staffing levels are significantly below other major agencies (such as USACE, NAVFAC), especially in the Resident Engineer and Contracting side. In some projects, the relationship of CFM staff to Contractor is above 1:10, and project managers could oversee portfolios of approximately $1 billion. This situation limits the ability of CFM staff to address all issues identified in the field, thereby impacting project execution timelines.

Figure 6-22. Project Delivery Team for Major Projects


63

6.2.3.3 Organizational Practices Limit VA's Ability to Complete Projects on Budget and Schedule

As part of Assessment K, CFM employees completed the Organizational Health Index Survey, designed to measure the health of an organization. The results were then compared to the OHI global benchmark, as well as the public sector benchmark and a health care benchmark. The public sector benchmark is comprised of 27 surveys (n=47,159), and the construction and engineering benchmark is comprised of 18 surveys (n=24,005). When compared to peers, CFM lags in every outcome, and all organizational health outcomes apart from motivation lie in the bottom quartile of all survey respondents (Figure 6-23).

Figure 6-23. CFM OHI Outcomes Against Benchmarks

When compared to public and private sector peers, CFM lags across outcomes

Additionally, looking internally at how practices were prioritized, key operational practices such as financial management and operational discipline were ranked among the least prioritized practices by CFM employees (Figure 6-24). While there were bright spots in how CFM prioritized vision, values, and talent, the low rankings for such important practices has concerning implications for CFM's ability to deliver projects. Interviews bore out these same concerns about role clarity, internal handoffs and operational management.

Figure 6-24. CFM Prioritization of OHI Practices

CFM employees rate vision and values high, but describe role clarity, operational discipline, and financial management as underemphasized

Top 10 practices emphasized	Bottom 10 practices by emphasis
Ranked by respondents	Ranked by respondents
1. Performance contracts	28. Authoritative leadership
2. **Capturing external ideas**	29. Consultative leadership
3. **Shared vision**	30. Top-down innovation
4. **Talent acquisition**	31. Business partnerships
5. Talent development	32. **Role clarity**
6. Financial incentives	33. **Risk management**
7. Process based capabilities	34. **Operational management**

9. Competitive Insights	36. **Operationally disciplined**
10. Rewards & recognition	37. **Financial management**

SOURCE: VA-CFM (Veterans Affairs) - 2015 (n=79)

Throughout the OHI results, it was also clear that employees had significantly more negative views on how the organization scored against key metrics. Scores dropped substantially for employees who have been with CFM for more than one year.

6.2.3.4 Contracting Organization Is Overwhelmed and Burdened by Complex Approvals for Construction

During the VA interviews it has been shared with the assessment team that CFM Contracting Officers cover higher contract volumes than their government counterparts and have not been effectively trained to cover the complexities of construction and leasing contracts, and the low approval authority given to most COs requires passing leases through high levels of oversight which delay programs.

6.2.4 Systems

This section explores the tools used by VA in the delivery of major projects. Specifically, we aim to understand what systems are employed in the delivery of the projects and whether they drive efficiency and enable best practice performance. The observations in this section are based on interviews and evaluating the type, quality and speed of data provided during our

assessment to provide a secondary indicator of the availability and comprehensiveness of data. Some of the key observations are presented below:

6.2.4.1 The IT Systems Used by VA Are not Well Integrated To Help Deliver Projects Efficiently

A variety of tools and databases exist in VA to capture data for upward reporting and project management.

- **Project budgeting and cost control**: to provide selected financial information, VHA leverages Tririga, CFM information system (CFMIS) and Financial Management System (FMS), Project Management Data Retrieval and Integration (PMDRI)
- **Project planning and scheduling**: to plan execution activities, VHA typically leverages Primavera (P6) and Microsoft Project
- **Contract management**: to record all contracts and relevant modifications, the contracting organization leverages the Electronic construction management system (eCMS)
- **Past project performance**: to consult past performance metrics for major projects VHA uses the CFM Information System (CFMIS)

During interviews, VA staff shared that there is little integration among the different systems, limiting their effectiveness as a project management tool. Specific observations included:

- Data capture is occurring at multiple levels and through multiple tools. (See Figure 6-25 for the list of known tools and databases and relevant pain-points for each database.) The lack of an integrated system leads to multiple "sources of truth" about the status of the capital program.

- Manual reconciliation of data across multiple systems is tedious, leading many individuals to create personal spreadsheets to track scope, schedule, and quality. Across the site visits, the team observed numerous spreadsheets by Project Managers, Senior Resident Engineers, and Project Executives to keep track of relevant data across the multiple systems. Because most of these spreadsheets are personally held, the best available source of data on the current project is often not transparent to centralized leadership.

- Central reporting relies heavily on personnel to provide information instead of retrieving data via a centrally accessible system. Interviews have indicated that frequent reporting to multiple organizations has burdened the project team with information management instead of project management.

Figure 6-25. Catalog of Known Tools

The IT tools and databases used by VA are not fully integrated to help delivery projects efficiently

Tool or database	Description	Applicability and adherence	Key pain points
TRIRIGA (Oracle software)	Major project management software recently deployed by CFM to replace Paragon	• Major only • Low adherence (waived for Denver)	• Steep learning curve due to recent deployment • Not integrated with other systems
CFMIS (CFM Information System)	Select project details for all Major Construction projects	• Major only • Low adherence	• Similar information is stored in TRIRIGA, PMDRI, FMS but not linked • Manual entry to update
FMS (Financial Management System)	Financial management system to track funding obligations	• All • High adherence	• Official record of spending, but not linked to other software
Primavera (P6)	Major project scheduling tools used as record of status for payments to contractor	• Major • High adherence	• Is administered by a third party contractor
eCMS (Electronic Construction Management System)	"Filing cabinet" for procurement function with all contracts and relevant modifications	• All • High adherence	• Limited to no access for personnel outside of contracting • Link to FMS, CIFMS, and PMDRI unclear
VSSC – Capital Asset Database	Intranet database with performance metrics on currently active and past projects	• Minor and NRM • High adherence	• Need manual input to link to FMS • Project Tracking Reports do not include leading indicators or interim milestones
PMDRI	Financial and select project detail information	• Major and Minor • Medium to high adherence	• Linked to FMS

SOURCE: CFM interviews

6.2.4.2 Systems Do not Consistently Capture Key Performance Indicators (KPIs)

The metrics are also not standardized across VA. This leads to multiple iterations of data gathering and reporting. Existing centralized information systems require manual input by Project Managers or Senior Resident Engineers and field teams expend considerable resources in data collection and management efforts. This has also contributed to the development of personal tracking tools, stored on individual desktops, by leaders through the system.

The Project Review Board (PRB) is currently being piloted to ensure that senior decision makers in CFM have consistent and relevant information to drive successful project execution to partially address the issue of standardizing key reported metrics. The initiative remains in the early stages and, according to interviewees, has not met consistently since implementation. A summary of the design of the PRB is included in Figure 6-26.

Figure 6-26. Project Review Board

Project Review Board (PRB)

PRB objectives

- Identify opportunities for improving policies and business practices that affect project execution

- Provide forum for Project Managers to alert senior leaders to issues requiring their support and/or action

- Promote senior leader interaction with Project Managers

- Provide visibility on key metrics and milestones in project performance:

  - **Metrics**: 18 metrics across budget, schedule, safety, and quality that trigger an in-depth project review (e.g., cost growth of >10%)
  - **Milestones**: 5 key milestones identified for a mandatory briefing (e.g., 35% design complete)

PRB approach

- The project review board is conducted at two different levels, at the Office of Acquisition, Logistics, and Construction (OALC) and at the Office of Construction and Facilities Management (CFM):

  - For the **Office of Acquisition, Logistics, and Construction (OALC),** PRB is set as a monthly meeting chaired by the OALC principal director. The attendees are the associate executive directors at CFM, OGC and regional directors and project managers as requested

  - For the **Office of Construction and Facilities Management** (CFM), PRB is set as a monthly meeting chaired by the CFM executive director. The attendees are the associate executive directors at CFM, OGC and the regional directors for acquisition.

67

6.2.4.3 Field Teams Rely on a Variety of Cost and Schedule Projection Methodologies for Major Projects with Little Guidance or Support

While industry peers and other public sector agencies may often use sophisticated methods such as the Earned Value Management to forecast the potential outcomes of a project and make changes to management approaches to improve performance, VA currently relies on the field team (Senior Resident Engineers and Project Executives) and Project Managers in regional offices to develop project updates and projections with little guidance or support. In our interviews, project team members described an array of approaches that are being deployed with little standardization.

6.3 Recommendations for Consideration

VHA will likely face accelerating and unfunded capital requirements, driven by maintenance to aging infrastructure, projected growth needs to serve the Veteran population, and inefficient capital management

Consistently deploying world class practices in capital management has the potential to improve performance significantly and address some of the capital constraints VA faces, but would require an extensive overhaul of VA capital program and supporting organization.

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

125

VA has begun to initiate programs which should contribute to improved performance in capital delivery. These initiatives are providing tools to address some of the challenges that we have observed, however, there are also likely implementation challenges with these programs that should be addressed going forward.

6.3.1 Ongoing Initiatives

VA is pursuing a set of initiatives that intend to address some of the challenges identified in the assessment, all announced within the last year. It is early to see impact from these initiatives, particularly given the long-term nature of major construction projects. Internal and external interviewees have expressed concern about VA's ability to implement all of these given current resource levels. This should be part of a broader transformation plan to ensure a sustained impact. The detailed measures are presented below:

- **Project Delivery Manual**: Create an overarching, easily-accessible document that maps all the key processes involved in project delivery. As this manual is developed, it should be written to incorporate the recommendations contained in the Assessment and continue to develop as processes improve.

- **Capital Program Requirements Management Process (CPRMP)**: Introduce a stage gate process which would include compliance and milestone reviews throughout the lifecycle of major construction projects.

- **Project Review Board (PRB)**: CFM has initiated the PRB process to: a) identify opportunities for improving policies and business practices that affect project execution, b) provide a forum for Project Managers to alert leadership to issues requiring their support, and c) ensure continuous communication via PM centric reporting (Figure 6-26).

- **Project Management Plan (PMP)**: Outline major steps to accomplish acquisition from planning through activation and ensure clear communication throughout the project. The PMP is developed by the Project Manager for each major project.

- **VHA National Activation Office**: Ensure integration of facility activation into the construction process for timely facility openings.

- **Pre-construction reviews**: Implement a Major construction projects "constructability" review by a private construction management firm to review design and engineering factors that facilitate ease of construction and ensure project value.

- **Medical equipment planner:** Integrate medical planners into the construction project teams from concept design through activation.

6.3.2 Detailed Recommendations for Consideration

Building on existing initiatives when possible, we have structured a set of recommendations for consideration, to ensure VA delivers projects better, faster, and more cost efficiently:

6.3.2.1 Implement a Stage-Gate Process to Limit the Impact of Scope and Design Change on Overall Cost and Schedule Building on the CPRMP Program

The implementation of a stage-gate process would help CFM and control scope changes across the project lifecycle. Specifically, a stage-gate process would identify the specific points in time during the lifecycle where project objectives, scope, and project funding is approved, as well as:

- **Challenge accuracy and validity of A/E firm designs:** Ensure that the A/E design and technical solution complies with the design standards and is optimized from a cost-benefit standpoint with no superfluous elements without clear benefits for Veterans.

- **Implement "cold-eye"[47] and constructability reviews:[48]** A consistent peer and constructability review process before construction contract solicitation process could improve project scope and reduce contract modifications related to design omissions and errors.

- **Test standardization and consistency of outputs:** Ensure that the project maximizes standard and tested features from other projects that could significantly reduce procurement costs and execution times.

6.3.2.2 Design, Staff, and Empower Project Delivery Teams (PDT) to Increase Ownership and Accountability and Ensure Project Delivery Success

- **Provide clarity in the definition for individual roles and accountability for key decisions:** Create a standard project charter that includes a clear definition of roles and responsibilities, reporting lines and transparent links in outcomes and individual performance.

- **Ensure sufficient staffing of team roles at different stages of the project evolution:** Project teams require adequate staffing to oversee and provide guidance to contractors in field execution issues. Understaffing on the owner team side limits the team's ability act in a fast-paced environment and increases the risk of cost and schedule overruns.

- **Provide clear guidelines on staffing needs and skillset over the life of the project**: Project needs evolve as they progress from design to construction. Additionally, different construction stages require different technical expertise and capabilities (for example, earthworks and foundations, main structure, mechanical and electrical installation, architectural finishes). As a result, VA should define a clear staffing model that factors in differences in project size, complexity and stage (for example, design, construction, activation) to adequately resource project delivery teams.

- **Establish a clear documentation system and handover on transition points along the different stages of project:** Major projects are multi-year efforts with multiple transition stages, and different stakeholders. Decisions need to be tracked, documented and handed over in different stages to prevent delays and major cost impact.

---

[47] "Cold-eye" reviews are structured reviews conducted or facilitated by independent individuals with the required expertise to identify potential issues and recommend areas of improvement.

[48] Constructability reviews are structured reviews conducted prior to execution.

6.3.2.3 Develop Performance Management Systems That Quickly Identify and Mitigate Risk, as Well as Serve as Tools for Fast-Paced Decision Making

CFM-wide, standardized management tool should access data from consolidated databases to provide clear perspective to Project Delivery teams on:

- **Project costs and funding levels:** Reports should provide a perspective on initial project costs (baseline), construction progress, a detailed breakdown of real unit costs in key activities, and fact-based analysis of deviance versus initial estimates.

- **Integrated project schedule and critical path:** Reports should present an integrated master plan with a critical path and detail on engineering progress, construction, and activation activities. The overall schedule should be cost loaded to provide a detailed cash flow forecast.

- **Critical activities progress KPIs:** For each of the critical path activities, the standard report should provide progress curves to compare estimated versus real productivity and recovery plans for delayed or underperforming activities.

- **Safety standards and quality control:** Reports should include clear metrics on evolution of safety and quality parameters, as well as potential causes to trigger liquidated damages for contract non-compliance.

- **Risk matrix:** Report should include an up-to-date risk matrix, ranking different risks based on likelihood of occurrence and potential impact, as well as detailed mitigation plans for high risk & high impact identified risks.

- **Stakeholder management:** Report should include a stakeholder mapping with a clear communication plan and a detailed calendar for different committees' meeting cadence.

6.3.2.4 Transform the Contracting Organization to Align Contracting and Contract Modifications Approvals Processes to a Fast-Paced Environment

This would include:

- **Conduct an effort to map and streamline major processes and systems within the contracting organization** (for example, approval processes for contract modifications, response for RFIs) to increase agility of the decision making process and alleviate current workload levels.

- **Consider increasing warrants on site for faster decision making:** Increase skill requirements and warrant levels for SREs. For example, other delivery organizations required all SREs to have Professional Engineering Licenses and level 2 contracting warrant to reduce workload for contracting officers.

- **Adequately staff projects** with contracting officers and support teams to ensure contract compliance and rapid response, including on-site teams for mega projects.

6.3.2.5 Periodically Revisit Design Specifications and Standards With the A/E and Contractor Community to Ensure Cost-Efficient Designs and Solutions Are Included in the VA Manuals

VA should establish periodic feedback mechanisms with leaders in the industry to ensure specifications and design standards do not become outdated and costly.

6.3.2.6 Evaluate Optimal Delivery Model for Each Project Individually Factoring Complexity, Project Size Timing Constraints, and Internal Capabilities

Different projects could benefit from alternative delivery models (for example, design build, early contractor involvement) to optimally deliver project in cost and time. The decision to choose one over another should be a conscious one, understanding the pros and cons of every alternative as well as the different risk allocations. Regardless of the final decision or choice for every project, VA should provide adequate training to their project delivery teams on the contract specifics and best practice.

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

7 Design and Construction Assessment: Minor Projects and Non-Recurring Maintenance

7.1 Preface

VHA undertakes numerous minor and non-recurring maintenance capital projects to increase and maintain its asset base of owned facilities to meet Veteran needs. Section 201 of the Choice Act calls for assessment of the capital management programs specifically relating to the design and construction management processes. The assessment is structured to address the following four aspects:

- **Outcomes:** How do VHA hospital construction costs compare to the private sector? How does VHA perform in project delivery (cost, schedule, quality) across all it across construction programs? To what extent do construction projects and processes affect facility utilization or Veterans' health access?

- **Process:** What processes does VHA have in place for its minor and NRM construction programs? What pain points exist across these processes? Do construction processes address the identified current and future needs in a timely fashion? Can VHA improve the processes or other aspects of construction to improve quality?

- **People:** How does VHA structure and staff its project delivery teams? How does VHA culture impact project delivery?

- **Systems:** What systems are employed in the delivery of the projects? Do they drive efficiency and enable best practice performance for project delivery?

7.1.1 Overview of the Minor and NRM Construction Programs

VHA manages construction and renovation of its owned facilities through three main programs: major construction, minor construction, and Non-Recurring Maintenance (NRM). This section covers minor and NRM construction programs, detailed below:

- **Minor construction program (174 projects, [49] 13 percent of total)**: Projects that address construction, alteration, extension, or improvement of any facility, including parking structures, site acquisition, and demolition by replacement, with costs equal to or less than $10 million, managed by local VHA engineering staff.

- **Non-recurring maintenance (NRM) program (866 projects, 36 percent of total):** Projects that renovate existing facilities and associated infrastructure with expansion of space not to exceed 1000 square feet. The program primarily includes three types of projects: infrastructure improvement, sustainment, and green management, all managed by local VHA engineering staff:
    - **NRM sustainment ($25,000 to $10 million):** Projects focused on renovation and modernization of existing facilities and infrastructure (for example, lab renovation).

---

[49] Per 2015 budget; 2016 plan still in progress.

Projects in this category are often driven by national-level mandates instead of station needs.

- o **NRM infrastructure (Greater than $25,000):** Projects focused on replacing, upgrading or expanding infrastructure systems or focused on facility condition assessment (FCA) deficiency backlog (for example, heating, ventilation, and air-conditioning [HVAC] replacement).

- o **NRM green management:** Projects include environmental, energy, green building, and fleet management-related activities in support of reducing energy (for example, upgrade to LED lighting).

- o **Clinical-specific initiatives (CSI, up to $5 million):** The CSI program is funded out of the NRM budget for up to 10 percent of the budget. The program focuses on high-profile projects that are difficult to plan but require additional space to support care for the Veteran. These projects increase space by more than 1000 square feet. Current approved CSI categories include: polytrauma, mental health, high-tech and high cost medical equipment installations, women's health, site prep for donated space, and others. It should be noted that CSI projects do not go through the SCIP process.

7.1.2   Numerous Parties Drive the Minor and NRM Projects Process

More so than for major construction projects, minor and NRM projects work through multiple parties for approval, development, funding, and execution. VAMCs take a lead role in the development of minor and NRM project, with responsibility for project scope definition, business case creation (including alternative stress testing and cost estimation), SCIP submission, and project execution.

Approval and funding, however, is a more complex process, partially handled by VACO, VISNs or stations in turn. Minor projects are approved through the SCIP process that is managed by OAEM and funded centrally through VACO as individual projects are ready to obligate. NRM projects may receive approval for design funding through SCIP, but project funds come through the VERA allocation to VISNs and may be supplemented by station operating budgets for medical facilities.

Once a project is approved and funded for design, VAMCs are responsible for the overall design, construction and activation process, but they rely on VISN support for contracting and technical oversight capabilities and may rely on OCAMES for engineering support.

CFM does not have a designated role in minor and NRM project execution, though CFM design standards and cost estimating guides are applied to these projects as well. Additionally, stations can request a CFM Resident Engineer be tasked to their facility to cover complex projects beyond the capabilities of their local engineering staff, though this is a rare request and CFM is not obligated to comply.

7.2 Findings

7.2.1 Minor Construction Program Outcomes

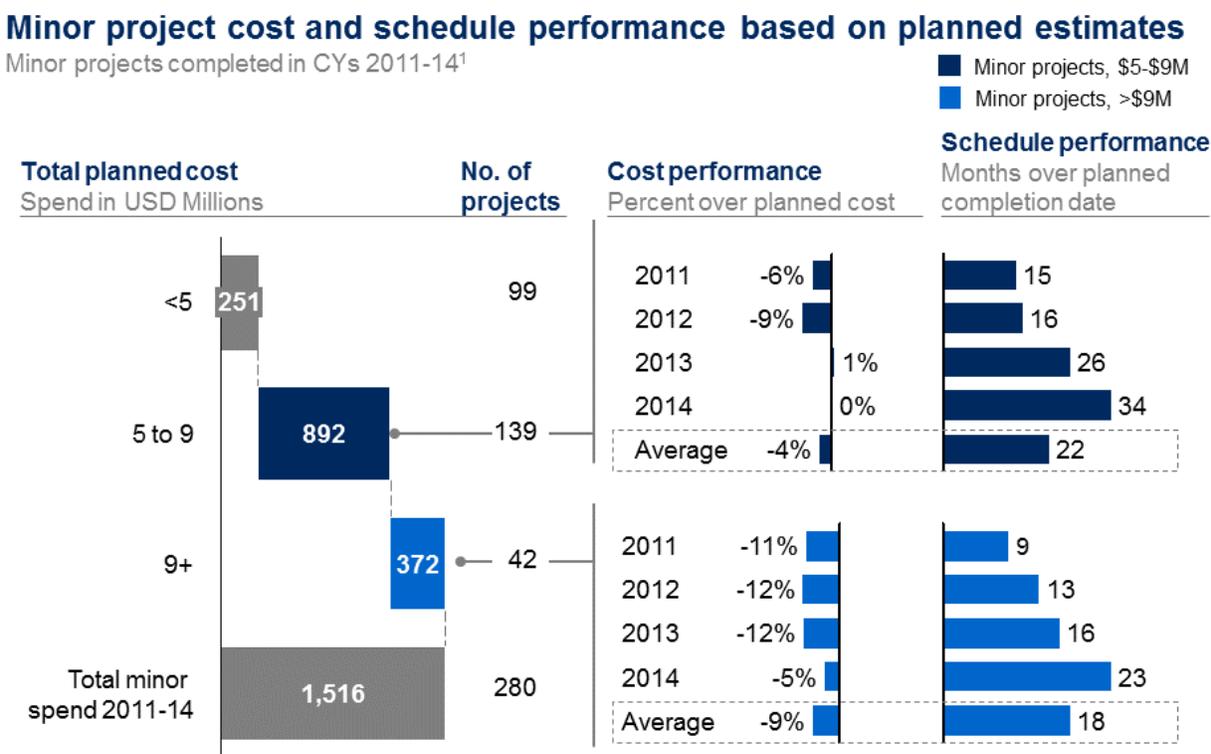
7.2.1.1 Minor Construction Projects Experience an Average Cost Overrun at Completion of 10 to 15 Percent

VHA has delivered 280 minor projects at a cost of $1.5 billion over the past four years. [50] Most of the completed minor projects fall between $5 million-9 million due, in part, to a legacy threshold of $7 million between minor and major projects (Figure 7-1).

Figure 7-1. Minor Project Performance

Minor project cost and schedule performance based on planned estimates

Minor projects completed in CYs 2011-14[1]

■ Minor projects, $5-$9M
■ Minor projects, >$9M


1 A $6 million project not included due to incomplete / potentially erroneous information

SOURCE: Minor Project Tracking Report for projects completed in CY 2011-2014

Compared with original planned costs, VHA averages 4 percent under budget for projects $5 million-9 million and 9 percent under budget for projects above $9 million. However, planned costs do not represent original construction contract costs, but the initial costs at business case submission. At the time of submission, project estimates generally include contingencies – including escalation rates – for both design and construction contracts, to ensure costs stay

---

[50] As a percentage of the original contracted award.

below the final threshold. With these contingencies included, project estimates are allowed to exceed CFM cost estimating guides by up to 25 percent.

The presence of contingencies allows minor projects to keep cost overruns lower than NRM projects, which do not have such contingencies. Since most of these contingencies are percentage based, higher cost projects receive more contingencies – even more so if the project cost is close to $9 million and facilities are concerned about the $10 million threshold. In recent years, projects have been completed closer to planned costs – under budget by 1 to 5 percent. When overruns are instead measured as a percentage of the original contracted award, projects experience average overruns of 13 percent, as illustrated in Figure 7-2 and Figure 7-3.

7.2.1.2 Minor Projects Increasingly Struggle to Meet Their Schedule Forecasts With Delays Ranging From 9 to 34 Months Over the Last Four Years

While project costs are managed aggressively on schedule performance, we observed that projects with planned costs from $5 million to $9 million were delayed for an average of 22 months, and projects with planned costs greater than $9 million were delayed for an average 18 months. Over the last four years, average minor project delays more than doubled for projects above $5 million. We observed a few consistent drivers for project delays including:

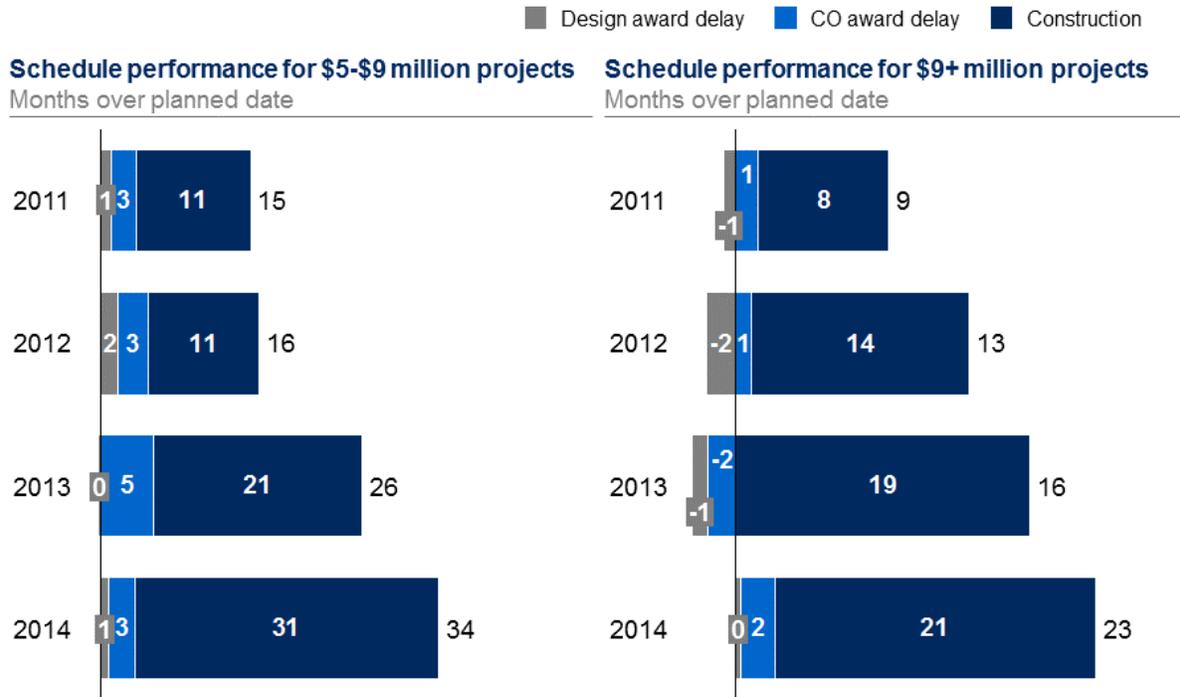
- **Forecasting errors:** Schedule delays are based on Project Tracking Reports. When a minor project is funded, the Project Engineer at the facility estimates initial schedule - which remains unaltered throughout the course of the project. Variation in the estimation approach of initial project schedules may account for part for the project delays.

- **Obligation delays:** Delays in the procurement process account for up to 5 months of overall delays including both design and construction contracts (Figure 7-4).

- **Execution delays:** Execution delays including change orders make up the bulk of the total delay period for minor projects experiencing average delays of 18 to 22 months. Within execution, we have observed a number of causes that drive delays such as differences in

field conditions compared to the expected designs (for example, location of electrical services is found to be different from expected once a project begins) and unexpected reshuffling clinical areas to accommodate remodeling or expansion projects among others.

Figure 7-4: Minor Project Performance for Projects Above $5 Million

All projects suffer from schedule delays in both construction and design


When data are assessed on a VISN level, we observed similar performance across all VISNs on minor projects except for VISN 2 which delivered projects ahead of schedule on the average. Variation in cost performance across VISNs may be indicative of forecasting errors or execution delays. We did not identify any correlation between the volume of Minor projects (by dollar value) completed by each VISN with their ability to complete a project on schedule.

7.2.1.3 Minor Project Scopes Are Optimized to Fall Just Under the $10 Million Threshold, Sacrificing Capital Efficiency

By statute, minor projects cannot exceed $10 million. Additionally, minor projects are not allowed to be designed as multi-phase projects, with each phase under the $10 million cap, but must be able to be completed on a standalone basis. This threshold has proved a challenge for station planning efforts, as discussed in Section 4.2.2. As a result, minor projects are consistently developed to stay just below the threshold. Figure 7-6 illustrates this behavior in recent SCIP submissions. These planning decisions have important implications for how projects are executed.

In some cases, projects are reduced in scale to fit under the threshold. All projects are also required to write in a 20 percent potential scale reduction through "deducts," reductions in project scope which can be used to reduce the project cost if bids come in too high. Stations routinely accept these deducts to shrink the scale of the project, though the exact scale of these deducts is impossible to determine, as they are not closely tracked at a national level.

Additionally, the limit is strictly governed for in-process projects. While there is a defined process to receive a cost limit increase, that process is burdensome, such that stations avoid it

---

if possible, reducing the scale or even abandoning the project if necessary. Both were seen in projects reviewed by the assessment.

7.2.2   Non-Recurring Maintenance Construction Program Outcomes

The NRM program accounts for the largest spend category over the past four years among the construction programs. NRM funding is often supplemented by stimulus-related legislation such as the American Recovery and Reinvestment Act and the Veterans Choice Act.

7.2.2.1   NRM Projects Struggle to Meet Costs and Schedule Across the Board

Over the past four years, VHA has completed more than 7,500 NRM projects with total cost of $5.4 billion (Figure 7-7). Approximately 85 percent of NRM projects are below the $1 million threshold at which NRM projects must undergo the SCIP prioritization process; however, such projects account for only 44 percent of the 2011-2014 spend.

Figure 7-7. NRM Project Performance

Projects above $1 million in planned costs account for majority of the NRM spend and seem to perform better on cost than on schedule

NRM projects completed in calendar years 2011-2014

2014	9	23
Average	7	17

SOURCE: NRM Project Tracking Report for projects completed in CY 2011-2014

Cost overruns for NRM projects between $100,000 and $1 million are more than three times compared to cost overruns for NRM projects above $1 million, 25 percent and 7 percent respectively. The consistency of overruns during the past four years is driven in part by the following factors:

- **Large projects are more likely to take scope deducts.** Projects over $1 million are more likely to deduct scope than to fund a change order due lack of resources for NRM projects. Unlike minor projects, NRM projects are not allocated project-level contingencies. VISNs facilitate change orders, and can only approve additional funds when resources are available. As NRM projects are oversubscribed, access to these funds is often limited and dependent on how these funds have built-up over the course of the year as projects either fall through or come in below estimates. Since the visibility on this available pool is limited until the end of the year, a change order approval is often dependent on size rather than importance. Often times, smaller, urgent NRM items divert money away from the fund and prevent larger blocks of funding from coming available for larger projects.

- **Projects submitted to SCIP go through more rigorous business case development and cost estimation.** Projects over $1 million require a full business case to be completed as part of the SCIP submission. This requires Chief Engineers do significant cost estimating

and project definition for these projects as compared to projects under $1 million. Regardless of any reviews through the SCIP process, this initial investment from station-level engineers may provide more reliable capital estimates for projects.

7.2.2.2   Delays in Obligation of Awards Make it Challenging for NRM Projects to Meet Project Schedule

Figure 7-8 shows the cost and schedule performance of NRM projects by phase – design and construction. Delays in obligation awards are measured against the expected date of contract award to actual date of contract award. Delays in obligation of up to four months for NRM projects between design and construction phases contribute significantly to the overall NRM delays of 10 to 17 months. Interviewees have consistently cited a lack of resources in the procurement organization as the root cause obligation delays. From a network perspective, all VISNs struggle equally to meet schedule on NRM projects (Figure 7-9).

VA best practice case studies – Contracting processes

During the course of site visit interviews, a few locations stood out as best practice examples of how to facilitate interactions between the station and VISN leadership and their contracting counterparts.

Selected examples:

- **Alabama VAMC:** The local team created an online tracker system with electronic signatures to monitor different approvals and contributions to RFIs and contracting packages. The system allowed the organization to have visibility on bottlenecks and have performance dialogues on how to optimize response times and time to approvals.

- **VISN 4**: This VISN takes a long term strategic approach to the implementation of its NRM program by using a rolling plan to strategically prioritize projects VISN-wide across fiscal years. With this system, the capital team can develop contracting packages in advance of the next fiscal year, using the historical funding levels as a predictor the volume of projects which will be funding in the coming fiscal year. This enables projects to be ready for award during the first quarter of the fiscal year, increasing the likelihood that projects will be completed as scheduled. As a result, VISN 4 is a leader in the amount of funds obligated for NRM projects, though it should be noted that this has not improved their construction execution timelines.

7.2.2.3   NRM Projects Experience Higher Design Cost Overruns Than Construction Cost Overruns

On cost performance, design costs overruns for NRM projects may escalate due to different factors such as unforeseen conditions for renovation-type projects and scope change depending on evolving needs. Without clear boundaries around project scope defined during business case submission, and even design completion via the design funds, NRM projects have a higher likelihood of design changes during construction. Construction costs overruns for $1 million are lower potentially due to a more rigorous approach enforced by the SCIP process.

From a network perspective, cost overruns on projects greater than $1 million are limited to a few VISNs.

Figure 7-8. NRM Project Performance by Phase and Size

NRM projects above $1 million experience the lowest construction cost overruns, whereas all projects suffer from similar schedule delays

■ Projects $0.1-$1 mil
■ Projects >$1 mil

7.2.3   Process

7.2.3.1   Minor and NRM Programs Follow Similar Processes and Require Complex Multi-Stakeholder Approval Impacting Cost and Schedule of Projects

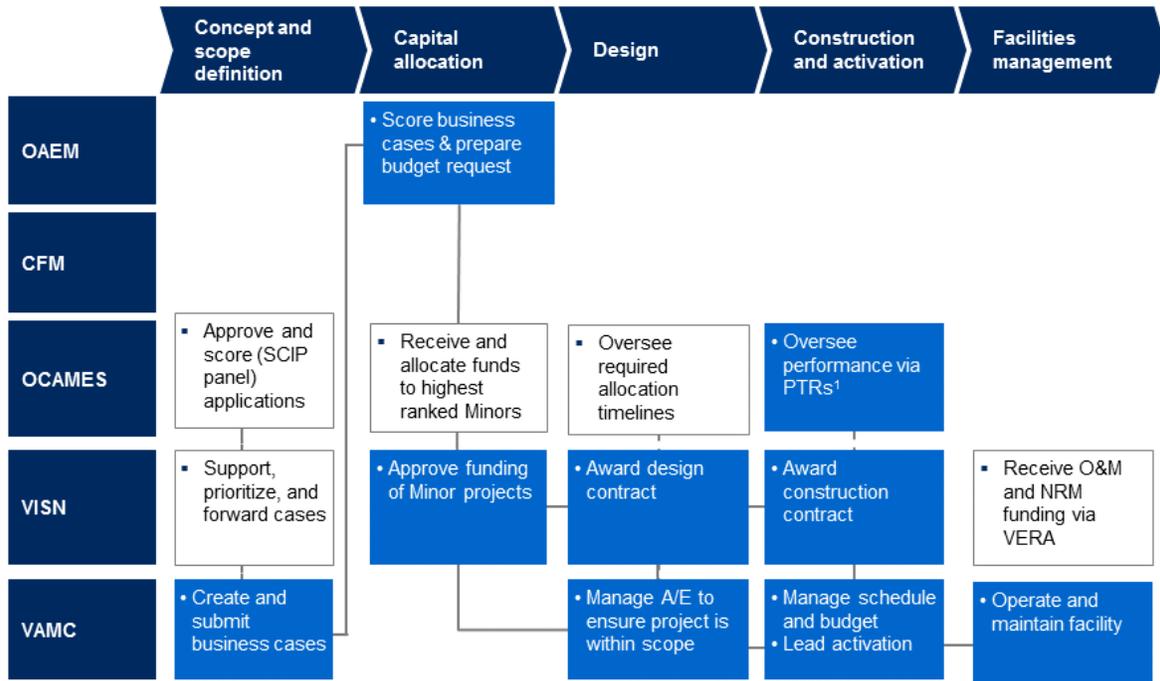
Minor and NRM projects experience similar phasing from concept, approval, design and execution. However, the activities and responsibilities vary. Figures 7-10 and 7-11 describe the process across the project lifecycle from concept and scope definition, capital allocation, design, construction and activation, and facilities management and illustrate the different approaches by type of project.

For minor projects, VAMCs are responsible for project scope definition, business case creation (including alternative stress test and cost estimation) and project SCIP submission to OAEM. Minor projects are approved without accounting for the funding limitations resulting in oversubscription of approved projects. Once the minor projects funding is appropriated, VACO allocates funding to projects as projects are ready to be obligated. Once funded, the VAMCs and VISNs lead project contracting and execution. The Contracting Officers lead the contracting process with help from VAMCs as needed. Following contract award, the primary manager of a minor project in the field is the Project Supervisor under the Chief of Engineering. Capital Asset

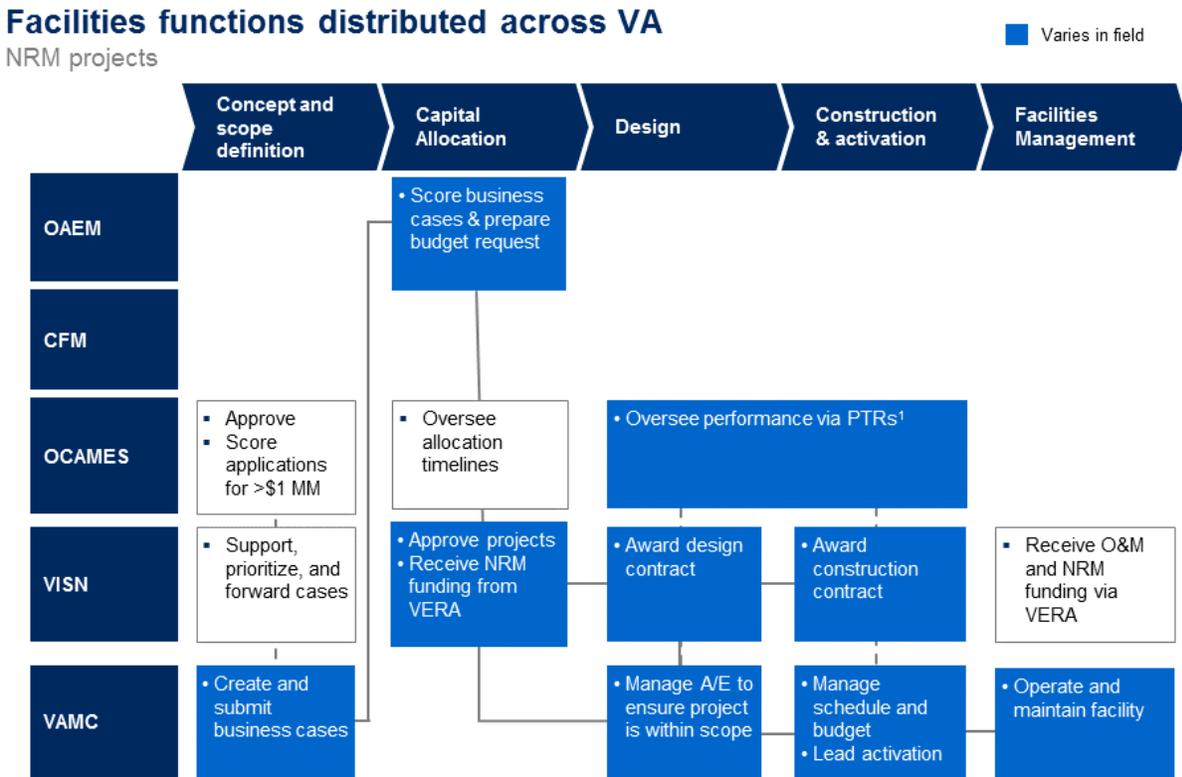
Managers at the VISNs help coordinate contract awards and modifications if necessary between Contracting Officers and VAMCs to help drive project execution.

Figure 7-10. Involvement of Different Entities in Minor Projects

Facilities functions distributed across VA
Minor projects

Legend: Supporting role / Critical role


1 PTR: Project Tracking Reports

Figure 7-11. Involvement of Difference Entities in NRM Projects


Facilities functions distributed across VA
NRM projects

For NRM projects, the process is very similar to minor projects in project scoping and SCIP applications, but differs in funding and approval process. Once a project is approved via SCIP and is ready to be obligated, VACO funds the design phase of the project which represents approximately 10 percent of the total project cost. Once funded for design, the VAMCs fund the construction phase with VERA allocated dollars.

For both project types, change order approvals are driven by available funding. For minor projects, contingency funds are already programmed during the planning phase making the process for change orders manageable. For NRM projects, the change order process requires multiple levels of approval centrally. NRM project funds are obligated in one fiscal year but executed in the next fiscal year. The timeline for NRM projects (Figure 7-12) is tight given the contracting timelines. Because NRM appropriations expire within one year, change orders – which are approved during execution phase – for projects obligated from one fiscal year cannot be funded from the same fiscal year funds without an approval process. The prior year fund approval process requires searching for available funds within VISN and then centrally at VACO and is complex, leading to schedule delays in the field. When funds for change orders are unavailable, the most likely levers executed in the field are scope deductions.

7.2.4 People

In assessing the organization responsible for delivery we considered the way in which VAMCs structure and resource their project delivery teams (PDT). We also assessed the impact that culture may have in VHA project delivery. Project delivery teams consist of the following key positions for a minor or NRM project:

- **Contracting officer (CO) at VAMC, VISN, or NCO:** Responsible for overall contract compliance and approvals. They are normally involved after a project is approved via SCIP and funded. The location for COs varies between local facilities, VISN, and NCOs across the organization.

- **Project Engineer at VAMC**: Responsible for project management in partnership with Contracting Officer and Contracting Officer Technical Representative (COTR). Project Engineers are usually involved from design through execution of the project. They also provide regular updates for active projects to OCAMES via Project Tracking Reports.

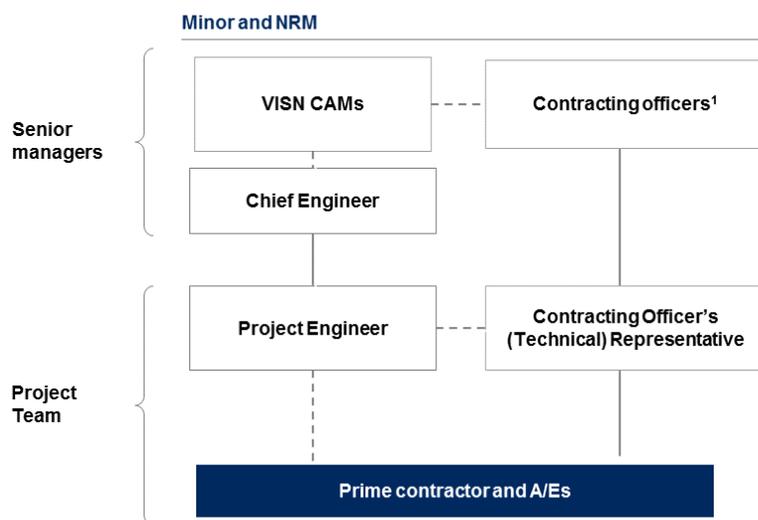
- **Capital Asset Manager (CAM) at VISN**: Responsible for providing general oversight during the planning, approval, and execution phase of the project

- **Contracting Officer Technical Representative (COTR) at VAMC**: Responsible for oversight and tasks delegated by the Contracting Officers for the project

7.2.4.1 Project Teams are Designed and Staffed to Support Compliance Requirements but These Structures Have Resulted in Reduced Accountability for Project Delivery Outcomes and a Limited Ability to Develop Solutions to Manage Cost Overruns and Schedule Delays

Minor and NRM project experience the same challenge of dispersed accountability between technical, contracting, and operations personnel. For minor and NRM projects, the Project Engineer leads the project execution in the field (see Figure 7-13) and is often responsible for project design. However, similar to major projects, the general contractor in the field is often unclear who the primary project owner is. The dispersion of contracting and execution creates silos that lead to potentially different objectives for the project. Such silos drive schedule delays due to unresolved issues with dependencies in project execution.

Figure 7-13. Project Delivery Team for Minor and NRM Projects

Project team structure for NRM and minor


1 Contracting officers may be located on-site at facility or at VISN offices

SOURCE: VAMC interviews, NRM and Minor project handbooks

7.2.4.2 Facility-Level Engineers Are Understaffed and Undertrained to Manage Multiple Complex Projects

Project Engineers (PE) are often staffed on multiple projects simultaneously and have indicated that this prevents them from addressing field execution issue that may arise is a timely manner. This staffing situation for PEs is primarily due to a lack visibility on future workload. The opacity, variability, and length of the process from project submission to project funding does not allow a station to plan its workload accurately for a given year. In conjunction with long staffing

timelines, the Chief Engineer can struggle to balance workload with staffing capacity (VISN/VAMC Interviews, 2015).

Furthermore, Project Engineers likely need a wide skillset to successfully deliver all the projects they are managing – from leading project design to coordinating project execution of projects as small as $25,000 (NRM) to as large as $10 million (minor). The projects require considerable coordination with the facility staff given that minor and NRM projects are executed while maintaining the operations of the facilities. To manage the project successfully, the Project Engineer has to swiftly and successfully engage all the stakeholders – facilities staff, OCAMES, VISNs, A/Es, and general contractors, Contracting Officers, and COTRs.

7.2.5   Systems

7.2.5.1   The Tools and Databases Used at VA Are not Well Integrated, Impairing the Efficient Delivery of NRM and Minor Projects

A variety of tools and databases exist in VA to capture data for NRM and minor progress reporting and project management.

- **Project budgeting and cost control**: to provide selected financial information VHA leverages Financial Management System (FMS)
- **Contract management**: to record all contracts and relevant modifications, the contracting organization leverages the Electronic construction management system (eCMS)
- **Past project performance**: to consult past performance metrics for minor and NRM projects VHA has the Capital asset database (VSSC)

Similar to our observations in major projects (see Section 6.2.3), it has been shared during our interviews that there is little integration among the different systems, limiting their effectiveness as a project management tool, with data capturing occurring at multiple levels and manual reconciliation leading to confusion on the ultimate source of truth. Specifically, interviewees reported:

- Data capture is occurring at multiple levels and through multiple tools. (See Figure 7-14 for the list of known tools and databases and relevant pain-points for each database.)
- Manual reconciliation of data across multiple systems is tedious, leading many personnel to create and rely on their own spreadsheets to track project-related data. Across the site visits, the team observed numerous spreadsheets by Project Engineers, Chiefs of Facilities, Capital Asset Managers, and Contracting Officers to keep track of relevant data across the multiple systems and stakeholders.

Figure 7-14. Tools Used for Minor and NRM Program

The various tools and databases used by the VA are not fully integrated to help delivery projects efficiently

Tool or database	Description	Applicability	Key pain points
FMS (Financial Management System)	Financial management system to track funding obligations	• All	• Official record of spending, but not linked to other software
eCMS (Electronic Construction Management System)	"Filing cabinet" for procurement function with all contracts and relevant modifications	• All	• Limited to no access for personnel outside of contracting • Link to FMS, CIFMS, and PMDRI unclear
VSSC – Capital Asset Database	Intranet database with performance metrics on currently active and past projects	• Minor and NRM	• Need manual input to link to FMS • Project Tracking Reports do not include leading indicators or interim milestones
PMDRI	Financial and select project detail information	• Major and Minor	• Linked to FMS

SOURCE: VAMC interviews

7.2.5.2 VHA Has Standardized Financial Tools to Track Obligations but Limited Performance Management Systems to Track Minor and NRM Project Execution

VHA employs multiple tools for the management and execution of NRM and minor projects. Two primary tools encountered by the team are managed centrally by OCAMES: Project Tracking Reports (PTRs) and Performance Monitor Reports. Both reports are updated monthly. PTRs provide a review of the ongoing projects, and the Performance Monitor Report reviews the obligation status. Locally, the VISNs maintain a shared spreadsheet between Capital Asset Manager, Chief of Engineering, and the Network Contracting Manager with these data.

The primary purpose of the tools above is either a) tracking projects before contracts are awarded or b) tracking projects after contracts are awarded. The focus of the organization from Project Engineer to VISN and OCAMES is on meeting obligation targets throughout the year, particularly for the NRM program. Because NRM funds expire within one year, VHA has internal targets by quarter for the obligation of allocated funds. For example, each VISN must obligate 80 percent of funds by the third quarter of fiscal year. The variability in NRM funds due to stimulus funds further increases the necessity to obligate the appropriated funds in time.

Project execution tools such as PTRs contain key metrics that describe the project health, but are not well utilized in the field to drive actionable decisions. The primary challenge in executing tools such as PTRs is the accurate collection and validation of data. Project Engineers are required to initiate PTRs once the project is funded and are required to update them monthly. However, given the dispersed accountability across technical, contracting, and operations, as mentioned in the Section 7.2.3 above, Project Engineers may not necessarily have all the required information, such as the estimated date for design contract award. Finally, the systems lacks a feedback loop, either positive or negative, back to the Project Engineers from the upward reporting exercise, except for the lack of action of filling out a PTR.

7.3 Recommendations for Consideration

VA minor and NRM construction programs present a significant opportunity for increased efficiency. By shifting focus from meeting yearly obligation target to optimal project prioritization and delivery, VA can significantly optimize its capital requirements while addressing the right needs for Veterans.

The following recommendations are concentrated on improvements which can be delivered within the current minor and NRM capital program to deliver the right projects in a faster and more cost effective manner:

7.3.1 Enhance Merit-Based Project Scrubbing to Test Scope and Overall Cost and Schedule Prior to Business Case Submission

The implementation of additional control points can help VHA ensure proposed projects are adequately scoped rather than optimized for approval strategies (for example, budgeted right below the $10 million threshold) at the cost of project merits or efficiency (VACO/VISN Interviews, 2015). Specifically, items which could be tested include the following:

- **Scope alignment to identified needs:** Ensure that the business case submitted responds to initially identified needs (for example, space, access, energy) and addresses them in a holistic and cost-efficient way (for example, avoid project fragmentation to fall below the Major Construction threshold).

- **Benchmark project costs:** Assess cost efficiency benchmarks for similar projects conducted within the same VISN to ensure that budget costs and contingency are accurate.

- **Emphasize the need for adequate project design**: Lengthy approval processes can cause VAMCs to compress the aspects of the schedule within their control leading VAMCs to shortcut engineering stages to meet approval and funding timelines within fiscal years. Adequate engineering times would allow risk identification and diminish cost overruns.

- **Test standardization and consistency of outputs:** Ensure that the project maximizes standard and tested features from other projects that could significantly reduce procurement costs and execution times.

7.3.2 Empower CFM and OCAMES to Effectively Share Know-How, Lessons Learned, and Design Standards

OCAMES could be leveraged as a "center of excellence" to provide input along the minor and NRM project lifecycles. Creating regular best practice sharing, forum, and working groups between VAMCs would enhance project definition, design and delivery.

7.3.3 Set up Performance Management Systems That Serve as Tools for Fast Paced Decision Making, Early Risk Identification and Mitigation

Leverage systems and reports included in the major project recommendations (Section 6.3) to standardize output across VA capital management program. The reports, while adjusted to minor and NRM projects characteristics, should also serve as a management tool and provide a clear perspective on:

- **Project costs and funding levels:** Reports should provide a clear perspective on initial project costs (baseline), construction progress, and fact-based analysis of deviance versus initial estimates.

- **Integrated project schedule and critical path**: Reports should present an integrated master plan with a clear critical path and detail on construction and activation activities. The overall schedule should be cost loaded to provide a detailed cash flow forecast.

- **Critical activities progress KPIs:** For each of the critical path activities, the standard report should provide clear progress curves to compare estimated versus real productivity and recovery plans for delayed or underperforming work fronts.

- **Risk matrix:** Report should include an up-to-date risk matrix, ranking different risks based on likelihood of occurrence and potential impact as well mitigation plans for high risk and high impact areas.

Additionally, the system should also include references to safety and quality control standards, as well as a clear perspective on stakeholder management.

7.3.4 Staff and Train Project Delivery Teams (PDT) According to Minor and NRM Technical Complexity and Ensure Project Delivery Success

- **Provide clarity in the definition for individual roles and accountability for key decisions:** Especially for minor and NRM projects, which rely on local staffing rather than the full team CFM uses, clarity for roles and guidance on recommended interactions is critical for project success.

- **Ensure sufficient staffing of project team roles:** Even if minor and NRM projects fall below the $10 million category, staffing and oversight from OCAMES should consider complexity of the projects (for example, construction over an existing structural, mechanical and electrical reality) and whether they require additional resources to deal with all interfaces and challenges successfully.

- **Ensure the appropriate level of coordination between medical center and construction staff:** Roles such as the construction liaison, which bridges the gap between medical staff

needs and construction teams, have reduced the inefficiencies and challenges that most brownfield projects face. Coordinators could also monitor changes in technology and equipment which could have an impact on projects. This and similar liaison roles should be considered.

7.3.5 Transform the Contracting Organization to Align Contract and Change Order Approvals Processes With a Fast-Paced Environment

This would include:

- **Conduct an effort to map and streamline major processes and systems within the contracting organization** (for example, approval processes for change orders, response for RFIs) to increase agility of the decision making process and alleviate current workload levels.

- **Ensure proximity of Contracting Officers with facility:** Latest centralization efforts have resulted in increased challenges for VAMCs to interact with contracting officers. Dedicating specific personnel and ensuring a clear cadence of in-person visits and interactions would help reduce system inefficiencies and speed up processes.

- **Consider the unique needs of construction contracts when incorporating structural changes to contracting organization.** Construction contracts require a high degree of specialized knowledge as well as the ability to view site conditions both before and during the project. Structural changes to the contracting organization, pursuant to Assessment J, Section 5.2.1, should reflect these needs.

This page intentionally left blank.

8 Leasing Program Assessment

The existence of a strong leasing program is a critical component of VA's ability to adapt to changing Veteran needs. Leasing can provide the opportunity to decrease upfront capital cost and accelerate delivery of clinics, offices, research facilities, warehouses, and other facilities. Section 201 calls for an assessment of the medical facility leasing program. We have evaluated four aspects of the leasing program, and have explored a set of questions within each:

- **Outcomes:** Is VHA paying a fair price for leased facilities? Do contract terms ensure that VHA gets the most out of its leased facilities? Does the leasing program enable VHA to quickly scale capacity up and down to maximize Veteran access to care?

- **Process:** Has VA instituted an optimal process for medical facilities to acquire new or renew existing leases? How consistently is that process adhered to, and does it result in timely execution? What pain points exist and how could those be alleviated?

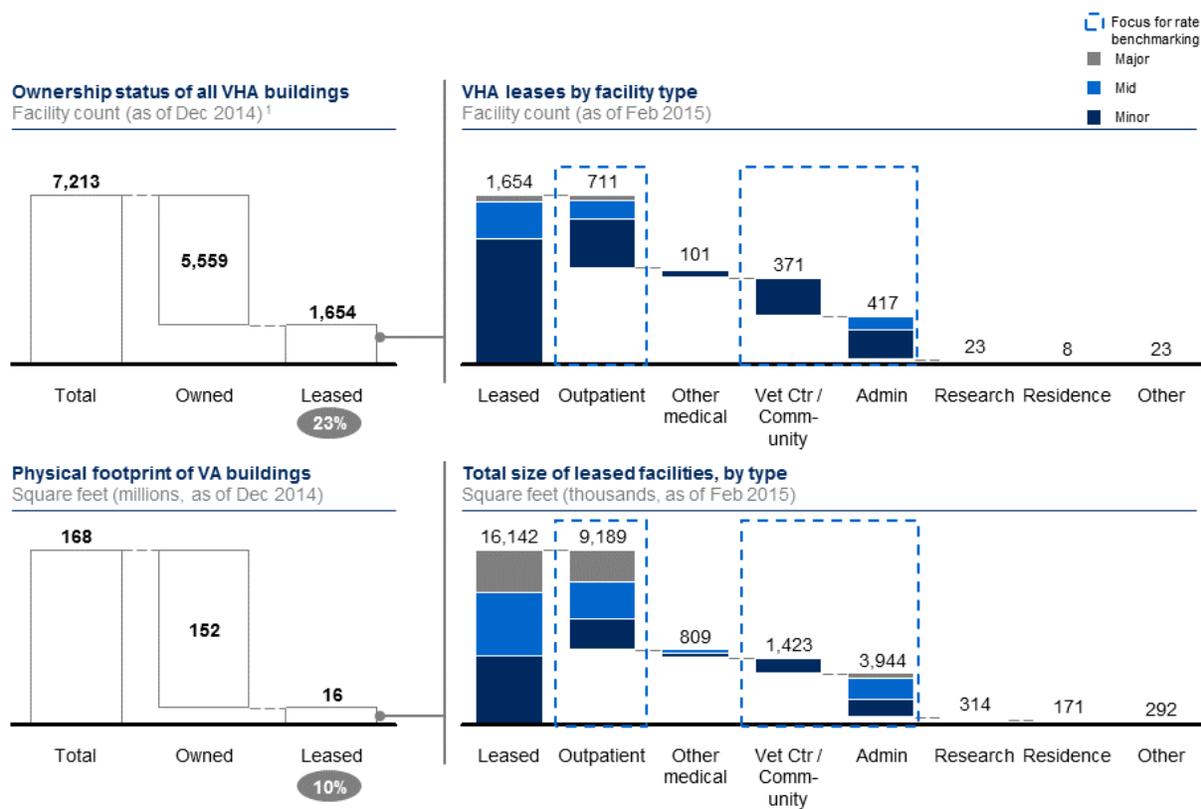
- **People:** Are the right entities involved, with clear roles and responsibilities? Do staff members have the right capabilities to fulfill those responsibilities?

- **Systems:** What systems are employed in the delivery of the leasing program? Do they facilitate efficiency and enable strong oversight and performance management?

8.1 Preface

8.1.1 Overview of VHA's Lease Portfolio

While nearly a quarter of all VHA buildings are leased, these facilities tend to be smaller than owned facilities and represent just over 10 percent of the physical space VHA occupies (FRPP, 2014). Of the approximately 1,600 facilities leased by VHA, nearly half are used primarily for the direct delivery of patient care, with the remainder primarily utilized for administrative functions and Veteran community centers. A relatively small number of other medical, research, and residential properties are also leased by VHA.

Figure 8-1. Lease Portfolio Overview


1 Data from FRPP submission adjusted to include GSA Occupancy Agreements and non-building leases (e.g., land) to reconcile figures with CAI lease data

SOURCE: OAEM data from 2014 FRPP submission; Capital Asset Inventory database

According to the Capital Asset Inventory database, existing lease contracts obligate VHA to spend approximately $420 million annually on rent for its leased properties.[51] In line with its footprint, just over half (approximately $250 million) of this spend is for outpatient care facilities such as community-based outpatient clinics, satellite outpatient centers, and other similar facilities. Medical centers typically view leasing as the default option when they need to expand their physical footprint to provide increased access to outpatient care for Veterans. Leasing is perceived as a method of acquiring space more quickly than construction, acquiring small spaces for which construction is not an option, and acquiring space without having to secure approval for a major construction project. Leased administrative space costs VHA just under $100 million in annual unserviced rent,[52] with community facilities, other medical facilities, research, and residential facilities comprising the remainder.

---

[51] While this represents annual obligations, lease contracts are multi-year and the long-term costs of VHA's leasing program have been estimated at $5.5 billion and growing (Government Accountability Office, 2014).

[52] Unserviced rent is defined as "the base rent, including real estate taxes, insurance, and any amortized build-out, but excluding operating expenses" (VA Directive 7815, 2012).

1 16% of VHA leases were originally categorized as Other and were manually recategorized based on lease name descriptions

SOURCE: Capital Asset Inventory Database as of February, 2015

Geographically, leased properties are spread across the United States. While leasing occurs in every VISN, some rely on it more heavily than others. VISN 8 (comprised of Florida, Georgia, Puerto Rico and the Virgin Islands) and VISN 17 (Texas) account for 12 percent and 10 percent of VHA's total annual rent obligations, respectively. Other small VISNs (5, 3, and 2) combined comprise less than 5 percent of total rent obligations.

8.2   Findings

8.2.1   Outcomes

As pressures mount for health care providers to effectively deploy capital, focus on the core business, and take advantage of cost savings associated with the transition to outpatient care, health care systems are increasingly turning to leasing to fulfill their facility needs. As such, VHA's focus on leased facilities is in keeping with current thinking in the industry. However, to be considered successful, a health care leasing program would need to achieve the following:

- **Costs:** Optimize the costs of meeting facility needs by freeing capital for more effective use.

- **Time and flexibility:** Enable more rapid and flexible fulfillment of facility needs than could be achieved through owned facilities.

- **Quality:** Provide high-quality facilities and facility-related services to patients, providers, and administrators. This is determined largely by quality stipulations in the lease contract and willingness to enforce the contract.

Our findings suggest that VHA has room for improvement in some of these areas. Below we provide an overview of our assessment of VHA's performance against these three outcomes. In the subsequent sections we explore the underlying causes of these outcomes through an assessment of the processes, people, and systems that support the leasing program.

8.2.1.1 VHA Lease Rates Are Similar to Benchmark Rates for Smaller Facilities, but Higher Than Benchmark Rates for Larger Facilities

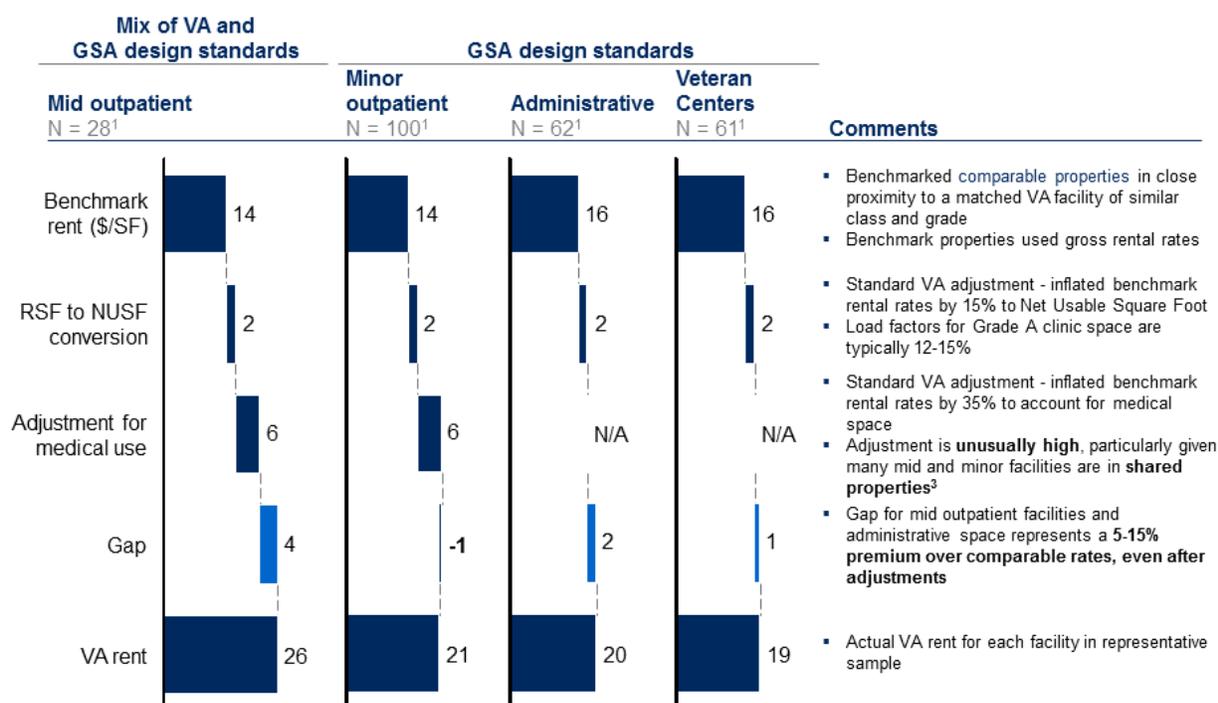
To assess VHA's cost outcomes, we conducted an extensive cost benchmarking exercise of VHA rates. Using CoStar, a database of U.S. real estate data and price information, we benchmarked VHA rates against market rates for comparable properties of similar class and size in close proximity (within five miles) of the VHA location. We completed this exercise at the individual facility level for more than 280 leased VHA properties that were associated with the stations randomly selected for our site visits. Benchmarked facilities included major, mid, and minor outpatient facilities as well as administrative buildings and Veteran Centers.

We then tested the benchmarking results of the above large-sample approach with an in-depth study of a smaller sample of leased facilities. To do so, we conducted a detailed examination of the lease contracts of this smaller sample of facilities and benchmarked adjusted rental rates against a specific set of comparable properties. We verified the comparability of these rates with real estate brokers, appraisers, and other real estate experts.

In order to ensure comparability of benchmark rental rates with the rental rates of VHA facilities, we made two adjustments to the benchmark rental rates (see Figure 8-4):

- **Rentable square feet (RSF) to net usable square feet (NUSF).** While benchmark rates in the CoStar database are denominated in RSF, the VHA database used NUSF. These are both standard approaches that measure different amounts of space in a given building, with RSF typically approximately 15 percent higher than NUSF in VHA clinical facilities. Given the benchmark rents were addressing RSF, we applied this 15 percent factor to be comparable to the smaller NUSF numbers used in the VHA database.

- **Office space to medical space.** Second, we adjusted the benchmark rental rates– to account for the increased cost to rent clinical spaces. Clinical space carries specific physical requirements to meet medical needs, such as room configuration (including private patient bathrooms), wide doorways for access, higher structural requirements, specialized ventilation, and sound control for improved patient experience and privacy. While we attempted to find comparable clinical spaces in the benchmark database, this was not always possible. VA's Office of Construction and Facilities Management (CFM) and Office of Asset Enterprise Management (OAEM) suggested a 35 percent adjustment to account for the premium paid to rent clinical space. This number was validated with a set of outside experts. As such, our benchmark rates were inflated by 35 percent to compare to VHA clinical spaces.

Figure 8-4. Lease Rate Benchmarking Results


1 The sample included all outpatient, veteran center, and administrative leases associated with a representative sample of 24 VA medical centers which represent the VAMC system as a whole across critical facility demographic and performance outcome metrics. 251 leased VHA facilities were included

2 CoStar database was used to benchmark current VHA lease rates on a square footage basis, using comparable office or medical buildings within 2-5 miles of the leased facility and classified as 2-3 star buildings

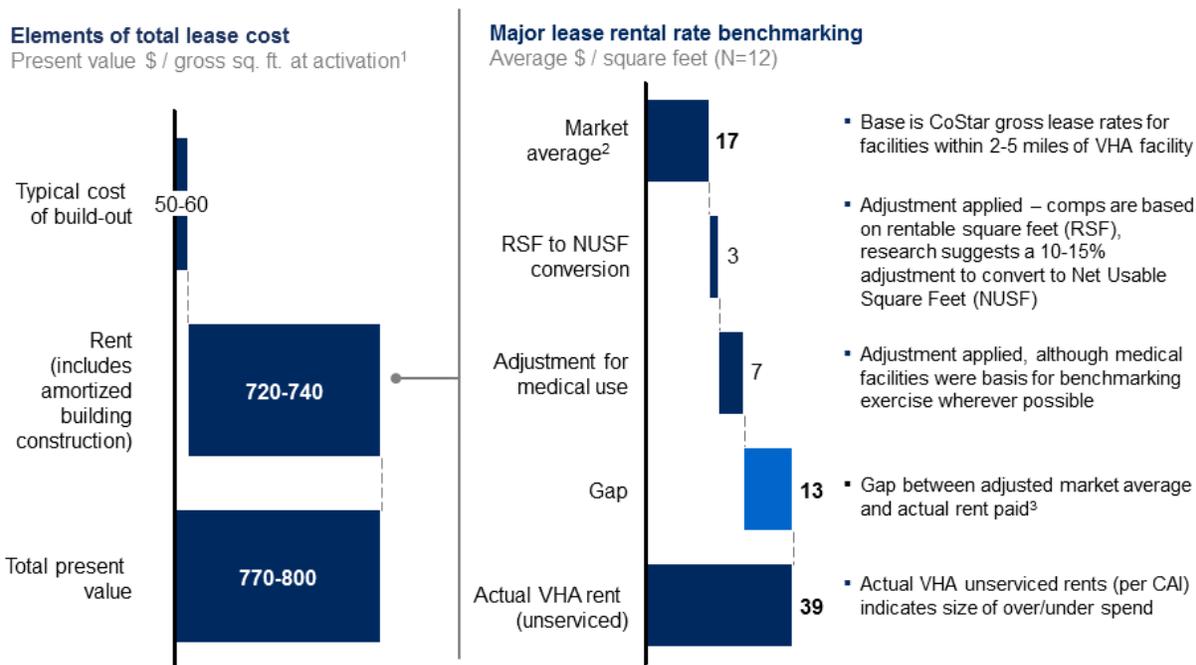
3 Properties shared with other tenants who are paying lower rents – the only premium VA should be paying are for internal fit-outs (sinks, shelves, etc.)

SOURCE: VA Rental Rate Explanation for GREX; CoStar Database, CBRE Global Office Occupier Guide

After applying the necessary adjustments we found that for the smaller and simpler facility types (minor and mid-sized outpatient clinics, administrative space, and Veteran centers) VHA rates were, on average, very close to benchmark market rates. While there are some gaps ranging from VHA paying approximately $1 per square foot less than market rates for minor outpatient clinics to $2 per square foot more than market rates for administrative facilities, these differences are within expected variability. This appears to demonstrate that VHA's approach of ensuring market competition for such leases is working well in achieving market rates for facilities that do not require significant structural customization to meet VHA-specific design standards.

Some mid-sized outpatient facilities, and nearly all major outpatient facilities, however, were built specifically to meet the design specifications of VHA. In these "build-to-suit" leases, VHA contracted a developer to design and build a customized facility, which was then leased to VHA. According to our benchmarking (see Figure 8-5), there is a gap between the VHA's rates and market comparables, which may be attributable to two characteristics unique to VHA. First, and most importantly, VHA facilities are subject to more stringent design specifications than benchmarked facilities (for example, resilience and structural security requirements, as well as environmental standards, discussed in Section 6.2.5.1). Given that the larger premiums over market rates appear with mid-sized leases – some of which are build-to-suit, and are highest for

the major leases – it is likely that these unique requirements for major outpatient clinics are a significant factor in the higher rental costs. Second, VA is constrained in the geographies and timing of lease activations; as a result, it may have less flexibility than private sector competitors and may be in a disadvantageous negotiating position.

Figure 8-5. Major Lease Rate Benchmarking Results


1 Average cost, derived from 28 major lease prospectuses included in the VA 2014 Budget. Using OMB A94 20-year discount rate of 3.1% and inflation rate of 2% for 20 year term and including projected build-out costs incurred at year of activation
2 CoStar database was used to benchmark current VHA lease rates on a square footage basis, using comparable office or medical buildings within 2-5 miles of the leased facility
3 For the 12 facilities, the unexplained gap clustered around 40% with 2 outliers where the VHA rate was below benchmark (Jamaica Plain [Boston, MA] and San Jose, PR)

8.2.1.2   Lease Timelines Preclude VHA From Benefitting From the Speed and Flexibility Leasing Typically Provides, Often Taking Over Twice as Long as Private Sector Benchmarks

One of the primary values of a leasing program is its ability to respond to changing facility demands faster than owned properties. However the time it takes to execute a lease often precludes VHA from effectively realizing this flexibility. Including the time required for planning, approvals, budgetary authorizations, project development, construction, and activation, CFM's guidance for the total time required to secure a major lease (see below for detailed descriptions of lease types) is approximately six to eight years (Figure 8-6). In reality, major leases that have been completed are taking almost nine years.[53] These lengthy timeframes are

---

[53] Data on major leases provided by Real Property Services (CFM) in May 2015.

in contrast with other public sector agencies that often complete major leases in significantly less time and private sector expectations of build-to-suit leases that often take less than three years.[54] While minor leases are much faster than major leases, largely because of the more limited approvals required, delays have been introduced as a result of the GSA delegation of authority to VHA being rescinded, and the resulting addition of required approvals for VHA leases. In an encouraging sign, the most recent major leases have been completed closer to the guideline of 65 months.

Figure 8-6. Major Lease Timelines, VA and Private Sector

Time associated with each major lease stage
Months

These timelines have three main ramifications. First, and most importantly, access to care for Veterans is negatively impacted. The duration and unpredictability of the leasing process makes it difficult for VHA to adapt the scale and location of capacity to changing Veteran demographics, and – as some leases expire before others are activated – can result in gaps in the availability of care. Second, this extension of the lease process creates substantial work for employees across VA, increasing internal capacity needs and costs, and diverting resources away from other activities. For example, station and contracting staff must constantly monitor and shepherd a lease throughout a multi-year approval and contracting process, creating

---

[54] Expert interviews and experience of leasing brokerage firms that work extensively with the federal government.

capacity constraints. Third, an extended leasing process increases the likelihood and volume of requests to modify the requirements of a leased property, particularly for major leases, increasing cost of the project and creating a reinforcing cycle of delays. This is particularly consequential for the high-cost, build-to-suit leases.

8.2.1.3 VHA Lease Contract Terms Are More Tenant-Favorable Than Industry Standards, but These Terms Are Often not Well Enforced

In addition to cost benchmarking, we conducted a detailed review of the contractual terms typically included in VHA leases. Based on a sample of leases selected to represent different facility types and lease values, we observed a trend of tenant-favorable provisions that are often not found in standard leases of comparable facilities (Leases for full contract analysis, OPL, 2015). Specific VHA terms that are unusually favorable are as follows:

- Broad rights to assign or sublease to another party, often with no restrictions
- No specified tenant insurance requirements
- Minimal to no restrictions on alterations to be performed by tenant during the term
- No obligations to restore the property to its original condition
- No specified penalties for tenant defaults, including late charges or interest
- Tenant receives a discount on operating expenses if tenant vacates a portion of the space

There were two areas where typical provisions were potentially unfavorable to VA:

- No right to audit landlord's books regarding operating expenses
- Renewal rights (for option years) are pre-specified; while this provides cost certainty for the tenant, it limits the ability to capture any favorable changes in market rates

On the whole, it appears that VA negotiates favorable contract terms, and for the most part, does so while paying fair market prices. However, while contracts may include favorable terms, these contracts are often not enforced (VACO/VISN/NCO/VAMC Interviews, 2015). While facility management staff generally indicated that the vast majority of lessors fulfilled their contractual obligations and provided excellent space and service to VHA, interviewees indicated numerous instances in which a lessor was not fulfilling perceived obligations in regards to maintenance activities. In no cases, however, did interviewees indicate that the contractually provided recourse was taken, and both contract officers and station staff indicated a reluctance or lack of capacity to actively enforce contracts.

8.2.2 Process

8.2.2.1 Overview of the Leasing Process

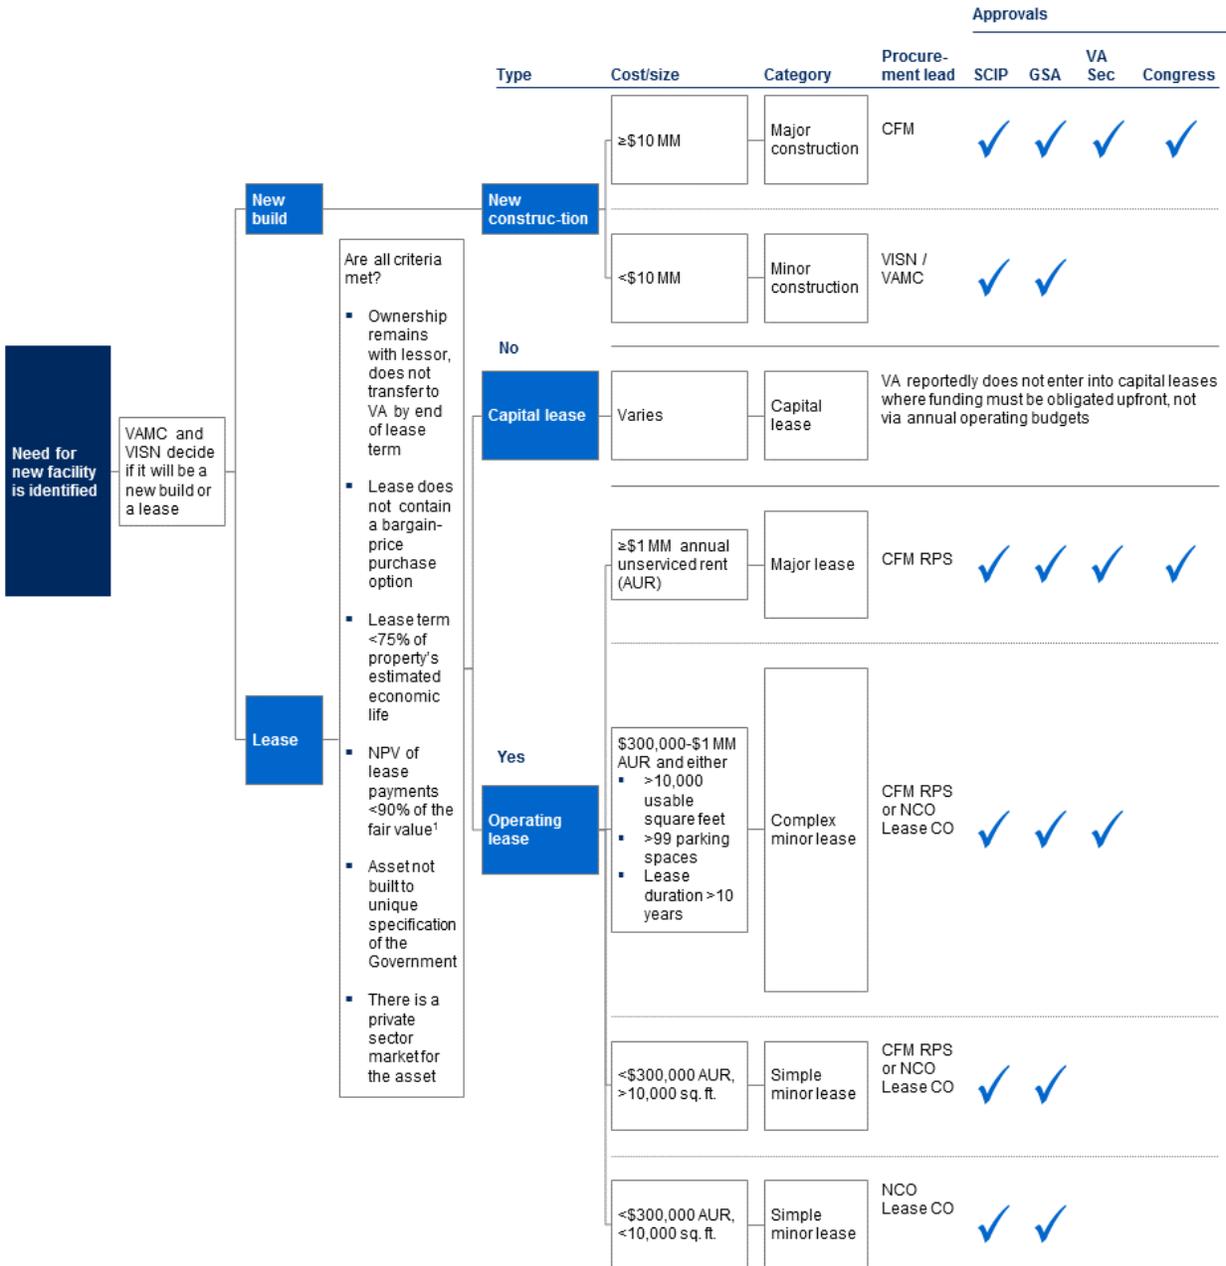
We have conducted a high-level review of the processes supporting the leasing program, which include planning and funding; procurement, construction, and activation; and ongoing management and renewal. The specific process steps a given lease goes through depend on the category into which the lease falls. The criteria that determine the lease category include

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

161

square footage, cost, duration of the lease contract, and other criteria such as parking spaces and portion of the building's value that is covered by the lease contract (Figure 8-7).

Figure 8-7. Lease Types

Our review of VHA's leasing program has looked at multiple lease types


1 As scored by RPS at key project milestones

SOURCE: OMB Circular A-11 Appendix B; Staff Interviews; VA Handbooks and Directives

Broadly, there are four categories of leases, each of which follow different processes and necessitate different levels of approvals:

- **Capital leases** involve the transfer of ownership, a net present value (NPV) of lease payments greater than 90 percent of the asset's value, a purchase option, the construction of a facility that cannot be utilized by another lessee, or an ownership shift. These leases require upfront obligation of all lease costs, and are thus very rarely used for VHA facilities.

- **Major leases** do not meet the capital lease criteria, but are above $1 million in annual unserviced rent. As with leases of all sizes, stations must formally submit these leases for approval through the Strategic Capital Investment Planning process, as well as receive approval from GSA, the VA Secretary, and Congress. Once approvals are secured, major lease procurement and management is handled centrally by the Real Property Services group within the Office of Construction and Facilities Management. According to the Capital Asset Inventory database VHA has 63 major leases representing 37 percent of total annual rent obligations ($154 million).

- **Complex minor leases**, which are above 10,000 square feet, have greater than 99 parking spaces, or include a contract duration of more than 10 years, may be handled centrally by Real Property Services or by the Office of Procurement and Logistics' Network Contracting Offices (NCOs) at the discretion of the VAMC Director. However, Real Property Services has submitted a formal proposal to delegate the procurement and management of these leases to the NCOs and local medical centers. VHA has 361 leases that fall into this category, representing 32 percent of annual rent obligations ($135 million).

- **Simple minor leases**, which are below $300,000 annual unserviced rent and less than 10,000 square feet are procured and managed by the Network Contracting Offices and local medical centers. These represent the large numeric majority of VHA leases, covering 1,230 facilities and 31 percent of annual rent obligations ($132 million).

Regardless of the lease type, there are 8 stages in the end-to-end leasing process, with the following owners for each stage:

1. Planning and requirement identification – station

2. Strategic capital investment planning – VISN, OAEM and VAMCs

3. Approvals from VACO and GSA – OCAMES and OAEM

4. Lease project development – contracting officer (either NCO or CFM RPS)

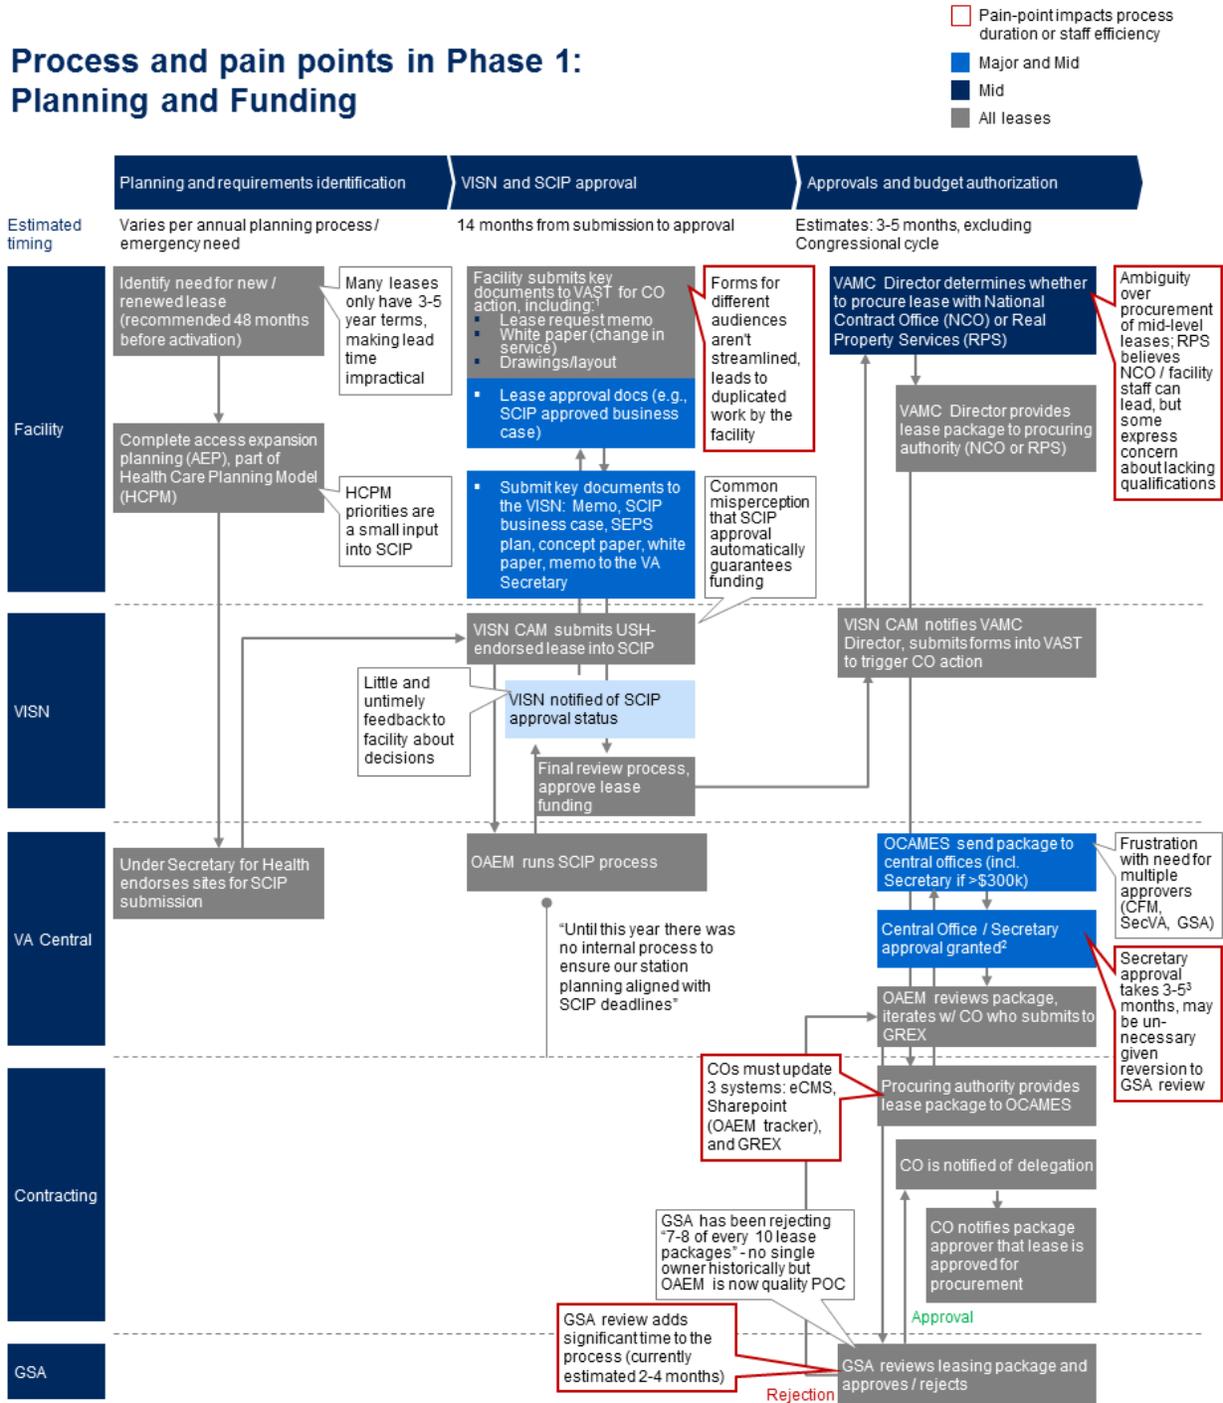
5. Construction tenant improvement – VAMCs and contracting officer

6. Activation – contracting officer and station

7. Management – contracting officer and CORs

8. Renewal – contracting officer and station

The figures below map out the end-to-end process required to complete major and minor leases, identifying challenges that VA staff described at different stages of the process.

Figure 8-8. Process and Pain Points in Phase 1


1 Major leases require additional forms: OMB 300, lease prospectus, SEPS plan
2 Major leases require Congressional action and are included in the budget request for authorization
3 Based on May 29th document "Request for Approval to Rescind and Replace the Existing Secretarial Approval Requirement for Mid-Level Lease Procurement (VAIQ 7511099), SECVA approval requirement was removed for lease packages under $1 million

Figure 8-9. Process and Pain Points in Phase 2

Process and pain points in Phase 2:
Procurement, Construction, and Activation

Legend:
- Pain-point impacts process duration or staff efficiency (red outline)
- All leases (gray)

Project development: Solicitation[1] / Procurement / Design | Construction | Activation

Estimated timing: 14 - 17 months | 12 months | 8 months | 12 - 24 months | 6 months

Facility
An extended approvals process increases likelihood that VAMC / VISN needs will have changed, requiring significant re-design

Equipment / furniture installation
Clinic opens
Inspection and building activation

VISN
"RPS staff are much more skilled than we (NCO leasing COs) are, and they get brokers – we aren't sufficiently trained to do this and need assistance"

Obligate funds for lump-sum build-out and first year's annual rent (future budget through annual general purpose funds)

Post-award kickoff and user group meetings

Design approval (at 75% and 95%)

"Sometimes a 'completed' building still has a punch list of 15,000 items that fall to facility staff to complete"

VA Central
IDIQ task orders for real estate broker and A/E

Advertise and conduct market survey

Develop conceptual design (to 35%)

Develop solicitation document

Conduct site due diligence

Hold pre-bid conference and clarify requirements

Receive, evaluate, negotiate offers

Award lease and submit congressional notification

Significant variance in time due to complexity and staffing constraints

Project justification and SCIP approval documents often lack robust planning, requiring significant design work and longer solicitation timeframes

"Sometimes we (COs) get pressure to approve a bid even if the facility is low quality – then we're expected to manage it"

"Despite design templates, the VAMC Director has final say – we should remember the customer is all Veterans and we can't customize everything for each MC"

Activation funds are expensive and not line-item budgeted, causing a significant hit to the VISN budget if requests are not fully funded (VISN needs to complement funding)

Contracting
"Political considerations can influence site selection"

"We (NCO leasing COs) aren't located near sites and don't have travel budgets to do necessary diligence – we should be affiliated with a station"

Contract for all equipment required for activation

External
Competition requirements may a require solicitation re-issue if insufficient bids

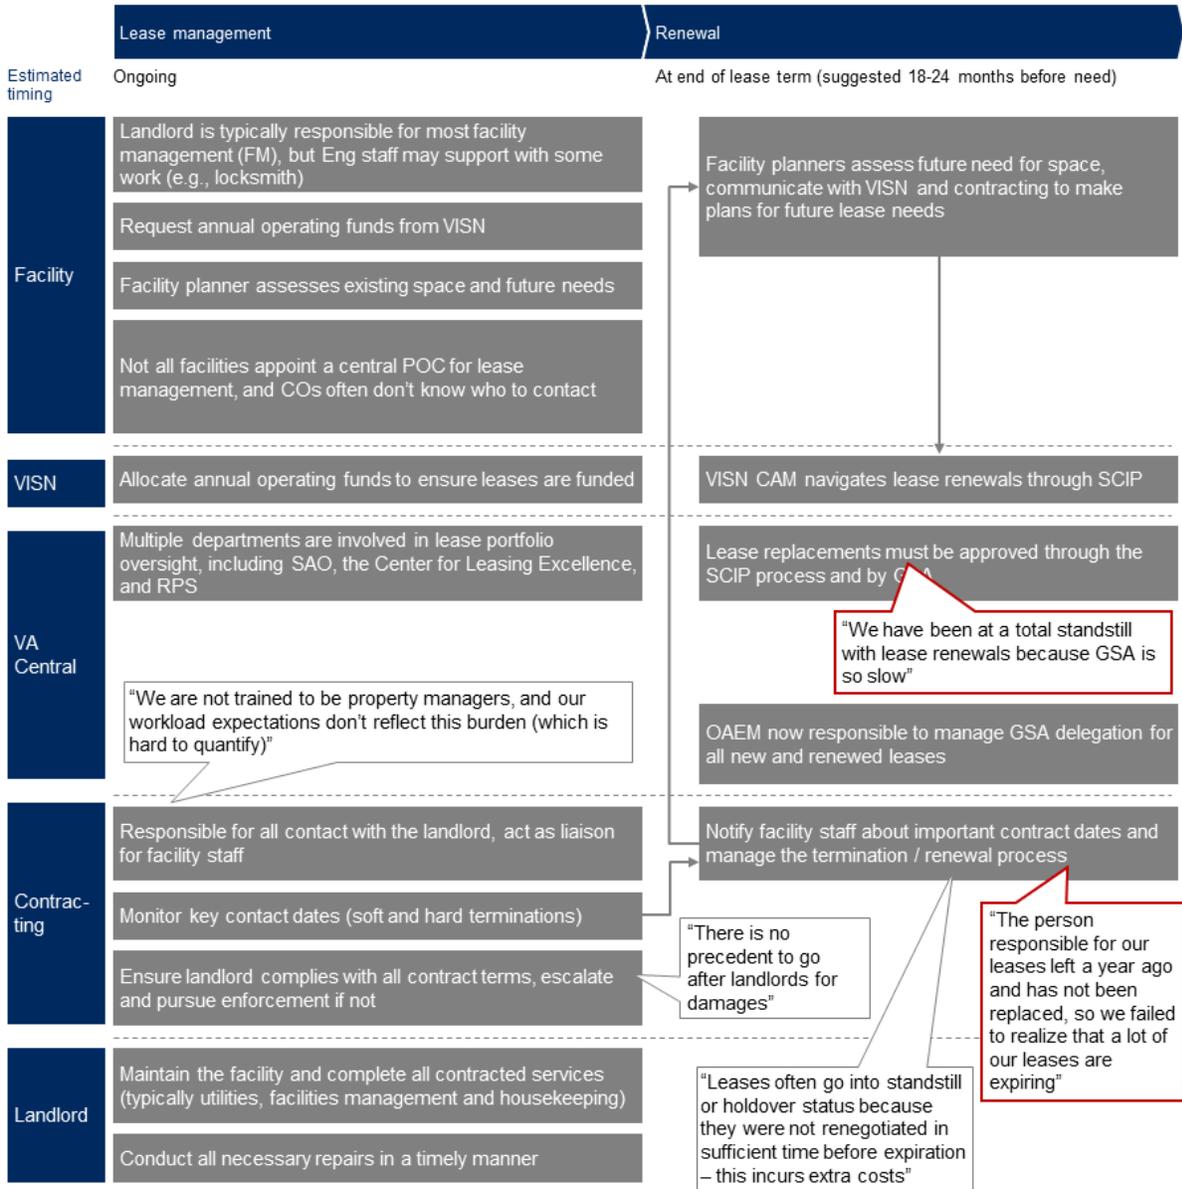
Developers submit bids

Site/construction preparation

Construction

1 VAMC, VISN, VACO (RPS) and NCO may all be involved in solicitation depending on lease size and solicitation stage

---

Figure 8-10. Process and Pain Points in Phase 3


8.2.2.2   Each Step of the Leasing Process Contains Pain Points Which Either Prolong the Process or Lead to Suboptimal Outcomes for VHA

Based on our interviews with the multiple stakeholders involved in the leasing process, we have identified issues within each step of the leasing process that either prolong the time required to procure and activate leased facilities or lead to suboptimal outcomes for VHA. These are described below.

1. **Planning process must begin 48 months in advance of desired activation date.**
   According to current OCAMES guidance, facilities are advised to start the planning process for leased facilities 48 months before the desired activation date. This extensive lead time reduces the VHA's ability to nimbly respond to changes in Veteran needs and is unrealistic given the usual lengthy leasing process. The result is leases that extend beyond their contracted duration and can lead to gaps in Veteran accessibility.

2. **SCIP approval is an unnecessary and redundant approval above Access Expansion Plan (AEP) facilitated by Health Care Planning Model.**
   Interviewees described a disconnect between the Health Care Planning Model process required to secure Under Secretary for Health approval to pursue a lease and the SCIP process. The capital planning section of this report elaborates on these concerns. Station staff also explained that while all leases must be approved in the annual SCIP process, approval is not accompanied with funding which must still be allocated at the VISN level. This can lead to misunderstandings whereby a lease is "approved," but activation is still dependent on local resourcing and may be an unnecessary approval step that delays leases without significant added value.

3. **Rescindment of GSA leasing delegation has added several months to leasing process.**
   In 2014, GSA rescinded the delegation of full leasing authority it had previously granted to VHA, and now requires VHA to gain GSA approval for all leases, regardless of size. While it is beyond the scope of this assessment to evaluate the justification for this step, it is clear that this additional approval is increasing the time it takes to process a lease. Initial estimates were that it would add two to four months to the approvals process, but the impact of the policy change was compounded because the lease approval process was disrupted for months, creating a significant backlog. Furthermore GSA initially rejected the large majority of lease packages submitted for review due to their perceived incompleteness, adding even more time to the process.

   In response to these changes, the Office of Asset Enterprise Management (OAEM) has created a new process to improve the quality of lease packages submitted into GREX (the system by which the GSA receives documents from other agencies), as well as track how long it takes for leases to progress throughout the process. Given the historical absence of data and insight into how long the leasing process takes, this is a positive step. Furthermore, there is a weekly coordinating call between the various entities (GSA, Construction and Facilities Management Real Property Services, VHA Center for Leasing Excellence (CLE), VHA Office of Capital Asset Management and Engineering Support (OCAMES), and the VA General Counsel) that is credited with improving the process and

will hopefully increase GSA's package approval rate and decrease the time required for approvals.

An additional challenge is that for leases with annual unserviced rent greater than $300,000, approval is also required by the Secretary. OCAMES is responsible for this process and acts as the liaison between VHA facilities / VISNs and the other departments. Interviewees suggested this approval can take an additional three to five months, and were not fully clear as to the content and purpose of this review step – particularly given GSA's recently rescinded delegation of authority. Near the conclusion of this assessment, an internal directive "Request for Approval to Rescind and Replace the Existing Secretarial Approval Requirement for Mid-Level Lease Procurement (VAIQ 7511099)" was issued which removed the SECVA approval requirement for lease packages under $1 million which could help to improve lease timing.

4. **Multiple handoffs and limited training hinder lease project development.**
   This phase is driven by the Contracting Officer (whether in an NCO or Real Property Services) and includes sub-phases of solicitation development, procurement, and design. There are a number of challenges with this stage of the leasing process:

   o **Interactions between the station and contracting.** Both station staff and Network Contract Office staff indicated that their interactions often led to significant delays in lease approvals. Station staff indicated a lack of clarity as to the specific requirements of the contracting process, and a lack of visibility into what was driving the time taken by contracting to complete lease procurement processes. Contract Officers indicated frequently attributed delays to incomplete lease packages or non-responsiveness on the part of some local station functions (for example, finance, engineering, primary care) in gathering information critical to progressing a lease. However, there were some facilities for which these interactions were not a challenge. These exceptions – where interviewees felt the interaction between the station and contracting was effective – were often in situations where there was early involvement of Contract Officers, facility management staff, accounting, and other affected stakeholders and ongoing interaction in a cross-functional team throughout the lifetime of a lease.

   o **Lack of pre-qualified brokers.** The solicitation process is longer than peers as VHA does not always maintain a list of prequalified brokers or developers to help secure leases. Using pre-qualified lease brokers is an effective way for many organizations with large facilities footprints to accelerate their leasing processes while ensuring similar or better outcomes in terms of cost and contract terms. VHA's approach to typically delivering these functions in-house may forfeit the benefits of these accelerated timeframes.

   o **Design requirements.** In the past, most build-to-suit clinics have been designed based on unique requirements for each new clinic, significantly increasing the time and costs involved in the design phase. Further, stations often adapt their design requirements after a lease is approved. Real Property Services has recently developed a limited set of design templates for leased facilities. These three templates meet different profiles of needs for outpatient facilities and should reduce

the time to complete a lease solicitation, as well as the time and cost required to build and activate the leased facility. Given the recent change, there is insufficient information on the results of this effort, but this, and related efforts, may operate to simplify the pre-solicitation phase of build-to-suit leases.

○ **External involvement.** There are also real or perceived external constraints that affect the timeline with which leases are processed. These constraints affect the leasing process in two ways. First, they influence the time it takes to select a site for leased facilities. Second, they may influence the final location selected for a leased facility. Pressure from various stakeholders to locate a new leased facility in a particular geography may extend the process of market research while multiple locations are considered that would not be considered without such external involvement. While these external pressures certainly do not account for the entirety - or even the majority - of delays in the leasing process, interviewees unanimously indicated that they did indeed affect the time taken in the initial market research and related early stages of the leasing process. In addition, documents shared with the assessors during the course of this assessment explicitly indicated higher levels of approvals required for leases that were relocated from one Congressional district to another. These increased approval requirements by definition extend the time required to process a lease and increase the likelihood that leased facilities stay within Congressional districts. For example some internal guidelines required additional levels of notification and approval by a Deputy Undersecretary if VHA proposed to move a lease across Congressional districts. This external involvement can lead to delays in providing facilities for Veteran care (VACO/VISN/VAMC Interviews, 2015).

5. **Post-design changes, construction of leasing is typically effective and straightforward.** For major leases that require construction, once the developer is selected and designs are complete, the construction process is not typically a major driver of schedule delays. It is critical to have an active CO and COR to overlook the construction process and ensure alignment with VA quality standards, however lease contracts generally incentivize the developer and future lessor to complete the project on time and within quality standards.

6. **Often problems aligning timing of activation funding to project completion.** While facility activation did not typically drive major cost or time overruns, funding for lease activation is often an issue. Staff report that it is unclear whether these funds must be provided by the VISN or the Medical Center, yet the costs can be quite significant – especially for major leases. Furthermore, activation funds must be used within the year specified in their appropriation – and given the uncertainty associated with lease timelines – it is difficult for VISNs and facilities to plan around when to allocate funding.

7. **Management of leases adds significant additional workload to leasing COs.** Leasing is fundamentally different from other service contracts in that it requires relatively intensive ongoing management by the CO assigned to the lease. This individual is the only person authorized to interact with the lessor, and must act as an

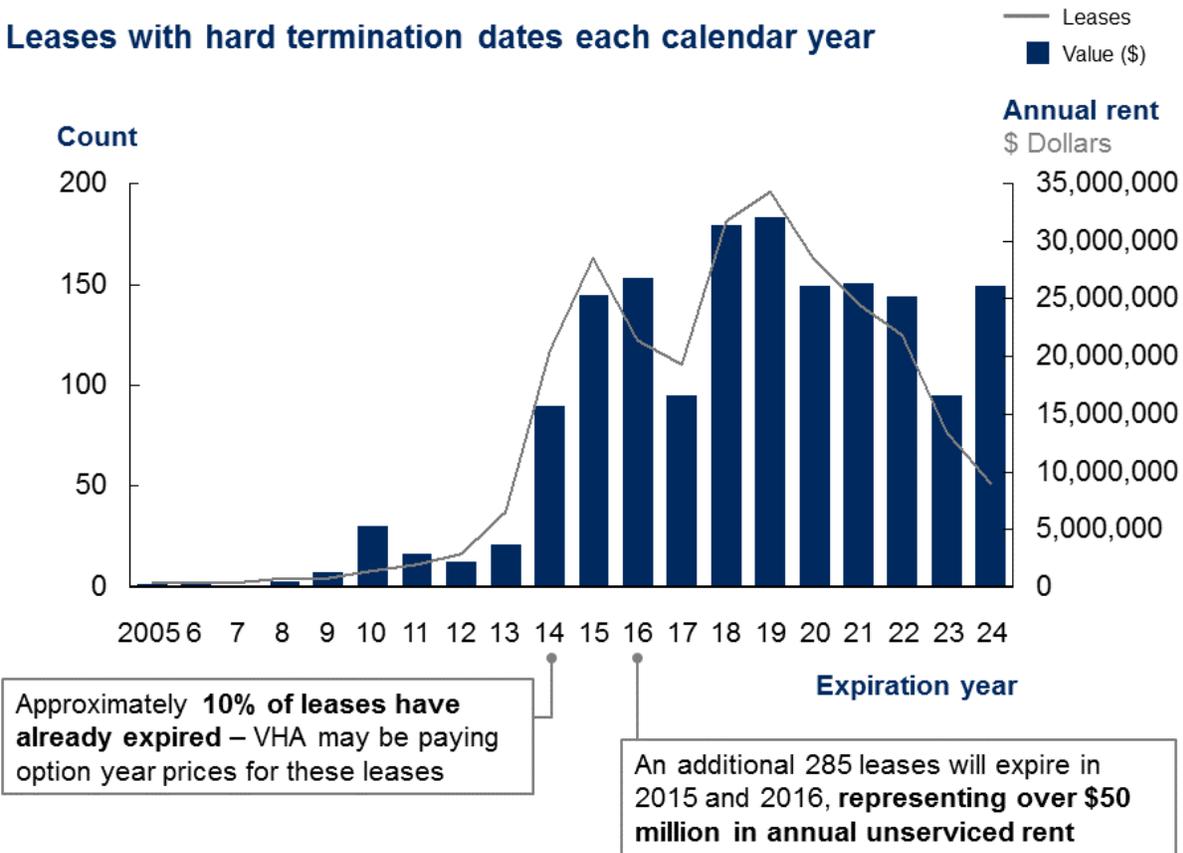
intermediary between the station staff who hears about facility issues from front-line staff and patients and the lessor. Given the significant demands on COs' time, it can be a challenge to balance these demands with other ongoing commitments, particularly if the CO is responsible for other lease procurements underway. Stations described numerous examples of lessors violating their contract service level agreements with no recourse because of a lack of willingness or ability on the part of COs to pursue enforcement action.

8. **The lease replacement process is unreliable, causing extensions of leases beyond the life of the contract and potentially increasing costs.**
   The lease replacement process is unreliable, causing extensions of leases beyond the life of the contract and increasing costs. Given the fragmented accountability for leases, there is often insufficient tracking of leases requiring renewal or replacement. This can lead to lapsed lease contracts, or leases that require urgent processing to ensure the leased facility can continue to be occupied. When a lease expires, VHA typically can continue to occupy the space but, beyond option years, must renegotiate the lease terms for this extension. Given the short timeframes involved, VHA is often in a weak negotiating position at this point, creating risk of rental rate escalation. According to the Capital Asset Inventory database, 10 percent of VHA leases have already expired and an additional 10 percent of the portfolio representing $50 million in annual rent will expire by the end of 2016. While there were insufficient data to quantify the costs of late renewal of lease contracts, this puts likely VHA in a position of vulnerability vis-à-vis lease renewals.

Figure 8-11. Lease Termination Dates

Leases with hard termination dates each calendar year

Approximately **10% of leases have already expired** – VHA may be paying option year prices for these leases

An additional 285 leases will expire in 2015 and 2016, **representing over $50 million in annual unserviced rent**


Source: Capital Asset Inventory database   82

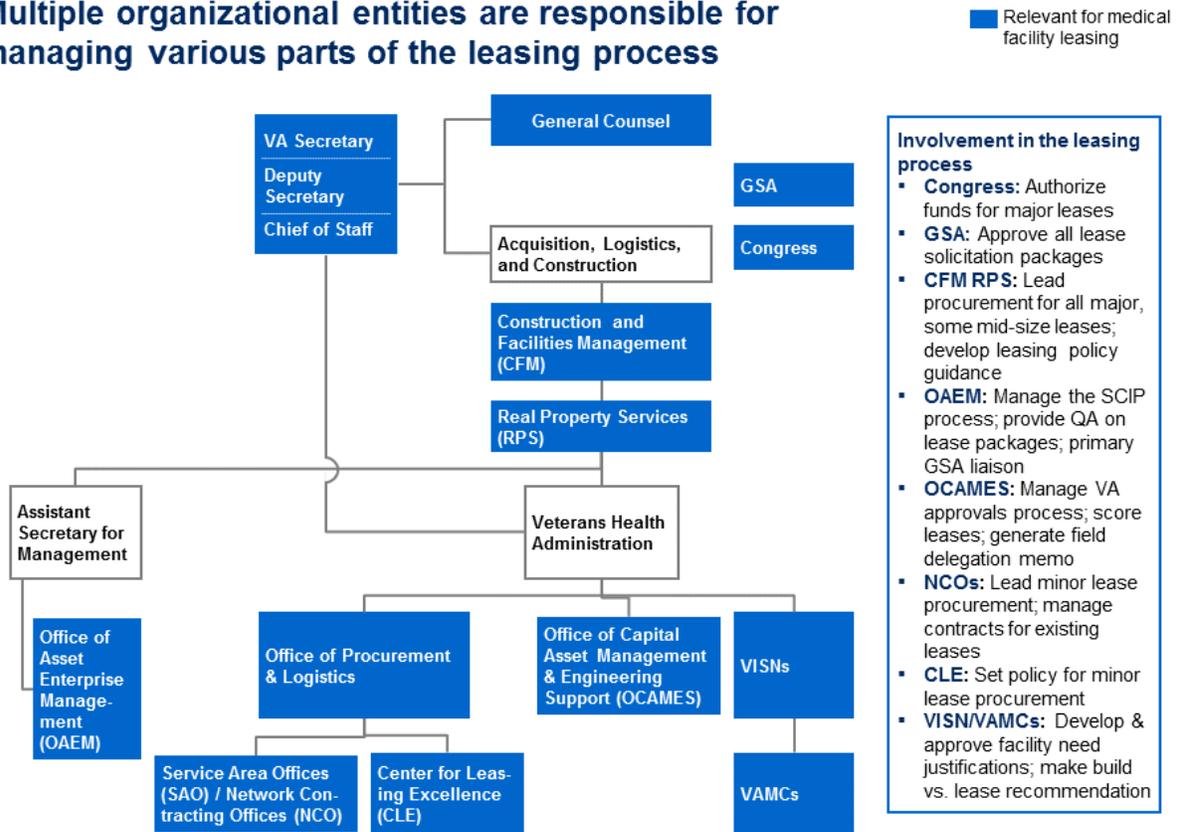
8.2.3   People

8.2.3.1   There Is a Lack of Single-Point Accountability for Specific Leases and Leasing Programs

Figure 8-12 shows a number of entities involved in the leasing process. While most entities are generally clear about their role, there is no end-to-end accountability for a given lease, and it is often unclear who is ultimately accountable for a lease at any point in time. For example, no one individual or entity is held accountable for the performance of a lessor throughout the lifetime of a lease. As described above, we have observed multiple instances of lessors underperforming on important tasks such as maintenance without any recourse. This is in part due to a gap in accountability between the local station's obligation to ensure a well-maintained facility and the CO's exclusive ability to enforce the contract with the lessor.

Confusion in accountability also exists throughout the procurement process. For example, from the perspective of VAMC staff, it is often unclear during lease procurement which entity or individual should be actively seeking updates and moving the approval process along. Some VISNs have adopted effective processes, such as weekly review meetings with mandatory attendance for all critical staff from the VISN, VAMC, and NCO, or identifying a single point

person at the VISN responsible for all VAMC leases who is the clear point person for the NCO Contracting Officer. When adopted, these efforts result in increased accountability and visibility into the process.

Figure 8-12. Organizational Entities Responsible for Leasing


SOURCE: Staff Interviews; VA information

8.2.3.2 In Some Parts of the Organization Responsible for Procuring and Managing Leases, There Are Insufficient Specialized Leasing Capabilities

Lease procurement and contracting processes are more complicated than many other forms of procurement, require a specialized skill set, and require ongoing contract management and interactions with the lessor, even after the contract is awarded. However, most COs handling leases do not have a specific background in leases and receive minimal specialized training, nor do they consistently avail themselves of support via the use of specialized real estate brokers. In addition, they reportedly have a very high workload given the burden to actively procure new and renew leases while fulfilling a property management role for existing leases. This, combined with the fact that they are typically allocated a number of other general procurement tasks in addition to their leasing portfolio, has led multiple contracting officers we interviewed to describe conditions of low morale and a desire amongst many contracting officers to focus

on non-leasing related contracting. This lack of deep leasing capabilities likely results in unfavorable negotiations, contract terms, and contract enforcement.

8.2.3.3 Capacity of Contracting Staff Is Inconsistent and Unplanned

VHA has limited central visibility into the demand and capacity balance across Service Area Offices. While some NCOs report adequate staffing to meet leasing procurement and contracting needs, others report extreme constraints (VACO/NCO Interviews, 2015). Many interviewees with contracting experience from other agencies reported that VHA COs responsible for leasing (LCO) had multiple times the workload of their counterparts. While VA did provide data about LCO workloads (for example, the number of lease contracts being actively procured and actively managed) to the best of their ability, the data are difficult to interpret because there is variance in how network contracting offices manage leases. For example, in one NCO all leases in the system may technically be assigned to one supervisor but multiple contract specialists are doing the work to procure and manage each lease. In another NCO, leases may be assigned in the system only to the contract officer actually doing the day-to-day work. These discrepancies are reflected in the data – some lease contract officers only have one lease assigned to their name, while others have as many as 64 leases. Setting aside these data constraints, the average number of leases was just over 14 per contract officer. While it is difficult to benchmark the optimal number of leases each LCO should manage, and that target would naturally vary given the size and complexity of a given lease, interviews with experts from the GSA and with experience in other contracting organizations suggested that more than approximately 10 leases per LCO would be challenging to effectively manage.

8.2.3.4 Performance Management Processes Are Insufficiently Transparent and Rigorous

Best practice approaches to performance management create clear transparency into performance (for example, time to complete leases); engage in regular and rigorous performance dialogues; provide rewards and consequences for performance; and create opportunities for improvement. VHA's leasing program does not meet these standards (VACO/NCO Interviews, 2015). For example, COs are not measured rigorously on their delivery of advantageous lease terms and contracts within specified timelines. There is little regular review of whether the leasing program is effectively achieving objectives, and virtually no regular rhythm of conversations between supervisors and staff about staff performance. These themes are explored more broadly in Assessment L (VHA OHI, 2015; CFM OHI, 2015).

8.2.4 Systems

8.2.4.1 Fragmented Systems Cause Rework and Lead to Delays

VHA has no integrated system to manage the entire leasing process. The fragmentation of systems (Figure 8-13) creates significant rework for staff and does not provide comprehensive tracking or measurement of the leasing program and its outcomes (VACO/VISN/VAMC Interviews, 2015). For example, station staff must submit information about proposed leases as part of the SCIP system, then COs resubmit this information in slightly different formats as part

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

173

of the GREX system, then again to eCMS for contract management, all while updating the OAEM lease tracker on SharePoint to enable oversight into where each lease is in the procurement process. While each of these systems serves an important need, the lack of cross-system integration causes significant additional work at each stage of the leasing process. The resulting lack of availability of integrated data also prevents sophisticated lease management in areas such as balancing workload, enforcing contracts, and enabling continuous improvement in rates and lease terms.

Figure 8-13. Systems Pertaining to Leasing

8.3 Recommendations for Consideration

Given the extensive timelines involved, VHA's leasing program is failing to deliver on its core objective of providing VHA the flexibility to rapidly adjust its facility footprint to meet Veteran needs.

8.3.1   Recommendations to Accelerate Timelines

8.3.1.1   Dramatically Reduce Approvals and Associated Timelines for Leases

- **Remove SCIP from critical path for lease approvals.** VHA could remove the requirement to wait for SCIP to proceed with a lease, reducing the time required to secure a new leased facility. Leases should still be entered into SCIP to align with other space change measures and record progress towards closing identified gaps, but the lease process should not be delayed by the SCIP process. We believe this would maintain adequate oversight while accelerating lease approvals.

- **Attempt to rationalize all approvals to the minimum possible.** The leasing program is generally receiving market rates for smaller and mid-sized facilities, but is significantly slowed down by the required approvals. Congress and VHA should reconsider the required approvals (for example, GSA, Secretary), particularly for smaller and mid-sized leases.

- **Create clear performance management and tracking around approval timelines.** For those approvals that remain, there should be consistent and transparent tracking of the approval times for each lease. This tracking should include the time from when lease was first submitted to an entity for approval to the time when that approval was given, while noting any requirements to return a proposal to its submitter because of incompleteness of the submitted package. Where delays consistently occur, remedial action should be taken.

- **Ensure clear upfront design requirements, and standardize these requirements where possible to reduce pre-solicitation delays for major leases.** Initial steps to create standard major clinic designs are commendable, and VHA should continue to work to reduce delays in the pre-solicitation phase due to having to redesign clinics, and extensive customization of designs for each new clinic. To the extent possible, these templates should be used with only minimal and modular customization. VHA should also pursue steps similar to those indicated in the design and construction section of this report to ensure final designs are agreed early, and changes to these designs follow a strict and transparent stage gate process.

8.3.1.2   Manage Stakeholder Involvement in Leasing Decisions

Interviews suggest external influences affect the time it takes to execute a lease, given the often public debates around site selection. When interviewees with knowledge of major lease timelines were asked a general question about the factors influencing delays in leases, 100 percent indicated that external involvement had contributed to these delays. They described the nature of these delays as typically due to pressure to consider additional sites to locate a new leased facility, expanding the time taken in the initial market research and related early stages of the leasing process. Documents shared with the assessors during the course of this assessment indicated higher levels of approvals required for leases that were relocated from one Congressional district to another.

8.3.2 Recommendations to Address Lease Cost Outcomes and Overall Efficiency of the Leasing Process

8.3.2.1 Rigorously Review Design Requirements for Major Leases to Reduce Lifetime Costs

Major leases are likely above market benchmark prices largely due to the unique design requirements of VHA and the federal government more broadly. We recommend including leased facility design requirements as part of the review of VHA design requirements to evaluate opportunities for streamlining or standardizing, as recommended in the design and construction section.

Rationalize existing leasing policy and guidance, establishing clear processes and decision-rights for each category of leases. Existing policy guidance about leasing is confusing, if not contradictory, and all stakeholders involved in the leasing process would benefit from clearly delineated processes, roles, and responsibilities. VA should update guidance to reflect the GSA's current involvement and authority, with a clear description of the end-to-end process that would be followed to take the idea of a leased facility through to building activation. This should cover all steps (for example, budget authorization) and actors (for example, the multiple departments and offices within VHA, VA and GSA), and clearly explain where VISNs and VAMCs retain discretion over how to pursue lease procurement. Lease categories should be simplified, with clear rules for what qualifies as a major or minor lease and resolution around who handles complex minor leases – Real Property Services or the Network Contracting Offices.

8.3.2.2 Improve the Capabilities of Leasing Contract Officers

Leasing should be established as a separate service line within the NCOs, to reflect the degree of specialization required to complete the task. VHA should make a concerted effort to recruit experienced leasing contract specialists, while continuing efforts to develop and roll-out a robust training program to ensure COs who lack experience or expertise can develop a sufficient skillset to complete their responsibilities. LCOs should have access to a centralized support team available to provide assistance with difficult or complicated lease procurement. Furthermore, NCOs should be enabled to procure external brokers to help with more challenging procurements.

8.3.2.3 Consolidate Responsibility for Reviewing Lease Packages and Liaising With all Approvers Into a Single Office

Currently OAEM, OCAMES, and the CLE are all involved in various stages of the review and approvals process. This expertise should be consolidated into a single office, which would be made responsible for active oversight and management of the leased facility portfolio, proactively identifying leases that are soon to expire, identifying any issues with the leasing program, and ensuring continuous improvement.

8.3.2.4 Explore Options to Integrate Systems to Provide an End-to-End View of the Leasing Process and Associated Times

The recently launched OAEM lease tracker attempts to create an integrated view of leases, which may help to increase visibility and enhance lease management. Further system integration should be considered to reduce the additional workload caused by fragmentation, and facilitate improved reporting, performance management, and oversight by a central body.

8.3.2.5 Ensure Contracting and Functions at the Station Work Together From the Outset to Procure New or Renew Existing Leases

It is critical that stations and contracting staff work closely together throughout the lifecycle of a lease. These teams should include all relevant stakeholders within the facility, contracting, VISN, and central support at VACO. This integrated project team should be involved from the beginning of a lease request through to facility activation and operation.

Identify a single point of contact at the VISN and VAMC levels that would be ultimately responsible for all leasing activities associated with that station. Stations that most effectively handled their leasing program had a clear point of accountability that oversaw leases. This individual should be able to coordinate across end users (for example, Primary Care), finance, station staff, and other functions to ensure successful leases. A single point of accountability also enables the accumulation of expertise and allows that individual to share the benefit of experience across multiple leases.

8.3.2.6 Actively Monitor Upcoming Lease Expirations

This is critical to ensure that dollars are being spent in the most cost-effective manner (by avoiding escalating rents or hastily renegotiated short-term lease extensions) and to avoid the urgent review processes that can often not be accommodated by the existing process. Stations should use existing systems to actively track and monitor leases, and ensure that proposals for renewals or new leases are submitted in sufficient time to prevent gaps in facility availability or increased costs as leases expire.

9 Facility Management Assessment

9.1 Preface

Section 201 calls for a review of the Department's process for identifying and designing maintenance projects at facilities. While Non-Recurring Maintenance (NRM) activities are prioritized and funded through the SCIP process with VACO and VISN-level input and oversight, day-to-day facility management work is conducted by station-level Engineering and Facilities Management Services (FMS) staff. Given that an effective facility management program is essential to preserving the value of VHA's infrastructure and providing quality facilities for Veterans, we have broadened the scope of our assessment to include an assessment of the VHA medical center facility management effort. Specifically, we have explored the following questions vis-à-vis VA's facility management:

- **Outcomes:** Does VHA optimize facility management costs to ensure each dollar is spent in the most high-impact way possible? Are facilities management activities ensuring patients and staff are experiencing high-quality facilities?

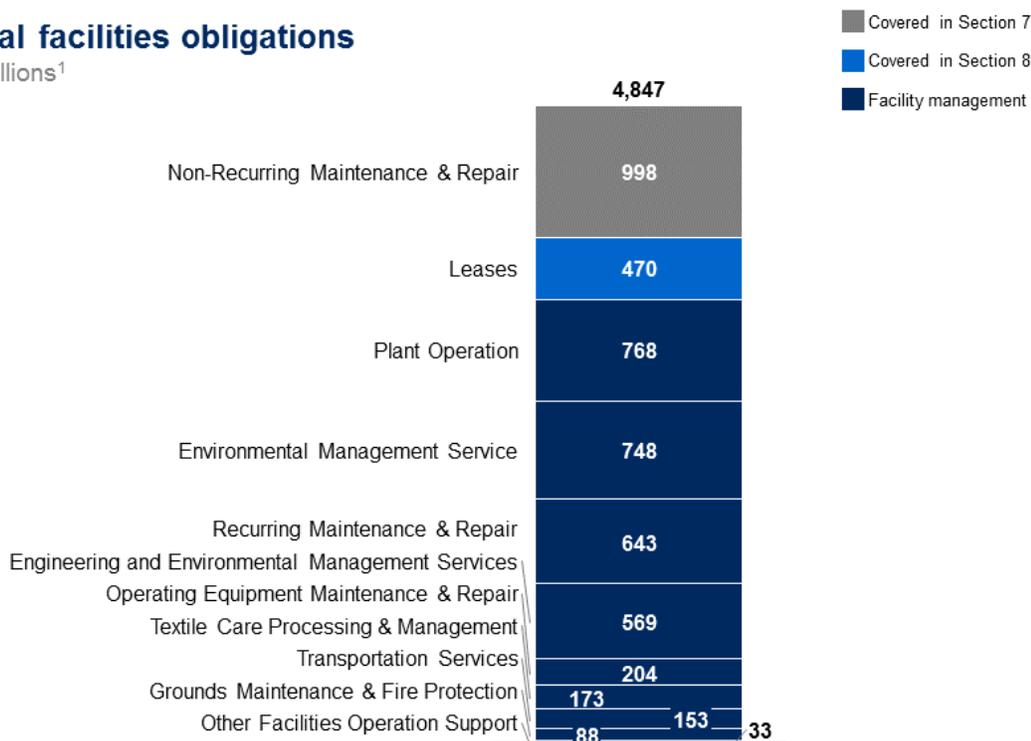
- **Process:** Is there substantial variation in how different stations conduct their facilities management activities? Is there an opportunity to improve the process to complete, or prioritization of, facility management activities?

- **People:** Do facilities have the right capabilities to fulfill the necessary duties? Does VHA rely appropriately on external vendors to conduct facility management?

- **Systems:** What systems are in place to support the delivery of a strong facilities management program? Are they used consistently and effectively across VHA medical centers?

9.1.1 Overview of VHA's Facility Management Activities

In FY 2014, VA's medical facilities budget was approximately $4.9 billion. These funds are used to address a wide range of facility needs, including recurring maintenance and repair, non-recurring maintenance, plant operation, engineering and environmental management services, and service contracts for activities that are contracted out to external providers. While the design and construction section of this assessment addresses non-recurring maintenance, this section provides a high-level assessment of the remainder of these facility management activities. Responsibility for facility management is primarily with local station leadership, with minimal control at the VISN level.

Figure 9-1. Medical Facilities Obligations


9.2 Findings

9.2.1 Outcomes

9.2.1.1 While Station Staff Are Attentive and Committed to Maintaining Facilities at Sufficient Quality Levels, They Are Often Challenged by Underlying Facility Issues

There are two standardized reports that assess the condition of VHA medical centers:

Facilities Condition Assessment reports are conducted by an independent entity for each medical facility every three years. These evaluate the condition of core infrastructure and primarily focus on issues that could be addressed by non-recurring maintenance activities, as opposed to reporting on the quality of the ongoing routine operation of a facility.

These reports – along with an array of other ad hoc and regular assessments of facility cleanliness and condition – provide an independent assessment of the condition of VHA facilities, which we did not attempt to replicate. Through our visits to facilities and interviews with multiple staff across clinical areas and a number of medical centers, we found, with very

few exceptions, VA medical center staff who were very committed and attentive, and endeavored to maintain facilities to high standards. We observed staff who responded in a timely manner to specific incidents (for example, spills in the hallway or elevator) and who were committed to maintaining excellent facilities for Veterans. Only rarely did interviewees (administrative and medical staff from various departments) indicate a lack of satisfaction with facility management staff.

However, we observed significant barriers that facility management staff faced in achieving their objectives of maintaining facilities to high quality. While some of these barriers involved immediate resource constraints (for example, budgets for staffing and conducting maintenance and janitorial tasks), the root cause of many of these issues is the general age and underlying condition of VHA facilities, described in depth in Sections 5.2.1.3 and 5.2.1.4. In cases where concerns about facility conditions arose, these were typically related to underlying structural issues with the facility that could not effectively be addressed by local facility management staff within allocated budgets and responsibilities. For example, one facility experienced difficulties maintaining its floors and hallways to their own standards. This was largely due to the facility being spread out across numerous buildings over a large campus, some of which were almost a hundred years old. Environmental services staff at this facility struggled to maintain cleanliness given the number of independent entryways coming out of parking lots and outside paths that were often covered with gravel and salt during the winter months. Another facility struggled to maintain a supply of hot water due to the age of the mechanical and plumbing systems. These underlying conditions and constraints in capital investments are a driving factor in day-to-day condition of facilities.

9.2.1.2 Most Stations Adhere to Routine Equipment Maintenance Schedules, but Are Constrained in Conducting More Resource-Intensive Preventative Maintenance

Most stations adhere to manufacturer or VHA-determined standards of routine equipment maintenance (for example, regular cleaning of air filters, maintenance of boiler systems), consistent with standard practice. In addition, recent VHA efforts to systematize facility reviews through a technology-supported, weekly Environment of Care (EOC) walk-around are an excellent effort to proactively address otherwise unnoticed preventative maintenance needs and maintain high-quality facilities. These EOC walk-arounds surface more superficial conditions of the facility that may not be systematically covered by either the high-level condition assessments or routine maintenance and environmental services work. While some VAMCs indicated challenges with the technology-enabled EOC system (for example, the tablet computers used for EOCs sometimes didn't work), this program is a positive step and should be continued.

However, interviewees reported having insufficient resources to stay ahead of non-critical preventive maintenance schedules. For example, the majority of stations visited indicated that it was difficult to secure resources to invest in improvements to pipes, utility plants, or other physical infrastructure and that is was challenging to allocate staff time to complete this type of work. This insufficient investment in preventative maintenance can lead to much more

expensive corrective maintenance issues that pose a risk of affecting facility quality and Veteran access. The Capital Planning section of this report addresses some of the funding constraints that limit preventative maintenance capital investments, and discusses how these investments should be reviewed and prioritized.

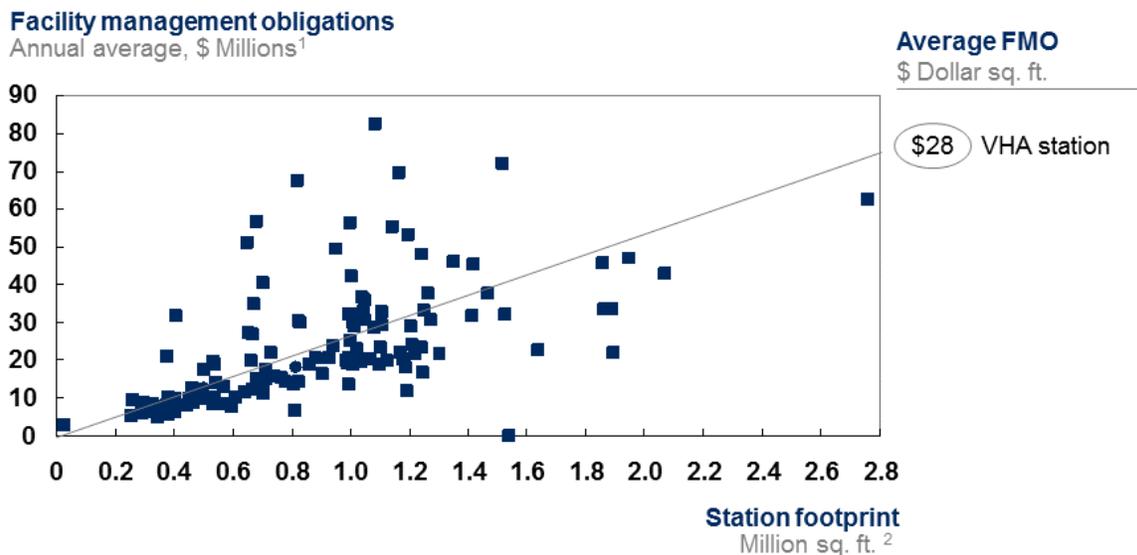
9.2.1.3 There Is Little Incentive for Stations to Reduce Facility Management Costs

We have examined facility management costs aggregated at the national level, as well as across specific facilities. These costs include plant operation, environmental management, recurring maintenance and repair, engineering, operating equipment maintenance and repair, grounds maintenance, and fire protection. For the purpose of these analyses, we have excluded non-recurring maintenance (addressed in the design and construction section) and leases (addressed in the leasing section).

Facility management spending decisions are largely made at the VAMC level. The VISN allocates operating budgets to each medical center and station leadership determines what amount will be made available to facility management staff to conduct necessary activities. While stations were typically very aware of budgetary limitations and attempted to operate as effectively as possible within cost constraints, we observed opportunities to improve cost management. Because operating budgets are allocated on an annual basis with the general expectation they will increase three to five percent year-over-year, there is little incentive to pursue innovative methods of reducing costs. This is especially true because the current funding mechanisms for NRM and minor projects require all significant repair projects (larger than $25,000) be centrally reviewed and funded through either the VACO (for minor projects) or VISN (for NRM) level. If stations achieve significant maintenance savings, those savings could not be easily redirected to facility projects.

9.2.1.4 Space-Adjusted Facility Management Costs Vary Widely Across VHA

To better understand how facility management spend varies across VHA, we have analyzed each station's average annual spending on a few key cost categories. Figure 9-2 plots facilities' annual facility maintenance obligations per owned square footage at the facility. As seen in the chart, while most facilities cluster around the average of just under $30 per owned square foot, a number of facilities have both much higher and much lower costs than average. In some of these cases this additional spend may be reasonable given particular demands of a facility. For example, plant operations costs may be higher for facilities with in-house water treatment needs. However we believe there are opportunities to learn from those facilities that achieve below average spend and improve the facilities with above average spend.

Figure 9-2. VHA Stations Have a High Level of Facility Maintenance Obligations Per Square Foot of Space


1 3 year average of annual Facility Management obligations (FY12 - FY14), including the following categories of Facility Management spending: Plant Operation, Environmental Management Services, Recurring Maintenance and Repair, Engineering and Environmental Management, Operating Equipment Maintenance and Repair, and Grounds Maintenance and Fire Protection; excludes Non-Recurring Maintenance, Leases, Textile Care Processing and Management, Transportation Services, and Other Facilities Operation Support. Data was provided by VA Resource Management Office and was available for 128 out of 193 stations
2 Includes only owned square feet

SOURCE: Data from VA Resource Management Office; 2014 FRPP Submission; 2013 BOMA survey

9.2.1.5 High-Level Benchmarking Indicates That VHA Pays Significantly More for Repair and Maintenance Than Other Medical Facilities

To further evaluate a specific component of facility maintenance spend, Figure 9-3 benchmarks stations' recurring maintenance and repair (RM&R) obligations (as defined by VA Resource Management Office, averaging annual spending from FY 2012-14 and considering facility square footage) to identify variance in costs across stations and relative to benchmarks. Across the 128 VHA stations with RM&R spend data available, the average annual spend on RM&R was $4.03 per square foot. This contrasts to benchmarks from the 2013 Building Owners and Managers Association survey, which reports that in hospitals and medical buildings, the average level of spending on routine maintenance was approximately $1.50 per square foot. Given the uniqueness and age of VHA facilities and operations, we caution against assuming that VHA should target the $1.50 per square foot without reflecting additional costs for these factors. These increased costs above benchmark are likely due to a combination of factors, including the facility condition due to age or lack of renewal capital investment (the link between facility condition and operating costs is described above in the section on total cost of ownership). However there are also operational inefficiencies that increase costs of VHA facilities management. These are described throughout the subsequent sections on processes, people, and systems challenges.

Figure 9-3. Benchmarking Results Suggest VHA Medical Centers Can Significantly Reduce Spending on Recurring Maintenance and Repair

9.2.1.6 VHA Fails to Fully Realize the Benefit of Energy Efficiency Investments and Practices That Have Positive Returns

Many stations have pursued innovative approaches to increase energy efficiency and thus reduce costs. For example, one station sold the scrap materials generated by a building closure to generate funds to purchase a fleet of electric vehicles, substantially reducing transportation costs on their large medical campus. The same station identified an alternate on-site generator technology, avoiding a large upcoming repair cost and generating significant annual savings. A different station used energy savings performance contracts (ESPCs) to fund energy efficiency installations, while a VISN was able to capture a 30-35 percent reduction in energy costs by renegotiating its energy supply contracts. Yet another station used NRM funds to install a fiber optic network that enabled advanced monitoring of energy utilization across the medical campus, resulting in significant energy savings. Each of these examples demonstrates how innovative thinking can generate substantial savings in station operating budgets (VAMC/VISN interviews, 2015).

Such innovative approaches, however, are not applied to their full potential. Demand reduction methods (for example, encouraging users to turn off lights and unplug computers) are not applied systematically; efficiency opportunities are largely not identified or pursued; and regulations often obstruct facilities' efforts. The first station described above spent months attempting to change station and procurement standards for generators before they were

allowed to pursue this successful cost-reduction effort. Alternatively, high profile and high cost projects such as solar panels have been incorporated on aging structures which may not justify that level of investment. Because of the ways in which funds are allocated, projects are often not evaluated based on their long-term savings potential, but based on upfront costs, compromising VHA's ability to reduce costs over the long term. Best practices are also not effectively shared across facilities, reducing the adoption of innovative approaches to cost reduction. Finally, facility management departments are only indirectly incentivized to pursue these solutions because the savings in operating costs accrue to the general operating budget rather than to their specific departments, and future appropriations may not give credit for proactively achieving these savings.

9.2.2 Process

Delivering an effective facilities management program requires having well-functioning processes in place to achieve the following:

- Ensure needs for corrective maintenance are quickly identified, reported, prioritized, and resolved
- Proactively complete preventive maintenance work
- Procure necessary materials and service contracts in a timely and cost-effective manner
- Correctly anticipate budgetary requirements to complete facilities management tasks
- Focus investments in ways that take into account long-term costs and benefits
- Delivery on clearly defined service level agreements between the facility management department and end customers (for example, medical departments)

Given the autonomy granted to individual facilities, we observed a wide range of approaches facility management teams have employed to fulfill these functions, with varying degrees of success. While each observation will not apply to all facilities within VHA, we believe they represent systematic patterns within VHA's facilities management program.

9.2.2.1 Total Cost of Ownership Is not Calculated or Integrated Into Capital Planning Decisions

There is a tradeoff between investing in improving the condition and technology of facilities and the maintenance costs of those facilities (Figure 9-4). Best practice organizations integrate a total cost of ownership view into their planning. This means understanding not just the initial costs of constructing or installing a particular facility or piece of equipment, but the lifetime costs of operation, maintenance, and disposal or replacement. They then dynamically adjust operating models and costs as facility conditions change. However there are a number of areas in which VA does not effectively manage total cost of ownership:

- VA does not effectively calculate the total cost of ownership implications of planning decisions – either when adding new facility space that increases operating costs, or when upgrading equipment or existing space that may reduce operational costs (SCIP Criteria, 2015; VACO/VISN Interviews, 2015). As such, it cannot make decisions that minimize total

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

185

cost of ownership of facilities. Figure 9-4 shows the results of a regression analysis, demonstrating a clear positive effect of a larger facility condition gap (representative of facilities in need of significant repair) on the operating costs of the facility. VA does not take into account this effect when making capital allocations.

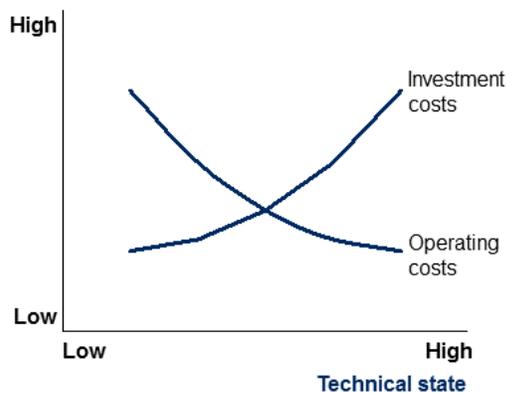
• Designs of new facilities or modifications to existing facilities only rarely take into account the implications on the long-term operating costs of these facilities. Small design choices that are neutral vis-à-vis upfront costs or quality of care can make a substantial difference in how expensive a facility is to operate. For example, small changes to exterior surfaces can reduce long-term cleaning costs; minor modifications to elevators can have a dramatic impact on the future costs to maintain them; and materials choices can affect the lifetime costs associated with cleaning and recurring maintenance. During the current design process, there is a lack of involvement of the staff that have the most detailed understanding of the implications of facility design on operating costs. Even when such staff are involved in the design, the design process often does not systematically consider lifetime operating costs.

• Finally, even when facility conditions or designs are improved, VA often does not reduce operating costs accordingly. For example, if a facility receives a large investment in its utilities equipment, it should likely be able to increase efficiency of utilities staff. Without more active management of operating costs based on facility conditions, the benefits of facility upgrades are not being realized.

Figure 9-4. Trade-offs in Facility Investments

VHA does not effectively manage the total cost of ownership of its facilities

Best practice organizations effectively manage total cost of ownership …

Investment vs. operating costs
$ Dollar / sq. ft.   ILLUSTRATIVE


Best practice organizations
- Minimize the total cost of ownership by finding the optimal balance of investment and operating costs
- Allocate capital and adjust designs accordingly
- Ensure flexibility in operating costs so benefits are realized

… while VHA does not sufficiently integrate a TCO perspective

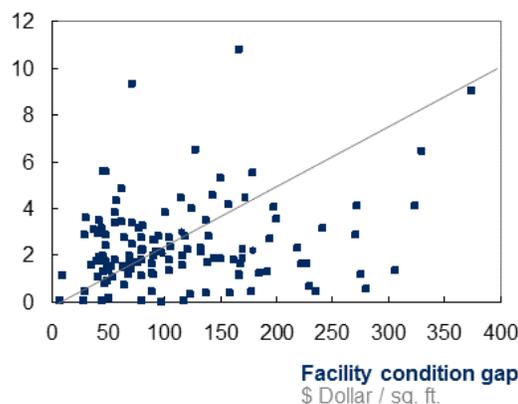
Facility condition gap
$ Dollar / sq. ft.


VHA
- Evaluate investments on basis of long-term total cost of ownership
- Sufficiently involve operating staff in facility design decisions
- Dynamically adjust operating costs (e.g., staffing levels) as facility conditions change

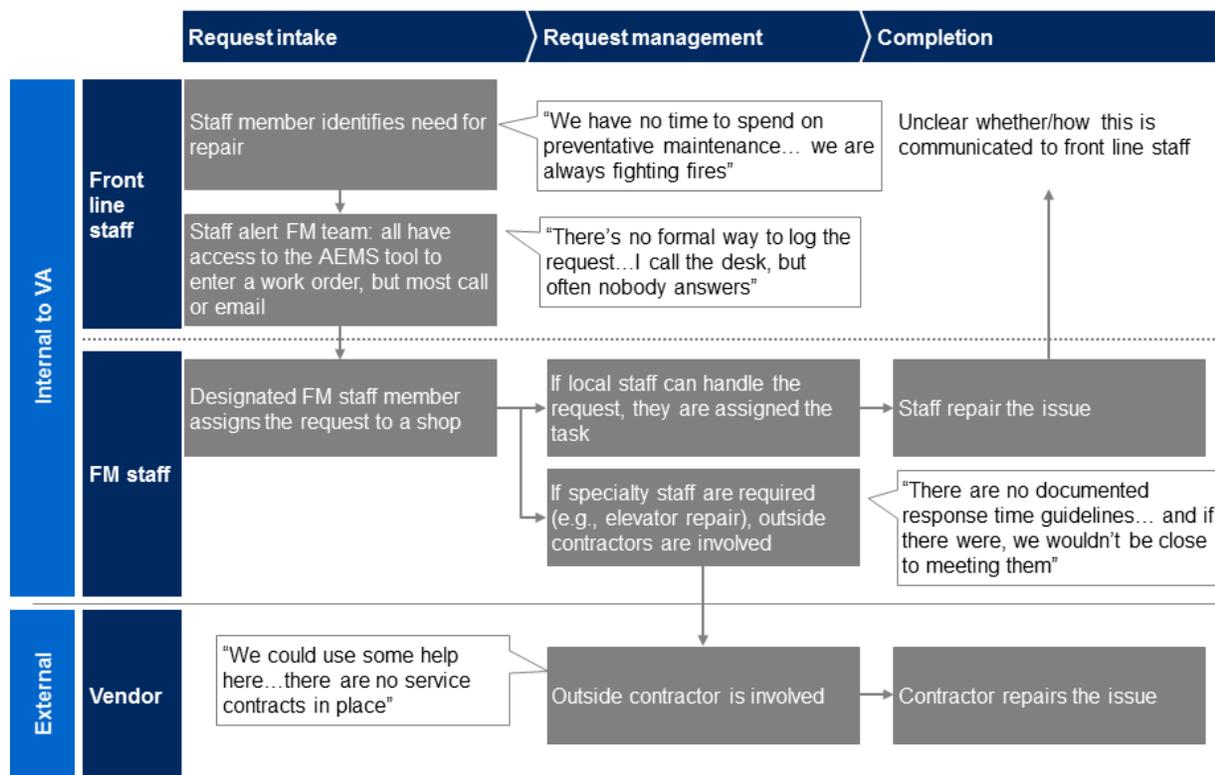
9.2.2.2 There Is Significant Inconsistency in Stations' Approaches to Resolving Corrective Maintenance Needs

Several stations interviewed consistently used an online system to report and assign corrective maintenance needs. In other stations, staff used more informal approaches to monitor submitted requests (for example, a request clipboard hanging in different units) and had no pre-agreed system to triage and prioritize requests, no standards for completion time, and no ability to systematically review and address outstanding requests (AIMS/MERS, 2015). In such facilities, interviewees reported that medical staff would often approach station management to report corrective maintenance needs in an informal capacity (VAMC Interviews, 2015). While they reported that their issues were typically resolved, this approach makes it much more difficult to deploy staff resources efficiently based on central prioritization of work, and then monitor completion of tasks.

9.2.2.3 There Is Wide Variation in the Processes Medical Centers Use to Track and Respond to Corrective Maintenance Needs, With a Lack of Defined Service Levels

Among the medical centers we observed, top performing stations utilized systems that allowed VAMC staff to report corrective maintenance needs, allocated tasks to individual shops to complete, and institutionalized performance management systems to ensure tasks were completed in a timely manner. This was typically done through a combination of a work-order submission system (VISTA – Veterans Health Information Systems and Technology Architecture) and a work order processing desk that medical staff could call with urgent requests. Each service had a designated staff member to enter requests (for example, reporting a burned out light bulb) into VISTA. Facility management clerks monitored these requests and deployed staff according to a pre-defined schema to prioritize needs, instituting guidelines for time to complete each task and using daily meetings to review and address outstanding needs. In such high-performing facilities, non-facility management staff typically knew how to submit a request and had confidence that submitted issues would be addressed.

In other facilities, processes were inconsistently adhered to and there were no processes in place to monitor progress against outstanding needs or assess time to completion. In addition, few facilities had clearly communicated service levels for particular types of requests, making it difficult for FMS staff to prioritize requests or for other staff in the medical center to have clear expectations as to how quickly problems would be remedied. Figure 9-5 illustrates the typical process for handling a corrective maintenance request at these facilities, with quotes from interviewees that illustrate challenges associated with the process.

Figure 9-5. Corrective Maintenance Process


1 This process reflects owned building operations. For leased facilities, facility management staff typically rely on the lessor for a large number of minor maintenance issues, and directly handle more significant maintenance issues that are not covered by the contract with the lessor

9.2.2.4 Interactions Between the Stations and Contracting Are Viewed as a Source of Delays

While facility staff with appropriate authorizations can use a government purchase card for micro-purchases below given thresholds ($3,000 for supplies, $2,500 for services), this practice is discouraged, and they are required to work with the contracting organization to procure any items exceeding that limit in an effort to increase cost efficiency in purchasing. While the contracting function was historically embedded in the medical center organizational structure, it has been centralized under the Office of Procurement and Logistics. In interviews with staff at the facilities and in the contracting organizations, it became apparent that while these organizations are working together well in some regions, there are significant challenges in the interactions between facilities and the contracting organization. We elaborate on the following observations to illustrate the types of frustrations voiced by each organization.

Station staff expressed many concerns regarding their interactions with COs in the Procurement and Logistics organization. They cited significant delays in processing contracts; lack of transparency of contracts (for example, many stations noted they had a hard time accessing actual copies of lease or service contracts); an unwillingness of COs to enforce contract remedies (for example, terminating a contract for default, pursuing compensation for poor

maintenance of a leased facility); conflicts between the interests of the contracting organization and those of the facility (for example, reducing contracting workload by consolidating providers versus preserving flexibility in leasing or facility management); lack of deadlines and penalties for late completion in contracts; repeated selection of under qualified contractors or contractors with a history of underperformance or non-completion because they offer the lowest price (for example, a contractor who had three projects in default at one facility was selected to do a fourth); lack of framework agreements allowing rapid processing of orders; and restrictions on who to contract with (for example, service disabled Veteran-owned small businesses (SDVOSBs) as per VAR and FAR).

Contract Officers also expressed a number of concerns. These included chronic understaffing; an inability to retain staff; lack of effective training for COs, particularly in more specialized fields such as leasing; delays and unreliable completion of materials required for the contracting process; and burdensome review processes that do not add to contract quality or value. They also point out that often CORs at the facilities do not consider this a core part of their job description, and are not evaluated on the basis of their performance as a COR.

Staff explained that these challenges had material implications on the effectiveness of facility-related tasks. These included substantial delays in time to complete lease procurement or construction projects; increased costs; loss of appropriated funds; poor quality facilities; difficulties in finding qualified contractors in future; and disruptions or risks to Veteran care. Often, staff feel forced to use the purchase card beyond its intended use (for example, by splitting a large purchase into multiple small purchases to fit within the purchase card threshold), simply to ensure that critical facility needs (for example, a door used to secure a mental health area of a hospital, a repair to an exposed piece of sharp, rusty metal) are met without the significant delays caused by the contracting process.

While the interactions between contracting and the local facility were often considered challenging, there were notable exceptions. These exceptions – where interviewees felt the interaction between the station and contracting was effective – often were in situations where there was early involvement of COs and facility management staff. Some medical centers have created a special Contracting Liaison role specifically designed to improve the quality of purchase order packages and improve communication between facility management staff and the contracting office. Individuals credited the creation of that role with a dramatic improvement in the contracting process. Other medical centers have regular meetings with all key stakeholders at the table, with the intent to check in on all priority and/or outstanding contracts and ensure progress is made toward timely procurement. In all cases, effective communication and a clear sense of ownership by all involved parties appears to drive increased satisfaction with the procurement outcomes.

9.2.3   People

All 25 medical centers visited as a part of this assessment maintain in-house facility management staff, typically ranging from as few as 50 people at smaller facilities up to 200 for larger medical centers. Based on interviews with facility management staff and other facility

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

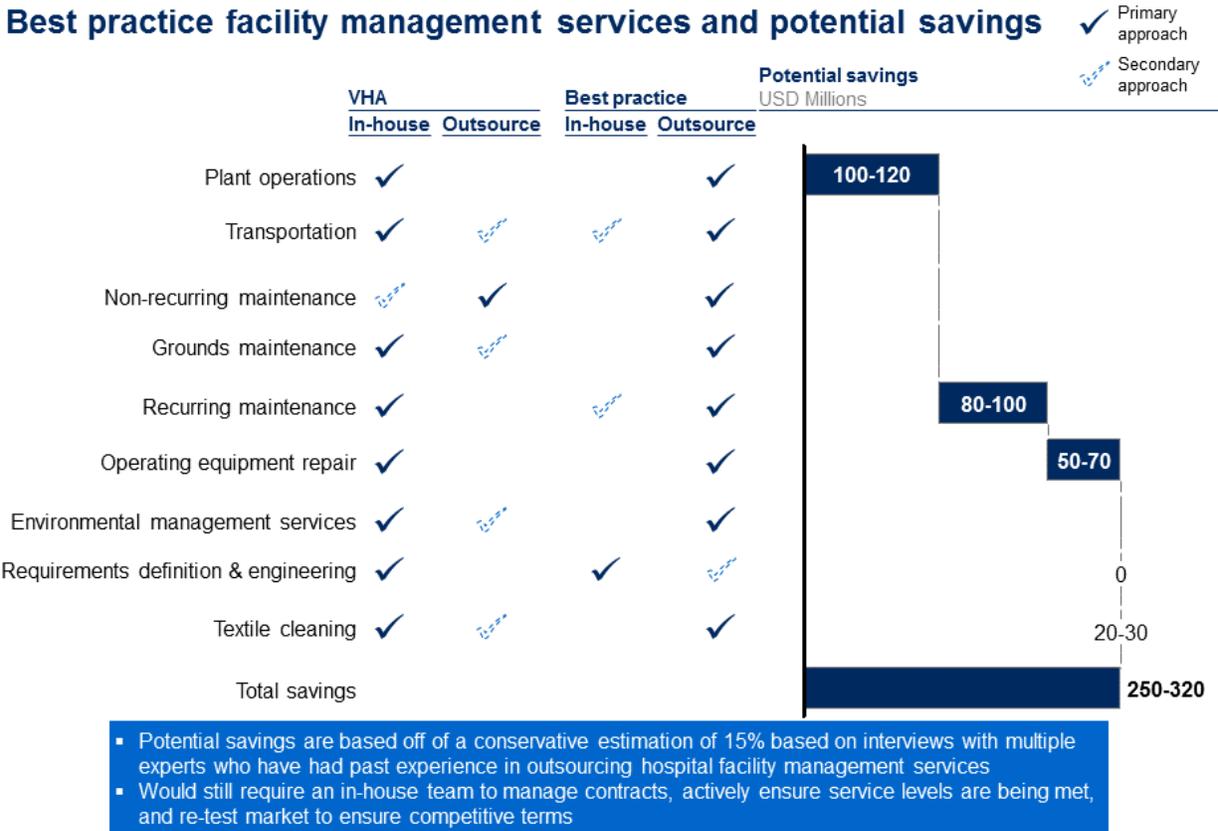
190

staff at the 25 stations selected for site visits, and supplemented with available data, we have a number of observations:

9.2.3.1 Medical Centers Conduct the Vast Majority of Facilities Management Work In-House, Increasing the Costs of Facility Management Work

Most health care organizations today outsource the majority of their facility management work. While many of the VHA facility management staff interviewed believed that it is significantly less expensive to complete facility management tasks in-house, these evaluations often did not factor in the potential to reduce total in-house staffing over time as workloads decreased (VAMC Interviews, 2015). Assessing savings from a long-term shift to outsourcing without considering labor costs generates an inappropriate assessment of the potential long-term value of outsourcing certain facility management tasks.

Facility outsourcing initiatives typically generate savings on the order of 15 percent of operating costs. These savings are enabled by the economies of scale and demand smoothing capabilities of external facility management service providers. In the below analysis (see Figure 9-6), we have calculated the value of 15 percent savings applied to those facility management categories where VHA currently deviates from the best practice approach. After applying that savings rate to the FY 2014 facility management costs, we estimate that VA could capture as much as $250-320 million per year by relying more strategically on outsourcing. However, capturing this value will require substantial changes to labor management practices, may compromise the flexibility and responsiveness sometimes afforded by in-house providers, and may be difficult to implement.

Figure 9-6. Facility Management Best Practices


SOURCE: VHA Finance; Savings estimates based on interviews with real estate and hospital operators with past experience outsourcing and consolidating facility management operations; review of documented savings

9.2.3.2 Chief Engineer Recruitment and Retention Has Been a Significant Challenge in Recent Years

At the majority of facilities and VISNs, facility management staff indicated high turnover of senior engineering staff, and described the challenges of replacing those individuals with qualified staff. One interviewee described multiple examples of private sector offers to Chief Engineers, which involved substantial increases in compensation. While this continues VHA's tradition of being a training ground for both medical and non-medical staff, it poses significant challenges to VHA's ability to maintain high quality facilities. This is especially true given the high amount of responsibility assigned to the facility level with little oversight from the VISN or VACO. Assessment L describes some of the challenges with leadership retention in more detail in section 5.2.1.

9.2.3.3 There Is a Lengthy Process to Fill Open Positions, Causing Staff Vacancies in Critical Roles

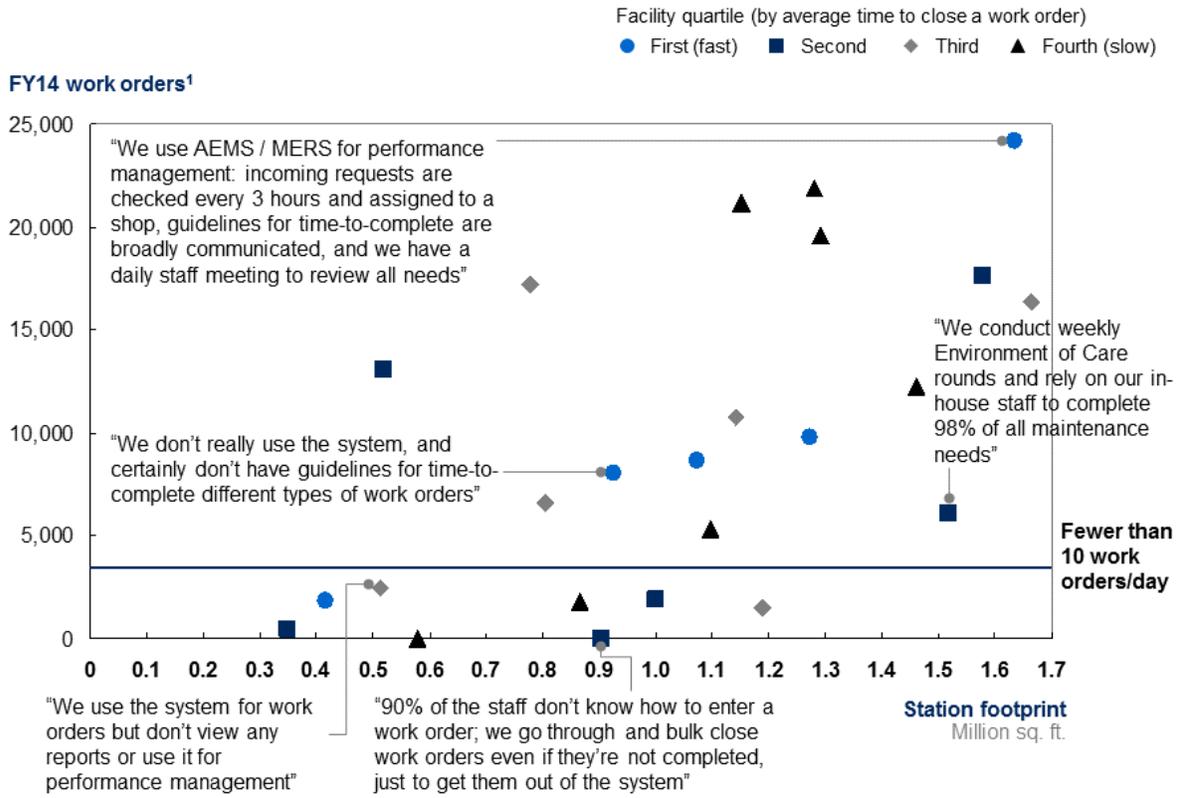
It often takes significant time to fill open positions. The large majority of facilities noted challenges filling positions that were open, and for which budget had been allocated (VAMC Interviews, 2015). For example, one facility had been waiting six months to fill two critical

electrician roles, and had not yet been notified as to any progress by human resources. Interviewees attributed these delays to poor communication between human resources and facility management leadership, insufficiently attractive roles, and a focus on hiring Veterans which narrowed the candidate pool. Such delays exacerbate capacity constraints of facility management staff.

9.2.4 Systems

9.2.4.1 The VISTA / AEMS MERS Work Order Tracking System Is Rarely Used to Monitor and Improve Performance, and Many Facilities Lack Specific Performance Targets for Corrective Maintenance

While there are exceptions, many facilities do not regularly monitor the time it takes to complete different types of tasks, nor do they conduct robust analysis to evaluate their performance and reassess staffing levels. Interviewees with facility management staff indicated a lack of uniformity in the use of the existing AEMS / MERS work order tracking system to manage maintenance tasks. This wide variance in practices is reflected in analysis of ticket volumes across facilities selected for site visits (see Figure 9-7 below). If the system were used consistently across facilities, one would expect a high correlation between the size of a facility and the volume of work orders. However, while there is some correlation there are many facilities that clearly do not regularly use the system to track work orders. For example, there are a number of large facilities that have fewer than ten tracked work orders per day.

Figure 9-7. Work Order Volume Against Facility Size


1 Includes FY2014 work orders for Building Service Equipment (that which is associated with Facility Management Services), from OP&L

Source: Office of Procurement & Logistics; 2014 FRPP Submission

Similarly, when analyzing the amount of time it takes the engineering department to close work orders there is significant variance across facilities. In the following analysis, we have classified facilities into quartiles according to the average time required to complete a work order, and then analyzed the response times to close tickets assigned to different shops. As expected there is a wide range in outcomes, from same-day turnarounds in some shops, to work order closure times of up to 113 days on tasks requiring a locksmith – yet it is not possible to determine what variance results from real differences in facility management quality and what is a result of poorly maintained electronic systems. These analytical challenges demonstrate the challenges VHA itself faces when trying to perform oversight on the facility management function across the network of facilities.

9.3   Recommendations for Consideration

9.3.1   Allow Facilities to Redirect Facility Management Savings to Discretionary Facilities Investments in Subsequent Years

Currently, individual facilities have little incentive to implement efforts to reduce facility operations costs, given the allocations to VISNs based on the VERA model, and typical allocations of operating funds to facilities based on past costs. If a facility reduces its costs, it may receive less funds the subsequent year. VHA could consider instituting a funding system that allows individual facilities to keep the majority of the cost savings achieved for investments in projects that could improve care or reduce costs over the long-term. There are a variety of ways to allocate funds while retaining this incentive, including allocating based on an annually moving average of the past 5 years, by square footage of the facility as a share of VISN level VERA funding, or through directly verifying savings numbers and ensuring the facility retains some share of these savings.

9.3.2 Incorporate a Total Cost of Ownership View Into Design, Capital Planning, and Facility Management

There are a number of opportunities to reduce total cost of ownership. By integrating a total cost of ownership perspective into capital planning, capital investment can be prioritized not only on upfront costs, but also based on the implications on long-term costs. By evaluating the operational cost implications of design choices, VA can make cost and quality-neutral upfront design decisions that should reduce long-term operating costs. And by ensuring flexibility in facility management resourcing, these savings can be more effectively captured in reduced operating costs.

9.3.3 Consider Outsourcing More Facility Management Functions

VHA should consider relying more extensively on outsourced facility management functions, particularly in the areas of environmental services, landscaping, and transportation. While local availability of service providers, quality of service providers, and the relative costs of such providers versus an in-house approach should determine whether to outsource, VHA may be able to obtain significant value by consolidating service contracts across facilities – ideally at a national level to unlock the greatest savings, but the regional level offers potential for savings as well. When evaluating the attractiveness of outsourcing versus continuing to provide services in-house, it is important that VHA considers the total cost of both models. For example, all VHA labor costs, as well as support costs, should be considered when evaluating in-house provision, and the reallocation of tasks considered secondary by outsourced services (for example, cleaning staff performing minor corrective maintenance) should be considered when evaluating outsourced options. Because the value of outsourcing would accrue in part through labor spend reductions, either through attrition or layoffs, this may pose an implementation challenge given VHA priorities and employment agreements.

9.3.4 Upgrade Facility Management Systems and Ensure Broader Adoption

Given the lack of effective use of AEMS / MERS, VA should consider either adopting a more effective, integrated facility management solution, or enable broader adoption of existing systems. This would enable more effective tracking, management, resource-allocation, and quality control.

9.3.5 Create Opportunities to Share Best Practices Across Facilities

Facility management is an inherently decentralized effort across VHA. As such, while there are trends in terms of both challenges and opportunities, there are also numerous instances of local innovation. Efforts in energy efficiency, cost-reduction, improved corrective maintenance response times, and a number of other areas have all showed promise at some facilities without being applied nationally, but recent restrictions and increased approval requirements make it even more challenging to spread these ideas. VHA should endeavor to enable best practice sharing through both formal and informal means. Different methods, such as regular calls, email groups, newsletter mentions, and in-person sharing could be piloted to test the impact of different models.

9.3.6 Increase the Transparency and Performance Management of key Human Resource Processes

As described above, interviewees often had little transparency into the causes of hiring delays, and facility management staff often did not maintain close working relationships with the Human Resources function. Increased transparency (for example, availability of current status on any current hiring process, metrics regarding time to fill positions) of human resources processes would make causes for delays evident. Based on this transparency, station and human resources staff can work together to overcome obstacles and improve the process on an ongoing basis. Such collaboration would require cross-functional support from senior management. This and other issues are discussed in more detail in Assessment L, Section 11.

9.3.7 Implement Energy Savings Opportunities That Have Positive net Present Value

Utility costs are some of the largest ongoing facility operation expenses. A number of facilities have shown that these costs can be reduced through a combination of demand reduction, efficiency, and innovative contracting methods. However often economically positive investments in efficiency (for example, LED lights, or a new cooling system) are reportedly overlooked in favor of more high-profile or symbolic energy efficiency investments. VHA should remove obstacles to investing in economically positive efforts and enable extensive sharing of innovative approaches to reducing energy costs.

9.3.8 Explore Interim Steps to Reduce Reliance on Purchase Cards

The FAR micro-purchase threshold which governs local purchase cards is expected to be increased on October 2015 to $3,500 as a result of the most recent review.[55] Any necessary internal policies should be adjusted to correspond with this anticipated increase. Overall, the process should be optimized to streamline procurement, rather than encouraging additional workarounds or relying on micro-purchases. These changes should be made in keeping with the recommendations of Assessment J, Section 5.2.1. As an interim step while optimizing the overall system, VHA might explore empowering trained and trusted individuals at facilities to make purchases larger than the purchase card limit but below an additional threshold without requiring a contracting-led competitive tender process (to the extent this is permitted under current regulations). With appropriate controls, this moderate increase in local authority could assist in alleviating the impact of long contracting timelines on Veteran care.

Appendix A   Detailed Methodology

To ensure a broad range of sources, our assessment draws upon national data sets, national surveys, expert interviews, and visits to selected VAMCs across the country, at which we conducted interviews, focus groups, and observations.

A.1   VAMC Site Selection

To increase consistency and generalizability of findings, McKinsey teams have coordinated our sampling methods to the extent possible while ensuring sampling the methodology reflected assessment-specific considerations. We have selected a core set of VAMCs to visit, which are representative of the VAMC system as a whole across critical facility demographic and performance outcome metrics.

The VAMC site selection process followed the following steps:

- **Stratification of facilities:** Stratified random sampling, with VISN as strata, was used to select an initial long-list of facilities. To reduce sample size, a subset of VISNs was randomly selected, from which one of the two initially selected sites was randomly de-selected.
- **Review of distribution:** Chi-square testing was used on each of the key facility profile and performance variables to ensure the distribution of scores in the sample is representative of the population. Variables were chosen to reflect anticipated drivers of facility performance, and included: VISN, rurality, adjusted admissions, complexity level (on VHA rating scale), adjusted LOS, patient satisfaction, cumulative access score, and facility age
- **Refinement of facility selection:** Initial facility list was vetted with internal and external SMEs and augmented as needed, to include facilities that are considered critical for inclusion (for example, a Polytrauma Center, facilities with innovative tools/practice) and ensure that all selected facilities had the range of services being assessed.

This method resulted in a sample of 25 facilities is representative across each of the criteria used in selection.

A.1.1   VAMC Site Selection Variables

Variables were selected based on criteria relevant to each assessment area and assumed impact on facility performance. Variable definitions are given below:

- VISN: used VHA Support Center (VSSC) classification of VAMCs by VISN
- Rurality: used VSSC 2014 categorization of facilities as rural or urban
- Adjusted admissions: relied upon American Hospital Association (AHA) 2014 data. Adjusted admissions = Total admissions *(Admissions*(OP revenues/Total revenues)). VHA reports revenue data (gross billed revenue) to AHA to calculate this metric. Adjusted admissions scores were divided into quartiles, with the middle quartiles grouped, to produce low (<2881.75), medium (2881.75-6081.00), and high (>6081.00) adjusted admissions categories

- Complexity level: used VSSC 2014 categorization of facility complexity. Level 1 facilities were grouped, to produce selection criteria of high complexity (levels 1a, 1b, and 1c), medium complexity (level 2), and low complexity (level 3).

- Adjusted LOS: used VA SAIL data. As only Q3 FY2014 was available to us at the time of selection, we were only able to use that quarter's results. LOS data were divided into quartiles, with the middle quartiles grouped, producing three variables: low LOS (<4.19), medium LOS (4.19-5.14), and high LOS (>5.14)

- Patient satisfaction: used VA SAIL data. As noted above, as only Q3 FY2014 was available to us at the time of selection, we were only able to use that quarter's results. Patient satisfaction data were divided into quartiles, with the middle quartiles grouped, resulting in low (<249.83), medium (249.83- 264.02), and high (>264.02) satisfaction categories

- Cumulative access score: used VA SAIL data. As noted above, as only Q3 FY2014 was available to us at the time of selection, we were only able to use that quarter's results. The eight access scores included in the VA Q3 FY2014 SAIL report were assigned quartiles and added together to produce a single cumulative access score, which was then divided into quartiles. This process resulted in cumulative score quartile categories of low (<17), medium-low (17-20), medium-high (20-23), and high (>23) access

- Facility age: relied upon VSSC 2014 operational date data for each VAMC. Operational dates were divided into quartiles, with the middle two quartiles grouped, producing categories of early (prior to June 4, 1929), medium (June 4, 1929 – April 7, 1952), and recent (after April 7, 1952) establishment

In several instances, variable data were not available for each VAMC. To ensure that these cases were not excluded from the sample, we scored absences with -1 and included the -1 score as a category for each selection criterion where there were absences.

Assessment K visited a total of 25 VAMCs and 13 VISNs, listed below:

VAMC Site Visits:

1. Southeast Louisiana VAMC, New Orleans, LA

2. Togus, ME VAMC

3. Lexington, KY VAMC

4. G V Sonny Montgomery VAMC, Jackson, MS

5. Central Alabama VAMC, Tuskegee, AL

6. Malcom Randall VAMC, Gainesville, FL

7. Olin E Teague VAMC, Temple, TX

8. Cincinnati, OH VAMC

9. Long Beach, CA VAMC

10. San Juan, PR VAMC

11. North Texas VAMC, Dallas, TX

12. Durham, NC VAMC

13. Raymond G Murphy VAMC, Albuquerque, NM

14. Canandaigua, NY VAMC

15. Jefferson Barracks VAMC, St Louis, MO

16. Boston, MA VAMC

17. Coatesville, PA VAMC

18. Baltimore, MD VAMC

19. John D Dingell VAMC, Detroit, MI

20. Portland, OR VAMC

21. Fort Harrison, MT VAMC

22. Fargo, ND VAMC

23. Oscar G Johnson VAMC, Iron Mountain, MI

24. Gulf Coast VAMC, Biloxi, MS

25. Palo Alto, CA VAMC

VISN Site Visits:

1. VISN 1 HQ, Bedford, MA

2. VISN 3 HQ, Bronx, NY

3. VISN 4 HQ, Pittsburgh, PA

4. VISN 5 HQ, Linthicum, MD

5. VISN 6 HQ, Durham, NC

6. VISN 10 HQ, Cincinnati, OH

7. VISN 11 HQ, Ann Arbor, MI

8. VISN 16 HQ, Ridgeland, MS

9. VISN 17 HQ, Arlington, TX

10. VISN 18 HQ, Gilbert, AZ

11. VISN 19 HQ, Denver, CO

12. VISN 20 HQ, Vancouver WA

13. VISN 22 HQ, Long Beach, CA

At the site visits, our team typically interviewed a standard set of roles. At VAMCs, these roles included: VAMC Director; VAMC Associate Director; Chief of Finance; Chief Engineer; Chief, Facility Management Service; Chief, Environmental Management; Director, Procurement; Project Engineer, and Facility or Strategic Planner. Interviewees were accompanied by their staff as they felt appropriate. At VISNs, these roles included: Network Director, Network Deputy Director; Director, Facilities Planning; Director, Facility Operations; Director, Contracting; Network Contracting Officer; Capital Asset Manager; and Director, Fiscal. Specific titles and responsibilities varied by location.

A.1.2 VAMC Core Site Selection Representativeness

Results for Fisher's exact test demonstrate that the sample is not significantly different from the population of VAMCs:

Table A-1. Core Site Selection Representativeness

A.2   Construction Site Selection

A.2.1   Construction Site Visit Methodology

To ensure a comprehensive and consistent assessment across all active construction sites by the team, we utilized a project assessment tool that allows rating for the relevant dimensions of executing a major project. For each of the ten dimensions below, we assessed qualitative and quantitative metrics with detail descriptions for ratings of 1 to 5 (Figure A-1). Project assessments were completed on projects at different stages of project execution from mobilization to punch list. Hence, the ratings for each project that we visited were only provided for the dimensions observed.

Dimensions for project assessment:

- **Design and engineering:** This criteria measures engineering performance management including the review process. It also addresses the improvement ideas, knowledge sharing, and incentives to apply knowledge.

- **Mobilization:** Mobilization criteria assess the initial project kick-offs and team formations, clear rules and procedures for the project, and resource plans for the course of the project.

- **Purchasing:** Purchasing criteria measure procurement processes for the project. For many active projects visited, the procurement phase was not easily assessed in the field.

- **Integrated planning:** Integrated planning criteria measure the quality and depth of coordination planning conducted on a project (for example, from critical path management across multiple contractors).

- **Productivity:** Productivity addresses the work site logistics and layout that impact the productivity of the site.

- **Performance management:** Performance management reviews the current systems in place for measuring the current and expected performance of the project.

- **Risk management:** Risk criteria measure the risks considered and the contingency plans in place should those risks materialize.

- **Contract management:** Contract management evaluates the claims management, payments, and interactions with the contractors.

- **Organization, competencies, and safety:** This criteria considers multiple aspects including team organization, capabilities, and safety.

- **Budgeting:** Budgeting evaluates the forecasting and cost estimating processes including efforts to minimize costs via value engineering.

Figure A-1. Assessment Tool for Active Construction Site Visits

The tool utilized considers the relevant dimensions exhaustively

- Transition process between budgeting and project execution
- Organizational management structure of the project
- Execution support tools
- Accident prevention practices
- Critical capacity to assess projects and improvement solutions proposal
- Integration and engagement of project teams, with definition of objectives and aspirations
- Monitoring of contract milestones
- Customer relationship management
- Management of supply chain and materials contracts
- Mechanisms for identifying and mitigating project risks
- Performance KPIs of project
- Agenda of project performance follow-up meetings
- Productivity monitoring and control of different activities
- Project planning management
- Preparation of operational timeline
- Dimensioning of required resources

(Wheel: Projects — 1 Design / engineering, 2 Mobilization, 3 Purchasing, 4 Integrated planning, 5 Productivity, 6 Performance management, 7 Risk management, 8 Contract management, 9 Organization, competencies and safety, 10 Budgeting)

SOURCE: Field observations; team analysis

The findings above are reflective of challenges faced across major projects in general. The Aurora case study is an example where many of the findings above have manifested in cost overruns and schedule delays. Several factors contribute to execution challenges for CFM including, but not limited to, impact of appropriation cycle, continuously changing scope of the project, and an evolving organization structure. The sections – process, people, and systems – will explore the execution challenges for the Major Construction Program in detail.

A.2.2 Observed Performance on Active Construction Sites

To assess performance and processes implementation for major construction projects, the team selected a sample of active construction project sites. The design principles for site selection criteria were the following:

- Sites include projects covered by all three CFM regions (West, Central and East)
- Included a range of project sizes within the major construction program (such as, to include projects of all different sizes)
- Observable/active construction in the field (where possible)

Based on the criteria above, the following major construction projects were selected for construction site visits within the timeframe of the assessment:[56]

Figure A-2. Selection Construction Site Visits

Table for construction site visits

City	State	Project detail	Total estimated cost[1] $ Millions	Percent of funding before 2011[2]	Sq. ft.	Region
Palo Alto	CA	Ambulatory Care / Polytrauma Rehab	717	31	681,000 (New); 13,500 (Alt)	Western
Long Beach	CA	Seismic Corrections – Bldgs 7 and 126	130	100	191,000	Western
Denver	CO	New Medical Facility	1,730	Unknown	1,035,000	Western
Dallas	TX	Spinal Cord Injury	142	5	164,000	Central
New Orleans	LA	New Medical Facility	995	90	1,600,000	Central
Biloxi	MS	Restoration of Hospital / Consolidation of Gulfport	286	100	417,000	Central
Bay Pines	FL	Improve Inpatient / Outpatient	158	72	135,000 (New); 186,000 (Alt)	Eastern

A.2.3 At Active Construction Sites, We Observed Variability in Project Delivery Processes

Site visits to active major construction sites during the assessment revealed that the lack of a defined process has led to multiple challenges – each unique to the site – in project execution. Figure A-4 summarizes key assessment areas for the projects visited.

From the construction site visits, the following key themes emerged:

- The lack of a defined process for major projects leads to significant variation in roles, responsibilities, and interactions among stakeholders for the project.
- The length, variability, and opaqueness of the existing undocumented processes leads to considerable delays on the projects
- Coordination – specifically between the VAMCs and CFM – is challenging in absence of a defined process.
- Certain pockets of excellence, such as a safe and secure site, exist at multiple sites

A.3 Benchmarking Methodology

A.3.1 To Accurately Assess the Cost and Time to Completion of Major Projects, We Conducted a Benchmarking Exercise to Understand Key Drivers of Variability Between Projects

Variation in construction costs and time to completion across and within private and public sector required a benchmarking to understand key drivers of variability. Our benchmarking effort and have extensively reviewed completed hospital construction data from multiple public and proprietary databases, cost benchmarking studies, and internal experience. We created a database of recently completed projects for medical facilities construction to assess cost and schedule implications for VHA construction projects.

Using the database, we conducted quantitative analyses to identify key drivers of variability in dollar per square foot costs and schedule in medical facilities construction. To understand the differences in construction costs, we defined which costs should be included in the benchmarking analyses for a construction project (see Figure A-5). Our effort focused on total

construction costs to leverage all available projects data most of which is reported only at total construction costs. Because the projects in the database are largely greenfield projects for new facilities as opposed to renovations, such costs are also more beneficial in understanding the total construction costs of a campus. Based on the projects for which the detailed cost breakdown was provided, the site work and indirect costs accounted for 10-25 percent of the total construction costs.

The construction costs for projects in the database were adjusted to U.S. national average and 2015 dollars using Engineering News Record indices and R.S. Means City Cost Indices to minimize variation due to location and time of project delivery (see Figure A-6). However, the total construction costs are expected to vary due to a multitude of factors including, but not limited to: design specifications, type of facility (for example, mental health versus OR), geography (for example, seismic areas), contracting method (fixed price versus cost reimbursable), project delivery method (design-build versus design-bid-build), construction market dynamics, size and complexity, and execution finesse. Though the above factors can drive large variations in costs, it is valuable to document the range of construction costs so we understand the project specific drivers and the delivery specific drivers – which are explored in process, people, and systems.

A.3.2   Key Definitions

Building construction costs: Building construction costs for the benchmarking are defined as all costs to erect structures with the perimeter of the buildings. These costs include all electrical, plumbing, and mechanical systems, but exclude specialty health care equipment costs.

Total construction costs: Total construction costs include all costs of the project except planning and design related costs. These costs included – in addition to building construction costs – all site development costs, financing costs, general conditions, and insurance and bonding costs.

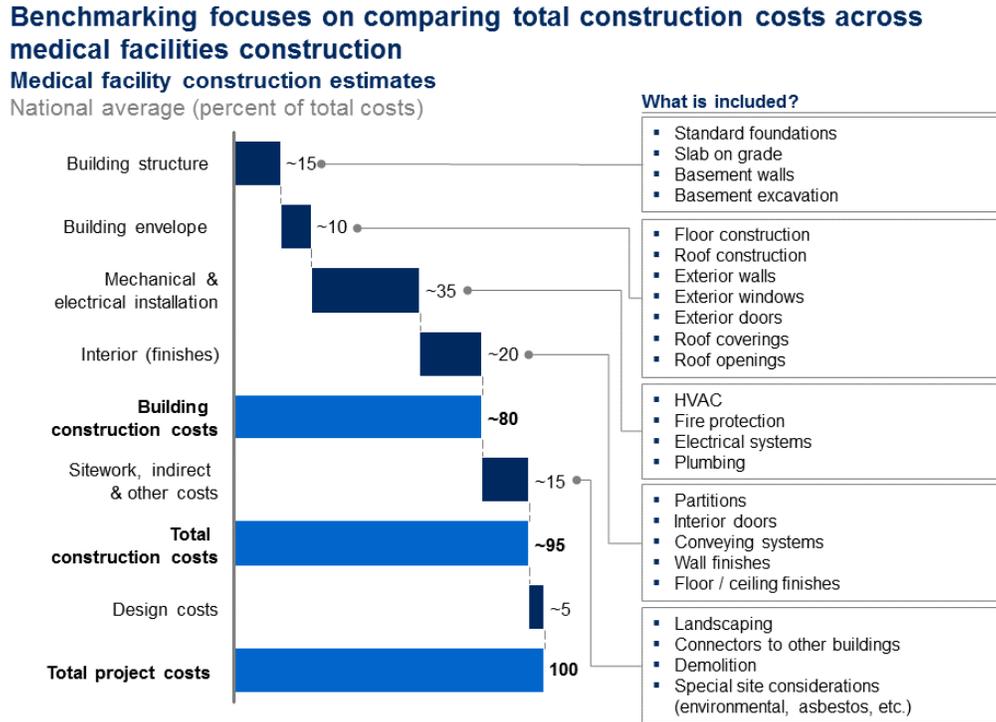
Figure A-5. Breakdown of Total Project Costs


Figure A-6. Adjustment Methodology for Time and Location of Costs

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

Appendix B   Detailed Analysis

B.1   Organizational Health Index

B.1.1   Overview of Results

The Organizational Health Index (OHI)™ survey was a key input for this assessment. Our team conducted and analyzed OHI surveys that were issued to CFM specifically and also to VHA as part of Assessment L (see Assessment L for more information). The survey results from VHA were segmented to include only facilities staff in our assessment. The CFM's response rate to the OHI survey was approximately 20 percent. The OHI survey is designed to measure the health of an organization, reflect what is working well, and offer actionable information on areas needing improvement. The survey examines current organizational strengths and weaknesses, with a special emphasis on leadership. This tool has been used across leading health care institutions and other government agencies.

Most employee surveys focus on satisfaction and engagement. The OHI survey does not try to do this. Instead, it evaluates nine elements of organizational health (outcomes) and their associated practices to create a thorough picture of how 'healthy' an organization is and allows results to be benchmarked against similar institutions. The OHI provides quantitative benchmarks against a database of more than 1,300 surveys of other organizations and more than 1.3 million employees. The usefulness of OHI also comes from the research behind it - it is statistically proven that 'healthy' organizations are more likely to outperform their industry peers.

This analysis highlighted several areas of concern for the ability of VA's construction program, both at CFM and VA, to respond to the challenges they face in moving towards a best practice organization. When compared to peers, CFM lags in every outcome, and each organizational health outcome apart from motivation lies in the bottom quartile of all survey respondents.

The motivation outcome, scoring in the third quartile, reflects a strong commitment to the purpose of caring for Veterans, a sentiment echoed resoundingly in interviews as well. This care for the Veteran and commitment to work on their behalf is powerful, but it alone is insufficient to fuel the organization's performance.

We have compared CFM and VHA to the OHI global benchmark, as well as a public sector benchmark and a construction and engineering benchmark. The public sector benchmark is comprised of 27 surveys (n=47,159), and the Healthcare Systems and Services benchmark is comprised of 18 surveys (n=24,005). CFM scores lag both benchmarks. Again, outcomes are slightly better in motivation. However, their peers in construction and engineering score nearly twice as well in outcomes such as leadership, culture and climate, accountability, and innovation. CFM scores particularly poorly against benchmark organizations in coordination and control, where their outcome score was 19. This is half that of the public sector and less than a third of scores in construction and engineering (Figure B-1).

Figure B-1. CFM Outcomes Against OHI Benchmark

When compared to public and private sector peers, CFM lags across outcomes

Percentage agreement on outcome effectiveness,
Difference between organization and benchmark median, %

Comparison to Benchmark
- Stronger (> +5)
- Comparable
- Weaker (< -5)

	CFM	Construction & Engineering	Public Sector
Direction	41	-30	-12
Leadership	39	-34	-19
Culture & Climate	37	-33	-9
Accountability	36	-33	-19
Coordination & Control	19	-44	-20
Capabilities	58	-22	-7
Motivation	42	-12	1
Innovation & Learning	23	-37	-21
External Orientation	27	-37	-24

Source: VA-CFM (Veterans Affairs) - 2015 (n=79); Public sector benchmark (n=47,159, no. surveys=27); Construction & engineering benchmark (n=24,005, no. surveys=18)

The 37 individual practices which make up the OHI illustrate a similarly consistent set of low scores. Every practice scored by CFM ranked in the bottom quartile against the global benchmark. In seven practices (capturing external ideas, challenging leadership, consultative leadership, financial incentives, open and trusting, rewards and recognition, and supportive leadership), CFM scored above VHA's results. In all other practices, CFM scored on par or below VHA.

B.1.2 Climate and Values

One aspect of the OHI Survey addresses organizational values. This "value mapping section" gives respondents the opportunity to identify those values or characteristics that most represented the current state of CFM as well as those desired values or characteristics they would like to see VHA move towards in the future. Six values, including two of the I-CARE values, were identified as both current and desired: Veteran focus, being of service to others, commitment, caring, making a difference, and fulfilling work (Figure B-2).

However, among the values most commonly seen in the current state, employees also mentioned "bureaucracy," "internal politics," "slow-moving," and "siloed." Of particular note, "fear" and "conflict" were both listed by CFM as values most commonly seen. Neither of these

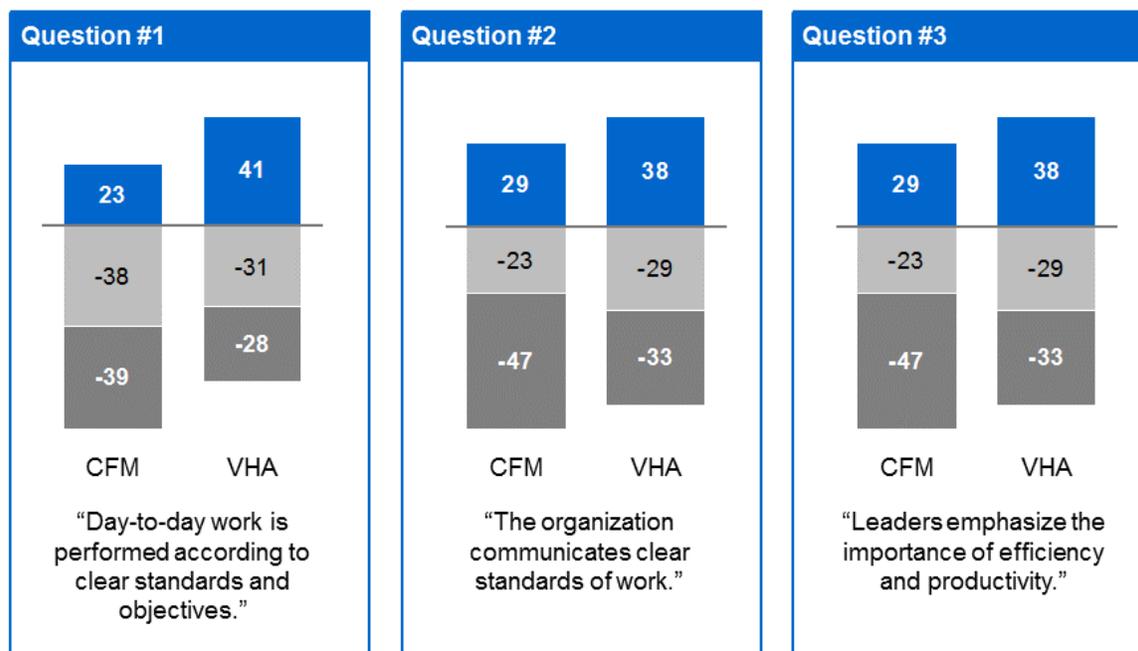
were represented on VHA's value mapping, and both speak to a particularly difficult climate at VA's construction arm. In our experience with OHI, it is unusual to see this concentration of value detractors in the value mapping exercise. In interviews across CFM, our team consistently heard employees express tremendous discouragement and concern regarding the climate of CFM given recent issues with sizeable project overruns and discussions around the organization's future. The more favorable motivation outcome is even more notable in the light of these concerns.

There is reason for encouragement when looking towards the desired values. CFM employees clearly state they hope to move toward an efficient and accountable culture, with an emphasis on continuous improvement, integrity, trust, and respect.

Figure B-2. CFM Value Mapping

Source: VA-CFM (Veterans Affairs) - 2015 (n=79)

Within the culture and climate outcomes, CFM lags behind VHA in several key questions measured by OHI. Only 23 percent of CFM respondents reported that day-to-day work is consistently performed according to clear standards, and only 29 percent reported the organization reported standards clearly and leadership emphasized efficiency and productivity frequently (Figured B-3). For the operationally discipline practice as whole, CFM scored 29 and VHA 44.

Figure B-3. Frequency of Operational Discipline Metrics


B.1.3 OHI Results by Tenure

Across the global database, it is common to see very early tenure employees express more positive views on the organizational health than more tenured employees. For CFM employees, there is a 34 percent difference in the average score of employees with less than one year of tenure compared to those with between one and three years of tenure (Figure 10-4).

This difference is particularly large in select practices. Under culture and climate, agreement on the CFM's operational discipline differs from 72 to 20 and agreement on creativity and entrepreneurship differs from 46 to 13. Under accountability, agreement on role clarity differs from 53 to 18, personal ownership differs from 53 to 18, and consequence management differs from 25 to 11.

 On average, these scores continue to differ when looking at even later tenure employees. There are some slight upticks, particularly in accountability, for employees with the longest tenure. The results, particularly regarding role clarity and consequence management, were borne out by interviews, the implications of which are discussed further within the people findings in each of the core assessment areas, Sections 5.2.3, 6.2.6, 7.2.4, 8.2.3, and 9.2.3.

Figure B-4. CFM Outcomes by Tenure

Agreement on frequency of practices and outcomes drops significantly after one year with CFM

A deeper look at the VHA OHI results can be found through Assessment L, with particular detail in Sections 3.3 and 7.2.6.

B.2   Overview of Aurora Replacement VAMC

The Aurora project will provide a new inpatient medical center including a Spinal Cord Injury (SCI) Center, an Outpatient Clinic, a Community Living Center (CLC), a research building, a central utility plant, and parking facilities. The project includes the remodeling of the recently purchased University of Physicians, including building and the disposal of the current medical center. The original public cost estimate was $328 million and the project was expected to be completed by February 2014. At the conclusion of our assessment, the public cost estimate for the project was $1.73 billion with an uncertain completion date.

Prior to our on-site visit to the Aurora project, Assessment K reviewed relevant public reports such as Congressional testimonies, United States Civilian Board of Contract Appeals documents (Kiewit-Turner, a joint venture, v. Department of Veterans Affairs, 2014), GAO reports (GAO-06-472, 2006; GAO-13-302, 2013). In the reports, critical aspects were identified as driving cost and schedule growth (Figure B-5) such as scope changes and the project delivery method selected:

1. **Scope changes:** Based on information from VA Budget Requests, Congressional testimonies, findings of the United States Board of Contract Appeals, and GAO reports, the original project cost estimated at $328 million represented a Joint Federal Facility with 1,060,000 square feet of space on leased land from University of Colorado Health (UCH).

   VA's estimate based on its space requirements led to two design options for 20 acres and 38 acre campuses – both of which would require more space than available adjacent to UCH. The estimated space available at UCH was 18 acres of land based on UCH reports in August 2004 or 12 acres accounting for easement and setbacks as mentioned in GAO-06-472 report.

   VA decided to pursue the design option for 38 acres and ended discussions for a joint facility. Over the years, the scope of the project changed multiple times growing up to 1,400,000 square feet (including new construction and alterations) before scaling back to 1,030,000 square feet. In 2004, the project was expected to include 188 inpatient beds with 30 spinal cord injury beds and a 60 bed nursing home care unit. Today, the project is expected to include 114 inpatient beds with 52 bed spinal cord injury and community living center. Though some of these changes scale the facility back in terms of scope, the timing of the changes has had a significant impact on the overall cost.

2. **Project delivery method:** Based on expert interviews, the selection of the project delivery method is driven primarily by the risk and complexity of a mega project along the time horizon for completion. Generally, there are three primary project delivery methods used at VA for major projects:

   a. Design/bid/build: Owner contracts separately with contractor and the architect / engineer (A/E) and most frequent delivery method at VA based on conducted interviews.

   b. Design/build: Owner procures engineering and construction services under a single contract.

   c. Integrated Design Construction (IDC): Owner contracts with A/E to initiate design and simultaneously contracts with a contractor before design is complete. The contractor provides input into the design through completion. At completion, the contractor provides a Guaranteed Maximum Price for the construction of the facility. In the industry, similar delivery methods may also be known as CM at risk or Early Contractor Involvement.

      Based on the GAO report and the United States Civilian Board of Contract Appeals decision research, VA chose IDC as a project delivery method for the Aurora project to benefit from contractor input on a complex project. VA had previous experience in administering this delivery model through smaller projects such the Polytrauma center in San Antonio, TX with a cost of $66 million but had no experience leveraging this model on such a large project.

To benefit most from IDC projects, the owner ensures contractor input is being solicited and implemented in the design phase. In Aurora, the design phase lasted 6 years, from 2005 to 2010 as mentioned in USCBCA decision and VA Budget requests. However, the contractor was not brought into the project until 2010 well after the design was underway. As a result, VA did not benefit from early contractor input, a key benefit of IDC. Additionally, VA faced challenges in accepting and enforcing cost-reduction suggestions by the contractor in the design, limiting a potential benefit from IDC.

The interviews conducted on our visit to the Aurora project reinforced the observations throughout Assessment K and also highlighted the process and personnel challenges impacting execution on a project of this scale and complexity.

3. **Execution challenges:** The light initial staffing from CFM plus a lack of well documented process, roles and responsibilities and sub-optimal systems posed significant challenges in the project early stages.

   To adequately manage the project workload and manage the different stakeholders involved (a joint venture of 4 A/E firms, external construction managers, and the general contractor joint venture), the CFM team had to expand almost five times the original size to better accommodate the workload and address the complexity of the project.

The elements presented in the case example are highlights of the challenges identified during our assessment and the insights obtained informed and influenced the overall assessment recommendations for consideration.

B.3 Detailed Approach to Capital Reduction Sizing

VA has identified more than $51 billion in total capital needs over the next 10 years through its capital planning methodology.[57] This combines $46 billion in projects submitted through the Strategic Capital Investment Plan (SCIP) and approximately $5 billion in anticipated outstanding funding needs for on-going major projects projected in the FY2016 VA Budget Submission:

- **SCIP Submission ($46 billion):** The $46 billion SCIP submission is made up of more than 8,000 capital requests. While our team did not independently verify the cost estimates for these capital requests, we did review the process by which these requests are identified and developed. During the data validation exercise, reviewers highlighted that approximately $2.5 billion of projects in the $46 billion in the SCIP were 'not-approved' or de-prioritized by VISNs. However, the lack of a formal scrubbing process for project selection or a formal feedback mechanism to link completed projects with addressed gaps suggests that projects that are incorporated in SCIP but not approved may still be prioritized in subsequent years.

- **On-going major construction projects ($5 billion)**: The VA has identified approximately $5 billion in capital requirements for on-going major construction projects based on our assessment of the FY2016 VA Budget Submission Appendix F: History of VHA Projects Update. Our analysis of this request include four distinct elements:

  o Active major projects: The FY2016 Budget Submission identifies 15 VHA major construction projects that have satisfied the criteria to be in the CFM 'active development list'. These projects represent approximately $4.3 billion in funding requirements for FY16 and beyond.

  o Other on-going major projects: The FY2016 Budget Submission identifies 7 VHA major construction projects which have received funding in prior years and are expected to receive future funding. However, these projects have not satisfied one of the criteria to be considered an 'active development project'. The total estimated value of these projects is approximately $1.5 billion.

  o Additional funding needs for the Aurora Medical Center: The future construction cost of the Aurora Medical Center is listed in the FY2016 Budget Submission as TBD. Based on the most recent internal VA updates and Congressional testimony, the total cost of this project is expected to be $1.73 billion. Of this total cost, $825 million is accounted for prior to FY16 which leaves approximately $905 million in future funding requirements.

  o While assessing the total capital requirement in the SCIP and the value of on-going active construction projects in the FY2016 Budget Submission, we identified 7

---

[57] This combines $46 billion in projects submitted through the Strategic Capital Investment Plan (SCIP) and $5 billion in anticipated outstanding funding needs for on-going major projects projected in the FY2016 VA Budget Submission. SCIP funding levels are taken from data provided by VA for the FY16 planning cycle, the most recent data available as of the writing of this report. See Section 3.1 for additional detail.

projects which are include in both the SCIP and the FY2016 Budget Submission. These duplicated projects represent approximately $1.7 billion in future expected project costs. To avoid double counting these projects in the total capital required by the VA, we have excluded these projects from the on-going major construction projects total and included them in the total value of the SCIP submission.

These requests cover current ten-year projections; however, new projects may be added as needs change and could change the total capital requirement. Given the gap between this capital requirement and anticipated funding levels, our team worked to develop a preliminary estimate of how much this $51 billion capital requirement could be reduced by implementing best practice capital management processes.

For VA, we have estimated an approximately 25-35 percent reduction potential in the estimated need if capital efficiency best practices are successfully applied. This section illustrates the methodology used to calculate the potential reduction in capital requirement. This was done by (1) consulting established research to develop a broadly applicable estimate based on best practices in capital management and (2) developing high level estimates based on VA capital requests and applying levers identified throughout the recommendations in this assessment.

B.3.1   Aspiration Setting: Best Practice Capital Optimization Research

To define the optimization aspiration, we identified best practices and potential efficiency levers based on comprehensive reports assessing best practices from different capital management organizations worldwide, utilized more than 80 case examples and lessons learned from health care facilities delivered in the United States over the past 5 years, and interviewed industry experts, including health care industry networks and leading agencies with large capital programs.

Research identified best practices from capital management organizations around the world that could be deployed to improve the total performance of capital programs for organization of a similar scale and complexity to VA (McKinsey, 2013). The cumulative improvement value of deploying all of these best practices in a single organization could result in savings up to 40 percent. The main areas of opportunity are:

- **Improving project selection and optimize infrastructure portfolio.** Experience with other facility portfolios has shown opportunity for 10-15 percent reducing in costs through improving the portfolio of facility assets. Specifically, portfolio levers would enable the flexibility to rationalize the portfolio to ensure facilities of the right kind are in the right place.

- **Streamlining project delivery.** A 15-20 percent opportunity exists in improving the delivery of facilities. Steps such as improving upfront design, enhancing accountability for projects, and increasing project controls can both reduce costs and increase the speed of project delivery.

- **Making the most of existing infrastructure.** Experience shows another 10-20 percent opportunity through maximizing the use of existing facilities. Effectively managing the use of space can reduce the overall facility need.

To understand and assess potential impact of different efficiency levers and its impact on cost and schedule, we studied 87 projects delivered in the United States over the past five years. The projects assessed included public and private owned projects, different delivery and contracting methods (design-bid-build, design-build and early contractor involvement) and geographies. Some of these projects were delivered in geographic proximity to VA projects in similar timeframes to serve as a reference benchmark.

To validate the different potential efficiency estimates we also extensively relied on industry benchmarks such as RS Means, Medical Construction Data, Design Build Association of America, Design Cost Data, 2013 Building Owners and Managers Association survey. As part of validating these numbers, our team conducted interviews with two leading health care systems in the United States (covering more than 450 hospitals and medical centers) and leading federal agencies with large capital programs (US Army Corps of Engineers, Naval Facilities Engineering Command, and then General Services Administration).

B.3.2 Impact Sizing for VA: Applicable Levers

Using this information on best practices and information obtained from VA on the $51 billion requirement, our team carefully assessed what could be the overall potential capital reduction in VA depending on different levers applied.

Capital management and delivery is a challenging task. Even the best capital management organizations do not succeed in deploying all best practices consistently across their organizations. For VA, even the most ambitious transformation effort may not achieve the total potential outlined in capital management best practices. As a result, our high level estimate for VA's potential capital reduction is approximately 25 to 35 percent reduction over the next ten years, a decrease from the 40 percent reduction potential identified in best practice research. For VA, this could reduce the overall $51 billion capital need to between $33 and $38 billion.

To quantify for the impact for capital efficiency levers, we aggregated potential savings from representative case studies and extrapolated potential to the overall baseline. We first calculated the average and range of impact for the relevant case data expressed as a percentage of potential savings, and then use expert input to validate impact sizing. We then scaled up the savings potential based on the overall baseline. They are provided in the following subsections:

B.3.2.1 Improving Project Selection and Optimizing Portfolio

This could reduce capital need by $7 to $8.5 billion. To size potential impact in VA, we focused on three main optimization levers (a) Refine project prioritization (b) increase scrutiny and scrubbing of projects, and (c) optimize space planning criteria:

- **Refine project prioritization:** By focusing the criteria and approval processes for capital projects, VA could concentrate capital spending on strategic priorities in order

to invest first in critical repairs and high risk facilities. To evaluate the potential impact of portfolio optimization , the team conducted hypothetical prioritization of the facility condition assessment project needs based on identified case example best practices, where projects are classified as mandatory (needed to comply with current regulation, safety and security and health care functionality) and discretionary (which includes meeting with current and projected needs). This could result in a reduced capital need of $5.5 to $6.5 billion.

- **Increase scrutiny and scrubbing of projects:** We assumed that the top priority projects in the access, energy or functional need can be optimized by extensive review and refining processes to achieve improved project design and scoping, leading to a 10 to 15 percent reduction in total capital. This would result in a reduced capital need of $0.5 to $0.7 billion.

- **Space planning criteria:** By optimizing design standards to current industry design standards for medical rooms and improving the architectural design at the department level, square footage requirements could be reduced by approximately 10 to 15 percent from current VA standards. This could result in a reduced capital need of $1 to $1.3 billion.

B.3.2.2 Streamlining Project Delivery

This lever could reduce capital need by $5.5 to 9 billion and lead to cost avoidance of an additional $5.5 to $9 billion in potential overruns.[58] By addressing comprehensively the root causes leading to consistent overruns in cost and schedule for construction projects, VA could both reduce overall cost to build and limit potential future overruns.

After accounting for optimization derived from portfolio optimization and calculating a post-optimization baseline of reduced capital need, we have assumed the following efficiencies from the different capital programs if all the levers above are adequately applied:

- **Major construction program:** We assessed the average current budget requests of latest major projects for VA, excluding future overruns. Public and private sector case studies and expert interviews suggested an improvement potential from up to 50%. We assumed a range of approximately 25-30% improved cost performance for VA, which would bring their performance in line with their current internal cost objectives. This reduces per square foot construction estimates of $650 (the level of the most recent project requests) to VA target of $450. This performance improvement would achieve a range of capital need reduction of $3.5 to $5 billion over a ten year timeframe.

  Additionally, we assessed historical overruns in major projects over the last five years, which added up to 87% over initial project requests. Based on existing best practices and case examples we assumed that the improved processes and recommendations will also contribute to reduce the 87% average overrun to a range of maximum of 25-

---

[58] Overruns calculated based on historic performance of major construction program, where projects average a total of 187 percent of initial total estimated cost.

50%. This performance improvement will generate an overall cost avoidance of approximately $5.5 to 9 billion preventing additional requests over the $51 billion of capital need estimates.

- **Minor Construction program:** Data collected by our team indicated that minor projects experience an average increase of 18 to 22 percent over initially contracted costs, as discussed in Section 7.2.1.3. We assumed a conservative reduction of 10 to 15 percent of the final project cost, which would partially address the observed cost increases. This estimate relies on existing research, our optimization track record in small and medium capital expenditures optimization, and expert interviews. This performance improvement would contribute to $1 to $ 1.5 billion in overall capital need reduction.

- **Non-Recurring Maintenance:** Similar to minor projects, we assume a partial reduction in the observed average increases of 25 percent for NRM projects between $100 thousand and $1 million and the average increases of 7 percent in NRM projects above $1 million, which would achieve an overall optimization of 5 to 10 percent in the overall portfolio over the next 10 years. This performance improvement would contribute to $1 to $2.5 billion in overall capital need reduction.

B.3.2.3   Making the Most of Existing Infrastructure

VHA could improve the utilization of its infrastructure ensuring that space planning programs regularly evaluate underutilized and vacant space to identify opportunities for increased utilization or to actively divest unusable properties. While most of these potential levers would fall outside the scope of Assessment K, experience shows that 10-20% opportunity capital reduction may exist from associated levers. We have not included this reduction in our sizing.

In summary, our analysis estimate that out of the $51 billion capital need for VA capital $12 to $17 billion, or approximately 25 to 35 percent of total need, could potentially be reduced through improving project selection, refining the project portfolio, and streamlining project delivery. In addition to the above, the successful implementation of the recommendations could prevent additional funding requests of $5.5 to $9 billion derived from potential overruns.

Assessment L (Leadership)

September 1, 2015

This page intentionally left blank.

Preface

Congress enacted and President Obama signed into law the Veterans Access, Choice, and Accountability Act of 2014 (Public Law 113-146) ("Veterans Choice Act"), as amended by the Department of Veterans Affairs (VA) Expiring Authorities Act of 2014 (Public Law 113-175), to improve access to timely, high-quality health care for Veterans. Under "Title II – Health Care Administrative Matters," Section 201 calls for an Independent Assessment of 12 areas of VA's health care delivery systems and management processes.

VA engaged the Institute of Medicine of the National Academies to prepare an assessment of access standards and engaged the Centers for Medicare & Medicaid Services (CMS) Alliance to Modernize Healthcare (CAMH)[1] to serve as the program integrator and as primary developer of the remaining 11 Veterans Choice Act independent assessments. CAMH subcontracted with Grant Thornton, McKinsey & Company, and the RAND Corporation to conduct 10 independent assessments as specified in Section 201, with MITRE conducting the 11th assessment. Drawing on the results of the 12 assessments, CAMH also produced the Integrated Report in this volume, which contains key findings and recommendations. CAMH is furnishing the complete set of reports to the Secretary of Veterans Affairs, the Committee on Veterans' Affairs of the Senate, the Committee on Veterans' Affairs of the House of Representatives, and the Commission on Care.

The research addressed in this report was conducted by McKinsey & Company, Inc., under a subcontract with The MITRE Corporation.

Executive Summary

Scope

Part L ("Assessment L"), Section 201 of the Veterans Access, Choice, and Accountability Act of 2014 ("The Veterans Choice Act") required an independent assessment of how leadership influences the Veterans Health Administration's (VHA's) ability to accomplish its mission. The law required an assessment of:

> "(L) The competency of leadership with respect to culture, accountability, reform readiness, leadership development, physician alignment, employee engagement, succession planning, and performance management."

Congress has thus directed that VHA leadership be viewed in the context of the eight separate but related elements of leadership, each of which is addressed in detail in the assessment, as summarized below.

The broad scope of the law's mandate represented an important opportunity to understand leadership at VHA, including its executive organization, Medical Center facility leaders, and regional network administrators. The scope of this assessment focuses on the senior leadership of VHA at each VA Medical Center (VAMC), Veterans Integrated Service Network (VISN), VA Central Office (VACO), and VHA Central Office (VHACO). The senior leadership at the VAMC and VISN are defined as the "Quadrad" or "Pentad" leaders: Director, Associate Director, Chief of Staff, Associate Director for Patient Care Services, and Assistant Director for Operations, if applicable.[2]

The assessment utilizes a three-step methodology entailing:

(i)   Data collection and analysis, including 39 site visits and more than 300 interviews with VHA leaders across the country, a survey of VHA employees about VHA leadership beliefs and practices, and analysis of existing VHA and other federal data;

(ii)   Synthesis of analyses, findings, and recommendations across the eight elements to identify patterns, points of interaction, and interdependencies. Through this process we identified overall findings and overarching recommendations; and

(iii)   Validation and testing to ensure a comprehensive mapping of findings and recommendations, as well as review by a Blue Ribbon Panel of outside experts and by subject matter experts (SMEs) from MITRE and McKinsey who did not participate in conducting the assessment.

Findings

Reviewing all eight elements described in Section 201, Assessment L provides an opportunity to create an integrated perspective of leadership at VHA. The scale of VHA is vast, and it is difficult to fully capture all the nuances and variability that exist throughout the system. Areas of

---

[2] The terms Quadrad and Pentad are used interchangeably throughout this report as they are at VHA.

excellence exist across the system, including some inspiring and resilient leaders, front-line systems redesign teams, and homegrown innovation. We touch on these throughout the full report. However, most areas of the organization show a highly risk-averse culture; lack of role clarity; fragmentation and organizational silos; and breakdowns in communication, accountability, and key processes that impair the organization's ability to deliver the mission.

Our efforts have yielded a complex portrait of leadership practices reflecting leaders at VHA who are diverse in their approach, experience, skill, and effectiveness. They are operating in a system without common agreed upon leadership goals, methods and processes. Examining each of the eight elements, we identified the following seven themes about leadership today at VHA:

1. **An expanding scope of VHA activities has led to confusion around leadership priorities and the strategic direction of VHA.** The organization's focus has expanded and shifted over time, and it is unclear what the priorities are, and unclear when they will shift again. Over time, VHA has expanded into the delivery of a wide range of clinical services, as well as various social pursuits. The organization is not configured or resourced to deliver this expanding scope of activities, and it is unclear where the boundaries of the mission lie. VHA is also treated by oversight entities and external stakeholders as both a hospital system and a traditional government agency. This unique complexity of VHA is not supported by equally unique performance expectations, operational flexibility, and supporting tools.

2. **From the point of view of leaders and employees, the VHA organization is intensely, unnecessarily complex due to lack of a clear operating model, limited role clarity, fragmentation of authority, and overlapping responsibilities.** This lack of clarity around operating model, roles and responsibilities extends across VAMCs, the VISNs, and Central Office. The issue is exacerbated by a cultural context that is often unable to work effectively across chains of command, except where all parties concur. Fragmentation and silos exist across the system and within each tier of the organization. Many key support functions, such as human resources or contracting, suffer from this, resulting in service too slow to meet the needs of the mission. Meanwhile, the sheer number of operational performance measures in many cases overwhelms and makes it difficult to know and focus on what is most important.

3. **The broader VHA culture is characterized by risk-aversion and distrust, resulting in an inability to improve performance consistently and fully across the system.** At almost every facility visited, at least one leader interviewed mentioned that risk-aversion and a reluctance to "speak up" were significant issues. Three out of every four leaders interviewed at VISNs in which site visits were conducted echoed this concern (VHA interviews, 2015). A general aversion to speak up or take risks originates from: a) trying to perform in a heavily siloed organization; b) fear that raising issues will result in punitive actions toward the individual or addition of significant workload with no additional support; and c) insufficient reward for those trying to make improvements. This culture permeates across all levels of the organization – from the front-lines, to Medical Center leaders, to people at Central Office. This culture of risk aversion also

hinders great ideas from spreading. A lack of enterprise-wide incentives and mechanisms for knowledge-sharing within or across the system yields pockets of innovation but not broader system-wide adoption (VHA interviews, 2015; VHA OHI survey, 2015).

4. **VHA leadership faces a workforce that appears to be steadily losing its motivation. Caring for Veterans is a value that powerfully motivates VHA leaders and employees alike – however, this commitment alone is insufficient to fuel the organization's motivation and performance.** Other sources of motivation such as a great work environment, job satisfaction, or working with an inspiring team have eroded in recent years (VHA interviews, 2015). Physicians are only partially aligned with the various demands put on them. In a changing environment in which VHA competes with other health care organizations for top talent, a value proposition that relies primarily on the intrinsic reward of caring for Veterans cannot make up for the erosion of other sources of employee motivation to meet the VHA mission.

5. **The performance of a particular VAMC hinges to a large degree on the capability of its Director and the executive leadership team; yet these leaders are "on their own" in many ways.** VAMC Directors often lack competent and timely assistance from support functions (including HR for disciplining, hiring employees, planning for succession; construction; IT; and contracting). Support from VISN and VHACO is variable and often limited. Directors are left to navigate their own career progression and development (VHA interviews, 2015).

6. **VHA leadership attention is consumed by addressing crises that have occurred in the past, at the expense of preparing for tomorrow's opportunities.** The number of directives for which leaders are accountable, coupled with heightened scrutiny from internal and external sources, compels leaders to spend much of their time reacting to crises and completing action items from above. Bottom-up innovation and consultative leadership are not well-developed, and there is a heavy reliance on top-down directives, exacerbated by the growth of Central Office Program Offices (VHA OHI survey, 2015; VHA interviews, 2015).

7. **The leadership pipeline is not robust enough to meet VHA's current and future needs, a function both of inadequate succession planning and unfocused leadership development efforts.** As of March 2015, 16 percent of VAMC Quadrad and VISN Network Director positions are vacant or have acting leaders. Twenty-three VA Medical Centers (16 percent) do not have a permanent Director. Nine VISN Network Directors (43 percent) are Acting (VHA Office of Workforce Services, 2015). Leadership positions are increasingly unattractive to the next generation of VHA leaders, which contributes to the difficulty in filling leadership openings (VHA interviews, 2015). VHA is currently experiencing a large and widespread number of current vacancies and upcoming retirements in key leadership roles, and open positions remain unfilled due to a lack of qualified candidates. Meanwhile, VHA's lack of a comprehensive approach to leadership development – experiential, relational, and training – has resulted in leaders with uneven preparation for their future roles. Multiple competency models and frameworks

---

are in use, and VHA's formal programs are not linked to career paths, not well-coordinated, and thus do not effectively bolster VHA's talent pipelines (VHA Office of Workforce Services, 2015; VHA interviews, 2015).

This report's findings indicate that immediate action is required. The challenges of the current culture and operating environment, the deteriorating atmosphere for leaders, and the intense public scrutiny suggest that sustaining an effective operation and an engaged employee and leadership base to serve six million Veteran enrollees each year will require a fundamental shift achieved through a bold, integrated, multi-year transformation.

Recommendations

The scale of the transformation needed to address the findings above has few precedents in the private or public sector. VHA employs one in nine federal civilian employees (OPM, Historical Federal Workforce Tables and FedScope, 2015). It is both the largest hospital system and the largest training ground for health care providers in the country, training tens of thousands of clinicians each year (VA, Office of Academic Affiliations, 2015). And the nature of the current system – with hundreds of unique locations, partnerships, and performance measures – only increases the complexity of the opportunity.

Given this challenge, the recommendations summarized below should not be approached like a checklist of individual and incremental performance improvements. Most transformations treated in this manner fail (Keller and Price, 2011). Instead, VHA should systematically implement these recommendations in a comprehensive, multi-year transformation program. The transformation program needs to clearly define its aspiration state, determine what is needed to meet this state, be housed in a formal change program, protect or build on best practices and high performing pockets, and ensure timely implementation faithful to the original aspiration.

Detailed recommendations are found in Section 4. These recommendations fall into six main opportunities:

1. **Galvanize VHA leaders around a clear strategic direction.**

   Decide and communicate the strategic direction of VHA going forward. The strategy could take a variety of forms, but there needs to be clarity within VHA of where the organization is headed, and this needs to be communicated throughout the organization and understood by all leaders and employees. We do not seek to define the strategic direction here, but clear strategic direction will be critical as the organization moves forward and works to implement the recommendations laid out herein.

2. **Stabilize, grow, and empower leaders.**

   VHA should strengthen its leadership foundation, both today's and tomorrow's. VHA should focus in the near term on increasing leadership stability and readiness by filling vacancies with high-quality leaders, improving the attractiveness of the role to prospective leaders, and ensuring leaders are ready to assume their roles. In the medium term they should build a coordinated people development strategy that connects top performers with the right opportunities and generates a robust pipeline of

leaders through a formal succession planning program and a coordinated set of development opportunities. Efforts should be made to build sustained leadership continuity across the system, including considering longer tenures for key leaders, such as Medical Center Directors and select roles at VHACO. This is necessary to have the authority, accountability, ownership and time needed to stabilize the organization, strengthen its health and performance, and shepherd the transformation.

3. **Redesign VHA's operating model to create clarity for decision-making authority, prioritization, and long-term support.**

    VHA should immediately lead an effort to clearly define roles and decision rights at each level and increase coordination within Central Office, refocusing the role of Central Office to managing outcomes and providing "corporate center"-like support to the field. The Central Office should prioritize, integrate, and actively provide support to the various initiatives and policies being implemented by the field. The net effect of the redesign should be a Central Office that is highly valued by the field for the expertise, services, and strategic direction it provides.

4. **Focus and simplify performance management to clarify accountability and actively support the mission.**

    Within six months, VHA should complete an effort to develop an integrated and balanced performance scorecard for VAMCs focusing on a smaller number of core metrics that roll up to support the broader enterprise view. These metrics should be designed to focus more on the mission and encourage cross-functional collaboration and should be carefully cascaded. This requires moving from hundreds today (over 382 alone in the National Performance Measures Report) to no more than 20 that cover quality, safety, patient experience, operational efficiency, finance, and human resources. The resulting data should be made readily available and accessible agency-wide with proper procedures in place to ensure quality.

5. **Rebuild a high-performing, healthy culture by cultivating greater employee collaboration, ownership, and accountability to accomplish the mission.**

    Culture is often described simply as "how things are done around here," and changing the VHA culture will need to happen at all levels of VHA: VHACO, VISN, and the VAMC level, as well as within the context of VA broadly. VHACO should consider how to integrate their efforts so the workforce is involved and experiences a coherent set of messages, policies, and support from VHACO. The VISNs should lead the VAMC leaders by sharing best practices, demanding steady improvement, and encouraging innovation. VAMC leaders will need to role model the change, describe why the culture must change, reinforce desired behaviors (and discourage unhelpful ones), and provide leaders and employees alike with the coaching, training and tools they will need to succeed. In our experience this is feasible, but there is no simple or fast way, and it will require a dedicated performance transformation effort.

6. **Redesign the human resources function as a more responsive customer service-focused entity.**

VHA, with the full support and backing of VA, should begin an effort in the next 12 months to transform the human resources (HR) function to be more responsive to meeting the needs of VAMC leadership, more efficient, and more customer service-focused. Although a comprehensive examination of HR was not within scope of Assessment L, systematic HR challenges were identified that need to be addressed through a transformation of the HR function. Such a transformation will likely require redesigning key processes (e.g., hiring), shifting the mindsets of HR cadre from compliance to effectiveness, training HR and its customers on key roles and responsibilities, and rationalizing its technology systems.

List of Tables

1 Introduction

1.1 Background

Title II Section 201 of the Veterans Choice Act requires an independent assessment of how VHA leadership impacts VHA's ability to accomplish its mission. Specifically, the section requires an assessment of the competency of leadership with respect to eight elements: culture, accountability, reform readiness, leadership development, physician alignment, employee engagement, succession planning, and performance management.

Table 1-1. Veterans Choice Act, Section L

Veterans Choice Act Section 201 (L)	Assessment L Section
Assess "the competency of leadership with respect to culture, accountability, reform readiness, leadership development, physician alignment, employee engagement, succession planning, and performance management."	The report explores each element articulated in the legislation in a separate section of this report, as follows: ▪ Section 5: Succession Planning ▪ Section 6: Leadership Development ▪ Section 7: Culture ▪ Section 8: Employee Engagement ▪ Section 9: Physician Alignment ▪ Section 10: Accountability ▪ Section 11: Performance Management ▪ Section 12: Reform Readiness The topics are grouped according to three broad categories: ▪ Leaders (Sections 5-6) ▪ Culture (Sections 7-9) ▪ Systems (Sections 10-12)

1.2 Scope

The scope of this assessment focuses on the senior leadership of VHA at each VA Medical Center (VAMC), network (VISN), and Central Offices (VACO, VHACO). The senior leadership at the VAMC and VISN are defined as the "Quadrad" or "Pentad" leaders and include the following (titles vary):

- Medical Center Director, Network Director
- Associate Director, Deputy Director
- Chief of Staff, Chief Medical Officer
- Associate Director for Patient Care Services, Chief Nursing Officer, Quality Management Officer

- Assistant Director for Operations (if applicable)

The terms Quadrad and Pentad are used interchangeably throughout this report as they are at VHA. This assessment looked only at leaders, not at the entire workforce.

1.3   Report Structure

This report is structured into three major sections: Assessment overview, Sub-assessment areas, and Enablers. The Assessment Overview (Sections 2-4) describes the methodology, the overall findings, and a holistic set of recommendations and implementation considerations. The next major section provides supporting evidence to the Assessment overview. This major section contains each of the sub-assessment areas or elements (Sections 5-12) with specific findings for each of the areas required by the Veterans Choice Act. Lastly, the Enabler section contains findings that are not in the sub-assessments required by the Act, but are nonetheless crucial to understanding leadership at VHA. Like the sub-assessment areas, the Enabler section provides supporting evidence for the overall Findings and Recommendations. Figure 1-1 provides a visual depiction of this structure.

Figure 1-1. Assessment Structure

	Accountability	10
	Performance management	11
	Reform readiness	12
Enabler	Supporting infrastructure	13

2 Methodology

2.1 Introduction

This independent assessment used a three-step methodology.

Step 1 – Data collection and analysis. The team drew on four primary data sources: site visit interviews (across 26 VAMCs, 13 VISNs, and selected VHACO and VACO leadership, for a total of 39 site visits and more than 300 interviews); surveys including a leadership survey across the entire VHA called the Organizational Health Index (OHI)™ survey, the VA All Employee Survey (AES), and the Federal Employee Viewpoint Survey (FEVS); collection of primary source data where needed; and a review of past assessments and reports on VHA leadership.

Concurrently, the team defined each of the eight elements, reviewed and analyzed the data for each analysis, and validated the outcomes where possible with multiple sources (e.g., site interviews, OHI survey results, and primary data). We also developed a set of key questions around each element that formed the backbone of our Assessment L interviews. The key questions for each element are laid out **Appendix Table A-1.** The distribution of interviews conducted is presented in **Appendix Table A-2.**

Step 2 – Synthesis. In this step, we used the specific analyses to identify common findings and recurring themes. Using the analyses as the foundation, we identified the major findings within each of the eight leadership elements that most impact VHA's ability to achieve its mission, and developed a set of detailed recommendations to address the findings. We then looked holistically at the findings and recommendations to identify patterns, points of interaction, and interdependencies. Through this process we identified seven overall findings and six overall recommendations.

Step 3 – Validation and testing. In this step, we mapped our overall findings and overall recommendations to ensure comprehensive coverage (see Appendix A for additional detail). We also asked multiple experts to review the analysis and findings in order to identify any bias, errors, or omissions. The primary review was conducted by the Blue Ribbon Panel (described in the Integrated Report). Additional reviews were conducted by subject-matter experts from both McKinsey and MITRE. Due to the required independence of the Veterans Choice Act, Section 201 assessments, findings and recommendations were developed independently. We therefore expect these recommendations will need to be refined by VHA leadership and the Commission on Care.

2.2 VAMC Site Selection

Stratified random sampling was used to select a core set of VAMCs for on-site assessment. This set of 23 VAMCs was representative of the VAMC system as a whole across critical facility demographic and performance outcome metrics (see Appendix A for further detail). In addition, the Assessment L team visited three additional VAMCs that had had major incidents to ensure a comprehensive view. The Assessment L team also visited 13 of the 21 VISN headquarters, as the

VISN leadership is seen as an important part of the chain of command that significantly impacts VAMC leadership.

2.3 Data Sources and Analysis

Data used in this report comes from four major sources: interviews, survey data, primary source data, and past assessments and reports.

Interviews. The team conducted over 300 interviews. These include approximately 224 interviews at VAMCs, 46 interviews at VISNs, 30 interviews with Central Office, and approximately 10 interviews of other federal agencies and former VHA leaders who are now in the private sector. At each VAMC site, we sought to interview the Director, Deputy Director, Chief of Staff, Associate Director for Patient Care Services/Chief Nurse Executive, Assistant Director for Operations, Union representative, as well as additional personnel, time allowing (e.g., Nurse Manager, Service Chief, HR Administrator). We conducted interviews at 13 of the VISNs, focusing on interviewing the Director, Deputy Director, and others as available (e.g., Chief Medical Officer).

Throughout this report, we draw heavily from these interviews. In selecting quotations to share, we worked to find quotations that are representative and illustrative of the themes and patterns that we heard throughout the interviews.

Survey data. This assessment used the VA All Employee Survey (AES), the Federal Employee Viewpoint Survey (FEVS), and the Organizational Health Index (OHI)™ survey. The AES and FEVS are government-conducted surveys focused on employee satisfaction, and we used the results from 2014 surveys. The FEVS is administered annually by Office of Personnel Management (OPM) and is a sample survey across federal agencies. The AES is administered annually by VA and is a census survey of VA employees.

The OHI survey examines current organizational strengths and weaknesses, with a special emphasis on leadership practices. This tool has been used across leading health care institutions and other government agencies. The OHI survey was used to assess the leadership practices at VHA in order to show how they contribute to the organization's health and performance. The OHI does not measure employee satisfaction (which is covered in other survey instruments such as FEVS and AES).

The OHI survey was selected as one of the key inputs for this assessment, because of its large data set (used for benchmarking) and statistical reliability and validity. Beginning collection in 2003, the OHI data set currently has over 700 organizations and 1.3 million respondents, and includes both 27 public sector and 33 health provider organizations. Using the global set of organizations across multiple industries a strong correlation exists between organizational health and organizational performance (De Smet, Palmer, & Schaninger, 2007). At its essence organizational health enables organizations to maintain the highest levels of financial and operating results (Keller and Price, 2011). For example, public companies with "top quartile" organizational health had a 68 percent chance of achieving above-average EBITDA margins, compared to the 31 percent likelihood of companies in the bottom quartile of health. Similar

---

relationships between performance and health also exist at business-unit levels within organizations (Leslie, Loch & Schaninger, 2006).

Within VHA, the participation was n=13,712, with a response rate of roughly five percent. For this response rate, the OHI standard calculates margin of error at the 95 percent confidence level, which means that there is a 95 percent probability that the results of the complete population are within the margins of error of the results obtained. It is a standard used across the industry. The average margin of error was VHA: +/- 0.82 percent.

From a statistical basis, the OHI has tested as both reliable and valid.

- Reliability refers to the consistency of a survey measurement. An evaluation instrument is reliable when it produces consistent, although not necessarily identical, results. A widely accepted measure of reliability is Cronbach's coefficient alpha – an intercorrelation coefficient of survey items to evaluate its internal consistency. All the OHI alpha scores are within the ideal range (0.76 at the lowest for the talent practice and 0.91 at the highest for the Coordination and Control outcome).

- The validity of a survey refers to whether the survey can really measure what it intends to measure. Factor analysis is one of the most common methods to test the validity of a survey (Tabachnick & Fidell, 2001). The factor loadings for all the outcome items are close to or higher than the +0.50 desired range (0.53 at the lowest for Reward and Recognition practice and 0.87 at the highest for Meaningful Value practice).

Throughout the report, VHA is compared to the OHI global benchmark, as well as a public sector benchmark and a health care benchmark. The public sector benchmark comprises 27 surveys (n=47,159), and the Health Care Systems and Services benchmark comprises 33 surveys (n=40,437). The global benchmark includes all organizations in the OHI database. Additional detail on the OHI and its results are located in Appendix A.

Primary source data. In order to complete several of the analyses, we used primary source data from VHA and other sources. The specific source for each analysis is listed with the specific analysis. Example data used include: VA AES results; FEVS; leadership vacancy rates; employee performance ratings; performance reports including Strategic Analytics for Improvement and Learning (SAIL); and employment and separation data from both VHA and the Office of Personnel Management. It should be noted that we did not conduct an audit to validate the accuracy of data were provided, although, where applicable, we did note potential data integrity issues highlighted during site visit interviews.

Most data requested were received within three months of request. In some cases, requested data could not be provided because VHA personnel reported that the data did not exist, or did not exist in an internal consolidated data tracking system. Examples of this included leadership development budgets for all programs and performance ratings for non-executive employees. This limited our ability to make detailed data-driven observations on some elements of leadership development and performance management; where possible, desired analyses were replaced by interviews and other sources of data.

Past assessments and reports. The Assessment L team conducted a thorough review of eight recent VHA assessments and reports. These reports were conducted by the Office of Inspector

General (OIG), Government Accountability Office (GAO), and other third-parties that investigated leadership topics, either directly or indirectly. These reports were used to provide context for Assessment L; however, all analyses in this report are based on primary source data. See Appendix A for the complete list of reports reviewed.

We also reviewed documents that govern or inform current activities taking place at VHA, such as the VA Strategic Plan, the VHA Strategic Plan, and the Blueprint for Excellence (VA, FY2014-2020 Strategic Plan, 2014; VHA, 2014 Interim Workforce and Succession Strategic Plan 2014; VHA, Blueprint for Excellence, 2014). Recognizing that many of the efforts described in these documents are currently underway, it is too early to comment in detail on them, but the recommendations contained herein in some cases are well-aligned with the efforts currently in progress.

3   Overall Findings

3.1   Overall Findings

Reviewing all eight elements described in Section 201, Assessment L provides an opportunity to create an integrated perspective of leadership at VHA. The scale of VHA is vast, and it is difficult to fully capture all the nuances and variability that exist throughout the system. Areas of excellence exist across the system, including some inspiring and resilient leaders, front-line systems redesign teams, and homegrown innovation. We touch on these throughout the full report. However, most areas of the organization show a highly risk-averse culture; lack of role clarity; fragmentation and organizational silos; and breakdowns in communication, accountability, and key processes that impair the organization's ability to deliver the mission.

Our efforts have yielded a complex portrait of leadership practices reflecting leaders at VHA who are diverse in their approach, experience, skill, and effectiveness. They are operating in a system without common agreed upon leadership goals, methods and processes. Examining each of the eight elements, we identified the following seven themes about leadership today at VHA:

1. **An expanding scope of VHA activities has led to confusion around leadership priorities and the strategic direction of VHA.** The organization's focus has expanded and shifted over time, and it is unclear what the priorities are, and unclear when they will shift again. Over time, VHA has expanded into the delivery of a wide range of clinical services, as well as various social pursuits. The organization is not configured or resourced to deliver this expanding scope of activities, and it is unclear where the boundaries of the mission lie. VHA is also treated by oversight entities and external stakeholders as both a hospital system and a traditional government agency. This unique complexity of VHA is not supported by equally unique performance expectations, operational flexibility, and supporting tools.

2. **From the point of view of leaders and employees, the VHA organization is intensely, unnecessarily complex due to lack of a clear operating model, limited role clarity, fragmentation of authority, and overlapping responsibilities.** This lack of clarity around operating model, roles and responsibilities extends across VAMCs, the VISNs, and Central Office. The issue is exacerbated by a cultural context that is often unable to work effectively across chains of command, except where all parties concur. Fragmentation and silos exist across the system and within each tier of the organization. Many key support functions, such as human resources or contracting, suffer from this, resulting in service too slow to meet the needs of the mission. Meanwhile, the sheer number of operational performance measures in many cases overwhelms and makes it difficult to know and focus on what is most important.

3. **The broader VHA culture is characterized by risk-aversion and distrust, resulting in an inability to improve performance consistently and fully across the system.** At almost every facility visited, at least one leader interviewed mentioned that risk-aversion and a reluctance to "speak up" were significant issues. Three out of every four leaders

interviewed at VISNs in which site visits were conducted echoed this concern (VHA interviews, 2015). A general aversion to speak up or take risks originates from: a) trying to perform in a heavily siloed organization; b) fear that raising issues will result in punitive actions toward the individual or addition of significant workload with no additional support; and c) insufficient reward for those trying to make improvements. This culture permeates across all levels of the organization – from the front-lines, to Medical Center leaders, to people at VHACO. This culture of risk aversion also hinders great ideas from spreading. A lack of enterprise-wide incentives and mechanisms for knowledge-sharing within or across the system yields pockets of innovation but not broader system-wide adoption (VHA interviews, 2015; VHA OHI survey, 2015).

4. **VHA leadership faces a workforce that appears to be steadily losing its motivation. Caring for Veterans is a value that powerfully motivates VHA leaders and employees alike – however, this commitment alone is insufficient to fuel the organization's motivation and performance.** Other sources of motivation such as a great work environment, job satisfaction, or working with an inspiring team have eroded in recent years (VHA interviews, 2015). Physicians are only partially aligned with the various demands put on them. In a changing environment in which VHA competes with other health care organizations for top talent, a value proposition that relies primarily on the intrinsic reward of caring for Veterans cannot make up for the erosion of other sources of employee motivation to meet the VHA mission.

5. **The performance of a particular VAMC hinges to a large degree on the capability of its Director and the executive leadership team; yet these leaders are "on their own" in many ways.** VAMC Directors often lack competent and timely assistance from support functions (including HR for disciplining, hiring employees, planning for succession; construction; IT; and contracting). Support from VISN and VHACO is variable and often limited. Directors are left to navigate their own career progression and development (VHA interviews, 2015).

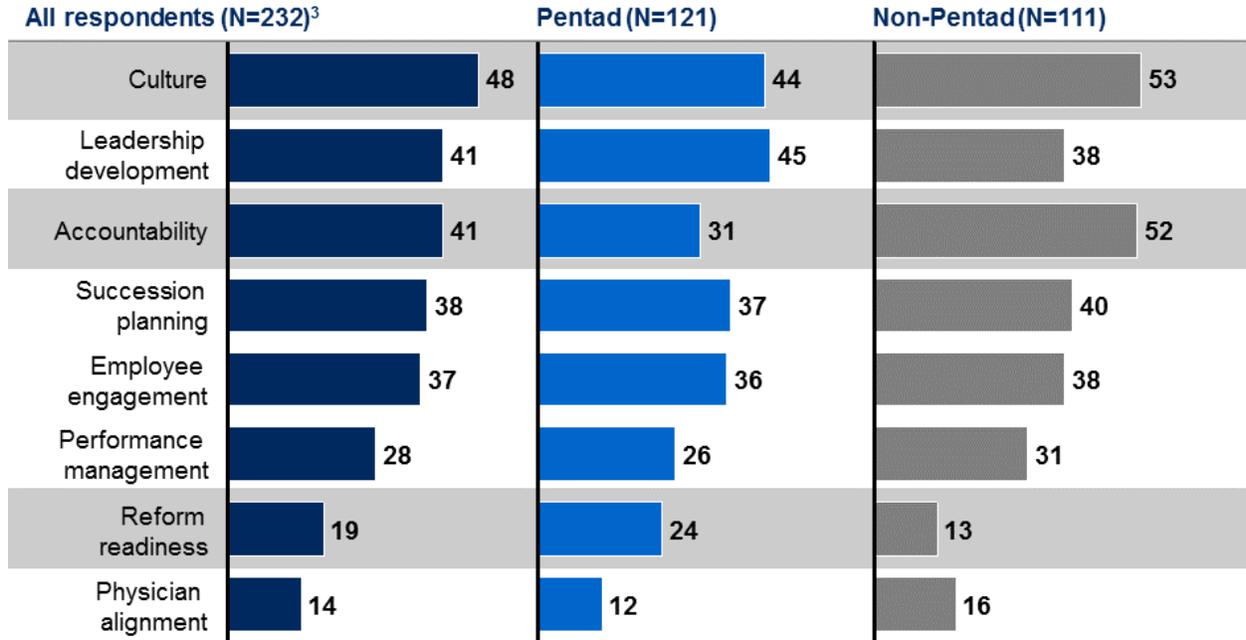
6. **VHA leadership attention is consumed by addressing crises that have occurred in the past, at the expense of preparing for tomorrow's opportunities.** The number of directives for which leaders are accountable, coupled with heightened scrutiny from internal and external sources, compels leaders to spend much of their time reacting to crises and completing action items from above. Bottom-up innovation and consultative leadership are not well-developed, and there is a heavy reliance on top-down directives, exacerbated by the growth of Central Office Program Offices (VHA OHI survey, 2015; VHA interviews, 2015).

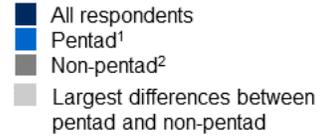
7. **The leadership pipeline is not robust enough to meet VHA's current and future needs, a function both of inadequate succession planning and unfocused leadership development efforts.** As of March 2015, 16 percent of VAMC Quadrad and VISN Network Director positions are vacant or have acting leaders. Twenty-three VA Medical Centers (16 percent) do not have a permanent Director. Nine VISN Network Directors (43 percent) are Acting (VHA Office of Workforce Services, 2015). Leadership positions are increasingly unattractive to the next generation of VHA leaders, which contributes

to the difficulty in filling leadership openings (VHA interviews, 2015). VHA is currently experiencing a large and widespread number of current vacancies and upcoming retirements in key leadership roles, and open positions remain unfilled due to a lack of qualified candidates. Meanwhile, VHA's lack of a comprehensive approach to leadership development – experiential, relational, and training – has resulted in leaders with uneven preparation for their future roles. Multiple competency models and frameworks are in use, and VHA's formal programs are not linked to career paths, not well-coordinated, and thus do not effectively bolster VHA's talent pipelines (VHA Office of Workforce Services, 2015, VHA interviews, 2015).

3.2   Prioritizing the Eight Elements

Over the course of the site visits, leaders were presented a list of the eight leadership elements (culture, accountability, reform readiness, leadership development, physician alignment, employee engagement, succession planning, and performance management). They were then asked which three of the eight leadership elements, if improved, would most benefit the VHA mission. VHA leaders most frequently identified culture, leadership development, and accountability as elements that, if improved, would have the greatest opportunity to help advance VHA. Succession planning and employee engagement followed closely in priority. Physician alignment, reform readiness, and performance management were viewed as the lowest on the list of priorities. **Figure 3-1** shows this prioritization.

Figure 3-1. Top Three Leadership Priorities




These preferences were consistent across Pentad and non-Pentad leadership with three exceptions: culture, accountability, and reform readiness. Non-Pentad leaders mentioned culture and accountability each more than 50 percent of the time, while Pentad leaders mentioned them 44 percent and 31 percent, respectively. And reform readiness, though lower on the priority list, is much more top-of-mind for Pentad leaders (24 percent) than non-Pentad leaders (13 percent).

4 Recommendations and Implementation Considerations

4.1 Introduction

This report's findings indicate that immediate action is required. The challenges of the current culture and operating environment, the deteriorating atmosphere for leaders, and the intense public scrutiny suggest that sustaining an effective operation and an engaged employee and leadership base to serve six million Veterans each year will require a fundamental shift achieved through a bold, integrated, multi-year transformation.

These detailed recommendations were developed to address the findings presented in this report. As explained in the methodology section, we looked holistically at the findings and recommendations to identify patterns, points of interaction, and interdependencies, and through this process we identified six overarching recommendations that encompass the detailed recommendations:

1. Galvanize VHA leaders around a clear strategic direction.

2. Stabilize, grow, and empower leaders.

3. Redesign VHA's operating model to create clarity for decision-making authority, prioritization, and long-term support.

4. Focus and simplify performance management to clarify accountability, actively support the mission, and promote continuous improvement.

5. Rebuild a high-performing, healthy culture by cultivating greater employee collaboration, ownership, and accountability to accomplish the mission.

6. Redesign the human resources function as a more responsive customer service-focused entity.

The impact to the Veteran of such changes will be immediate, significant, and long lasting. Immediately, the recommendations focus on improving the care given to Veterans by providing stable, empowered, and prepared leaders. Significantly, the recommendations put the Veteran forefront in the behaviors and mindsets of VHA employees by changing from individual or functional performance to focusing on the delivery of care. Lastly, the recommendations create a long-term, sustainable culture focused on ownership of the mission, innovation, and clear accountability.

The scale of the transformation needed to address the findings above has few precedents in the private or public sector. VHA employs one in nine federal civilian employees (OPM, Historical Federal Workforce Tables and FedScope, 2015). It is both the largest hospital system and the largest training ground for health care providers in the country, training tens of thousands of clinicians each year (VA, Office of Academic Affiliations, 2015). And the nature of the current system – with hundreds of unique locations, partnerships, and performance measures – only increases the complexity of the opportunity.

Given this challenge, the recommendations summarized below should not be approached like a checklist of individual and incremental performance improvements. Most transformations treated in this manner fail (Keller and Price, 2011). Instead, VHA should systematically implement these recommendations in a comprehensive, multi-year transformation program. The transformation program needs to clearly define its aspiration state, determine what is needed to meet this state, be housed in a formal change program, protect or build on best practices and high performing pockets, and ensure timely implementation faithful to the original aspiration.

This requires capable leaders, dedicated resources in a central transformation management office, relaxation of constraints to accelerate the effort (e.g., reducing non-statutory constraints), careful monitoring and management, and consistent senior management attention and focus over the life of the effort. Success will require VHA leaders to role model the change needed, describe why the transformation is needed, reinforce desired behavior, and provide leaders and employees alike with the coaching, training and tools they need. This will require a sequenced approach, designed to stabilize leadership, strengthen the organizational foundation, and sustain performance.

Details on the approach to recommendation development may be found in Appendix A.

4.2 Recommendations

4.2.1 Galvanize VHA Leaders Around a Clear Strategic Direction

As a backdrop to this transformation, VHA should clearly define its strategic direction, articulating what VHA is working toward. This can set a well-defined foundation for the changes that will be implemented. Specifically:

- Decide and communicate the strategic direction of VHA going forward. The strategy could take a variety of forms, but there needs to be clarity within VHA of where the organization is headed, and this needs to be communicated throughout the organization and understood by all leaders and employees. We do not seek to define strategic direction here, but clear strategic direction will be critical as the organization moves forward and works to implement the recommendations laid out herein.

- Determine activities and priorities based on clarified strategic direction through a full review of existing activities and decisions to stop, start, modify, or continue as appropriate. The outcome of this should be complete alignment and integration of activities and priorities against this strategic direction, across all levels of the organization (VAMC, VISN, VHACO, VACO). Congressional approval may be required to change some of the VHA priorities, in particular stopping or starting some of the VHA activities.

4.2.2 Stabilize, Grow, and Empower Leaders

VHA should strengthen its leadership foundation, both today's and tomorrow's. VHA should focus in the near term on increasing leadership stability and readiness by filling vacancies with high-quality leaders, improving the attractiveness of the role to prospective leaders, and

ensuring leaders are ready to assume their roles. In the medium term they should build a coordinated people development strategy that connects top performers with the right opportunities and generates a robust pipeline of leaders through a formal succession planning program and a coordinated set of leadership development opportunities.

4.2.2.1 Jumpstart the Transformation and Increase Leadership Stability and Readiness in the Next Six to Twelve Months

The three steps below are intended to immediately address the vacancy issue that impacts nearly four in 10 Medical Centers and ensure every location in VHA has an established local leadership team in place to lead the transformation (VHA Office of Workforce Services, 2015). This will help to stabilize the system while a broader and more robust leadership pipeline is developed and implemented.

- Fill current and planned leadership vacancies at Medical Centers and VISNs quickly, through internal promotions for those who are prepared and ready for the positions, retention, signing or relocation incentives, and external hires with extensive health system management experience. The intent here is to get the "right" people, with the "right" preparation, into these positions swiftly. This will require aggressive and expedited recruitment, hiring, and on-boarding processes, for both internal and external hires. For internal hires, this may mean offering a qualified Acting leader a 2-year Interim position, or expediting candidates that are already in the process. High-caliber external candidates should be considered for remaining vacancies. As one VHACO leader explained, "while it's not a long-term answer, we need to look at exploiting other mechanisms to address our hiring needs – for example, other agencies get around this with 2-year appointments." To fill these positions swiftly and help stabilize the system, VA should designate a lead senior executive to drive the Senior Executive Service (SES)[3] hiring process on behalf of the VISNs/VAMCs and gain OPM approvals, place more authority with the VISN to expedite non-SES hiring, and consider using external recruiters for this initial surge of hiring. VHA should focus on the VISN Network Director and Medical Center Director positions immediately, who can then take leadership in filling other pivotal Pentad roles. This recruiting effort should be led by the VISNs to streamline approvals and expedite the process. VHA should consider relaxing the hiring freeze for other select VISN positions (the hiring freeze does not impact Medical Centers). While recruiting and development are listed as a key transformational action in the Blueprint for Excellence, as of May 2015 VHA does not show any actions related to recruiting, and assesses their efforts at "potential risk (yellow)" (VHA, Blueprint for Excellence, 2014).
- Strengthen the appeal of the role for senior leaders by pursuing regulatory or legislative changes that expand or create a new federal classification for VHA Pentad leaders and other critically needed/vacant positions, combining the flexibility that exists in other federal positions (e.g., Title 38[4], SES, Excepted Service) to address compensation and

---

[3] Senior Executive Service (SES) employees constitute the senior executives throughout federal government.

[4] Title 38 is a federal classification for health care professionals and covers a range of clinical professions at VHA.

benefits, hiring decisions, promotion process, and performance management. This will create a balance that enhances the system's ability to reward senior leaders for the risk they assume in this increasingly politicized environment, while also making it easier to usher poor performers out of the system. It should be noted that VA is pursuing a legislative remedy in its most recent federal budget request to expand Title 38 salary flexibility to non-clinical leadership positions, although Congress has yet to act on this request (VA, 2016 Congressional Submission, 2015).

- Prepare VHA leaders through an executive development program that would use formal (e.g., training) and informal (e.g., mentorship) methods when they begin new roles. The focus should be two-fold: what leaders need to know within the first six months of taking on a senior leadership role (e.g., Congressional process, budgeting, and labor management), and introduction to a network of colleagues outside of their facility. Responsibility for successful execution of these programs should be placed with VISN directors. Some VISNs and the national New Executive Training Program (NExT)[5] have strong on-boarding programs, though they often happen irregularly, meaning leaders may not get to them until a year or more after they have been in their new role. Codifying the best of these and making them available across the system would help leaders be better prepared for the additional responsibilities accompanying their new role (e.g., hiring, budgeting, interaction with labor, significant public duties). On-boarding sessions should be held as needed, likely at least monthly, and new senior leaders should attend, either in their VISN or a neighboring VISN, within the first month of assuming a senior leadership role. Ongoing mentoring and support should also occur. An SES coaching program currently exists, with 75% of new SES appointees matching with a coach in 2014, and 96% matched in 2013, though usage and effectiveness of the coaching program is unclear and highly irregular (VHA Healthcare Talent Management Office, 2015; VHA interviews, 2015).

4.2.2.2 Establish a People Development Strategy That Creates a Pipeline of Future Leaders and Greater Leadership Continuity

- Create a succession management process across VHA that connects individuals with the leadership pipeline. VHA should replace the current system of unwritten rules and ad hoc decisions with a formal candidate identification, preparation, and placement program that is regularly reviewed by VHA leadership (VHA interviews, 2015). This should be done in a way that is consistent with the Merit System Principles (5 USC, Section 2301), or policy changes should be sought to change or grant temporary exceptions to these principles. Fundamentally, VHA should establish a way to track individual candidates over time across the system, ensure they are provided the right leadership development opportunities at the right times, and match them to the right career opportunities throughout the system.

---

[5] VHA Office of Workforce Services, "Healthcare Talent Management Workforce Development Programs within the Veterans Health Administration," 2014.

- Rationalize leadership development offerings. Focusing on critical leadership needs, maintain or reintroduce successful programs from the past (as has begun with the relaunch of Health Care Leadership Development Program, or HCLDP), and build new programs as needed. Eliminate existing programs that are duplicative, or have not demonstrated an ability to create a pipeline of future leaders (e.g., program graduates do not ascend to positions for which the program is designed to deliver). Move to a career path model that connects leadership candidates to a suite of appropriate opportunities (learning, networking, mentoring, coaching, apprenticeship, and career experience) at the right time in their development, with ownership of the career path elements housed in a centralized office. Ensure that those with potential and interest are applying to programs. Establish leadership development program selection criteria that are determined by succession need and employee performance and potential.

- Construct a single, comprehensive VHA competency model for leaders throughout the system that reflects the latest needs of health care executives and forms the foundation for future development, preferably leveraging the existing competing frameworks.

- Build sustained leadership continuity, including considering longer tenures for key leaders, to have the authority, accountability, ownership and time needed to stabilize the organization, strengthen its health and performance, and shepherd the transformation. As part of this, VHA could consider:

  o Declaring the intent for Medical Center Directors to have a four-year minimum tenure with the objective to remain in place for six to eight years and with the understanding that exceptions are necessary but should not be the norm. The purpose of this recommendation is to increase organizational stability and continuity at the facility level by ensuring each leader is present long enough to build a rapport with the facility and its leadership team, and see significant efforts through to completion or sustainable implementation. Additionally, it reduces the frequency of geographic displacement, a dynamic that is becoming increasingly unattractive to many facility leaders (VHA interviews, 2015). As VHA develops leadership career paths, it could consider adapting this recommendation by Medical Center complexity level, recognizing the importance of the "feeder system" offered by smaller facilities.

  o Increasing leadership stability and resilience in political headwinds by lengthening tenure of key political appointees, to enhance continuity and span administrations. Key leaders would therefore be considered for a term akin to the IRS[6] commissioner given the apolitical nature of their role and the challenging circumstances of this transformation. With the IRS, for example, Congress authorized the U.S. Internal Revenue Service Reform and Restructuring Act of 1998 (RRA 98). The RRA 98 allowed Charles Rossotti a five-year term that crossed the Clinton and G.W. Bush administrations, and provided Rossotti the opportunity to fully implement the IRS transformation (Rainey and Thompson, 2006).

---

[6] Internal Revenue Service

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

- Remove or reduce non-statutory constraints (e.g., travel restrictions, inadequate assessment of candidates, tying training to relocation) that limit effective delivery of career development opportunities.

4.2.3 Redesign VHA's Operating Model to Create Clarity for Decision-Making Authority, Prioritization, and Long-Term Support

VHA should immediately lead an effort to clearly define roles and decision rights at each level and increase coordination within Central Office, refocusing the role of Central Office to manage outcomes and provide "corporate center"-like support to the field. The Central Office should prioritize, integrate, and actively provide support to the various initiatives and policies being implemented by the field. The net effect of the redesign should be a Central Office that is highly valued by the field for the expertise, services, and strategic direction it provides. To attain that goal, VHA should consider the following specific recommendations:

- Clarify the roles and responsibilities of each major operating unit – VHACO, the VISNs, VAMCs, CBOCs[7], and other organizational units. Clarify decision rights of the VISN and Medical Center.
  - o Articulate decision rights clearly by level, organization, and role, standardizing where appropriate while also allowing for regional flexibility based on local needs.
  - o Clearly define the role of the VISN (or any other regional structures being considered), including defining key roles and responsibilities, the balance between empowerment and support of medical facilities, and their role in coordinating, translating, communicating, and innovating across the system. Such an approach would be consistent with the simplicity of purpose of the VISNs when they were created in the mid-1990s. The role of the VISN should focus on the following:
    - – Promoting continuous improvement across the VISNs and within their respective networks
    - – Ensuring effective coordination and collaboration across sites (between and across VAMCs and CBOCs, as well as non-VA care). Examples include:
      - Creating local forums for best practice sharing across sites
      - Creating work groups around service lines that require regional coordination (such as stroke, cardiovascular) – where reaching certain volumes is correlated with higher quality, or where only certain centers will offer a given service such as with coronary artery bypass surgery (CABG), transplant, etc. These should be aligned against and collaborate closely with VHACO's "lines of business" (discussed in further detail below).
      - Coordinating contracting, network management and other elements of non-VA care within region

---

[7] Community-based outpatient clinic.

- Setting performance improvement agenda for each VAMC in partnership with VAMC Director and creating transparency across the VISN on performance
- Prioritizing capital investments across the VISN
- Succession planning and participation in hiring/firing decisions on VAMC Directors and potentially other top team staff
- Acting as a communication channel to and from VACO, translating field needs and concerns up, and VACO direction, requests, and decisions down. It is critical for the VISN/region to have some discretion and help orchestrate or prioritize among what is coming "down from corporate," especially while there is not good coordination centrally. This role would become more minor as Central Office requests and directives become streamlined.

- Formally define thresholds for Medical Center Pentad decision-making approval (e.g., amount of budget, hiring, policy latitude before approval is required).

- Reorganize VHACO around an enterprise view designed to support the field, increasing collaboration, supporting prioritization, ensuring alignment with strategic direction. The intent of this is to move from a series of "stove-piped" program offices issuing independent directives and action items, with few mechanisms to encourage coordination, to a much smaller number of coordinated primary strategic priorities. These could be organized similarly to how a private sector health system might organize its corporate center in "lines of business," around which supporting program offices would be organized and through which supporting program office work would be conducted. Such "lines of business" would coordinate and support regional work groups (as described above). This would create a system that can flex and be more agile as new priorities are identified by Congress or VA.
  - In service of this, VHA should rationalize current program office activity through a comprehensive review that is designed to reshape program offices to meet the following set of criteria:
    - Designed to develop and champion key clinical priorities, processes, and best practices that are directly supporting the mission and strategic direction of VHA
    - Collaborative and holistic, focusing on critical processes and outcomes rather than individual directives
    - Aggregated into a small number of well-coordinated offices and initiatives to minimize contradictory guidance and directives
    - Coordinated centrally, with the requisite resources available to the field
    - Proactive and strategic, with "lines of business" that stand the test of time and are not primarily reactive
    - Reviewed periodically with a broader enterprise view (i.e., not in isolation), with a clear mechanism to sunset offices that are no longer needed
  - Establish a regular, periodic time (e.g., quarterly, semi-annually) when process guidance is released to Medical Centers for acceptance or modification, and finalized. This will help create a forum for greater coordination between program offices and

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

17

enable greater continuity in the field due to less frequent interruptions by new directives.

- o Create policy communication standards that require any new policy to include a clear rationale, a recommended approach, an expectation of a local implementation plan, and sufficient time to implement a local plan. This would be one of the responsibilities of the new lines of business.

- o Require alignment between and coordination across policy (10P) and operations (10N), by actively eliminating the "artificial distinction between policy and ops" that exists today (VHA interviews, 2015). This could include, for example, ensuring that all guidance issued to the field is thoroughly reviewed, approved, and prioritized by operations before being released by VHACO. The reviews should ensure the policies are feasible to implement, have the necessary resources to execute, and a proper feedback mechanism to indicate whether the field is able to successfully act on guidance.

- • Return to more flexible funding:

  As discussed in the findings (see Section 13.2), we believe the size and fragmentation of earmarked funds (e.g., 450 separate specific line items) has eroded the ability to manage toward an outcome for Medical Centers. Congressional action will likely be required to change the designated (earmarked) funds. While we are suggesting greater flexibility, that does not imply less oversight, as managing to the overall budget will remain a critical leadership responsibility.

  - o Evaluate current funding model and reduce number of special programs, or bundle specific purpose funding, to ensure Medical Centers have local flexibility to shift resources appropriately. Request the necessary Congressional authorization approval.

  - o Ensure VISNs have adequate authority to shift resources appropriately as needed. Ensure the Veterans Equitable Resource Allocation (VERA) model sufficiently accounts for anticipated demographic and geographic shifts. The new model should be revised to function effectively while still complying with Congressional restrictions.

  - o Conduct review of full set of financial management systems and streamline where appropriate to improve system interoperability. A better planning and resource management system is required. For example, one clear opportunity is to replace financial management, inventory, and procurement systems with a modern ERP system that allows full integration of supply chain processes with financial accounting (see Assessment J for additional detail).

  - o Bolster decision support and analytics. Improve the process to develop and approve staffing requests, including providing and supporting scalable, evidence-based staffing methodologies and interdisciplinary resource management processes for key employee populations. Ensure feedback loops are built into contracting and facilities processes.

4.2.4 Focus and Simplify Performance Management to Clarify Accountability, Actively Support the Mission, and Promote Continuous Improvement

Within six months, VHA should complete an effort to develop an integrated and balanced performance scorecard for VAMCs focusing on a smaller number of core metrics that roll up to support the broader enterprise view. These metrics should be designed to focus more on the mission and encourage cross-functional collaboration and should be carefully cascaded. This requires moving from hundreds today (over 382 alone in the National Performance Measures Report) to no more than 20 that cover quality, safety, patient experience, operational efficiency, finance, and human resources. The resulting data should be made readily available and accessible agency-wide with proper procedures in place to ensure quality. Specific recommendations include:

- Create an integrated and balanced performance scorecard for VAMCs. Specifically:
  - o Reduce the total number of required key performance metrics from several hundred to no more than 20, covering domains including quality and safety, patient experience, operational efficiency, finance, and human resources. This should cascade from the Director's performance plan throughout the organization, resulting in not more than 10 to 20 metrics per position, rolling up to not more than 20 key metrics for the overall Medical Center. At each level, metrics should be precise and actionable.
  - o Ensure core metrics remain consistent across facilities year-over-year to underpin operational excellence and continuous improvement around VHA's strategic priorities.
  - o Reserve space for locally-determined priorities in addition to the core metrics across facilities, both to manage against local needs and to encourage ownership.
  - o Communicate expectations before the start of a performance year, eliminating the frequent lengthy delays in communicating expectations to the facilities. Having a core set of metrics year-over-year would help mitigate any remaining delays, as facilities would already be familiar with the majority of the expectations.
  - o Motivate employees through financial and non-financial incentives, including bonuses, potential for advancement, and other non-financial incentives. Examples include: 1) expanding individual recognition by Pentad leaders, with select use of spot awards; 2) communicating clear promotion paths; and 3) providing high-performing employees with access to training and exposure to regional and national leadership, for example, opportunities to present initiatives to senior leaders at their VISN or at VHACO.
- Design effective and motivating performance management through cascaded metrics linked to the enterprise goals, such as celebrating successes and linking metrics to incentives.
  - o Assign ownership of key metrics across the organization such that employees clearly understand how their work contributes to performance against mission and strategic direction **[Figure 4-1].**

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

o Develop performance measures that have a stronger emphasis on mission contribution and team outcomes. Base performance measurement on mission contribution for all employees (e.g., fewer individual functional metrics and more team- or facility-based metrics). This will incent collaborative behavior as teams have to work together to achieve outcomes. By encouraging more cross-functional cooperation, this could also decrease siloed thinking and fragmentation.

o Tie financial incentives for leaders, such as bonuses, to mission contribution in a significant way (e.g., mission contribution and individual performance are weighted equally in determining bonus amounts).

Figure 4-1. Cascading Metrics

Targets should cascade down, and should be precise and actionable at each level

ILLUSTRATIVE

Level	Target
Network director	Reduce Average Length of Stay (ALOS) across network to a specific target across facilities
Director	Reduce ALOS across facility
Clinical leadership (e.g., chief of staff, nurse executive)	Reduce ALOS across facility
Clinicians (e.g., physicians, nurse managers, staff nurses, etc.)	• Reduce ALOS on unit • Percent discharges before noon on unit • Percent of patients with care plan in place

Everyone understands and takes part

- Increase facilities' ability to capture, access, and work with more real-time data to enhance transparency and help leaders manage for performance. This capability will support process improvement efforts by providing rapid feedback on the impact of changes so that facility leaders can identify, share, and build on their results. More real-time data can also improve transparency and the personal accountability by allowing individuals to see how they compare to their peers.

- Use performance management to promote continuous improvement.

o VHACO leaders should establish a limited number of forward-looking goals and targets to drive significant changes system-wide. These goals should focus on changes that can advance a critical few priority health outcomes and should be included as part of the balanced scorecard. These goals and targets should not be compliance-focused or overly prescriptive and should energize local innovation and improvement efforts throughout VHA. For these specific clinical conditions where data show there is a significant quality improvement opportunity, VHACO leaders should set bold but achievable targets for the system. An example of VHA's past success in advancing a critical health outcome is the reduction of hospital-acquired Methicillin-resistant Staphylococcus aureus (MRSA) infections throughout by 68 percent from 2007-2012, compared to the reduction in non-VHA hospitals of only 38 percent during that same period. VHA has shown that bold efforts on key goals can result in impressive health outcomes across the system (Evans et al., 2012).

o Facility leaders should champion the use of improvement techniques (for example, Business Process Redesign, Lean Six Sigma, visual management systems like huddleboards, etc.) to spur data-driven progress. These techniques increase ownership at the local level and engage the front-line employees, who are closest to the work, in developing solutions. Medical Center leaders must prioritize, support, and be actively engaged in these improvement efforts in order to create a sustained culture of collaborative problem-solving and improvement.

o VHA leaders should clarify decision-making processes, roles, and thresholds related to performance measures and emphasize their use to facilitate learning. When early indicators suggest an issue, offer coaching and consultation before punitive action. This requires a commitment of leaders at each level to initiate collaborative problem-solving and to use measures as a tool for progress rather than a management stick. All leaders will need to support and reinforce this message to create psychological safety for people to raise issues rather than obscure them.

4.2.5 Rebuild a High-Performing, Healthy Culture by Cultivating Greater Employee Collaboration, Ownership, and Accountability to Accomplish the Mission

Culture is often described simply as "how things are done around here," and changing the VHA culture will need to happen at all levels of VHA: VHACO, VISN, and the VAMC level, as well as within the context of VA broadly. VHACO should consider how to integrate their efforts so the workforce is involved and experiences a coherent set of messages, policies, and support from VHACO. The VISNs should lead the VAMC leaders by sharing best practices, demanding steady improvement, and encouraging innovation. VAMC leaders will need to role model the change, describe why the culture must change, reinforce desired behaviors (and discourage unhelpful ones), and provide leaders and employees alike with the coaching, training and tools they will need to succeed. In our experience this is feasible, but there is no simple or fast way, and it will require a dedicated performance transformation effort. Specific recommendations include:

- Spur collaboration

- o Introduce a more collaborative approach to cross-functional activities, replacing functional silos with employees working together across functions or services to advance the mission. Select specific functions or services that require multiple stakeholders, similar to the Patient Aligned Care Team (PACT) model to focus on. This is already occurring in some facilities and is ripe for scaling to other facilities and functions (e.g., hiring, contracting, specialty clinics). An open mindset on the part of leaders and employees alike would support this exploration of new ways of working together. More cross-functional dialogue, system redesign, and joint performance metrics would also help underpin this collaborative approach.

- • Encourage innovation, both within and across facilities, and beyond the system

  - o Celebrate risk-taking. Publically celebrate efforts to advance the mission and innovate – both successes and smart failures – through recognition events, staff communications, and informal interactions. This will at once engender a culture of appreciation and a psychologically-safe environment where appropriate risk-taking is not only accepted, but invited and celebrated. This may take some time, and there is an opportunity to signal commitment to this through some early actions and role-modeling.

  - o Build processes, roles, and systems to scale best practices. Strengthen mechanisms to identify and scale best practices; this will likely need to be an individual's primary responsibility in each Medical Center. Pentad leaders should view this as a key responsibility of theirs as well. Other mechanisms could include knowledge-sharing forums or conferences (internal and external), systems designed to capture and disseminate ideas (for example, an "idea bank" around systems redesign), and incentives. This should also include more deliberate pursuit of opportunities for partnership beyond the system, such as relationships with academic medical centers or other government agencies.

- • Foster a culture of continuous improvement, learning, and ownership

  - o Harness the local knowledge, experience, and enthusiasm of front-line employees to drive lean process redesign. This is happening in many places today, in a variety of ways (Gemba, MESS Boards, SIM, and other visual management systems). This has to be driven, sponsored, and reinforced from VISN and VAMC leadership and cascade throughout the management chain. A spirit of learning and improvement must be encouraged (such as, "yes, let's try this"), and employees need to feel like they can take calculated risks and are "safe to fail" to readjust attitudes and behaviors. This should be reinforced with performance management.

  - o Shift to a culture of ownership, supported by clarified decision rights and open communication. Introduce new communication strategies with employees that will help them both understand *why* measures are taken and influence *how* such measures are taken. For example, clinical directives should begin with a clearly articulated rationale explaining the purpose and the impact. Likewise, administrative directives or requests for data should explain their purpose and their intended outcome.

---

o Shift from an expectation that the front-line will simply implement policies, to an expectation that the front-line will be involved in pragmatic discussions of how to achieve intended outcomes. This increased communication and dialogue will increase employee engagement and meaningfully inform policy and directives. As local leadership draws employees into key decisions in a more deliberate and transparent way, in effect trusting them to become leaders of their system, this will engender more trust, and ultimately enhance ownership and psychological safety.

o Invite employees to the dialogue. Draw on the expertise of the workforce to improve local leadership decisions. Specifically: 1) create a rotating position where supervisors and front-line employees join select executive leadership meetings; 2) establish weekly executive office hours; and 3) increase the consistency of formal and informal dialogue with employees through labor-management partnerships, town halls, and daily rounds. This is being done in some facilities already, and there is an opportunity to spread this further.

- Connect to the strategic direction. Directly connect all employees' tasks with VHA's strategic direction to clearly identify their contributions. Specifically: 1) include how the activities performed by employees support the mission and strategic direction in all communications; 2) craft performance plans and position descriptions that increase emphasis on mission-related activities and decrease emphasis on compliance-related activities, with the intent of increasing role clarity; and 3) provide non-clinical employees with more opportunities to interact with Veterans.

It should be noted that getting people to listen, and motivated to act, is getting harder and harder. VHA may need an innovative leading-edge communication campaign, combined with substantially increased face-to-face interactions, to make messages "stick" in this environment. This input comes with responsibility, and needs to be underpinned by rigorous performance management and transparent data systems that ensure accountability.

4.2.6 Redesign the Human Resources Function as a More Responsive Customer Service-Focused Entity

VHA should begin an effort in the next 12 months to transform the human resources (HR) function to be more responsive to meeting the needs of VAMC leadership, more efficient, and more customer service-focused. Although a comprehensive examination of HR was not within scope of Assessment L, systematic HR challenges were identified that need to be addressed through a transformation of the HR function. Such a transformation will likely require redesigning key processes (e.g., hiring), shifting the mindsets of HR cadre from compliance to effectiveness, training HR and its customers on key roles and responsibilities, and rationalizing its technology systems. This will require detailed understanding of the regulatory environment and close collaboration with stakeholders including but not limited to unions and OPM.

Specific recommendations pertaining to HR include:

- Streamline or redesign processes so they include clear roles, responsibilities, service-level agreements, and performance metrics, all designed to help HR actively support VHA

leaders in a timely way and to help address compliance requirements (e.g., discipline process expectations, hiring process turnaround times, troubleshooting of federal regulations). For example, in many facilities, HR is urged to fill 80 percent of positions within 60 days. Several HR groups spoke of self-imposed constraints that lengthened hiring time for their internal customer: "to make sure we meet speed-of-hire, we'd turn back certs [hiring certificates] instead of extending them, if the services didn't give us exactly what we needed. Now, we're trying to encourage the team, rather than turn the cert back, to keep pushing to fill the role" (VHA interviews, 2015). By simplifying and redesigning the hiring process, VHA can design a more collaborative process that is at once more efficient and responsive to customers' needs. Picking a few key processes, redesigning them locally, piloting them in a few sites, and then rolling out nationally is one way to advance this.

- Provide training and tools to all hiring managers on federal regulations related to key processes, for example, hiring or progressive discipline, so that all stakeholders understand the regulatory nuances to be able to keep the process moving as swiftly as possible. For example, ensure system leaders understand their role in driving the hiring process, and HR employees understand what is (and is not) required to keep processes moving effectively and efficiently. Though processes can sometimes be quite labor-intensive, they are clearly documented. Better knowledge of, training around, and adherence to process guidance – by HR and its customers alike – would enhance execution. Ensure process adherence is a focus of leaders as well.

- Remove functions from human resources that are more appropriately controlled elsewhere in the organization (for example, centralize responsibility for local physician recruiting with physician leadership at VISN, similar to private sector hospital systems).

- Rationalize human resources technology systems to decrease complexity and increase coordination among functions. One VAMC reported having more than 30 different HR systems and tools. Another HR leader explained, "Someone can call us for something as simple as written counseling, and before we can even give them any advice, we have to go into two or three systems to even know who they are" (VHA interviews, 2015). Rationalizing systems and increasing interoperability would enhance HR's ability to serve its customers.

4.3   Implementation Considerations

As previously noted and in alignment with Section 201 of the Choice Act, Section 201 assessments, findings and recommendations were developed independently. We therefore expect these recommendations would be refined by VHA leadership and the Commission on Care.

Below, we have listed the changes that we believe are fundamental preconditions for successfully implementing the recommendations described in Section 4.2, as well as suggested immediate actions to be taken at the national level.

4.3.1 Pre-Conditions for Implementation

The transformation described in this assessment must take place within a system and culture that is currently in flux. As VHA seeks to stabilize itself, it must do so using some of the very tools, systems, and processes that are not working well today, in an environment where there may not yet be clarity of strategic direction, role clarity, and local empowerment. This dynamic should be kept in mind, especially regarding critical success factors around implementation.

Recognizing the interdependencies of this transformation effort, there are several pre-conditions for success:

- Clear definition of where the organization is headed, grounded in VHA's mission and strategic direction, and a careful articulation and communication of the path to meet this aspiration
- Support and commitment from senior leadership in the field and in Central Office, bolstered by strong field involvement (including the front-line)
- Congressional support
- Capacity, perhaps created by scaling back or stopping select initiatives that are less important to strategic direction
- A formal change program housed in a central transformation office, with authority and resources designed to be able to support the transformation throughout the organization. This needs to include staff that can be deployed in the field to support facilities in design, implementation, and scaling of best practices
- A clear action plan, with milestones and timelines, to ensure timely implementation of the vision
- Demonstrated progress, early wins, and ongoing monitoring
- Sustained and consistent leadership

Throughout, VHA leaders will need to role model the change needed, describe why the transformation is needed, reinforce desired behaviors, and provide leaders and employees alike with the coaching, training, and tools they will need to succeed.

4.3.2 Immediate Actions for Consideration

Some efforts should be considered to begin right away, while others will likely require more advanced planning and resourcing before meaningful design or implementation can begin. Recommended immediate actions are laid out in **Table 4-1** and should include:

Table 4-1. Immediate Actions

Overall recommendation	Potential immediate actions
Galvanize VHA leaders around a clear strategic direction	▪ Clarify strategic direction ▪ Directly communicate strategic direction to all employees throughout the organization

---

Overall recommendation	Potential immediate actions
Stabilize, grow, and empower leaders	▪ Fill vacancies with the "right" leaders through internal and external hires
Redesign VHA's operating model to create clarity for decision-making authority, prioritization, and long-term support	▪ Align operating model with overall strategic direction ▪ Consolidate VHACO into fewer and coordinated "lines of business"
Focus and simplify performance management	▪ Develop an integrated and balanced scorecard for VAMCs, focusing on a small number of core metrics
Rebuild a high-performing, healthy culture by cultivating greater employee collaboration, ownership, and accountability to accomplish the mission	▪ Connect employees' tasks with overall strategic direction ▪ Open lines of communication
Redesign the human resources function as a more responsive customer service-focused entity	▪ Focus on advancing the mission versus compliance only

5   Succession Planning

5.1   Summary

This report defines succession planning as "the process of identifying long-range needs and cultivating a supply of internal talent to meet those future needs" (Society for Human Resource Management).

A well-functioning succession management process begins with identifying specific needs for critical positions and includes:

- Proactively identifying needs for key leadership positions
- Specifically identifying individual candidates
- Developing leaders
- Connecting candidates with the right openings at the right time.

In determining how well VHA's succession planning approach meets its leadership pipeline needs, study findings are as follows:

- VHA is currently experiencing a large and widespread number of current vacancies and upcoming retirements in key leadership roles, and open positions remain unfilled due in part to a lack of qualified candidates.
- Leadership positions are increasingly unattractive to the next generation of VHA leaders, which contributes to the difficulty in filling leadership openings.
- The existing succession planning effort does not meet the needs of VHA.

Throughout this section, we draw on insights shared during interviews with VHA leaders as well as data from the OHI survey (VHA interviews, 2015; VHA OHI Survey, 2015). Unless otherwise cited, direct quotations are from VHA interviews and survey data are from the OHI survey. We also draw on various other primary source data and cite them as appropriate throughout the section.

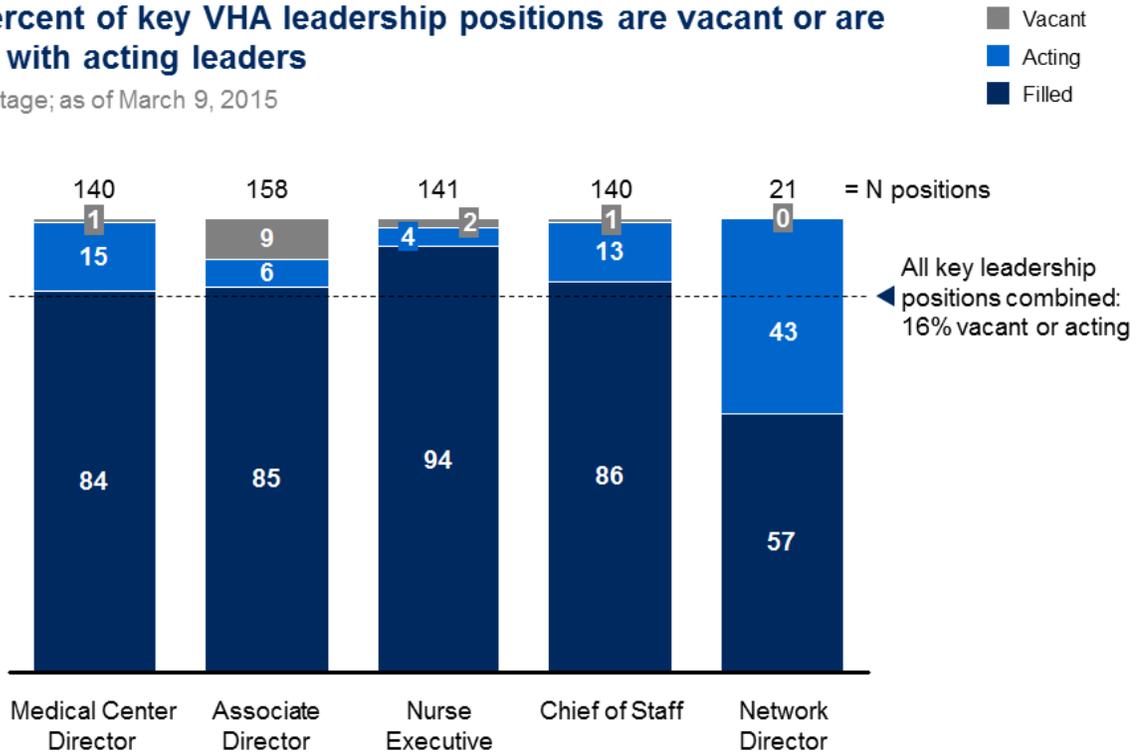
5.2   Findings

5.2.1   VHA Is Currently Experiencing a Large and Widespread Number of Vacancies and Upcoming Retirements in Key Leadership Roles, and Open Positions Remain Unfilled Due in Part to a Lack of Qualified Candidates

In discussing succession planning at VHA, a Medical Center employee described a consistent theme: "We have been talking about the coming leadership crisis for 10 years, but we never did anything about it. Now we're seeing it become a reality."

Figure 5-1 describes this reality. As of March 2015, 16 percent of VAMC Quadrad and VISN Network Director positions are vacant or have acting leaders (VHA Office of Workforce Services,

2015). Twenty-three VA Medical Centers (16 percent) do not have a permanent Director. Nine VISN Network Directors (43 percent) are Acting. In addition, this trend extends to the top of the organization as three of the top five officials at VHACO are Acting at the time of this assessment.[8]

Figure 5-1. Current Leadership Vacancies and Actings


SOURCE: VHA Office of Workforce Services, as of March 2015

This reality is also widespread across key leadership positions in Medical Centers: 39 percent of VAMC Quadrads have at least one current vacancy; three Medical Centers operate with only one permanent Quadrad member. Our interviews acknowledged that the vacancies were due in part to the VHACO and VISN hiring freeze, approvals of the VAMC and VISN positions at the VACO level, and anticipation of the VISN realignment. However, all leadership vacancies have downstream consequences throughout the chain of command. For example, where there are VISN Network Director vacancies, potential Medical Center Director applicants report a hesitancy to pursue positions where their direct supervisor is an unknown entity. As one Acting Director said, "This position has been open nearly a year and one of the main reasons people

---

[8] The three Acting positions include: Acting Principal Deputy Under Secretary for Health, Acting Deputy Under Secretary for Health for Operations and Management (DUSHOM), and Acting Chief of Staff. The two permanent positions mentioned above are Under Secretary for Health and Deputy Under Secretary for Policy and Service.

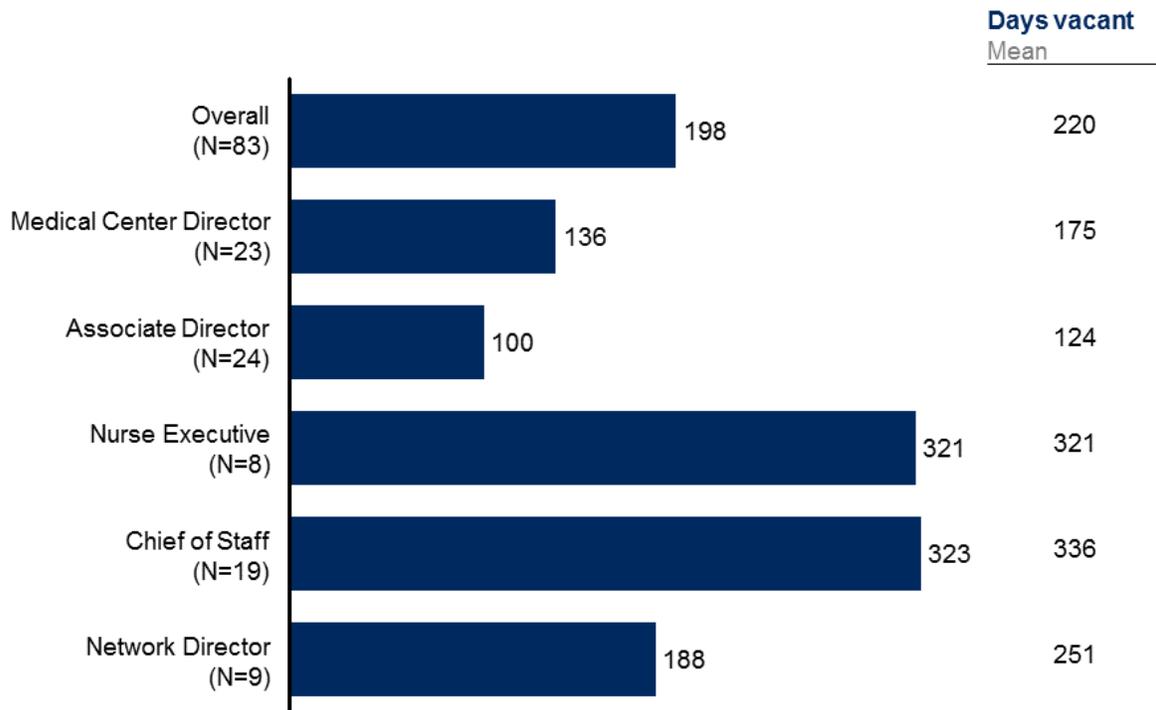
won't take it is that they haven't filled the Network Director yet – who would ever take a job without knowing whom you are working for?" Similar reluctance was expressed at other levels (e.g., Service Chief reporting to an Acting Chief of Staff). High retirement eligibility – 57 percent for key leadership positions, detailed in the next section – worsens this picture (VHA Office of Workforce Services, 2015).

Faced with significant key leadership vacancies and the potential for even larger ones in the months and years ahead, VHA has been unable to fill leadership gaps quickly. The length of time current key openings have been unfilled stretches for greater than seven months on average, with over half of all key openings currently open for greater than six months (VHA Office of Workforce Services, 2015) **[Figure 5-2].**

Figure 5-2. Length of Vacancies

Currently vacant key VHA leadership positions have been open for a median of 198 days

Days vacant, median

	Days vacant (median)	Days vacant Mean
Overall (N=83)	198	220
Medical Center Director (N=23)	136	175
Associate Director (N=24)	100	124
Nurse Executive (N=8)	321	321
Chief of Staff (N=19)	323	336
Network Director (N=9)	188	251


SOURCE: VHA Office of Workforce Services, as of March 2015

The current length of vacancy days is likely attributable to a lack of available candidates as well as the hiring process itself. This is validated by discussions at the VAMC and VISN levels, where interviewees report, "I'm starting the hiring process with just three viable resumes for a Medical Center Director position," and "We are probably hiring people too early on in their VA careers for these positions, but we don't have a choice. We're setting them up for failure."

A large retirement-eligible population among its current leaders threatens to deepen the leadership vacancy challenge faced by VHA. **Figure 5-3** shows that 57 percent of leaders in key positions are retirement-eligible.[9] Over two-thirds of Network Directors, Nurse Executives, and Chiefs of Staff are retirement-eligible, as well as 47 percent of Medical Center Directors (VHA Office of Workforce Services, 2015). There are indications that this retirement threat is beginning to be realized; in FY 2014, retirements by VHA employees GS-13 and higher increased by 37 percent over the previous 5-year average (OPM, FedScope, accessed 2015).

Figure 5-3. Retirement Eligibility

57 percent of key filled VHA leadership positions are held by retirement-eligible leaders

Percentage; as of March 9, 2015

---

[9] "Key positions" are defined as VISN Network Director and Medical Center Quadrad leaders (Medical Center Director, Associate Director, Associate Director for Patient Care Services/Chief Nurse Executive, and Chief of Staff).

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

5.2.2 Leadership Positions Are Increasingly Unattractive to the Next Generation of VHA Leaders, Which Contributes to the Difficulty in Filling Leadership Openings

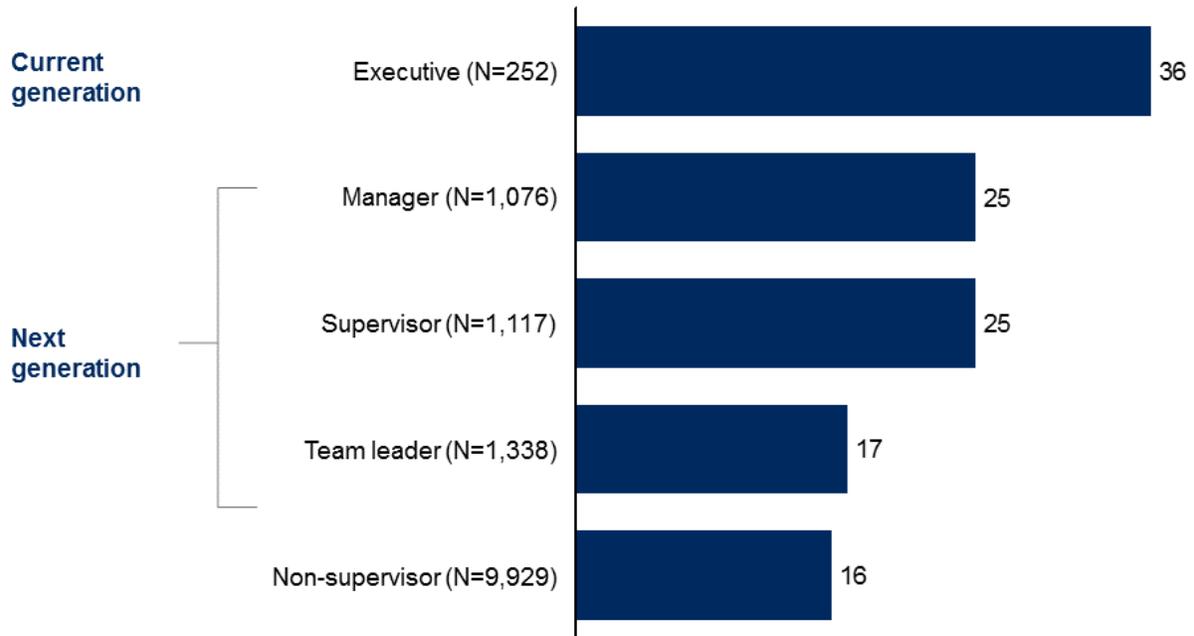
According to Office of Personnel Management (OPM) officials interviewed, applications to Senior Executive Service (SES) positions across the federal government have been stable in recent years (Office of Personnel Management interview, 2015). This suggests that VHA's struggles with filling senior positions are somewhat unique.

The VHA leadership value proposition for all leaders in VHA does not balance the intense pressure, scrutiny, and life changes required by the position. The value proposition is decreasing for the next generation – today's managers, supervisors, and team leaders. As **Figure 5-4** displays, just one in four managers and supervisors respond positively when asked about the attractiveness of career opportunities, as compared to one in three executives today. This is most pronounced when speaking with Pentad and VISN staff who could be considered candidates for Medical Center Director positions but are not pursuing advancement. This was also reflected in interviews: one in three Pentad leaders suggested there was little incentive to take a promotion as it substantially increased risk with little increase in potential reward. Risk in this context was defined as the potential consequences of increased exposure to the media, Congress, and VHACO in the current environment.

Figure 5-4. Career Opportunities

Next generation of VHA leaders considers career opportunities less attractive than current generation

Career Opportunities: Percent of respondents who frequently observe the following[1]:
"The organization offers top performers the most attractive career opportunities within the organization"
"Promotions in the organization are based on merit"

Current generation	Executive (N=252)	36
Next generation	Manager (N=1,076)	25
	Supervisor (N=1,117)	25
	Team leader (N=1,338)	17
	Non-supervisor (N=9,929)	16


1 Score is generated based on average of responses to the two questions
SOURCE: VHA OHI Survey 2015 (N=13,712)

The unpredictable short-tenure assignments contribute to making these positions less attractive for the next generation of leaders. In many cases, this unpredictable nature is caused by frequent movement between positions due to reassignment or application for new positions. The resulting shorter tenures have a material impact on the leader's ability to make change happen quickly – often the organization will "wait them out." Employees appear more resistant to a career path that requires frequent geographic mobility. According to data provided by VHA, current SES employees have worked at four to five locations in their VHA career, with a 3- to 4-year average length of stay at each location (VHA Office of Workforce Services, 2015). As one Director said, "My team today isn't willing to put their families through all the upheaval that I did to mine." In addition, many Directors assume their roles toward the end of their careers, which requires the patience of navigating a gradual career progression with a single employer. Interviewees reported that this nature of progression was less accepted by the next generation of leaders.

5.2.3   The Existing Succession Planning Effort Does Not Meet the Needs of VHA

No key succession planning elements are fully practiced by VHA. Federal statute clearly lays out the succession planning responsibilities of agencies, which include:

- Development of a "comprehensive management succession program, based on the agency's workforce succession plans, to fill agency supervisory and managerial positions"

- Succession efforts supported by agency training and mentoring: the focus "should be to develop managers as well as strengthen organizational capability"

- "Ensure an adequate number of well-prepared and qualified candidates for leadership" are available in the agency (U.S. Code Title 5 CFR Section 412).

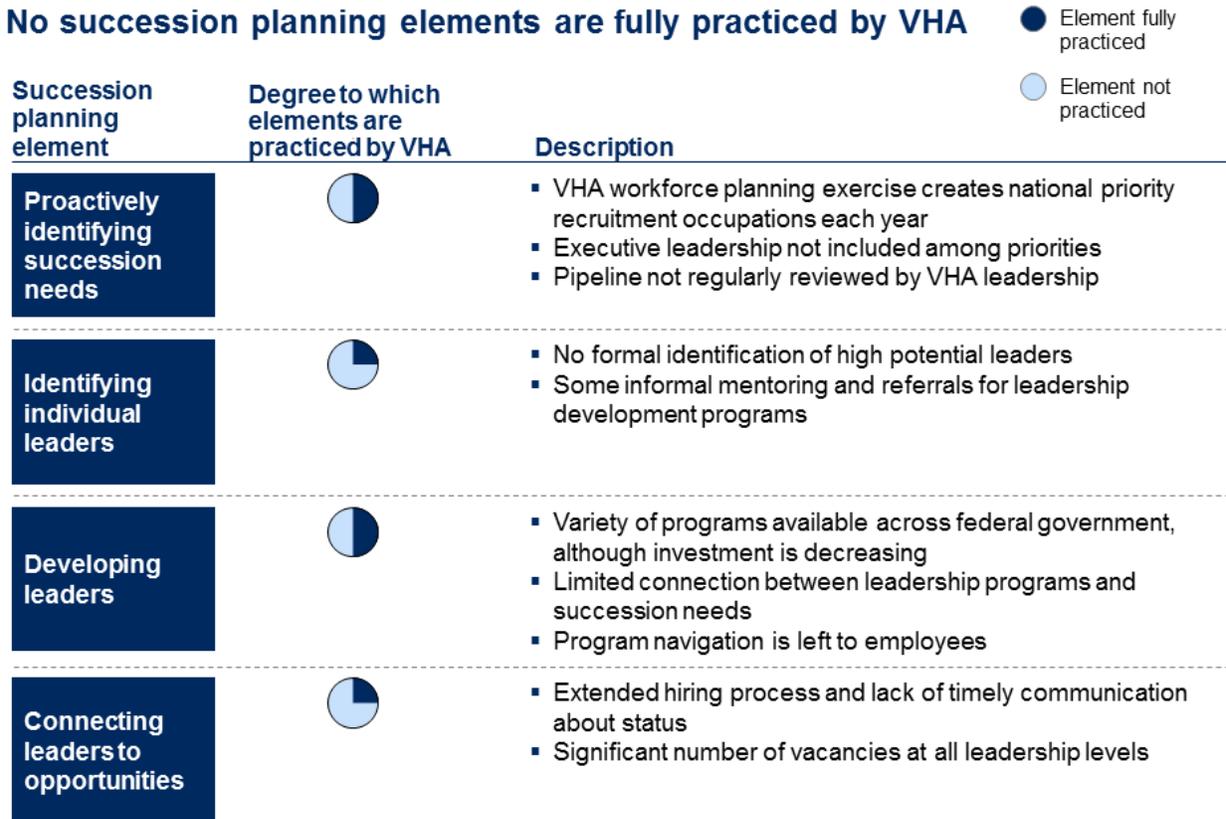
What follows is a set of best practice elements of succession planning and management (Day, 2007; Society for Human Resource Management, "Successful Practices in Succession Planning"). **Figure 5-5** assesses VHA's current practices rated against these best practice elements.

- **Proactively identifying needs for key leadership positions.** This involves senior leadership regularly meeting to review major leadership positions and the status of potential successors for each position. Today, VHA's workforce planning process is an aggregation of bottom-up needs and is limited to detailing broad categories of priority occupations. For VHA, this proactive identification could happen at the VISN level, with input from VHACO as well.

- **Specifically identifying individual candidates.** Once specific needs are identified, successor candidates should be recommended by managers who are trained to evaluate for potential as well as performance. Today, VHA lacks both the tools (position management system, a candidate assessment center for specific development tracks) and processes (a potential component of the performance management process) to identify individual candidates.

- **Developing leaders.** Cultivation of leaders is addressed elsewhere in this report (see Section 6), but important to note here is that leadership development plans and programs should specifically grow succession-identified pipelines. Access to programs in VHA occurs "without a lot of rhyme or reason" according to one VHA official, and development plans, according to interviews with HR officials, are completed by employees on their own, without a formal mechanism for dialogue with their managers or other mentors. They may choose to consult with their managers in the process, but it is at their discretion.

- **Connecting candidates with the right openings at the right time.** Career paths to positions for those participating in development programs and activities should be predictable with clear expectations. At VHA, leadership development programs prepare candidates for positions that, for example, require mobility when that may not be of interest to the employee being trained. Additionally, a series of "unwritten rules" complicates the leadership path, with potential leaders perceiving that VHA favors, for example, facility complexity progression (gaining experience leading a Level 2 facility before leading a Level 1 facility) and certain experience needs (assignment details or VISN exposure) before approving a promotion to senior leadership (VHA interviews, 2015).

Figure 5-5. VHA Succession Planning Performance


SOURCE: Society for Human Resource Management; VHA interviews, 2015

These elements work together in many private sector settings to create a robust leadership pipeline. In interviews, multiple VHA employees, particularly HR administrators, expressed discomfort with applying these succession planning elements in the public sector due to possible conflict with Merit System Principles (5 USC, Section 2301) and pre-selection prohibitions, the threat of increased Equal Employment Opportunity (EEO) or Merit System Principle Board (MSPB) complaints, and bargaining restrictions. Therefore, HR administrators requested greater guidance from VHA before accepting that this approach would be possible.

Conversations with VHA leaders at VAMCs, VISNs, and VHACO revealed the impact of the lack of effective succession planning. Leaders expressed widespread concern over the lack of a systematic "enterprise" approach to succession planning, and "day-to-day" focus obscuring long-term thinking. More than half of the leaders interviewed shared this concern. Typical sentiments heard were:

- "Every time we turn around we have vacancies and no one to fill them. We are very thin."
- "[When we talk about] Workforce Succession Planning, we really just give lip service to succession planning. We really do just truly workforce planning."
- "We've not had an enterprise view [to succession planning]. I don't have anyone or any system who can tell me where the opportunities are. I have an amazing obstetrician

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

telling me she wants to join VA, and she's willing to move, and I don't know what to tell her."

- "I am retiring next month and there is no replacement for me – the top three leadership positions are vacant with no plan."
- "Succession planning? It doesn't happen here."

The evidence above indicates that VHA's current succession planning approach does not meet the needs of VHA. Instead, it results in a workforce planning exercise that only helps define priority occupations that will require hiring today and in the future. In interviews, the annual workforce planning process received mixed reactions, with a high level of awareness of the exercise but also a high level of skepticism that the workforce planning exercise has real influence on the ground. Further, the current process does not specifically address Quadrad-level leadership workforce planning issues, which VA has organized centrally in the Corporate Senior Executive Management Office (CSEMO).

With focused policies and improved communication to employees, succession planning is possible while complying with federal statutes. Within the Merit System Principles of fair and open competition, fair and equitable treatment, and protection against personal favoritism, there are opportunities to plan for merit-based leadership succession (5 USC, Section 2301). Leaders should encourage all qualified employees to apply for the formal leadership development programs to prepare them for positions and ensure eligibility. Candid and constructive feedback provided to those not selected for these programs will improve their preparation and application to such programs in the future. In addition, risk assessments conducted for critical leadership positions will identify near-term vacancies (for example, next six to nine months). In some cases, there could be opportunities to prepare vulnerable positions for these anticipated vacancies through double-encumbering key leadership positions. The interviews elicited a variety of these tactics, but there is no consistency or standardization across VHA leadership, and there is significant opportunity to develop a systematic approach to individual succession management, in the service of developing and deploying the next generation of VHA leaders.

This page intentionally left blank.

6 Leadership Development

6.1 Summary

In this report, leadership development is defined as "formal and informal training and professional programs designed for all management and executive-level employees to assist them in developing the leadership skills and styles required to deal with a variety of situations" (Society for Human Resource Management).

Leadership development extends beyond formal programs to also include mentoring, apprenticeship, and career experience. This is the lens through which we approached leadership development at VHA.

In determining how well VHA is developing the capabilities of current and future leaders through leadership development activities, we found:

- VHA's lack of a comprehensive approach to leadership development has resulted in leaders unable to fully prepare for future roles.
- VHA's formal programs are not linked to career paths, not well-coordinated, and thus do not result in a robust leadership pipeline.
- Multiple competency models in use at VHA result in inconsistent and incomplete leadership development programs.

As of early 2015, renewed efforts are underway, led by VHA's Office of Workforce Services, to centrally address many of the topics described below.

Throughout this section, we draw on insights shared during interviews with VHA leaders as well as data from the OHI survey (VHA interviews, 2015; VHA OHI Survey, 2015). Unless otherwise cited, direct quotations are from VHA interviews and survey data are from the OHI survey. We also draw on various other primary source data and cite them as appropriate throughout the section.

6.2 Findings

6.2.1 VHA's Lack of a Comprehensive Approach to Leadership Development Has Resulted in Leaders Unable to Fully Prepare for Future Roles

A comprehensive approach to leadership development is a combination of four activities:

- **Formal programs.** Structured opportunities for networking, reflection, goal-setting, and learning
- **Mentoring.** Access to role models who help define career paths and troubleshoot difficulties
- **Apprenticeship.** Opportunities to gain on-the-job experience for the next step in a career progression

---

- **Career experience.** Combined understanding of functions and expertise gained by climbing a career ladder over time.

VHA provides each of these activities, but focuses overwhelmingly on a system of formal programs that has, as one leader said, "faded away over the past few years" due to travel restrictions and reductions in training budgets. However, there is evidence of a recent renewed commitment to leadership development and reintroducing national training and mentoring programs (e.g. NExT and HCLDP; coach matching program). Aside from these formal leadership development programs, over 6,000 certified mentors are available for employees. Details and short-term assignments are sometimes available (in some cases a byproduct of high leadership vacancy rates) to build experience for potential positions. (VHA Office of Workforce Services, 2015). Even so, these programs and similar efforts are insufficient to address the current leadership gaps and needs.

With declining formal programs and no unified approach to tie together the other elements of leadership development, employees are left to piece together these activities on their own. This has led to concerns expressed in interviews that "we are setting up some of our leaders to fail." More than 40 percent of Pentad leaders and 30 percent of non-Pentad leaders interviewed echoed the sentiment that VA's investment in leadership development has been insufficient in recent years. The result is leaders who are not able to bring the full capability and resources of VHA to bear on the needs of the Veteran.

6.2.2   VHA's Formal Programs Are Not Linked to Career Paths, Not Well-Coordinated, and Thus Do Not Result in a Robust Leadership Pipeline

In its 2014 Interim Workforce and Succession Strategic Plan, VHA candidly describes the state of its leadership development approach and acknowledges three current challenges, all of which have been observed throughout this assessment:

Career. "The lack of clear career ladders or logical paths of progression from entry through upper levels of leadership makes the system confusing to navigate and negotiate."

Program coordination. "Because the overall system of leadership development is not synchronized or aligned, there are overlaps and gaps between the programs."

Investment decisions. "Student capacity is driven by budgetary and other constraints, not by actual need for graduates" (2014 VHA Interim Workforce and Succession Strategic Plan, 2014).

Interviews and analyses from this assessment support the previous findings noted above. Regarding career paths, interviews reveal that leadership progression at VHA is predominantly self-directed, with motivated employees applying for programs and responsible for piecing together a career path through these programs. Planning support is not offered in many VAMCs, which can lead to missed opportunities or enrollment in trainings that are not the best fit for an employee's career path and potential. In addition, the timing is such that many leadership programs are for individuals already occupying positions for which training is being provided. As one interviewee told us, "I wish I had this before I started the job – that's when I could have used it the most."

Regarding program coordination, no single entity coordinates leadership development in VHA – there are least 19 entities within VHA, VA, and the federal government that offer at least 30 leadership development programs in aggregate (VHA Office of Workforce Services, 2015). The mentality as described by a VHA leadership development leader is that "everyone wants to hang on to their own piece," which has led to "no consistent ownership and a lack of coordination."

Regarding investment decisions, investment and enrollment in leadership development programs have decreased in recent years, resulting in limited access for leaders in need of these programs. In data provided by VHA, the number of graduates across seven key programs decreased 24 percent between 2011 and 2014 to 1,800 graduates across all levels of VHA, while overall investment decreased 14 percent between 2013 and 2014 (VHA Healthcare Talent Management Office, 2015). Interviewees report that access to programs has been limited because of travel restrictions and VHACO approval delays. In addition, interviews with federal officials involved with Senior Executive Service (SES) programs revealed that VHA has not offered a Career Development Program for senior positions in recent years, a program that is a standard across federal agencies. Efforts to restart this program are underway (Office of Personnel Management, 2015).

In an environment with decreasing resources, VHA has limited insight into which programs are the best use of limited funds. VHA officials involved with leadership development programs told us, "We don't have good measurement of our programs." Outside of satisfaction surveys, interviews did not reveal any evaluation of leadership development programs (such as whether trainees were connected to the jobs for which they were trained) or of employee performance in new roles after completion of training or coaching programs.

6.2.3 Multiple Competency Models and Frameworks in Use at VHA Result in Inconsistent and Incomplete Leadership Development Programs

One education expert at VHA told us, "We don't have a consistent competency model that has been blessed and sent to the field." At least four models or frameworks exist currently. The VHA High Performance Development Model is a health care-centered competency model favored within VHA and used to inform some trainings, but it is distinct from VA competencies endorsed by the VA Learning University (VALU) that are predominantly used in performance management settings. These are both separate from qualifications required by OPM for senior executives. All are detailed in **Figure 6-1.**

Figure 6-1. Competency Models in Use

Four competency models and frameworks compete to prepare and evaluate VHA leaders

VHA High Performance Development Model	VA Leadership Competencies	VA All Employee Competencies	OPM ECQs (Executive Core Qualifications)
▪ Personal mastery	▪ Leading people	▪ Communication	▪ Leading change
▪ Technical skills	▪ Partnering (building coalitions)	▪ Interpersonal effectiveness	▪ Leading people
▪ Interpersonal effectiveness	▪ Leading change	▪ Critical thinking	▪ Results driven
▪ Customer service	▪ Results driven	▪ Organizational stewardship	▪ Business acumen
▪ Flexibility/adaptability	▪ Global perspective	▪ Veteran and customer focus	▪ Building coalition
▪ Creative thinking	▪ Business acumen	▪ Personal mastery	
▪ Systems thinking			
▪ Organizational stewardship			

SOURCE: VHA Office of Workforce Services, 2015

While there is no competency consensus at VHA, a review of private sector health care leadership standards reveals six capabilities that are commonly expected of high-performing leaders. These include:

- **Stakeholder management,** including external affairs and bureaucracy navigation
- **Financial acumen,** including resource management and fiscal stewardship
- **Operational excellence focus,** including relentless attention to clinical outcomes and a continuous improvement orientation
- **Strategic thinking,** including establishing mission and direction and leading change
- **People leader,** including coaching, developing, and influencing others
- **Technical mastery,** including high competence in native discipline and continuing contribution to that discipline (Interviews with leading systems).

As **Figure 6-2** shows, each of these is found, at least in part, in VHA's existing models and frameworks, but they are neither found in every model, nor for every type of leader (VHA Healthcare Talent Management Office, 2015). For example, leaders who attend trainings based in VHA's High Performance Development Model may not specifically receive in-depth business or financial skills unless they also attend a training that is influenced by the VA Leadership

competencies, the latter of which more consistently addresses these skills. A standardized, comprehensive view would guard against both inconsistent preparation and expectations across VHA and also possible gaps in competencies.

Figure 6-2. Leadership Capabilities

Capabilities required of health care leaders are not universally found in existing VHA competency models and frameworks

7   Culture

7.1   Summary

This report defines the culture of an organization as the "collection of overt and covert rules, values, and principles that are enduring and guide organizational behavior" (Burke and Litwin, 1992) or more simply "the way things are done around here" (*McKinsey Quarterly*, 2003). Other common definitions often talk about the mindsets and behaviors of an organization. Despite these relatively simple definitions, the culture of any organization is a complex and interconnected construct.

To understand and evaluate the culture at VHA, this report used in-depth analyses of data obtained from surveys including the Organizational Health Index (OHI), the Federal Employee Viewpoint Survey (FEVS), the VA All Employee Survey (AES), and interviews.

Examination of the culture found in VHA reveals a few practices that are powerful enablers of the mission and several cultural practices that are making the mission much more difficult to achieve. Study findings are as follows:

- Throughout all levels of the organization, employees and leaders share in their dedication to the mission of caring for Veterans.
- VHA employees want to move from a bureaucratic, political, and siloed organization to one defined by accountability, trust, and efficiency.
- Risk-aversion permeates all levels of VHA.
- There exists a pervasive lack of trust throughout VHA.
- The OHI Survey reflects poor organizational health across all nine outcomes.
- VHA does not currently align with any of the OHI archetypes for high-performing organizations.

In addition, while out of scope of this report, it also became clear throughout interviews that the broader VA culture has an impact on VHA culture.

Throughout this section, we draw on insights gathered during interviews with VHA leaders as well as data from the OHI survey (VHA interviews, 2015; VHA OHI Survey, 2015). Unless otherwise cited, direct quotations are from VHA interviews and survey data are from the OHI survey. We also draw on various other primary source data and cite them as appropriate throughout the section.

7.2   Findings

7.2.1   Throughout All Levels of the Organization, Employees and Leaders Share in Their Dedication to the Mission of Caring for Veterans

Within all ranks of VHA, there is an almost universal embrace of the mission of caring for Veterans. In interviews with employees ranging from front-line nurses to leadership, this mission is frequently cited as the most important reason why people come to work. At every

VAMC where we conducted site visits, at least one leader interviewed at each facility endorsed the value that the workforce placed on "commitment to the mission" (VHA interviews, 2015). Roughly half of the interviewees mentioned commitment to the Veteran. Representative quotes include:

- "Our mission is the glue. It binds people together to get the work done."
- "Taking care of Veterans is not just a phrase, but it is an action."
- "It's an honor to serve Veterans."
- "[Our] canteen sells out of VA Employee jackets. People are proud to wear them, proud of where they work."
- "You won't find a more dedicated staff who do whatever and however is necessary to work."

This dedication to the mission of caring for Veterans is also reflected in the FEVS. One of the trends in it is Employee Skills-Mission Match, which "assesses the level to which employees get satisfaction from their work and understand how their jobs are relevant to the organizational mission" (Partnership for Public Service and Deloitte, *The Best Places to Work in the Federal Government*, 2014; FEVS, 2014). This is the only category in which VA consistently leads the Large Agency median **[Figure 7-1]**.

Figure 7-1. Employee Skills-Mission Match

Employee Skills-Mission Match is the only category that consistently exceeds the large agency median

SOURCE: Partnership for Public Service and Deloitte, The Best Places to Work in the Federal Government, 2014

7.2.2 VHA Employees Want to Move From a Bureaucratic, Political, and Siloed Organization to One Defined by Accountability, Trust, and Efficiency

One aspect of the OHI Survey addresses organizational values. This "value mapping section" gives respondents the opportunity to identify those values or characteristics that most represented the current state of VHA as well as those desired values or characteristics they would like to see VHA move toward in the future. Five values, including two of the ICARE values[10], were identified as both current and desired: Veteran focus, being of service to others, caring, commitment, and advocacy **[Figure 7-2].**

However, among the values most commonly seen in the current state, employees also mentioned "bureaucracy," "internal politics," "hierarchical," and "siloed." The other three ICARE values – "integrity," "respect," and "excellence," were included in desired values but not current. In addition, VHA employees want to see the organization move from a siloed, slow-moving, and bureaucratic organization to a collaborative, efficient organization with a focus on excellence – and an organization focused on the Veteran and on the employee. The slow-

---

[10] The ICARE values are VA's core values and include integrity, commitment, advocacy, respect, and excellence.

moving, siloed bureaucracy acts as a significant barrier to helping provide each Veteran the unique care he or she needs.

Figure 7-2. Current and Desired Values

Difference between current and desired values

Top 15 current and desired values

CURRENT VALUES Where we are today ...	CURRENT & DESIRED VALUES What we'd like to continue ...	DESIRED VALUES Where we'd like to be ...
Bureaucracy		Accountability
Internal politics	Veteran focus	Continuous improvement
Having a noble purpose	Being of service to others	Being Collaborative
Slow-moving	Caring	Excellence[1]
Hierarchical	Commitment[1]	Efficiency
Inconsistent	Advocacy[1]	Integrity[1]
Silos		Well organized
Making a difference		Respect[1]
Contributing to the greater good		Employee focus
Conflict		Professional growth

1 ICARE value

7.2.3   Risk-Aversion Permeates All Levels of VHA

Employees at VHA, ranging from front-line nursing staff up to VISN Directors, are notably risk-averse. The current culture found in VHA is one in which employees are "afraid to raise their hand to call something out." Interviews throughout the organization support this finding. At almost every facility visited, at least one leader interviewed mentioned that risk-aversion and a reluctance to "speak up" were a significant issue. Three out of every four leaders interviewed at VISNs in which site visits were conducted echoed this concern. Additionally, VHA employees cited a lack of psychological safety as one of their main concerns (VHA interviews, 2015). One leader explained, "Risk-aversion permeates the VHA." The effect on the Veteran is a staff conditioned towards compliance with rules versus focused on effective delivery of care.

The OHI provides additional evidence **[Figure 7-3].** Specifically, the OHI looks at the following management practices when considering risk-aversion: "Consequence management," "risk management," "open and trusting," and "supportive leadership." When compared against the public sector and health care benchmarks, VHA scores demonstrably lower on each practice –

and even public and healthcare sector benchmarks, it should be noted, are in the bottom quartile of all respondents.

Figure 7-3. Risk-Aversion

Risk aversion permeates the organization

7.2.4 There Exists a Pervasive Lack of Trust Throughout VHA

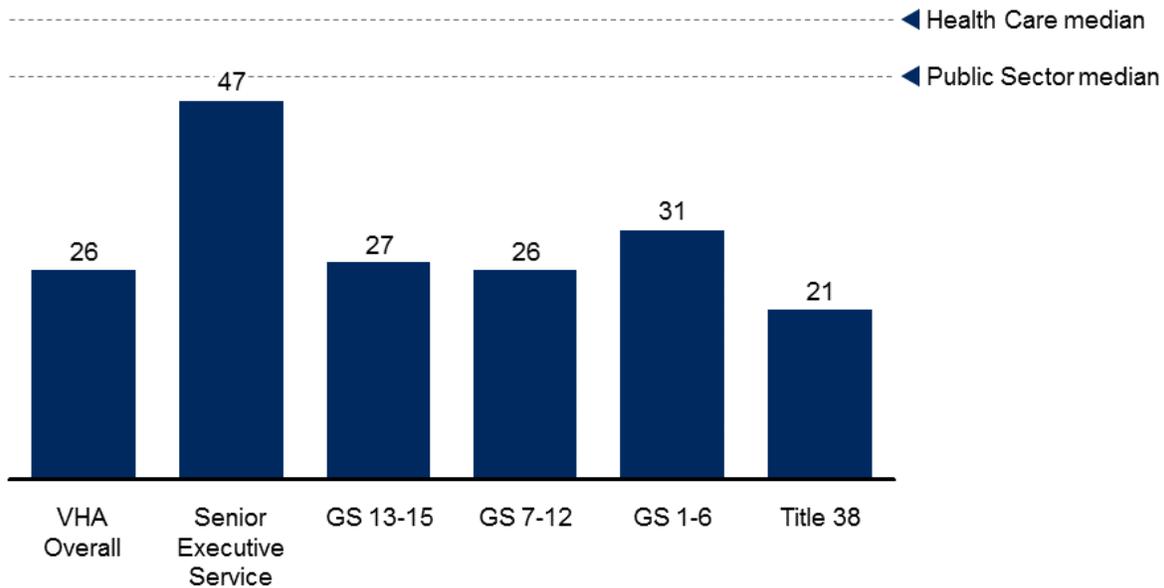
Within VHA, there appears to be a significant lack of trust among employees across levels. Some Medical Center Directors spoke of not trusting VHACO, and some VHACO officials spoke similarly of Medical Center leaders. Front-line supervisors stated they did not trust the leadership within the facility. Representative quotations from interviews include:

- "There is an opportunity for improvement, an opportunity for trust."
- "Trust? Not a lot. People do trust the Director, but have mixed trust of the Quad, and less trust in lower leadership."
- "Lack of trust leads to micromanagement."
- "Everyone is so worried about getting into trouble or losing their job. Trust is lacking through the organization."
- "We need to encourage innovation and empower front-line to make decisions. This may be a trust issue. I'm seeing hesitation because they don't want to do something wrong."

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

- "We've developed hopelessness and helplessness: helpless to fix things, and hopeless that anyone else would help."

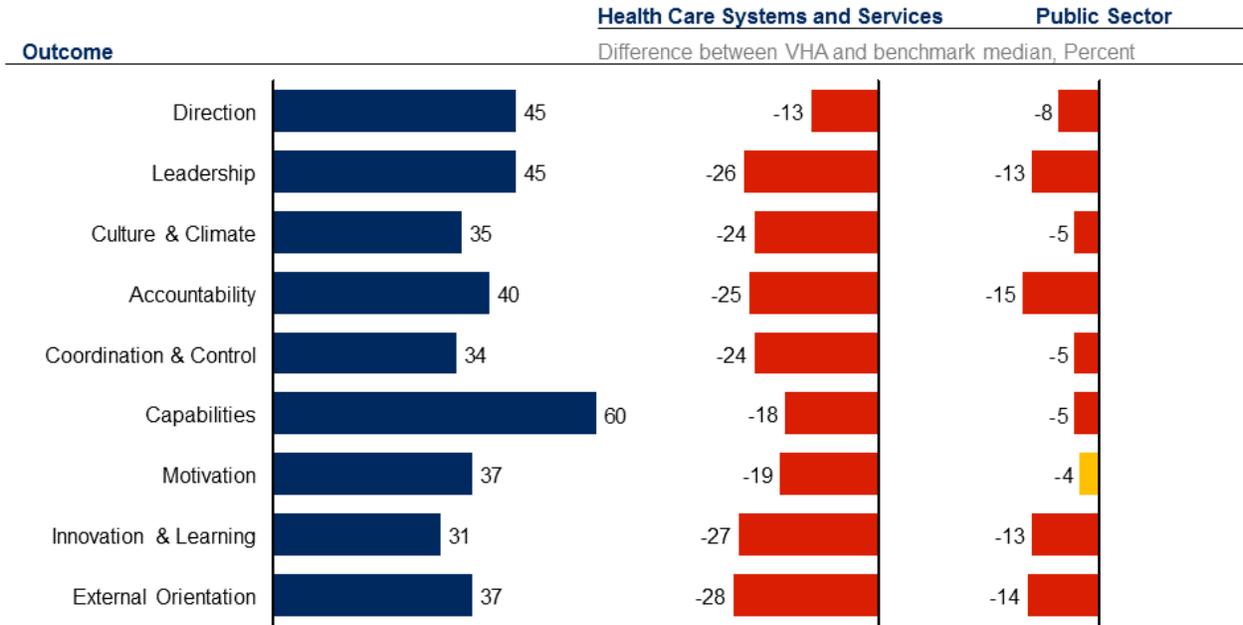
Analyses of the OHI data centered around the open and trusting nature of the work environment corroborate this **[Figure 7-4].** Across levels of employment, this practice is in the lowest quartile. SES rank the practice significantly higher than other segments, 47 compared to 21 to 31**.** This may be due to senior leaders having greater visibility into the full set of reasons for VHA's major actions, increasing their level of trust in the organization.

Figure 7-4. Open and Trusting


SOURCE: VHA OHI Survey 2015 (N=13,712); Global Benchmark (N=1,259,322, no. surveys=737); Public Sector Benchmark (N=47,159, no. surveys=27); Health Care Systems and Services Benchmark (N=40,437, no. surveys=33)

7.2.5 The OHI Survey Reflects Poor Organizational Health Across All Nine Outcomes

The OHI survey affords the opportunity to benchmark VHA's organizational health against other similar organizations. When compared to peers, VHA lags in every outcome (the current state of an organization), and each organizational health outcome lies in the bottom quartile of all survey respondents **[Figure 7-5].**

Figure 7-5. VHA Outcomes Compared to Benchmarks


SOURCE: VHA OHI Survey 2015 (N=13,712); Health Care Systems and Services (N=40,437, no. surveys=33), Public Sector (N=47,159, no. surveys=27)

This performance is also reflected in the practices (the actions an organization takes to achieve results). Examining the 37 management practices, VHA scores in the bottom quartile of 35 of 37 of them. Only two practices, shared vision and Veteran focus, scored in the third quartile, reflecting a strong commitment to the purpose of caring for Veterans, a sentiment echoed resoundingly in interviews as well.

The OHI also included several open text questions. An assessment of open text responses requesting three words that describe VHA reveals a number of recurring themes. Language around Veterans, care, and bureaucracy was most common. **Figure 7-6** shows a visual analysis of the frequency of words, with the size of the word reflective of the relative frequency with which the word showed up in the open text responses. This is consistent with the themes we heard in our interviews.

Figure 7-6. Three Words Describing VHA

A visual analysis of open text responses reveals a number of themes, including bureaucracy and Veteran-centered care

NOTE: Size of word reflects frequency of response when asked for 3 words that define VHA

SOURCE: VHA OHI Survey 2015 (N=13,712); analysis of open text responses

7.2.6 VHA Does Not Currently Align With Any of the OHI Archetypes for High-Performing Organizations

Within high-performing organizations, McKinsey has identified four distinct archetypes of healthy organizations, based on the signature mixes of practices that organizations deploy to create a coherent and effective management system.

The first, "leadership-driven," is manifested by inspirational leaders who are the performance catalyst, setting high expectations and helping the organization achieve those expectations. The second, "market-focused," is characterized by an organization with strong customer focus, competitive insights, and valuable business partners. The third archetype, "execution edge," is represented by organizations that leverage the knowledge of employees at all levels and outperform the competition through superior execution, and continuous improvement. The final archetype is characterized by the "collective talent and knowledge" of the organization and success depends on developing it effectively.

There is not a one-size-fits-all, or single "best practice" way to achieve sustainable performance and health – all four of these archetypes are different proven paths to success. Moreover, no organization can manage all 37 organizational health practices equally – focusing on the

winning recipes of select practices with known synergies is likely to be most successful in the long run. These archetypes can provide areas of focus.

Importantly, organizations that align very strongly to any of the four archetypes have a five times greater chance of being healthy than peers with weak alignment. Organizations that align very strongly to an archetype tend to have top quartile OHI scores, while those with no alignment have bottom quartile OHI scores.

Today, VHA does not align strongly with any of these specific archetypes, but aligns weakly with the "execution edge" and "market focus" archetypes **[Figure 7-7].** Most high performing public sector organizations align with the "execution edge" archetype – and most high-performing health care organizations align with either the "market focus" or "execution edge" archetypes: 50 percent of top quartile provider organizations align to "market focus," and 33 percent align to "execution edge." VHA should make a deliberate push to more strongly align with a chosen archetype.

Figure 7-7. Archetypes

VHA aligns weakly with Market Focus and Execution Edge
Archetype similarity based on current relative practice ranking

A **Leadership-driven:** Inspirational **leaders act as a performance catalyst**. They set high expectations and help the organization achieve them

B **Market Focus: Shaping market trends** and building a portfolio of solid, innovative brands keeps us ahead of the competition

C **Execution Edge:** We leverage our people and **know-how at all levels of the organization** to outperform the competition through **superior execution and continuous improvement**

D **Collective talent and knowledge:** Our collective **talent and knowledge** is our most important asset – our success depends on us developing this effectively

A: 0
B: 1.41
C: 2.79
D: 0.41

The 4 archetypes reflect different core beliefs on value creation and success. Organizations with Very Strong alignment to one of the 4 proven archetypes have a 5 times greater chance of organizational health than those with Weak alignment

SOURCE: VHA OHI Survey 2015 (N=13,712)

8   Employee Engagement

8.1   Summary

For this assessment, employee engagement is defined as "the employee's sense of purpose that is evident in their display of dedication, persistence, and effort in their work and overall attachment to their organization and its mission" (Executive Office of the President and OPM, 2014). We focused on the current state of employee engagement, as well as the extent to which leaders influence employee engagement through role modeling, fostering understanding and conviction, and rewards and recognition.

Findings include:

- At VHA, in general, employees feel a strong sense of commitment to caring for Veterans, but they do not feel as much commitment from the organization.
- Employees experience a challenging work environment and "burnout."
- Many VHA employees do not feel well informed or listened to by leadership.
- Reinforcing engagement and behavior with formal mechanisms happens in limited pockets, but faces several constraints, including limited access to positive reinforcement mechanisms, a weak culture of appreciation, and heavily burdensome processes for progressive discipline.

Throughout this section, we draw on insights shared during interviews with VHA leaders as well as data from the OHI survey (VHA interviews, 2015; VHA OHI Survey, 2015). Unless otherwise cited, direct quotations are from VHA interviews and survey data are from the OHI survey. We also draw on various other primary source data and cite them as appropriate throughout the section.

8.2   Findings

8.2.1   At VHA, in General, Employees Feel a Strong Sense of Commitment to Caring for Veterans, but They Do Not Feel as Much Commitment From the Organization

The annual AES shows a current measure of employee satisfaction across VA. While many of the questions touch elements of employee engagement, two are most salient as a starting point for this discussion of employee engagement. "Engagement – Employee" is the highest of all 2014 AES measures (4.23, the only measure above 4 on the 5-point scale), and reflects the personal connection employees feel to the mission of VA. Meanwhile, "Engagement – Organization" is one of the weakest scores in 2014 (3.10), and reflects the general sentiment that employees do not perceive VA to care about their general satisfaction at work (VA, All Employee Survey, 2014) **[Figure 8-1].**

Figure 8-1. Select Measures from AES

Overview of select 2014 VHA All Employee Survey measures
Mean response; 1 = Strongly Disagree, 3 = Neutral, 5 = Strongly Agree

Legend: 2014, 2013, 2012

Engagement – Employee: I feel a strong personal connection with the mission of VA
- 4.23 (2014)
- 4.19 (2013)
- 4.13 (2012)

Engagement – Organization: VA cares about my general satisfaction at work
- 3.10 (2014)
- 3.20 (2013)
- 3.28 (2012)

Advocate: My supervisor stands up for his / her people
- 3.69 (2014)
- 3.70 (2013)

Job Control: My ideas and opinions count at work
- 3.34 (2014)
- 3.44 (2013)

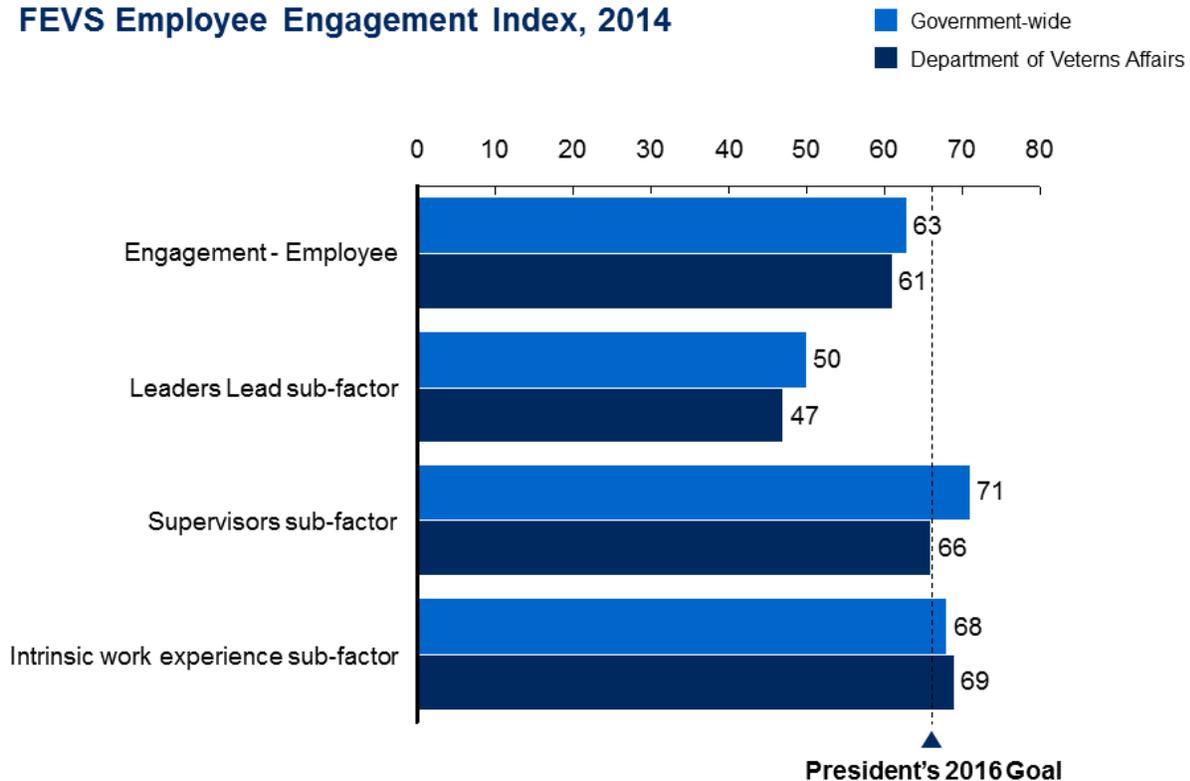
Psychological safety (Bring up problem): Members in my work group are able to bring up problems and tough issues
- 3.60 (2014)
- 3.61 (2013)
- 3.56 (2012)

Fairness: My supervisor is fair in recognizing accomplishments
- 3.67 (2014)
- 3.70 (2013)

SOURCE: VA, All Employee Survey, 2014

Furthermore, the Employee Engagement Index in the Federal Employee Viewpoint Survey (FEVS) is a measure of the engagement potential of an agency's work environment (i.e., the conditions that lead to engagement). In support of the President's Management Agenda Cross-Agency Priority (PMA CAP) goal on people and culture, the Obama administration set a goal to raise this government-wide engagement score to 67 percent by the 2016 FEVS. However, VA followed the government-wide trend with the index of both groups decreasing in 2014 (61 percent and 64 percent, respectively) (Partnership for Public Service and Deloitte, *The Best Places to Work in the Federal Government*, 2014; FEVS, 2014).

VA ranks in the bottom quartile of the category Large Agencies for the total index, as well as the Leaders Lead and Supervisors sub-factors. Conversely, VA is higher than the government-wide average for the Intrinsic Work Experience sub-factor and ranks in the third quartile for Large Agencies. This is consistent with the overall finding of the employees' commitment to the mission of caring for Veterans **[Figure 8-2].**

Figure 8-2. FEVS Employee Engagement Index


SOURCE: OPM, Federal Employee Viewpoint Survey 2014

However, efforts are underway to improve employee engagement. The Office of Management and Budget (OMB), OPM, and the Presidential Personnel Office sent a memo to agency leaders in November 2014 with suggested strategies to raise this Employee Engagement Index score. The memo recommends identifying appropriate FEVS metrics to incorporate into SES and manager performance plans, cascading through to supervisors (Executive Office of the President and OPM, "Strengthening Employee Engagement and Organizational Performance, 2014). Guidance was sent from Secretary McDonald to include a "measurable component related to action planning and/or results to improve employee engagement or based on employee feedback" (VA, Senior Executive Performance for Fiscal Years [FY] 2014 and 2015, 2015).

Our interviews echo these themes. Recurring themes around commitment to the Veteran were:

- "I'm from a family of Veterans – this mission is personal to me."
- "We are committed to the Veterans, but we also have a great lifestyle."
- "I'm here for our Veterans."
- "People are committed and have a strong sense of the mission."

- "Clinicians are dedicated to patients, and there is a special meaning that these people serve our country."

Themes around lack of organizational support from leadership include:

- "It needs to be a two-way street. They [leaders] need to seek to understand not just speak."

- "Our staff's morale is impacted negatively by the fact that they're always asked to do more with no additional resources – nothing is ever taken off the to-do list."

- "Burnout is real."

- "We need to make employees feel like what they think matters. Huddleboards have been really good for this."

This is also reflected in the OHI data, which, as shown previously in **Figure 7-2,** demonstrate that while Veteran focus is highlighted as both a current and desired value, both employee focus and professional growth were identified as desired values but not as current (see Section 7).

8.2.2 Employees Experience a Challenging Work Environment and "Burnout"

Interviewees have shared that employees experience a complex operating environment, including silos, inadequate and often one-way communications, limited access to resources, Congressional inquiries, and ongoing "thrashings" from the press. Many employees feel a lack of empowerment in resolving issues.

VHA ranks near the bottom in the federal government's "Best Places to Work Survey," where VA finished above only the Department of Homeland Security in rank among large federal agencies (Partnership for Public Service and Deloitte, *The Best Places to Work in the Federal Government*, 2014) **[Figure 8-3].**

Figure 8-3. Federal Best Places to Work

VHA ranks near the bottom of the Federal Best Places to Work

1 The Best Places to Work index score is calculated based on 3 different questions in the Office of Personnel Management's Federal Employee Viewpoint Survey (FEVS)

1. I recommend my organization as a good place to work (Q. 40)
2. Considering everything, how satisfied are you with your job? (Q. 69)
3. Considering everything, how satisfied are you with your organization? (Q. 71)

The overall index score measures the performance of agencies and agency subcomponents related to employee satisfaction and commitment. The index is weighted according to the extent to which each question predicts "intent to remain"

SOURCE: Partnership for Public Service and Deloitte, The Best Places to Work in the Federal Government, 2014

Looking at VA's and VHA's trends over time, they have generally mirrored the large agency median since 2010, as all three have gone downward. All hit an all-time low in 2014 (Partnership for Public Service and Deloitte, *The Best Places to Work in the Federal Government*, 2014) **[Figure 8-4]**. It should also be noted that the window of responses was between May 6 – June 13, 2014, at the height of the scheduling crisis, which is a likely driver of VA's and VHA's low scores in 2014.

SOURCE: Partnership for Public Service and Deloitte, The Best Places to Work in the Federal Government, 2014

Burnout is also a concern. The 2014 AES evaluated the level of burnout experienced by employees within VHA as somewhat higher than in 2013 (2.17 compared to 2.05, with lower numbers being more favorable). The specific burnout measures evaluated by the AES asked employees to share how often they "feel burned out from work," "worry that this job is hardening" them, and whether or not they feel they have "accomplished many worthwhile things in this job." While the AES does not compare its survey against external benchmarks for these measures, the answers indicate that burnout is a major concern for VHA employees. Employees "feel burned out from work" a few times a month. They "worry the job is hardening" them and feel they "have accomplished many worthwhile things in this job" once a month or less (VA, All Employee Survey, 2014).

This can have negative effects on the Veteran as he or she moves through the system. Burnout, as a measure of employee enthusiasm and excitement to come to work each day, is especially worrisome in a health care setting, where direct patient care is central to outcomes and the Veteran experience, and in a system where there is already strain on workforce planning and succession planning. Burnout may exacerbate the challenges of keeping VHA staffed to meet the needs of the patient population.

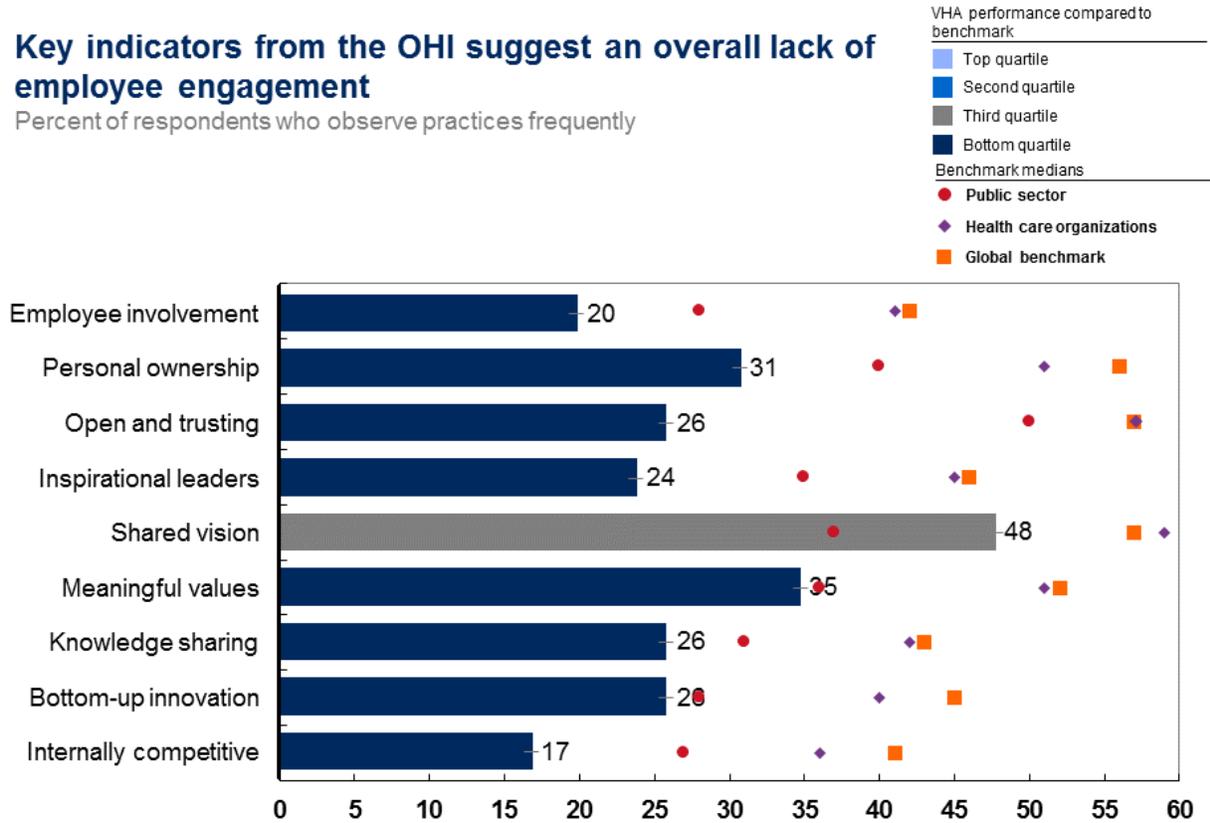
The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

In recent years, RN "quits," defined as voluntary departures, exclusive of retirements, terms, and reductions in force (RIFs), have grown four times as fast as the nursing population itself: between 2011-2014, nurse employment grew by an average of four percent per year, while nurse quits grew by an average of 17 percent per year (OPM, FedScope, accessed 2015). As the system works hard to keep its nurses and recruit new ones, keeping an engaged and committed employee base will be essential, and managing burnout will be part of that.[11]

A low level of employee engagement across VHA is reflected in the OHI as well. Across nine management practices that drive employee engagement, ranging from "personal ownership," to "inspirational leadership," to "shared vision" and "meaningful values," to "how ideas spread through the organization," VHA is lagging far behind the public sector, health care, and global benchmark. "Shared vision" is in the third quartile; all others are in the bottom quartile **[Figure 8-5].**

---

[11] The team looked at RNs (OPM classification 0610) for two reasons. First, it is the largest population of VHA employees and second on the list of Mission Critical Occupations according to VHA's 2014 Interim Workforce and Succession Strategic Plan. Second, this group was chosen because of its size and its relative similarity to the overall population with respect to burnout: in the most recent AES, 8.2 percent of RNs fit VA's burnout profile, compared to 8.8 percent of the overall VA population.

Figure 8-5. Employee Engagement


SOURCE: VHA OHI Survey 2015 (N=13,712); Global Benchmark (N=1,259,322, no. surveys=737); Public Sector Benchmark (N=47,159, no. surveys=27); Health Care Systems and Services Benchmark (N=40,437, no. surveys=33)

8.2.3 No Consensus Exists About VHA Employees Being Well Informed or Listened to by Leadership

Communication is a critical component of employee engagement and an integral way to foster understanding and commitment. The team observed wide variability in strength of communication across the facilities we visited. This was often highly dependent upon the strength of the Pentad leaders and employees' direct supervisors. On the whole, the AES indicates that many employees recognize their supervisors communicating information to them – VHA's average score for information-sharing was 3.65 in 2014 (VA, All Employee Survey, 2014). In spite of this relatively strong score, however, much of what we heard in interviews suggests that communication breakdowns can occur at every level in the organization, from Central Office to the front-line. Byproducts of this include some employees' perception that leadership does not care about them, limited clarity around performance expectations, and employee hesitation to speak up.

Representative quotes include:

- "VA works in silos, which leads to communication gaps."

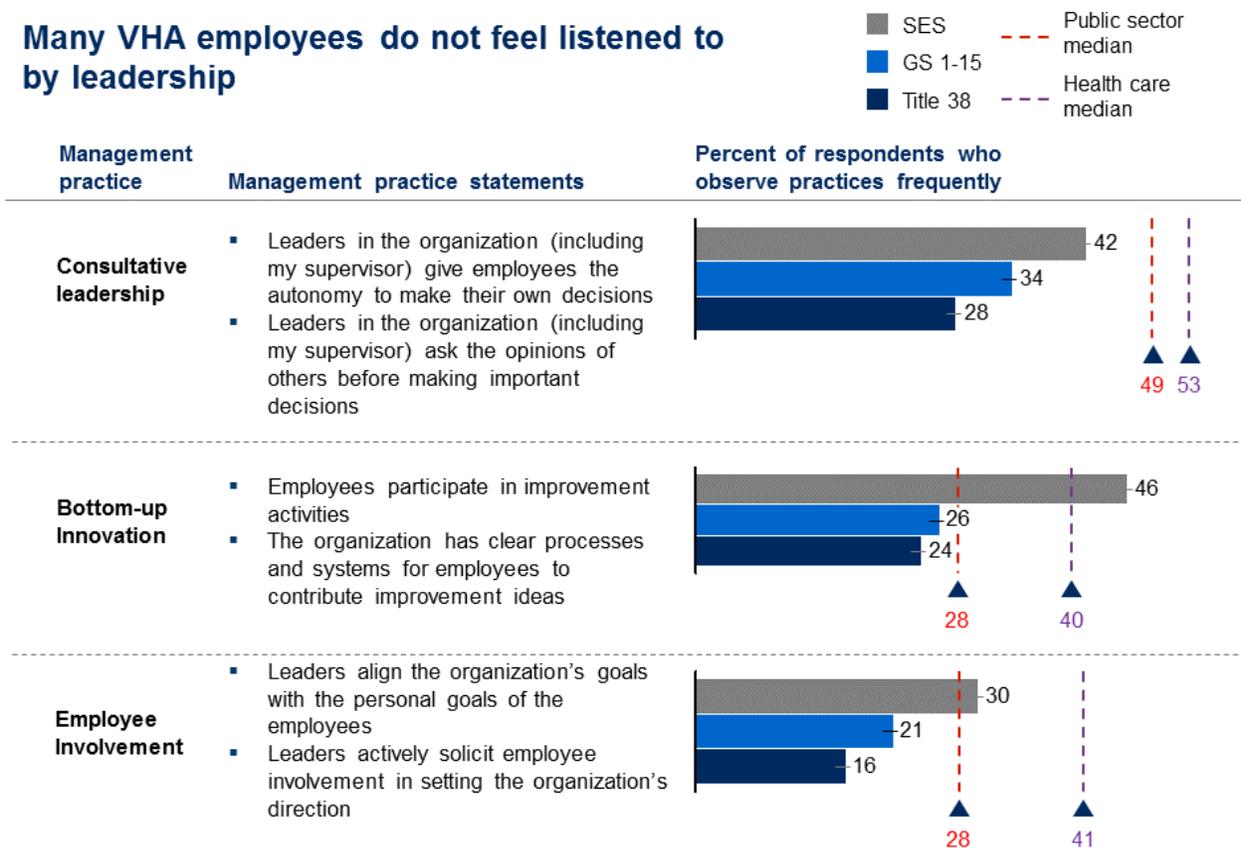
- "There are some supervisors who do not communicate well. When they don't communicate it makes it harder on the employees and you see it in the morale."

- "The biggest problem is that employees don't always know or understand what needs to be done in order to get an Excellent or Outstanding on their review, because supervisors don't communicate well."

- "Open communication and awareness remains a challenge across all levels."

- "We see a lot of 'I'm gonna do what my supervisor tells me and keep my opinions to myself.'"

The OHI shows a gap between SES and other groups on consultative leadership, bottom-up innovation, and employee involvement, three practices that reflect both how much leaders consult with their employees, and the extent to which new ideas and innovations stem from front-line employees **[Figure 8-6].** This suggests a disconnect between what senior leaders are trying to communicate about encouraging innovation, and what employees are hearing.

Figure 8-6. Listening


There are some bright spots around communication that should be noted, including several facilities where employees speak of an "open door culture" (e.g., Durham, NC and Pittsburgh,

PA). Meanwhile, the leadership at the St. Louis, MO, VAMC offer a "10-M" program, where employees can sign up to speak with the Director for 10 minutes about anything on their mind.

8.2.4 Reinforcing Engagement and Behavior With Formal Mechanisms Happens in Limited Pockets, But Faces Several Constraints, Including Limited Access to Positive Reinforcement Mechanisms, a Weak Culture of Appreciation, and Heavily Burdensome Processes for Progressive Discipline

Reinforcing employee engagement and behavior with formal reward and recognition mechanisms happens in a limited way but faces several constraints. There is some use of reward and recognition – including facilities that use an array of recognitions, such as, Employee of the Month awards, Daisy awards, and High Fives. But VHA leaders express frustration at their inability to effectively reward positive engagement and performance. For example, retention bonuses for specialists require VISN approval in some cases: "Our Director manages nearly a half-billion-dollar budget, yet can't approve a $20,000 retention bonus" for a hard-to-replace specialist.

When poor conduct occurs, the disciplinary process is perceived as lengthy and intensely difficult: responding to a conduct issue can take up to one to two years, with multiple steps requiring careful documentation, multiple parties, and time. This has a direct impact on the Veteran as poorly performing individuals will remain on the front lines or be involved in their care for a long time. This process is further explored in Section 10.

9 Physician Alignment

9.1 Summary

This report defines physician alignment as the degree to which physicians in an organization are aligned with the goals of their organization (Betbeze, 2014).

To understand this alignment, or lack thereof, it is necessary to look at the mindsets and behaviors of the physicians as they relate to the overall goals and objectives of the organization. Findings of the study are:

- Physicians are represented on key committees, but communication often breaks down, resulting in disenfranchisement of the provider base.
- While financial rewards are not key motivators for physicians at VHA, access to research funding and work/life balance are available at VHA and are often more compelling.
- Several current structures and processes in place within VHA do not allow for effective physician alignment.

Throughout this section, we draw on insights shared during interviews with VHA leaders as well as data from the OHI survey (VHA interviews, 2015; VHA OHI Survey, 2015). Unless otherwise cited, direct quotations are from VHA interviews and survey data are from the OHI survey. We also draw on various other primary source data and cite them as appropriate throughout the section.

9.2 Findings

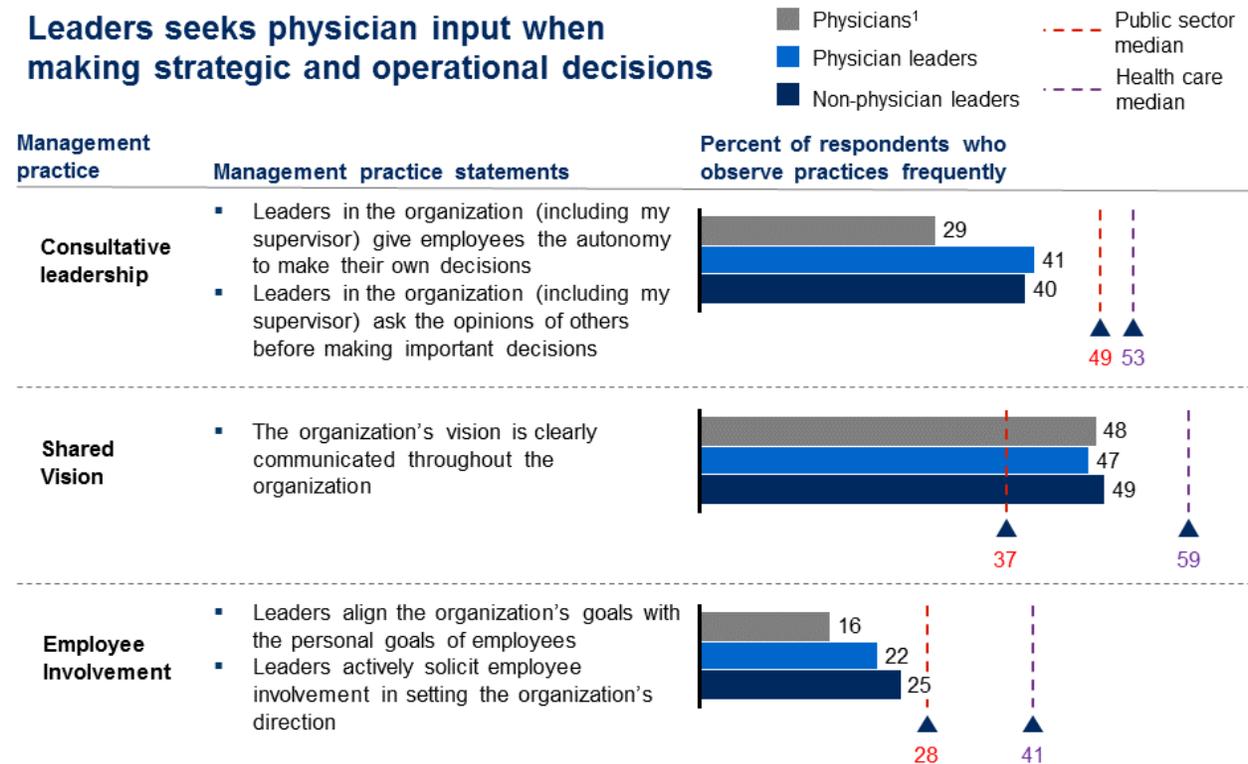
9.2.1 Physicians Are Represented on Key Committees, But Communication Often Breaks Down, Resulting in Disenfranchisement of the Provider Base

Leaders throughout the different levels of VHA routinely seek the input of physicians and other providers when setting organizational goals and policies. There are physicians on many of the major policy-setting committees at the VAMC, VISN, and VHACO levels. For example, at the VHACO level, there is a Chief of Staff Advisory Committee to the VA Principal Deputy Under Secretary for Health, which is a direct conduit for VAMC Chief Medical Officers to VHACO leadership (VA, VA Functional Organizational Manual, 2014). There is physician representation on VISN-level committees, including the Research Service Line Committee, the VISN Compliance Committee, and VISN-level Pharmacy and Therapeutics (P&T) Committees, to name a few. At the VAMC level, there are physicians on the Research and Development (R&D) Committee and VAMC Pharmacy & Therapeutics (P&T) Committees (VA website). In the interviews we conducted, Chiefs of Staff at the Medical Centers routinely made comments such as:

- "We have physician representation on all of the committees."
- "Leadership definitely seeks physician input."

- "Front-line MDs have a 2-year rotation on the Strategic Planning Board, and quarterly-rotating non-voting positions on the Resource Board."

While there is physician representation on key committees, the OHI indicates that physicians not in leadership roles feel their input is less sought after than that of physician leaders and non-physician leaders. This is reflected by lower scores on consultative leadership and employee involvement **[Figure 9-1].** Consultative leadership and employee involvement practices lag both public sector and health care benchmarks.

Figure 9-1. Physician Input


1 Demographics are split as follows: Physicians: Physicians not in executive or manager role (N=878); Physician leaders: Physicians in an executive or manager role (N=125); Non-physician leaders: Non-physicians in an executive or manager role (N=1,328)

SOURCE: VHA OHI Survey 2015; Public Sector Benchmark (N=47,159, no. surveys=27); Health Care Systems and Services Benchmark (N=40,437, no. surveys=33)

A close look at the outcomes related to communication measures found in the OHI shows a disparity between the way leaders perceive they are communicating and the way physicians feel leaders are communicating back with them **[Figure 9-2].** Notably, physicians not in a leadership role report low scores on "open and trusting" and "knowledge-sharing." This disconnect suggests that leadership does an inconsistent job of subsequently articulating the organizational goals back to physicians. Neither leadership nor physician representation on these committees communicates effectively back to the physician base. The communication begins but may stop short of a rich, two-way dialogue. Even though physicians may be represented on key committees, "there are silos between clinicians and leadership," and these

---

communication breakdowns can lead to a sense of disenfranchisement and a lack of engagement of the broader physician and provider base.

Figure 9-2. Clear Articulation and Communication to Physicians

OHI indicates leadership does not always clearly articulate organizational goals to physicians

Legend:
- Physicians[1] (gray)
- Physician leaders (blue)
- Non-physician leaders (dark blue)

9.2.2 While Financial Rewards Are Not Key Motivators for Physicians at VHA, Access to Research Funding and Work/Life Balance Are Available At VHA and Are Often More Compelling

Within health care systems, frequently used levers to drive physician alignment include financial incentives (salary, bonus, productivity pay), work/life balance incentives, access to research and funding, and academic affiliations and their accompanying prestige and clinical teaching opportunities. Though VHA is not able to offer competitive financial incentives, the other levers are being used more successfully.

In terms of financial rewards, the current salary structure for physicians does not provide tremendous incentive. Salaries for VHA physicians are not commensurate with those outside

VHA. As **Figure 9-3** shows, VHA mean pay, even with recent Title 38[12] restructuring allowing more competitive compensation for physicians, is still significantly below benchmark.

Figure 9-3. VHA and Private Sector Physician Salaries

While VHA is not able to provide commensurate salaries, there are other reinforcing mechanisms that VHA has at its disposal to both recruit and retain physicians. Numerous interviews with Chief Medical Officers at both the VISN and VAMC levels revealed that "VHA is the place to come for work/life balance." In addition to the better lifestyle, there is "less paperwork" because "physicians don't have to deal with various insurance companies and the headaches that come with all that paperwork." Others have cited the trend toward physician practice acquisition by provider systems as a reason they favor employment at VHA. Leadership at 75 percent of VAMCs at which site visits were conducted said the prospect of a better work/life balance was a top reason why physicians chose employment at VHA. This incentive, however, is in danger of being lost, some interviewees explained, as more and more metrics being pushed down from VHACO are forcing physicians to "treat the metric and not the patient." The increase in the number of "boxes physicians are being forced to check," including

---

[12] Title 38 is a federal classification for health care professionals and covers a range of clinical professions at VHA.

through clinical reminders on CPRS,[13] is proving to be onerous and a disincentive and is perceived by physicians to be getting in the way of providing patient care (VHA interviews, 2015; see Assessment B for additional detail).

VHA is also able to attract and retain physicians because of its academic affiliations. A number of physician leaders explained their interest in both teaching and direct patient care: "Physicians come here because they want to teach and see patients." Most VAMCs are actively involved in the teaching of medical students and residents, and physicians enjoy the privileges that come with academic appointments at their affiliated medical universities. According to VA's Office of Academic Affiliations, "in 2013, 40,420 medical residents, 21,540 medical students, 253 Advanced Fellows, and 1,397 dental residents and dental students received some or all of their clinical training in VA. Of its 152 VA Medical Centers and six independent outpatient clinics (IOCs), 124 hospitals and three IOCs have affiliation agreements with 130 of 141 allopathic Accredited Medical Schools and 22 of 29 osteopathic medical schools for physician education" (VA Office of Academic Affiliations). With these affiliations, VA is the nation's largest integrated provider of health care education and training for physician residents.

The opportunity to conduct both clinical and bench research is another motivator for physicians, and here again VHA is well-positioned. Physicians "seek out VHA because it is often easier to get research projects funded." Additionally, the research arm of VHA is set up in a way that allows "principal investigators to reapply for funding less frequently than they would need to at a university hospital." VHA's research budget is entirely intramural, affording only VHA physicians the opportunity to apply for grants. Notably, VHA investigators have won three Nobel prizes and seven Lasker awards (VA Office of Research and Development).

Other nonfinancial rewards routinely seen in high-performing organizations include formal rotational programs for aspiring leaders and leadership development programs. Currently, there are no formal rotational programs for physicians found within VHA. While there are formal leadership development programs, budgetary and travel restrictions placed on VHA have greatly reduced the availability of in-person programs.

9.2.3 Several Current Structures and Processes in Place Within VHA Do Not Allow for Effective Physician Alignment

In a 2011 study of over 1,400 physicians, training and resources ranked second only to compensation as a factor that would influence them to change their behavior (Kumar et al., 2011). As such, when assessing the alignment of physicians and hospital leadership and what is needed to influence change, resources available to physicians need to be considered. Physicians within VHA routinely commented "we don't have enough space" and "in the private sector, I would have at least two exam rooms." Other challenges cited include inefficient scheduling practices and clinical support staff, as well as challenges around IT and buying supplies. This

---

[13] Computer Patient Record System

perceived lack of resources leads to frustration for providers (see Assessment B for additional detail).

10 Accountability

10.1 Summary

In this report, accountability is defined as "when one individual is answerable to another individual or organization for work (a goal-oriented behavior), resources, results and/or services" (Dive, 2008).

Accountability encompasses two elements: responsibilities for which one is held accountable, and authority and decision rights to fulfill these responsibilities.

It should be noted that while Assessment L uses a broad definition of accountability, interviews reflect that the term "accountability" is often interpreted within VHA more narrowly to mean firing or disciplinary action.

In determining to what degree VHA leaders are held accountable and whether VHA leaders have the authority to fulfill their accountabilities, study findings are as follows:

- VAMC leaders understand that they are accountable for every aspect of a Medical Center as experienced by patients, employees, oversight entities, and external stakeholders.
- For each area for which VAMC leaders are held accountable, an increase in hierarchical control intended to mitigate risk has constrained leaders' requisite authority.
- While VHA employees believe they are individually held accountable, the perceived difficulty of the termination process decreases the practice of holding VHA employees accountable.
- VHA senior leaders are held less accountable through termination than other federal agency senior leaders.

10.2 Findings

10.2.1 VAMC Leaders Understand That They Are Accountable for Every Aspect of a Medical Center as Experienced by Patients, Employees, Oversight Entities, and External Stakeholders

In reviewing position descriptions, and supported by interviews, VHA leaders view themselves accountable for nine distinct areas within a Medical Center: employee experience, culture, operational excellence, fiscal stewardship, Veteran experience, facility matters, compliance with directives, physical safety, and external affairs (USAJobs, 2015). And while this list is expansive, it is well understood by leaders and employees throughout VHA. One Medical Center Director described a feeling held by many of those interviewed: "In a role like ours, you are, in essence, accountable for everything and to anyone." A senior VHA official added, "There's no going back now. With all the attention in the past year, the Directors are the public face of VA in their community." The implication is that the local VAMC Director is the single point of contact for the Veteran and the local community.

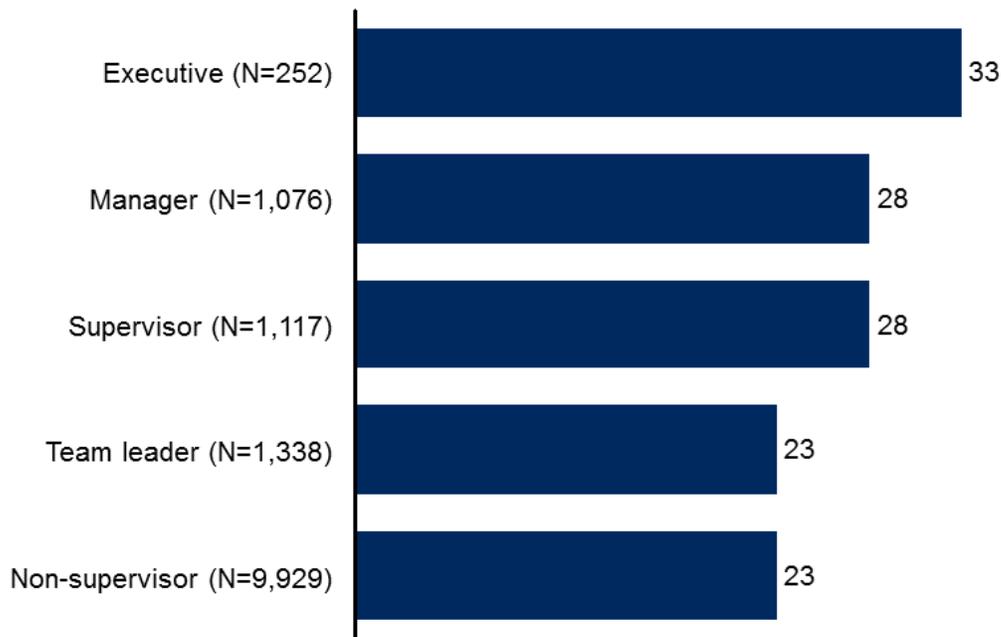
10.2.2 For Each Area for Which VAMC Leaders Are Held Accountable, an Increase in Hierarchical Control Intended to Mitigate Risk Has Constrained Leaders' Requisite Authority

A VA Medical Center Director position description includes the provision that a Director "has full delegated line authority to accomplish all of the medical center's missions" (USAJobs, 2015). In both perception and practice, however, this written expectation of delegated authority does not match reality; instead, it is replaced by a fragmented environment with numerous internal and external entities possessing or competing for control. While this arrangement may have served VHA in years past, expanded control to mitigate perceived political risk has exacerbated the situation to the point where it directly conflicts with the challenges of today's environment – including changing demographics, priorities, and pressures. The new and changing needs of today's Veteran call for flexibility and clear decision rights in support of the mission that VHA leaders do not currently possess.

This is represented in **Figure 10-1,** as just 33 percent of VHA executives believe that employees in the organization have sufficient authority to make decisions. In less senior roles, this decreases further.

Figure 10-1. Decision-Making Authority

SOURCE: VHA OHI Survey 2015 (N=13,712)

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.


Meanwhile, ownership and accountability are heavily fragmented across entities within the system, which helps to explain VAMC leaders' belief about lack of full authority. This is illustrated in **Figure 10-2.**

Figure 10-2. VAMC Accountabilities

Entities with authority for VAMC accountabilities

Area for which VAMC is accountable	VAMC	VISN	VHACO	VACO	Union	Congress	Other

Physical safety	✓	✓					
External affairs		✓	✓			✓	✓

SOURCE: VHA interviews, 2015; USAjobs VAMC job descriptions

There are at least three areas where authority is fragmented to such a degree in practice that the ability of VAMC leaders to meet expectations is compromised: operational excellence; fiscal stewardship; and compliance with directives. In each of these areas, the flexibility required of today's operating environment also requires more decision-making authority at the VAMC level than VHA's current approach permits.

- **Operational excellence.** Performance targets are set by VHACO and filtered through each VISN, generally four to six months into a program year. As of spring 2015, in the middle of Q2 of the fiscal year, many VAMCs visited had yet to receive them. And yet, at the end of each fiscal year, facilities are accountable for meeting these targets, having had far less than the full year to achieve them. While VAMC leaders are accountable for operational excellence, their ability to customize performance measures or prepare for implementation is limited by their lack of authority, while the time available to achieve this target is compressed by delayed communication of targets. As one Director explained,

"There are new measures every year and they become the center of attention, until the next measures are set."

- **Fiscal stewardship.** After appropriations are made by Congress, a VAMC budget is generally determined by VHACO through a funding formula (Veterans Equitable Resource Allocation, or VERA) that flows General Purpose funding through VISNs, and Specific Purpose funding often directly to Medical Centers. Though definitions of General Purpose and Specific Purpose funding have changed significantly, the funding coming through Specific Purpose has grown and become more fragmented, which limits local flexibility to direct resources where most locally relevant. This topic is explored further in Section 13.

- **Compliance with directives.** Communications from Congress, VHACO, and VISNs extend beyond advisory frameworks to step-by-step directives and govern many aspects of operating a Medical Center. Compliance with these directives – and welcoming accompanying audits and site visits by all stakeholders – are a core accountability of Medical Center leadership. This absorbs management attention and restricts the flexibility needed in operating environments of differing complexity. Of the "operate-by-directive" environment, one clinician leader told us: "It is very much a rule by 'You shall' edicts – I am told the exact number of people I will hire and the jobs that they will do – even if I don't have a need for the policy or the people." There is often more focus on the rule than the intended outcome.

10.2.3 While VHA Employees Believe They Are Individually Held Accountable, the Perceived Difficulty of the Termination Process Decreases the Practice of Holding VHA Employees Accountable

While accountabilities are clear, the ability to hold employees responsible for meeting their accountabilities is perceived as a challenge in VHA. The Organizational Health Index Survey reveals that fewer than half of employees believe employees are held accountable for results.

There are many ways in which people can be held accountable, ranging from well-defined performance expectations for each role, to clear links between performance, incentives, and consequences, to periodic progress check-ins, to progressive discipline around adverse events. Discussions with employees throughout VHA revealed that the discipline process – up to and including removal from the agency when appropriate – is a primary contributor to the perceived difficulty of holding employees accountable. Through a "progressive discipline" process, steps mandated by federal law and OPM regulations, further detailed through VA policy, and negotiated with unions, in practice require a minimum of eight months to terminate an employee for poor performance or misconduct, and often much longer (VHA interviews, 2015; VA Handbook). As one clinician told us, "We are asked to do so much. The discipline paperwork is where I cut corners – the process is just too much. That means that I'm unable to let go of employees. I just give up after a while." Other employees felt alone in the process: "It's so complicated. I wish HR would help us more rather than fight us." This perception contributes to lower accountability for performance and misconduct – both believed and, as detailed below, practiced in VHA **[Figure 10-3].**

Figure 10-3. Progressive Discipline

VHA progressive discipline process requires at least eight months and often extends well beyond a year

Sample progressive discipline ladder, Title 5 employees

SOURCE: VHA interviews, 2015; VA Handbook

As an illustration, the standard progressive discipline ladder for Title 5 misconduct issues includes verbal counseling, written notice, admonishment, reprimand, short suspension (under 14 days), long suspension (longer than 14 days), reduction in grade and/or pay, and role removal. Many of these steps require union notification periods and documentation submitted by the supervisor and approved by the supervisor's manager as well as the Decision Official (e.g., VAMC Director) in the more advanced stages of the process. Some steps, by multiple interviewees' accounts, can take two to three months. This process, developed in partnership with unions, is carefully designed and clearly documented. However, following this process in reality has proven immensely difficult for two major reasons. First, supervisors feel very much at risk of retaliation and the various counter accusations that can be started. Second, given the high workload, unlikely chance of timely resolution, urgent needs of patients, and perceived variable support from HR, supervisors often choose to spend the incremental hour with patients or doing work rather than addressing personnel issues. In effect, the return on time spent regarding personnel issues does not appear to be worth the investment of time and associated risk.

One result of this is that low-performing employees may stay in the system far longer than ideal, which puts an extra burden on and hurts the morale of high-performing employees. In

some cases, leaders have resigned themselves and chosen to not even begin the disciplinary process, instead deciding to carry on as-is, despite sub-optimal conduct or performance:

- "The slow termination process is a morale killer for high performers."
- "OK, I give up, I work shorthanded."

The progressive discipline process, often cited as labor-intensive and ineffective, leads to very limited accountability for low-performing employees and lowers employee morale overall. As described previously, this has a direct impact to the Veteran as poorly performing individuals will remain on the front lines or be involved in their care for a long time. The real or perceived lack of HR support in the termination process forces management to navigate complex employee discipline requirements alone, which leads to many giving up.

Business leaders explain:

- "We don't make it welcoming from the very start. Time delays. Meaningless paperwork."
- "To discipline someone, you have to leave a paper trail, and document. You have to work through labor. You have to be really careful. A lot of people won't even bother."

And HR personnel concur: "If you don't document perfectly, you're back to square one."

In spite of these challenges, some persist through the lengthy and sometimes seemingly arduous process. We heard at least three such examples during our interviews, from leaders who had pursued the progressive discipline process through to conclusion and explained they would do it again if the need were to arise again (VHA interviews, 2015).

10.2.4 VHA Senior Leaders Are Terminated for Performance Less Than Other Federal Agency Senior Leaders

While accountability for performance takes many forms, from requiring a simple response to spurring large changes, termination is one form rarely used by VHA. Federal personnel data show that VHA senior leaders – specifically, VAMC Directors, VISN Network Directors, and some VHACO staff who are all members of the Senior Executive Service (SES) – are held accountable through termination for discipline or performance less frequently than are their peers in federal agencies. VA ranks last among all Cabinet-level agencies in SES termination, with just one termination in the five years between FFY2010 and FFY2014[14] **[Figure 10-4].** It is unknown how many SES were effectively terminated by being directed to retire, demoted, or reassigned.[15] As a point of reference, in this same time period, other agencies on average terminated SES employees for discipline or performance at a rate 10 times that of VA. Three SES terminations in Arizona, Alabama, and Pennsylvania in 2014 (Washington Post, 2015) indicate a potential change in this pattern and are not included in presently available data.

---

[14] Federal Fiscal Year (FFY) runs from October through September.

[15] Anecdotally, early retirement, removal from SES ranks, and reassignments do occur for performance reasons; however, quantitative data are not available.

11 Performance Management

11.1 Summary

This report defines performance management as the formal use of clearly defined qualitative and/or quantitative metrics or assessments used to track the performance of an activity, organization, or individual, and the comparison of performance for different activities, organizations, or individuals (adapted from Camm and Stetcher, 2010).

The performance management cycle, a continuous loop of target-setting, performance-tracking dialogues and rewards, provides a useful reference for evaluating performance management processes at both the operational and individual levels.

In determining how well its performance management processes help VHA leadership achieve its mission, the study findings are as follows:

- Hundreds of operational performance measures overwhelm leaders and this, combined with limited transparency and inconsistent data availability, makes it difficult to focus on what is most important.
- Individual performance management processes are hindered by targets inconsistent with the VHA mission, delayed implementation, lack of meaningful dialogue, and limited rewards.

Throughout this section, we draw on insights shared during interviews with VHA leaders as well as data from the OHI survey (VHA interviews, 2015; VHA OHI Survey, 2015). Unless otherwise cited, direct quotations are from VHA interviews and survey data are from the OHI survey. We also draw on various other primary source data and cite them as appropriate throughout the section.

11.2 Findings

11.2.1 Hundreds of Operational Performance Measures Overwhelm Leaders and This, Combined With Limited Transparency and Inconsistent Data Availability, Makes it Difficult to Focus on What is Most Important

Operational performance management can be analyzed through the lens of the performance management cycle: targets, tracking, reviews, and rewards **[Figure 11-1].** In doing so, each segment reveals opportunities for improvement.

Figure 11-1. Performance Management Process

The Performance Management Process

Clear direction for organization, actively communicated

1 Clear targets that advance mission

2 Performance tracking

3 Effective review meetings

4 Reward and recognition

Clear targets that advance mission

VHA tracks several hundred performance measures at the facility level. A common response repeated consistently by interviewees when asked about operational performance metrics was: "There are too many." One Director described his perception of VHA's approach to setting performance measures as: "If 50 metrics are good, 100 must be better." There is widespread recognition of this overabundance of metrics and the need to simplify: as one leader articulated, "Performance goes down when there are more measures. We need to get away from the spreadsheet and closer to the action. Facilities need coaches – not just shaking a finger and saying, 'Can't miss this.'"

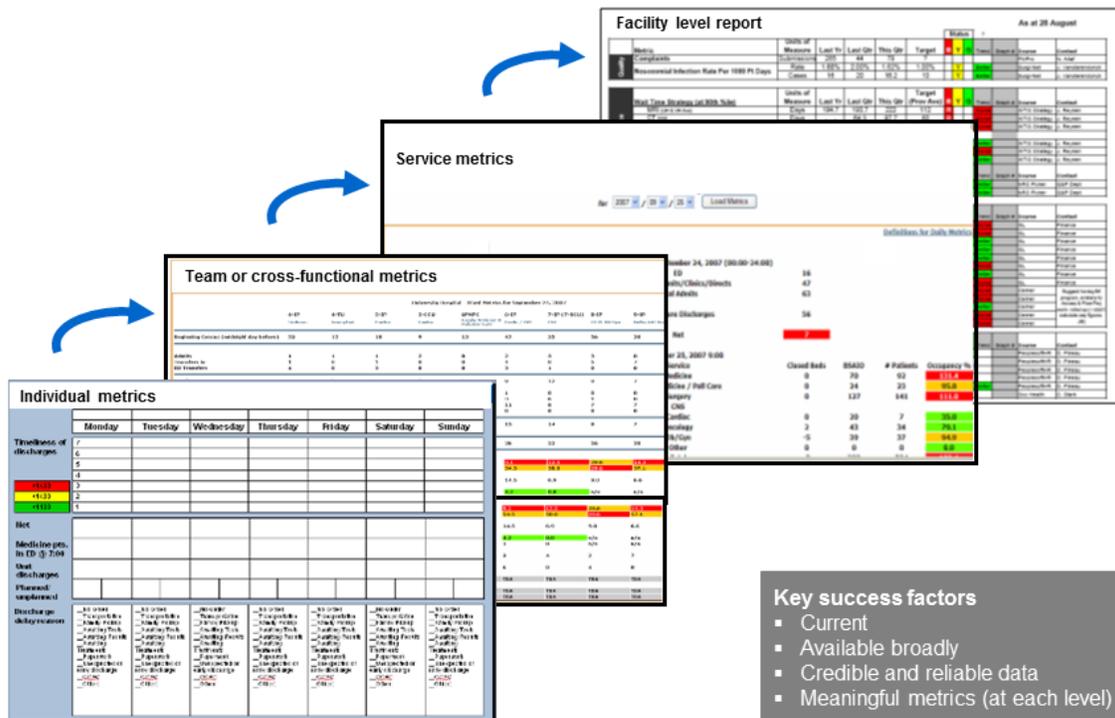
With 382 measures today in its 10-N National Performance Measures Report provided by interviewees, VHA is not setting clear, actionable targets (10N NPRM, 2015). Instead, leaders are left to figure out for themselves the most critical metrics against which to measure their part of the organization. As one Director told us, "We choose the most important ones to focus on and leave the rest alone." In attempting to increase control over outcomes through measurement, VHA has inadvertently created an environment in which leaders are selecting which measures are most rational instead of which measures – either those existing or those not yet adopted by VHA – help advance the mission.

This was not always the case. As former Under Secretary for Health Dr. Ken Kizer described in a 2014 article in the *New England Journal of Medicine*:

> *The performance-measurement program – a management tool for improving quality and increasing accountability that was introduced in the reforms of the late 1990s – has become bloated and unfocused. Originally, approximately two dozen quality measures were used, all of which had substantial clinical credibility. Now there are hundreds of measures with varying degrees of clinical salience. The use of hundreds of measures for judging performance not only encourages gaming but also precludes focusing on, or even knowing, what's truly important.* (Kizer and Jha, 2014)

In addition to numerous clinical process and performance measures, each VHA program office has specialized targets that are built into performance plans. These have contributed to the even greater number of performance metrics. At present, these include measures for homelessness reduction, diversity hiring, and contracting, among many others. This mission-expanding metric proliferation, in particular, has the dual effect of fragmenting focus for leaders and reducing control over their local activities.

At many high-performing private sector hospitals, targets are balanced in support of the mission, with a limited number of key metrics focused in the following areas that collectively contribute to organizational performance: quality, patient satisfaction, operational excellence, finance, and human resources. Metrics cascade logically across levels of the organization, and roll up into an overarching scorecard **[Figure 11-2].**

Figure 11-2. Metrics


In contrast, VHA's catch-all approach extends well beyond these focused areas. In addition, VHA does not cascade targets consistently, and in many cases they are not precise and actionable.

In addition to having too many metrics, there are also places where VHA is noticeably silent. For example, VHA does not place sufficient emphasis on finance and human resources, with measures in the 10-N performance measures report related to finance and HR limited to contracting and hiring goals. This inconsistency hampers transparency.

In recent years, VHA has promoted a new, more focused set of measures – Strategic Analytics for Improvement and Learning (SAIL). Issued quarterly, SAIL measures 36 areas over 10 categories including: access; inpatient/outpatient performance; mortality; adjusted length-of-stay; customer satisfaction; readmission; adverse events; efficiency; ambulatory care/sensitive conditions hospitalizations; and mental health. While it has not replaced the existing hundreds of performance measures, SAIL is more consistently aligned to the VHA mission in that its quality measures focus on core operations. While not comprehensive enough to be the sole set of metrics used by VHA leaders (for example, financial and human resources measures are not included, and the number of measures is likely still too high to be actively managed by leadership), SAIL represents a foundation upon which improved target-setting could be built.

Performance tracking

The large number of performance measures makes it difficult to effectively track performance. Performance management approaches commonly used in private sector settings are not feasible given the number of measures currently used today at VHA. The proliferation of measures leads to the perception that, as one Director told us, "If everything is a priority, then nothing is a priority."

There are bright spots, however. Use of visual reports during daily performance meetings by senior leaders is increasing, for example in Jackson, MS. This serves to increase transparency and helps leaders and employees focus on key metrics. The SAIL report is another good example of clear visual reporting, communicating results in a visual that quickly informs leaders how they are performing against their peers. Other facilities, such as the Lexington, KY VAMC, use a systems redesign approach to focus their employees on critical improvement initiatives. Lexington has also folded the introduction of standardized huddleboards – visual management systems – into Service Chiefs' performance standards. Meanwhile, VISN 3 (Bronx, NY) leaders spoke of bringing a productivity ethos to the physicians there through the introduction of relative value units (RVUs). Initially, RVUs were heavily resisted by physicians, and it took three years of consistent effort to overcome that resistance. Explained one leader: "We started with no one believing anyone had the right to look at them [doctors]. Got a few willing people to sign up. We then made it very visual and simple. Next we spent a lot of time talking and changing the 'you don't understand' mindset. As each learned to make a little improvement, the program began to get buy-in. We presented results to leadership periodically and celebrated successes. Over the past year Brooklyn really stepped up. The Director was a champion and helped drive the effort. Transparency was key. The impact was that the cost/RVU went down 24 percent. Wow." Building more transparency along these lines could be very helpful to leaders on the front line.

Effective review meetings

One of the primary practical roles of the VISN is to ensure performance targets are negotiated with VHACO and are being met at the VAMC level. This leads to regularly scheduled meetings with VAMC leadership to review binders of performance reports and frequent requests for detailed corrective action plans when a measure is "in the red." Because target-setting is often delayed and new initiatives are introduced regularly, a consistent theme of these meetings was described by one VAMC leader as "explaining why we would not make the measure this year but hoping that making progress toward it would be good enough."

In practice, progress reviews generally focus primarily on the weakest performance measures and are not used as problem-solving sessions. Rather, the expectation is that the VAMC will create an improvement plan and present it to the VISN for approval. Coaching and best practice-sharing as a way to bridge performance gaps does occur, but not with regularity. This contributes to a commonly held perception that metrics are used to identify weak performers, rather than to help drive performance excellence.

Reward and recognition

As facility funding is formula-based, there are not direct relationships between facility performance and financial reward (that is, greater access to resources) at the operational level.

Indirect rewards such as continued affiliations with academic hospitals, reputational enhancement (especially for those looking to advance their career), and increased freedom to focus on improvement instead of corrective action do exist. One reward, a publically available quintile status from the SAIL report, was frequently mentioned as an important source of pride. There is opportunity to simplify performance management to focus more on the mission, drive performance excellence, and promote continuous improvement.

11.2.2 Individual Performance Management Processes Are Hindered by Targets Inconsistent With the VHA Mission, Delayed Implementation, Lack of Meaningful Dialogue, and Limited Rewards

Analyzing individual performance management through the same lens of the performance management cycle – targets, tracking, reviews, and rewards – reveals significant gaps.

Targets

VHA leaders' individual performance targets are linked to operational targets. This linkage, in principle, should promote clarity. In practice, however, three characteristics of the VHA process limit the setting of clear, actionable targets.

First, delays in setting operational targets at the national and VISN levels result in downstream delays for VAMC individual leaders and their direct reports. Targets and new initiatives are late by as much as five months into the program year. VAMC interviewees report: "We cannot expect our staff to achieve performance expectations by the end of the year when there is ramp-up and learning associated with new metrics." These delays contribute to a belief held by many employees that VHA does not set explicit targets for operating performance **[Figure 11-3].**

Figure 11-3. Operational Target-Setting

Nearly half of VHA employees do not believe that explicit targets exist for operating performance

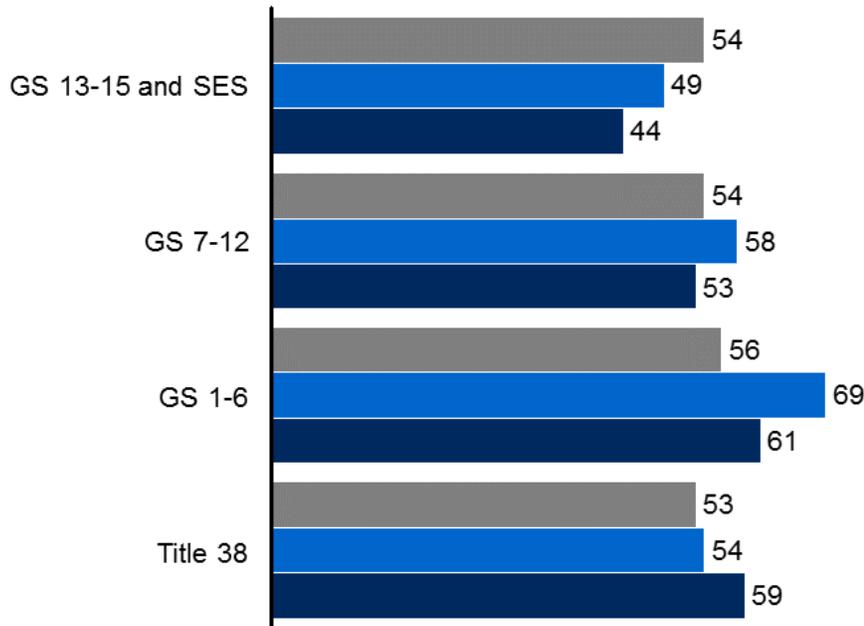
GS 1-6: VAMC 56, VISN 69, VHACO 61
Title 38: VAMC 53, VISN 54, VHACO 59


SOURCE: : VHA OHI Survey 2015 : VAMC (N=10,134); VHACO (N=1,207); VISN (N=603)

Second, the proliferation of special programs has created more confusion for leaders. For example, a Hepatitis C initiative was the only measure listed under "leading change" for one senior leader; and for another leader, breast and cervical cancer screening was the first priority categorized under "business acumen." Leaders are careful to note that these care priorities are important, but that measurements are implemented in ways that can confuse priorities.

Third, metrics are presented as individual in nature, both to a facility or across facilities, and then to the individuals who work in a facility. Instead of acknowledging that, in many cases, an entire facility contributes to successful achievement of the mission, metrics are assigned to functional owners and split along clinical/non-clinical roles. The volume of metrics described above contributes to this lack of team-based measurement.

VHA's Blueprint for Excellence indicates that VHA is currently working to align individual performance plans to the organization's overall goals.

Performance-tracking

Despite the volume of metrics, and the general lack of standardization, performance-tracking is a relative strength of VHA. A mix of centralized and homegrown reports, dashboards, and other tools is used to monitor performance and drive excellence on a daily basis. When standardized

tools either do not exist or do not fully meet a need, Medical Centers create solutions that work best for their teams. For example, one physician leader in the Durham, NC VAMC provides flashcards with metric methodology and current performance to front-line staff to help employees understand how their actions influence a performance measure and to let them know where they stand. There is an opportunity to share these approaches more broadly throughout the system.

Progress reviews

Individual performance reviews follow a rigid structure mandated by federal statute, VA directive, and labor bargaining agreements. Formal reviews typically occur once a year, with ratings between 1 to 5 provided to employees. Some HR officials report that midyear reviews are becoming more normal in their facilities as well.

Having this structure in place provides a solid foundation, but as Figure 11-4 shows, employees do not believe that performance feedback and review processes are effective. Performance dialogues between management and employees that are timely and actionable, and help identify and advance developmental needs, are not a norm at VHA. "I haven't had a performance review in years," said one senior leader. In recent months, this has impacted many senior leaders in VHA: as of June 2015, 20 percent of SES positions have their 2014 ratings deferred, pending the results of investigations or other actions, and, for some cases, without explanation for the deferral (VA, Accountability Fact Sheet, 2015; VHA interviews, 2015).

Figure 11-4. Progress Reviews

Most VHA employees at all levels believe progress reviews do not collect accurate information

Percent of respondents who frequently observe the following behavior:
"The organization's performance feedback and review processes collect accurate information about employees' strengths, weaknesses, and potential"

SOURCE: : VHA OHI Survey 2015 : VAMC (N=10,134); VHACO (N=1,207); VISN (N=603)

For senior executives at VHA, performance ratings, the primary feature of the review process, suffer from a common shortcoming: imperfect distribution biased toward high performance **[Figure 11-5].** Every VHA senior executive received a "Fully Successful" or higher rating from FY2010-2013 (VHA Workforce Management and Consulting Office). Increased scrutiny and a decision to award no "Outstanding" ratings in FY2014 has done little to change this pattern, as 94 percent of VHA senior executives were provided a "Fully Successful" or higher rating. The incongruity of this situation grows when reviewing Office of Personal Management criteria for "Minimally Satisfactory," one level below "Fully Successful." "Minimally Satisfactory" performance for executives is defined as follows: "Contributions to the organization are acceptable in the short term…the executive generally meets established performance expectations, timelines and targets…" While not praiseworthy, this standard – a 2 out of 5 on the rating scale – appears relevant for more than a few executives in any organization. This rating inflation diminishes the credibility of a key tool of VHA's review process and suggests ratings reform is needed, or another way of evaluating performance is needed, or both.

Figure 11-5. Performance Rating Distribution

Despite a policy decision to award no outstanding rating, 94% of senior leaders were rated fully successful or exceeds fully successful in FFY 2014

Distribution of SES and SES-equivalent FFY 2014 performance evaluations[1]

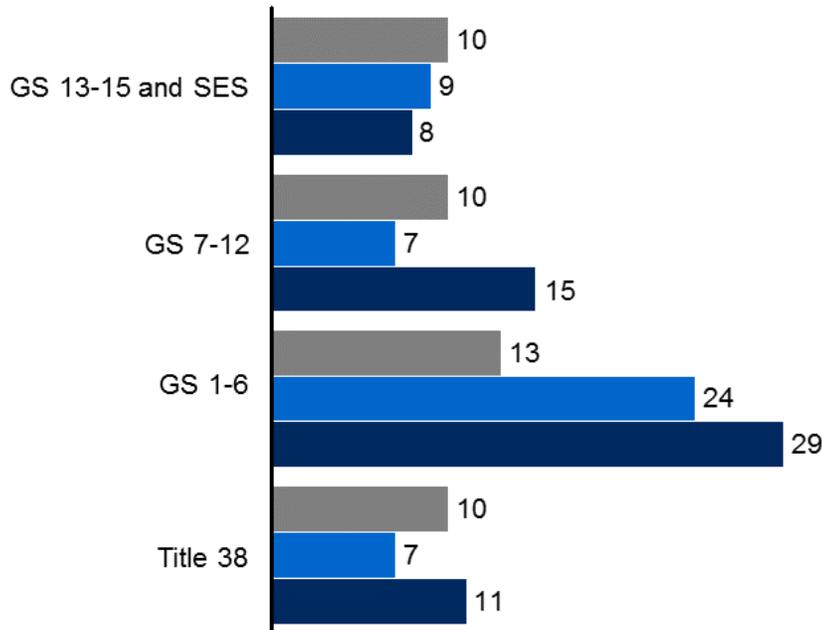
Rewards and recognition

The clearest weakness for VHA revealed in the OHI was financial incentives. Nearly all employees at each level of the organization, and particularly senior leaders, believe that financial incentives are not attractive enough to motivate employees **[Figure 11-6].** Only one in 10 senior leaders believes VHA provides attractive financial incentives. At the most senior level at VHA, for example, SES salaries are capped at $183,300 (OPM, 2015). In practice, the average non-Title 38 VAMC Director salary is $166,900, ranging from an average of $176,800 at the most complex VAMCs, to $157,400 at complexity level 2 facilities and $162,300 at complexity level 3 facilities (VHA Healthcare Talent Management Office, 2015).[16] In comparison, private sector hospital CEOs often enjoy high six-figure or seven-figure compensation packages.


---

[16] Title 38 employees, including seven Title 38 VAMC Directors, are not included in SES salary cap and VAMC Director salary averages.

VHA faces challenges in offering rewards that are more motivating to employees. A consistent theme in speaking with HR chiefs reveals that limited rewards encourage front-line employees to switch jobs frequently to transition to higher-grade opportunities: "Employees are constantly striving toward the next grade, without much regard to the position. It is the only way in their eyes to be properly rewarded, even if they are not fully aware of the increased responsibility a higher-grade position brings with it."

Bargaining agreements steer managers toward standardized treatment of employees, and, as has been established elsewhere in this report, compensation policies are less flexible compared to private sector counterparts, although this is less pronounced in some Title 38[17]-eligible occupations where locally competitive salary flexibility is allowed (see Assessment F for additional detail). It should be noted that VA is pursuing a legislative remedy in its most recent federal budget request to expand Title 38 salary flexibility to non-clinical leadership positions, although Congress has yet to act on this request (VA, 2016 Congressional Submission, 2015).

---

[17] Title 38 is a federal classification for health care professionals and covers a range of clinical professions at VHA.

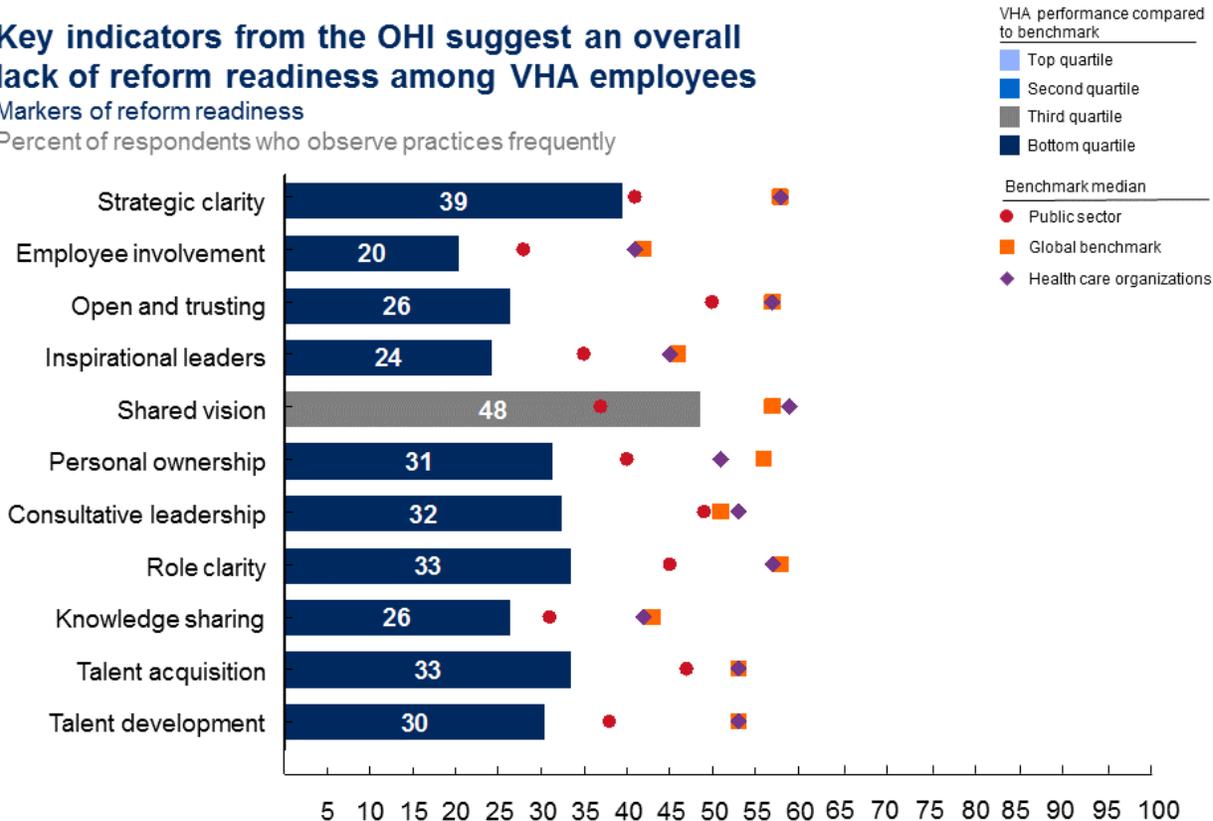
12 Reform Readiness

12.1 Summary

This report defines reform readiness as the ability and willingness of an organization to embrace and drive change.

Successful change in an organization requires clarity around the need for change, clear signaling by leadership that change is important, and resulting employee buy-in and support from leadership to help implement and sustain the change.

In determining the degree of reform readiness found within VHA, study findings are as follows:

- Employees believe that VHA leaders do not effectively encourage or embrace new ideas.
- Change at VHA happens, but only rarely, takes a very long time to permeate the organization, and often stalls.
- Many change efforts come from Central Office and do not fully engage employees in the change process.
- Change efforts are rarely given the necessary time or support to ensure success.


The OHI measures of reform readiness **[Figure 12-1]** show the VHA system is demonstrably less ready for change than either comparable public sector organizations or other health care systems.

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

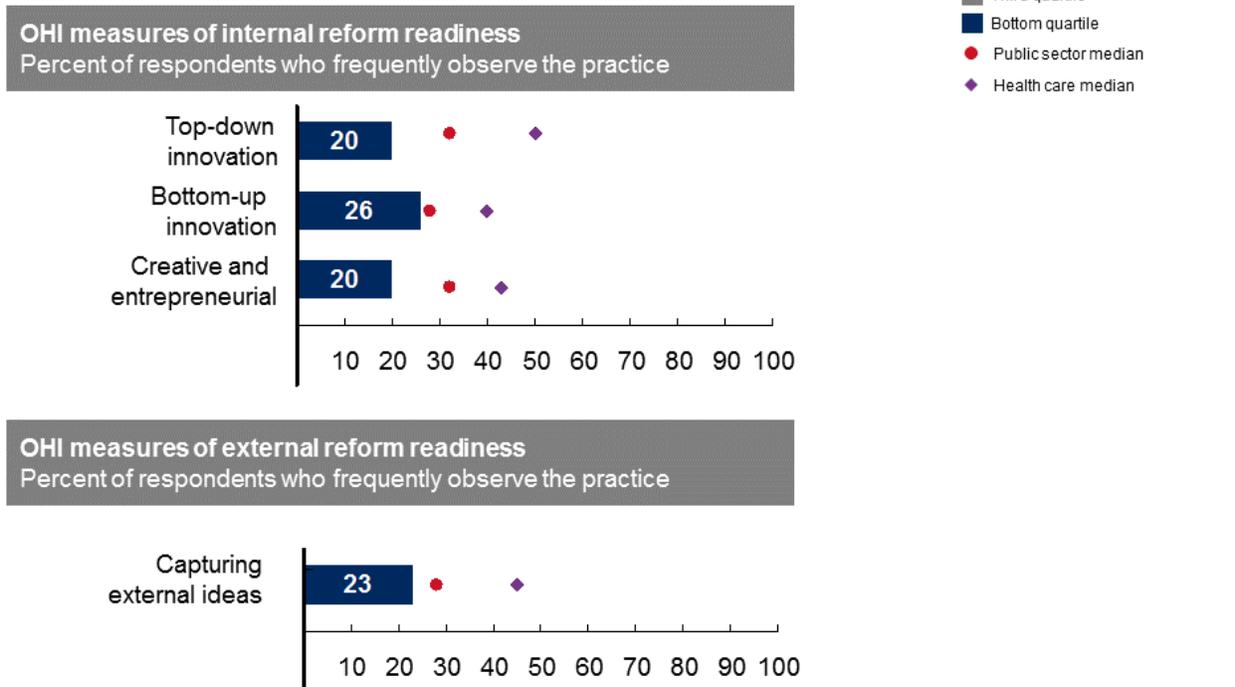
Throughout this section, we draw on insights shared during interviews with VHA leaders as well as data from the OHI survey (VHA interviews, 2015; VHA OHI Survey, 2015). Unless otherwise cited, direct quotations are from VHA interviews and survey data are from the OHI survey. We also draw on various other primary source data and cite them as appropriate throughout the section.

12.2 Findings

12.2.1 Employees Believe That VHA Leaders Do Not Effectively Encourage or Embrace New Ideas

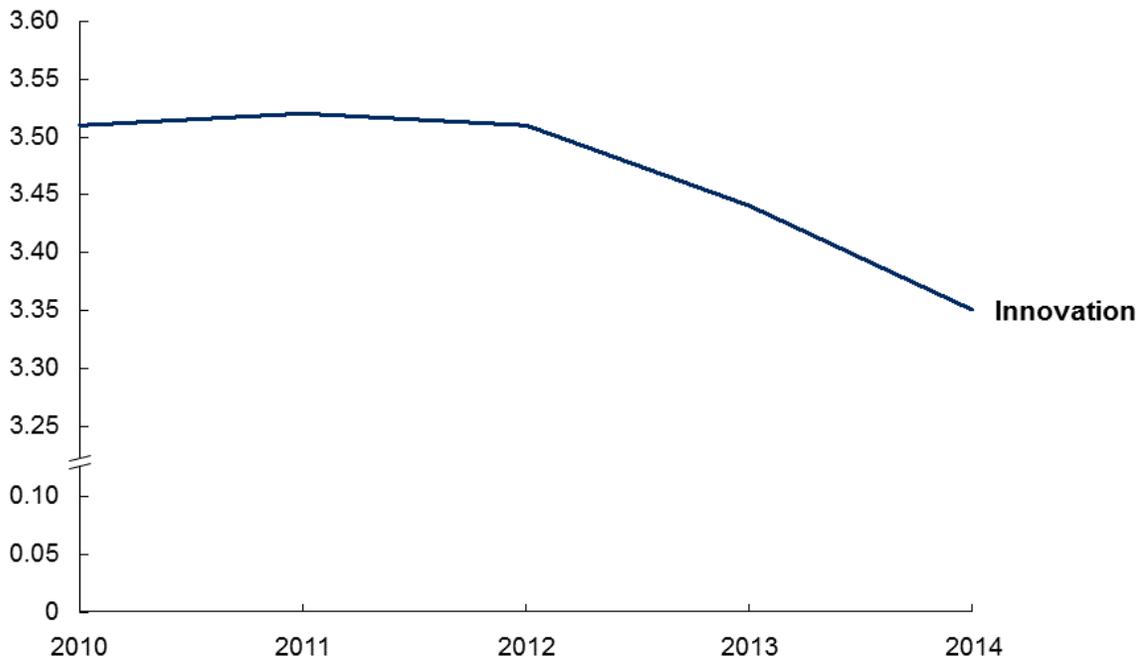
Analyses of OHI data indicate that current VHA leadership is not readily receptive to either external or internal suggestions for change. Measures of internal reform readiness and external reform readiness at VHA are bottom quartile, lower than both public sector and health care median performance **[Figure 12-2].**

Figure 12-2. Receptiveness to New Ideas


SOURCE: VHA OHI Survey 2015 (N=13,712); Public Sector Benchmark (N=47,159, no.surveys=27); Health Care Systems and Services Benchmark (N=40,437, no. surveys=33)

Data from the recent VA All Employee Survey (AES) convey a similar lack of readiness for change **[Figure 12-3].** Over the last four years, there has been decreasing agreement with the AES question: "New practices and ways of doing business are encouraged in my work group." Scores have gone from a high of 3.54 in 2011 to 3.38 in 2014. Though a small decrease in absolute terms, it represents one of the five largest declines in recent years (VA, All Employee Survey, 2014).

Figure 12-3. Innovation

VHA employees have felt decreasing encouragement to innovate
AES measure of innovation[1]
3-Neutral 4-Agree


1 AES Question: "New practices and ways of doing business are encouraged in my work group"

SOURCE: VA, All Employee Survey, 2014

Interviewees describe an organization where employees are not encouraged to bring up new ideas. Sometimes this comes from system fatigue, other times from being told not to raise one's hand, and still other times employees may be hesitant to speak up for fear of retaliation, or a burden of added work. This environment dampens the internal generation of new ideas. The impact on the Veteran is significant, as this directly impacts the improvement of their care through reduced spread of best practices or new ideas. VHA's Blueprint for Excellence lists "Provide a Psychologically Safe Environment for Employees" as a key transformational action. It is unknown what the impact of VHA's actions will be on improving psychological safety.

12.2.2 Change At VHA Happens, but Only Rarely, Takes a Very Long Time to Permeate the Organization, and Often Stalls

As a large federal agency, VHA is slow to change. The sheer size of the organization makes change difficult, and several leaders spoke of a "stasis" that keeps people from really exploring the "evolution of the status quo." Change efforts often take years, not months, and can be limited by rules and competing priorities:

- "So many obstacles and rules that it's really hard to change."

- "It takes five to seven years to get a program up and running. We are not a nimble organization."

- "Institutional resistance in getting change to happen – no coordinated approach to combat this."

- "One of the problems when you look at VHA: there is an effort to start [something] and then six months later another initiative. Some groups lapse because they are taken over by others… VA is pretty poor on implementation. Some energy, then another theme overtakes it."

The short tenures of many VAMC directors also add to the challenge. Over the last five years, the VAMC director turnover rate has been around 10 percent, but this figure excludes leaders who leave one Director position to assume another Director position at another facility, which would increase the rate above the 10 percent figure (VHA Healthcare Talent Management Office, 2015). In several instances we heard leaders explain that their staff "needed stable leadership, needed people who cared about this organization, who were going to stay for a while." Another leader explained, "We've had no consistency at the top. We've had acting directors for the last two years. There is no permanent body. We need that consistency. The directors come in with new ideas, but they don't have the time to implement anything."

12.2.3 Many Change Efforts Come From Central Office and Do Not Fully Engage Employees in the Change Process

There are many sources of potential change for an organization, but when bottom-up innovation and external orientation are less developed (as referenced in **Figure 8-5**) there is an over-reliance on top-down directives for change. At VHA, one of the most common source for change is Central Office (VHACO or VACO) requiring the organization to do something, with or without essential resources, time to react, and support. The growth of Central Office Program Offices, explored in greater detail in Section 13, has exacerbated this.

This "command-and-control" approach to change is difficult to embrace and hard to implement: "When change comes, getting that implemented effectively is a challenge." It is also difficult to react to requests before additional requests arrive: "New policies or expectations come down, and before there is time to learn them and get comfortable, there's something else." This emphasis on command and control misses the opportunity to truly engage employees and field leaders in driving, absorbing, and embracing change. As one VHACO leader explained, "VHA needs to take a field-up process to make change happen… The greatest strength we have is our workforce, and we are blowing it."

There are, however, areas where innovation is thriving on a facility-level scale. For example, the Portland, OR VAMC encourages innovation by creating a culture that values innovation "at the top," creates space and time for smart people to get together and collaborate, and has clear communication, all of which supports what some employees explained as a "culture of yes." Against a backdrop of resistance to change and fear of retaliation, these pockets of excellence are proof that innovation can still thrive in some areas of VHA.

12.2.4 Change Efforts Are Rarely Given the Necessary Time or Support to Ensure Success

The current VHA operating environment is not conducive to change because change efforts are often not given the necessary time or support to ensure success. External stakeholders – such as Congress, VSOs, and the media – are expecting quick-reaction timing and want to see fast results. This near-term pressure does not engender support of broader transformation efforts that take time to unfold and take root, which in turn does not set up a longer-term platform for sustained transformation. Meanwhile, it can be difficult for VHA leaders to focus on driving the change, as they are often distracted by "putting out fires." This is also exacerbated by a lack of stable leadership at the very top due to the frequent rotation of political appointees. Across government agencies, short tenures of political appointees can limit their effectiveness, as "people in the agency can simply wait them out if they want to resist the change". As described earlier Congress authorized the U.S. Internal Revenue Service Reform and Restructuring Act of 1998 (RRA 98), which granted Charles Rossotti a five-year term that provided Rossotti the opportunity to fully implement the IRS transformation (Rainey and Thompson, 2006). Meanwhile, in the high performing health systems the team visited, we also generally saw longer tenures for top executives – an average of 10 years across four system CEOs.[18] Though a small sample size, this suggests that leaders at these high performing organizations have a long enough runway and a stable foundation from which to lead their organizations effectively.

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

13 Supporting Infrastructure

As we undertook this assessment focused on the eight elements identified in the Veterans Choice Act, three other critical issues emerged: overall operating model, budgeting and resource management, and human resources – recruiting in particular. Although these were outside the scope of Assessment L, these elements are critical underpinnings of how the system works and how leaders operate within VHA, and we felt it important to acknowledge them. We did not do a full assessment of each of these areas; these are initial findings that we hope can help address the supporting infrastructure challenges identified during our work on Assessment L.

Throughout this section, we draw on insights shared during interviews with VHA leaders (VHA interviews, 2015). Unless otherwise cited, direct quotations are from VHA interviews. We also draw on various other primary source data and cite them as appropriate throughout the section.

13.1 Overall Operating Model

From the point of view of leaders and employees, the VHA organization is intensely, unnecessarily complex – it is becoming harder and harder to "get things done" as the number of new policies and oversight continues to grow. This difficulty results from a fragmentation of authority and overlapping responsibilities. There is a lack of clarity around roles and responsibilities across VAMCs, the VISNs, and VHACO. The fragmentation and silos exist across the system and within each tier of the organization (e.g., VACO, VHACO, VISN, VAMC). Authorities, leadership development, contracting, and financial and budgeting controls lack clarity and coordination across entities and levels, resulting in duplication, communication breakdowns, and responses too slow to meet the needs of the mission. It is also important to recognize that VA exists in a context influenced by a number of stakeholders, including for example Congress, Veterans, VSOs, OMB and OPM.

During the course of the assessment the team identified four main findings:

- VHACO has grown rapidly in the past few years and fails to coordinate, integrate, or prioritize the policies it directs the VISNs and VAMCs to follow.

- The VISNs' ability to manage and support their regions is heavily hampered by resourcing restrictions and direct VHACO control over VAMC operations.

- The VAMCs' operating model suffers from powerful silos, which prevent an effective end-to-end mission focus.

- VA's increasingly top-down management style, coupled with poor prioritization and the external political environment, result in a lack of clarity around strategic direction, reactivity to external headwinds, and flawed efforts to standardize.

Before elaborating on the findings, it is important to describe the current operating model and its origins.

13.1.1 Background and Context

VHA currently operates across three major organizational levels: Central Office (VHA and VA headquarters); regional headquarters (VISNs); and the Medical Centers (VAMCs). Under Dr. Ken Kizer's leadership, the VISNs were set up in the mid-1990s to create an organizational unit that was the right level to be patient-centered, facilitate collaboration across facilities, maintain long-standing relationships with local caregivers, and be small enough to be accountable for activities in that region. As Dr. Kizer explained in a recent article:

> *During the reforms of the 1990s, decentralization of operational decision-making was a core principle. Day-to-day responsibility for running the health care system was largely delegated to the local facility and regional-network managers within the context of clear performance goals, while Central Office staff focused on setting strategic direction and holding the "field" accountable for improving performance.* (Kizer and Jha, 2014)

Many leaders we spoke with referred back to the original intent behind the operating model design and described how each layer was intended to perform the following functions[19]:

- **Central Office.** Set strategy and policy, perform oversight, support the field, and be a high-level interface with Congress and other government agencies

- **VISN.** Integrate operations for the region. Specifically, the VISNs allocate resource/budget allocation across facilities; identify and capture network economies of scale; bring the voice of the field to Washington and liaise with headquarters; support innovation through targeted pilots; coordinate referrals to the private sector; act as the regional interface with state- and regional-level agencies; integrate actions with VBA and NCA in the region; support contracting; and conduct performance management and oversight across the VAMCs.

- **VAMC.** Deliver care – specifically, the Medical Centers and their associated CBOCs serve as the focal point for delivery and coordination (in or out of the Medical Center) for individual Veterans. This includes coordination and billing of care done by non-VHA entities (e.g., university-affiliated hospitals). The VAMCs report up through the 21 VISNs.

13.1.2 VHACO Has Grown Rapidly in the Past Few Years and Fails to Coordinate, Integrate, or Prioritize the Policies it Directs the VISNs and VAMCs to Follow

Over the past decade, VHACO has shifted from focusing on setting direction, crafting policy, and performing oversight and performance management to a much more centralized top-down model (Kizer and Jha, 2014). As described by a VHACO official, it became a management style of "You shall do this, you shall do that. All those 'thou shalts' – they're all piecemeal, just a bunch of disjointed tasks that don't make sense."

Currently, VHACO has a large number of Program Offices that create and monitor an array of policies, and these policies most often flow directly to the VISNs and VAMCs. The program

---

[19] The following list is non-exhaustive and derived from VHA interviews, 2015.

offices, often under intense pressure from external stakeholders, create the policies and do not adequately coordinate or prioritize them with the other Program Offices. The number of program offices is over 100: an external website review accounts for 104 Program Offices, while an internal VHA report from earlier this spring shows 120 (VA website, va.gov). This organizational fragmentation is highlighted in the 2015 Governance Task Force Report:

> *For example, programs responsible for elements of patient care are now dispersed into Patient Care Services, Public Health, and the Assistant Deputy Under Secretary for Health for Clinical Operations. Another example is programs related to quality… VHA programs directed to each of [six aims for high-performance health care] are dispersed throughout the organization, with effectiveness, safety, and efficiency reporting to Quality; patient-centered care reporting directly to the DUSHOM; timeliness (i.e., clinic access) reporting to the ADUSHOM for Administrative Operations; and the Office of Equity reporting directly to the Principal Deputy Under Secretary for Health.* (VA, Task Force on Improving Effectiveness of VHA Governance, 2015)

The number of people staffed to Program Offices has grown dramatically over the past five years. VHACO Program Office FTE[20] growth has vastly outpaced growth of the total VHA employee population and Veterans served, more than doubling between 2009 and 2014 **[Figure 13-1]**.

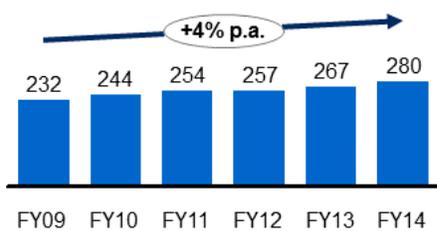
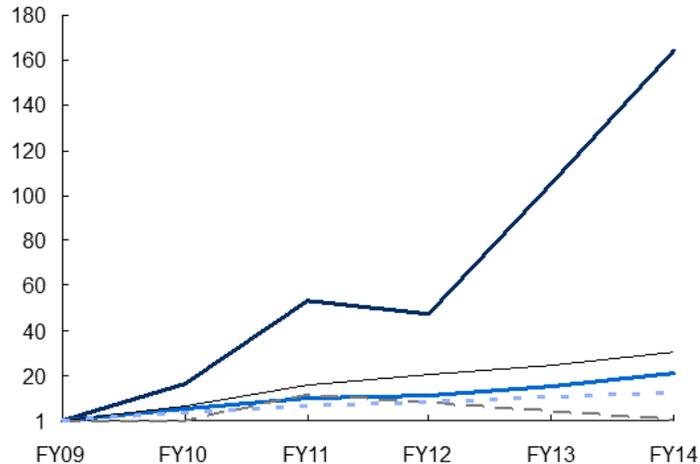
Figure 13-1. Program Office Growth

VHACO Program Office FTE growth has outpaced other VHA populations




1 Station 101 only; excludes CMOP, CPAC, Business Office, and other similar direct service programs

SOURCE: VA, Task Force on Improving Effectiveness of VHA Governance, 2015

It is difficult to benchmark the size of VHACO to private sector comparables. While the growth of VHACO may have multiple drivers during the FY 2009–FY 2014 timeframe, the overall trend of a growing VHACO is clear even when including accounting realignments from the field to Central Office.

Despite Program Office growth, there is little systematic effort to coordinate or integrate efforts and initiatives. The deliberate organizational split between operations (10N)[21] and policy (10P)[22] exacerbates this. The team could not identify any other office performing the integrating role and only the Under Secretary for Health has the requisite organizational power. One senior VHACO leader explained: "We have policy and directives. But these are revered more in Central Office than in the Field. The directives are redundant and don't all add up. They're updated every five years, but more as a "check the box" exercise. We don't really focus on how they get updated, and they're not updated in concert with each other."

---

[21] 10N is Operations and Management

[22] 10P is Policy and Services

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

The resulting impact on Medical Centers is felt as a constant stream of changes being requested from afar, with little to no warning, context, or dialogue. These policies are not integrated into local operations and are rarely accompanied by resources or implementation support. The Medical Centers are required and held accountable to implement the various uncoordinated policy directives, often with no input provided by the individuals who will actually implement the policy. As one VHACO leader explained, "We have a bunch of policy development but no ownership for outcomes. People in the field have responsibility for execution, with no input into the strategy development." Additional perspectives from VHA leaders both in the field and at VHACO include:

- "New priorities result in new programs. And a new Program Office in Central Office leads to a new program person in the VISN (such as homelessness or mental health). This is how we've grown. I don't know that it's the best way to do things. Every time a new initiative gets stood up, a new Program Office gets stood up. None of them ever get stood down."
- "Every Program Office has great aspirations, but they operate in silos."
- "VA headquarters officials issue memos and directives, with little face-to-face conversation around expectations or implementation issues. Leaders should be out in the field to see if what they develop inside the Beltway [Washington, DC] resonates. Often it doesn't."
- "The farther you get away from the sharp end of the stick, the more people get caught up in the bureaucracy…. One of the reasons why the bureaucracy in Washington needs to be as lean as possible is to help keep the focus on what's important. There should be no bureaucracy beyond what's necessary for the front-lines to do what they're supposed to do."
- "In Central Office, when people have an idea, they stand up a committee, which then leads to the stand-up of an office that then operates in a silo and pummels the field."
- "Why so many [taskings and requests from Central Office]? I don't know. It's become a common mechanism. It comes from the VISN and every Program Office. It takes a ton of tracking. And we rarely get any feedback or follow-up on things we submit. We have a staff member who does nothing but receive action items, disburse them, and follow up. We look at the list every morning after rounds to assess what needs to be done immediately and whom we need to pressure."

While Congress mandates parallel efforts for various initiatives, it generally does not mandate separate program offices for each initiative. Nonetheless, setting up a new program office for a new directive can be a clear indication that VHA is taking specific steps in response to a new priority. Absent focused efforts to manage these priorities in a well-coordinated way, it is not surprising that program offices have grown so dramatically.

13.1.3 The VISNs' Ability to Manage and Support Their Regions Is Heavily Hampered by Resourcing Restrictions and Direct VHACO Control Over VAMC Operations

The role of the VISN has become increasingly variable and nebulous over the past two decades. Although we did not diagnose what transpired since the VISNs were formed in the mid-1990s, the role they serve today is quite different from the original concept envisioned when the VISNs were formed.

Currently, the role of the VISN is widely variable and ill-defined. Some VISNs play a heavy compliance role, others play a consultative or support role, and some are in-between. In some cases, the VISN role is primarily one of soliciting information from VAMCs and consolidating it to respond to requests from Central Office. It is often not clear when VHACO will work through the VISN or go straight to the facilities. As described by one former Network Director, "There are no rules of engagement at all – a big frustration of mine." There are some exceptions, where more clarity exists, such as VERA funding paths. Against this context, there is a need for clearer alignment between the VISN and Central Office, and a focus on what is the right role of the corporate center.

VISNs are responsible for performance of their respective Networks, but face significant restrictions on how they can allocate money and integrate, revise, or prioritize policies flowing from Central Office. This limits the ability of the VISN Directors (and the VAMC Directors who report to them) to rapidly correct unforeseen issues or allocate resources based on localized needs. The budgetary restrictions and their effects are described in the next finding. Interviews at all levels of the VHA organization indicated that the VISN rarely is able to effectively coordinate or influence the policies coming down from Central Office. Though they play some role in filtering and streamlining information coming from Central Office, they have limited ability to shape the message or participate in the dialogue.

13.1.4 The VAMCs' Operating Model Suffers From Powerful Silos, Which Prevent an Effective End-To-End Mission Focus

VAMC personnel face a daunting challenge in their mission to deliver care to the Veteran as they must work across a multitude of organizational silos, with each silo often seeking to optimize its outcomes (or minimize its risk exposure). Three major causes for the silos are the intense compliance focus, a narrowing use of funds, and a culture that does not reward collaboration across work groups.

Except for the VAMC Director, the VAMCs we visited often lacked roles or champions who focus their efforts across the silos in order to coordinate delivery of care, and when these champions do exist, they often cited limited authority and influence over other organizational units to collaborate. Examples of the impact include the hurdles that doctors and nurses face to procure basic necessities, the length of time it can take to get a maintenance request resolved, and the difficulty in coordinating care across multiple departments. Interviews indicated that support functions (i.e., human resources, IT, or contracting) viewed complete compliance with siloed rules as success without regard to the impact on overall care delivery. The result is a model that

is very difficult to operate and pushes employees to disengage out of frustration and risk-aversion.

13.1.5 VA's Increasingly Top-Down Management Style, Coupled With Poor Prioritization and the External Political Environment, Result in a Lack of Clarity Around Strategic Direction, Reactivity to External Headwinds, and Flawed Efforts to Standardize

This combination of increased centralization, expanded size, and lack of coordination and prioritization is further complicated by the political environment in which VA operates. This landscape contributes to a lack of clarity around strategic direction, confusion around leadership priorities, and fragmentation of management attention:

- **An expanding scope of VHA activities has led to confusion around leadership priorities.** The organization's focus has expanded and shifted over time, and it is unclear what the priorities are, and unclear when they will shift again. Many leaders in the field express a desire for more strategic clarity, coordination, and support from Central Office. One former VA official expressed the urgent need for "leaner programs, clear discussions between the program and operations side, clarity over what's most important and where the energy should be focused." Other leaders expressed:
  - "Is there a clear vision of the future, agreed-upon aspects, performance outcomes, clearly communicated? No."
  - "At VA, it becomes 'Here's the next initiative. Here's the next one.' It's never clear which one is about accountability and which one is a good idea."
  - "We're drowning in policies. GAO recently told us that our policies are unclear. When you create a structure like the one we have where people's jobs are to create policies, you get what we have."
- **The external political environment complicates an already complex organization trying to fulfill its strategic direction.** Lack of clarity of direction is further weakened by Central Office's reactivity to external headwinds. This reactive stance results in "Flavor-of-the-Month" policies and taskings, which do not send clear signals to the field about what is most important. Select perspectives include:
  - "At high levels of the organization, there are no priorities, and the winds shift and people get confused."
  - "Every time they had a finding, VA's only answer was to write a directive. But that's not the only answer."
  - "VA looks at a problem, they get a hearing, it becomes public, and all of a sudden there's an entire structure to make sure this never happens again."
  - "We have a defensive posture with policies – 'just in case.'"
  - "Central Office manages everything by crisis."

- o "We must react to the 'Flavor of the Year.' This extreme focus on a single issue takes time, attention, and resources away from the general purpose of the facility – to treat Veterans – when we still have a hospital to run."
  - o "I don't understand the role of Program Offices. Most were built in crisis. There's never an ROI afterward."
- **The increasingly top-down management approach has led to inconsistent and poorly implemented standardization efforts.** In some cases, the wrong things are standardized, while in others there is so much standardization and control that implementation proves difficult. And yet, many leaders recognize the value of standardization, and would like to see VHA standardize more, in the right way:
  - o "Centralization and standardization – we tend to standardize everything and nothing at the same time."
  - o "VA doesn't standardize the things it needs to at the Medical Center level and give them the authority to do those tasks and create a support model for them to do it. And so you end up with a lot of variability across hospitals. [The] same thing happens at Networks. Each Network comes up with its own set of solutions."
  - o "We need to identify key business processes that have to be standardized (like scheduling), and standardize those things ruthlessly. We need fidelity in the system to run the business. We can't figure out what to standardize."
  - o "We still do not have a national policy on scheduling/appointments, despite all the attention. We're coming up with our own anyway – but that is a place where Central Office could have been helpful. Where we need direction, we don't get it."

Leaders hold out hope that standardization can work well within this system, and Pharmacy Benefits Management (PBM) is one example of where it has worked quite well (see Assessment J for additional detail).

13.2 Budgeting and Resource Management

Throughout the course of our work and interviews, topics related to budget and resource allocation came up frequently. Our findings are as follows:

- Several challenges arise in how funding is allocated.
- Much of the support funding is outside of local control, which contributes to organizational silos and cumbersome or inefficient processes.
- Spending authorities are uneven.
- Management systems are not well integrated and data analytics capabilities are inadequate.
- The increasing share of Specific Purpose funding hinders leadership's ability to effectively allocate resources.

13.2.1 Several Challenges Arise in How Funding Is Allocated

A number of challenges are observed with the current system. They include:

- VERA does not keep up with shifting care priorities and patient loads.

  As care priorities and the Veteran population have changed, Medical Center leaders report that the Veterans Equitable Resource Allocation (VERA) model has not kept pace with changing on-the-ground needs, as VERA is based on historic figures and does not take into account forecasted changes (VA, Veterans Equitable Resource Allocation (VERA) 2014 Handbook). This is especially challenging for facilities that are seeing significant increases in patient load. Moreover, new priorities are funded with restrictive Specific Purpose funds, each designed for a very explicit, but not always comprehensive, goal. The compartmentalization of funding reduces flexibility in how to use the resources, and some believe it has gone too far: "Rather than hold people accountable for projects, they try to fence the funds. We have 27 different appropriations."

- Current system does not incentivize continuous efficiency improvement.

  After receiving General Purpose funds from VA through VERA, VISNs first allocate a portion of the money to VISN-specific initiatives and emergency reserves. VISN-initiative funds must be reported to VACO, and emergency reserves are not allowed to exceed 1.5 percent of the total allocation. The VISN then allocates the remainder of the money to the stations (VAMCs), making adjustments between stations as needed. Through this reallocation, stations that continually operate budget shortfalls are provided for out of the surplus of other stations in the network. While this does allow for necessary adjustments (such as, expensive care in rural regions dictated by access needs), it also removes the incentive for stations to pursue cost-efficiencies. Given the history of reallocation, station leadership knows that surpluses in their own budgets could be easily redirected to accommodate shortfalls elsewhere, rather than reinvested in their own station (GAO, 2011; VHA interviews, 2015).

- VERA allocation does not take into consideration additional operating costs that result from leasing, effectively imposing a long-term penalty on VISNs that rely more heavily on leased facilities.

  The allocation formula does not consider additional operating costs driven by the increased use of leased medical facilities. VERA is determined through a formula based primarily on patient volume and complexity of care. This is designed to increase responsiveness to workload changes, but also has the consequence of penalizing VISNs that rely heavily on leased facilities instead of owned properties. The operating costs, per patient, of a leased facility are higher than those of an owned facility, where capital costs are covered with an additional allocation of capital funds upfront. As VHA increasingly looks to leased properties to accommodate increases in workload, this mismatch in the VERA formula has the potential to strain the budgets of growing VISNs that are funding numerous leases out of their operating budgets (VERA 2014). (See Assessment K for additional detail.)

- Obligation targets (percent of funds allocated by certain quarter) cause projects to be prioritized based on ability to obligate/execute, rather than true need-based priority.

  A major focus of VHA is meeting obligation targets throughout the year – specifically for the non-recurring maintenance (NRM) program. Because NRM funds expire within one

year, VHA has internal targets by quarter for obligation of allocated funds – for example, some VISN must obligate 80 percent of funds by the third quarter of the fiscal year. This constraint drives selection and execution of projects depending on "preparedness" to execute (for example, an off-the-shelf design project) rather than needs-based priority. (See Assessment K for additional detail.)

13.2.2 Much of the Support Funding Is Outside of Local Control, Which Contributes to Organizational Silos and Cumbersome or Inefficient Processes

Local facilities have little authority over VA-wide functions like HR, IT, and contracting. Many of the tools of leadership – managing people through human resources, ensuring employees have access to resources, materials, and facilities needed to care for the Veteran, etc. – are outside of the direct control of local leaders who rely on these processes. Mechanisms are not in place to compensate for this, service-level agreements are not widely used, and the culture in general does not engender collaboration across organizational units.

13.2.3 Spending Authorities are Uneven

Spending authority is uneven, with many working hard to keep spend under certain dollar thresholds to avoid lengthy and uncertain approval processes.

By statute, minor projects and NRM projects cannot exceed $10 million. As a result, most projects are consistently developed to stay just below the threshold (see Assessment K for additional detail). **Figure 13-2** illustrates this behavior in recent strategic capital investment plan (SCIP) submissions.

Figure 13-2. Breakdown of Major and Minor Projects by Project Size

Volume of project submissions directly under $10 million Minor Construction threshold illustrates careful project packaging

Average size and number of FY16 SCIP Major and Minor Construction requests

$195 MM   Major construction avg. $
$8.5 MM   Minor construction avg. $

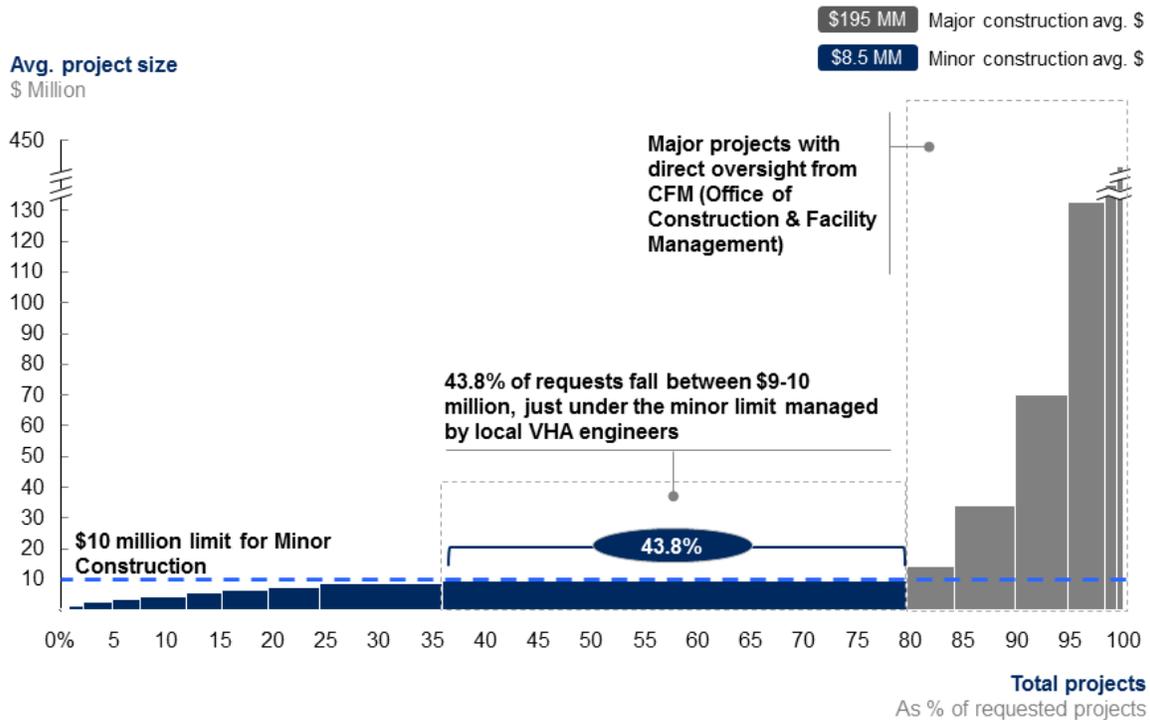
Avg. project size
$ Million

Major projects with direct oversight from CFM (Office of Construction & Facility Management)

43.8% of requests fall between $9-10 million, just under the minor limit managed by local VHA engineers

$10 million limit for Minor Construction

43.8%

Total projects
As % of requested projects


SOURCE: FY14-16 SCIP submissions; VHA interviews, 2015

Additionally, the limit is strictly governed for in-process projects. While there is a defined process to receive a cost limit increase, that process is extremely burdensome, such that stations avoid it if at all possible, reducing or even abandoning the project if necessary. (See Assessment K for additional detail.)

13.2.4 Management Systems Are Not Well-Integrated and Data Analytics Capabilities Are Inadequate

Managers must make many major decisions without the benefit of normal business analytics. The effects are most acute in procurement and staffing. The procurement system is not integrated with the financial management system, and there is limited built-in feedback. Systems are fragmented, for example, 145-item master files and purchasing databases exist. The inventory management system does not provide actionable and relevant metrics for performance management, and data related to medical supplies and devices are not standardized and is often missing. (See Assessment J for additional detail.)

In staffing decisions, current practices and tools do not allow VHA to know whether it is consistently setting staffing levels appropriately, affecting the ability to manage resources effectively. At the most basic level, models do not exist or are not easily accessible for how to

---

staff a facility of a given size and complexity. One VHACO leader explained, "I don't know how many people should be staffed in a CBOC, or a Level 1a, or a Level 3 facility." Many service lines lack clear national staffing guidance, resulting in ad hoc methods of estimating FTE need. Resource management is often siloed by service line, resulting in inconsistent decision-making on staffing that does not always match needs. It should be noted that nursing staffing models are relatively well-developed for certain service lines, and the fact that they even exist is a great start – and there is an opportunity to take a more holistic look at staffing models to understand the skills and capabilities needed for the VHA workforce at large.

(See Assessments F, H, and J for additional detail.)

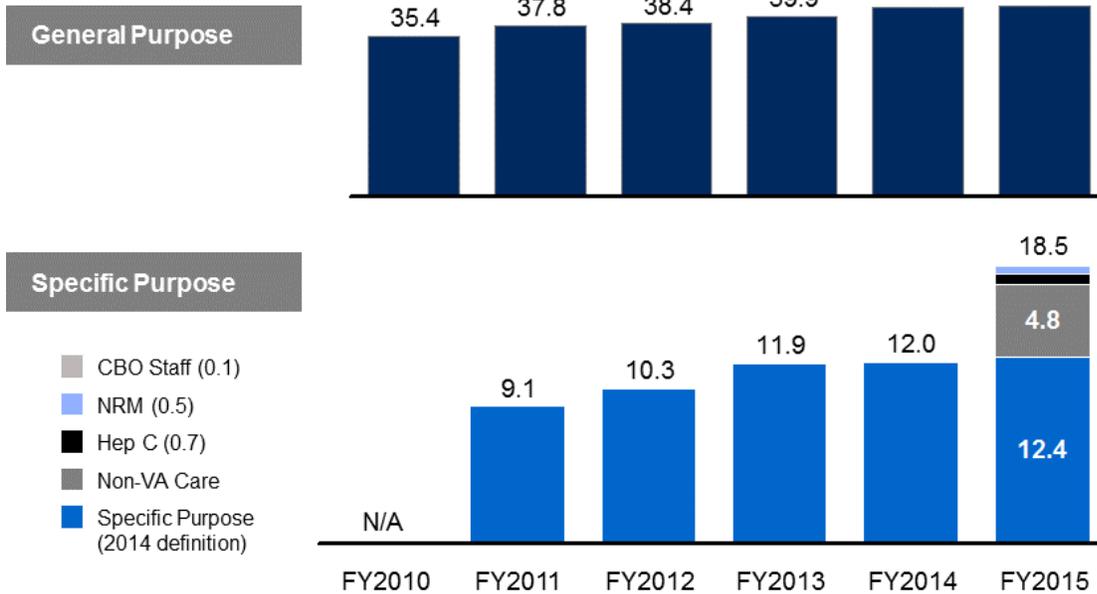
13.2.5 The Increasing Share of Specific Purpose Funding Hinders Leadership's Ability to Effectively Allocate Resources

An increase in Specific Purpose funding restricts the flexibility leadership has to meet mission needs **[Figure 13-3].** Specific Purpose funding has many restrictions placed by Congress on how it can be used, and it can be highly variable year-to-year: "There is no equitability in Special[23] Purpose programs – you never know when you're going to get it." In addition, once Specific Purpose is carved out first, VERA allocates the remaining General Purpose funding. VHA is required to fund Specific Purpose at the amount specified, so in a world of constrained resources it is most often General Purpose funding that comes up short. It is important to note that the definition of Specific Purpose has changed significantly in the last year, making it difficult to fully reconcile budget figures in an "apples to apples" way. Nonetheless, because of the difference in how Specific Purpose and General Purpose funding can be spent, this increase in Specific Purpose funding has a material impact on the field's ability to adjust funding allocations to account for local needs.

---

[23] Special Purpose is sometimes used interchangeably with Specific Purpose.

Figure 13-3. General Purpose and Specific Purpose Funding

Evolution of General Purpose and Specific Purpose funding, FY2010-FY15
$ Billons


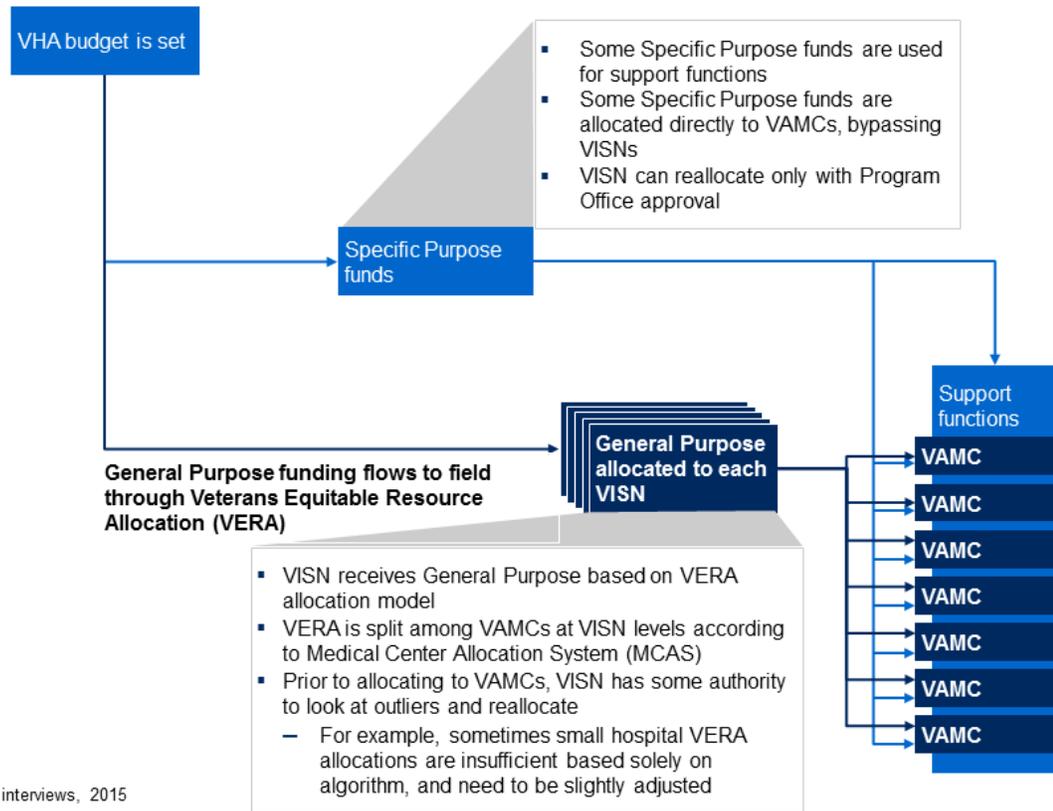
1 2011-15 for Specific Purpose
2 Specific Purpose numbers for every year include new programs and program offices (e.g., Office of Informatics and Analytics, National Center for Patient Safety, Employee Education Service Center)

SOURCE: VERA 2014 Handbook, FY2015 Draft VERA Budget

The growth in FY2015 Specific Purpose funding comes from two major sources. The addition of a $5 billion Non-VA Care line item (a provision in the Veterans Choice Act) effectively changed how that funding is managed. Before this, Non-VA Care funds were in General Purpose funding and allocated to the field through VERA. The Veterans Choice Act required that this money be allocated based on workload credits, but managed through the Central Business Office via Specific Purpose. The other major change was the addition of approximately $700 million in Hepatitis C Specific Purpose funding. The net effect is to fence off 30 percent from leadership's control, reducing their ability to effectively direct resources to areas of most need.

The fragmentation of Specific Purpose funding also poses a challenge for operators. Specific Purpose funding for FY2015 is spread across more than 450 line items (VHA Finance Office, 2015).

Specific Purpose funds typically flow directly to facilities, bypassing VISNs, which reduces the VISN's role in optimally managing the Network's total resources. **Figure 13-4** offers a high-level overview of how funding flows to the field.

Figure 13-4. Resource Allocation Across VAMCs


13.3 Human Resources – Recruiting

13.3.1 Human Resources Has Not Been Able to Meet the Recruiting Requirements of the VAMCs and VISNs

VHA has large hiring requirements, hiring tens of thousands employees annually – many with specialized clinical expertise. Although a comprehensive examination of the human resources function was not within scope of Assessment L, systematic HR challenges were identified through the course of our assessment. While each of the elements addresses some aspects of the VHA human resources function, one aspect that is not addressed specifically, but surfaced in many places as a critical challenge, is recruiting. Hiring is also cited in VHA's Blueprint for Excellence as a critical challenge that VHA is facing, and as of May 2015 "Reducing hiring barriers" status was rated as "potential risk (yellow)" (VHA, Blueprint for Excellence, 2014). This assessment did not conduct an end-to-end review of the hiring process, but our initial findings suggest significant challenges with the current system and indicate an end-to-end review could be worthwhile.

For many reasons, HR has not been able to meet the recruiting requirements of the VAMCs and VISNs. Recruiting is crippled due to the length of process and cumbersome systems that do not "talk" to each another and are not user-friendly. The length of time to hire priority positions stretches for months, and the process is not user-friendly to applicants. HR is expected to fill a position within 60 calendar days, 80 percent of the time, but process requirements, even if perfectly executed, take about 49 to 62 days **[Figure 13-5].**

Figure 13-5. Hiring Process

HR is expected to fill a position within 60 calendar days 80% of the time, but process requirements, even if perfectly executed, takes ~50-60 days

ILLUSTRATIVE

	Number of business days	Number of calendar days	Responsible
Job announcement	5-14 (14 if bargaining unit position)	7-20	Supervisor and HR Specialist
Qualification	5	7	
Review, interview, and selection	25	35	Service Chiefs
Offer made	2	--	HR
	37-45	49-62	

Insights from the field

- "Measures for recruiting / hiring are unrealistic when you consider the process requirements"

- "On a perfect day (with nothing going wrong), we're already at the 60 day target"

- "Yet most Medical Centers and VISNs will say that they're meeting their hiring targets of '60 calendar days, 80% of the time'"

- "But we know that things aren't that perfect, so this reporting is not accurate"

SOURCE: VHA interviews, 2015

Business leaders and HR personnel alike express frustration around recruiting.

Business leaders express:

- "You end up playing games, instead of 'hiring like the rest of the world' and selecting the best applicants."

- "We lose people in the process – it takes three months to onboard and they receive other offers in the meantime."

- "The last MD I hired in Mental Health took 200 days beginning to end. They're looking at other offers. We lost an NP and an MD because of the long wait."

- "The hiring process is completely broken."

And HR personnel concur:

- "We're supposed to fill 80 percent of positions within 60 days. If I follow all the rules and everything goes perfectly – we have the candidates, others do what they're supposed to do – it takes 58 days. It's nearly impossible to hit this because of all the hoops we have to jump through."
- "I don't know who is responsible for filling Quadrad roles."

Candidates also express dissatisfaction over the recruiting experience. For example, we spoke with multiple Quadrad leaders who had interviewed for Medical Center Director positions more than two months earlier, and had either not yet heard from anyone regarding the outcome, or had heard through other avenues (such as the local newspaper) that the position had been filled.

It should be noted that the HR recruiting function must operate in an incredibly complex environment, making a difficult task even harder. Federal rules and regulations create many distortions and make effective HR delivery much more challenging than the private sector (for example, OPM guidelines and Veterans' Preference). Operating multiple systems that do not interface seamlessly leads to inefficiency. One HR administrator observed: "We have 39 HRIS[24] systems, and they don't talk to each other. We don't all have to use all of them, but we all have to use 20 or more no matter what piece of the HR job we do." This systematic fragmentation and limited system interoperability exacerbate challenges associated with scale, structure, staffing, training, and process. VAMC, VISN, VHACO, VACO, and other federal entities (such as OPM) each "own" part of the HR process. Finally, Central Office, VISN, and VAMC policies are added to OPM policies, increasing the complexity.

Fixing recruiting, and thereby the hiring process, will not be simple; however, it is imperative to maintain the health of VHA's own workforce.

---

[24] Human resource information systems

Appendix A   Detailed Methodology

To ensure a broad range of sources, our assessment draws upon national datasets, national surveys, expert interviews, and visits to selected VAMCs across the country at which we conducted interviews. These are listed in the bibliography.

A.1   Interviews

Upon defining each of the eight elements, the Assessment L team developed a set of key questions around each element that formed the backbone of our Assessment L interviews. The key questions for each element are laid out below in **Appendix Table A-1.**

Appendix Table A-1. Key Interview Questions

Element from Veterans Choice Act Legislation	Assessment L Interview Questions
Culture	▪ How would you define the culture here? ▪ How does leadership influence the culture?
Accountability	▪ How are leaders held accountable? ▪ How should leaders be held accountable? ▪ To what degree do you feel you have the authority to successfully perform your roles and responsibilities? ▪ How do Central Office directives or guidelines influence or impact leadership decisions and execution?
Reform Readiness	▪ How ready are your leaders to drive large-scale changes/ transformation efforts for your organization? ▪ What are the biggest barriers to change that you face as a leader?
Leadership Development	▪ Have you attended any leadership development programs? What has left an impression with you? How do you select participants for leadership development programs in general – both formal and informal? How do you measure the effectiveness of these programs – both formal and informal?
Physician Alignment	▪ Describe the relationship between physicians and the administration here. How are physicians involved in larger facility-wide decision-making? How about when a specific problem arises?
Employee Engagement	▪ Describe for us how engaged employees are right now? Has this changed over time? How are issues identified, raised, and resolved here?

Element from Veterans Choice Act Legislation	Assessment L Interview Questions
Succession Planning	▪ How are leaders identified at VHA? What are the leadership characteristics you tend to see in VHA's future leaders? Are there other characteristics that are needed but you don't see as often? ▪ What's the state of the leadership pipeline? ▪ Tell me about the last time a key staff member or colleague left the organization – how did you approach filling the position? How long did it take?
Performance Management	▪ How are the performance metrics captured at the facility level used to make management decisions? ▪ On individual performance management, what happens after the formal evaluation cycle is complete, with what frequency are leaders giving feedback to and reviewing important metrics with employees?

Appendix Table A-2 presents the distribution of the interviews conducted.

Appendix Table A-2. Distribution of Interviews

Location	Pentad / Non-Pentad	Number of Interviews
VAMC	Pentad	95
	Non-Pentad	129
VISN	Pentad	34
	Non-Pentad	12
VHACO, VACO		30
Other federal agencies and former VHA leaders		10
Total		**310**

A.2   VAMC Site Selection

To increase consistency and generalizability of findings, teams have coordinated our sampling methods to the extent possible while ensuring the sampling methodology reflected assessment-specific considerations. We selected a core set of VAMCs to visit, which are representative of the VAMC system as a whole across critical facility demographic and performance outcome metrics.

The VAMC site selection process followed the following steps:

1. **Stratification of facilities.** Stratified random sampling, with VISN as strata, was used to select an initial long-list of facilities. To reduce sample size, a subset of VISNs was randomly selected, from which one of the two initially selected sites was randomly de-selected.

2. **Review of distribution.** Chi-square testing was used on each of the key facility profile and performance variables to ensure the distribution of scores in the sample is representative of the population. Variables were chosen to reflect anticipated drivers of facility performance, and included: VISN, rurality, adjusted admissions, complexity level (on VHA rating scale), adjusted LOS, patient satisfaction, cumulative access score, and facility age.

3. **Refinement of facility selection.** Initial facility list was vetted with internal and external SMEs and augmented as needed, to include facilities that are considered critical for inclusion (for example, a Polytrauma Center, facilities with innovative tools/practice) and ensure that all selected facilities had the range of services being assessed.

This method resulted in a sample of 23 facilities and is representative across each of the criteria used in selection.

A.2.1   VAMC Site Selection Variables

Variables were selected based on criteria relevant to each assessment area and assumed impact on facility performance. Variable definitions are given below:

- **VISN.** Used VHA Support Center (VSSC) classification of VAMCs by VISN.

- **Rurality.** Used VSSC 2014 categorization of facilities as rural or urban.

- **Adjusted admissions.** Relied upon American Hospital Association (AHA) 2014 data. Adjusted admissions = Total admissions* (Admissions*[OP revenues/total revenues]) VHA reports revenue data (gross billed revenue) to AHA to calculate this metric. Adjusted admissions scores were divided into quartiles, with the middle quartiles grouped, to produce low (<2881.75), medium (2881.75-6081.00), and high (>6081.00) adjusted admissions categories.

- **Complexity level.** Used VSSC 2014 categorization of facility complexity. Level 1 facilities were grouped, to produce selection criteria of high complexity (Levels 1a, 1b, and 1c), medium complexity (Level 2), and low complexity (Level 3).

- **Adjusted LOS.** Used VA SAIL data. As only Q3 FY2014 was available to us at the time of selection, we were only able to use that quarter's results. Length of Stay (LOS) data were divided into quartiles, with the middle quartiles grouped, producing three variables: low LOS (<4.19), medium LOS (4.19-5.14), and high LOS (>5.14).

- **Patient satisfaction.** Used VA SAIL data. As noted above, as only Q3 FY2014 was available to us at the time of selection, only that quarter's results could be used. Patient satisfaction data were divided into quartiles, with the middle quartiles grouped, resulting in low (<249.83), medium (249.83- 264.02), and high (>264.02) satisfaction categories.

- **Cumulative access score.** Used VA SAIL data. As noted above, as only Q3 FY2014 was available to us at the time of selection, only that quarter's results could be used. The eight access scores included in the VA Q3 FY2014 SAIL report were assigned quartiles and added together to produce a single cumulative access score, which was then divided into quartiles. This process resulted in cumulative score quartile categories of low (<17), medium-low (17-20), medium-high (20-23), and high (>23) access.
- **Facility age.** Relied upon VSSC 2014 operational date data for each VAMC. Operational dates were divided into quartiles, with the middle two quartiles grouped, producing categories of early (prior to June 4, 1929), medium (June 4, 1929, to April 7, 1952), and recent (after April 7, 1952) establishments.

In several instances, variable data were not available for each VAMC. To ensure that these cases were not excluded from the sample, the team scored absences with -1 and included the -1 score as a category for each selection criterion where there were absences.

A.2.2 VAMC Core Site Selection Representativeness

Results for Fisher's Exact Test demonstrate that the sample is not significantly different from the population of VAMCs.

Appendix Table A-3. Fishers Exact Test Results

A.3   VISN Site Selection

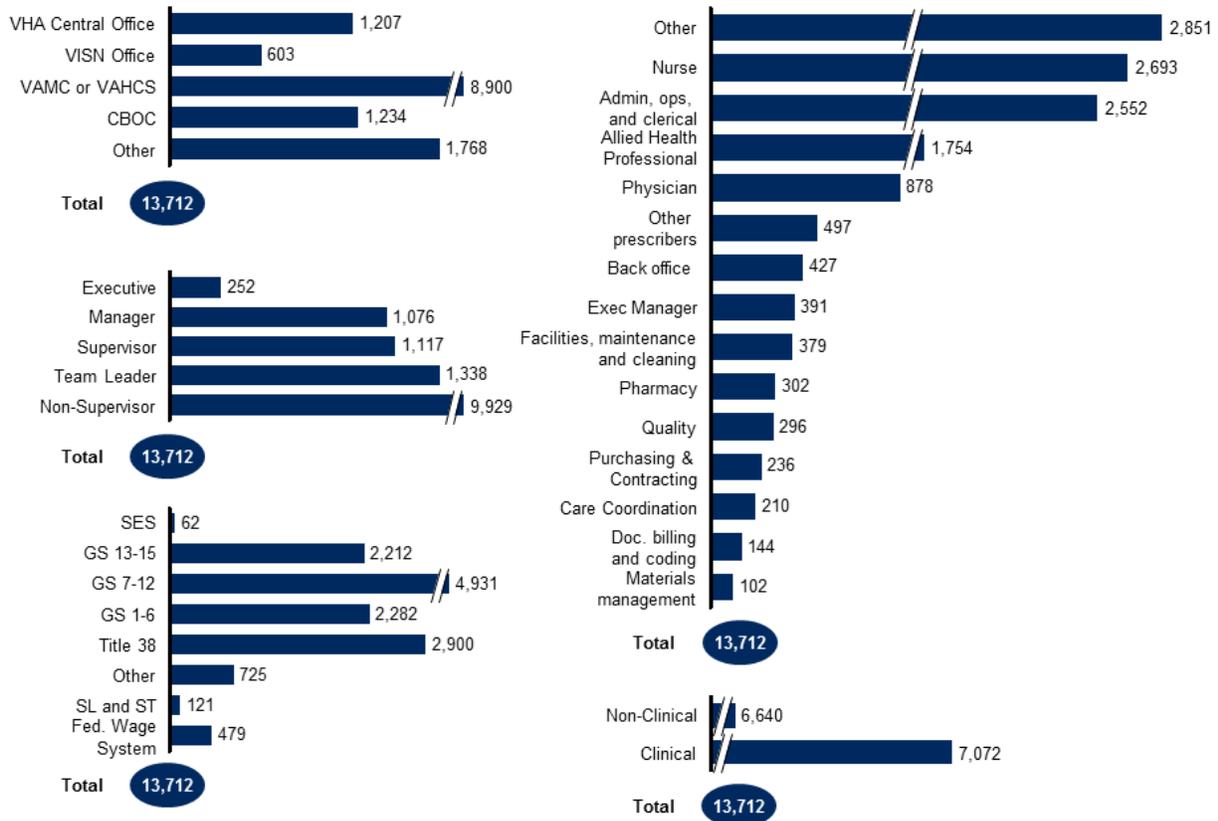
In addition to the VAMCs described above, the Assessment L team also selected sample VISN headquarters to visit, as well as three additional VAMCs. The VISN leadership is seen as an important part of the chain of command with distinct duties that significantly impact VAMC leadership. The Assessment L team visited 13 of the 21 VISNs. Given the relative homogeneity of the VISNs (in comparison to the VAMCs), the need to be as efficient with resources as possible, within limited time, we selected VISN sites that were in geographic proximity to the VAMCs selected. The VISN sites did not influence which VAMCs were selected.

A.4   Organizational Health Index Supporting Data

The OHI was one of the major instruments used to conduct the assessment of VHA leadership. The Methodology Section describes the basis of the OHI and the statistical tests used to validate its results. The OHI Survey was launched as a census survey on March 18, 2015 and stayed open through April 17, 2015. The communication effort included an initial memo from Dr. Clancy, Former Interim Under Secretary for Health, and additional communications from VISN and VAMC leadership. A detailed data cube has been provided to VHA.

The OHI results are based on a statistically valid sample. The participation was n=13,712, with a response rate of five percent. Select demographics are laid out in **Appendix Figure A-1**.

Appendix Figure A-1. Select VHA OHI Demographics

Select VHA OHI demographics


SOURCE: VHA OHI Survey 2015 (N=13,712)

The OHI standard calculates margin of error at the 95 percent confidence level, which means that there is a 95 percent probability that the results of the complete population are within the margins of error of the results obtained. It is a standard used across the industry. The average margin of error was VHA: +/- 0.82 percent.

These results were validated against the other instruments and techniques used during the assessment.

Several additional analyses based on OHI data are presented below. **Appendix Figure A-2** below shows how the different levels in the organization rank order the ICARE values. SES felt that ICARE values were prevalent in today's organization at a much higher rate than all of the other grade categories, with Respect being the one value that all ranks felt was not among the top 10 values today.

Appendix Figure A-2. ICARE values

Current and desired ICARE value mapping on the OHI by grade

Employees at VAMCs and CBOCs (N = 9,199)

■ SES (N=30)
■ GS 1-15 & Title 38 (N=9,169)

Percent desiring the value (among top 10 values)[1]

Value	SES	GS 1-15 & Title 38
Integrity	33	28
Commitment	30	32
Advocacy	43	24
Respect	40	25
Excellence	43	31

Percent recognizing the value today (among top 10 values)[2]

Value	SES	GS 1-15 & Title 38
Integrity	10	0
Commitment	33	21
Advocacy	40	14
Respect	0	0
Excellence	33	4

1 Specific language of question reads: "Please select a minimum of 5 and a maximum of 10 statements from this list of values that best describe your views regarding what VHA's culture should be like in the future. Please also choose a minimum of 5 and a maximum of 10 statements that least describe your views regarding what VHA's culture should be like in the future"

2 Specific language of question reads: "Please select a minimum of 5 and a maximum of 10 statements from this list of values that best describe VHA currently. Please also choose a minimum of 5 and a maximum of 10 statements that least describe VHA currently"

SOURCE: VHA OHI Survey 2015 – VAMC & VAHcS & CBOC (N=9,199)

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

Appendix Figure A-3 below shows the full set of values (not just ICARE) and how the different grades viewed their prevalence today. SES viewed Veteran focus as the most prevalent value, while GS 13-15 and Title 38 employees ranked bureaucracy as the most prevalent value. This same group also ranked slow-moving and silos much higher in prevalence than the SES employees.

Appendix Figure A-3. Value Mapping Varies by Demographics (1 of 3)

Today's values seen differently by level of employment
Value mapping on the OHI: Current
Percent employees recognizing the value today; VAMCs and CBOCs only

Legend:
- ■ 40%+ (Highest)
- ■ 20-39%
- ■ 10-19%
- □ 0-9% (Lowest)

A.5 Approach to Recommendation Development

Assessment L's considerable breadth, combined with the sense of urgency presented by the current environment, present the context for our recommendations. Each element, and therefore each finding, is interrelated with others. It follows, then, that opportunities to improve VHA cannot be approached in isolation, but rather in thoughtful coordination; our recommendations draw upon findings and themes that cross multiple elements and were considered as a whole during development.

In considering the findings collectively, inspiration was found through private sector practices, pockets of existing practices within VHA, and past experience with companies facing similar difficulties. We undertook an iterative process combining two approaches – a bottom-up approach using each element to generate recommendations and identify several themes – followed by a top-down approach to spur additional ideas within these identified themes. Throughout this process, various drafts were also refined with internal experts with significant expertise in government innovation, hospital operations, and broader private sector

experience, and the Blue Ribbon Panel established by MITRE as part of this assessment. Recognizing that change efforts will be designed to both address and incorporate multiple elements (such as, culture, accountability, and performance management), the recommendations are presented across elements rather than element-by-element.

Four guiding principles supported the development of these recommendations:

1. Bold. As detailed above, the scale of challenges requires bold action. Some of the recommendations laid out may be provocative: we offer them in the belief that they are necessary, and to do less will not be sufficient.

2. Feasible. The recommendations should strike a balance between boldness and practicality, recognizing the current operating environment in which this change needs to occur – a system that needs to be stabilized.

3. Clear. The recommendations themselves should be simple and easy to understand by a broad range of stakeholders. Given the complexity of the interdependencies between them, this simplicity is critical.

4. Detailed. The recommendations should be detailed enough to offer a sense of how they could become actionable. The team stops short of implementation-ready detail, however, as that is better developed by change leaders and owners. The recommendations also need to be detailed enough such that one can say "yes" or "no" to them.

A.6   Validation: Mapping Findings to Recommendations

As explained in Section 2.1 Validation and Testing, after analyzing and synthesizing data, we developed a set of detailed recommendations to address findings. We then analyzed these recommendations to determine their relevance and importance to the findings.

To ensure comprehensive coverage, we mapped the seven overall findings against the six overall recommendations to create a "heat map" of coverage. Overall recommendations were considered against each overall finding and assigned a score of relevance. All overall findings were, at minimum, directly addressed by one overall recommendation and indirectly addressed by another. This analysis is shown below in **Appendix Figure A-6.**

Appendix Figure A-6. Mapping Overall Findings to Overall Recommendations

Mapping overall findings to overall recommendations

Legend:
- Directly addresses (blue)
- Partially addresses (dark blue)
- Indirectly addresses (gray)

Overall recommendations

Overall findings	1. Clarify strategic direction	2. Stabilize, grow, and empower leaders	3. Redesign VHA's operating model	4. Focus and simplify performance management	5. Rebuild a high-performing, healthy culture	6. Redesign the human resources function
1. Confusion around leadership priorities and the strategic direction of VHA	Directly		Indirectly	Partially		
2. The VHA organization is intensely, unnecessarily complex due to lack of a clear operating model, limited role clarity, fragmentation of authority, and overlapping responsibilities			Directly	Directly	Partially	Partially
3. The broader VHA culture is characterized by risk-aversion and distrust		Indirectly	Indirectly		Directly	Indirectly
4. VHA leadership faces a workforce that appears to be steadily losing its motivation		Indirectly			Directly	Partially
5. The performance of a particular VAMC hinges to a large degree on the capability of its Director and the executive leadership team; yet they are "on their own" in many ways		Partially	Indirectly	Directly		Directly
6. VHA leadership attention is consumed by addressing crises that have occurred in the past, at the expense of preparing for tomorrow's opportunities	Indirectly			Directly	Indirectly	
7. The leadership pipeline is not robust enough to meet VHA's current and future needs		Directly			Indirectly	Partially

Through similar processes, we also conducted a detailed mapping exercise. A detailed findings by detailed recommendations map was created to determine the coverage. In this analysis, we grouped detailed findings by their corresponding category of assessment, as done in Sections 5 – 12. Section 13, Support Infrastructure, was also analyzed. Each detailed recommendation was then assigned a value of relevance corresponding to detailed findings. This check showed comprehensive coverage and relevance across all findings and recommendations, consistent with the analysis of the overall mapping shown above.

A.7   Review of Past Reports

The team conducted a literature review of past reports of VHA leadership and identified reports that directly addressed one or more of the eight elements within scope of Assessment L (e.g. OIG and GAO). Below is the list of reports reviewed as well as summaries of findings and recommendations from them **[Figure Appendix A-7 and A-8].** These reports were used to provide context for Assessment L; however, all analyses in this report are based on primary source data.

Appendix Figure A-7. Recent Studies Correspond With Our Assessment

Recent studies in the last decade have identified many of the same issues identified in our assessment (1/2)

■ Identified in study

Category	Issues cited	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015
Leadership development and succession planning	The current approach to training and developing leaders is inadequate and should be fundamentally revamped												GAO[2]
	There are opportunities to coordinate and share training and development programs across federal agencies		GAO[5]										
	Program planning is limited									OIG[1]			
	VHA can report on program participation and cost, but could better develop identifying outcome-oriented measures		GAO[5]										
	VHA has identified gaps in occupations or competencies, and has undertaken strategies to address these gaps		GAO[5]										
	Succession planning has support and commitment from top leadership, and high-level positions are directly accountable		GAO[5]										
Culture and employee engagement	A culture of innovation is needed to move VHA forward					BAH[3]							
	Leadership plays a significant role in shaping culture					BAH[3]							
	The role and importance of leadership to health care performance and transformation is critical and overarching					BAH[3]							
	Inadequate documentation of retention incentives awards and lack of guidance, oversight, and training								OIG[1]				
Accountability	Leadership is not held accountable for results, even when they were aware of problems											OIG[1]	GAO[2]
	Inadequate oversight and accountability												GAO[2]
	Inconsistent compliance / implementation of policies, processes, procedures, and practices											OIG[1]	GAO[2]
	No timely resolution of problems and recommendations											OIG[1]	GAO[2]

Recent studies in the last decade have identified many of the same issues identified in our assessment (2/2)

■ Identified in study

Category	Issues cited	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015
Performance management	Self-assessments and self-reported data is inconsistent, inaccurate, and sometimes misleading											OIG[1]	
	Gaps in the availability of data required by VA to efficiently identify resource needs and to ensure that resources are effectively allocated												GAO[2]
	Incorrect processes impact validity of data, some of which are considered for awards and salary increases											OIG[1]	
	VHA can report on program participation and cost, but could better develop identifying outcome-oriented measures												
Reform readiness	Lack of clarity exists around strategic objectives, which makes setting and achieving goals difficult					BAH[3]							
	VA faces unique challenges in scaling change across an enterprise of its size											NVTC[4]	
Other: systems and processes	Systems are cumbersome and don't always "talk" to one another											OIG[1]	
	Lack of oversight in adherence to process and systems protocols											OIG[1]	
	Staff violated system protocol, and in some cases were instructed to do so											OIG[1]	
	Executives and senior staff were aware that staff were using inappropriate scheduling practices											OIG[1]	
	Leaders taught staff to use inappropriate scheduling practices and/or did not fully communicate about scheduling best practices												
Other: HR	Increasing availability and efficiency of human resources could have a high impact on timeliness of care					BAH[3]							GAO[2]

Appendix Figure A-8. Recommendations to Respond to Issues

Recent studies have laid out a suite of recommendations to respond to issues identified (1/2)

■ Identified in study

Category	Issues cited	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015
Leadership development and succession planning	Give leaders broad exposure to leaders in other realms					BAH[3]							
	VA should consider alternative but complementary approaches to assessing leaders					BAH[3]							
	Leaders should be rewarded for efforts that spur innovation					BAH[3]							
	Clearly define desired leadership competencies					BAH[3]							
	Improve training												GAO[2]
	Improve impact measures of programming									OIG[7]			
	Enhance financial incentive programs to attract and retain top talent					BAH[3]							
	VA should proactively analyze and prepare for changing demands and staffing needs (for example, specialty MDs)					BAH[3]							
	VHA should seek opportunities to coordinate succession planning and development programs with other agencies								OIG[6]				
	Conduct 100 percent reviews of retention incentives and stop unnecessary payments.								OIG[6]				
Culture and employee engagement	Build a culture of innovation and build leadership development model to support it					BAH[3]							
	Engage frontline staff in the change process					BAH[3]							
	Conduct reviews of internal and external best practices					BAH[3]

Appendix C   Acronyms

ADUSHOM	Assistant Deputy Under Secretary for Health of Operations and Management
AES	All Employee Survey
AHA	American Hospital Association
ALOS	Average Length of Stay
BLS	Bureau of Labor Statistics
CABG	Coronary Artery Bypass Surgery
CAMH	CMS Alliance to Modernize Healthcare
CBOC	Community-Based Outpatient Clinics
CFR	Code of Federal Regulations
CMS	Centers for Medicare & Medicaid Services
CPRS	Computer Patient Record System
CSEMO	Corporate Senior Executive Management Office
DUSHOM	Deputy Under Secretary for Health of Operations and Management
ECQ	Executive Core Qualification
EBITDA	Earnings before interest, taxes, depreciation, and amortization
EEO	Equal Employment Opportunity
FEVS	Federal Employee Viewpoint Survey
FFRDC	Federally Funded Research and Development Center
FFY	Federal Fiscal Year
FTE	Full Time Equivalent
FY	Fiscal Year
GAO	Government Accountability Office
GS	General Schedule
HCLDP	Health Care Leadership Development Program
HR	Human Resources
HRIS	Human Resource Information Systems
ICARE	VA's core values, including Integrity, Commitment, Advocacy, Respect, Excellence
IG	Inspector General

IOC	Independent Outpatient Clinic
IRS	Internal Revenue Service
IT	Information Technology
LOS	Length of Stay
MCAS	Medical Center Allocation System
MD	Medical Doctor
MRSA	Methicillin-Resistant Staphylococcus Aureus
MSPB	Merit System Principle Board
NCA	National Cemetery Administration
NExT	New Executive Training Program
NP	Nurse Practitioner
NRM	Non-Recurring Maintenance
OHI	Organizational Health Index
OIG	Office of Inspector General
OMB	Office of Management and Budget
OPM	Office of Personnel Management
P&T	Pharmacy & Therapeutics
PACT	Patient Aligned Care Team
PBM	Pharmacy Benefits Management
PMA CAP	President's Management Agenda Cross-Agency Priority
R&D	Research and Development
RIF	Reduction in Force
RN	Registered Nurse
ROI	Return on Investment
RRA	Reform and Restructuring Act
RVU	Relative Value Unit
SAIL	Strategic Analytics for Improvement and Learning
SCIP	Strategic Capital Investment Plan
SES	Senior Executive Service
SME	Subject Matter Expert
USC	U.S. Code

VA	Veterans Affairs
VACO	Veterans Affairs Central Office
VALU	VA Learning University
VAMC	Veterans Affairs Medical Center
VBA	Veterans Benefits Administration
VERA	Veterans Equitable Resource Allocation
VHA	Veterans Health Administration
VHACO	Veterans Health Administration Central Office
VISN	Veterans Integrated Service Network
VSSC	VHA Support Service Center
