Despite the number of best practices implemented at individual facilities, there is little support at the VISN and national levels to facilitate cross-facility communication and implementation of proven best practices at scale.[223] In speaking with individual facilities, most are unaware of the initiatives employed at other EDs to manage throughput and flow.[224] This extends to triage, diagnostics, and bed management, as well as data management and performance improvement. The Department of Emergency Medicine plans to promote best practice adoption, and has initiated an emergency medicine mail group that sends daily emails with the goal of connecting individual VAMC EDs, but the department has yet to reach its full potential.[225] Some facilities, especially at the VISN level, share best practices through local contacts, but the perceived impression among more than 25 percent of the VAMC ED leaders we interviewed is that VISN and VHACO provide little tactical support in operationalizing best practices and implementing them system-wide.[226]

6.3   Recommendations

VHA inpatient access practices have multiple stakeholders: Congress and the executive branch, VACO, VHACO, VISN leadership, and VAMC management and staff. Encouraging innovation and addressing challenges in inpatient access will require collaboration between all of these groups, and a commitment to making difficult, long-term change. Different recommendations should be owned by different groups (e.g., recommendation requiring changes to VACO policy versus local policy) – however, support for change from all stakeholders is critical to effective implementation.

Our recommendations, building on existing strengths and addressing existing challenges in inpatient access to care, can be categorized into three main themes.

6.3.1 Develop an accurate end-to-end picture of patient demand and VAMC capacity

---

[221] Site visit ED shadowing session (N=21 sites)

[222] Site visit ED throughput workshop (N=21 sites)

[223] Site visit ED throughput assessment workshop and ED shadowing (N=21 sites)

[224] Site visit ED throughput assessment workshop and ED shadowing (N=21 sites)

[225] Site visit ED throughput assessment workshop and ED shadowing (N=21 sites)

[226] Site visit ED throughput assessment workshop and ED shadowing (N=21 site)

6.3.2 Decrease the number of clinically inappropriate admissions due to limited access to sub-acute care

6.3.3 Expand use of evidence-based processes for managing patient flow, including clear role assignments and individual performance management

These themes are consistent with practices suggested by the academic literature, professional associations, and high-performing hospitals within VHA and outside the system, as well as solutions proposed by front-line VHA staff – further details are included in "summary of supporting evidence" sections in each sub-recommendation (see Appendix **C.4** for additional detail on our methodology for gathering this data). To help VHA implement our recommendations, we have also suggested next steps in the "potential near-term actions" sections of the sub-recommendations. Note, because different VAMCs may have already adopted some recommended practices or experience unique barriers, these suggestions should be tailored the individual circumstances of each VAMC. Each recommendation is supported by several sub-recommendations, which map to the "organization, workflow processes, and tools" domains specified in the Choice Act. For a detailed map of how the sub-recommendations relate to these domains, see **Table C-2** in **Appendix C.3**.

Several recommendations overlap with other assessment areas. Where this occurs, we have referenced the relevant assessment area, where additional detail can be found.

6.3.1 Develop an Accurate End-to-end Picture of Patient Demand and VAMC Capacity

Data gaps limit VHA's understanding of patient demand patterns and available VAMC capacity (e.g., bed and staffing). To address this gap, VHA should first simplify the process and required approvals by which beds are classified as operational and then standardize the definition and tracking of patient demand patterns. Following development of clear metrics and aggregation of accurate data, VHA should consider building an analytical model to predict future patient demand.

6.3.1.1 Simplify the Process and Required Approvals by Which Beds are Classified as Operational or Unavailable

We observed through national data analysis, site visits, and interviews with VHACO leadership that VHA has an inaccurate view of current bed capacity. VHA should promote the accurate reporting of bed closures by simplifying the process by which VAMCs report short-term closures. This in turn should provide VHA with a more accurate view of available inpatient capacity (e.g., operational beds).

Summary supporting evidence:

- See Section 6.2.1.1 for more detail on findings.

- More than 40 percent of facilities reported closing beds without submitting a formal request through the "bed letter" process.[227]
- Senior Program Office leadership described the bed closure process as an "archaic way of managing and reporting bed capacity; there are often significant discrepancies between the number of authorized beds in the National Bed Database and the actual number of beds in operation at the VAMCs."[228]

Potential near-term actions:

- *VACO/VHACO:* Reduce the approval requirements for temporary bed closures to encourage facilities to accurately report bed closures.
- *VACO/VHACO/VISN:* Support individual VAMCs' decisions to close beds due to patient safety risks from insufficient staffing.
- *VAMC:* Drive staffing and resource discussions based on an accurate picture of operating capacity.
- *VHACO:* Configure BMS so that it reports the aggregate number of operational beds at the facility, but still allows VAMCs to keep all beds "open" in the tool so they can rotate bed assignments and expedite bed turnover.
- *VHACO/VISN/VAMC:* Build awareness at the facility level on the importance of accurate bed reporting and its relevance to resource planning.

6.3.1.2 Develop a Prioritized Set of Standardized Metrics to Understand Current Demand at the VAMC, VISN, and VHACO Levels and Implement an Automated Process to Collect and Aggregate this Data Across the System

We observed considerable variability in patient demand tracking, including unmet demand, across VAMCs. Literature supports that a comprehensive understanding of demand and capacity data is key to inpatient access and providing timely care (Welch, 2011). For example, appropriate tracking of the number of diversions (e.g., patients that VHA cannot care for in-house due to capacity limitations) is critical to preventing future access issues. Standardizing the definition and automating the tracking of current demand should provide VHA with a more accurate picture of regional and national demand so that it can better forecast its capacity needs.

Supporting summary evidence findings:

- See Section 6.2.1.2 for more detail on findings.
- More than 30 percent of VAMCs visited recommended building a team to track performance metrics including demand and patient flow.[229]

---

[227] Choice Act data call (N=55 sites)

[228] VHACO SME interview

[229] Site visit ED throughput workshops (N=21 sites)

- More than 40 percent of percent VAMCs visited recommend integrating patient flow tools (e.g., BMS, EDIS, VistA), in line with commercial EHR tools (e.g., Epic, Cerner, and Meditech) to allow better end-to-end reporting on patient flow[230] (as an indicator of demand and capacity).
- Less than 10 percent of VAMC data call respondents reported on the number of patients that were diverted or transferred from their facility over the past year.[231]

Potential near-term actions:

- *VACO:* Develop a standardized cross-cutting, balanced performance management scorecard with a range of domains of performance, including operational metrics related to patient demand and hospital capacity; refer to Assessment L for additional detail on this action.
- VHACO: Convene an interdisciplinary committee to identify a prioritized subset of key patient flow metrics (e.g., diversions, ED LOS, LWBS, bed turnover time) and data sources (e.g., patient intake file, EDIS, NUMI, BMS, and CPRS) to be measured across VAMCs.
- VHACO: Establish a daily report that pulls the patient flow data elements, identified by the VHACO Committee, required to understand the full picture of ED and inpatient surgical demand as well as available capacity, including daily and seasonable variations in census.
- *VHACO:* Consider integrating EDIS and BMS tools with VistA/CPRS to provide a common tool to track patient flow at the facility, VISN, and national levels; refer to Assessment H for additional details on information systems.
- *VACO/VHACO:* Develop the process and capabilities to automatically track diversion and transfer data and pull it into a standardized report that includes the number of patients diverted per day and hour as well as the spend on non-VA care for diverted patients.
- *VHACO:* Consider building or enhancing the functionality of existing tools to predict future patient demand based on historical data.
- *VAMC:* Build a team responsible for tracking performance metrics and disseminating that information to front-line staff, at least weekly, to encourage accountability for patient flow.
- *VAMC:* Outline a diversion/transfer policy in collaboration with regional public and private hospitals that details when patients may be diverted and the process to identify open beds in the community.
- *VHACO:* Develop a standardized cross-cutting, balanced performance management scorecard with a range of domains of performance, including operational metrics related to patient demand and hospital capacity; refer to Assessment L for additional detail on this action.

---

[230] Site visit ED throughput workshops (N=21 sites)

[231] Choice Act data call (n=55 sites)

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

6.3.2 Decrease the Number of Clinically Inappropriate Admissions Due to Limited Access to Sub-acute Care

Given that the NUMI reports that more than 30,000 VAMC admissions would be better served in an alternative setting of care,[232] decreasing these admissions that fail to meet NUMI criteria would require both an investment in sub-acute care (e.g., home health, detox clinics, short-term rehabilitation) at the national VHA level and a dedication, at the facility level, to allocate appropriate patient support resources (e.g., case managers and social workers) in the ED and surgical departments. These patient support resources are critical in helping physicians identify alternative settings of care and helping patients transition to them from an ED visit or surgical procedure. Additionally, patients should be educated on the appropriate utilization of VHA health care including the outpatient care resources available to them (e.g., patient advocate care teams, complementary and alternative medicine) as well as the safety risks associated with a clinically inappropriate hospital stay (e.g., hospital-acquired infections). Once the infrastructure is in place to support these patients outside the acute setting, VAMCs should begin to hold physicians accountable for appropriateness of admissions (e.g., include UM in physician performance appraisals). It is critical to highlight, however, that physicians cannot be held to these performance standards until appropriate community support is in place. To achieve this reduction in appropriate visits, we suggest the following changes:

6.3.2.1 Ensure appropriate access to near-team (e.g., same day, same week) primary and urgent care

6.3.2.2 Facilitate access to sub-acute resources for Veterans who are not appropriate to go home without support following a procedure or ED visit, but do not require acute hospital care

6.3.2.3 Staff case managers and social workers consistently across VAMC EDs to connect patients with appropriate sub-acute resources and help them navigate transitions following a procedure or ED visit

6.3.2.4 Build provider awareness around the importance and nuances of UM admission criteria and then hold physicians to admissions standards

6.3.2.5 Educate Veterans and their families on the resources available in the VA health care system as well as when it is appropriate to use different settings of care

6.3.2.1 Ensure Appropriate Access to Near-team (e.g., same day, same week) Primary and Urgent Care

Our assessment identified that limited access to immediate (e.g., same day or same week) primary and urgent care clinic appointments is contributing to ED demand. We recommend

---

[232] NUMI admissions appropriateness FY14

promoting access to primary and urgent care to decrease low-acuity ED demand and better meet the needs of patients who require immediate non-acute care.

Summary supporting evidence:

- See Section 6.2.2.2 for more detail on findings.

- Sixty percent of VAMCs visited limited access to outpatient care as a major challenge to inpatient access.[233]

- Forty-three percent of VAMCs visited stated that increasing access to clinics and primary care (e.g., extended hours and number of short-term/same-day appointments) would improve ED throughput by decreasing the number of ED visits that are not clinically appropriate.[234]

- Boston VAMC demonstrated success by allocating a set number of same-day primary care appointments for ED patients; its one percent missed opportunity rates are well under VHA's goal of under three percent.[235,236]

Potential near-term actions:

- *VHACO/VISN:* Conduct a national assessment of current VHA resources (e.g., access to primary care and urgent care services) based on present and future low-acuity patient demand.

- *VACO/VHACO:* Develop baseline standards for regional immediate, low-acuity care options based on current and projected regional patient demographics (e.g., walk-in clinic hours to support low-acuity ED demand); refer to Assessments A and B for additional detail on Veteran demographics.

- *VHACO/VISN:* Optimize clinic scheduling and productivity to increase the number of available appointments; refer to Assessment E for additional detail on improving clinic capacity through more efficient scheduling and utilization of appointments.

- *VACO:* Evaluate the impact of creating and/or expanding VHA facilities to meet demand gaps for immediate appointments.

6.3.2.2 Facilitate Access to Sub-Acute Resources for Veterans who are not Appropriate to go Home Without Support Following a Procedure or ED Visit, but do not Require Acute Hospital Care

Our assessment revealed insufficient access to sub-acute facilities (e.g., short-term rehabilitation, observation/domiciliary departments, detox clinics, homeless housing, mental health support, home health care). Literature supports the connection between the availability of sub-acute care and a reduction in inappropriate hospital utilization (Sadowski, 2009). Access

[233] Site visit ED throughput workshops (N=21 sites)

[234] Ibid.

[235] Missed opportunities include LWBS, left against medical advice (AMA), and elopement

[236] Site visit interview with Boston VAMC's ED nurse manager

to sub-acute facilities should be improved through increased VHA-operated facilities and/or increased contracts with private facilities.

Summary supporting evidence:

- See Section 6.2.2.3 for more detail on findings.
- Seventy percent of VAMCs visited attributed the high number of clinically inappropriate admissions to a lack of sub-acute resources, including observation and domiciliary units, homeless housing, and detox centers.[237]
- Sixty percent of VAMCs visited suggested increasing the capacity of VHA-operated sub-acute facilities.[238]
- Fifty percent of VAMCs visited suggested increasing the ability to contract with sub-acute facilities.[239]

Refer to Assessments B and D reports for more details regarding this recommendation.

Potential near-term actions:

- *VACO/VHACO/VISN/VAMC:* Conduct a national, market-by-market assessment of current sub-acute resources based on present and future patient demand; refer to Assessments B and D for additional details regarding current health care capabilities and future patient demographics.
- *VACO/VHACO:* Conduct a review of admission criteria for domiciliary and homeless housing and ensure a streamlined process is in place to facilitate direct admissions from VAMCs.
- *VHACO:* Develop baseline standards for regional sub-acute options based on current and projected regional patient demographics (e.g., review the number of detox admissions over the past year and the number of substance abuse patients within a regional VHA patient population and then determine the number of detox clinic beds necessary to support those patients).
- *VACO/VHACO/VAMC:* Evaluate the impact of creating and/or expanding VHA sub-acute facilities to meet demand gaps with private facility contracts, as available (e.g., compare the patient safety risks and regional financial cost of inpatient admissions for detox patients who do not have a medical need, with the fully loaded cost of contracting and/or building a detox clinic).

[237] Site visit ED throughput workshops (N=21 sites)

[238] Site visit workshop on discharge planning (n=20 facilities); front-line staff proposed a variety of different solutions to decrease inpatient length of stay through better sub-acute placement; refer to Section 6; the same recommendations can be applied to improve inpatient access

[239] Site visit workshop on discharge planning (n=20 facilities); front-line staff proposed a variety of different solutions to decrease inpatient length of stay through better sub-acute placement; refer to Section 6; the same recommendations can be applied to improve inpatient access

6.3.2.3 Staff Case Managers and Social Workers Consistently Across VAMC EDs

We observed inadequate support in the ED and surgical suites to help patients and physicians navigate admission alternatives. Evidence shows a correlation between case management in the ED and decreased ED visits (Kumar, 2013). We suggest staffing case managers and/or social workers to connect patients with appropriate sub-acute resources and help them navigate transitions following a procedure or ED visit.

Summary supporting evidence:

- See Section 6.2.2.3 for more detail on findings.
- Forty-four percent of sites surveyed staff case management/social work in the ED[240], but 67 percent of case managers interviewed during site visits stated that current case managers/social workers are understaffed.[241]
- Thirty-three percent of data call respondents stated that additional case management and social work in the ED would improve access by decreasing clinically inappropriate admissions.[242]

Potential near-term actions:

- *VACO/VHACO:* Convene an interdisciplinary team to establish guidelines on staffing case managers/social workers to ED volume.
  - *VACO/VHACO:* Consider evidence-based literature, VHA patient populations, case manager/social worker salaries, costs of clinically inappropriate admissions, and availability of sub-acute resources, as outlined in Section 6.3.1.2, when developing guidelines.
  - *VAMC:* Consider assigning a social worker or case management team to manage the relationship with new sub-acute facilities.
- *VACO/VHACO:* Assess facilities need for funding to support staffing to these guidelines (e.g., private contracts or VHA facilities) as detailed in Section 6.3.2.2.
- *VHACO:* Establish a standardized process for identifying target patients (e.g., nurse checklist, criteria at registration, physician consult).
- *VAMC:* Design an escalation process for case management and social work to engage leadership on complex cases.
- *VAMC:* Outline a process (e.g., checklist) for identifying the appropriate setting of care based on physician diagnosis and available resources.
- *VAMC:* Hold brief interdisciplinary meetings on a regular cadence to promote collaboration among UM and ED and floor nurses, physicians, and case management/social work to discuss challenging cases and improvement opportunities.

---

[240] Choice Act survey (N=127 respondents)

[241] Site visit ED throughput workshop (N=21 sites)

[242] Site visit ED throughput workshop (N=21 sites)

6.3.2.4 Build Provider Awareness Around the Importance and Nuances of UM Admission Criteria and Then Hold Physicians to Admissions Standards, Once Appropriate Sub-acute Resources are in Place

Our assessment revealed that there is minimal acceptance of and accountability for UM admission standards. Evidence supports that physician adherence to performance improvement initiatives (e.g., UM) is best achieved when the system promotes individual ownership and accountability (Patel, 2014). As a result, we recommend engaging physicians to establish UM performance standards and then holding physicians to those standards (e.g., include UM's admission appropriateness metrics in physicians' performance appraisals), once appropriate sub-acute resources are in place.

Summary supporting evidence:

- See Section 6.2.2.4 for more detail on findings.
- Twenty to twenty five percent of admissions fail to meet InterQual criteria indicating an opportunity for better physician adherence to admission criteria (NUMI, 2014).
- None of the VAMCs visited included UM admission appropriateness metrics in physician's performance appraisals.[243]

Potential near-term actions:

- *VHACO:* Review McKesson InterQual criteria with an interdisciplinary team of ED physicians, hospitalists, and UM to understand the strengths of the NUMI tool and to establish accepted workarounds to address tool limitations.
- *VHACO/VAMC:* Gain buy-in by engaging physicians in the development of any performance management standards related to NUMI admission criteria.
- *VAMC:* Staff UM nurses in the ED to collaborate with physicians on admission appropriateness.
- *VHACO/VAMC:* Hold physicians accountable to those agreed-upon performance standards (e.g., through performance pay, promotions), but create a system of checks and balances so that physicians are not penalized for admitting a patient when there is not a safe, alternate location of care, as outlined in Section 6.3.1.2. The objective of this recommendation is to promote Veteran care in the most appropriate location, not to limit care when it fails to adhere to predefined guidelines that do not encompass the specifics of a complex case.
- *VAMC:* Design an escalation process for case management and social work to engage leadership on complex cases.

---

[243] Site visit ED throughput workshops (N = 21 sites)

6.3.2.5 Educate Veterans and Their Families on the Resources Available at the VA Health Care System as well as When it is Appropriate to use Different Settings of Care

While we observed training focused on complementary alternative medicine and wellness (e.g., myHealthy vet), we did not observe education for patients on appropriate utilization, as supported by literature. As a result, VHA should use patient education to drive more appropriate utilization of acute and sub-acute care.

Summary supporting evidence:

- See Section 8.2.1 for more detail on findings.

- In one study, patient education led to a considerable decrease in hospital utilization (40 percent reduction in ED visits and 33 percent reduction in admissions) for an inner city Medicaid population; patients were taught in their home and over the telephone how to control their illness and when to seek attention from primary care versus the ED (Fedder, 2003).

- Many patient education campaigns have effectively promoted appropriate use of healthcare services (e.g., they have decreased inappropriate utilization of antibiotics) through a targeted, long-term patient education campaign (Huttner, 2010).

Potential near-term actions:

- *VACO/VHACO:* Develop a national campaign about health care utilization (e.g., when to go to primary care, urgent care, the risks associated with a hospitalization).

- *VHACO/VAMC:* Staff VHA educators (e.g., clinicians, social workers) to provide training to Veterans through a variety of different channels (e.g., VA orientation following enrollment, VAMC lunch and learns, during discharge planning).

- *VACO/VHACO/VISN:* Engage Veteran Service Organizations to support the training (e.g., answer Veteran questions) and distribute educational materials.

6.3.3 Expand use of Evidence-based Processes for Managing Patient Flow, Including Clear Role Assignments and Individual Performance Management

We observed variability across VAMCs in the utilization of evidence-based best practices, as detailed in Section 6.2.3, indicating an opportunity to improve system-wide adoption. We suggest four evidence-based changes to improve system-wide patient care and flow:

6.3.3.1 Expedite the initiation of clinical protocols in triage

6.3.3.2 Segment ED diagnostics and care through fast track processes to treat non-urgent patients in a dedicated area by dedicated staff

6.3.3.3 Standardize the inpatient flow process (e.g., admission through bed placement) including clear role assignments and individual accountability for patient flow

6.3.3.4 Build the infrastructure at the VHACO level to promote cross-facility sharing of patient flow best practices

6.3.3.1 Expedite the Initiation of Clinical Protocols in Triage

Our assessment identified inconsistent utilization of clinical protocols in triage. Evidence supports expediting care in triage by staffing a provider in triage or utilizing RN standing to initiate clinical protocols (Day, 2013; Retezar, 2011).

Summary supporting evidence:

- See Section 6.2.3.1 for more detail on findings.
- One study demonstrated that diagnostic testing in triage was associated with a 14 percent reduction in mean treatment time, regardless of chief complaint (Retezar, 2011).
- St. Louis VAMC saw a 17 percent decrease in its mean ED LOS after staffing a provider in triage (Day, 2013).
- Boston VAMC attributes its patient flow performance[244] to its standing RN orders.[245]
- VAMC site visit participants (80 percent of sites visited) staff or recommend staffing a provider in triage or instituting RN standing orders.[246]

Potential near-term actions (following implementation of Section 6.3.2):

- *VHACO:* Convene a national interdisciplinary team or leverage an existing group (e.g., a flow collaborative, emergency medicine group) including physicians, advanced practitioners, and nurses to establish evidence-based clinical protocols.
- *VHACO/VAMC:* Utilize RN standing order sets in low-volume facilities and staff a provider (or advanced practitioner) in triage for large volume facilities.
- *VHACO/VAMC:* Train ED clinicians on all clinical protocols and hold individuals accountable for consistent implementation of protocols (e.g., enforce the use of clinical protocols by including as an element of ED clinicians performance appraisals).

6.3.3.2 Segment ED Diagnostics and Care Through Fast-track Processes to Treat Non-Urgent Patients in a Dedicated Area by Dedicated Staff

We observed varied implementation of ED fast-track processes for lower-acuity patients. Evidence supports the use of a fast-track process to treat non-urgent patients, in a dedicated area to prevent congestion of the main ED for low-acuity patients.

Summary supporting evidence:

- See Section 6.2.3.1 for more detail on findings.

---

[244] Boston VAMC scores in the top quartile of VAMCs for ED LOS (e.g., Boston VAMC's ED LOS is shorter than 75 percent of VAMCs) EDIS FY14.

[245] Site visit interview with Boston VAMC ED nurse manager

[246] Site visit ED throughput workshops (N=21 sites)

- Palo Alto has seen a 20 percent decrease in its ED LOS for medical admissions since 2012 when it initiated its "fast-pass," fast-track process.[247]
- Literature shows that the presence of a fast-track process in the ED decreases ED wait times, ED LOS, and LWBS rates without changes in mortality or revisit rates (Sanchez, 2006).

Potential near-term actions (following implementation of Section 6.3.2):

- *VAMC:* Review ED layout, provider staffing, and demand picture to determine whether there are the resources, space, and demand to support sectioning off part of the ED for fast-track, low-acuity patients.
- *VAMC:* Explore alternative fast-track solutions, if constrained by space and/or resources, including a conveyance model where patients rotate through diagnostic stations so that only a few ED rooms are required.

6.3.3.3 Standardize the Inpatient Flow Process (e.g., admission through bed placement) Including Clear Role Assignments and Individual Accountability for Patient Flow

Our assessment revealed inconsistency in the implementation of flow management processes and roles to expedite admission and bed placement. In line with the evidence, we recommend assigning individuals to manage patient flow (e.g., bed manager and charge nurses), standardizing the admission process including hand-offs between ED and inpatient clinicians (e.g., physicians and nurses), and enforcing the use of BMS and other patient flow tools.

Summary supporting evidence:

- See Section 6.2.3.1 for more detail on findings.
- More than 50 percent of VAMCS visited[248] attributed patient flow challenges to delays in physician orders, availability of floor nurses to take reports, and limited capacity for charge nurses to manage flow in addition to their direct patient care responsibilities.
- More than 40 percent of VAMCs visited[249] recommended staffing a charge nurse who is responsible for managing flow (e.g., they do not take a full patient load) (Thomas, 2005); recommended by 43 percent of VAMCs visited.
- More than 55 percent of VAMCs visited[250] recommended standardizing and streamlining the patient handoff process between ED and inpatient nurses.

Potential near-term actions:

- *VHACO/VAMC:* Update ED and IP charge nurse's responsibilities so that they do not take a patient load, but rather support the staff nurses and manage patient flow.

---

[247] Palo Alto data bed control data (FY12, FY13, FY14)

[248] Site visit ED throughput workshops (N=21 sites)

[249] Site visit ED throughput workshops (N=21 sites)

[250] Site visit ED throughput workshops (N=21 sites)

- *VAMC:* Establish a bed management flow team including nurse leadership from each department as well as bed management, and hold daily meetings on bed availability, potential discharges, and upcoming admissions.

- *VAMC:* Convene an interdisciplinary team of ED physicians, hospitalists, charge nurses, and flow coordinators to map out the admission process.

- *VAMC:* Engage ED and floor nurses to establish a standardized process for reporting on admitted patients.

- *VHACO/VAMC:* Increase awareness across departments about BMS, so that individuals understand the its capabilities and their ability to portray an accurate view of inpatient capacity, as detailed in the recommendations in Section 6.3.1; once user acceptance has been achieved, distribute responsibility for updating the tool and enforce accuracy by incorporating BMS and EDIS reports in daily flow meetings.

6.3.3.4 Build the Infrastructure at the VHACO Level to Promote Cross-facility Sharing of Patient Flow Best Practices

While the Department of Emergency Medicine has built the capabilities to measure ED throughput through EDIS, we observed little cross-facility communication and sharing of best practices. Building the infrastructure at the national level to support better collaboration across VAMCs should improve performance variability across the system (Welch, 2011).

Summary supporting evidence:

- See Section 6.2.3.2 for more detail on findings.

- Considerable variability across VAMCs in performance metrics (e.g., 72 percent of VAMCs have longer door-to-doctor times as compared to market averages[251]) indicates a clear opportunity to establish a system-wide approach to scaling-up of successfully implemented, facility-led patient flow initiatives.

- The Cleveland Clinic, e.g., holds an innovation summit each year to discuss best practices from academic literature as well as practical, front-line-submitted solutions so that lower-performing facilities may learn from higher-performing facilities (Cleveland Clinic, 2010).

Potential near-term actions:

- *VHACO:* Establish community of practice calls and workshops, at the national level, for ED and patient flow leadership at the facilities to discuss challenges and share solutions.

- *VHACO:* Convene an interdisciplinary team, or leverage existing teams, to review and evaluate patient flow best practices, submitted by VAMCs and identified in the literature, to establish a system-wide database of proven best practice models.

- *VHACO:* Provide field implementation teams to support VAMCs with the implementation of proven best practices.

---

[251] EDIS FY14 and CMS Hospital Compare (ED) FY14

6.3.4 Potential Opportunity

One of the key opportunities to be captured by improving inpatient access, through the recommendations described above, is driving additional capacity for patients who are diverted to other facilities or leave the ED without being seen. Not only do diversions limit patient access and contribute to patient safety risks and decreased satisfaction, but they also have significant financial impact. In most instances, VHA is responsible for care delivered at private facilities for diverted, service-connected Veterans. Given that 20 to 25 percent of admissions fail to meet VHA's UM admission criteria, compared with 10 percent to 15 percent in the private sector, there is an opportunity to free capacity by better adhering to criteria (Sheehy, 2013; Stranges, 2010). Furthermore, improved staffing allocations and optimized patient flow practices should also improve efficiency and potentially free capacity.

In addition to freeing capacity, admissions that are not clinically appropriate have broader financial impact. On average, the costs of an inpatient stay far exceeds the cost of sub-acute care. As a result, it is much more cost-effective to treat Veterans at the correct level of care rather than admit them to an inpatient bed. Most importantly, however, clinically inappropriate admissions increase a patient's risk for hospital-acquired infections and other safety risks (Magill, 2014). As one nurse stated, "Hospitals are not a safe place, but keeping patients in the hospital has been our culture for a long time"[252] (Magill, 2014). Treating patients in the correct setting of care is not only fiscally sensible, but it is also in Veterans' best interest.

As detailed in findings, we do not have comprehensive and accurate data on current capacity (e.g., number of operational beds) and diversions (both number and financial impact) to appropriately size the opportunity of freeing capacity through better adherence to admissions criteria. Our assumption is that improving capacity will decrease the number of diversions and spend on non-VA care as well as increase patient satisfaction by driving down wait times for beds and LWBS rates. However, a larger and more accurate data source is required to confirm our hypothesis and appropriately size the opportunity at each facility and across the system.

---

[252] Site visit interview (nurse manager)

This page intentionally left blank.

7 Effective Length-of-Stay Management and Care Transitions

Part F ("Assessment F"), Section 201 of the Veterans Access, Choice, and Accountability Act of 2014 ("the Choice Act") mandates an assessment of the organization, processes, and tools used to support length-of-stay (LOS) management and effective care transitions. There is significant evidence in academic literature suggesting that improvements in LOS management and care transition processes are associated with a number of positive outcomes, including improved health care quality, decreased hospital complications, reduced readmissions, decreased hospital costs, and improved patient satisfaction (Parry, 2009; Kleinpell, 2008; Coleman, 2006; Bull, 1994). Thus, LOS management and effective care transitions are important not only to promote efficiency and drive potential cost savings, but also to prevent exposing Veterans to avoidable hospital-associated harms when inpatient stays extend longer than clinical conditions warrant (Leape, 2009; IOM, 2001). Since inpatient facilities across VHA admit, care for, and discharge approximately 600,000 Veterans annually,[253] LOS management and effective care transitions are key to VHA's ability to optimally provide care that is patient-centered, high-quality, and cost-efficient.

Based on the language of the Choice Act legislation, the scope of this assessment area includes the organization, workflow processes, and tools in place at VHA facilities that support LOS management and effective care transitions within the acute care and inpatient mental health settings. Given that the legislation specifies a focus on the inpatient setting, our assessment does not cover outpatient or VHA-operated long-term care facilities (e.g., community living centers, domiciliary care).[254] This section (Section 7) of the report does not cover emergency department (ED) operations and workflows, as the ED is not considered to be an inpatient venue of care. However, additional details regarding ED operations and practices are contained within Section 6 of this report, as the ED is a primary point of entry to the inpatient setting and therefore, critical to an assessment of access to inpatient care.

7.1 Summary

7.1.1 Assessment Approach

As described in the Methodology section of this report (Section 2), we collected information in several ways, using a common approach across sub-assessment areas within Assessment F:

- Visits to 21 VAMCs, to conduct:
  - Forty-two interviews with case managers, social workers managers, quality mangers, and utilization management coordinators

---

[253] 2014 VHA Support Service Center (VSSC)

[254] This is consistent with CMS's definitions of what constitutes an inpatient stay (CMS, 2014)

- o Twenty[255] assessment workshops with front-line personnel, including physicians, nurses, social workers, case managers, and utilization management nurses (about 125 staff total)
- o Forty-two unit shadowing sessions of intensive care units (ICUs) and medical/surgical acute care units as well as 21 facility tours

- Survey[256] sent to all relevant clinical occupations across all VAMCs (e.g., physicians, case managers, nurses, social workers, allied health professionals), completed by 1,275 respondents[257] across 92 VAMCs[258]. Due to the fact that VHA does not track the setting of work (i.e., inpatient or outpatient) in available human resource data and we did not control the distribution of the survey to the end-user we are unable to calculate the significance of the total response rate, but do not believe it to be a representative sample across any of the roles. Given this, survey data should be viewed as providing anecdotal insights as opposed to a representative data sample.

- Request for local policy documents from all VAMCs ("data call"), returned by 49 (41 percent) VAMCs[259]

- Data collection from national data systems, including LOS data[260] and National Utilization Management Integration (NUMI) data

- Interviews with internal VHA subject-matter experts (SMEs) with knowledge of current national LOS management and care transition programs, policies, and practices

Having collected information to understand VHA's practices with respect to LOS management and promotion of effective care transitions, we then assessed how these practices compared to best practices and industry benchmarks. Best practices and benchmarks, detailed in **Table D-1** of **Appendix D.1,** were identified through several sources, including:

---

[255] A discharge planning assessment workshop was not held at one of our sites due to scheduling and patient care conflicts.

[256] As noted in the Methodology section (Section 2), we do not believe that the survey constitutes a representative sample of VHA staff.

[257] Total indicates number of staff from complexity level 1a, 1b, 1c, or 2 VAMCs responding to any survey question related to LOS management and care transitions; number of respondents for each survey question varies due to customization of questions according to clinical occupation.

[258] Only includes VAMCs with complexity level 1a, 1b, 1c, or 2

[259] Based on total 121 VAMCs with complexity level 1a, 1b, 1c, or 2

[260] We analyzed LOS data from two sources as part of this assessment: encounter-level data from the VA Information Resource Center (VIReC) VHA Medical SAS (MedSAS) Inpatient Dataset and data from the VHA Inpatient Evaluation Center (IPEC). Because data contained within the IPEC system truncates any patient lengths-of-stay longer than 35 days, we used the VHA MedSAS Inpatient Dataset for externally benchmarking national VHA LOS outcomes. Prior to analysis of the MedSAS Dataset, we excluded records of patients whose stays included a segment within VHA long-term care and rehabilitation settings (e.g., domiciliary care, blind rehabilitation) to avoid inappropriately inflating VHA LOS performance. To assess for differences in facility-level LOS performance, we used data from VHA's Inpatient Evaluation Center (IPEC).

- Interviews with high-performing private hospital systems (e.g., hospitals with short LOS, adjusted for mix of Diagnosis-Related Group (DRG) admissions, from the 2013 AHA Survey)
- Academic literature (e.g., research supporting interdisciplinary discharge planning as a driver of decreased LOS)
- Surveys conducted by professional organizations (e.g., American Case Management Association (ACMA) survey of case management processes and tools commonly used by private hospitals)

There are several areas in which significant academic research has been conducted to rigorously examine which practices are true drivers of care transition effectiveness and/or improved LOS. Where this is the case, we have attempted to compare VHA's current practices with practices that have been demonstrated effective in the academic literature. In other areas, however, there has been little, if any, academic research to confirm effectiveness of certain organizational features, processes, and tools. Where this is the case, we have compared VHA's practices to what is common across the industry and/or what is reported by high-performing organizations as best practice.

7.1.2 Summary of Findings

Our analysis suggests that for all acute inpatient admissions across VHA, the average DRG-mix-adjusted LOS is about 2.1 days (56 percent) longer than Medicare averages.[261] This difference is based on the industry-standard methodology of comparing LOS for VHA patients with a given DRG to the average Medicare patient with the same DRG. Note that this methodology does not account for Veteran-specific mental health and sociodemographic factors, which are likely to drive an increased burden of co-morbid disease relative to civilian populations and which are not fully accounted for by DRG-mix adjustment alone (Behavioral Health Barometer, 2014; Report of the Department of Defense on Mental Health, 2007).

While patient co-morbidity factors may contribute to increased LOS relative to Medicare patients in the private sector, inter-VAMC variability on LOS outcomes suggests that other factors are also at play. VHA tracks a measure called OMELOS[262] (observed-minus-expected LOS) to adjust for the impact of Veteran co-morbidities on LOS outcomes across the organization. Note that because the "expected" LOS used in the calculation is based on internal VHA LOS averages and a Veteran-only predictive model, this methodology cannot be used for external comparisons. Despite OMELOS being an internal comparator only, the approximate 3.4-day variability (1.7 days shorter than "expected" to 1.7 days longer than "expected"[263]) in

---

[261] Based on comparison of average LOS across VHA facilities versus CMS's FY2014 published geometric mean length-of-stay (GMLOS), accounting for the VHA's FY2014 DRG mix

[262] OMELOS is a VHA-specific LOS metric designed to account for inter-facility LOS differences driven by patient complexity: it is calculated by subtracting actual LOS from "expected" LOS as determined by a multivariate regression model of VHA LOS based on several patient-level predictors (e.g., age, diagnosis, co-morbid diagnoses, lab values, source of admission)

[263] VHA IPEC data (FY2014)

acuity-adjusted OMELOS across VAMCs suggests that variability in practices adopted at the facility level and varied availability of supporting resources and services may also be contributing to LOS differences compared with the private sector. This inter-VAMC variability in practices was confirmed by our site visits, as described in greater detail within this report.

Our assessment revealed four main findings with respect to VHA's strengths and challenges in LOS management and effective care transitions (see Section 7.2 for details regarding each finding):

7.2.1 Implementation of national LOS programs and initiatives has failed to achieve organization-wide improvements despite local pockets of best practice adoption. National programs, including the Utilization Management (UM) program and several collaboratives (e.g., Transitions Collaborative, Flow Collaborative), have been launched to address existing challenges with LOS and care transitions. Although several facilities have experienced improvements through participation in these programs, national LOS challenges persist: the difference between VHA LOS and average DRG-adjusted Medicare LOS has increased by five percent since the beginning of FY2012.

7.2.2 Existing post-acute care options (e.g., rehabilitation/skilled nursing facilities) do not always match Veteran needs, delaying discharge. Patient LOS is, on average, about 5.1 days longer for Veterans discharged to post-acute care settings compared with patients discharged elsewhere. Participants in 55 percent of on-site workshops reported challenges with transitioning Veterans into post-acute care, including difficulties arranging for post-acute rehabilitation, securing timely placement in VHA-operated programs, and contracting with community facilities.

7.2.3 Typical VAMC operating models do not promote efficient inpatient care, leading to prolonged LOS. Limited availability of important clinical services (e.g., specialty and allied health consults) on weekends may contribute to the approximately 18 to 32 percent increases in LOS for admissions extending through the weekend.[264] In addition, development and implementation of evidence-based inpatient care pathways have been left to individual facilities, resulting in variable adoption nationally.

7.2.4 Use of discharge planning best practices is inconsistent, decreasing effectiveness and coordination. Nationwide adoption of practices to appropriately manage LOS and promote effective care transitions has not matched practices of high-performing hospital systems. For example, only 55 percent of VAMCs have dedicated inpatient case managers to coordinate the overall discharge planning process, which may result in avoidable discharge delays.

---

[264] VHA MedSAS data (FY14)

7.1.3 Summary of Recommendations

Our assessment revealed several areas where VHA can build on current strengths or address existing challenges to improve LOS and care transition management. We recommend that VHA consider two strategic themes, as detailed below. As with the findings, these themes apply to VHA organization, processes, and tools.

> **7.3.1 Mitigate discharge delays related to post-acute placement (e.g., increase availability of post-acute care options).** VAMCs experience significant LOS challenges with patients requiring facility-level post-acute care following discharge. VHA should evaluate current and projected future capacity within both VHA-operated and community-based post-acute care facilities, address mismatches to better meet post-acute care needs of Veterans, and ensure sufficient patient education regarding post-acute care options.

> **7.3.2 Build on existing best practices, both internal and external to VHA, to increase local adoption of evidence-based inpatient care and discharge planning practices.** VAMCs across the organization have shown varying degrees of dedication to adoption of practices that promote efficient and effective patient care. VHA should provide technical support and facilitate targeted best practice sharing to assist facilities in improving upon local practices related to efficient care delivery and effective discharge planning. Additionally, VHA should engage Veterans as active stakeholders in the care transition process by providing education regarding safe and effective transitions of care to the most appropriate post-acute care venue.

7.1.4 Past Findings and Recommendations

Several past assessments have commented on VHA's LOS management and care transition practices. Within academic literature, VHA challenges with increased LOS have been observed since the late 1980s (Rogers, 1989; Wolinsky, 1987), although research conducted a decade ago suggested a gradual narrowing of LOS differences (Rosenthal, 2003). While there have been no recent, comprehensive, national assessments of VHA's overall LOS management practices, OIG facility-level reviews and assessments of VHA service lines have identified challenges at individual facilities and for specific clinical services. The findings and resulting recommendations from these assessments are outlined in **Figures D-1 and D-2** of **Appendix D.2**.

These past assessments have tended to focus on specific issue areas and/or individual facilities, separately developing recommendations for improvement in discrete areas. In contrast, our assessment tries to take an end-to-end view of inpatient clinical operations across the five key sub-assessment areas and all high- and medium-complexity VAMCs.

7.2 Findings

Our assessment revealed four main findings related to VHA's current LOS management and care transitions processes:

> **7.2.1 Implementation of national LOS programs and initiatives has failed to achieve organization-wide improvements despite local pockets of best practice adoption**

7.2.2 Existing post-acute care options (e.g., rehabilitation/skilled nursing facilities) do not always match Veteran needs, delaying discharge

7.2.3 Typical VAMC operating models do not promote efficient inpatient care, leading to prolonged LOS

7.2.4 Use of discharge planning best practices is inconsistent, decreasing effectiveness and coordination

These findings are based on several key sources of insight. We have used the national datasets that were available, information returned as part of the data call, and perceptions and experience reported or observed during site visits or via the staff survey. In many instances where data does not allow us to definitively comment, we have described the potential implications of the data points we do have, along with recommendations in Section 7.3 for further analysis.

Underlying each finding are several drivers; these drivers map to the "organization, workflow processes, and tools" domains specified in the Choice Act. For a detailed map of how the drivers relate to these domains, see **Table D-2** in **Appendix D.3**.

7.2.1 Implementation of National LOS Programs and Initiatives has Failed to Achieve Organization-wide Improvements Despite Local Pockets of Best Practice Adoption

As outlined in Section 7.1.2, LOS within VHA is significantly longer than the DRG-adjusted average for Medicare patients treated within the private sector. Recognition of this and other LOS challenges has spurred the development of several initiatives aimed at improving VHA's LOS management practices, including establishment of a national utilization management (UM) program and development of several national "collaboratives" focused on effective LOS management and care transition practices. Our assessment suggests that while these efforts may have yielded pockets of improvement, overall VHA LOS has failed to improve during the past 3 years **(Figure 7-1)**, with the difference between VHA LOS and average DRG-adjusted private sector Medicare LOS increasing from 52 percent to 57 percent during FY2012-FY2014. Our assessment indicates the following three factors as barriers to national improvement:

7.2.1.1 Lack of availability of LOS performance metrics at the front-line and limited performance management inhibit the transparency and emphasis necessary to drive improvements

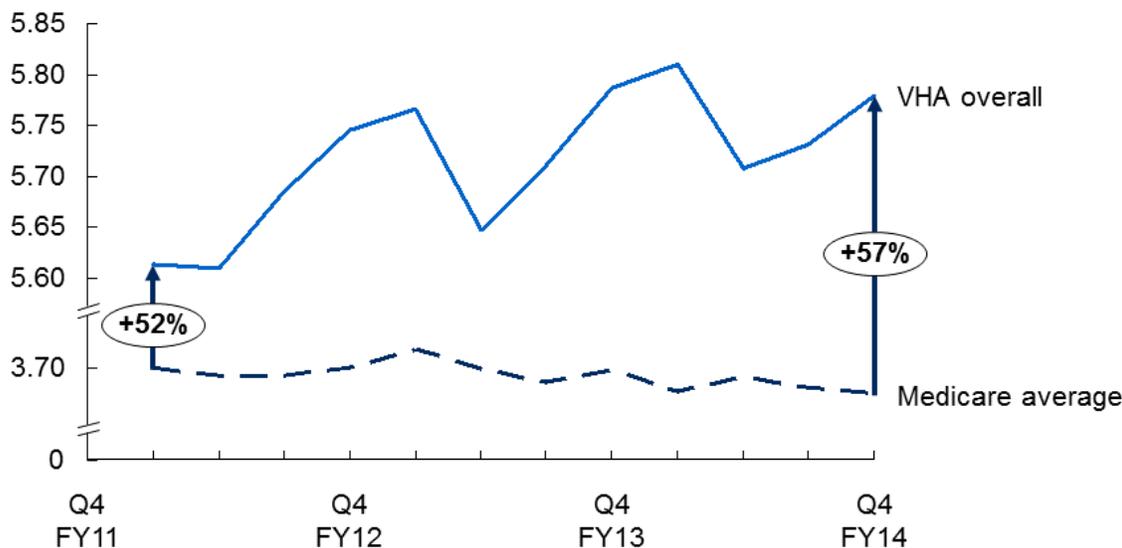
7.2.1.2 Limited organization-wide engagement in the national utilization management (UM) program reduces the program's potential impact

7.2.1.3 Variable participation in national LOS management-focused "collaboratives" and inconsistent adoption of best practices drive variation in recent LOS improvements

Figure 7-1. VHA LOS Trends Over Time

VHA national LOS compared to external Medicare average has grown during the last three years

LOS over time: VHA overall[1] vs. Medicare average[2]

Number of days


1 VHA LOS is based on encounter-level data from the Medical SAS Inpatient Dataset
2 Based on Medicare GMLOS for DRG mix treated at VHA, which does not account for prevalence co-morbidities (e.g., mental health) in the Veteran population

SOURCE: VHA Medical SAS Inpatient Dataset (2012-14); CMS Medicare Severity Weighting factors (FY2012-FY14)

7.2.1.1 Lack of Availability of LOS Performance Metrics at the Front-Line and Limited Performance Management Inhibit the Transparency and Emphasis Necessary to Drive Improvements

The use of performance management with associated incentives to promote desired outcomes (e.g., quality) has become increasingly common in health care. While managers and health services researchers often focus on the performance improvements possible through aligning of incentives with desired outcomes, research has also demonstrated that transparency alone can also be a powerful driver of performance improvement (Custers, 2008; Lindenauer, 2007). Our assessment suggests that VHA may not be fully reaping the benefits of transparency and performance management to drive LOS and care transition improvements, because: (1) LOS performance is not consistently and effectively communicated to front-line clinical staff; and (2) performance management systems rarely incorporate staff performance on LOS-related metrics.

> **LOS performance is not consistently and effectively communicated to front-line clinical staff.** Our assessment indicates gaps in VAMC communications of LOS performance to front-line clinical staff. Although one LOS performance measure is

incorporated into the SAIL report (adjusted LOS), among VHA hospitalists, only 48 percent reported receiving periodic updates regarding their performance in appropriately managing LOS.[265] Of these, only 22 percent indicated that LOS performance is communicated at the individual level, whereas 56 percent and 73 percent reported that this information is communicated at the facility- or service-line level, respectively.[266] Overall, this suggests that only about 11 percent of VHA providers have individual-level LOS metrics communicated to them. This gap in LOS performance communication applies to other clinical stakeholder groups as well: among nurse managers, charge nurses, and case managers, 20 percent reported that LOS metrics are not regularly communicated and an additional 31 percent suggested that communications regarding performance are "ineffective."[267] This data reveals gaps in common VHA practices related to promoting performance transparency, a practice that has been shown effective in the academic literature to yield LOS improvements (Zemencuk, 2006).

Performance management processes rarely incorporate staff performance on LOS-related metrics. VHA Handbook 5013/11 establishes expectations that VAMCs conduct annual performance ratings of clinical staff (2012). While these reviews provide an opportunity to discuss performance across many key dimensions, our analysis indicates that they are rarely used to discuss LOS performance. Among VHA hospitalists, only 6 percent reported that LOS metrics were a topic of discussion during regular performance reviews.[268] Our analysis of standardized VHA forms used in physician performance evaluations supports this survey data, as we found that LOS performance is not incorporated within the categories against which physicians are evaluated within VA Form 10-2623a. While our national assessment indicates limited organization-wide adoption of performance management practices focused on LOS, some facilities have seen positive results by incorporating LOS metrics into regular provider reviews (see case study below).

Table 7-1. VAMC Case Study: LOS Performance Management

Best practice case study – Bay Pines VAMC
From about 2008-2013, the **Bay Pines VAMC** incorporated provider-level data from the **National Utilization Management Integration (NUMI)[269] system into regular provider performance reviews** to promote LOS performance improvements.

Best practice case study – Bay Pines VAMC

Context

- **Physician performance pay equaling $15,000 or 7.5 percent of annual pay can be used to incentivize high levels of physician performance (per 2014 VA Handbook 5007/47: Pay Administration)**
- **Leadership at the facility level** have the ability to **determine the metrics** upon which performance pay is based
- **Clinical leaders** established a system through which a **portion of physician performance pay** was distributed based on individual **NUMI performance**

Details

- C**linical leadership met with each physician** annually to discuss current performance levels and **goals for the coming year**
- **Facility set up a tiered incentive structure** to distribute different amounts of incentive pay **based on NUMI performance**

Impact

- Contributed to better-than-average facility-level performance on OMELOS, VHA's internal measure for acuity-adjusted LOS (lower values are better; see Section 7.1.2 for further details): FY2012 value of -0.64 (median VHA: 0.06) and FY2013 value of -0.43 (median VHA: -0.10)
- Minimized need to divert patients to external facilities, as reported by a facility leader: "While the facility had this program in place, we were never on diversion because we were efficiently managing our LOS."

7.2.1.2 Limited Organization-wide Engagement in the National Utilization Management (UM) Program Reduces the Program's Potential Impact

As outlined in VHA Directive 1117 (2014), a national UM program is in place across VHA with an objective of ensuring "the right care, in the right setting, at the right time, for the right reason utilizing evidence-based practices and continuous measurement and improvement." The directive further outlines that UM personnel be deployed across levels of the organization (e.g., national, VISN, facility) to create a coordinated national platform for promotion of appropriate use of inpatient resources. UM staff at the facility level are responsible for reviewing admissions and continued stays for appropriateness based on InterQual criteria and inputting results into the National Utilization Management Integration (NUMI) tool for performance tracking.

We find that there has been limited organization-wide emphasis on driving LOS improvements through the UM program. Evidence for this includes the following: (1) UM staff are largely

---

on McKesson's InterQual criteria. This data is related to LOS because decreases in number of continued stay reviews not meeting criteria shorten overall LOS.

tasked with case reviews rather than prospective LOS and discharge management; (2) NUMI metrics are not incorporated into the facility SAIL report, limiting executive leadership emphasis; and (3) front-line clinical staff (e.g., nurses) are consistently unfamiliar with UM metrics and their interpretation.

UM staff are largely tasked with case reviews rather than prospective LOS and discharge management. VHA Directive 1117 (2014) dictates that UM nurses perform case reviews on 75 percent of admissions, observation stays, and subsequent days of care and enter results into the NUMI application. The directive also recommends that UM nurses collaborate with clinical staff (e.g., care coordinators, case managers, discharge planners, nursing staff) and "participate in daily rounds, bed huddles, or Interdisciplinary Team meetings as appropriate." Our assessment suggests that the expectations for UM nurses to perform case reviews and also collaborate with clinical staff are seen as competing priorities. As one facility-level UM program manager stated: "We'd love for our UM nurses to be able to work more with the clinical teams, but there is no way that we could do that and still make sure that all the reviews get done." This issue has undermined front-line engagement with the UM program, as front-line clinical staff often indicated that they had limited interaction with UM nurses to drive performance improvements. As one physician stated: "We repeatedly see the same causes of reviews not meeting criteria day after day, and many are issues that are out of our control. It would be better to collaborate regarding the patients where we can actually make a change." These challenges have contributed to low organization-wide confidence in the ability of the national UM program to drive significant LOS management improvements. For example, 33 percent of facility-level quality management and utilization management coordinators interviewed during site visits stated that they felt the UM program would have "relatively low to no impact" on LOS outcomes at their facility compared to only 29 percent of respondents who expected the UM program to have "high impact."[270]

NUMI metrics are not incorporated into the facility-level performance plans, limiting executive leadership emphasis. As shown in Table 7-1, utilization of the NUMI application has been strong across the organization, with UM nurses reviewing 79 percent of all inpatient days during FY2014. However, trends in performance (proportion of UM reviews meeting InterQual criteria) suggest limitations in VHA's ability to drive true performance improvements through the UM program and NUMI: data from the past 2 years indicates that the percentage of continued stay reviews meeting criteria has remained between 60 percent and 70 percent, with no consistent recent upward trend. One factor that may contribute is that NUMI metrics are currently not incorporated within the national SAIL report, which may drive limited engagement from VAMC leadership. This is illustrated by a

---

[270] Site visits quality manager / utilization management coordinator interviews (N=21)

facility-level leader who commented: "If NUMI metrics are not part of my performance plan, I'm not going to worry about it."[271]

Table 7-2. Overview of NUMI Reviews and Recent Performance[272]

Review type	Description	Utilization (percent of cases reviewed)		Performance (percent of cases meeting criteria)	
		Target	FY2014	Target	FY2014
Continued stays	Assessment of whether patient's clinical status continues to warrant inpatient acute care versus care at some other level	75	**79**	80	**66**

Front-line clinical staff (e.g., nurses) are consistently unfamiliar with UM metrics and their interpretation. Observations during our site visits suggest that engagement of front-line staff in the UM program has also been limited. For example, we found that although NUMI indicators are integrated into the BMS boards on the acute care units, 95 percent of staff nurses observed during our site visits were unable to communicate the meaning of these indicators.[273] This observation may reflect insufficient training of front-line staff to date regarding this NUMI feature and suggests that additional education may be needed to ensure that front-line staff have the right information and training to fully engage in national UM efforts.

7.2.1.3 Variable Participation in National LOS Management Initiatives and Inconsistent Adoption of Best Practices Drive Variation In Recent LOS Improvements

In addition to the national UM program, VHA has implemented various other initiatives to improve patient flow and facilitate effective care transitions. Much of this work has been done through collaboratives launched by the VHA Office of Systems Redesign and Improvement.[274] Since 2006, VHA has offered a number of collaboratives with potential impact on LOS management issues, including the Fix Collaborative (focused on addressing hospital LOS), the Transitioning Levels of Care Collaborative (focused on improving efficiency of care transitions), the Bedside Care Collaborative (focused on improving care delivery patterns), and the Patient Flow Collaborative (focused on the impact of flow and optimal use of VHA's Bed Management System). These collaboratives convene staff from VAMCs across the country to learn about

---

[271] Interview with VHA national leader

[272] NUMI continued stay review data (FY2014)

[273] Site visit med/surg unit shadowing sessions (N=21)

[274] Interview with VHACO leader

evidence-based best practices in inpatient clinical operations and to share learnings from successful local initiatives. While there may be similar opportunities to collaborate with external hospital organizations to share learnings and best practices, our assessment did not provide evidence that VHA has systematically pursued these opportunities for external collaboration to promote increased performance improvement.

Our analysis suggests that the impact of these initiatives may have been limited by (1) shifting support for continuously administering the collaboratives; and (2) variable participation in national collaboratives due to lack of facility-level support and inability to accommodate all willing participants.

> Shifting support for continuously administering the collaboratives. Shifting priorities at the national level have yielded inconsistent focus on LOS improvement efforts across the organization. This is illustrated by the recent experience of VHA's various collaboratives during FY2013-FY2014. After being administered successfully for 3 to 4 years, all collaboratives were halted in 2012 due to a national travel ban[275] across the organization. Only recently was this travel ban lifted, and the Transitions Collaborative resumed again during FY2015.[276] Furthermore, VHA's investment in these collaboratives may be decreasing over time. As reported during a recent interview: "The caps on the number of VAMCs that can participate in the collaboratives continue to get tighter and tighter. At the same time, the number of approved participants is getting to be less and less. We used to be able to take an entire team of six to participate in the collaboratives, but now we have to send two and the rest of the team participates virtually. It doesn't have the same effect on promoting change back at the facility when not all team members are able to fully participate in the collaboratives."[277]

> Variable participation in national collaboratives due to lack of facility-level support and inability to accommodate all willing participants. Impact from national collaboratives has varied significantly across the organization, in part driven by variable participation. One potential barrier to broader participation is inconsistent support from facility-level leadership across the organization. As stated during a recent interview: "Buy-in from facility leadership is critical for participation in collaboratives. Not only must the facility cover all travel expenses, but it also requires a willingness to grant participating team members protected time on a weekly basis to meet together, discuss progress, and continue to move initiatives forward. All of this has a cost, and some directors just aren't willing to pay it."[278]

> In addition, because participation in LOS improvement collaboratives is by application and there are limited positions available, collaboratives are not always

---

[275] Additional information regarding travel restrictions can be found in Assessment L

[276] Interview with Transitions Collaborative leader

[277] Interview with collaborative participant

[278] Interview with collaborative participant

---

able to accommodate all would-be participants. Our analysis suggests that a total of 53 unique VAMCs participated in the 2010-2012 round of national collaboratives.[279] While some of this may be due to lack of communication regarding the collaboratives, our interview with organizers of the recently launched Transitions Collaborative suggest that capacity constraints may also contribute: organizers received about roughly 40 VAMC applications for about 25 open positions.[280]

Our analysis revealed evidence that committed participation in these collaboratives may lead to improvements in outcomes. The example of the West Roxbury VAMC is illustrative. During a recent interview, a clinical leader from the facility remarked: "Participating in the national Flow Collaborative was extremely valuable in promoting performance improvement at our VAMC." With the support of facility-level executive leadership and as a result of efforts initiated as part of the collaborative, West Roxbury has aggressively pursued interventions to improve its LOS management and care transition practices. As a result, West Roxbury's acuity-adjusted LOS has decreased approximately 20 hours over a 6-year period. Additional details regarding West Roxbury's approach to performance improvement and recent results are shown in the case study below.

Table 7-3. VAMC Case Study: National Collaborative Impact

Best practice case study – West Roxbury VAMC
As part of the national **Flow Collaborative**, the **West Roxbury VAMC** has implemented several initiatives to improve patient flow and reduce LOS. **Context**   ▪ Selected to participate in VHA's national Flow Collaborative   ▪ Served as a pilot for a broader national initiative   ▪ Modeled several interventions to mirror concepts first applied within the Cleveland VAMC   **Initiatives implemented**   ▪ Created flow center to enable co-location of several stakeholders (e.g., transfer coordinator, scheduler, bed management coordinator) with responsibility for various aspects of patient flow   ▪ Restructured case management and utilization management departments to combine into a single role ("collaborative care nurses") under the flow center organizational structure   ▪ Organized flow center committee to meet every other week to discuss opportunities to improve flow and LOS management

---

[279] FIX Collaborative Team Participation data (includes VAMCs participating in at least one of three collaboratives during 2010-2012: Bedside Care, Patient Flow Coordination, of Transitioning Levels of Care)

[280] Interview with Transitions Collaborative leader; of the 25 VAMCs accepted, only 12 are approved for in-person participation (remaining facilities participate virtually via teleconference)

Best practice case study – West Roxbury VAMC
Impact
▪ Improved OMELOS (internal measure for acuity-adjusted LOS; see Section 7.1.2 for further details) by about 20 hours (0.85 days) over a 6-year period through targeted improvement initiatives implemented through both the Flow Center and other facility-level efforts   ▪ Promoted increased awareness and emphasis on performance improvement: "We have a much better, system-level understanding of the flow. I think every VAMC should have a flow center."

7.2.2 Existing Post-acute Care Options (e.g., rehabilitation/skilled nursing facilities) do not Always Match Veteran Needs, Delaying Discharge

One critical enabler of effective discharge planning is the ability to efficiently and effectively transition patients from the inpatient setting to the next appropriate care venue. This is a key step in the discharge planning process as inadequate coordination and planning can lead not only to discharge delays but also to avoidable hospital readmissions (Fox, 2013). If discharge options are not appropriately matched to patient needs, LOS may be increased and quality of care may suffer.

Veterans can be discharged from the acute care inpatient setting to a variety of venues **(Figure 7-2)**. Effective discharge planning for patients transitioning to specialized post-acute care and social settings is critical given the prevalence of complex medical and psychosocial co-morbidities within these patient populations. Our assessment suggests challenges related to VHA's ability to efficiently transition these Veterans to post-acute care settings. These challenges contribute to extended LOS, as evidenced by about a 3.5- to 5-day LOS increase for patients requiring placement within a post-acute care facility or specialized social program compared with patients discharged to home **(Figure 7-3)**. Difficulty with Veteran placement is also indicated by data captured within VHA's NUMI system: post-acute placement and social issues (e.g., lack of caregiver support) drive roughly 26 percent of VHA's bed days of care that fail to meet InterQual criteria **(Figure 7-4)**.[281] This finding is particularly notable because these Veterans comprise only about 9 percent of overall VHA admissions.

- **Other:** including regulatory, environmental, and scheduling factors
- **Outpatient care:** patient stable for discharge, remains IP awaiting services appropriate for OP setting (e.g., diagnostics, procedures, consults)
- **Social:** patient clinically stable with unresolved social issues (e.g., lack of caregiver, transportation)
- **Inpatient level of care capacity:** patient's current level of care does not meet IQ criteria (e.g., insufficient capacity in higher or lower level of care, patient awaiting transfer to VA or non-VA facility)
- **Post-acute transitions:** patient clinically stable awaiting transition to post-acute settings for continued care (e.g., placement issues, awaiting CLC acceptance)
- **Clinical:** clinical presentation and / or physician judgment are the basis for continuing care in current level of care (e.g., clinical instability, co-morbidities)

Challenges with post-acute placement are the most common non-clinical reason for reviews not meeting inpatient continued stay criteria

SOURCE: NUMI Continued Stay Review data (FY2014)

As noted in **Figure 7-4** above, VHA's NUMI data indicates several reasons for inpatient days not meeting InterQual criteria. Each of these reasons warrants further exploration to identify potential opportunities to improve LOS. Our interactions with front-line staff during site visits disproportionately highlighted issues related to post-acute placement and social resources; as such, we consider these issues in greater detail within Sections 7.2.2.1–7.2.2.2. Due to the broad nature of the "other" category and its lower frequency of mention, we chose not to analyze this category in greater detail. The "outpatient care" and "inpatient level of care capacity" categories are discussed in section 5. While each of these criteria impact the appropriateness of a patient's continued stay, as defined in NUMI, a patient's level of care has minimal impact on his or her overall length of stay. Given the frequency with which "clinical" is recorded as the reason for inpatient days not meeting criteria (49 percent of days not meeting criteria), this cohort warrants special attention. Our on-site interactions with clinicians suggest that this category likely represents a heterogeneous Veteran population for whom InterQual criteria fail to fully capture the patient complexity justifying inpatient admission. Other potential justifications for the high proportion of patients failing to meet InterQual continued stay criteria for reasons related to clinical judgment are that physicians place little value on UM criteria or that clinical documentation does not accurately reflect patients' care contributing to

ineffective UM reviews (addressed in Section 9). McKesson's InterQual criteria supports more than 3,700 hospitals across the country (McKesson website, 2015), so we believe it is a relevant algorithm, albeit with potential for customization to reflect VA patient characteristics. Section 9 provides additional detail on provider documentation as a potential limiter to effective UM.

Our assessment demonstrated the following key issues affecting VHA's ability to effectively transition patients to settings for appropriate post-acute care:

> **7.2.2.1 Veterans requiring placement within post-acute care facilities experience significant discharge delays**

> **7.2.2.2 Limited social resources (e.g., transitional housing, homeless programs) for Veterans awaiting discharge prolongs LOS**

7.2.2.1 Veterans Requiring Placement Within Post-Acute Care Facilities Experience Significant Discharge Delays

VAMCs experience significant difficulty with patients being discharged to post-acute care facilities. This is evidenced by the following: (1) VHA data indicates prolonged LOS and frequent reviews not meeting criteria due to placement issues; and (2) front-line staff report significant difficulty with post-acute placement.

> **VHA data indicates prolonged LOS and frequent reviews not meeting criteria due to placement issues.** We found that while LOS management is a challenge across VHA, it is a particular challenge for Veterans discharged to post-acute care facilities. Our analysis of national datasets indicates that LOS for these patients exceeds LOS for Veterans discharged to home by about 5.1 days (Figure 7-3). Data tracked within the NUMI tool provides further evidence of discharge delays suggested by VHA LOS data. During FY14, about 19 percent of continued stay reviews not meeting criteria were due to post-acute placement issues, making post-acute placement issues the most common non-clinical reason for reviews not meeting criteria (Figure 7-4).

> **Front-line staff report significant difficulty with post-acute placement.** Challenges with post-acute placement were commonly reported by front-line staff. Staff at 55 percent of sites reported this discharge barrier during assessment workshops,[282] and case managers/social workers cited this issue more commonly than any other discharge barrier (42 percent of interviewees).[283] Patient placement issues were reported to be particularly acute for specific Veteran subgroups, including aggressive-demented patients and patients requiring long-term ventilator care. Front-line staff at several facilities indicated that this challenge is influenced by an inability to efficiently contract with post-acute care facilities in the community (reported by 25 percent of sites).[284]

---

[282] Site visit discharge planning assessment workshops (N=20)

[283] Site visit case manager / social worker interviews (N=21)

[284] Site visit discharge planning assessment workshops (N=20)

VHA has created a network of Community Living Centers (CLCs) in an attempt to address Veteran placement challenges. At present, approximately 75 percent of VAMCs have dedicated CLCs, which are VHA-operated post-acute care facilities whose offerings range from short-term rehabilitation, to long-term care for psychiatric illness, to hospice and palliative care services.[285] Access to a CLC would be expected to alleviate post-acute Veteran placement issues to some degree. However, our analysis of NUMI data suggests minimal differences between VAMCs with CLCs and those without in frequency of continued stay reviews not meeting InterQual criteria due to post-acute placement issues (19.3 percent for facilities with CLCs versus 17.9 percent for facilities without CLCs). This finding supports themes expressed by front-line staff during site visits, namely that some CLCs have capacity issues and that CLC placement requires lengthy qualification processes, leading to discharge delays.[286]

Based on the scope of our assessment outlined within the Choice Act, we did not assess capacity within VHA-operated CLCs or current and projected Veteran post-acute care demand. However, an assessment of these adjacent areas would be beneficial to developing a more comprehensive understanding of VHA's challenges related to post-acute placement.

7.2.2.2 Limited Social Resources (e.g., transitional housing/homeless programs) for Veterans Awaiting Discharge Prolongs LOS

Features of the Veteran population make VHA particularly susceptible to discharge challenges related to availability of social resources in the post-acute setting. The academic literature has documented increased prevalence of several key social factors within the Veteran population, including homelessness, PTSD, substance abuse, and limited family support (Tsai, 2015). These and other social factors can create barriers to discharge, as Veterans may be medically ready to leave the acute care inpatient setting but may be difficult to place in a more appropriate setting.

Each of the following implicates social resources as contributing to Veteran discharge delays: (1) VHA data indicates prolonged LOS and frequent reviews not meeting criteria due to social issues; (2) front-line staff report social issues as a prominent discharge barrier; and (3) staff reported consistent challenges arranging transportation for Veterans during site visits.

VHA data indicates prolonged LOS and frequent reviews not meeting criteria due to social issues. LOS for Veterans requiring discharge to settings to address social issues (e.g., transitional housing, domiciliary care for homeless Veterans) is about 3.5 days longer than for Veterans discharged to home, as indicated in Figure 7-3. Data from the NUMI tool also suggests that social issues often lead to inpatient bed-

---

[285] VSSC (2014)

[286] Site visit discharge planning assessment workshops (N=20)

days that do not meet InterQual criteria for continued stay. During FY2014, 7.1 percent of inpatient continued stay reviews not meeting criteria were due to social issues (Figure 7-4). Of these reviews not meeting criteria, 65 percent were due to either homelessness or lack of caregiver support. This data indicates that limited access to social resources outside the inpatient setting drives discharge delays and prolongs LOS.

Front-line staff report social issues as a prominent discharge barrier. During our site visits, social issues were consistently cited as a source of discharge delays. To illustrate, 50 percent of sites reported challenges with holding patients in the inpatient setting for non-medical reasons due to scarce outside resources (e.g., limited availability in substance abuse treatment programs).[287] When asked to rank eight potential discharge challenges according to their impact on prolonging LOS, "social factors" was ranked as the largest challenge, rated as the number one discharge barrier by 47 percent of front-line staff.[288] Comments made by front-line staff during site visits further reinforce this point. One case manager reported: "Our VISN has developed many strong programs to address social issues like substance abuse and homelessness, but it is often very difficult to place patients in these programs, even when these programs are operated by other facilities within the VISN."[289] A comprehensive assessment of capacity within VHA's post-acute social programs was out of scope for our assessment, but it would be helpful to better understand how widespread these issues are as well as their underlying drivers and potential solutions across the organization.

Staff reported consistent challenges arranging transportation for Veterans during site visits. Timely transportation from the acute care facility to post-acute care settings is a key enabler of effective LOS management. During our on-site assessment workshops, 80 percent of sites reported limited transportation options as a common discharge barrier for Veterans otherwise ready for discharge.[290] Many factors were reported as contributing to problems with transportation, including unavailability of family members to provide rides for Veterans, limited availability of Veteran Transportation Services (VTS) at key times, inadequate contracts with community transportation partners, and overly stringent qualification standards for Veteran travel benefits. These difficulties may contribute to delayed care transitions and inefficient use of inpatient resources. We did not comprehensively assess VHA's transportation programs and policies for determining Veteran eligibility; additional analysis would be beneficial to understand the root causes of the transportation issues raised on-site.

7.2.3 Typical VAMC Operating Models do not Promote Efficient Inpatient Care, Leading to Prolonged LOS

High-performing hospital organizations create opportunities for LOS improvements by employing an operating model emphasizing timely access to needed clinical services. In many cases, this means moving away from traditional patterns of inpatient care delivery in favor of practices that promote patient-centered and evidence-based care. For example, abundant evidence from the academic literature supports 7-day-per-week coverage of consultative services as an intervention to accelerate progression of inpatient care and improve LOS (Engel, 2013; Kolber, 2013; Rapoport, 1989). In addition, improvements in quality and efficiency have been achieved through implementation of inpatient clinical protocols, which are standardized processes for delivering a specific intervention (e.g., ventilator weaning) in the inpatient setting (Girard, 2008; Gao, 2005). Finally, high-performing hospital systems have improved efficiency and quality of inpatient care processes through development of inpatient clinical pathways, which are standard processes for managing the admission-to-discharge needs of specific patient sub-groups (e.g., patients undergoing knee replacement/extensive colon surgery) (Winther, 2015; Wind, 2006). These changes to the hospital operating model are key enablers of improved LOS performance because they accelerate inpatient care processes, expedite recovery, and facilitate appropriate discharge to lower levels of care.

Our assessment suggested challenges with specific elements of VHA's operating model. For example, 60 percent of participants in our on-site discharge planning workshops reported delays obtaining consults and tests as a barrier to timely progression of care.[291] Furthermore, implementation of standard, evidence-based protocols and pathways has been left to individual facilities, resulting in significant variation within and among VAMCs in patterns of care for managing similar clinical problems. Improvements to VHA's practices for diagnosing and treating patients are needed to enable efficient progression of care, which contributes to both high-quality outcomes and appropriate use of inpatient resources.

We identified two drivers of VHA's challenges in providing inpatient care through an efficient, evidence-based approach:

7.2.3.1 Reduced access to consultative services (e.g., specialist/allied health consults) over the weekend heightens discharge challenges

7.2.3.2 Inconsistent implementation of standard protocols and pathways drives variability in care patterns and may increase patient LOS

7.2.3.1 Reduced Access to Consultative Services (e.g., specialist/allied health consults) Over the Weekend Heightens Discharge Challenges

Section 2.2 of this report outlines in detail VHA's challenges with respect to staffing during off-tour hours. These challenges not only drive gaps in VHA's ability to safely and effectively respond to patient needs, but also have implications for LOS management and efficacy of care transitions. Our analysis of VHA national data has revealed that: (1) discharges are less common

---

[291] Site visit discharge planning assessment workshops (N=20)

over the weekend; and (2) LOS is prolonged over the weekend, particularly for patients requiring specialty and allied health support. These observations support the hypothesis that limited weekend coverage of key clinical personnel is one key driver of prolonged LOS for VHA.

Discharges are less common over the weekend. Analysis of VHA encounter-level data suggests that only about 14 percent of VHA discharges occur on Saturday or Sunday (Figure 7-5).[292] In a true 24/7 system operating without distinction between weekdays and weekends, this expected number would be about 28 percent. Although industry-wide benchmarks for weekend discharge percentages are limited, data from Intermountain Healthcare indicates that weekend discharges within its system comprise about 25 percent of overall discharges.[293] This suggests that gaps in VHA's weekend operating model may prolong LOS. This is consistent with reports from front-line staff at several VAMCs, one of whom stated: "In terms of hours of operation, our facility is more like a clinic than a true 24/7 inpatient acute care hospital."[294]

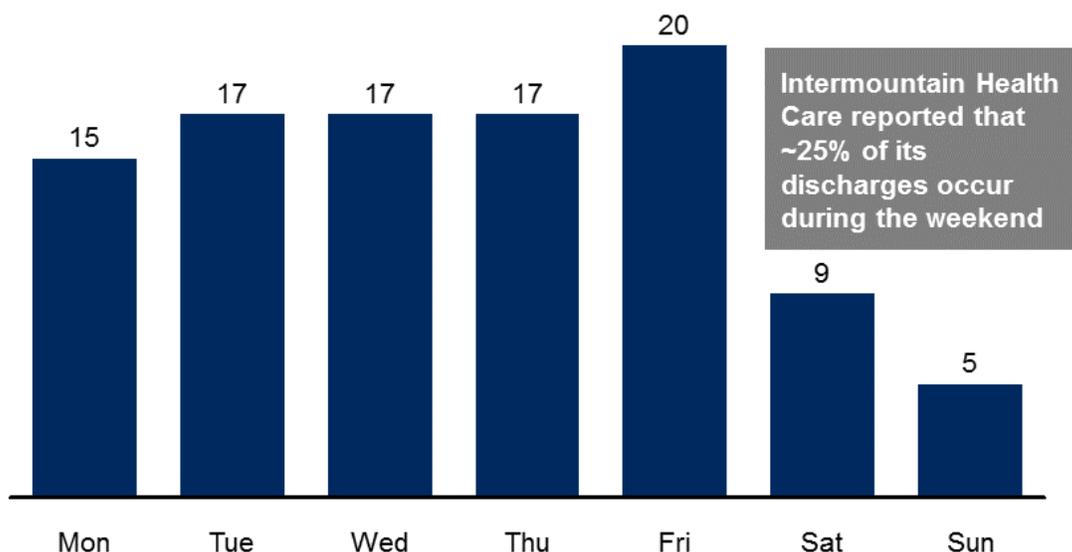
Figure 7-5. Discharges by Day of Week

VHA discharges drop off significantly during the weekend
Percent of discharges, by day of week


SOURCE: VHA MedSAS Data (FY2014)

LOS is prolonged over the weekend, particularly for patients requiring specialty and allied health support. Data collected within the National Utilization Management Integration (NUMI) tool provides evidence for increased LOS for patients whose stay extend into the weekend: there is a 2.7 percent increase in continued stay reviews not meeting criteria on weekends (36.3 percent) versus weekdays (33.6 percent).[295] In addition, our analysis of VHA encounter-level data suggests that patient stays for diagnoses commonly requiring consultative services are prolonged when these stays extend over the weekend. This is illustrated in Figure 7-6 by increased LOS for Veterans admitted Thursday through Sunday for stroke (about 18 percent LOS increase), joint replacement (about 32 percent LOS increase), and angina (about 18 percent LOS increase).[296,297] However, due to the unavailability of time-stamped consult data, we were unable to analyze

---

[295] NUMI continued stay review data (FY2014)

[296] VHA MedSAS data (FY2014)

[297] Patients treated in the inpatient setting for these diagnoses regularly require early evaluation and, in many cases, reevaluation by specialty consultants to ensure progression of treatment and readiness for safe discharge.

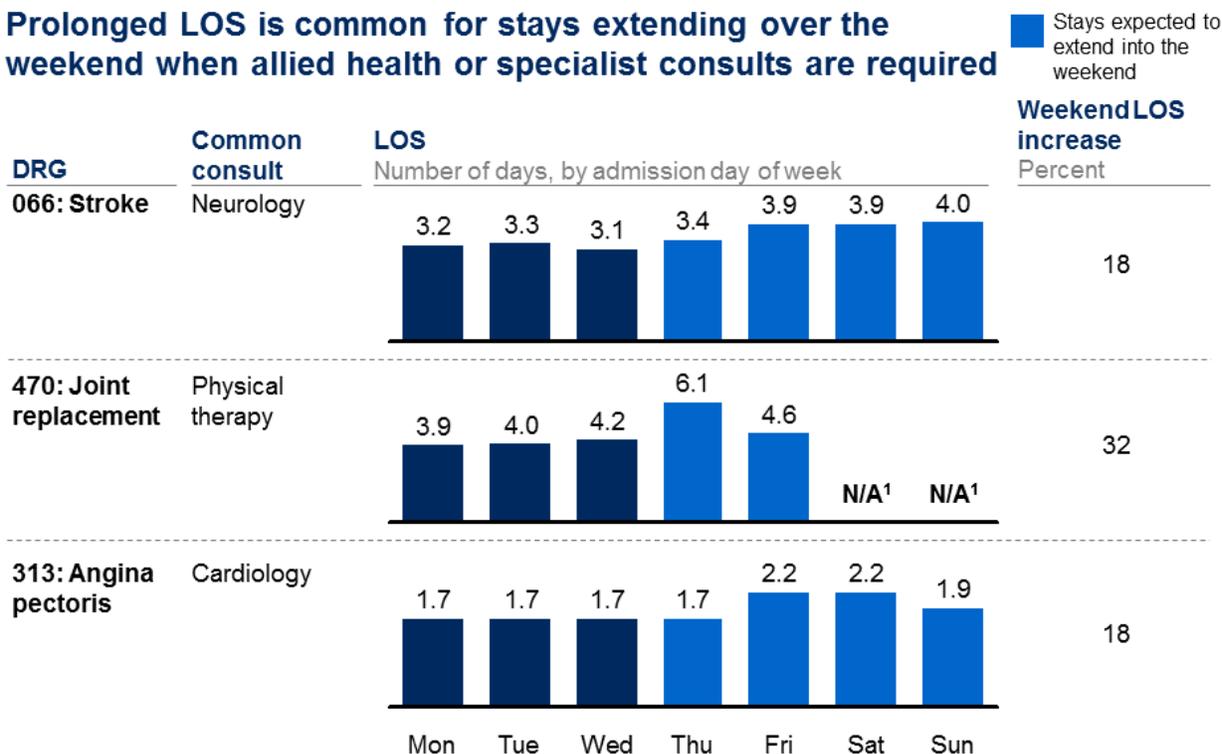
The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

discrepancies, by day of week, between when a consult was ordered and when it was administered.

Figure 7-6. LOS by Admission Day of Week for DRGs Requiring Consultations

Prolonged LOS is common for stays extending over the weekend when allied health or specialist consults are required

■ Stays expected to extend into the weekend

DRG	Common consult	LOS — Number of days, by admission day of week							Weekend LOS increase — Percent
		Mon	Tue	Wed	Thu	Fri	Sat	Sun	
066: Stroke	Neurology	3.2	3.3	3.1	3.4	3.9	3.9	4.0	18
470: Joint replacement	Physical therapy	3.9	4.0	4.2	6.1	4.6	N/A[1]	N/A[1]	32
313: Angina pectoris	Cardiology	1.7	1.7	1.7	1.7	2.2	2.2	1.9	18


1 Only 1.2% of joint replacements occur on Saturday/Sunday, skewing LOS performance for these days because cases tend to be more acute
2 Based on Medicare GMLOS for DRG mix treated at VHA, which does not account for prevalence of mental health co-morbidities in the Veteran population

SOURCE: VHA MedSAS Data (FY2014)

7.2.3.2 Inconsistent Implementation of Standard Protocols and Pathways Drives Variability in Care Patterns and may Increase Patient LOS

Evidence from the academic literature suggests that provider organizations can achieve significant gains in quality and efficiency of inpatient care through implementation of evidence-based protocols and pathways (Silow-Carroll, 2007). While it is not possible to homogenize all care delivery processes, alignment of care patterns for common interventions (e.g., ventilator weaning in the ICU, early mobility for post-operative patients) and diagnoses (e.g., knee replacement, sepsis) through evidence-based protocols and pathways has been shown, in many instances, to reduce patient complications and decrease overall LOS (Drolet, 2013; Blackwood, 2011). Many high-performing hospital systems, including Intermountain Healthcare, have driven significant improvements in clinical quality and efficiency through implementation of standard, evidence-based practices (see case study below).

Table 7-4. External Case Study: Inpatient Clinical Pathways

Best practice external case study – Intermountain Healthcare[298]
To increase the adoption of evidence-based care, the **Intermountain Healthcare** has developed **clinical pathways** promoting a standard approach to managing common clinical conditions across the organization (Intermountain Healthcare Interview, 2015). **Intermountain's approach to care pathway development and implementation** ▪ Identify priority diagnoses with significant variability in existing patterns of care delivery as potential candidates for pathway development ▪ Review the academic literature to determine current best practices for care delivery to patients with target diagnoses ▪ Align on standard processes and patterns of care to treat the diagnosis and educate providers regarding their use ▪ Embed care pathways into existing clinical workflow through creation of standard order sets, making the standard of care the "default option" **Illustrative results** ▪ Extensive colon surgery pathway (Early Recovery After Surgery): decreased average LOS from 11 days to 4 days ▪ Sepsis identification pathway: reduced ICU mortality for patients with sepsis and decreased LOS by several days

Our assessment indicates that: (1) VHA's national evidence-based practice efforts have almost exclusively focused on development of guidelines for use in the outpatient setting; and (2) while adoption of inpatient protocols and clinical pathways is commonly reported organization-wide, consistent use appears to be limited by lack of information regarding their availability.

> VHA's national evidence-based practice efforts have almost exclusively focused on development of guidelines for use in the outpatient setting. VHA has a long history of working to implement evidence-based practice into clinical workflows (Chou, 2007; Bauer, 1999). In collaboration with the Department of Defense (DoD), VHA established the VA/DoD Evidence-Based Practice Guideline Work Group in 1998, a group heralded by the Institute of Medicine for its efforts to develop and implement evidence-based practice guidelines.[299] However, the standards developed by the work group have focused exclusively on care processes for the outpatient setting, limiting their impact on inpatient care delivery.[300] This outpatient focus was confirmed by a national leader, who stated in a recent interview: "We've focused exclusively on development of outpatient clinical *practice guidelines*, which are

---

[298] Intermountain Healthcare SME interview (May 19, 2015)

[299] From VA/DoD Clinical Practice Guidelines website (http://www.healthquality.va.gov/)

[300] Interview with VHACO leader

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

distinct from *clinical pathways*. Pathways tend to be a more local phenomenon to reflect local practice patterns and processes. I'm not sure that national has a role in determining how inpatient care should be delivered at the local level."[301] This leader also suggested that the VA/DoD workgroup's outpatient focus is reflective of the distribution of care provided by the organization: because VHA provides a greater volume of care in the outpatient setting, guideline development has focused preferentially on this setting.

While adoption of inpatient protocols and clinical pathways is commonly reported organization-wide, consistent use appears to be limited by lack of information regarding their availability. Our on-site observations suggest that inpatient protocols and clinical pathways are commonly available, but their use is inconsistent across VHA. ICU staff commonly acknowledged the existence of protocols and clinical pathways during site visits (81 percent of sites).[302] Our survey supports this finding, with 80 percent of participating nurses reporting existence of protocols or pathways at their facility.[303] While existence of protocols and pathways is common, nurses also frequently expressed barriers to their consistent use, including limited development of resources at the national level, unfamiliarity with the breadth of protocols and pathways in place at the local level, and difficulty in navigating the online resources where protocols and pathways are housed.[304] Survey responses further reinforce the existence of knowledge gaps regarding available protocols and pathways: 37 percent of physicians reported that they didn't know whether their facility had protocols or pathways (this is in addition to the 12 percent of physicians who stated that their facility did not have these resources at all).[305]

Due to a lack of organization-wide data reporting adherence to protocols and clinical pathways, we were unable to systematically examine utilization patterns across the organization. However, our site visit interactions do provide some insight into the types of resources that are currently in place. When referencing protocols and pathways currently in place at their facility, nurses commonly referred to protocols only (e.g., ventilator weaning protocol, central line bundle). None of the sites that we visited as part of our assessment referenced the existence of care pathways to guide care delivery from admission to discharge. While we are unable to confirm whether this is the case organization-wide, our assessment suggests that development of comprehensive care pathways has been, at best, extremely limited across VHA.

7.2.4 Use of Discharge Planning Best Practices is Inconsistent, Decreasing Effectiveness and Coordination

Effective discharge planning practices are key to promoting efficiency as well as effectiveness of the care transition process. This has been demonstrated within the academic literature, with studies showing that well-planned discharges contribute to decreases in both LOS and readmission rate (Miani, 2014; Fox, 2013). Our assessment indicates that VHA has not systematically implemented practices to encourage timely and effective transitions of care. For example, just over half (55 percent) of VAMCs have dedicated case managers across inpatient units.[306] In addition, while interdisciplinary discharge meetings have been implemented by about 79 percent of VAMCs, variable attendance challenges effectiveness.[307] Finally, adoption of case management tools has been ad hoc and driven by individual facilities, potentially resulting in gaps in comprehensiveness of these tools. These and other challenges contribute to gaps in VHA's discharge planning practices relative to high-performing hospital organizations and may prolong LOS and challenge safe and effective transitions of care.

We discovered that three key drivers of VHA's current challenges with discharge planning are:

7.2.4.1 Suboptimal and inconsistent use of case managers results in re-allocation of critical discharge planning responsibilities to other staff

7.2.4.2 Variable deployment of key processes designed to expedite discharge results in avoidable discharge delays

7.2.4.3 Limited adoption of discharge planning tools may inhibit optimal application of case management efforts

7.2.4.1 Suboptimal and Inconsistent Use of Case Managers Results in Reallocation of Critical Discharge Planning Responsibilities to Other Staff

Private hospitals typically employ dedicated inpatient case managers[308] to manage the discharge process end-to-end and ensure completion of all tasks necessary for safe and timely care transitions (ACMA, 2013). Our assessment revealed several instances of key discharge-related tasks being performed by other staff, including physicians calling nursing homes to arrange patient placement, floor nurses performing initial social evaluations to identify potential discharge barriers, and patient advocates coordinating care among medical service lines (e.g., coordination of orthopedics with prosthetics service).[309] These practices may both

---

[306] Choice Act data call (N=49)

[307] Site visit med/surg and ICU shadowing sessions (N=42)

[308] Case managers are often registered nurses by training with specialized expertise in discharge planning to ensure that the acute and chronic needs of patients are appropriately met. Case managers often work in collaboration with social workers (responsible for handling complex psychosocial issues including patient placement and insurance eligibility) and utilization management (UM) specialists (responsible for ensuring that each patient's use of intensive inpatient resources is appropriate).

[309] Site visit discharge planning assessment workshops (N=20)

---

inhibit top-of-license practice and also delay care transitions as staff members without deep expertise in discharge planning perform key discharge tasks in addition to their primary duties.

Our assessment revealed several reasons for these care patterns, including: (1) less than half of VAMCs have assigned inpatient case managers across inpatient units; and (2) even where deployed, case manager roles and duties vary significantly from one VAMC to another.

> **Less than half of VAMCs have assigned inpatient case managers across inpatient units.** Private sector hospitals typically employ a robust team of case management and social work professionals to promote timely discharge. According to a recent industry survey, the average private sector hospital employs twelve RN case managers, eight social workers, two to three utilization management (UM) or utilization review (UR) specialists, and one discharge specialist (ACMA, 2013). In contrast, only 55 percent of respondents to our data call indicated deployment of dedicated inpatient case managers at their facility.[310] The lack of assigned personnel to manage the discharge planning process at many facilities likely contributes to LOS management challenges.
>
> **Case manager roles and duties vary significantly from one VAMC to another**. We observed significant variability among VAMCs in both titles and roles for case managers across adopting facilities. At facilities where the inpatient case management role had been implemented, titles for the role were varied and included care coordinators, discharge planners, collaborative care nurses, and collaborative care case managers. In addition to title differences, the duties of these staff varied from one facility to another: some shared utilization management duties while others focused exclusively on discharge planning, some had only inpatient responsibilities while others had duties that spanned both inpatient and outpatient settings. This variability resulted in some initial difficulties for facilities newly implementing the case manager role, as reflected by a case manager who commented during one site visit: "There were significant growing pains with implementation of the role less than a year ago. At first, it was unclear what duties should fall to the case manager versus the social worker. We've started to work some of the issues out, but there has definitely been some duplication of effort."
>
> In contrast, other VAMCs have experienced tremendous success with implementation of case managers (see case study below). Variable results from implementation of the case manager role across VAMCs suggests gaps in dissemination of best practices across the organization.

---

[310] Choice Act data call (N=49)

Table 7-5. VAMC Case Study: Inpatient Case Managers

Best practice case study – Cleveland VAMC
As part of a comprehensive set of interventions associated with its Flow Center, the Cleveland VAMC has deployed collaborative care case managers to perform case management functions and promote timely and effective discharges. **Context** ▪ Cleveland VAMC discovered that utilization management (UM) nurses[311], initially organized under the facility's quality management department, were performing tasks that other staff were performing as well ▪ Facility leadership decided to consolidate five discharge planners with ten UM nurses under the new title of collaborative care case managers ▪ Management altered the department structure to organize the case managers under Cleveland's Flow Center to increase emphasis on efficient patient flow **Collaborative care case manager duties and responsibilities** ▪ Perform daily UM reviews and lead clinical teams in discharge planning ▪ Participate in daily rounds with clinical teams ▪ Collaborate with members of the interdisciplinary team (e.g., physicians, nurses, physical therapists, social workers) to ensure that discharge needs are met **Impact** ▪ Decreased OMELOS (internal measure for acuity-adjusted LOS; see Section 7.1.2 for further details on this metric) by about 12 hours (0.5 days) over a 3-year period (Q1 FY2012 – Q4 FY2014) ▪ Improved UM performance on percentage of case reviews meeting McKesson InterQual[312] criteria for continued stay (increased from 60 percent to 72 percent during the past 2 years)[313]

7.2.4.2 Variable Implementation of key Processes Designed to Expedite Discharge Results in Avoidable Discharge Delays

A number of practices have been successfully instituted in private hospitals to promote timely discharge and effective care transitions. Our site visits and analysis of VHA national data has

---

[311] The role of UM nurses, as outlined within VHA Directive 1117: Utilization Management Program (2014), is to perform daily UM reviews to track percent of patients meeting InterQual criteria and to collaborate with interdisciplinary clinical teams, as appropriate.

[312] McKesson InterQual is a utilization management tool that provides evidence-based clinical decision support on the appropriateness of care (including admissions and continuing stays).

[313] Based on National Utilization Management Integration (NUMI) data – comparison of percent continued stay reviews meeting criteria during Q1 FY2013 versus Q4 FY2014.

revealed the following gaps within VHA compared to best practice in the industry: (1) many, but not all, VAMCs perform interdisciplinary discharge planning meetings, but with variable attendance from key stakeholders; and (2) processes to promote early morning discharges are infrequently adopted.

Many, but not all, VAMCs perform interdisciplinary discharge planning meetings, but with variable attendance from key stakeholders. Private hospitals commonly employ interdisciplinary team meetings to promote early recognition and resolution of potential discharge barriers (Wong, 2011). This interprofessional collaboration has been shown in several studies to drive improvements in patient care (Zwarenstein, 2009). One academic medical center reported an 18 percent reduction in LOS from instituting effective interdisciplinary discharge meetings (Southwick, 2014). Our assessment demonstrated that several VAMCs have also successfully deployed daily interdisciplinary discharge meetings to improve LOS management (Figure 7-7 contains an illustrative example).

Figure 7-7. VAMC Case Study: Interdisciplinary Discharge Meetings

Case study: Sacramento VAMC

Interdisciplinary discharge meeting adoption

Background	▪ Implemented **daily interdisciplinary discharge meetings** to enhance communication and address potential discharge barriers early during inpatient admissions
Details of interdisciplinary discharge meetings	▪ Held **daily** (M-F) on each inpatient unit ▪ Led by **nurse practitioners** with responsibility to oversee discharge planning ▪ Attended by **various clinical roles** ▪ Scoped to last no longer than **30 min** (30 seconds to discuss each patient) ▪ Designated as **"stand up meetings"** (participants stand to promote efficiency)
Impact	▪ Achieved OMELOS in the **top quartile** among VAMCs nationwide (see chart to the right)

FY2014 OMELOS[1]
Number of days

-0.3 VHA median

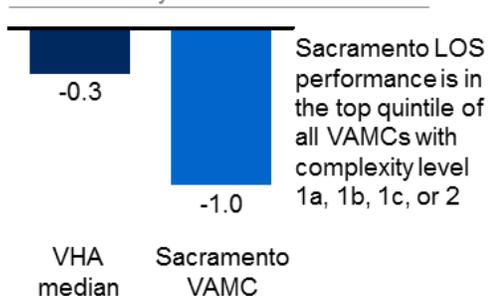
Sacramento LOS performance is in the top quintile of all VAMCs with complexity level 1a, 1b, 1c, or 2


1 Observed-minus-expected LOS (OMELOS) is a LOS metric used within VHA to compare acuity-adjusted LOS performance across facilities; negative values are better, as they indicate actual LOS less than "expected"

SOURCE: Interview with Sacramento VAMC leadership; FY2014 IPEC OMELOS data

While common, the practice of holding daily interdisciplinary discharge meetings is not universal across VAMCs. Of sites visited during our assessment, 79 percent of

ICU and acute care units reported daily adoption of these meetings.[314] Our interactions with front-line clinical staff during site visits suggest that interdisciplinary meetings are typically designed to involve an appropriate mix of professionals across clinical roles, as shown in **Figure 7-8**.[315] However, participants at 65 percent of our assessment workshops reported challenges with inconsistent attendance at these meetings for key clinical roles, potentially contributing to discharge delays when not all stakeholders are involved in or aware of discharge preparations.[316] This observation and our site visit finding that not all VAMCs have adopted these meetings suggest that potential impact from optimal interdisciplinary discharge meeting adoption has not been fully realized across VHA.

Figure 7-8. Roles Included in Interdisciplinary Discharge Meetings

VAMCs involve a mix of clinical stakeholders in daily interdisciplinary discharge meetings, with potential gaps in involvement from some roles

Percent of sites reporting involvement, by role

Daily discharge meetings scheduled	Providers	Charge nurses	Case managers / social workers	Nurses	Allied health professionals
79	74	74	64	60	57

Involvement of key clinical stakeholder groups

[316] Site visit discharge planning assessment workshops (N=20)

---

day as part of a comprehensive strategy for improving LOS and patient flow. For example, one private sector hospital reported improvements in its average discharge time following implementation of a simple intervention whereby physicians communicated a 1:00pm discharge time goal during patient rounds on the day prior to discharge (Kravet, 2007). Another hospital in the private sector set a goal to discharge 30 percent of its patients before noon and thereby increased its pre-noon discharges from 11 percent to 38 percent (Wertheimer, 2014). Although limited external benchmarks exist, we find that only 17 percent of VAMCs meet or exceed this sample benchmark of 30 percent of discharges before noon (Figure 7-9). The figure also shows that VAMC performance on discharge time is widely variable, suggesting a significant improvement opportunity. Note that several facilities with the highest rates of discharges before noon rank in the bottom quartile for overall LOS, suggesting the need for concurrent management of both overall LOS and discharge process management (discharges before noon) to drive desired LOS management outcomes.

Figure 7-9. VHA Discharges by Noon

VAMC performance on percent of discharges by Noon is highly variable across VHA

Percent

- Overall, VHA discharges ~20% of patients before noon

- Significant variability in VAMC performance may indicate opportunity to prioritize clinical efforts for patients awaiting discharge

7.2.4.3 Limited Adoption of Discharge Planning Tools may Inhibit Optimal Application of Case Management Efforts

Several discharge planning tools are commonly used in private hospitals to promote safe and timely discharge. Two commonly used tools are discharge checklists and case management software tools (Halasyamani, 2006; ACMA, 2013). Our site visits and data collection have revealed gaps in VHA's suite of such tools, namely: (1) discharge checklists are developed at the local level and do not always address a comprehensive set of discharge needs; and (2) VHA has not adopted case management software tools.

Discharge checklists are developed ad hoc at the local level. Across VAMCs, there is no consistent tool used to facilitate comprehensive discharge planning. This can contribute to an inconsistent and incomplete discharge planning process, poor patient preparation, and last-minute scrambles at the time of discharge. Where implemented in private hospitals, discharge checklists have minimized these negative outcomes by ensuring that a comprehensive set of patient needs is addressed in an organized manner prior to discharge (Halasyamani, 2006).

In order to address potential gaps in post-discharge care, some VAMCs have developed their own local tools to standardize the discharge process and streamline care transitions. Analysis of materials received through the data call suggests that discharge checklists have not been adopted across VHA: only 70 percent of VAMCs submitting documents as part of the data call submitted a discharge checklist, as requested.[317] Furthermore, of discharge checklists submitted, several are targeted to the needs of specific patients (e.g., patients with heart failure/behavioral health issues) rather than designed for Veterans in general. While these locally developed resources may promote effective discharges in many cases, the fact that these tools have been inconsistently adopted across facilities and are not applicable to all Veterans suggests potential gaps in the tools used by VAMCs to effectively plan discharges.

VHA has not adopted case management software tools. Case management software tools have been developed to address many of the common pain points within the discharge planning process. Some tools are designed to identify patients at high risk for readmissions and avoidable hospital days so that staff may intervene to prevent these outcomes. These software platforms risk-stratify patients based on presence of co-morbid conditions, lack of social/family support, and other important patient factors. Other tools address the labor-intensive and manual nature of the post-acute placement process by automating key steps (e.g., identifying post-acute care facilities with capacity, electronically transferring patient data). According to industry survey data, these tools have been implemented by about 30 percent to 50 percent of private sector facilities (ACMA, 2013). Though there have been no

---

[317] Choice Act data call (N=67)

academic studies to definitively prove the benefits of these tools, our interviews with experienced inpatient case managers confirmed that use of these tools is becoming increasingly common within private sector hospitals.

Based on evidence gathered from our site visits, VAMCs have not implemented software tools to facilitate the discharge planning and patient placement processes. Case management staff at one facility reported that implementation of tools had been proposed at their facility but not initiated due to privacy/security concerns. This is consistent with our findings from interviews with national VHA leaders, one of whom commented: "Our efforts to implement a case management tool were essentially 'dead on arrival.' IT leadership said it was incompatible with VA IT culture because of privacy and security concerns, and the effort went nowhere."

Lack of adoption of these tools may exacerbate existing challenges with effective discharge planning. For example, in the absence of tools to trigger patients in need of intensive case management based on patient factors, VHA case managers report using traditional approaches to prioritize interventions. These approaches include comprehensive assessments of all new admissions, reliance on MD/RN consults, or informal identification of priority patients during interdisciplinary rounds, among others **(Figure 7-10)**. Reliance on these methods may result in inefficiencies, as suggested by 33 percent of case managers who indicated during interviews that there are better ways, in their view, to trigger patients for case management interventions.[318]

7.3 Recommendations

VHA LOS management and care transition practices have multiple stakeholders: Congress and the executive branch, VACO, VHACO, VISN leadership, and VAMC management and staff. Encouraging innovation and addressing critical challenges in effective LOS management and care transitions will require collaboration among all of these groups, and a commitment to making difficult, long-term change. Different recommendations should be owned by different groups (e.g., recommendation requiring changes to VACO policy versus local policy) -- however, support for change from all stakeholders is critical to effective implementation.

Our recommendations, building on existing strengths and addressing existing challenges in effective LOS management and care transitions, can be categorized into two main themes.

7.3.1 Mitigate discharge delays related to post-acute placement (e.g., increase availability of post-acute care options)

7.3.2 Build on existing best practices, both internal and external to VHA, to increase local adoption of evidence-based inpatient care and discharge planning practices

---

These themes are consistent with practices suggested by the academic literature, professional associations, and high-performing hospitals within VHA and outside the system, as well as solutions proposed by front-line VHA staff – further details are included in "summary of supporting evidence" sections in each sub-recommendation (see **Appendix D.4** for additional detail on our methodology for gathering this data). To help VHA implement our recommendations, we have also suggested next steps in the "potential near-term actions" sections of the sub-recommendations. Note, because different VAMCs may have already adopted some recommended practices or experience unique barriers, these suggestions should be tailored the individual circumstances of each VAMC. Each recommendation is supported by several sub-recommendations, which map to the "organization, workflow processes, and tools" domains specified in the Choice Act. For a detailed map of how the sub-recommendations relate to these domains, see **Table D-2** in **Appendix D.3**.

Several recommendations overlap with other assessment areas. Where this occurs, we have referenced the relevant assessment area, where additional detail can be found.

7.3.1 Mitigate Discharge Delays Related to Post-acute Placement (e.g., increase availability of post-acute care options)

Improvements to VHA's care transition processes for patients requiring post-acute placement are key to addressing overall LOS challenges. Several challenges exist with respect to VHA's ability to transition Veterans from the acute inpatient setting to the next venue of care. The most pressing discharge-related challenge identified in this assessment was difficulty placing patients in post-acute care facilities. While this challenge is not unique to VHA, leading provider organizations that have aggressively addressed this discharge barrier have experienced improvements not only in efficiency, but also in important quality metrics (e.g., decreased hospital readmission rates) (Sandvik, 2013).

Priority recommendations to improve Veteran access to appropriate post-acute care are provided below:

7.3.1.1 Increase availability of post-acute care options, particularly for special needs Veteran populations

7.3.1.2 Increase resources for patient transportation and provide front-line staff with authority to approve transport when it poses a barrier to timely discharge

7.3.1.1 Increase Availability of Post-acute Care Options, Particularly for Special Needs Veteran Populations

Analysis of VHA data suggests that LOS for patients requiring placement within post-acute care facilities and social support programs is about 3.5 to 5 days longer than patients discharged to home. Although some portion of this observed increase may be due to differences in Veteran health status, frequent site visit reports of discharge barriers related to Veteran placement indicate that delays in the care transition process also contribute. Private sector hospitals facing similar challenges have improved LOS and quality outcomes by increasing access to post-acute care facilities. VHA should address discharge barriers related to Veteran post-acute placement

to improve LOS and streamline care transitions. Doing so will require additional analysis of capacity and availability of post-acute care facilities, both VHA-operated and within the community. Because a comprehensive review of these facilities was out of scope for this assessment, we recommend additional steps below to better understand and respond to post-acute care needs of Veterans.

Summary of supporting evidence:

- See Sections 7.2.2.1 and 7.2.2.2 for more detail on findings.

- Proposals from clinical staff participating in on-site workshops suggest consistent front-line recognition of Veteran post-acute placement issues, with participants recommending increased capacity within VHA-operated CLCs and other post-acute care facilities (60 percent of sites), increased ability to contract with post-acute facilities in the community (50 percent of sites), and expansion of programs and services matched to Veteran needs (50 percent of sites).[319]

- Evidence from an academic study of critical access hospitals (CAHs) suggests that acute care facilities can reduce LOS by increasing availability of post-acute care options for patients, including patients with complex clinical needs (e.g., ventilator patients) (Lindsay, 2014).

Potential near-term actions:

- *VHACO:* Conduct national review of current and projected post-acute care capacity and availability of specialized programs (e.g., substance abuse rehabilitation, medical foster homes for Veterans with limited caregiver support) in communities surrounding VAMCs, compared with current and projected Veteran needs.
  - o *VACO/VHACO:* Project Veteran need for post-acute care across geographies based on current and future trends in patients requiring facility-level care or placement in specialized programs after discharge.
  - o *VHACO:* Assess current and projected future capacity within VHA-operated post-acute care facilities (e.g., CLCs, domiciliary care); compare with projections of future inpatient acute care needs to identify potential opportunities to convert inpatient space into capacity for post-acute care.
  - o *VHACO:* Provide projections and recommendations to local VAMCs, highlighting geographies with urgent current post-acute care needs as well as those with projected needs in the near term.
- *VHACO:* Streamline nationally-outlined processes for contracting with community post-acute care facilities to enable increased formation of VAMC-community partnerships.
- *VAMC:* Address gaps in local post-acute care capacity and avoidable sources of discharge delay related to inefficient care transitions.
  - o *VAMC:* Identify community facilities with existing VHA contracts as well as potential community partners for future contracting.

---

[319] Site visit discharge planning assessment workshops (N=20)

   ○ *VAMC:* Form local partnerships with high-quality community facilities (through establishment of contracts) to address gaps in current VHA post-acute and social care coverage.

   ○ *VAMC:* Map transition process for Veterans discharged to post-acute care facilities to identify and mitigate addressable barriers to timely discharge.

7.3.1.2 Increase Resources for Patient Transportation and Provide Front-line Staff With Authority to Approve Transport When it Poses a Barrier to Timely Discharge

Our site visits indicated that timely access to transportation is often a significant barrier to discharge. Recommendations from industry associations suggest efficiency gains through improved patient transportation processes and resources. VHA should act to address discharge challenges related to transportation that cause extended stays in the acute care setting.

Summary of supporting evidence:

- See Section 7.2.2.2 for more detail on findings.

- Proposals from clinical staff participating in on-site workshops suggest front-line support for transportation-focused interventions, with 75 percent of sites proposing increased transportation options or relaxed transportation eligibility standards to improve facility LOS outcomes.[320]

- Evidence from a comparable large, public sector health system suggests timely arrangement of patient transportation is a key enabler of successful discharge practices (NHS, 2008).

- Recommendation from health care improvement organizations includes a proactive focus on arranging patient transportation as part of comprehensive efforts to facilitate timely discharge (IHI, 2014).

Potential near-term actions:

- *VACO/VHACO:* Revise national transportation policies to permit local clinical staff to arrange and cover costs of transportation for a limited number of Veteran cases in which transportation barriers inappropriately extend inpatient stays.

   ○ *VACO/VHACO:* Base eligibility determinations for exceptions to national transportation policy on NUMI continued stay case reviews flagged as not meeting criteria due to transportation concerns.

   ○ *VACO/VHACO:* Set limit on annual allowable expenses for transportation exceptions based on facility-specific factors (e.g., number of Veterans served, Veteran catchment area, federal mileage guidelines).

---

[320] Site visit discharge planning assessment workshops (N=20)

- *VAMC:* Review local capacity and utilization of existing VHA transportation resources to understand performance overall as well as during periods of reported capacity limitations (e.g., nights, weekends).
- *VISN/VAMC:* Expand alternative local transportation options (e.g., contracts with community-based transportation, programs for volunteer transportation services) to address gaps in facility-level patient transport coverage.

7.3.2 Build on Existing Best Practices, Both Internal and External to VHA, to Increase Local Adoption of Evidence-based Inpatient Care and Discharge Planning Practices

Adoption of evidence-based practices for efficient inpatient care delivery and effective discharge planning across VHA is key to LOS management efforts. Our assessment revealed inefficiencies in the approach that many VAMCs employ to providing efficient clinical care and managing discharges, including lack of performance management focused on LOS metrics, limited implementation of care pathways to align patterns of care with best clinical evidence, and variable discharge planning processes across the organization. As evidenced in the academic literature, acting to fill these gaps may have positive effects on patient LOS (Shepperd, 2004), avoidable readmissions (Naylor, 1999), and patient satisfaction (Hager, 2010).

As outlined in Section 7.2.1, VHA has launched several collaboratives with the potential to address these issues. However, system-wide impact from these collaboratives has been limited due to variable participation related both to limited ability of VHA to support VAMCs nationwide and to unequal facility-level desire to participate in collaboratives. As a result, care practices in place across facilities are in varying stages of maturity, particularly with respect to discharge planning (facilities that have been frequent participants in collaboratives and have spurred local performance improvement have more robust discharge planning processes than other VAMCs). In consideration of these facility-level differences, it is critical that VHA's strategy to improve LOS management is one of local empowerment and best practice promotion to enable facilities to adopt those practices that will move them from their current state to the next appropriate step in promoting effective and efficient care practices. Improvements in VHA's approach to data transparency and performance management are critical to enabling these improvement efforts by creating a shared understanding of current and targeted future performance on LOS management metrics.

Priority recommendations to enhance VHA's inpatient care practices are provided below:

7.3.2.1 Track key performance measures related to LOS management processes to increase transparency, accountability, and performance improvement

7.3.2.2 Develop evidence-based care pathways for common inpatient clinical processes, and incorporate into EHR tools and clinical workflows

7.3.2.3 Promote sharing and implementation of discharge planning best practices across VAMCs

---

7.3.2.4 Increase off-hours coverage of clinical services including specialist consults, allied health evaluations, and imaging/diagnostics

As indicated above, we have included enhanced performance management as the first sub-recommendation, as implementation of performance management structures related to LOS are foundational to supporting the other sub-recommendations.

7.3.2.1 Track Key Performance Measures Related to LOS Management Processes to Increase Transparency, Accountability, and Performance Improvement

Our assessment revealed gaps in VHA's approach to consistently communicating LOS performance to facility leadership and clinical staff. Evidence from the academic literature indicates that data transparency and performance management can be powerful tools to drive operational improvements in health care. VHA should undertake efforts to increase facility and individual-level transparency into UM and LOS performance and promote accountability for improvements to alter perceptions of local stakeholders and support other performance improvement efforts.

Summary of supporting evidence:

- See Section 7.2.1.1 for more detail on findings.
- Research in the health services literature suggests that hospital management approach is an important contributor to LOS performance (Jong, 2006).
- Experience of leading hospitals demonstrates that operational improvements can be driven through increased data transparency (e.g., performance tracking dashboards) (McLaughlin, 2014).
- Recommendation from the Society of Hospital Medicine includes using LOS as one of 10 performance metrics for evaluating hospital physicians (SHM, 2006).
- Evidence from the medical literature suggests that even simple interventions such as profiling physician performance on LOS relative to peers can be effective in reducing LOS (Zemencuk, 2006).
- Experience of the Bay Pines VAMC illustrates that integration of NUMI performance metrics into the physician bonus structure yielded local operational improvements, including improved NUMI performance on continued stay reviews, improvements in patient flow, and elimination of the VAMC's need to divert patients to outside facilities (see case study in Section 7.2.1.1).

Potential near-term actions:

- *VHACO/VAMC:* Incorporate an optimal set of LOS metrics into national SAIL report and promote facility-level performance improvements through annual aspirational target setting.
  - o *VHACO:* Designate a limited set of outcomes-oriented metrics to assess facility-level improvements to LOS practices (e.g., percent of discharges by noon, percent of discharge orders entered by 9:00am, and percent of patients with pre-discharge order entered).

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

- o *VHACO:* Balance current SAIL LOS metric (adjusted LOS) with the limited set of outcome-oriented metrics to create an optimized set for drawing LOS performance comparisons across facilities on key outcomes and processes.
- o *VHACO/VAMC:* Set national targets and annual aspirational facility-level goals to promote consistent performance improvement.

- *VAMC:* Profile unit-level performance on LOS management metrics (e.g., OMELOS, continued stay appropriateness from NUMI reviews, percent of discharges before noon) at the local level and regularly recognize high-performing units to accelerate adoption of best practices facility-wide.

- *VAMC:* Incorporate physician performance on LOS metrics into annual physician performance plans developed at the local level, with a portion (amount to be determined by the facility) of physician performance pay tied to achievement of LOS performance goals.

7.3.2.2 Develop Evidence-based Care Pathways for Common Inpatient Clinical Processes, and Incorporate into EHR Tools and Clinical Workflows

Our observations of clinical units and discussions with front-line staff suggest opportunity to improve VHA's approach to care delivery for common Veteran inpatient conditions through consistent adoption of evidence-based practices. This approach would more closely mirror high-performing organizations that have adopted standard processes to promote patient care that is effective, efficient, and evidence-based. To achieve this goal, we recommend that VHA collaborate with local physicians both to strengthen local adoption of standard clinical protocols across the organization and to develop evidence-based care pathways and promote their local implementation as part of a sustained VHA transformation effort.

Summary of supporting evidence:

- See Section 7.2.3.2 for more detail on findings.

- Proposals from clinical staff participating in on-site workshops suggest front-line support for increased use of standard processes to deliver inpatient care, with 35 percent of sites recommending development and implementation of protocols or care pathways as an intervention to improve LOS management practices.[321]

- Research from the academic literature supports the use of clinical protocols to improve inpatient LOS for select processes (e.g., early mobility protocols for rehabilitation) (Drolet, 2013).

- Evidence from the academic research supports the use of inpatient care pathways outlining admission-to-discharge processes to streamline inpatient stays related to several conditions and procedures, including knee replacement and colon surgery (Peterson, 2008; Bradshaw, 1998).

---

[321] Site visit discharge planning assessment workshops (N=20)

- Experience of an illustrative high-performing provider organization demonstrates LOS and quality benefits through implementation of care pathways, including reductions in mortality through implementation of a sepsis pathway and sizable LOS reductions through implementation of a perioperative colon surgery pathway (see case study in Section 7.2.3.2).

Potential near-term actions:

- *VHACO:* Increase availability of data at the front line (e.g., percent of Veterans with sepsis receiving standard sepsis bundle, percent of Veterans receiving timely physical therapy as part of early mobilization protocol) to drive transparency into current patterns of care delivery organization-wide.

- *VHACO/VAMC:* Promote consistent national use of standard evidence-based protocols for common, high-impact interventions (e.g., ventilator weaning, sepsis bundles) through performance management.
  - *VHACO/VAMC:* Develop national resource that aggregates evidence-based protocols for key inpatient interventions (e.g., ventilator weaning, sepsis bundles), leveraging protocols currently in place across the organization.
  - *VHACO/VAMC:* Ensure that evidence-based protocols are embedded within clinical decision support tools (e.g., computerized physician order entry, electronic health record templates) to facilitate adoption of evidence-based practices.
  - *VHACO:* Align data collection and reporting capabilities to track the use of priority protocols and performance on related quality metrics across the organization.

- *VHACO/VAMC:* Organize a national VHA center of excellence to begin the development and implementation of clinical pathways, evidence-based processes addressing the admission-to-discharge needs for inpatient treatment of common Veteran diagnoses.
  - *VHACO:* Designate a full-time champion to lead the center of excellence as part of VHA's broader transformation efforts, selecting an individual with clinical experience and extensive knowledge of quality and performance improvement techniques.
  - *VHACO/VAMC:* Engage with clinical leaders from across VHA of various roles and specialties throughout the pathway development and refinement process.
  - *VHACO/VAMC:* Assess current state of care pathway implementation across the organization (call for existing care paths from VAMCs promoted by national recognition for facilities with existing best practices).
  - *VHACO:* Select three to five national clinical priorities for initial care pathway development work, optimizing for processes with considerable variability in practice patterns and ample evidence from the academic literature to support positive impact from inpatient pathway development.
  - *VHACO:* Collaborate with VA/DoD Evidence-Based Practice Guideline Work Group to ensure alignment and a prevent duplication of efforts.

---

o *VHACO:* Develop data collection and reporting capabilities to monitor implementation of pathways and associated quality outcome improvements at the facility-level.

7.3.2.3 Promote Sharing and Implementation of Discharge Planning Best Practices Across VAMCs

Our assessment revealed that while select VAMCs have implemented best practices in discharge planning, these practices have not been consistently adopted across VHA. Key areas of significant national variability are the deployment of case managers to oversee the discharge planning process and the adoption of standardized discharge processes. Evidence from the medical literature demonstrates significant opportunity for LOS improvement through improved discharge planning. VHA should undertake a national effort to promote discharge planning best practice adoption, building upon existing pockets of strength to broaden implementation of practices that have demonstrated impact in improving LOS outcomes at select VAMCs.

Summary of supporting evidence:

- See Sections 7.2.4.1, 7.2.4.2, and 7.2.4.3 for more detail on findings.

- Proposals from clinical staff participating in on-site workshops suggest front-line support for improved discharge planning, including the following interventions:
  o Prioritization of early morning rounding/consults/diagnostics for patients awaiting discharge (70 percent of sites)
  o Deployment of dedicated inpatient case managers (50 percent of sites overall, and 91 percent of sites without dedicated case managers at present)
  o Initiation of discharge planning process earlier during admission (45 percent of sites)
  o Improvement to processes for securing needed materials (e.g., medications, durable medical equipment) prior to discharge (45 percent of sites)
  o Standardization of the overall discharge process (35 percent of sites)[322]

- Evidence from the academic literature supports improved outcomes (e.g., patient readmission rate) through implementation of hospital-based case management (Kim, 2005).

- Research in the medical literature demonstrates improvements in LOS and readmission rates through development of tailored discharge plans (Shepperd, 2004).

- Experience of the Cleveland VAMC suggests improvements in UM metrics through deployment of inpatient "collaborative care case managers" to both manage discharge planning process and perform UM reviews (see case study in Section 7.4.2.1).

- Experience of West Roxbury VAMC illustrates LOS improvements (about a 20-hour improvement in OMELOS over a 6-year period) through implementation of "collaborative

---

[322] Site visit discharge planning assessment workshops (N=20)

care nurses" and adoption of targeted, daily interdisciplinary meetings (see Section 7.2.4.2).

Potential near-term actions:

- *VHACO:* Provide national technical support (e.g., informational materials based on effective facility-level strategies to inpatient case management) to assist VAMCs in crafting facility-level approach to inpatient case manager deployment.

- *VAMC:* Deploy inpatient case managers with assigned responsibility for managing the overall discharge process at VAMCs lacking personnel dedicated to this role.

- *VHACO/VAMC:* Develop national resources and guidance to assist facilities in creating a standard discharge process suited to local needs that addresses a comprehensive set of discharge planning components, including:

  - *VAMC:* Standards for timing of initial patient discharge needs assessment (e.g., 90 percent of patient assessments conducted within 48 hours of admission).

  - *VAMC:* Expectations regarding frequency, duration, facilitation, and expected participants for regularly-programmed interdisciplinary discharge meetings.

  - *VAMC:* Standard operating procedures granting priority scheduling of rounds / labs / diagnostics for patients awaiting discharge.

  - *VAMC:* Goals for timing of key discharge tasks (e.g., entry of pre-discharge order, performance of medication reconciliation, provision of patient education, entry of discharge order).

  - *VAMC:* Checklist to promote timely execution of a comprehensive set of pre-discharge tasks (see Figure D-3 in Appendix D.5 for a sample discharge checklist, adapted from the checklist in use at Salt Lake City VAMC).

- *VACO/VHACO/VAMC:* Increase national and local efforts to engage Veterans and their families in optimal use of their VA health care benefits.

  - *VACO/VHACO:* Launch national campaign to educate Veterans and their families on the optimal setting to receive care for different complaints and clinical conditions.

  - *VAMC:* Provide Veteran education regarding risks and benefits of acute inpatient hospitalization as part of regular discharge planning processes at the local level.

  - *VAMC:* Incorporate early communication with Veteran families regarding appropriate use of inpatient care into locally-developed discharge planning processes.

7.3.2.4 Increase Off-hours Coverage of Clinical Services Including Specialist Consults, Allied Health Evaluations, and Imaging/diagnostics

Our findings on-site indicate significant challenges with VHA's operating model related to the ability to provide needed care outside of normal business hours. The medical literature supports LOS improvements through optimized coverage of consultative and other key clinical services, particularly during weekends. VHA should undertake improvements in this domain to match the practices of high-performing hospital organizations, reducing unnecessary delays in care and ensuring optimal use of inpatient bed capacity and resources.

Summary of supporting evidence:

- See Section 7.2.3.1 for more detail on findings.

- Proposals from clinical staff participating in on-site workshops suggest front-line recognition of LOS challenges during off-hours, with 95 percent of facilities recommending increased access to consultative services during off-hours to reduce avoidable discharge delays.[323]

- Evidence from the academic literature supports LOS improvements through increased access to weekend services, including physical therapy (Kolber, 2013; Rapoport, 1989).

- Experience of high-performing hospitals demonstrates improved LOS outcomes resulting from 7-day-per-week coverage of consultative services (Engel, 2013).

Potential near-term actions:

- *VAMC:* Match consultative, diagnostic, and clinical support services to patient needs, particularly during weekends when limited services contribute to extended LOS; refer to Section 5.3.3.1 of this report for additional detail on this action.

7.3.3 Potential Opportunity

Improvements to LOS management and care transition practices have the potential to generate impact across a number of important dimensions. By increasing efficiency of inpatient processes, VHA has the opportunity to shorten LOS, which could reduce potential issues with access to inpatient care for VAMCs with capacity concerns.[324] Other positive, though less quantifiable, outcomes would be expected based on the reported experience of other hospitals and previously cited evidence from the academic literature. These outcomes include increased patient satisfaction, improved quality of care, reduced readmission rates, improved patient adherence to post-discharge care plans, and enhanced quality of life for Veterans (Winther, 2015; Lagoe, 2011; Kleinpell, 2008; Siggeirsdottir, 2005). These benefits, though difficult to quantify, provide sufficient justification for VHA to undertake the reforms necessary to improve LOS in order to deliver on the organization's stated mission of "honoring America's Veterans by providing exceptional health care."

Regarding the quantifiable benefits of improved LOS management, reduction in VHA national LOS could free significant capacity within the inpatient setting. As previously noted, VHA LOS exceeds DRG-adjusted Medicare average for patients treated in the private sector by 2.1 days (55 percent) (see Section 7.1.2). Despite Veteran-specific factors that likely account for some of the observed LOS difference, discrepancies in facility-level outcomes across VHA (about a 4-day range in OMELOS, see Section 7.1.2) and our observations regarding the variability of best practice adoption across the organization (see Sections 7.2.1-7.2.4) suggest that LOS outcomes could be improved by improving VHA's current capabilities and practices. Even small

---

[323] Site visit discharge planning assessment workshops (N=20)

[324] As noted in Section 6, our assessment indicated a lack of robust data at the national level regarding inpatient capacity and utilization metrics, preventing a comprehensive analysis of where LOS improvements might ease access concerns across the organization.

improvements in overall LOS represent a significant opportunity across VHA's current approximately 600,000 annual admissions: for every 1 percent reduction in average LOS, VHA would free roughly 35,000 bed-days, which represents the potential to accommodate approximately ~6,000 additional admissions annually within VHA's system (about 1 percent of current overall admissions).[325]

---

[325] Note that in order to realize these potential capacity gains, VHA would likely need to alter current staffing to effectively care for an increased volume of new admissions. This is based on the finding from the academic literature that patients require more time-intensive care during the early phases of admission compared to the pre-discharge period.

8 Patient Experience

Part F ("Assessment F"), Section 201 of the Veterans Access, Choice, and Accountability Act of 2014 ("the Choice Act") mandates an assessment of the organization, processes, and tools used to support positive patient experience. It is important to note that in recent years, the understanding of what patient experience means has evolved to go beyond the basic provision of high-quality medical care (Wolf, 2014). The core elements of patient experience encompass interactions with health care staff and processes across the continuum of care, involving the individualization of care and communication, and the engagement with patients as members of the care team in order to meet and exceed their expectations (Staniszewska, 2014, The Beryle Institute, 2010; Wolf, 2014). VHA has adopted a similar definition with their patient-centered care (PCC) program, which is designed for VHA to "…partner with our Veterans to be mission-ready for their lives, optimizing their health in service of what matters to them."[326]

In light of industry focus and the potential for new access choices for Veterans through the Choice Card, promoting a positive patient experience will be increasingly important for patient acquisition and retention, continuity of care, and quality (Manary, 2013).[327,328] While patient experience is shaped throughout the continuum of care including the outpatient setting and touch points outside of formal clinical encounters, in keeping with the legislation, this section will focus exclusively on patient experience in the inpatient setting.

8.1 Summary

8.1.1 Assessment Approach

As described in the methodology of this report (Section 2), we collected information in several ways, using a common approach across sub-assessment areas within Assessment F:

- Visits to 21 VAMCs (complexity level 1a, 1b, 1c, and 2)[329], to conduct over 300 interviews with leadership (e.g., VAMC Director, Assistant Director for Patient Care Services, Quality Manager) and front-line personnel (e.g., patient advocates, nurses, physicians, and allied health professionals) on Veteran-centered care and patient satisfaction.

- Data call sent to a clinical, quality, and patient advocacy staff across all VAMCs to gather objective data that is not consistently maintained at the national level (e.g., patient

---

[326] VHA's definition of patient-centered care

[327] Increased patient acquisition and retention: Satisfied patients are over three times more likely to return to a provider they have been to before.

[328] Improved Patient Access and Health: Positive correlation exists nationally between CMS quality scores and HCAHPS (Hospital Consumer Assessment of Healthcare Providers and Systems) scores.

[329] Given the focus of Assessment F on inpatient medical facilities, we chose to only visit and include data call and survey results from VAMCs providing substantial inpatient medical care (complexity levels 1a, 1b, 1c, and 2), and did not include other types of facilities (e.g., community-based outpatient clinics [CBOCs], complexity level 3 facilities).

---

advocacy organizational structure, prevalence of best practices), completed by 51 respondents across 121 (42 percent) VAMCs (complexity level 1a, 1b, 1c, and 2).[330]

- Data collection from the national Survey of Healthcare Experiences of Patients (SHEP) which is sent to all patients following discharge from a VAMC; data is aggregated at the VAMC, VISN, and system-level.

- Interviews with leadership from multiple VACO and VHACO offices, including the Office of Patient Centered Care and Cultural Transformation (OPCC&CT) and MyVA, focused on patient experience and Veteran-centered care.

Having collected information to understand VHA's practices and performance with respect to positive patient experience, we then assessed how these practices compared to best practices and industry benchmarks. Best practices and benchmarks were identified through several sources, including:

- Interviews with leadership from high performing hospitals (internal and external to VHA), selected from among organizations that scored in the 95th percentile in the Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS),[331] a nationalized survey tool to collect data on patient experiences and perspectives.

- Academic literature (e.g., research supporting a link between employee training, leadership support, and Veteran engagement in promoting a positive patient experience).

VHA's instrument to measure inpatient satisfaction, the SHEP survey, was designed to "systematically obtain information from patients that can be used to identify problems or complaints that need attention and to improve the quality of health care services delivered to Veterans" (VA Form 10-1465-1, 2007). The survey is mailed to all patients discharged from a VAMC and includes a series of questions, as outlined in Appendix E-1, that prompt the patient to evaluate his or her experiences related to: hospital cleanliness and quietness, communication with doctors and nurses, overall responsiveness, communication about medications, discharge information, and care transitions.[332] Discharged patients are also prompted to rate their overall hospital experience and their willingness to recommend the hospital. Results are aggregated at VAMC level and used to evaluate individual facility performance, as well as system-wide and regional comparisons (VA Form 10-1465-1, 2007).

---

[330] Total VAMC count depends on whether campuses of the same parent station are counted as separate VAMCs or one entity. We have based the count used in our site selection (122) on data drawn from VSSC, 2014 and SAIL, 2014 (see Appendix). In some instances, we use 121 as the denominator, based on data available in the data sets most commonly used for that section.

[331] CMS HCAHPS refers to the Center for Medicare and Medicaid's Hospital Consumer Assessment of Healthcare Providers and Systems, a survey tool that compares the "top box" or most positive responses to HCAHPS survey questions. The "top-box" response is "Always" for five HCAHPS composites (Communication with Nurses; Communication with Doctors; Responsiveness of Hospital Staff; Pain Management; and Communication about Medicines) and two individual items (Cleanliness of Hospital Environment; Quietness of Hospital Environment), "Yes" for the sixth composite, Discharge Information; "9" or "10" (High) for the Overall Hospital Rating item, and "Would definitely recommend" for the Recommend the Hospital item (VHA Facility Safety Report, 2012)

[332] VHA SHEP Scores (FY14)

SHEP closely follows the guidelines described by the Centers for Medicare and Medicaid Services' (CMS) Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS) tool to assess private facilities (for example, the questions and scoring in both surveys are verbatim, as outlined in Appendix E-1).[333] We have benchmarked VAMC SHEP scores with HCAHPS scores as HCAHPS is the industry standard for measuring patient experience, however we recognize there may be other aspects of experience that HCAHPS does not measure (e.g., financial and clinical outcomes).

To enable an analogous comparison of VHA SHEP scores to private HCAHPS scores, we used VHA's methodology for calculating composite scores across the common inpatient dimensions of care[334] (detailed methodology outlined in Appendix E-1). It is relevant to note, however, that there may be some variability in SHEP and HCAHPS scores as a result of the techniques used to administer the survey. HCAHPS requires that all patients be surveyed between 48 hours and 6 weeks of discharge through one of four survey modes: mail, telephone, mail with telephone follow-up, or active interactive voice recognition (HCAHPS Fact Sheet, 2015). While VHA meets these guidelines, it administers all surveys through the mail, 2 weeks post discharge (VA701-13-R-0313-002, 2013).

Despite comparability of collection tools, there are additional factors to consider when comparing patient satisfaction at VHA with that of private facilities, including impact of both discrete patient populations and facility characteristics on satisfaction scores. For example, Veterans strong affiliation with the mission of VA and sense of connection with fellow Veterans may result in higher patient satisfaction scores as compared to a community health system. Conversely, literature shows that patient populations with high rates of mental health and socio-demographic challenges (e.g., low income and homelessness) have been shown to negatively skew patient experience scores (Westaway, 2003), while obstetric (OB) patients have been shown to report disproportionately positive experiences (Patel, 2011). As a result, there are several reasons why VHA's scores could be anticipated to be lower than the market average:

- Higher prevalence of mental illness. On average 20 to 40 percent of recently returned service members and Veterans are found to have a mental disorder, compared with only 4.2 percent of the general population (Behavioral Health Barometer, 2014; Report of the Department of Defense on Mental Health, 2007).[335]
- Higher prevalence of low-income patients. Twenty-three percent of Veterans have a household income under $30,000, while only 17 percent of private households are below $30,000. The Federal Poverty Line for a family of four is $24,250 (Office of the Assistant Secretary for Planning and Evaluation, 2015). According to VA's National Center for

[334] Cleanliness of the hospital environment, communication about medicine, communication with doctors, communication with nurses, discharge information, quietness of the hospital environment, overall rating of the hospital, willingness to recommend hospital, care transitions, pain management, and responsiveness of hospital staff

[335] Refer to Assessments A and B for additional information on Veteran demographics.

Veteran Analysis and Statistics, as disabled Veterans' household income increases the likelihood that they use VA health care decreases (Unique Veteran Users Report FY12, 2014).

- Higher incidence of homelessness. In 2015 the rate of homelessness amongst the general population was 18.3 homeless people per 10,000 people compared with 25.5 homeless Veterans per 10,000 Veterans (National Alliance to End Homelessness, 2015)

- No OB services. Women account for only eight percent of VA users (Unique Veteran Users Report FY12, 2014), though the number of women Veterans who use VA benefits is increasing (up 27.5 percent since 2005). While private facilities' HCAHPS scores are elevated by the inclusion of OB services, these do not exist in VHA facilities (Patel, 2011).

While it is difficult to quantify the impact, positive or negative of these factors, VHA's patient satisfaction scores are slightly lower than private facilities, as outlined in **Figure 8-1** and **8-2**. VHA's average score across the 11 dimensions, calculated using the methodology described above, is within six points of the market average, and VHA exceeds the market average in care transition by 20 percentage points.[336] While VHA does have top performing facilities in line with high performing private facilities (e.g., Cleveland Clinic's average score across all HCAHPS measures is 86.1 and Palo Alto VAMC's average is 86.2), the average VAMC score of 82.4 percent is below the Cleveland Clinic's aggregate score of 86 percent.[337] Additionally, variability does exist across the system, as detailed in **Figure 8-2**, (e.g., standard deviation of SHEP scores is 3.6 compared with market standard deviation of 4.3)[338] indicating an opportunity to leverage the best practices of high-performing facilities (both internal and external to VHA) to support the improvement of lower-performing facilities. Historically VHA patient satisfaction scores on care transitions have exceeded national averages, this is surprising given the findings in Section 7; unfortunately, the scope and approach for our assessment did not allow us to delve into the root cause behind this discrepancy. Appendix E-2 outlines patient experience best practices as related to health systems' organizational structure, workflow processes, and tools.

8.1.2 Summary of Findings

We observed several key areas of strength and challenges related to patient experience at VHA. These findings apply to VHA organization, processes, and tools as specified in the legislation; a detailed mapping is available in Appendix E-3.

8.2.1 National and facility-level focus on the prioritization and provision of Veteran-centered care has driven pockets of best practice innovation. More than 90 percent of VAMCs visited cited Veteran-focused staff as a key strength of their facility.[341] Many individuals cited Veterans as the chief reason they decided to work for VHA, even when faced with more lucrative offers.[342] This focus on the Veteran is evident across organizational levels. One example is Palo Alto's Veteran and Family Advisory Committee that was founded to engage Veterans and their families as active participants in patient care and hospital operations. To achieve this level of engagement, the VAMC includes patient advisory members on all hospital committees to ensure the Veteran voice is heard. Palo Alto has assisted several other hospitals, including the Mayo Clinic, to implement similar models.[343]

8.2.2 Adoption of best practices and engagement of Program Office support services are varied across VAMCs. While initiatives at both the Central Office and selected facilities exemplify Veteran-centered care and industry-accepted best practices, system-wide adoption is limited due to inconsistency in facility leadership, which drives a lack of prioritization on patient experience best practice implementation, and insufficient VHACO infrastructure to codify and share facility-driven initiatives across the system.

8.2.3 Challenges with respect to timeliness and specificity in the SHEP survey results limit VAMCs' ability to drive performance improvement. Lack of timeliness (e.g., reports are delayed 3 to 6 months[344]) and specificity (e.g., data is not segmented by individual department, or unit) of SHEP survey results limits the perceived effectiveness, accuracy, and actionability of patient satisfaction results.

8.1.3 Summary of Recommendations

Our assessment revealed several areas where VHA can build on current strengths or address existing challenges to improve patient experience. We recommend that VHA consider two strategic themes, as detailed below. As with the findings, these themes apply to VHA organization, processes, and tools.

8.3.1 Collect More Timely and Relevant Patient Experience Data to Drive Performance Improvement at the Facility, Department, and Individual Level. VHA should ensure

[344] Site visit patient advocate interviews (N=21 sites)

its patient satisfaction tool(s) delivers granular survey results (for example, at the individual department or unit level) in a timely (e.g., real-time or near real-time) and actionable format (e.g., consistent across the system).

8.3.2 **Strengthen national and facility level support for patient-centered care programs to increase adoption.** VHA should strengthen adoption of best practices by providing the infrastructure to support the evaluation, codification, and implementation of facility-driven initiatives. This level of system-wide adoption can only be achieved through improved coordination, consistency, and support from leadership at the VACO, VHACO, VISN and VAMC levels.

8.1.4 Past Findings and Recommendations

In 1995, VHA launched a "major reengineering of its health care system with aims that included better use of information technology, measurement and reporting of performance, and integration of services and realigned payment models" (Jha, 2003). While the focus of this system redesign was improved quality – and results showed dramatic improvement in quality[345] (Jha, 2003) — patient satisfaction following the redesign has been favorable. In 1999, 80 percent of users were more satisfied with their hospital experience as compared to 2 years earlier. Additionally, in 1999, VHA outscored private hospitals in overall customer satisfaction as measured by the American Customer Satisfaction Index (Edmondson, 2006). VA was recognized in 2004 for setting national benchmarks in patient satisfaction while having proportionally fewer resources, as compared to the private sector (Perlin, 2004).

While patient satisfaction at VHA is often cited as a strength, the Voice of the Veteran, the American Legion task force, and the American Customer Satisfaction Index have identified some limiting factors and recommendations for improvement, as detailed in Appendix E-4. Examples of these limitations include, but are not limited to:

1. An excessive number of quality and patient satisfaction performance measures

2. Deficiencies with patient satisfaction reporting, as evidenced by the 3- to 6-month delay in survey results

3. Challenges in staffing front-line clinical employees and patient advocates due to the lengthy hiring process.

In 2011, VHA established the Office of Patient Centered Care and Cultural Transformation (OPCC& CT) with the goal of moving VHA from a "disease-based and reactive health care system to one that concentrates on Whole Health: a personalized, proactive, and patient-

---

[345] The VHA exceeded Medicare averages between 1997 and 1999 across five inpatient clinical quality metrics related to acute myocardial infarction (AMI) and congestive heart failure (CHF). AMI measures include: aspirin within 24 hours after MI, aspirin at discharge, and beta blocker at discharge. VHA exceeds the Medicare average on these measures by 8 percent, 10 percent, and 19 percent, respectively. CHF measures include: ejection fraction measured and ACE inhibitor if injection fraction is <40 percent; VHA exceeds the Medicare average by 27 percent and 25 percent respectively (Jha, 2003).

driven" approach to health care (VHA OPCC&CT Resource Guide, 2015).[346] The OPCC&CT is dedicated to providing care that is

"...personalized: tailoring a person's health care to their individual characteristics, proactive: using strategies that strengthen the person's innate capacity for health and healing, and patient-driven: health care that is based in and driven by what really matters to the person in their life" (Krejci, 2014).

In 2013, the OPPC&CT published a report on lessons learned from implementing patient-centered care (PCC) practices at its four established centers of innovation, New Jersey VAMC, Greater Los Angeles VAMC, North Texas VAMC, and Birmingham VAMC. The report outlines seven core themes that impacted the implementation of patient-centered care and span across seven themes that are core to an effective implementation (OPCC&CT Lessons from the Field, 2013):

- Recognize the role of leadership.
- Engage Veteran patients and family members.
- Enculturate staff to adopt a patient-centered perspective.
- [Foster] innovation.
- [Recognize] staff roles and priorities.
- [Recognize] challenges of VA procedures and infrastructure.
- Implement environment of care changes.

These prior assessments have tended to focus on specific issue areas and/or individual facilities, separately developing recommendations for improvement in discrete areas. In contrast, our assessment tries to take an end-to-end view of inpatient clinical operations across five key sub-assessment areas and all high- and medium-complexity VAMCs.

8.2   Findings

Through our site visits, data analysis, interviews, and benchmarking, we identified strengths and challenges in patient experience across the VHA inpatient care setting. The sub-sections that follow (8.2.1, 8.2.2, and 8.2.3) describe these findings in detail, including information on what we believe the drivers of each finding to be.

8.2.1   National and facility level focus on the prioritization and provision of Veteran centered care has driven innovations in best practice

8.2.2   Adoption of best practices and engagement of program office support services are varied across VAMCs

8.2.3   Challenges with respect to timeliness and specificity in the SHEP survey results limit VAMCs' ability to drive performance improvement

---

[346] Additional detail on the OPCC&CT outlined in Section 8.2.1.

As noted in Section 2.2, data issues prevented us from conclusively assessing many areas of patient experience. We have used the national datasets that were available, information returned as part of the data call, and perceptions and experience reported or observed during site visits or via the staff survey. In many instances where data does not allow us to definitively comment, we have described the potential implications of the data points we do have, along with recommendations in Section 5.3 for further analysis.

8.2.1 National and Facility-level Focus on the Prioritization and Provision of Veteran-centered Care has Driven Innovations in Best Practices

More than 90 percent of VAMCs visited cited Veteran-focused staff as a key strength of their facility.[347] This prioritization of Veteran-centered care appears to cascade across organizational levels, as detailed in **Figure 8-3**. It is evident at the national level through organization-wide training programs and at the VAMC level through initiatives that connect staff and Veterans, as well as tailored programs that engage and empower Veterans in their own care.

At the national level, consistent with industry best practices that support compulsory system-wide patient-centered care training (Luxford, 2011), a Veteran-centered care training program has been consistently rolled out to all VAMC employees[348]. One example coming out of that training is what was termed by some in VHA as the "elevator culture" – as a sign of respect, employees consistently yield to Veterans getting on or off the elevator. We've observed this practice by employees at each of the sites visited.[349]

Additionally, national and facility-level initiatives focus on connecting staff with Veterans. Examples include the national "No Veteran Dies Alone" program and Maine VAMC's local community garden and Culinary Health on Wheels (CHOW) programs. No Veteran Dies Alone is a volunteer program that brings nurses and volunteers in on their days off to sit with dying patients. An ICU nurse describes this program as "a blessing to be able to give back to them, when they have given so much for us" (Knake, 2010). CHOW engages Veterans and employees alike, to grow fruits and vegetables in the VAMC's community garden; much of each gardener's crops are donated to Veterans in need. Additionally, the CHOW program provides education on how to prepare healthy, low-cost meals[350] (VA Maine Healthcare Facebook page, 2015).

Finally, interviewed patient advocates explained a growing trend in facility-level initiatives to engage patients in their own care and experience. Examples of these initiatives include Veteran tasting panels to improve food quality, Veteran and family advisory councils (detailed in Section 8.2.1.2), and Veteran volunteers.[351] This practice of creating a collaborative care environment empowers Veterans to become actively involved in the improvement of overall patient

experience and exemplifies evidence-based best practices that recommend engaging the patient as an active participant in his or her care (Wolf, 2014; Hibbard, 2013).

Figure 8-3. Veteran-Centered Care Initiatives

The prioritization of Veteran centered care appears to cascade across organizational levels

Initiatives	Example		
• National **Veteran centered care training program**	• **"Elevator culture"** in which all employees wait for the Veteran • **Employee recognition** for delivering patient centered care	"Substance abuse is the norm amongst our patients, aggression issues are common, other places don't like them, but we do. We give them something no one else will. We love them[1]"	
• National and facility level programs **focus on connecting staff with Veterans**	• **"No Veteran dies alone"** volunteer program brings nurses in on their days off to sit with dying patients	"It's a blessing to be able to sit there with them and let them know they're not forgotten[2]"	
• Facility level initiatives **involve Veterans in improving their experience**	• **"Veteran and Family advisory councils"** serve as a forum to engage Veterans in improvement efforts, clinical care delivery, and policy creation	"I wanted to focus on the little things that we can do locally to make things better when someone goes to the doctor[3]"

3 Maddox, Michael, "Veteran and Family Advisory Council Launched." W.G. (Bill) Hefner VA Medical Center – Salisbury, NC. VAMC website news, December 2014

Supporting this national and facility-level focus on the prioritization and provision of Veteran-centered are two key drivers:

8.2.1.1 Program offices (e.g., OPCC&CT, myVA, National Center for Health Promotion and Disease Prevention) at the national level, support patient-centered clinical innovation, outcomes-based research, and education and implementation support

8.2.1.1 Veteran-focused initiatives, developed locally at individual VAMCs, exemplify industry best practices at the bedside

8.2.1.1 Program Offices, at the National Level, Support Patient-centered Clinical Innovation, Outcomes-based Research, and Education and Implementation Support

At the national level, several offices and initiatives (for example, OPCC&CT, myVA, National Center for Health Promotion and Disease Prevention) appear committed to promoting Veteran-

centered care across the system. While this is most evident in the programs that support patient-centered care innovation, research, and implementation support, namely the OPCC&T, there is a risk across VACO and VHACO program offices of conflicting and/or poorly coordinated national support; reference Assessment L for additional details on Program Office coordination and consolidation.

- Office of Patient-Centered Care and Cultural Transformation (OPCC&CT)

    Aligned with its three core strategies of (a) clinical innovation; (b) research and outcomes; and (c) education, the OPCC&CT, as described in **Figure 8-4** and detailed below, has implemented several practices in line with evidence and patient experience best practices. Additionally, the OPCC&CT has differentiated itself in its change management approach. The office understands that cultural change cannot be directed, so rather than compel a single model for PCC, it showcases several proven models and allows the VAMCs to select the models and level of support that best meet their needs[352] (Dunn, 2015). To date, the office reports that over 65 percent of VAMCs[353] have requested some level of engagement from either its field implementation teams, Whole Health Training Program, and/or Communities of Practice indicating that this national program is underway but has not been implemented across the system.

    These PCC best practice models and resources are evident in all three elements of the office's strategy.

    ### (a) Clinical innovation.

    OPCC&CT has partnered with five VAMCs — New Jersey, Greater Los Angeles, North Texas, and Birmingham — to create five hubs or Centers of Innovation, from which to showcase evidence-based strategies for driving improvements in patient experience. Each of these Centers pilots new PCC approaches and programs and evaluates their impact on health outcomes (Krejci, 2014). For example, Los Angeles VAMC and New Jersey VAMC have each piloted new patient experience organizational structures. New Jersey divided its Patient Care Services' Department into a Clinical Office and an Office of Patient Experience, while LA has created a single patient care and clinical transformation office that staffs patient advocates, HR specialists (focused on employee engagement) and clinicians.[354] Both approaches align with best practices, exemplified by high-performing facilities like the Cleveland Clinic, highlighting the importance of a facility-level position(s) focused on patient experience (Beryl Institute, Cleveland Clinic, 2010), supported by an interdisciplinary team (Manary, 2014).

    ### (b) Research and outcomes.

    Evidence-based practices are a cornerstone of the OPCC&CT; its team not only supports external research on industry-accepted best practices, but it also evaluates

---

[352] Interview with Office of Patient Centered Care and Cultural Transformation

[353] Interview with Office of Patient Centered Care and Cultural Transformation

[354] Interview with Office of Patient Centered Care and Cultural Transformation

the health outcomes of pilot initiatives at each of the Centers of Innovation. OPCC&CT recently partnered with the Bravewell Collaborative to pilot the Patients Receiving Integrated Medicine Interventions Effecting Registry (PREMIER). The data registry is intended to "provide foundational new knowledge on how integrated medicine is being used in real-world settings…to ultimately inform future clinical trials as well as decision-making in clinical settings" (Krejci, 2014). OPCC&CT uses its findings from research to support evidence-based programs that deliver patient-centered care to VAMCs across the system (Capturing proactive patient centered care, 2014).

(c) Education.

As detailed above, OPCC&CT provides support and training to VAMCs that request assistance, but does not compel patient experience initiatives or new models of care. Field implementation teams (FIT) are deployed to sites that request additional support. Initially their strategy focused on inspiring facility leadership; however, the team is adapting its focus to the front-line. Lessons learned from patient-centered care highlighting the importance of leadership and front-line engagement came directly from the field implementation teams.[355]

Whole Health (WH) is a "custom-designed clinical education program" designed by the University of Wisconsin – Madison Integrative Medicine focused on "empowering self-healing" through complementary alternative medicine including "nutrition, stress management, movement, and mindful awareness" (Whole Health: Change the Conversation). Administrators and clinicians alike cite the effectiveness of this program stating, "Whole heath was life-changing for me; I really appreciate the meditation and the art of guiding others, truly listening, and getting patients to think about what health goals they have, even in my capacity as an administrative person[356]" and "I immediately was able to start using principles, and asking questions like: What is the most important thing to you. These questions make it more clear what the Veteran is thinking about and what is important."[357]

Community of practice calls and workshops are held regularly to enhance collaboration across facilities and connect VAMCs with experts. Current communities of practice include: integrated health, patient-centered care, patient advocacy, and the Veteran experience. One patient advocate attendee at a 2015 workshop commented, "It was good to sit in a room with other advocates and hear that they were dealing with the same challenges we had… It was clear that they [OPCC&CT moderators] cared about our perspective."[358] These calls and workshops

not only facilitate collaboration, but they also empower the front-line to take ownership of performance improvement (Luxford, 2011).

Figure 8-4. Program Office Focus on Patient-Centered Care

Mission of the Office of Patient Centered Care and Cultural Transformation

"Our goal is to design a system where we partner with our Veterans to be mission ready for their lives, optimizing their health in service of what matters to them.[1]"

– Tracy Gaudet, MD (Director OPCC&CT)

Approach[2,3]	Successes[2,3]
▪ **Evidence based research** on the impact of patient-centered care initiatives and **pilot programs at VAMC Centers of Innovation** ▪ Targeted leadership and front-line **implementation support through the deployment of Field Implementation Teams** ▪ **Dissemination of best practices** through communities of practice, workshops, and video	▪ FIT conducted **engagement sessions at >50% of VAMCs** ▪ **Supported and funded the establishment of patient centered care Centers of Innovation** that piloted innovative strategies and served as demonstration sites ▪ Built a series of **communication resources and tools** including a share-point and intranet with videos ▪ Initiated **research to evaluate the most effective way in which leadership, staff, and clinicians enhance the practice and experience of care,** based on evidence and Veteran perspectives ▪ **Built a series of community of practice forums** – monthly national discussions to allow practioners and clinicians to share updates and strong practices

"Cultural transformation cannot be mandated, **our approach is to let the facilities pull the information they want** … we have built trust by showing leaders the experiences provided at our Centers of Innovation … in the future we are developing videos to help communicate these new models of care[3]"

3 OPCC&CT SME interviews (N = 4)

- Program offices with patient experience functions

  In addition to the resources available through OPCC&CT, many other program offices have similar and/or complementary initiatives. While each of these offices appears focused on Veteran-centered care, there may be some overlap and duplication across offices.

  National programs include, but are not limited to:

- Office of Patient-Centered Care and Cultural Transformation (OPCC&CT). Founded in 2011, it "creates a structure to oversee [VHA's cultural transformation to patient-centered care], employing and training staff, establishing Centers of Excellence, and guide and support the transformation of every VHA Network and health care facility." (Gaudet, 2014)

- National Center for Health Promotion and Disease Prevention "provides programs, education, resources, coordination, and oversight to field staff to prevent illness and

enhance health, well-being, and quality of life for Veterans." (VA Functional Organizational Manuel, 2014)

- Specialty Care Services "ensures the best overall preventative, clinical, spiritual, religious, and nutritional care is made available to Veteran patients." (VA Functional Organizational Manuel, 2014)

- Analytics and Business Intelligence "supports the External Peer Review (EPRP) and SHEP tool including developing measures to track clinical and other outcomes based on the philosophies of evidence-based practice." (VA Functional Organizational Manuel 2014)

- National leadership council "provides the governance structure for all policies, plans, and procedures across the entire VHA, including Veteran experience." (VA Functional Organizational Manuel, 2014)

> Among program offices there may be a risk of replicating and or complicating support functions and performance measures, related to Veteran-centered care; reference Assessment L for more detail on Program Office overlap. For example, one study reported that the number of VAMC quality and patient satisfaction measures have increased from 11 to 500 since 2000 (Wong, 2012). In reviewing program offices focused on Veteran-centered initiatives, it appears that OPCC&CT's focus on Whole Health and complementary alternative medicine overlaps with the National Center for Health Promotion and Disease Prevention's focus on wellness and prevention, and the Specialty Care Services' focus on clinical, spiritual, religious, and nutritional support. Additionally, while the Senior Leadership Council provides advisory and governance structure, it is unclear what level of leadership and oversight is provided by the National Leadership Council as compared to the other VACO and VHACO program offices. Furthermore, it is unclear whether the leadership from the above-mentioned program offices sit on the National Leadership Council for Veteran experience. A senior VHA official expressed this lack of collaboration and coordination across Program Office stating:

> "Central Office should be strategic and not driven by fear [as a result of poor publicity in the news]. We often react to the point of micromanagement where everyone is trying to manage operations. Program Office coordination to get to an enterprise solution is an area that needs to improve."[359]

> The MyVA initiative was launched in September 2014 with the objective of "empowering employees to deliver excellent customer service...improving or eliminating process that impede great customer service...and by rethinking internal structures and processes to become more Veteran-centric and productive."[360] The program aims to achieve these objectives by integrating and coordinating services across VA including VHA, Veterans Benefit Administration (VBA), and National Cemetery Association (NCA).

---

[359] VHACO SME Interview (2015)

[360] VACO SME Interview (2014)

One example of such coordination, is the program's regional approach to standardizing Veteran-centered care across the system in collaboration with OPCC&CT.[361] Since this approach is still in the planning phases, it is unclear how effectively myVA will coordinate across these program offices, but myVA is working closely with OPCC&CT in an effort to improve Veteran-centered care in field by aligning on initiatives and minimizing central office redundancy.

8.2.1.2 Veteran-focused Initiatives, Developed Locally at Individual VAMCs, Exemplify Industry Best Practices at the Bedside

We have observed many examples of patient experience initiatives, across facilities, that exemplify best practices in (1) Veteran engagement; (2) communication and education; and (3) training. However, there is great variability in the types of programs implemented and their impact. Appendix E-2 outlines best practices exemplified in the literature and high-performing institutions. The following section details the prevalence of those identified best practices across VAMCs.

Veteran and family engagement (Hibbard, 2013 and Wolf, 2014).
Palo Alto VAMC implemented a Veteran and Family Advisory Committee in 2010 to ensure that Veteran and family viewpoints are heard by the Medical Center.[362] Since its founding, the committee has met with over 110 staff and discussed nearly 100 projects and initiatives.[363] With the council's feedback, the VAMC has enhanced patient education materials and implemented sources for real-time patient feedback; it is currently developing a patient safety campaign and two family lounges. In describing the council, Veteran and family members who have applied and been selected to serve on the committee have said, "I am grateful to be part of the solution that affects our loved ones" and "It feels good to make improvements for the health care of Veterans" (VFAC brochure, 2013).

In light of its success, Palo Alto VAMC has developed a workshop to assist other VAMCs in implementing similar Veteran and family engagement models. Additionally, Palo Alto VAMC has assisted the Mayo Clinic in refining its approach to patient and family activation in care.[364] Palo Alto's VAMC follows four core principles, adapted from OPCC&CT:

"Listen to and honor Veteran and family choices; share complete and unbiased information; encourage Veterans and families to participate in care and decision-making at the level they choose; and [promote collaboration such that] Veterans, families, and staff work together to improve clinical care, patient experience,

[364] Palo Alto VAMC follow-up discussion: Office of Patient Experience

policies, programs, and facility design."[365]

Immediate service recovery through timely communication and patient education (Hibbard, 2013; Beryl, 2010). More than 84 percent of facilities[366] self-report engaging volunteers and front-line staff to round on patients daily to identify and resolve any complaints at the point of care. Of the facilities visited, 75 percent communicate with patients and family through updated whiteboards that indicate their provider team, plan, or discharge, approach to pain management, and other relevant information. [367]

More than 80 percent of facilities front-line staff visited cited patient education as a strength. [368] Albuquerque VAMC has developed and implemented "CHF project red," a video that provides nursing, pharmacy, and nutrition counseling for admitted patients with CHF. The video is played for the patient several times throughout his or her stay and nurses provide individual education at the bedside to reinforce the material.[369]

Empowered front-line to develop and own performance improvement (Luxford, 2011). Most facilities (more than 95 percent)[370] have implemented initiatives targeted at improving patient satisfaction, including but not limited to those detailed above. Gainesville VAMC successfully piloted its resource-neutral "Mobility Tech program" that trained nursing techs to help get patients out of bed earlier and assist them with physical therapy exercises. Results have shown a 48 percent reduction in falls on one floor and a 9.7 percent reduction in readmissions. Gainesville anticipates that the impact of this program, when appropriately scaled, will include improved patient satisfaction and pain management, and reduced lengths of stay.[371]

8.2.2 Adoption of Facility-level Best Practices and Engagement of Program Office Support Services are Varied Across VAMCs

While initiatives at both the central and facility levels exemplify Veteran-centered care and industry accepted best practices, consistent adoption across the system is limited. As detailed above, most facilities have implemented some initiatives focused on patient satisfaction, but there is little consistency in the types of initiatives and their impact. For example, in the Gainesville mobility example, the program has shown promising results, but it has only been implemented on one floor in one VAMC. Additionally, though most VAMCs cite patient training

---

as a strength, patient education programs like project red have been implemented sporadically across the system; we observed this program in less than 15 percent of sites visited.[372] Limited adoption and standardization may be attributed to three key drivers:

8.2.2.1 Central Office reach is limited by the level of facility leadership engagement

8.2.2.2 Structure to codify and share facility-driven initiatives across the system is limited

8.2.2.3 Implementation of point-of-care feedback tools (e.g., GetWell Network, Truth Point) is varied across the system

8.2.2.1 Central Office Reach is Limited by the Level of Facility Leadership Engagement

OPCC&CT followed a logical implementation approach when initially rolling out its PCC programs at individual VAMCs. It first publicized its FIT programs at the VACO, VHACO, VISN, and VAMC levels, offering its support service to all interested VAMC directors.[373] When engaged by a VAMC Director, OPCC&CT deployed a team to visit the VAMC and conduct an initial diagnostic, including informal interviews and discussion with senior leadership and listening sessions with front-line staff.[374] Following these site visits, the FIT team prepared an individualized report for the VAMC director with a basic roadmap that outlined next steps for implementing new PCC models.[375] The problem with this model was the high degree of facility leadership turnover. As one OPCC&CT leader stated, "One of the hardest things is when we start working with a facility and the leadership leaves and no one is left to continue to the program; we have left many promising facilities right in the middle of an implementation.[376]"

In light of leadership turnover, OPCC&CT has since moved to a staff engagement model, deploying specialty teams focused on topics such as nursing or patient advocacy.[377] While this approach is effective in driving some front-line change, without strong leadership its large-scale potential is limited, as supported in academic literature (Singer, 2013). Ad hoc projects with front-line staff likely lack coordination with the facility's overall strategy. Moreover, 38 percent of site visit interviewees stated that they were overwhelmed by the number of compulsory programs and initiatives.[378] Without clear leadership support to help prioritize initiatives, it is unlikely that staff will have the capacity to both meet mandated and directive obligations and engage the FIT program. Finally, staff engagement is a critical component of PCC and patient experience (Luxford, 2011). One program leader expressed concern regarding staff engagement saying, "If we don't treat our facility leaders a little differently, how are they going to empower

their staff?"[379] Refer to Assessment L for additional detail on leadership engagement and turnover.

In April of 2014, following broad system implementation challenges, the OPCC&CT was asked to create the Integrating Health Coordinating Center (IHC) to "identify and remove barriers to providing IH across the system; and be a resource for clinical practices and education for both Veterans and clinicians (Krejci, 2014)." While the goal of this center is improved coordination, results are still preliminary.

8.2.2.2 Structure to Codify and Share Facility-driven Initiatives Across the System is Limited

Despite of the number of VAMC PCC initiatives, there is little support at the VISN and national levels to implement facility-driven best practices across the system.[380] While OPCC&CT promotes industry best practices through its research arm and pilot programs, it struggles with sharing facility-driven best practices across the system. The office is starting to promote collaboration through its workshops and communities of practices, but recognizes that there is a gap in identifying practices in the field, evaluating those practices, codifying them, and pushing them back out to the field at the appropriate time.[381]

It is clear by the prevalence of facility-driven best practices that there is an opportunity to better leverage innovation in the field to impact patient experience. For example, Gainesville VAMC's Mobility Tech program[382] was recognized at a national innovation summit. However, despite proven results and savings from length-of-stay reductions, it did not receive the necessary support to implement the program across the VAMC, let alone the VISN or system. The perceived issue is the Centers of Innovation focus primarily on the initial innovation, but with little tactical support in operationalizing facility-driven best practices and implementing them system-wide.[383]

Palo Alto's Veteran and Family Advisory Council, detailed in Section 8.2.1.2, has overcome this challenge. While the council was developed in-house, Palo Alto's Office of Patient Experience has worked with OPCC&CT to facilitate workshops and trainings at other facilities.[384] The success of this implementation compared with others is likely due to several factors:

- Demonstrated sustained success at the facility level[385] – the council was initially stood up in 2010.[386]

---

[379] Interview with Office of Patient Centered Care and Cultural Transformation

[380] Interview with Office of Patient Centered Care and Cultural Transformation

[381] Interview with Office of Patient Centered Care and Cultural Transformation

[382] Mobility Tech program is a resource-neutral initiative that engages techs, trained by physical therapists, to ambulate Med/Surg patients; results show the patients are ambulated earlier and with more regularity than previously demonstrated contributing to higher patient satisfaction and earlier discharges (Gainesville, VAMC)

[383] VAMC site visit interviews (n=21 facilities)

---

- Considerable interest from the field, as well as external organizations like the Mayo Clinic.[387]
- Dedicated facility leadership willing to manage training workshops in partnership with OPCC&CT, in addition to their daily jobs.

It is important to note; however, that Palo Alto is a large urban VAMC. This approach of dedicating VAMC resources to train other facilities is unlikely to be scalable without VHACO support, especially in smaller more resource-constrained VAMCs.

8.2.2.3 Implementation of Point-of-care Feedback Tools (e.g., GetWell Network, Truth Point) is Varied Across the System

Select VAMCs are piloting real-time feedback tools, demonstrated in **Figure 8-5.** These tools are targeted at soliciting patient feedback at the bedside, but adoption appears to be limited; 40 percent of data call respondents reported[388] that their VAMC has implemented at least one real-time or near real-time tool to supplement SHEP data. Funding for these tools comes exclusively from the VAMCs or VISNs, so there is minimal Central Office oversight and/or support.[389] The GetWell network has been piloted across several facilities but its potential is limited by security restrictions – for example, the vendor has not received approval to integrate with VistA.[390] Unlike the other feedback solicitation tools, the GetWell network software is designed to customize satisfaction questions and education to a patient's specific condition. Without VistA integration; however, the tool asks patients a standard set of questions and provides common education (e.g., nutrition). Several individuals interviewed during site visits commented that approval was imminent, but to date it is not approved.[391] One high-performing VAMC stated, "We listened to the vendor's pitch but we are not willing to invest money until Central Office has bought into the program and documented its impact."[392]

Figure 8-5. Supplementary Patient Satisfaction Tools

Facilities are piloting new tools to support real-time, point of care feedback

Patient Experience Company A	Patient Experience Company B	Patient Experience Company C
Industry leading data analysis and best practices	**Interactive patient whiteboard**	**Real-time data collection**
▪ Provides access to largest real-time HCAHPS and health care benchmark database in the country	▪ Facilitates real-time communication on pain management, communication, etc.	▪ Enables front line staff and volunteers to round on patients and collect actionable experience information at the bedside
▪ **Piloted at all facilities in VISN 7,** to assess impact on patient experience and evaluate return on investment	▪ Integrates directly with CPRS for documenting pain management and patient education	▪ **Long Beach, LA, and Albuquerque** VAMCs have implemented
	▪ **Gainesville, Cincinnati, and Albuquerque VAMCs,** are working with VACO to operationalize patient record integration	

Frustration with the speed and management of new initiatives by leadership at the VISN and VACO levels has led to the fragmented adoption of real-time point of care feedback tools

8.2.3 Challenges With Respect to Timeliness and Specificity in the SHEP Survey Results Limit VAMCs' Ability to Drive Performance Improvement

The VHA's patient satisfaction (SHEP) survey tool provide capabilities on a par with private facilities, but delays in survey results and level of reporting challenges significantly limit the perceived effectiveness, accuracy, and actionability of patient satisfaction results.

Two key drivers in the limited effectiveness of current patient satisfaction survey results include:

8.2.3.1 SHEP results are often delayed by 3 to 6 months and reflect aggregate VAMC patient satisfaction scores (for example, data is not segmented by individual department or unit)

8.2.3.2 Patient satisfaction metrics are not generally included in individual's performance reviews because SHEP data is aggregated at the VAMC level

---

8.2.3.1 SHEP Results are Often Delayed by Three to Six Months and Reflect Aggregate VAMC Patient Satisfaction Scores (e.g., data is not segmented by individual department or unit)

Patient satisfaction survey results were cited as a challenge at more than 62 percent of VAMCs visited.[393] SHEP survey results are considerably delayed (e.g., about a 3- to 6-months lag) and provide data at the facility level, which dilutes the impact of performance outcome data at the department and unit levels. More specifically, interviews with front-line employees found a general perception that SHEP data are obsolete and irrelevant.[394] In comparison, private organizations receive HCAHPS scores from CMS at least once every 3 weeks, with many receiving data real-time through patient experience tools (CMS HCAHPS website, 2015; Patient Voice: Every Patient Matters. Every Voice Counts, 2015) at the unit or department level.

8.2.3.2 Patient Satisfaction Metrics are not Consistently Included in Manager and Team Performance Reviews

Industry best practices promote individual ownership and accountability of patient experience (Luxford, 2011). However, 60 percent of VAMC data call respondents[395] stated that patient satisfaction is a component of their department's performance assessments; this drops to 43 percent of VAMC data call respondents[396] when focused exclusively on VAMC leadership. While this variability is likely due to the accuracy and availability of patient satisfaction data across VAMCs, it contrasts with high performing health systems, like Intermountain Healthcare, which include patient satisfaction as a component of all managers' performance reviews – senior leadership through front-line managers.[397]

Academic literature shows correlations between positive patient experience and employee engagement (Manary, 2014). One study, in particular, showed that health systems with higher levels of physician engagement had, on average, HCAHPS scores that were 8.2 points higher than facilities with lower levels of physician engagement (Manary, 2014). To achieve this level of engagement across levels, academic literature recommends that all staff be empowered to prioritize and innovate change as well as be held accountable for patient experience outcomes (Robert Wood Johnson, 2012).

8.3   Recommendations

VHA patient experience practices have multiple stakeholders: Congress and the executive branch, VACO, VHACO, VISN leadership, and VAMC management and staff. Encouraging innovation and addressing challenges in patient experience will require collaboration between all of these groups, and a commitment to making difficult, long-term change. Different

---

recommendations should be owned by different groups (for example, recommendation requiring changes to VACO policy versus local policy) – however, support for change from all stakeholders is critical to effective implementation.

Our recommendations, building on existing strengths and addressing existing challenges in patient experience, can be categorized into two main themes.

8.3.1 **Collect more timely and relevant patient experience data to drive transparency and performance improvement at the facility, department, and individual levels**

8.3.2 **Strengthen national and facility-level support for patient-centered care programs to increase adoption**

These themes are consistent with practices suggested by the academic literature, professional associations, and high-performing hospitals within VHA and outside the system, as well as solutions proposed by front-line VHA staff – this information is included in "summary of supporting evidence" sections in each sub-recommendation. To help VHA implement our recommendations, we have also suggested next steps in the "potential near-term actions" sections of the sub-recommendations. Note, because different VAMCs may have already adopted some recommended practices or experience unique barriers, these suggestions should be tailored the individual circumstances of each VAMC. Each recommendation is supported by several sub-recommendations, which map to the "organization, workflow processes, and tools" domains specified in the Choice Act. For a detailed map of how the sub-recommendations relate to these domains, see **Table E-3** in **Appendix E.3**.

Several recommendations overlap with other assessment areas. Where this occurs, we have referenced the relevant assessment area, which has additional detail.

8.3.1 Collect More Timely and Relevant Patient Experience Data to Drive Transparency and Performance Improvement at the Facility, Department, and Individual Levels

Delays in survey results and level of reporting challenges significantly limit the perceived effectiveness, accuracy, and actionability of patient satisfaction results. Over 60 percent of VAMCs visited[398] cited SHEP limitations as a challenge in driving patient experience performance improvement. We suggest two key changes to better drive performance improvement from patient satisfaction data:

8.3.1.1 Ensure VHA's patient satisfaction feedback tool(s) delivers survey results in a timely (real time or near real-time) and actionable format (for example, segmented at the VISN, VAMC, department and unit levels)

8.3.1.2 Include patient experience metrics in leadership and department level performance reviews

---

[398] Site visits patient advocate interviews (N=21 sites)

8.3.1.1 Ensure VHA's Patient Satisfaction Tool(s) Delivers Survey Results in a Timely (e.g., real-time or near real-time) and Actionable Format (e.g., segmented at VISN, VAMC, department, and unit Levels)

Our assessment revealed challenges with the current SHEP survey process. Evidence supports that organizations, at a minimum, should collect patient satisfaction information real-time or near real-time at the individual department level. Expediting the reporting of patient satisfaction survey results and delivering data at the department or individual unit level would provide VHA with the support needed to drive more timely service recovery and performance management across the system.

Summary of supporting evidence:

- See Section 8.2.3.1 for more detail on findings.

- Forty percent of data call respondents supplement current SHEP results with a real time, or near-real time point-of-care feedback solicitation tool that provides granular real-time results.[399]

- High performing patient experience vendors administer surveys over the phone as soon as 48 hours post-discharge (HCAHPS Fast Facts, 2015) and provide individual-level reporting (Patient Voice: Every Patient Matters. Every Voice Counts, 2015; Leebov, 2001).

- Top-scoring HCAHPS facility, Cleveland Clinic, created an intelligence team responsible for the development and maintenance of an internal web-based dashboard that shows real-time survey results, benchmark comparisons, and performance indicators (Cleveland Clinic, 2010).

Potential near-term actions:

- *VACO/VHACO:* Engage an interdisciplinary group — including Veterans, OPCC&CT resources, VAMC front-line staff and leadership, and IT — to evaluate standard and supplementary patient experience feedback tools implemented across VAMCs and determine if a single tool can sufficiently meet VHA's needs in terms of actionability, granularity, and timeliness. The group should evaluate the tools':
  - Timeliness of survey administration (for example, when are patients solicited) and results turnaround
  - Level of granularity of results (for example, facility-level, department-level, unit-level)
  - Configuration capabilities to meet individual VAMC needs (for example, enable the VAMC to focus on immediate service recovery or Veteran engagement) and VHA's overall patient experience strategy
  - Potential to be leveraged in the outpatient setting
  - Ability to integrate with current tools (e.g., VistA)

- *VHACO:* Evaluate the impact of nationally funding a single point-of-care tool, rather than funding several tools at the facility level.

---

[399] Choice Act data call (N=51 sites)

- *VACO/VHACO:* Negotiate contracts with the key vendor(s) as determined in the previous step.

8.3.1.2 Include Patient Experience Outcome Metrics (e.g., Point-of-Care Feedback, SHEP feedback, VAMC peer and Leadership Observations, etc.) in Leadership and Department Performance Reviews

Our data call and site visits identified considerable variability in patient experience performance management across VAMCS. Literature shows that clinician adherence to performance improvement initiatives is best achieved when the system promotes individual ownership and accountability (Patel, 2014). As a result, we recommend engaging leadership and front-line staff to outline department-level patient experience standards and then holding leadership and departments to those standards (Patel, 2014).

Summary of supporting evidence:

- See Section 8.2.3.2 for more detail on findings.
- Over 60 percent of VAMC data call respondents[400] reported that they include patient experience metrics as a component of individual performance reviews in line with industry best practices (Luxford, 2011).
- Top-scoring HCAHPS facility, Intermountain Healthcare, includes patient satisfaction in all managers' performance appraisals, senior leadership through front-line managers.[401]

Potential near-term actions:

- *VHACO:* Develop a standardized cross-cutting, balanced performance management scorecard with a range of domains of performance, including patient experience; refer to Assessment L for additional detail on this action.
- *VACO/VHACO:* Deploy a coordinated program office (for example, led by OPCC&CT or myVA) effort to provide VAMCs with the tools (e.g., training, communication frameworks) necessary to deliver a positive patient experience.
- *VAMCs:* Engage an interdisciplinary team to develop achievable and meaningful performance management standards.
- *VACO/VHACO/VISN/VAMC:* Hold managers and teams across all levels of VA accountable to those agreed-upon performance standards (e.g., through performance pay, promotions, suspensions).

8.3.2 Strengthen National and Facility-level Support for Patient-centered Care Programs to Increase Adoption

While central Program Offices (e.g., OPCC&CT) are building the infrastructure to support the system-wide implementation of best practices, several challenges (as detailed Section 8.2.1)

---

[400] Choice Act data call (N=51 sites)

[401] Intermountain Healthcare SME interview (April 2, 2015)

---

limit system-wide adoption. We suggest several changes aimed at improving adoption, including:

> **8.3.2.1 Coordinate Veteran-centered initiatives across Program Offices**
>
> **8.3.2.2 Promote consistent leadership at the VAMCs**
>
> **8.3.2.3 Facilitate sharing of facility-driven best practices**

8.3.2.1 Coordinate and Consolidate Veteran-Centered Initiatives and Directives Across Program Offices

We discovered, through site visits and interviews with VACO and VHACO leadership that VISNs and VAMCs receive hundreds of directives from a variety of different Program Offices.[402] While many of these appear to be focused on Veteran-centered care, there is a risk of conflicting or poorly coordinated national support. Our recommended approach would prioritize and streamline facility directives, best practices, and performance benchmarks across Program Offices, such that the VAMCs receive a limited set of prioritized requirements from VHACO, as exemplified by high-performing facilities. This approach would also provide VAMCs with additional capacity (for example, they would have fewer directives to respond to) and the autonomy to focus on programs most important to them (e.g., Veteran engagement, service-level advocates, whole health training).

Summary of supporting evidence:

- See Section 8.2.1 for more detail on findings.
- VAMC performance measures have increased exponentially over the past 15 years; VAMC employees are unable to keep up with current performance measures and directives, let alone focus on new patient-centered care initiatives (Wong, 2012).
- Program office leadership has stated, "We've seen improvement [in coordination of program offices], but it needs to improve. That's part of a very clear Central Office vision, clarity on the direction we're going, not everyone interpreting it their own way[403]" and "There's a lot of goodness in the system, but sometimes there is too much goodness coming at the facilities, and they're overwhelmed.[404]"

Potential near-term actions:

Refer to Assessment L for details related to the implementation of this recommendation.

---

[402] VAMC site visit interview: patient advocates (N=21 facilities)

[403] VACO SME interview

[404] VACO SME interview

8.3.2.2 Improve VAMC Leadership Turnover to Ensure a More Consistent Patient Experience Strategy at the Facility-level and Better Utilization of Available Resources

Our assessment has shown that VHACO's effectiveness in driving system-wide adoption of patient experience best practices is limited by inconsistent VAMC leadership.
A more stable leadership structure would not only help facilities focus their efforts on a prioritized set of initiatives (for example, priorities are not constantly changing every time the leadership turns over), but it would also help the Central Office disseminate information about new programs and implementation support (for example, VAMC leadership can effectively bridge the Central Office and front-line). Improving turnover would require both filling current vacancies and establishing longer leadership tours at the VAMCs.

Summary of supporting evidence:

- See Section 8.2.2.1 for more detail on findings.
- Of the VAMC Quadrads, 39 percent have at least one current vacancy; three Medical Centers operate with only one permanent Quadrad member.[405]
- Academic literature supports that strong, consistent executive leadership is required to drive system-wide cultural change. (Singer, 2013).

Potential near-term actions:

- *VHACO:* Address current VAMC leadership vacancies; refer to Assessment L for more detail on this recommendation.
- *VHACO:* Promote longer VAMC leadership tours to encourage greater management consistency at the facilities.

8.3.2.3 Encourage Innovation at The Facility Level by Building the Program Office Infrastructure to Support the Evaluation, Codification, and Implementation of Facility-Driven Patient Experience Initiatives

We observed many examples of facility-driven best practices indicating an opportunity to better leverage innovation in the field to impact patient experience. However, appropriate Program Office-level support (e.g., OPCC&CT) is needed to facilitate best practice sharing and implementation across the system.[406]

Summary of supporting evidence:

- See Section 8.3.1.3 for more detail on findings.
- Of VAMCs visited, 100 percent have implemented patient experience initiatives (for example, quiet program, community gardens, volunteer rounding) at their local facility.[407]

---

[405] VHA Office of Workforce Solutions (2015)

[406] VHA Interview with OPCC&CT

[407] Site visits interviews with Patient Advocate (n=21 facilities)

- As a leading facility in Veteran and family engagement, Palo Alto VAMC exemplifies successful facility-led innovation through the rollout of its Veteran and Family Advisory Committee workshop in collaboration with OPCC&CT.[408]

- Top-scoring HCAHPS facility, the Cleveland Clinic, holds an innovation summit each year to discuss patient experience best practices from academic literature as well as practical, front-line-submitted solutions such that lower-performing facilities may learn from higher-performing facilities (Cleveland Clinic, 2010).

Potential near-term actions:

- *VHACO:* Increase awareness of OPCC&CT through dynamic communication campaigns highlighting new initiatives (national and facility levels) and available resources.

- *VHACO:* Ensure that the OPCC&CT is sufficiently resourced to meet the implementation needs of the VAMCs.

- *OPCC&CT:* Develop a process where individual facilities can apply to pilot a PCC best practice; similar to the Centers of Innovation; this would allow VAMCs to develop, manage, and evaluate the effectiveness of their initiative, in collaboration with OPCC&CT, and eventually showcase proven, best practices to other VAMCs.

- *VAMCs:* Submit case studies of unique patient-centered care practices to OPCC&CT for syndication.

8.3.3 Potential Opportunity

Our analysis shows that mean patient satisfaction scores are slightly lower than national averages, notwithstanding significant confounding factors that make comparison difficult, as discussed in Section 8.1.1. While aggregate VHA scores are on a par with national averages, some facilities in the bottom quartile trail national averages by as much as 12 percent as demonstrated in **Figure 8-2.**[409]

If VHA is able to bring its bottom quartile to the national average, it would lead to positive impact across the following dimensions.

- Increased patient acquisition and retention. Satisfied patients are three times more likely to return to a provider they have been seen before (Manary, 2013).
  - Patient satisfaction is predictive of an individual's choice in medical care (Fan, 2005), which drives improved continuity of care (Corrigan, 2012).
  - Dual users of non-VA and VA facilities (e.g., Veterans who are presumably not experiencing the full benefits of VA continuity of care) reported lower satisfaction with their care (Fan, 2005).

- Improved health outcomes. Positive correlation exists nationally between CMS quality scores and patient satisfaction scores (Price, 2014).

---

[408] VHA interview with OPCC&CT and Palo Alto Veteran and Family Advisory Committee

[409] SHEP data (FY14) and CMS HCAHPS data (FY14)

- Improved patient access and health. Positive correlation exists nationally between CMS quality scores and HCAHPS scores (which serve as a proxy for SHEP scores) (Price, 2014).

VHA has demonstrated excellent patient satisfaction across many of its facilities. For example, Long Beach VAMC has demonstrated close to a five percent increase in its scores from 2012 to 2014 related to care transition decision-making, communication about medication, and cleanliness of the hospital.[410] Additionally, the VAMC was able to increase its care transition decision-making above the VHA average in three years. This increase in scores may be attributed to the VAMC's recent hiring of a Chief of Patient Experience, its improved focus on Veteran and employee engagement (for example, training on "what it means to be a patient" and recognition pins for employees who receive compliments from patients), and recent implementation of patient-centered care initiatives (e.g., thank-you cards for Veterans on discharge, "Patient-Centered Care" celebration month").[411] Given Long Beach's success, improvement in lower-performing facilities should be plausible provided the implementation support structure is established across facilities to facilitate the sharing of best practices and lessons learned.[412]

9 Accurate Documentation and Subsequent Coding of Inpatient Services

Part F ("Assessment F"), Section 201 of the Veterans Access, Choice, and Accountability Act of 2014 ("the Choice Act") mandates an assessment of the organization, workflow processes, and tools used to support accurate documentation and subsequent coding of inpatient services. Documentation and coding in health care are considered critical in supporting appropriate billing and collection of third-party payment as well as for generating insight across a number of other purposes including abstraction of quality metrics, measurement of provider workload and productivity, and identification of demographic and epidemiologic trends within the population. Use of coded administrative data for these purposes is supported by studies suggesting that administrative data represents a viable alternative to manual chart reviews for understanding patient conditions (Humphries, 2000; Kieszak, 1999). While some concerns remain across the industry (among both public and private health care organizations) regarding coding's ability to fully capture the complexity of patients served, medical coding will likely continue to play a significant role in health care given current payment models and prevailing methodologies for assessing quality of clinical care (Lawson, 2012).

The role of documentation and coding is similarly vital within VHA because it influences the organization's ability to effectively collect payments for services provided to 23–26 percent[413] of patients with billable third-party insurance (Patient Insurance Statistics 2014), appropriately match existing services and develop new services to meet Veteran needs, and accurately allocate funding across VAMCs through the Veterans Equitable Resource Allocation (VERA) system.[414] Because most of VHA's budget is allocated through the VERA system, accurate documentation and coding is vital to appropriately match available resources to a dispersed and heterogeneous Veteran population (Wasserman, 2003).

Based on the language of the Choice Act legislation, the scope of this assessment area includes the practices employed by VAMCs to ensure that information recorded in VHA's clinical documentation and coding systems is both accurate and complete. While we did assess VHA's internal quality assurance processes, we did not conduct an independent audit of the accuracy of provider documentation or medical coding. It should also be noted that assessments of VHA's information technology tools/strategies and the processes for billing/collection of third-party billable claims are covered by assessment areas H and I respectively; the corresponding assessment reports should be consulted for additional details on these topics.

---

[413] Represents range (October FY2013 through November FY2015) of monthly percent total inpatient and outpatient records capturing services provided to Veterans with billable insurance

[414] The Veterans Equitable Resource Allocation (VERA) model was instituted in April 1997 as a means of distributing VHA funding across the organization based on need rather than historical funding patterns. VERA funding is based on several factors, including "number of patients, adjustments for regional variances in labor and contract costs, high cost patients, education support, research support, equipment, and non-recurring maintenance" (VERA 2014: Equitable Funding Across 20 Health Care Networks). Given that adjustments for high cost patients and patient volume are based on information captured within documentation and coding systems, accurate capture of clinical information is critical to appropriate resource allocation.

9.1 Summary

9.1.1 Assessment Approach

As described in the summary of this report (Section 1), we collected information in several ways, using a common approach across sub-assessment areas within Assessment F:

- Visits to 21 VAMCs to conduct:
  - Forty-two interviews with health information management (HIM) leaders, medical coders, and physician service line chiefs
  - Twenty[415] assessment workshops with front-line personnel, including physicians, utilization management (UM) personnel, clinical documentation (CDI) specialists, HIM leaders, and medical coders (approximately 115 staff total)

- Survey[416] sent to relevant clinical occupations across all VAMCs, completed by 979 respondents[417] across 92 VAMCs[418]. Due to the fact that VHA does not track the setting of work (i.e., inpatient or outpatient) in available human resource data and VISN and VAMC Directors were responsible for the distribution of the survey to the end-user we are unable to calculate the significance of the total response rate, but do not believe it to be a representative sample across any of the roles. Given this, survey data should be viewed as providing anecdotal insights as opposed to a representative data sample.

- Request for local policy documents from all VAMCs ("data call"); documentation and coding section returned by 52 (43 percent) VAMCs[419]

- Data collection from national data systems, including HIM Executive Summary, HIM Inventory, and Physician Query Tracking (PQT) data

Having collected information to understand VHA's practices with respect to accurate documentation and subsequent coding, we then assessed how these practices compared to best practices and industry benchmarks. Best practices and benchmarks, detailed in **Table F-1** of **Appendix F.1** were identified through several sources, including:

- Interviews with high-performing private hospitals (e.g., including national multi-hospital systems, hospitals with an employed physician workforce, and hospitals that are part of an integrated delivery network to ensure comparability with VHA)

---

[415] A documentation and coding assessment workshop was not held at one of our sites due to scheduling and patient care conflicts.

[416] As noted in the Methodology section (Section 2), we do not believe that the survey constitutes a representative sample of VHA staff.

[417] Total indicates number of staff from complexity level 1a, 1b, 1c, or 2 VAMCs responding to any survey question related to documentation and coding; number of respondents for each survey question varies due to customization of questions according to clinical occupation.

[418] Only includes VAMCs with complexity level 1a, 1b, 1c, or 2

[419] Based on total 121 VAMCs with complexity level 1a, 1b, 1c, or 2

- Academic literature (e.g., research supporting a link between coding accuracy and measurement of quality outcomes)
- Resources from medical coding professional organizations (e.g., guidance from American Health Information Management Association (AHIMA) on developing a compliant provider query process)

A number of documentation and coding practices have been shown within academic literature to promote accurate capture of information within clinical and administrative systems. We supplemented this evidence from academic literature with guidance from professional associations (e.g., AHIMA), interviews with other best practice hospital organizations, and industry surveys to comprehensively identify best practices for benchmarking current VHA processes.

9.1.2 Summary of Findings

The process of inpatient documentation and coding consists of four main steps, as outlined in **Figure 9-1**. Effective management of the overall process requires a collaborative effort from providers, medical coders, and facility leadership to ensure that clinical findings are documented optimally, codes are assigned accurately, and management is engaged consistently in promoting and enabling high performance.

Figure 9-1. Inpatient Documentation and Coding Process

The inpatient documentation and coding process consists of four key steps

	Description	Applicable category	Details
1	**Providers document findings and care plan in the EHR**	All inpatient encounters	• Enables effective **written communication** among providers • Supports accurate **medical coding** (codes must be based on provider documentation)
2	**Medical coders assign inpatient DRG codes based on documentation**	All inpatient encounters	• Relies on specialized capabilities of **trained medical coders** • Captures information related to the **inpatient hospitalization** to enable **secondary uses** (e.g., billing)
3	**Medical coders assign professional fees codes based on documentation**	Inpatient encounters for Veterans with third-party insurance	• Relies on specialized capabilities of **trained medical coders** • Captures information related to the care **provided by physicians while inpatient** to enable **secondary uses** (e.g., billing)
4	**Medical coders query providers to follow up and clarify documentation**	All inpatient encounters with unclear documentation	• Clarifies **unclear documentation** to enable optimal coding • Facilitates **tracking of documentation trends** to enable training and improvement

Our assessment revealed three main findings with respect to VHA's strengths and challenges in documentation and coding (see Section 9.2 for details regarding each finding):

9.2.1 Inconsistent emphasis on clinical documentation impedes consistent capture of complete clinical information, hindering appropriate resource allocation and revenue collection. Varied and generally low emphasis on accurate clinical documentation and coding across the organization results in potentially incomplete data. While some VAMCs have stressed proper documentation to maximize budgetary allocations and improve quality ratings, many have not. This is evidenced by differences in local approaches to documentation training: only 57 percent of physicians participating in the Choice Act survey reported that their facility provides training regarding documentation and coding.[420]

9.2.2 Adoption of documentation best practices is variable, resulting in inconsistent quality of clinical documentation system-wide. Industry professional organizations

---

[420] Choice Act survey (N=406)

have established documentation standards to ensure integrity of data captured within electronic health care records (Arrowood, 2013). These standards include recommendations for appropriate use of clinical templates (e.g., designing templates to meet requirements for both billing and clinical data-sharing) and for processes to ensure appropriate use of copy-paste functionality (e.g., conducting reviews to ensure that certain clinical information, like patient vital signs, are not being inappropriately copied from one encounter to another). In spite of national efforts to address these issues through required monthly electronic health record (EHR) quality reviews, VHA clinical staff and medical coders reported that challenges persist: 80 percent of sites reported limited template utilization or use of suboptimal templates and 55 percent reported inappropriate use of copy-paste.[421]

9.2.3 **System-wide focus on coding standards has resulted in coding performance typically meeting or exceeding private sector benchmarks.** VHA inpatient coding accuracy[422] is about 93 percent nationally and inpatient coding occurs, on average, 4 days after discharge, suggesting that VHA coding performance is closely aligned with industry benchmarks. Routine internal auditing of coding performance at the facility-level and development of a national dashboard for performance tracking appear to be contributing to strong coding reliability. However, the potential existence of suboptimal documentation upon which coding is based may inhibit coders' ability to optimize coding to match clinical actualities.

9.1.3 Summary of Recommendations

Our assessment revealed several areas where VHA can build on current strengths or address existing challenges to improve documentation coding. We recommend that VHA consider two strategic themes, as detailed below. As with the findings, these themes apply to VHA organization, processes, and tools.

9.3.1 **Increase local prioritization of clinical documentation through acceleration of national CDI program and targeted provider education and training, supported by performance management at the facility and provider level.** VHA launched a national clinical documentation improvement (CDI) program in 2013, but, to date, only 46 percent of VAMCs have implemented programs at the local level.[423] VHA should strengthen the current CDI program by outlining national documentation improvement priorities, providing targeted guidance, and creating a national knowledge-sharing network to disseminate successful local practices. These efforts should be reinforced by targeted provider education, transparency tied to meaningful

---

[421] Site visit documentation and coding assessment workshops (N=20)

[422] Note that accuracy in this context refers to inter-coder reliability, or the extent to which an expert coder would assign the same medical codes based on existing clinical documentation; high coding accuracy does not necessarily mean that codes represent a patient's true condition, as insufficient or inaccurate provider documentation may inhibit optimal assignment of codes

[423] 2014 HIM Inventory (N=134)

outcomes (e.g., percent of claims not billable to insurance due to incomplete documentation), and performance management for both facilities and providers to increase prioritization of clinical documentation across VHA (see Assessment I report for additional details).

9.3.2 Strengthen provider documentation standards (e.g., management of clinical templates, EHR review process) to promote optimal capture of patient information and improve resulting resource management. Challenges with clinical documentation were common across VAMCs, as evidenced by 80 percent of participants in documentation and coding assessment workshops reporting suboptimal template use and management practices.[424] VHA should improve documentation practices through enhanced governance focused on template management, targeted guidance regarding EHR reviews, and improved performance management reinforcing query responsiveness.

Our assessment did not provide evidence of organization-wide challenges with medical coding tools and processes. As such, we did not make any recommendations targeted specifically to medical coding. As VHA is able to achieve improvements in documentation patterns through the recommendations above and other targeted actions, leadership should continue to monitor coding performance to evaluate whether targeted changes are needed.

9.1.4 Past Findings and Recommendations

Several recent assessments have indirectly identified findings related to VHA documentation and coding practices, although these issues have not been the primary focus areas of past assessments. Recent findings from national assessments include clinical documentation not containing all necessary information for third-party billing (OIG, 2013; OIG, 2012), documentation not meeting requirements for patient transfer or discharge (OIG, 2010), documentation inaccuracies (OIG, 2009), and coding discrepancies for select patient subgroups (Carlson, 2010). In addition to these national level assessments, a few documentation and coding topics have been incorporated into OIG's facility-level comprehensive reviews, revealing additional challenges including lack of facility-level EHR review committees (OIG, 2010), inadequate implementation of copy-paste audits (OIG, 2012), and poorly-developed standards for resident documentation and oversight (OIG, 2007).[425] Illustrative findings and recommendations from recent assessments are outlined within **Figures F-1** and **F-2** in **Appendix F.2**.

These past assessments have tended to focus on specific issue areas and/or individual facilities, separately developing recommendations for improvement in discrete areas. In contrast, our assessment tries to take an end-to-end view of inpatient clinical operations across five key sub-assessment areas and all high- and medium-complexity VAMCs.

---

[424] Site visit documentation and coding assessment workshops (N=20)

[425] Note that these are illustrative of the types of issues identified recently; they are not intended to be a comprehensive listing.

9.2   Findings

Our assessment revealed three main findings related to VHA's current documentation and coding practices.

9.2.1   **Inconsistent emphasis on clinical documentation impedes consistent capture of complete clinical information, hindering appropriate resource allocation and revenue collection**

9.2.2   **Adoption of documentation best practices is variable, resulting in inconsistent quality of clinical documentation system-wide**

9.2.3   **System-wide focus on coding standards has resulted in coding performance typically meeting or exceeding private sector benchmarks**

These findings are based on several key sources of insight. We have used the national data sets that were available, information returned as part of the data call, and perceptions and experience reported or observed during site visits or via the staff survey. In many instances where data does not allow us to definitively comment, we have described the potential implications of the data points we do have, along with recommendations in Section 9.3 for further analysis.

Underlying each finding are several drivers; these drivers map to the "organization, workflow processes, and tools" domains specified in the Choice Act. For a detailed map of how the drivers relate to these domains, see **Table F-2** in **Appendix F.3**.

9.2.1   Inconsistent Emphasis on Clinical Documentation Impedes Consistent Capture of Complete Clinical Information, Hindering Appropriate Resource Allocation and Revenue Collection

VHA's unique financial and reimbursement model contributes to misunderstandings regarding the proper role of documentation and coding within VHA relative to private sector providers. Within the private sector, the prevailing reimbursement model is a fee-for-service system wherein hospitals and providers receive payment from health insurance companies following provision of medical services and submission of coded medical documentation that justifies appropriateness of treatment. The importance of proper clinical documentation and coding is well-understood and innately reinforced within this system: encounters that are inappropriately coded or insufficiently supported by clinical documentation may be subject to review or rejection, contributing to compliance risks and lost revenues. The fee-for-service system also closely aligns the reimbursement incentives of facilities with those of providers, as the accurate and complete clinical documentation required to support facility reimbursement also ensures that providers are able to collect for the services they provide to patients.

In contrast to this system, VHA's funding for patient care comes from two sources: VAMC funding is primarily provided though the Veterans Equitable Resource Allocation (VERA) system, supplemented by third-party reimbursements for the 23-26 percent of services provided to

Veterans with billable insurance coverage.[426] Funds disbursed through the VERA system do not follow a traditional fee-for-service approach. Instead, the VERA system is designed to equitably distribute VHA's budget based on the number and characteristics (e.g., service connection, income levels, other special health care needs) of Veterans cared for at each facility (VHA, 2014; Wasserman, 2003). Although the VERA system is critically dependent on information from clinical documentation, the link between documentation patterns and VERA funding is less direct than within fee-for-service models. In addition, individual provider incentives supporting optimal documentation may be weakened within VHA's reimbursement system, specifically because providers are salaried and have few formal incentives to improve documentation patterns (e.g., performance incentives rewarding optimal documentation, penalties for sub-standard documentation practices).

Despite VHA differences relative to private sector, documentation and coding remain critical to VHA's ability to effectively and efficiently provide inpatient care. As one VHACO leader stated during an interview: "There is no difference between VHA and the private sector in the importance of documentation and coding—it is just as important here as it is there."[427] Clinical documentation and coding are essential not only to VHA's ability to properly allocate overall funding through the VERA system and appropriately bill and collect from third-party insurers, but also to:

- Efficiently measure organizational performance on key quality measures, assuring quality of care that matches or exceeds that of the private sector.
- Proactively identify trends in Veteran populations and design programs and interventions suited to changing Veteran needs.
- Accurately capture provider clinical workload to support appropriate clinical staffing.

Despite these considerations, we found that the organizational emphasis placed on accurate clinical documentation does not consistently match the private sector. Our analysis suggests that this is driven by the following:

9.2.1.1 Limited direct integration of health information management (HIM) and finance functions at the VAMC level weakens leadership prioritization of documentation

9.2.1.2 Inconsistent provider education and training practices are not aligned with VHA's view of the high importance of clinical documentation

9.2.1.3 Lack of performance management contributes to low priority on documentation

9.2.1.1 Limited Direct Integration of Health Information Management (HIM) and Finance Functions at the VAMC Level Weakens Leadership Prioritization of Documentation

Strong organizational ties between Health Information Management (HIM) and a hospital's finance department are common in the private sector given the critical influence of coding on

---

[426] VHA Patient Insurance Statistics 2014

[427] Interview with VHACO leader

reimbursement, facilitate communication, frequent interactions, and enhanced collaboration between the departments. Within VHA, we find this coordination to be weaker, as evidenced by: (1) lack of national guidance on recommended HIM organizational structure; and (2) less than one-fifth of cases where HIM reports to a member of the VAMC executive leadership team.

Lack of national guidance on recommended HIM organizational structure. Limited national direction related to the positioning of the HIM function at the facility level has contributed to varied organizational designs. VHA Handbook 1907.01: Health Information Management and Health Records, which outlines basic HIM functions and responsibilities of key stakeholders, does not endorse a specific organizational structure (VHA, 2014). Other national VHA policies are similarly silent on HIM organizational structure, as suggested by a national HIM leader, who stated: "There have been several reorganizations over the years and HIM has landed at various places within the organization. Many facilities are currently organized with HIM under health administrative services (HAS), but this is not mandated by any official directives."[428]

Data from the national HIM inventory and our review of organizational charts obtained through the national data call confirm differences in organizational design. We found that the HIM function is positioned under the HAS service in 69 percent of cases, although some facilities employ an alternative organizational structure (e.g., reporting through chief of staff).[429] Organizational charts obtained through the data call reveal that even for the subset of facilities with HIM organized under HAS, reporting structure for HIM varies from one facility to another: some HIM chiefs report directly to the HAS chief while others report through an associate HAS chief at lower level of the organization. This variability in organizational design often positions HIM leaders deeper within the facility's reporting structure and is likely to generate differences in the visibility, inclusion, and prioritization of the HIM function from one facility to another, contributing to differences in facility-level emphasis on documentation and coding performance.

Less than one-fifth of cases where HIM reports to a member of the VAMC executive leadership team. Across VAMCs, only 17 percent of HIM chiefs report to a member of the hospital executive leadership team.[430] This does not mirror common practice within private hospitals, where 46 percent of HIM chiefs indicate that they report to their hospital's chief financial officer (Johns, 2013). This is important because studies in the academic literature have suggested a link between successful health information management outcomes and lines of authority and visible management support (Van der Meijden, 2003). The prevailing organizational design choices and reporting structures employed by VAMCs may dilute the focus that

---

[428] Interview with VHACO leader

[429] 2014 HIM Inventory (N=134)

[430] 2014 HIM Inventory (N=134)

hospital leadership and other staff place on documentation and coding issues, resulting in weaker facility-level culture surrounding the importance of documentation and coding.

9.2.1.2 Inconsistent Provider Education and Training Practices are not Aligned With VHA's View of the High Importance of Clinical Documentation

Studies in the academic literature have provided evidence that physician education and training can be effective in improving documentation practices (Russo, 2013). Provider education sessions not only provide a vehicle to address common provider documentation challenges, but they also reinforce the critical role of documentation to support high-quality patient care and ensure appropriate resourcing at the facility-level. This is particularly critical in a VHA context because about 78 percent of VAMCs host physician trainees through affiliations with academic medical centers, which leads to frequent rotation of trainees and supervising physicians and decreases provider familiarity with VHA documentation systems and best practices (VHA, 2009). Our assessment suggests that: (1) provider education and training sessions are offered inconsistently across the organization; and (2) lack of VHA provider emphasis on complete and accurate documentation is often inconsistent with the role documentation plays to support reimbursement.

Provider education and training sessions are delivered inconsistently across the organization. According to interviews with high-performing hospital organizations, provider documentation training and education are critical to improve clinical documentation. In order to be successful, these organizations develop engaging training materials targeted to the specific documentation needs of provider sub-groups (e.g., cardiology training focused on the documentation elements necessary for heart failure encounters). Our interviews with facility HIM chiefs indicate that provider education and training is a significant barrier to optimal documentation across VHA, with 67 percent of interviewees reporting this challenge at their VAMC.[431]

Across VHA, only 53 percent of HIM departments at the VAMC-level report offering regularly-scheduled provider education trainings.[432] This is consistent with provider responses to the Choice Act survey: only 57 percent of respondents reported trainings on proper medical record documentation offered by their facility.[433] In addition, providers reported significant differences in the frequency with which trainings are offered or required across the organization (Figure 9-2). Where provider training is in place, the majority of respondents reported that trainings are "somewhat effective" (65 percent of total respondents), with only 14 percent reporting that trainings are "highly effective."[434] While provider training has not

[433] Choice Act survey (N=406)

[434] Choice Act Survey (N=228)

---

been consistently implemented across the organization, we found that many VAMCs have developed local training programs and policies to address facility-level challenges. These efforts have contributed to improvements in documentation quality and other key metrics, as illustrated by the experience of the Durham VAMC (see case study below).

VHA's lack of consistency in provider training practices contrasts with reports of one high-performing hospital system. According to a recent interview with Intermountain Healthcare, its providers are required to participate in mandatory trainings at hiring and mandatory trainings every six months, targeting specialty-specific documentation needs. Additional training opportunities are also available as needed, based on request.[435] Gaps in VHA's approach to training relative to Intermountain suggest a missed opportunity to signal the importance of documentation and to equip providers with the guidance needed to document optimally. This deficiency was widely recognized by front-line staff during site visits: 50 percent of sites reported inadequate provider education and training as a challenge to clinical documentation.**[436]**

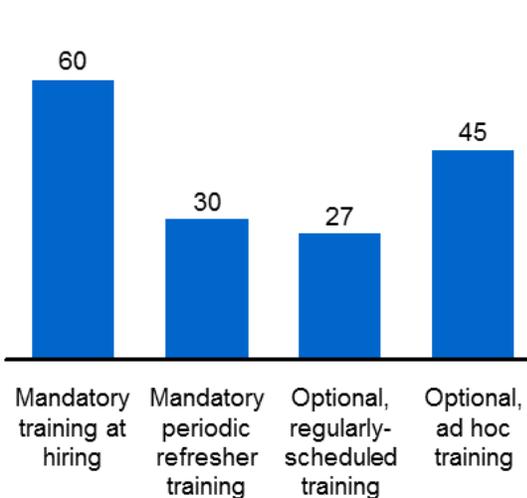
Percent of providers (N=233)[2]

Mandatory training at hiring	Mandatory periodic refresher training	Optional, regularly-scheduled training	Optional, ad hoc training
60	30	27	45


Intermountain Health care reported both mandatory training at hiring and mandatory refresher trainings every 6 months, tailored to the needs of different provider segments

1 Respondents include hospitalists (N=86) and specialists (N=320)
2 Percentages sum to greater than 100 due to respondents reporting of multiple types of training offered by the facility

SOURCE: Choice Act survey

Table 9-1. VAMC Case Study: Provider Documentation Training

Best practice case study – Durham VAMC
The **Durham VAMC** has increased its **training efforts for both attending physicians and resident trainees** to promote improved documentation. **Context** ▪ Recognized with release of the **SAIL report** that facility's clinical **quality and patient complexity measures did not appear to be reflected** in the performance data ▪ Determined to **increase emphasis on provider education and training** to address perceived inconsistencies **Efforts implemented** ▪ Perform **documentation education and training refresher session** each time a provider comes on service ▪ Incorporate **documentation educational materials into new resident orientation** for trainees beginning their rotation at the facility

Best practice case study – Durham VAMC
▪ **Include review of resident discharge summaries into regular morning report sessions with trainees to promote improvement of common documentation problems** **Impact** ▪ **More accurately reflected patient complexity, resulting in an increased facility average case mix index from ~1.0 to ~1.2 over a four-year period**

Lack of VHA provider emphasis on complete and accurate documentation is often inconsistent with the role documentation plays to support reimbursement. Inconsistent recognition of the importance of accurate clinical documentation among providers was commonly reported during our assessment. To illustrate, one VHACO leader described an experience that occurred while discussing clinical documentation with a provider. In response to a recommendation that providers be more specific in their documentation to enable accurate coding, the provider countered: "We really don't need to document that specifically in the VA. That's not how we get paid."[437] We heard similar sentiments expressed during other site visits, including from one provider who commented: "Part of the VA's value proposition is that you get to *focus on the medicine*—if they start cracking down on the paperwork, then what's the selling point? Why work here?"[438] Data from polls conducted during our documentation and coding assessment workshops suggests that these cultural views are common among providers across the system: 56 percent of providers indicated that accuracy of documentation and coding within VHA is less than private sector.[439]

9.2.1.3 Lack of Performance Management Contributes to Low Priority on Documentation

Our analysis suggests limited efforts to promote improvement in the quality of information captured within clinical and administrative systems through performance management. This performance management issue is exhibited in at least three ways: (1) physicians often lack formal incentives to document optimally; (2) documentation and coding metrics are not directly included within the facility-level Strategic Analytics for Improvement and Learning (SAIL) report; and (3) administrative staff are not evaluated on their ability to reliably capture patient demographic and insurance information.

Physicians often lack formal incentives to document optimally. Performance management is a powerful tool that many organizations use to promote desired behaviors. There is evidence that this tool can be effectively applied to physicians,

with the academic literature suggesting that physicians respond predictably to incentives (Barro, 2003). High-performing hospital systems use performance management and incentives to promote optimal documentation (see case study below).

Table 9-2. External Case Study: Physician Documentation Performance Management

Best practice external case study – Intermountain Healthcare[440]
To support its goals of ensuring accurate capture of patient information, Intermountain Healthcare has implemented **provider education and performance management** related to clinical documentation (Intermountain Healthcare Interview, 2015).   **Details**   ▪ **Collaborates with providers regarding potential documentation metrics for incorporation into annual provider reviews**   ▪ **Aligns on documentation metrics with clear links to quality of care to increased provider support and engagement**   ▪ Sets one to two **annual documentation performance goals** with physicians, with performance **linked to compensation**   **Impact**   ▪ Experienced improvements in **patient case mix to match true clinical condition** of patients treated   ▪ **"Our training and performance management processes have significantly increased our organization's readiness for the upcoming ICD-10 transition."**

Observations from our site visits suggest that performance management is infrequently applied to physician documentation practices (e.g., physicians are not evaluated based on the quality of their clinical documentation). Many physicians suggested that they receive little if any feedback on their documentation within the VHA system. This contrasts with standard practice at private hospitals, as suggested by one VHA physician's comments: "When I started working at a new hospital in the private sector, a medical coder was assigned to work with me during my first few months to make sure I was documenting and coding everything appropriately. Here in the VA, it is rare for me to get any feedback regarding my documentation." HIM chiefs frequently referenced a lack of provider performance management as a barrier to effective documentation, with 38 percent of VAMC HIM chiefs citing lack

---

[440] Intermountain Healthcare SME interview (May 5, 2015)

of formal physician incentives as the biggest barrier to documentation and coding accuracy for their facilities.[441]

These site visit findings are validated by provider perspectives gathered from the Choice Act survey. Though approximately two-thirds (67 percent) of providers report having received some feedback regarding the quality of their clinical documentation during the last year,[442] only 36 percent of those providers indicated that the feedback come as part of regular performance evaluations.[443] Overall, this suggests that approximately 24 percent of providers are evaluated on their documentation as part of regular performance reviews. This is consistent with our analysis of VHA-published provider review materials obtained as part of our assessment: VA Form 10-2623a, the national "Proficiency Report" used for provider evaluations, does not contain performance metrics related to provider documentation.

Documentation and coding metrics are not directly included within the facility-level SAIL report. Quality managers interviewed during site visits indicated that facility performance on measures contained within the Strategic Analytics for Improvement and Learning (SAIL) report has been a recent focus for many VAMCs.[444] The SAIL report contains 33 performance metrics across a number of important clinical and operational domains, including quality (e.g., hospital complication rates), efficiency (e.g., length-of-stay), patient experience (e.g., customer satisfaction), and access (e.g., wait times). This report has been an important VHA tool for assessing performance nationally and for directing facility-level improvement efforts.

We found that the SAIL report does not contain any metrics directly assessing documentation and coding performance. However, clinical staff at many VAMCs suggested that many of the metrics contained within the SAIL report are critically dependent upon accurate clinical documentation. For example, rates of catheter associated urinary tract infections (a metric tracked within the SAIL report) are derived from clinical data, and inaccuracies in EHR documentation can lead to erroneous conclusions regarding the quality of care provided by a facility. This observation has caused select facilities to focus on documentation improvements as a mechanism to improve performance on quality measures, as suggested by one physician leader who stated: "When we first looked at our facility's performance on the SAIL data, we were shocked because a lot of our performance data just didn't seem right. We found that many of the issues were related to how we were capturing information within the medical record. We focused on documentation improvements and were able to improve our performance on quality measures, yielding changes in our facility rating from 2-star to 5-star in a very short time." A

[444] Site visit quality manager / utilization manager interviews (N=21)

similar view was expressed by some, but not all, other VAMCs, prompting variable documentation improvement efforts as a means of improving SAIL performance. **Administrative staff are not evaluated on their ability to consistently capture patient demographic and insurance information.** Consistent capture of patient demographic and insurance information has implications for VHA's ability to provide high-quality clinical care as well as for facilities' ability to appropriately capture third-party reimbursement. However, 90 percent of sites suggested significant challenges in consistently capturing this information.[445] Workshop participants reported several drivers of these challenges including inconsistent use of registration scripts, insufficient training of clerks, and lack of standardized processes to verify patient information for patients admitted emergently. Based on this information, many of the challenges associated with patient registration and information verification could be addressed by aligning on processes for information verification and enhancing performance management practices for patient registration staff. Issues related to the capture of insurance information create downstream challenges with coding, as failure to accurately capture insurance information during an admission results in the generation of numerous "new insurance late check-out" (NILCO) records for delayed coding. The generation of NILCO records is part of VHA's process to ensure that third party billing occurs for all encounters for patients with third party billable insurance. VHA has a system in place to check patient encounters that are initially not flagged as being billable to third party insurance to verify insurance status and identify encounters that may be billable. Records identified through this process are assigned to medical coders for coding of the physician services rendered on behalf of these patients and submission to third party payors, potentially disrupting coder workflows. For additional information on VHA's challenges with timely insurance identification, please reference Assessment Report I.

9.2.2 Adoption of Documentation Best Practices is Variable, Resulting in Inconsistent Quality of Clinical Documentation System-wide

Accurate and complete clinical documentation is the cornerstone of effective health information management and transparency into performance. One critical enabler of effective clinical documentation is the use of electronic health records (EHRs), an area in which VHA has traditionally been viewed as an industry leader (HHS, 2015). With organization-wide implementation of the Veteran's Health Information System and Technology Architecture (VistA) dating back to 1985, VHA boasts longer experience with the use of electronic health records than nearly any other health care organization. And despite the recent development of commercial systems for medical documentation, VistA continues to be highly-regarded among clinical personnel, with recent surveys suggesting that physicians prefer VistA's CPRS to most commercial EHRs (Medscape, 2012).

---

[445] Site visit documentation and coding assessment workshops (N=20)

However, an EHR is only effective so long as the data captured within it is accurate. As shown in **Figure 9-3**, provider documentation is the first of several steps in the documentation and coding process. Because of the interdependencies of further steps, it is critical that health care organizations ensure that complete and accurate clinical documentation is consistently captured within the health record. To support these purposes, industry professional organizations have established documentation standards to ensure integrity of health care records, including optimal template management and the appropriate use of copy-paste (Arrowood, 2013).

Figure 9-3. Role of Copy-Paste and Template Management in Clinical Documentation

For quality assurance, health care organizations implement processes to ensure that provider documentation practices are compliant with the high standards that ensure that clinical documentation is reliable for coding, billing, and communicating accurate information among providers. Our assessment revealed that facilities continue to report challenges with the quality of clinical documentation, in spite of the quality assurance practices currently in place. These issues may contribute to inaccurate data capture and preclude appropriate billing and decision-making based on captured data. We identified the following challenges associated with clinical documentation:

9.2.2.1 Inconsistent adoption of provider documentation best practices (e.g., template use, appropriate copy-paste) challenges effectiveness

9.2.2.2 Ineffective provider query practices and limited provider responsiveness at many facilities contribute to persistence of suboptimal documentation

9.2.2.3 Incomplete uptake of clinical documentation improvement (CDI) programs and variable best practice implementation has limited potential impact from these programs

As mentioned in section 9.2.1.3, lack of robust performance management and transparency appears to contribute to limited prioritization of accurate documentation and coding across the organization. In turn, this lack of emphasis at the facility and provider level may result in the many of the suboptimal decisions and behaviors reported in 9.2.2.1–9.2.2.3. Because of this, VHA should consider efforts to promote transparency and performance management around documentation and coding performance as foundational to any efforts to address the suboptimal practices outlined in this section.

9.2.2.1 Inconsistent Adoption of Provider Documentation Best Practices (e.g., template use, appropriate copy-paste) Challenges Effectiveness

Consistent adoption of appropriate documentation practices is critical to maintaining the integrity of information captured within EHR systems. Because of this, professional organizations have laid out expectations regarding the appropriate use of copy-paste, effective implementation of clinical templates, and robust processes for EHR quality assurance to promote optimal documentation (Arrowood, 2013). Our assessment suggests several documentation challenges for VHA, including: (1) templates are not consistently used or optimally managed; (2) copy-paste is not always used appropriately, challenging usability of clinical documentation; and (3) health record review processes have not effectively resolved all documentation challenges.

> **Templates are not consistently used or optimally managed.** Use of well-designed clinical templates helps support effective documentation and coding in the following ways:
>
> - Facilitates effective written communication among providers
> - Ensures capture of all critical information to support accurate coding
> - Enhances coder productivity by standardizing location of key information within patient records
>
> Because of these benefits, industry professional organizations have promoted template use for clinical documentation, in particular as a potential strategy to address the upcoming industry-wide transition to ICD-10 in October 2015, which will require more specific clinical documentation to support accurate medical coding (Clark, 2012).
>
> We found the appropriate use of existing clinical templates to be a challenge across VAMCs. Clinical and administrative staff at 80 percent of site visits reported issues

---

with appropriate template use, making this the most commonly-reported challenge related to provider documentation patterns.[446] Specifically, sites reported challenges with consistent use of template notes instead of free text notes, completion of all necessary fields within templates, and use of the same template across similar patient encounters.

Our assessment suggests that issues raised regarding template use may originate, in many cases, from insufficient controls on template creation at certain VAMCs. VHA Handbook 1907.01 specifies that new templates must be approved prior to implementation (VHA, 2014). However, the directive does not lay out a standard approval process for use across VHA. Data from our VHA data call suggests inconsistencies in the approach taken at the VAMC level to template management.[447] For example, one facility reported a policy whereby a template proposed by an individual physician could be approved through a single review by a committee at the VAMC level. In contrast, another VAMC reported a more extensive process requiring service line alignment to develop new templates followed by approvals at both the VAMC and VISN levels before implementing a new template.

Select VAMCs have launched efforts to rationalize the number and design of available clinical templates. For example, the Palo Alto VAMC undertook a full review of its nursing templates during an 18-month period starting in 2013. The initiative commenced with compilation of a comprehensive listing of all nursing templates in use at the facility. Each of the original 1,400 templates identified was reviewed to determine whether it should be maintained or eliminated. Through the review process, Palo Alto was able to decrease the number of nursing templates by more than 50 percent. The nursing service also strengthened its review criteria for proposed new templates in order to maintain improvements.

Although we did not assess the quality of local clinical templates resulting from template management practices currently in place, the perspectives conveyed by participants during our on-site documentation and coding assessment workshops suggest the need for improvements. Many of the improvement ideas proposed during our workshops relate to the lack of alignment of template design with coding requirements. This emphasis on template design was grounded in the concern that, in some cases, existing templates may contribute to miscommunication of patient status between providers and coders due to their lack of key documentation elements necessary to support accurate and medically appropriate coding.[448]

Copy-paste is not always used appropriately, challenging usability of clinical documentation. The appropriate use of copy-paste within EHRs promotes provider efficiency in documentation by enabling consistent and timely capture of complex

---

[446] Site visit documentation and coding assessment workshops (N=20)

[447] Choice Act data call template management process descriptions

[448] Site visit documentation and coding assessment workshops (N=20)

patient data that doesn't change over time (Figure 9-3). However, widespread use of copy-paste also presents a number of potential challenges, including:

- Propagation of outdated or inaccurate information
- Expansion in the quantity of potentially redundant clinical information
- Difficulty in determining authorship of documentation (AHIMA, 2014)

Our analysis suggests that use of copy-paste across VHA is a widespread challenge. During documentation and coding assessment workshops conducted during site visits, 55 percent of sites reported inappropriate use of copy-paste within clinical documentation.[449] Coders commonly expressed that unwarranted use of the copy-paste function slows down medical coding and can lead to challenges in interpreting the record for coding when information within a single note is internally inconsistent. The challenge of efficiently interpreting clinical documentation when copy-paste is used indiscriminately was reflected by the comments of a medical coder, who stated: "Sorting through the noise created by copy-paste is a huge challenge. It is almost impossible to find the information that you're looking for when you have to scroll through screen after screen of copied documentation. And even when you find what you're looking for, all the copy-paste makes you wonder how accurate it really is: when the note says that the catheter was removed three days in a row, it diminishes your confidence in the rest of the information contained in the patient record."[450]

Health record review processes have not effectively resolved all documentation challenges. Expectations regarding performance of regular facility-level EHR quality reviews are outlined within VHA Handbook 1907.01: Health Information Management and Health Records (2014). This directive dictates quarterly review of the EHR focused on a number of key dimensions, including appropriateness of copy-paste use, evaluation of proposed new templates, and presence of unsigned progress notes. A 2014 OIG Combined Assessment Summary Report indicated strong compliance with this process, suggesting that ~75 percent of facilities perform EHR quality reviews at least quarterly (OIG, 2014).

Our assessment also suggests that the majority of VAMCs are performing nationally-directed EHR quality reviews, with 88 percent of facilities reporting that they reviewed copy-paste use at least quarterly during the last year.[451] However, as previously noted, challenges persist with respect to appropriate use of templates and copy-paste functionality. Given that both of these issues are intended to be addressed through EHR quality reviews, the EHR quality review processes currently in place do not appear to be consistently yielding the desired improvements in documentation quality. Our assessment suggests that this may be, in part, due to

---

[449] Site visit documentation and coding assessment workshops (N=20)

[450] Site visit documentation and coding assessment workshop participant comment

[451] Choice Act data call (N=49)

variability in locally-outlined EHR quality review processes. To illustrate, only 55 percent of facilities submitting documents through the VHA data call submitted EHR review policies as requested.[452] Even among VAMCs submitting policies, we observed significant variability in the depth with which quality review processes are outlined. These differences likely contribute to variation in VHA's ability to drive desired documentation improvements through consistent EHR reviews.

9.2.2.2 Ineffective Provider Query Practices and Limited Provider Responsiveness at Many Facilities Contribute to Persistence of Suboptimal Documentation

As part of a collaborative documentation and coding process, medical coders submit queries to providers when clinical documentation is incomplete or unclear. When providers respond to queries and appropriately addend clinical documentation, coding quality is enhanced because coders are able to appropriately code encounters based on a patient's true clinical condition and the level of care provided rather than incomplete clinical documentation initially captured in the medical record (Arrowood, 2013).

National HIM leadership has put in place the technical infrastructure to support performance of provider querying and consistent tracking of results across VHA. In 2012, VHA launched the Physician Query Tracking (PQT) tool. This tool supports provider querying by allowing HIM personnel to track the number of queries submitted to providers, provider response rates, and query outcomes. Trending query data has the potential to yield insights into problematic documentation practices and suggest whether documentation practices are improving over time. In spite of availability of the PQT tool organization-wide, it has not been fully adopted. We found that ineffective provider query practices continue to inhibit optimal documentation and coding, as evidenced by: (1) variable adoption of the provider query process and query tools across VHA; (2) low provider responsiveness to queries; (3) use of suboptimal methods for querying providers; and (4) variable use of the PQT tool's reporting and tracking capabilities.

> **Variable adoption of the provider query process and query tools across VHA.** Handbook 1907.01 outlines expectations that all VAMCs implement a provider querying process at the facility-level to ensure quality of the information captured within the EHR (VHA, 2014). Data from the PQT tool suggests that while adoption of provider querying has improved over time, the practice has not yet been embraced at all facilities, with 10 percent of VAMCs not querying providers during FY2014 (compared to 20 percent in FY2013 and 41 percent in FY2012).[453] Our site visit findings are consistent with this data and also suggest that adoption of provider querying continues to gain traction across VHA: at least two facilities that we visited reported implementation of the provider query process during Q2 of FY2015.
>
> **Low provider responsiveness to queries.** Provider responsiveness to queries within VHA does not match performance within private hospitals. Figure 9-4 compares the

---

---

distribution of provider query response rates within VHA to private hospitals. Overall, the distribution shows that VHA has a few high-performing facilities, but 38 percent of VAMCs have provider response rates under 50 percent. The overall lack of responsiveness within VHA may contribute to coding inaccuracies, because coders are forced to code based on existing, potentially incomplete, medical documentation when providers do not respond to queries.

Figure 9-4. Comparison of Provider Query Responsiveness: VHA Versus Private Hospitals

VHA provider responsiveness to queries lags private sector

Provider query responsiveness – VHA[1] vs. private hospitals[2]

SOURCE: VHA Physician Query Tracking (PQT) tool (FY2014); ACDIS Physician Query Benchmarking Report (2010)

Use of suboptimal methods for querying providers. Most VAMCs use secure VHA email to relay queries to providers. This is in contrast to what has been found to be most effective in private hospitals, where only 3% of CDI specialists have identified email to be the most effective of a variety of physician querying techniques (Figure 9-5).

Figure 9-5. CDI Specialist Perspective on Most Effective Provider Query Technique

Private hospital CDI specialists report that leaving queries in a patient's medical record is perceived the "most effective" provider query technique[1]

1 Leaving queries in a patient's medical record and the other tactics noted were tracked in the "2010 Physician Query Benchmarking Report", and are provided here as an illustration of query techniques used within the private sector and their perceived effectiveness by survey respondents. Our assessment and the high preforming facilities we interviewed are not endorsing any particular technique.
2 Includes hand delivery of query form, fax, and "other"

SOURCE: 2010 Physician Query Benchmarking Report (ACDIS)

VHA physicians raised several concerns about the use of email as the primary mode of provider querying. Limited off-site accessibility to secure VHA email, high number of e-mails received per day, and low overall utilization of VHA email were all sited as factors inhibiting providers' ability to respond to email-based queries in a timely fashion. This problem becomes particularly acute in the context of VAMCs affiliated with academic medical centers, where providers may spend as few as two days per month treating patients within VHA facilities, causing these providers to have even more limited access to secure VHA email systems. As on VHA physician noted: "Many providers at our facility split time between VA and an academic medical center. For those that spend one day per week or fewer at VA and rarely check VA email when they are not at the facility, is it really feasible for them to notice and then respond to a query by the time the coders need their response for coding?"

Variable use of the PQT tool's reporting and tracking capabilities. Even among facilities that have embraced provider querying and attained high levels of provider responsiveness, our assessment suggests variable use of the PQT tool's full reporting capabilities to drive documentation improvements. For instance, one VAMC reported using the tool consistently to assess patterns and issues with documentation to identify improvement opportunities. The HIM leader at the facility

stated: "We use the PQT tool to target individual providers. Sometimes the issues are with individual providers, other times with provider teams. We use the data to pull up patterns for review and then go out and train the providers that need training." In contrast, another facility has embraced the PQT tool and reports strong provider engagement and responsiveness, but leaders stated they scarcely use data from the PQT tool to design their documentation improvement efforts. Variation in the use of the PQT tool's reporting and tracking capabilities may contribute to differences in the effectiveness of local efforts to improve documentation practices.

9.2.2.3 Incomplete Uptake of Clinical Documentation Improvement (CDI) Programs and Variable Best Practice Implementation has Limited Potential Impact from These Programs

Recent industry trends toward increased tracking and reporting of clinical quality measures has caused many health care organizations to increase the scrutiny with which they examine medical documentation. This increased emphasis on proper documentation patterns has led to the development of clinical documentation improvement (CDI) programs across the industry (Towers, 2013; Danzi, 2000). These programs aim to improve provider documentation practices by providing training and education on compliant documentation to physicians, a skill that is not taught in medical school (Arrowood, 2013). There is significant heterogeneity across health care organizations in the approach to CDI program implementation, although a common model involves the hiring of dedicated CDI specialists (who can either be expert coders or nurses with a working knowledge of medical coding) to work with a physician advisor to promote documentation accuracy through performance measurement and provider education. Well-functioning CDI programs play a vital role in promoting accuracy and completeness of clinical documentation.

The national VHA HIM office provided guidance to facilities on implementing CDI programs by releasing the VHA CDI Program Guide in March 2013. This resource outlines several key objectives of CDI programs, including review of provider documentation for high-priority clinical records, promotion of provider buy-in, and provision of targeted provider education and training. Each facility was encouraged to implement a CDI program conforming to the objectives and specifications outlined in the program guide. Our assessment suggests that: (1) VAMC uptake of CDI programs has been incomplete; and (2) CDI program impact has been inconsistent across participating facilities.

> **VAMC uptake of CDI programs has been incomplete.** We found that VAMCs have not uniformly adopted CDI programs. According to the 2014 HIM Inventory, 46 percent of VAMCs reported having a CDI program (compared to 31 percent of VAMCs in 2013).[454] Lack of facility-level support for these programs appears to be one barrier to more widespread adoption.[455]

---

[454] 2014 HIM Inventory (N=134)

[455] Site visit HIM chief interviews (N=21)

CDI program impact has been inconsistent across participating facilities. Our analysis suggests variability in the approach that facilities have taken to CDI program implementation. For instance, we would expect to see consistent implementation of provider querying for VAMCs with CDI programs, given that provider querying is a core activity promoted by CDI. However, we found that 3 of the 43 (7 percent) VAMCs (complexity level 1a, 1b, 1c, and 2) reporting CDI program implementation submit queries on less than 0.1 percent of encounters, suggesting limited use of the provider query process in spite of CDI program adoption.[456] In addition, we found that while 57 percent of the highest-performing VAMCs on provider query responsiveness do have CDI programs, overall query responsiveness for VAMCs with CDI programs is only slightly higher than for VAMCs without CDI programs (58 percent versus 51 percent).[457] This data suggests that while some VAMCs may have implemented particularly effective practices as part of their CDI efforts, not all facilities have been as effective with their CDI program implementations.

VAMCs implementing CDI have reported varying degrees of success with their locally-designed programs. For example, the Lexington VAMC has driven improvements in measured clinical quality and accurate patient classification through its CDI program (see case study below). However, not all VAMCs have experienced the same outcomes, as illustrated by on local HIM chief who stated, "We recently implemented a CDI program here but we haven't yet seen the results we were hoping for. We would love to know what is working at other facilities." These facility-level differences in CDI effectiveness and variability in implementation of core CDI components may indicate gaps in VHA's national approach to local CDI program implementation.

Table 9-3. VAMC Case Study: CDI Program Implementation

Best practice case study – Lexington VAMC
The **Lexington VAMC** has implemented a **CDI program** to promote documentation improvement and accurate capture of data to reflect the quality of care delivered by the facility.   **Details**   ▪ Dedicated one **CDI specialist** to manage to facility's program and to **work directly with clinicians on documentation improvement and training**   ▪ Designated a CDI physician advisor to champion CDI efforts and provide training to physicians on documentation issues   ▪ Implemented the "Madison Model" patient classification assessment tools to ensure review of patient records with high-priority clinical conditions to ensure that documentation and coding of these records accurately captures patient complexity

---

Best practice case study – Lexington VAMC
Impact ▪ In one year, the facility moved from a one-star rating to a five-star rating based on improved capture of measures that contribute to clinical quality

9.2.3 System-wide Focus on Coding Standards has Resulted in Coding Performance Typically Meeting or Exceeding Private Sector Benchmarks

Coding is the process by which clinical documentation is translated into industry standard medical codes. This process is performed by medical coders who are trained to assign medical codes consistently and appropriately based on provider documentation. Maintaining coding accuracy is of critical importance because coding data is used for various secondary purposes (e.g., billing, analytics, quality reporting). Medical coding professional associations recommend that hospitals set a minimum coding accuracy target of 95 percent (AHIMA, 2008).[458] In addition to accuracy targets, hospital organizations also commonly set targets for coding timeliness to ensure that records can be closed and sent to payors for billing, facilitating prompt revenue collection. Timeliness targets vary across organizations, but are typically set between three and seven days after discharge (HCPro, 2011).

Our assessment indicates that VHA performance on coding timeliness (e.g., time from patient discharge to coding) and accuracy (e.g., reliability of coding based on existing clinical documentation) is closely aligned with private sector benchmarks. According to the most recent national VHA audit of 10 randomly-selected facilities, the overall inpatient coding accuracy rate was found to be 93 percent.[459,460] With respect to coding timeliness, recent VHA data indicates an average inpatient coding turnaround time of four days after discharge.[461] Our analysis suggests the following as key drivers of high performance:

9.2.3.1 Visibility into performance through establishment of clear coding targets and performance tracking supports transparency and improvement

9.2.3.2 Regular application of coder auditing by internal coding experts at the facility-level yields feedback loop to identify inaccuracies and improve performance

9.2.3.3 Use of coding software that incorporates best practice features (e.g., error checking, decision support) facilitates coding accuracy

---

[458] Note that accuracy in this context refers to inter-coder reliability, or the extent to which an expert coder would assign the same medical codes based on existing clinical documentation; high coding accuracy means that does not necessarily mean that codes represent a patient's true condition, as insufficient or inaccurate provider documentation may inhibit optimal assignment of codes

[459] VHA Coding and Billing Audit Results (2013-2014)

[460] As mentioned in the introduction of this section, we did not independently verify this result (e.g., through a coding audit).

[461] VHA HIM Executive Summary (2014)

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

9.2.3.1 Visibility Into Performance Through Establishment of Clear Coding Targets and Performance Tracking Supports Transparency and Improvement

The ability to accurately monitor performance trends over time is a key enabler of performance improvement. This has been shown across a variety of health care domains, including patient safety and operational efficiency (Donaldson, 2005). In order to ensure high performance for medical coding professionals distributed across VHA's national geographic footprint, visibility into performance is key to promoting improvement. Implementation and sound practices to promote high medical coding performance was evidenced by: (1) establishment of clear medical coding performance targets across the organization; and (2) development of an executive summary dashboard for medical coding performance tracking.

> **Establishment of clear medical coding performance targets across the organization**. VHA Handbook 1907.03: Health Information Management Clinical Coding Program Procedures establishes clear performance standards across a number of critical performance domains (VHA, 2012). For example, a consistent, national coding accuracy standard is set at 95 percent, consistent with benchmarks established in private industry. We found that establishment of this standard has created remarkable consistency in target-setting across the organization, as evidenced by 97 percent of VAMCs reporting establishment of accuracy targets aligned with national targets.[462]
>
> **Development of an executive summary dashboard for medical coding performance tracking.** In support of the organization's efforts to promote timely and accurate coding, VHA disseminates a quarterly health information management executive summary dashboard to facilitate performance comparisons and tracking of improvements over time. This dashboard, first published at the beginning of FY2013, highlights performance across a number of key coding metrics, including time from discharge to coding and presence of unsigned progress notes. This tool contributes to VHA's coding performance by providing a tool for consistent tracking of performance across the organization and identification of improvement opportunities.

9.2.3.2 Regular Application of Coder Auditing by Internal Coding Experts at the Facility-level Yields Feedback Loop to Identify Inaccuracies and Improve Performance

For high-performing hospital organizations, compliance of medical coding practices is critical to ensuring accurate capture of clinical data, identifying potential gaps in capabilities of coders, and protecting against allegations of fraud and abuse. Regular auditing of medical coding is a key process to ensure coding compliance (Prophet, 1998). Assurance of compliant coding practices across VHA are supported by: (1) clear guidance on expectations for coder auditing procedures; and (2) consistent adoption of coder auditing procedures at the facility level.

---

[462] VHA 2014 HIM Inventory (N=134)

Clear guidance on expectations for coder auditing procedures. As outlined above, VHA's national HIM office has established clear expectations regarding quality assurance processes for medical coding, as outlined in VHA Handbook 1907.03 (VHA, 2012). In addition to establishment of a clear 95 percent performance target, the handbook also specifies that "coder assigned codes [be] reviewed internally by a qualified coder at the highest level of knowledge and skill, or by utilizing an external coding consultation group that has knowledge of and experience in VA coding practices and requirements." This guidance provides clear expectations to VAMC HIM leadership on the processes expected to ensure compliance of medical coding practices. In addition, we found the practice of performing regular internal audits of coding quality to be consistent with the practices in place at high-performing provider organizations.[463]

Consistent adoption of coder auditing procedures at the facility level. Our interviews during site visits and information from national datasets suggest that coder audits have been consistently implemented across VHA. Responses captured in the 2014 HIM Inventory indicate that 89 percent of facilities conduct regular or routine auditing of coding staff.[464] While 25 percent of facilities report contracting for external coding audit services, our interviews with facility-level HIM chiefs suggest that the majority of the auditing is conducted by experienced coders at the facility-level.[465] These practices have driven high rates of accuracy for medical coding, as suggested by a national accuracy rate of 93 percent from the most recent national audit and self-reported performance from the data call, wherein respondents reported an average accuracy rate of approximately 93 percent during the last 15 months.[466]

Implementation of monthly coder auditing creates a regular feedback cycle that accelerates identification of challenges and performance improvements. Among HIM staff responding to our survey, 83 percent indicated that coders receive feedback regarding the accuracy of their medical coding at least quarterly; 89 percent of these respondents reported that monthly audits were either "very effective" or "somewhat effective" at identifying errors and changing behaviors.[467] These survey responses suggest that regular coder auditing may contribute to accurate assignment of codes across the organization.

9.2.3.3 Use of Coding Software That Incorporates Best Practice Features (e.g., error checking, decision support) Facilitates Coding Accuracy

The process of medical coding has become increasingly reliant on electronic systems during the past decade, introducing the need for effective software systems to support coding functions

---

[463] Interview with a large national provider organization with robust proprietary revenue cycle capabilities

[464] 2014 HIM Inventory (N=134)

[465] 2014 HIM Inventory (N=134); site visit HIM chief interviews (N=21)

[466] Choice Act data call (N=40)

[467] Choice Act survey (N=29)

(Towers, 2013). VHA currently uses the Nuance Clintegrity 360 suite of products to support its coding efforts across the organization. Our assessment found that the software tools currently in place for VHA support the efforts of coders to accurately assign codes to patient records. Specifically, our assessment suggests that: (1) VHA's medical encoder software incorporates features to support coding accuracy; and (2) users report high degree of satisfaction with existing coding software.

> **VHA's medical encoder software incorporates features to support coding accuracy.** Given the current complexities of medical code assignment, qualified medical coders rely on software platforms to support accurate code assignment to clinical encounters. The medical encoder used within the Clintegrity 360 system in place at VAMCs nationally is the Quadramed encoder. This product is a standard coding tool that is also used by 12 percent of organizations within the private sector, making it the second most common medical encoder in use throughout the industry (HCPro, 2011). Our site visit (shadowing observations of medical coders) suggested that VHA's coding software incorporates critical features to support accurate coding assignment, including decision support and error checking tools, reporting and auditing capabilities, and educational resources (e.g., online code books).[468] According to our survey, 60 percent of HIM staff reported referencing decision support tools included within the encoder at least several times per week,[469] and 90 percent reported that these resources are either "highly effective" or "somewhat effective" at identifying and preventing errors in medical coding.[470]
>
> **Users report high degree of satisfaction with existing coding software.** Our site visit shadowing sessions and on-site interviews with medical coders and HIM leadership revealed overall satisfaction with VHA's coding tools. Facility-level HIM chiefs voiced their satisfaction with VHA's current coding product, with 95 percent of site visits interviewees indicating that VHA's code editing software meets coding needs.[471] These views were corroborated by our survey, wherein 90 percent of HIM staff rated VHA's medical coding systems as "very easy to use" or "moderately easy to use."[472] Finally, satisfaction with existing capabilities of current coding tools was indicated by findings from our documentation and coding assessment workshops: of the >200 potential improvement ideas suggested to enhance VHA's documentation and coding performance, none suggested changing the organization's medical encoder or incorporating new features.[473]

9.3   Recommendations

VHA documentation and coding practices have multiple stakeholders: Congress and the Executive branch, VACO, VHACO, VISN leadership, and VAMC management and staff. Encouraging innovation and addressing critical challenges in documentation and coding will require collaboration among all of these groups, and a commitment to making difficult, long-term change. Different recommendations should be owned by different groups (e.g., recommendation requiring changes to VACO policy versus local policy) -- however, support for change from all stakeholders is critical to effective implementation.

Our recommendations, building on existing strengths and addressing existing challenges in documentation and coding, can be categorized into two main themes.

> **9.3.1   Increase local prioritization of clinical documentation through acceleration of national CDI program and targeted provider education and training, supported by performance management at the facility and provider level**
>
> **9.3.2   Strengthen provider documentation standards (e.g., management of clinical templates, EHR review process) to promote optimal capture of patient information and improve resulting resource management**

These themes are consistent with practices suggested by the academic literature, professional associations, and high-performing hospitals within VHA and outside the system, as well as solutions proposed by front-line VHA staff – this information is included in "summary of supporting evidence" sections in each sub-recommendation (see **Appendix F.4** for additional detail on our methodology for gathering this data). To help VHA implement our recommendations, we have also suggested next steps in the "potential near-term actions" sections of the sub-recommendations. Note, because different VAMCs may have already adopted some recommended practices or experience unique barriers, these suggestions should be tailored the individual circumstances of each VAMC. Each recommendation is supported by several sub-recommendations, which map to the "organization, workflow processes, and tools" domains specified in the Choice Act. For a detailed map of how the sub-recommendations relate to these domains, see **Table F-2** in **Appendix F.3**.

Several recommendations overlap with other assessment areas. Where this occurs, we have referenced the relevant assessment area, which has additional detail.

9.3.1   Increase Local Prioritization of Clinical Documentation Through Acceleration of National CDI Program and Targeted Provider Education and Training, Supported by Performance Management at the Facility and Provider Level

As noted in section 9.2.1, one of VHA's key challenges in promoting accurate documentation and coding is a lack of understanding across various organizational levels regarding the importance of documentation and coding practices for VHA. Changes in the culture surrounding the importance of documentation and coding could increase the integrity of data contained in

VHA's systems, increasing opportunities for revenue collection and improving VHA's internal resource allocation and quality measurement capabilities.

To facilitate the needed cultural change, we recommend the following:

9.3.1.1 Incorporate documentation metrics into regular performance reviews for both providers and facilities

9.3.1.2 Reinforce CDI program by providing targeted guidance on national documentation priority areas and by creating a national information-sharing network for CDI best practice sharing

9.3.1.3 Develop and deploy provider educational and training programs to address unique VHA documentation needs and reemphasize the importance of documentation for Veterans and the organization

9.3.1.1 Incorporate Documentation Metrics Into Regular Performance Reviews for Both Providers and Facilities

Our assessment revealed evidence of low prioritization of documentation and coding across the organization. Establishment of stronger performance management systems focused on documentation and coding performance could improve prioritization organization-wide. VHA should use enhanced data transparency and performance management systems to motivate VAMC efforts to improve clinical documentation.

Summary of supporting evidence:

- See Section 9.2.1.3 for more detail on findings.

- Proposals from staff participating in on-site workshops suggest front-line support for increased transparency and performance management, with 60 percent of sites recommending increased provider accountability for documentation performance as a solution to improve performance[474]

- Experience from a high-performing hospital organization demonstrates the effectiveness of incorporating documentation metrics (e.g., responsiveness to queries, timeliness of discharge summary completion, presence of unsigned progress notes, improvements in provider case-mix over time) into performance reviews to promote improved documentation practices (see case study in Section 9.2.1)

Potential near term actions:

- *VHACO:* Incorporate composite documentation and coding quality metric into the national SAIL report for facility-level performance tracking.
    - ○ *VHACO:* Review documentation quality metrics currently tracked within HIM reports and other national data sources (e.g., allocation resource center data, patient case mix data) to identify critical performance tracking metrics.

---

[474] Site visit documentation and coding assessment workshops (N=20)

- ○ *VHACO:* Align on a single metric that reflects the quality of local clinical documentation practices for incorporation into the SAIL report.
- ○ *VHACO:* Confirm impact and determine appropriate roll-out of education and training to facilities on the impact of clinical documentation on the measurement of other metrics currently included within SAIL report (e.g., quality metrics).
- *VHACO/VAMC:* Create a national provider performance dashboard to track documentation quality metrics at the individual provider level, enabling increased performance management at the local level.
  - ○ *VHACO:* Identify and increase emphasis on new and existing outcomes-oriented documentation quality metrics (e.g., percent of discharge summaries complete within 48 hours, number of unsigned progress notes) for tracking performance of local clinical service lines and individual providers.
  - ○ *VHACO/VAMC:* Provide education and training to facility-level chiefs of staff on capabilities of performance dashboard and recommended uses with local service line chiefs and physicians.
  - ○ *VAMC:* Assign responsibility for facility-level documentation performance to local chiefs of staff to signal documentation's importance among providers.
  - ○ *VAMC:* Incorporate individualized documentation improvement goals within annual provider performance plans and reviews, reinforced by incentives for high performance on key metrics.
- *VACO/VHACO:* Improve national capabilities for tracking impact of documentation practices on opportunities for billing and reimbursement.
  - ○ Refer to Assessment I for additional details.

9.3.1.2 Reinforce CDI Program by Providing Targeted Guidance on National Documentation Priority Areas and by Creating a National Information-sharing Network for CDI Best Practice Sharing

VHA has experienced difficulty in improving organization-wide documentation performance through current CDI efforts. Recommendations from industry professional organizations support the use of CDI programs to drive improvements in documentation practices. VHA should reinforce and improve current CDI efforts to support enhancements in provider documentation patterns and increased prioritization of accurate clinical documentation across VHA.

Summary of supporting evidence:

- See Section 9.2.2.3 for more detail on findings.
- Proposals from staff participating in on-site workshops demonstrate pockets of enthusiasm for CDI implementation at the local level, with 38 percent of facilities lacking

---

CDI programs recommending implementation to address documentation and coding challenges.[475]

- Evidence from the academic literature suggests improvements in key documentation outcomes (e.g., percent correct DRG assignment) through implementation of CDI programs with dedicated CDI specialists (Hicks, 2003).
- Experience of Lexington VAMC demonstrates potential to improve quality outcomes and optimize resource allocation through CDI efforts (see case study in Section 9.2.2.3).

Potential near term actions:

- *VHACO/VAMC:* Focus national CDI efforts on a subset of priority documentation areas.
  - *VHACO/VAMC:* Outline three to five priority clinical areas requiring documentation improvements (e.g., increased specificity in documenting heart failure) based on information captured nationally within the PQT tool and insights from facility-level HIM chiefs; rotate priority clinical areas periodically in response to documentation improvements and identification of new challenges.
  - *VHACO:* Develop national educational materials regarding each priority area and how to promote documentation improvements (e.g., provider groups to target for education, clinical templates to facilitate comprehensive capture of required clinical data).
  - *VHACO:* Track progress by outlining and following a set of targeted metrics expected to improve through effective CDI implementation (e.g., average case mix for patients with DRGs targeted by CDI efforts).
- *VHACO/VAMC:* Create a national information-sharing network for dissemination of CDI best practices.
  - *VHACO/VAMC:* Review key performance metrics (e.g., query responsiveness, changes in VERA allocations, changes in quality performance as measure by SAIL report) for sites that have implemented CDI programs, identifying sites that have experienced significant recent improvements.
  - *VHACO/VAMC:* Engage with high-performing CDI facilities to identify common features of high-performers.
  - *VHACO/VAMC:* Showcase practices and results of high performing facilities as part of existing HIM webcasts and in brief presentations to facility HIM chiefs and CDI specialists to promote broader program support and dissemination of best practices.

9.3.1.3 Develop and Deploy Provider Educational and Training Programs to Address Unique VHA Documentation Needs and Reemphasize the Importance of Documentation for Veterans and the Organization

Our assessment indicates that inconsistent provider training and education in documentation standards may be one driver of documentation challenges. High-performing hospital

---

[475] Site visit documentation and coding assessment workshops (N=13)

organizations have improved provider documentation through consistent, targeted provider training and education programs. We recommend targeted improvements to current VHA provider documentation training and education practices to address these difficulties and ensure appropriate messaging regarding documentation's critical role for the organization.

Summary of supporting evidence:

- See Section 9.2.1.2 for more detail on findings.

- Proposals from staff participating in on-site workshops indicate nearly universal support for increased provider documentation training, with 95 percent of sites recommending increased provider education and training to improve documentation practices.[476]

- Studies within the academic literature have demonstrated positive impact on provider documentation patterns following targeted training and education (Danzi, 2000).

- Experience of Durham VAMC suggests that effective provider training supports accurate documentation and improvement in secondary metrics based on coding (e.g., accurate measurement of case mix) (see case study in Section 9.2.1.2).

Potential near term actions:

- *VHACO:* Develop national communication and training materials to reinforce the key role of documentation within VHA and to address VHA-specific documentation needs.
    - o *VHACO:* Align on coherent national messaging (e.g., accurate documentation improves quality of care for Veterans and supports increased revenue collection locally to address priority facility-level needs) to promote documentation improvement efforts from key clinical stakeholders.
    - o *VHACO:* Prepare provider training materials addressing the components of documentation that are unique within VHA context.
    - o *VHACO:* Develop national, service-line specific provider documentation "tip cards" addressing common documentation pitfalls associated with different service lines.
- *VAMC:* Develop local strategies for continuous provider education and training on documentation issues.
    - o *VAMC:* Deliver an in-person, peer-led education session establishing a common understanding regarding the proper role of documentation for VHA.
    - o *VAMC:* Establish expectations for mandatory provider attendance at occasional, service-line specific trainings addressing key facility-level and service-line specific priority documentation issues.
    - o *VAMC:* Offer additional targeted training opportunities at the request of service line chiefs (e.g., individualized training for providers with high query volumes, service line training for service line documentation challenges) to address priority issues as they arise at the facility level.

---

[476] Site visit documentation and coding assessment workshops (N=20)

- *VAMC:* Create local systems to allow for provider input on desired documentation training topics and align training sessions with common provider challenges and concerns.

9.3.2 Strengthen Provider Documentation Standards (e.g., management of clinical templates, EHR review process) to Promote Optimal Capture of Patient Information and Improve Resulting Resource Management

VHA HIM and clinical staff commonly reported documentation patterns that are misaligned with industry best practice. Efforts to address these challenges has the potential to improve the quality of clinical documentation and resultant medical coding, improving care for Veterans as well as VHA's ability to optimize third party revenue collections.

To bring about desired improvements in VHA documentation patterns, we recommend the following:

> **9.3.2.1 Eliminate duplicative clinical templates and standardize requirements for new template creation**

> **9.3.2.2 Strengthen EHR reviews to ensure appropriate use of copy-paste, including implementation of CPRS tool to automate the process**

> **9.3.2.3 Implement standardized processes for following up on outstanding provider queries and improve provider accountability for query responsiveness**

9.3.2.1 Eliminate Duplicative Clinical Templates and Standardize Requirements for New Template Creation

Our interactions with providers and coders during site visits indicated that appropriate template use and management are common challenges to optimal documentation across VAMCs. Recommendations from industry professional associations emphasize the benefits of clinical templates to coding accuracy, documentation readability, and ICD-10 readiness. VHA should improve its template management and use practices to improve coder efficiency and increase the organization's readiness for the upcoming ICD-10 transition.

Summary of supporting evidence:

- See Section 9.2.2.1 for more detail on findings.
- Proposals from staff participating in on-site workshops emphasize the need for improved template management and use practices, with 75 percent of sites recommending this solution to improve current documentation practices.[477]
- Recommendations from industry professional organizations indicate potential benefits in documentation completion, documentation quality, coder productivity, and coding accuracy from clinical template usage (Clark, 2012).

---

[477] Site visit documentation and coding assessment workshops (N=20)

- Experience of Palo Alto VAMC demonstrates opportunity to streamline the number and design of clinical templates to improve documentation consistency (see case study in Section 9.2.2).

Potential near term actions:

- *VHACO:* Maintain a national "template library" to allow sharing among facilities and promote broader adoption of effective clinical templates.
  - *VACO/VHACO:* Create national online resource for posting and downloading national example clinical templates and to promote inter-VAMC sharing of locally adapted templates.
  - *VHACO:* Conduct national materials request to aggregate high-performing clinical templates developed at the local level.
  - *VHACO:* Review locally-developed templates to create best practice national example clinical templates for priority clinical note types.
  - *VHACO:* Ensure that design of national example clinical templates is consistent with VHA's data interoperability and data standards goals (refer to Assessment H report for additional detail).
- *VAMC:* Conduct local review of existing provider templates to identify opportunities to streamline and improve templates across note types.
  - *VAMC:* Eliminate duplicative templates based on current frequency of use and effectiveness of design (e.g., comprehensiveness, readability).
  - *VAMC:* Create a standard listing of preferred provider templates for inpatient notes across disciplines and note types (e.g., surgery history and physical template, cardiology consultation template).
- *VHACO/VAMC:* Strengthen local criteria for creation of new templates to ensure optimal design and avoid unnecessary duplication.
  - *VHACO/VAMC:* Ensure inclusion of coders on local and national EHR review committees to ensure that their views (e.g., impact on coding efficiency, inclusion of all data necessary to code optimally) are represented when considering development of new clinical templates.
  - *VAMC:* Use standard checklists from professional associations to ensure that new templates meet industry standards for quality and necessity (see Figure F-3 in Appendix F.5).

9.3.2.2 Strengthen EHR Reviews to Ensure Appropriate use of Copy-paste, Including Implementation of CPRS Tool to Automate the Process

Our analysis indicates that EHR quality reviews undertaken at the facility level have not entirely addressed challenges with clinical documentation practices. Although the majority of facilities have processes in place to review the EHR, it appears that gaps remain in the ability of these reviews to improve documentation practices. Implementation of consistent, comprehensive EHR quality reviews are recommend by professional coding associations to ensure

documentation compliance and quality. VHA should improve its current EHR quality review process to ensure that documentation integrity is maintained across VHA.

Summary of supporting evidence:

- See Section 9.2.2.1 for more detail on findings.

- Proposals from staff participating in on-site workshops suggest consistent desire to improve documentation, with 50 percent of sites recommending targeted enhancements to CPRS to promote more consistent documentation practices; many of the proposals focused on addressing the inappropriate use of copy-paste.[478]

- Recommendations from coding professional organizations highlight the need for regular review of clinical documentation through EHR audits to ensure appropriate documentation practices (Arrowood, 2013).

- Interview findings indicate that VHA is in the process of incorporating a copy-paste identification feature within CPRS, which is expected to be released in June 2015 and will automate identification of copy-paste usage to facilitate further review.[479]

Potential near term actions:

- *VHACO/VAMC:* Enhance local processes for reviewing copy-paste use within CPRS through targeted national guidance and implementation of supporting tools.
  - o *VHACO:* Proceed with organization-wide launch of automated copy-paste identification tool and train local facility HIM leadership on the tool's functionality to drive increased efficiency and effectiveness of local chart review.
  - o *VAMC:* Develop local policies to address inappropriate use of copy-paste (e.g., provider notification standards, training requirements for providers found to be noncompliant, remedial actions for pattern of repeat inappropriate use).
  - o *VAMC:* Incorporate expectations regarding appropriate copy-paste use within national provider educational and training sessions (see recommendation 9.3.1.2).

9.3.2.3 Implement Standardized Processes for Following up on Outstanding Provider Queries and Improve Provider Accountability for Query Responsiveness

Our analysis of data from VHA's PQT tool indicates that provider query efforts have been hampered by low provider responsiveness. High-performing private sector hospital systems have developed robust query processes with clear expectations and accountability for responsiveness to promote documentation improvements. VHA should implement tactical improvements to query practices currently in place across the organization to help promote timely provider accessibility of queries and increased overall responsiveness.

Summary of supporting evidence:

- See Section 9.2.2.2 for more detail on findings.

---

[478] Site visit documentation and coding assessment workshops (N=20)

[479] Interview with VHACO leadership

- Evidence from industry surveys suggests that alternative processes for submitting and answering queries may supplement email-based querying to improve responsiveness (ACDIS, 2011).
- Recommendations from professional associations indicate that providing outcomes data on key query metrics promotes increased provider responsiveness to queries (Towers, 2013).

Potential near term actions:

- *VHACO/VAMC:* Provide national training and guidance to facility-level HIM chiefs on use VHA's PQT tool to track query responsiveness at the individual provider level.
  - *VHACO:* Disseminate educational materials and best practice suggestions for using PQT tool's reporting capabilities to promote transparency and improved performance.
  - *VAMC:* Track and report individual-level outcomes on key physician query metrics (e.g., volume of queries, response rate).
- *VAMC:* Clarify local processes and expectations regarding provider responses to coder queries.
  - *VAMC:* Develop standard processes at the local level to follow up on unresolved queries, including query notification methods outside of email when providers do not initially respond (see Figure F-4 in Appendix F.5 for an illustrative provider follow-up process).
  - *VAMC:* Incorporate expectations for provider responsiveness to queries within local bylaws and general rules.
  - *VAMC:* Outline local performance management procedures to address provider query unresponsiveness (e.g., notification standards, training requirements for providers found to be noncompliant, remedial actions for continued unresponsiveness).

9.3.3 Potential Opportunity

We have outlined a series of recommendations to address VHA's current documentation and coding challenges. The expected benefits to VHA of improving documentation practices are both financial and non-financial. With respect to financial benefits, recent OIG reports indicate that VHA has the potential to increase revenue collection through improved documentation and coding practices on encounters that could be submitted to third-party insurers for reimbursement (OIG, 2012; OIG, 2011).[480] Another financial benefit from improved documentation is the ability to appropriately match budgetary allocations to VAMCs through VERA; we did not attempt to quantify the size of this opportunity. Finally, several non-financial benefits would result from improved coding, including improved data abstraction regarding

---

[480] These revenue estimates capture the opportunity size from improvement to both inpatient and outpatient encounters; opportunity size is based on improvements to documentation, capture of patient insurance information, and coding (e.g., accurate indication of patient service connection status).

quality of care, increased insight into true Veteran demographic and health status trends, and improved epidemiologic tracking of disease.

This page intentionally left blank.

Appendix A   Detailed Methodology

To ensure a broad range of sources, our assessment draws upon national data sets, national surveys, expert interviews, and visits to select VAMCs across the country, at which we conducted interviews, focus groups, and observations. Given Assessment F's focus on inpatient care, we have chosen to only visit VAMCs providing inpatient care, and no other types of facilities.

A.1   VAMC Site Selection

To increase consistency and generalizability of findings, assessment teams have coordinated our sampling methods to the extent possible while ensuring the sampling methodology reflected assessment-specific considerations. We have selected a core set of VAMCs to visit, which are representative of the VAMC system as a whole across critical facility demographic and performance outcome metrics.

The VAMC site selection process followed the following steps:

1. **Stratification of facilities:** Stratified random sampling, with VISN as strata, was used to select an initial long-list of facilities. To reduce sample size, a subset of VISNs was randomly selected, from which one of the two initially selected sites was randomly de-selected.

2. **Review of distribution:** Chi-square testing was used on each of the key facility profile and performance variables to ensure the distribution of scores in the sample is representative of the population. Variables were chosen to reflect anticipated drivers of facility performance, and included: VISN, rurality, adjusted admissions, complexity level (on VHA rating scale), adjusted LOS, patient satisfaction, cumulative access score, and facility age.

3. **Refinement of facility selection:** Initial facility list was vetted with internal and external SMEs and augmented as needed, to include facilities that are considered critical for inclusion (e.g., a Polytrauma Center, facilities with innovative tools/practice) and ensure that all selected facilities had the range of services being assessed.

This method resulted in a sample of 23 facilities that is representative across each of the criteria used in selection. Assessment F then deselected the three complexity level 3 sites chosen as part of the initial sample, as these facilities do not provide extensive inpatient services and were therefore not of interest for our assessment. We retested the representativeness of the sample, and found that the sample of 20 level 1 and 2 facilities was still representative across our key criteria.

We also visited Miami as a case study, per the recommendation of VHA experts that Florida would be of particular interest given its growing Veteran population and unique challenges. This resulted in a total of 21 VAMC site visits (20 randomly selected VAMCs and 1 case study).

A.1.1   VAMC Site Selection Variables

Variables were selected based on criteria relevant to each assessment area and assumed impact on facility performance. Variable definitions are given below:

VISN: used VHA Support Center (VSSC) classification of VAMCs by VISN
Rurality: used VSSC 2014 categorization of facilities as rural or urban
Adjusted admissions: relied upon American Hospital Association (AHA) 2014 data. Adjusted admissions = Total admissions *(Admissions*(OP revenues/Total revenues)). VHA reports revenue data (gross billed revenue) to AHA to calculate this metric. Adjusted admissions scores were divided into quartiles, with the middle quartiles grouped, to produce low (<2881.75), medium (2881.75-6081.00), and high (>6081.00) adjusted admissions categories
Complexity level: used VSSC 2014 categorization of facility complexity. Level 1 facilities were grouped, to produce selection criteria of high complexity (levels 1a, 1b, and 1c), medium complexity (level 2), and low complexity (level 3). Given the inpatient focus of our assessment, we visited facilities with robust inpatient services, and excluded level 3 facilities from our selection
Adjusted LOS: used VA SAIL data. As only Q3 FY2014 was available to us at the time of selection, we were only able to use that quarter's results. LOS data was divided into quartiles, with the middle quartiles grouped, producing three variables: low LOS (<4.19), medium LOS (4.19-5.14), and high LOS (>5.14)
Patient satisfaction: used VA SAIL data. As noted above, as only Q3 FY2014 was available to us at the time of selection, we were only able to use that quarter's results. Patient satisfaction data was divided into quartiles, with the middle quartiles grouped, resulting in low (<249.83), medium (249.83- 264.02), and high (>264.02) satisfaction categories
Cumulative access score: used VA SAIL data. As noted above, as only Q3 FY2014 was available to us at the time of selection, we were only able to use that quarter's results. The eight access scores included in the VA Q3 FY2014 SAIL report were assigned quartiles and added together to produce a single cumulative access score, which was then divided into quartiles. This process resulted in cumulative score quartile categories of low (<17), medium-low (17-20), medium-high (20-23), and high (>23) access
Facility age: relied upon VSSC 2014 operational date data for each VAMC. Operational dates were divided into quartiles, with the middle two quartiles grouped, producing categories of early (prior to June 4, 1929), medium (June 4, 1929 – April 7, 1952), and recent (after April 7, 1952) establishment

In several instances, variable data was not available for each VAMC. To ensure that these cases were not excluded from the sample, we scored absences with -1 and included the -1 score as a category for each selection criterion where there were absences.

A.1.2   VAMC Sample Representativeness

Results for Fisher's exact test demonstrate that the randomly selected sample of 20 VAMCs is not significantly different from the population of VAMCs:

Table A-1. Fisher's Exact Test Results

Appendix B   Additional Detail on Clinical Staffing

B.1   Professional Association Definitions of "Clinical Staff"

American College of Physicians: Licensed clinical staff members (including APRN, PA, RN, LSCSW, LPN and "medical technical assistants" or CMAs) who are directly employed by the clinician (or the clinician's practice) or a contracted third party and whose CCM services are generally supervised by the clinician, whether provided during or after hours. Thus the "incident to" rules do not necessarily require that the clinician be on the premises providing direct supervision (American College of Physicians, 2015).

American Medical Association: A clinical staff member is a person who works under the supervision of a physician or other qualified health care professional and who is allowed by law, regulation and facility policy to perform or assist in the performance of a specified professional service; but who does not individually report that professional service. Clinical staff are medical assistants, licensed practical nurse, etc. (American Medical Association, 2013).

Utilization Review Accreditation Commission: Employees or contracted consultants of the health care organization who are clinically qualified to perform clinical triage and provide health information services. (Utilization Review Accreditation Committee, 2008).

Centers for Disease Control and Prevention: cites "Nurses, medical providers, and therapists." (Centers for Disease Control and Prevention, 2014).

B.2   Differences in Staffing Practices by Clinical Occupation

Table B-1. Staffing Practices by Clinical Occupation

Staffing component	Practices by clinical occupation
Determining staffing need – staffing methodologies	Varies by occupation – see Section 5.2.1 for detail: ▪ Comprehensive staffing methodology, including FTE calculator and guidance on process to develop FTE requests: nursing ▪ National guidance on minimum staffing and coverage levels: emergency medicine, ophthalmology, pharmacy; radiology; surgery ▪ No national staffing directives for setting staffing levels for inpatient staff: advanced practitioners (NPs, PAs, CNSs, and CRNAs); all physician specialties other than radiology, ophthalmology, and surgery; dietary and nutrition services; hospitalist medicine; inpatient mental health; occupational therapy; physical medicine and rehabilitation; respiratory therapy; social work; speech pathology and audiology
Resource management structure	Facilities observed used the same resource management structures for all clinical staff (typically, a resource management committee – see Section 5.2.1 for more detail)

Staffing component	Practices by clinical occupation
Scheduling tools, support, and accountability	▪ Varies by clinical occupation: ▪ **AHPs:** schedules typically set by AHP team leaders/supervisors (43% of interviewees), or by teams of AHPs (43%)[481], using Excel spreadsheets (74%)[482] ▪ **Nurses:** schedules typically set by nurse managers, with a small majority of sites using self-scheduling (55%) and very few using scheduling software such as AcuStaf (10%)[483] ▪ **Physicians:** department chief typically responsible for setting schedules (79%),[484] using Excel (94%)[485]
Flexing	▪ Varies by clinical occupation (see Section 5.2.3): ▪ **AHPs:** flex needs typically met by floating of staff across inpatient and outpatient (90%), overtime (57%), and triaging patients when staffing is not available to support care (24%).[486] Agency use is very low (14%).[487] ▪ **Nurses:** flex needs typically met by floating of staff nurses across units (95%), voluntary overtime (90%), mandated overtime (50%), contract labor (50%), float pool (40%), and closing beds when staffing is not available to support care (25%)[488] ▪ **Physicians:** flex needs typically met by increasing staff physician hours, using per diems (50%), other contract labor (30%), and diverting patients when staffing is not available to support care (40%)[489]

B.3   Mapping to Organization, Workflow Processes, and Tools

[489] N=20

Findings and recommendations	Organization	Workflow processes	Tools
5.2.1: VHA does not have the tools or data to set or monitor staffing levels appropriately			
5.2.1.1: The nursing service has developed a comprehensive, evidence-based staffing methodology, though other occupations lack clear guidance on assessing staffing need	✓	✓	✓
5.2.1.2: Some facilities manage data well locally; however, VHA as a whole does not consistently capture and track data needed to assess the appropriateness of staffing		✓	✓
5.2.1.3: Resource management is siloed by service line, resulting in inconsistent decision-making that does not always match needs	✓	✓	
5.2.1.4: Local resource management decision-making does not always reflect national service line staffing guidance	✓	✓	✓
5.2.2: Hiring timeline significantly exceeds private sector benchmarks, affecting ability to fill vacancies			
5.2.2.1: Hiring requirements (e.g., credentialing, boarding) are complex and time-consuming		✓	
5.2.2.2: Local hiring processing is reported to be inefficient	✓	✓	
5.2.2.3: Attracting talented clinical staff can be a challenge due to low pay compared to private sector in many geographies	✓		
5.2.3: Allocation of staff does not consistently match patient care need			
5.2.3.1: Hospital operating models are skewed toward clinic hours	✓		
5.2.3.2: Access to flex resources is limited, inhibiting ability to meet peaks in demand or manage short-term understaffing	✓	✓	
5.3.1 Increase transparency of staffing by providing evidence-based staffing methodologies for all clinical staff and improving data management			

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

Findings and recommendations	Organization	Workflow processes	Tools
5.3.1.1 Provide and support scalable, evidence-based staffing methodologies an interdisciplinary resource management processes	✓	✓	✓
5.3.1.2 Improve data management			✓
5.3.2 Increase timeliness of hiring to patient care teams			
5.3.2.1 Review and streamline hiring requirements		✓	✓
5.3.2.2 Increase HR service level expectations needed to facilitate streamlined requirements	✓	✓	
5.3.2.3 Communicate an optimal hiring process to VAMCs, clarifying their responsibilities and encouraging them to complete activities in parallel	✓	✓	
5.3.2.4 Expand ability to increase pay to match market	✓	✓	
5.3.3 Allocate staff to match patient care needs			
5.3.3.1 Ensure that staffing on WHEN hours is sufficient to meet patient need		✓	✓
5.3.3.2 Make contracting more flexible and efficient		✓	
5.3.3.3 Increase flexibility of float position structure to meet patient need	✓	✓	

B.4   Past Findings and Recommendations

Figures B-1 and B-2 below are illustrative of the types of issues identified and recommendations made in recent years, and not comprehensive lists.

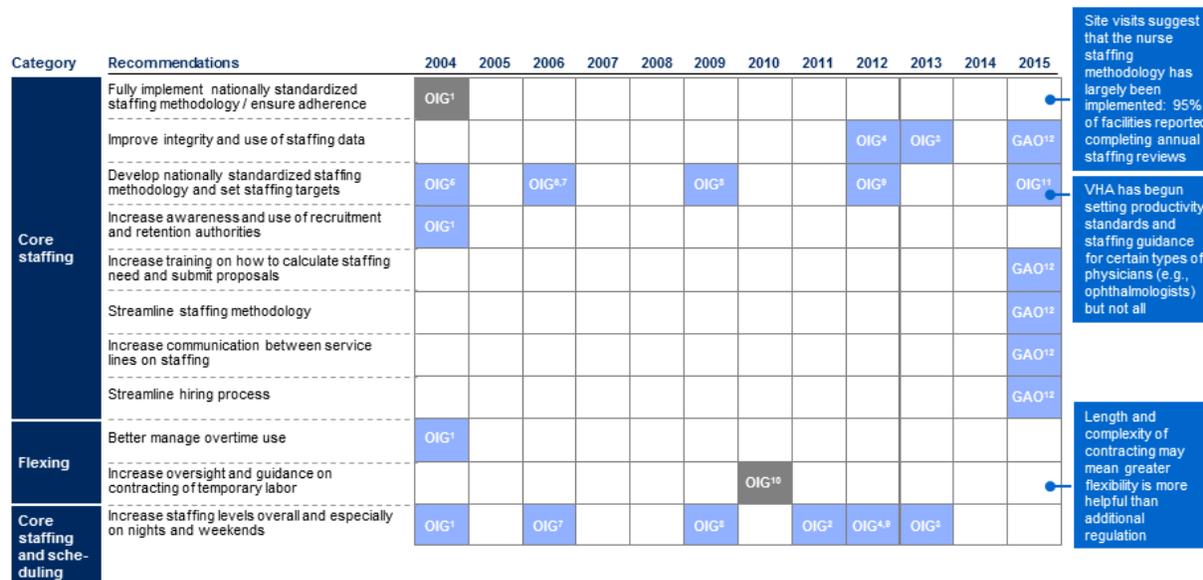
Figure B-1. Previous Reports' Findings

1 VA Office of the Inspector General, "Healthcare inspection: a follow-up review of VHA mental health residential rehabilitation treatment programs (MH RRTP)" (22 June 2011)
2 VA Office of the Inspector General, "Combined assessment program summary report: evaluation of nurse staffing in Veterans Health Administration facilities" (30 April 2013)
3 VA Office of the Inspector General, "Healthcare inspection: evaluation of nurse staffing in Veterans Health Administration facilities" (13 August 2004)
4 VA Office of the Inspector General, "Issues at VA Medical Center Bay Pines, Florida and procurement and deployment of the core financial and logistics system (CoreFLS)" (2004)
5 VA Office of the Inspector General, "Review of Selected Financial and Administrative Operations at VISN 1 Medical Facilities" (2006)
6 7 VA Office of the Inspector General, Follow-Up Evaluation of Clinical and Administrative Issues Bay Pines Health Care System Bay Pines, Florida" (2006)
7 VA Office of the Inspector General, "Healthcare inspection: Review of Veterans Health Administration Residential Mental Health Care Facilities" (25 June 2009)
8 VA Office of the Inspector General, "Audit of physician staffing levels for specialty care services" (27 December 2012)
9 VA Office of the Inspector General, "Review of Veterans' Access to Mental Health Care" (23 April 2012)
10 VA Office of the Inspector General, "Audit of VISN Procurement Practices for FSS Professional and Allied Healthcare Staffing Services" (7 June 2010)
11 VA Office of the Inspector General, "Audit of Veterans Health Administration Mental Health Initiative Funding" (6 April 2009)
12 VA Office of the Inspector General, "OIG determination of Veterans Health Administration's occupational staffing shortages" (30 January 2015)
13 United States Government Accountability Office, "VA healthcare: Actions Needed to Ensure Adequate and Qualified Nurse Staffing" (October 2014)

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

Figure B-2. Previous Reports' Recommendations

While some recommendations have generated momentum, many have stalled

In keeping with this study's recommendations
Not in keeping with this study's recommendations


Site visits suggest that the nurse staffing methodology has largely been implemented: 95% of facilities reported completing annual staffing reviews

VHA has begun setting productivity standards and staffing guidance for certain types of physicians (e.g., ophthalmologists) but not all

Length and complexity of contracting may mean greater flexibility is more helpful than additional regulation

1 VA Office of the Inspector General, "Healthcare inspection: evaluation of nurse staffing in Veterans Health Administration facilities" (13 August 2004)
2 VA Office of the Inspector General, "Healthcare inspection: a follow-up review of VHA mental health residential rehabilitation treatment programs (MH RRTP)" (22 June 2011)
3 VA Office of the Inspector General, "Combined assessment program summary report: evaluation of nurse staffing in Veterans Health Administration facilities" (30 April 2013)
4 VA Office of the Inspector General, "Review of Veterans' Access to Mental Health Care" (23 April 2012)
5 VA Office of the Inspector General, "Issues at VA Medical Center Bay Pines, Florida and procurement and deployment of the core financial and logistics system (CoreFLS)" (2004)
6 VA Office of the Inspector General, "Review of Selected Financial and Administrative Operations at VISN 1 Medical Facilities" (2006)
7 VA Office of the Inspector General, Follow-Up Evaluation of Clinical and Administrative Issues Bay Pines Health Care System Bay Pines, Florida" (2006)
8 VA Office of the Inspector General, "Healthcare inspection: Review of Veterans Health Administration Residential Mental Health Care Facilities" (25 June 2009)
9 VA Office of the Inspector General, "Audit of physician staffing levels for specialty care services" (27 December 2012)
10 VA Office of the Inspector General, "Audit of VISN Procurement Practices for FSS Professional and Allied Healthcare Staffing Services" (7 June 2010)
11 VA Office of the Inspector General, "OIG determination of Veterans Health Administration's occupational staffing shortages" (30 January 2015)
12 United States Government Accountability Office, "VA healthcare: Actions Needed to Ensure Adequate and Qualified Nurse Staffing" (October 2014)

B.5   Downshifting by Role, Based on Data Call

---

[491] Best practice, based on the academic literature, suggests that WHEN staffing should approximately match weekday staffing, especially on weekend days (Cavallazzi et al., 2010; Ananthakrishnan et al., 2009; Aujesky et al., 2009; Shaheen et al., 2009; Peberdy et al., 2008; Kostis et al., 2007)

[492] Standard practice, drawn from hospital survey data (Labor Management Institute, 2014)

[493] Ibid.

[494] N=14

[495] N=8

[496] N=4

[497] N=2

[498] N=15

[499] N=9. Includes inpatient medicine and inpatient surgery units

[500] N=21. Includes inpatient medicine and inpatient surgery units.

[501] N=15. Includes inpatient medicine and inpatient surgery units.

[502] N=7. Includes inpatient medicine and inpatient surgery units

[503] The literature is mixed on the effect of night-time intensivists on patient outcomes. However, recent studies appear to be converging on the view that staffing night-time intensivists improves outcomes for facilities with low-intensity day-time intensivist staffing (i.e., optional intensivist consultation) and has no significant effect on facilities with high-intensity day-time intensivist staffing (i.e., mandatory intensivist consultation or where intensivist has primary responsibility for patient care) (Wallace et al., 2012). This finding corroborates earlier literature finding positive effects of night-time intensivist coverage in facilities with low-intensity day-time coverage (Blunt and Burchett, 2000) and no effects in facilities with high-intensity day-time coverage (Kerlin et al., 2013; Gajic et al., 2008).

B.6   Best Practices and Benchmarks

Table B-4. Clinical Staffing – Best Practices and Benchmarks

Category	Component	Best practice / benchmark
Organization	Staffing ratio[513]	Ensure physician, NP, and PA staffing appropriate to each care setting: ▪ Hospital-wide: 1 staff physician to 3.7 occupied beds (Sanofi, 2014);[514] 1 resident physician to 2.9 occupied beds (Sanofi, 2014);[515] 1 PA to 9.1 occupied beds (Sanofi, 2014)[516] ▪ Critical care ICU: 1 intensivist to 14 patients (Ward et al., 2013)[517]; use of high-intensity model (i.e., mandatory intensivist consultation or closed ICU) rather than low-intensity model (no intensivist or

---

[508] Where best or standard practices are not department-specific (e.g., for staff that serve multiple departments)

[509] N=23

[510] N=21

[511] N=20

[512] N=13

[513] Percentages and ratios refer to day shift.

[514] Industry standard practice, based on Sanofi survey of hospitals. Figure is hospital-wide, and refers to multi-hospital systems (MHS). Sanofi provides data on MHS and non-MHS hospitals. We judged MHS systems to be a more appropriate benchmark for the VA integrated health care system than non-MHS hospitals. Figure reported as 0.27 physicians per occupied bed, converted to physician-to-occupied bed ratio.

[515] See footnote 3 for detail on source. Figure reported as 0.35 physicians per occupied bed, converted to physician-to-occupied bed ratio.

[516] See footnote 3 for detail on source. Figure reported as 0.11 PAs per occupied bed, converted to PA-to-occupied bed ratio.

[517] Figure represents best practice; Ward et al. found that outcomes worsened after the intensivist-to-patient ratio dropped below 1:14.

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

Category	Component	Best practice / benchmark
		elective intensivist consultation) (Pronovost et al., 2002)[518]
		▪ Med/Surg: : at least 0.13 hospitalists per 1,000 adjusted patient days (Epané and Weech-Maldonado, 2015)519
		▪ ED: 1 ED physician to 2.2 patients per hour (Phoenix Physicians, 2011; Collins, 2009)520
		Ensure RN, CNA, and LPN/LVN staffing appropriate to each care setting (Labor Management Institute, 2014)[521],[522]:
		▪ Hospital-wide: N/A
		▪ Critical care ICU: 1 RN to 1.8 patients, 1 CNA to 9 patients, and if LPNs/LVNs are used, 1 LPN/LVN to 5.9 patients523
		▪ Med/Surg: 1 RN to 4.8 patients, 1 CNA to 8.7 patients , and if LPNs/LVNs are used, 1 LPN/LVN to 11.9 patients524
		▪ ED: 1 RN to 6 patents, 1 CNA to 10.9 patients, and if LPNs/LVNs are used, 1 LPN/LVN to 3.5 patients 525

---

[518] Pronovost et al. find that high-intensity intensivist staffing models are associated with reduced mortality and LOS.

[519] Epané and Weech-Maldonado found high-intensity hospitalist staffing (defined as mandatory intensivist consultation or closed ICU; represented upper quartile of their sample, 0.13 – 24.06 hospitalists per 1,000 adjusted patient days) reduced LOS.

[520] Figure is an average of best practice recommendations by the American College of Emergency Physicians (1.8 to 2.8 patients per physician per hour) and a white paper by Phoenix Physicians (2 to 2.25 patients per physician per hour).

[521] LPN/LVN roles are gradually being phased out of most private sector facilities via attrition, per recommendation of the Institute of Medicine (Institute of Medicine, 2011). Having a lower LPN/LVN-to-patient ratio than that seen in Labor Management Institute survey data should not necessarily be taken as meaning a facility is not meeting best practice.

[522] CNA-to-patient ratios seen in the Labor Management Institute survey day may reflect use of sitters to meet 1:1 patient needs in many hospitals (e.g., for suicidal patients). If sitters are not used in a VAMC, CNA-to-patient ratios may need to be greater than ratios seen in private facilities.

[523] Results in nurse staffing model composition of 66% RNs, 20% LPNs/LVNs, and 13% CNAs.

[524] Results in nurse staffing model composition of 51% RNs, 21% LPNs/LVNs, and 28% CNAs.

[525] Results in nurse staffing model composition of 31% RNs, 53% LPNs/LVNs, and 17% CNAs. The ratio of CNAs to patients seen in EDs surveyed by the Labor Management Institute may be relatively high because EDs are consistently using ancillary support roles such as unit clerks and transporters to perform clerical and transport functions. While VAMCs should also ensure that these supporting roles are used to support nurses and nursing assistants, if they do not consistently staff unit clerks and transporters, they should likely use a CNA-to-patient ratio closer to that seen on the floors (~1:9).

Category	Component	Best practice / benchmark
		Ensure AHP and therapy assistant staffing appropriate to providing inpatient care across the facility, based on best estimates in currently limited literature: [526] ▪ PTs: ICU, 2 hrs/bd.dy (Ridoutt et al., 2006); Med/Surg, 0.3-0.5 hrs/bd.dy (Christie and Grimwood, 2006); average across hospital setting, 1.3 hrs/bd.dy (Allied Health in Rehabilitation Consultative Committee, 2007; Australasian Faculty of Rehabilitation Medicine, 2005)[527] ▪ OTs: Med/Surg, 0.1-0.3 hrs/bd.dy (Christie and Grimwood, 2006); average across hospital setting, 1.2 hrs/bd.dy (Allied Health in Rehabilitation Consultative Committee, 2007; Australasian Faculty of Rehabilitation Medicine, 2005) ▪ Speech pathologists: average across hospital setting, 0.6 hrs/bd.dy (Allied Health in Rehabilitation Consultative Committee, 2007; Australasian Faculty of Rehabilitation Medicine, 2005) ▪ Dieticians: average across hospital setting, 0.4 hrs/bd.dy (Allied Health in Rehabilitation Consultative Committee, 2007; Australasian Faculty of Rehabilitation Medicine, 2005) ▪ Podiatrists: average across hospital setting, 0.1 hrs/bd.dy (Allied Health in Rehabilitation Consultative Committee, 2007; Australasian Faculty of Rehabilitation Medicine, 2005) ▪ Clinical psychiatrists: average across hospital setting, excluding mental health units, 0.4 hrs/bd.dy (Allied Health in Rehabilitation Consultative Committee, 2007; Australasian Faculty of Rehabilitation Medicine, 2005)

---

[526] Estimating AHP staffing need is an issue industry-wide, with no clear consensus on best practice data and methodology to support AHP staffing decision-making. As Cartmill et al. write, "The evidence for use of staffing ratios for allied health practitioners is scarce and lags behind the fields of nursing and medicine" (Cartmill et al., 2012, 1). We have drawn on such guidance as does exist in the literature, though this research is far less definitive than the body of work on nurse and physician staffing. For further discussion of challenges in AHP staffing decision-making, see Fraher et al., 2011.

[527] Allied Health in Rehabilitation Consultative Committee and Australasian Faculty of Rehabilitation Medicine averages taken from each organization's published standards for amputation, arthritis, burns, cardiac, head injury, major multi-trauma, neurological, orthopedic, pain, pulmonary, spinal, amputation (acute), amputation (rehab), and TBI.

Category	Component	Best practice / benchmark
		Ensure pharmacist and pharmacy technician staffing appropriate to providing inpatient care across the facility: ▪ Pharmacists: 17.8 pharmacists per 100 occupied beds (ASHP, 2013) ▪ Pharmacy technicians: 16 pharmacy technicians per 100 occupied beds (ASHP, 2013)
Organization	Reducing off-tour staffing (Downshifting)	Maintain adequate physician, NP, and PA staffing on "off-tour," including by: ▪ Hospital-wide: N/A ▪ Critical care ICU: staffing night-time intensivists for facilities with low-intensity day-time intensivist staffing (Wallace et al., 2012)[528] ▪ Med/Surg and ED: ensuring weekend day-time coverage matches weekday coverage (Cavallazzi et al., 2010; Ananthakrishnan et al., 2009; Aujesky et al., 2009; Shaheen et al., 2009; Peberdy et al., 2008; Kostis et al., 2007)[529] Maintain adequate RN, CNA, and LPN/LVN staffing on "off-tour," decreasing staffing at most by (Labor Management Institute, 2014): ▪ Hospital-wide: N/A ▪ Critical care ICU: RNs, 5%; LPNs/LVNs, 21%, CNAs, 7% ▪ Med/Surg: RNs, 8%, LPNs/LVNs, no change,[530] CNAs, 28% ▪ ED: RNs, no change; LPNs/LVNs, no change; CNAs, no change[531]

---

[528] Wallace et al. find that night-time intensivist coverage reduces in-hospital mortality for facilities with a low-intensity day-time intensivist staffing model (defined as optional consultation with an intensivist), and see no effect of night-time coverage for facilities with high-intensity coverage. This finding corroborates other studies demonstrating positive effects of night-time intensivist coverage in facilities with low-intensity day-time coverage (Blunt and Burchett, 2000) and no effects in facilities with high-intensity day-time coverage (Kerlin et al., 2013; Gajic et al., 2008).

[529] Studies cited found significant association between weekend admission, when staffing levels and mix decline, and poorer outcomes.

[530] Among hospitals surveyed by the Labor Management Institute, LPN/LVN staffing levels increased on average by 2% on night shift

[531] Among hospitals surveyed by the Labor Management Institute, RN staffing levels saw no change on night shift, LPN/LVN staffing levels saw no change on night shift, and CNA staffing levels increase by 3% on night shift. Increase in CNA staffing levels may reflect decreases in unit clerk and transporter coverage overnight, resulting in CNAs serving clerical and transport functions.

Category	Component	Best practice / benchmark
		Maintain adequate AHP staffing on "off-tour," including by: ▪ Hospital-wide: providing weekend physical therapy service for inpatients (Brusco et al., 2007)[532] ▪ Critical care ICU, Med/Surg, and EDU: other best practices for AHP downshifting have not yet been clearly established in the literature
Processes	Flex labor sources	▪ Prioritize use of float pool nurses rather than agency and travel nurses (Strzalka and Havens, 1996)[533] ▪ Limit use of agency and travel nurses to <2% to total number of nursing hours worked (Labor Management Institute, 2014)[534]
Tools	Scheduling tools	▪ Use self-scheduling for nurses (Hung, 2002; Teahan, 1998)[535] ▪ Use predictive scheduling models for roles without set shifts and large cohorts (Ernst et al., 2004; Warner and Prawda, 1972)

B.7 Additional Detail on Past Reform Efforts

ORGANIZATION

- Limited exercise and existence of recruitment and retention authorities (e.g., ability to incent retention and use of Title 38 positions) (VA OIG, 2004a)

- High turnover (VA OIG, 2004a)

- Insufficient staffing mix (VA OIG, 2011)

- Siloed resource management organization and processes (GAO, 2015)

- Inconsistent and insufficient clinical care support staffing (OIG, 2004a)

- Inefficiency in contracting for temporary labor (OIG, 2010)

---

[532] Study found decreased LOS for patients who received Monday through Saturday physical therapy, as compared to a control group receiving Monday through Friday therapy.

[533] Strzalka and Havens found that float pool nurses performed better than agency nurses on key clinical indicators.

[534] Based on Labor Management Institute survey data, finding mean average of agency to total number of nursing hours worked of 1.3%, and mean average of traveler to total number of nursing hours worked of 1.7%.

[535] Use of self-scheduling is associated with reduced managerial time spent on scheduling, improved nurse morale, and some decreases in turnover due to improved morale.

PROCESSES

- Inconsistent or problematic implementation of standardized staffing methodologies (VA OIG, 2011; 2013; GAO, 2015)

- No clear staffing methodology or targets (e.g., productivity standards) (VA OIG, 2015; 2012; 2009; 2006; 2006; 2004; 2004)

- Lengthy HR process delaying hiring (GAO, 2015; VA OIG, 2004; 2009)

- Overly high use of overtime and informal floating to meet flex needs (OIG, 2004)

- Excessive downshifting resulting in insufficient staffing on off-tour (OIG, 2011; 2009)

TOOLS

- Unreliable or non-existent staffing data (VA OIG, 2015; 2012)

B.8 Description of clinical Staffing Site Visit Assessment Workshop Improvement Idea Generation Process

Our site visits provided an opportunity to generate potential improvement ideas with front-line staff members familiar with the clinical staffing challenges affecting their facility. As part of each on-site clinical staffing workshop (N=19), we facilitated a conversation regarding barriers to effective access to inpatient care at their facility and then asked participants (~120 total staff members composed of physicians, nurses, allied health professionals) to generate improvement ideas that would strengthen facility-level processes and outcomes. Upon completion of all site visits, we compiled the 262 proposed solutions and grouped similar improvement ideas to assess how often participants cited improvement ideas aligned with our recommendations. Data from this exercise is often included within the "summary of supporting evidence" sections for each sub-recommendation.

This page intentionally left blank.

Appendix C   Additional Detail on Access to Care

C.1   Best Practices and Benchmarks

We have identified several inpatient access-to-care best practices and benchmarks in the areas outlined below.

Table C-1. Access to Care – Best Practices and Benchmarks

Category	Component	Best practice / benchmark
Organization	Top of license practice	▪ Staff mid-level providers, particularly in triage (Russ, 2010) ▪ Staff sufficient support roles (e.g., transporters, techs, sitters) to support clinical staff (Chang, 2012)
Organization	Leadership	▪ Staff a board-certified, dedicated ED Director (Patel, 2014) ▪ Facilitate a collaborative environment among leadership and staff in the ED and inpatient departments (Patel, 2014)
Organization	Performance management	▪ Tie clinician individual performance to patient flow performance outcomes (Patel, 2014) ▪ Use a multidisciplinary team to identify opportunities to improve patient flow (California Healthcare Foundation, 2011)
Processes	ED triage/flow	▪ Utilize RN standing order sets for common symptoms (e.g., abdominal pain, chest pain) (Retezar, 2011) ▪ Implement a fast-track process (outside of the main ED) for low-acuity patients to expedite patient flow ▪ Avoid bed assignments for low-acuity patients and instead have them rotate through stations for labs, imaging, doctor consultation, etc. (conveyance model) (Sanchez, 2006, Storrow, 2008) ▪ Discharge patients directly from the fast-track care area (Sanchez, 2006) ▪ Establish and follow a formalized escalation/diversion process to determine when a facility is at capacity (Handel, 2010)
Processes	Bed assignment and admission	▪ Implement a standard bed management algorithm to identify the appropriate bed and unit (e.g., setting of care) for each patient on admission (Chen, 2012)

Category	Component	Best practice / benchmark
		▪ Designate transition units or alternate service locations to reduce ED boarding (McNaughton, 2012; Handel, 2010) ▪ Increase capacity of units to handle variable types of ED admission (pooling) (Handel, 2010)
Tools	ED signaling board and bed management system	▪ Provide a real-time view of the ED and inpatient continuum of care, including bed availability (Proudlove, 2003) ▪ Integrate ED/bed management tool with EHR and add-on patient flow modules (e.g., lab, imaging, OR) (Campbell, 2009)

C.2   Assessment Mapping to Choice Act Legislation

We have matched our findings and recommendations with the organization, workflow processes, and tools as outlined in the legislation.

Table C-2. Mapping to Organization, Workflow Processes, and Tools Domains Specified by the Statute

Findings and recommendations	Organization	Workflow processes	Tools
6.2.1: Data gaps limit VHA's understanding of patient demand patterns and available VAMC capacity (e.g., bed and staffing)			
6.2.1.1: Inaccurate view of bed capacity across multiple systems limits VHA's ability to understand current capacity	✓	✓	✓
6.2.1.2: Incomplete view of patient demand, including unmet patient care needs, limits VHA's ability to understand demand relative to current capacity	✓	✓	✓
6.2.2: Inappropriate hospital visits and admissions (e.g., from the ED and surgical suite) contribute to ED bottlenecks and limit bed availability			
6.2.2.1: Demographic characteristics of Veterans (e.g., higher incidence of mental health diagnoses, co-morbidities, and homelessness among Veterans as compared to the general population)			

Findings and recommendations	Organization	Workflow processes	Tools
6.2.2.2: Limited access to immediate (e.g., same day or same week) primary and urgent care clinic appointments, contributing to ED demand		✓	✓
6.2.2.3: Insufficient access to sub-acute facilities (e.g., short-term rehab, detox clinics) for patients who should not be discharged home following an ED visit or surgical procedure, but do not require admission to an inpatient bed		✓	✓
6.2.2.4: Minimal physician acceptance of and accountability for UM admission standards (e.g., the evaluation of the appropriateness of health care services according to evidence based criteria)	✓	✓	✓
6.2.3: Best practices related to workflow and performance management exist at some facilities, but have not been scaled across the system			
6.2.3.1: Inconsistent adoption of proven best practices to manage patient flow within facilities (e.g., early initiation of clinical protocols in ED triage, fast-track processes for low-acuity patients, team focused on managing flow)	✓	✓	✓
6.2.3.2: Limited cross-facility communication and sharing of best practices	✓	✓	✓
6.3.1: Develop an accurate end-to-end picture of patient demand and VAMC capacity			
6.3.1.1: Simplify the process and required approvals by which beds are classified as operational or unavailable	✓	✓	✓
6.3.1.2: Develop a prioritized set of standardized metrics to understand current demand at the VAMC, VISN, and VHACO levels and implement an automated process to collect and aggregate this data across the system	✓		✓
6.3.1.3: Expand use of evidence-based processes for managing patient flow, including clear role	✓	✓	

Findings and recommendations	Organization	Workflow processes	Tools
assignments and individual performance management			
6.3.2. Decrease inappropriate admissions due to limited access to sub-acute care			
6.3.2.1: Ensure appropriate access to near-team (e.g., same day, same week) primary and urgent care	✓	✓	
6.3.2.2: Facilitate access to sub-acute resources for Veterans who are not appropriate to go home without support following a procedure or ED visit, but do not require acute hospital care	✓	✓	
6.3.2.3: Staff case managers and social workers consistently across VAMC EDs to connect patients with appropriate sub-acute resources and help them navigate transitions following a procedure or ED visit	✓		
6.3.2.4: Build provider awareness around the importance and nuances of UM admission criteria and then hold physicians to admissions standards	✓		✓
6.3.2.5: Educate Veterans and their families on the resources available in the VA health care system as well as when it is appropriate to use different settings of care	✓	✓	
6.3.3: Expand use of evidence-based processes for managing patient flow, including clear role assignments and individual performance management			
6.3.3.1: Expedite the initiation of clinical protocols in triage	✓	✓	✓
6.3.3.2: Segment ED diagnostics and care through fast track processes to treat non-urgent patients in a dedicated area by dedicated staff	✓	✓	
6.3.3.3: Standardize the inpatient flow process (e.g., admission through bed placement) including	✓	✓	✓

Findings and recommendations	Organization	Workflow processes	Tools
clear role assignments and individual accountability for patient flow			
6.3.3.4: Build the infrastructure at the VHACO level to promote cross-facility sharing of patient flow best practices	✓	✓	✓

C.4 Description of ED Throughput Site Visit Assessment Workshop Improvement Idea Generation Process

Our site visits provided an opportunity to generate potential improvement ideas with front-line staff members familiar with the ED throughput challenges affecting their facility. As part of each on-site ED throughput assessment workshop (N=21), we facilitated a conversation regarding barriers to effective access to inpatient care at their facility and then asked participants (~120 total staff members composed of physicians, nurses, social workers, UM nurses, case managers) to generate improvement ideas that would strengthen facility-level processes and outcomes. Upon completion of all site visits, we compiled the 315 proposed solutions and grouped similar improvement ideas to assess how often participants cited improvement ideas aligned with our recommendations. Data from this exercise is often included within the "summary of supporting evidence" sections for each sub-recommendation.

Appendix D   Additional Detail on Effective Length-of-Stay Management and Care Transitions

D.1   Best Practices and Benchmarks

We have identified several LOS management/effective care transitions best practices and benchmarks in the following areas:

Table D-1. LOS Management – Best Practices and Benchmarks

Category	Component	Best practices / benchmarks
Organization	Case management department structure	▪ Dedicate inpatient-focused case managers/discharge planners (Kim, 2005) ▪ Employ proper staffing levels and mix of case management professionals, including RN case managers, social workers, utilization review specialists, and other supporting personnel (ACMA, 2013)
Organization	Hospital operating model and service availability	▪ Provide adequate coverage of clinical and support personnel across days and times to minimize delays in patient care due to e.g., inability to fill a PT consult, limited prosthetics staff off-tour (Engel, 2013; Kolber, 2013; Rapoport, 1989)
Organization	Post-acute care facility availability	▪ Ensure adequate capacity within facilities to support unique post-acute care needs of patients treated in the inpatient setting (Lindsay, 2014)
Workflow processes	Interdisciplinary discharge-focused meetings	▪ Hold daily interdisciplinary discharge-focused meetings to enable early identification of discharge barriers and facilitate interventions to mitigate anticipated delays (Shepperd, 2004; Curley, 1998) ▪ Promote attendance from all key stakeholders (e.g., providers, case managers, social work, UM, PT/OT, pharmacy) for effective interdisciplinary collaboration (Zwarenstein, 2009)
Workflow processes	Discharge planning	▪ Initiate discharge planning at time of admission (Cherlin, 2013; ACMA, 2013) ▪ Set goals to increase percentage of early morning discharges (Wertheimer, 2014; Kravet, 2007)
Workflow processes	Clinical pathway adoption	▪ Employ accepted clinical protocols to standardize delivery of key interventions (e.g., ventilator weaning, early mobility) around evidence-based standards (Girard, 2008; Gao, 2005)

Category	Component	Best practices / benchmarks
		▪ Implement clinical pathways specific to key diagnoses to increase delivery of efficient, evidence-based care (Winther, 2015; Wind, 2006)
Tools	Utilization management trackers	▪ Use tools that standardize tracking of UM metrics and promote transparency into local performance (Wickizer, 1989)
Tools	Case management prioritization system	▪ Support case management activities with tools that target interventions to priority patient subgroups (ACMA, 2013)
Tools	Discharge planning tools / checklists	▪ Use aids that streamline discharge process (e.g., checklists) by ensuring consideration of all relevant discharge needs (Soong, 2013; Halasyamani, 2006)
Tools	Post-acute care coordination and communication tool	▪ Support coordination with post-acute care facilities using tools to streamline process of locating and communicating with local facilities (ACMA, 2013)

D.3 Assessment Mapping to Choice Act Legislation

We have matched our findings and recommendations with the organization, workflow processes, and tools domains outlined in the legislation.

Table D-2. Mapping of Drivers to Organization, Workflow Processes, and Tools Domains Specified by The Statute

Findings and recommendations	Organization	Workflow processes	Tools
7.2.1: Implementation of national LOS programs and initiatives has failed to achieve organization-wide improvements despite local pockets of best practice adoption			
7.2.1.1: Lack of availability of LOS performance metrics at the front-line and limited performance		✓	

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

Findings and recommendations	Organization	Workflow processes	Tools
management inhibit the transparency and emphasis necessary to drive improvements			
7.2.1.2: Limited organization-wide engagement in the national utilization management (UM) program reduces the program's potential impact	✓		✓
7.2.1.3: Variable participation in national LOS management initiatives and inconsistent adoption of best practices drive variation in recent LOS improvements	✓	✓	
7.2.2: Existing post-acute care options (e.g., rehabilitation / skilled nursing facilities) do not always match Veteran needs, delaying discharge			
7.2.2.1: Veterans requiring placement within post-acute care facilities experience significant discharge delays	✓	✓	
7.2.2.2: Limited social resources (e.g., transitional housing / homeless programs) for Veterans awaiting discharge prolongs LOS	✓	✓	
7.2.3: Typical VAMC operating models do not promote efficient inpatient care, leading to prolonged LOS			
7.2.3.1: Reduced access to consultative services (e.g., specialist / allied health consults) over the weekend heightens discharge challenges	✓	✓	
7.2.3.2: Inconsistent implementation of standard protocols and pathways drives variability in care patterns and may increase patient LOS		✓	✓
7.2.4: Use of discharge planning best practices is inconsistent, decreasing effectiveness and coordination			
7.2.4.1: Suboptimal and inconsistent use of case managers results in re-allocation of critical discharge planning responsibilities to other staff	✓		
7.2.4.2: Variable implementation of key processes designed to expedite discharge results in avoidable discharge delays		✓	

Findings and recommendations	Organization	Workflow processes	Tools
7.2.4.3: Limited adoption of discharge planning tools may inhibit optimal application of case management efforts			✓
7.3.1: Mitigate discharge delays related to post-acute placement (e.g., increase availability of post-acute care options)			
7.3.1.1: Increase availability of post-acute care options, particularly for special needs Veteran populations	✓	✓	
7.3.1.2: Increase resources for patient transportation and provide front-line staff with authority to approve transport when it poses a barrier to timely discharge	✓	✓	
7.3.2: Build on existing best practices, both internal and external to VHA, to increase local adoption of evidence-based inpatient care and discharge planning practices			
7.3.2.1: Track key performance measures related to LOS management processes to increase transparency, accountability, and performance improvement	✓	✓	✓
7.3.2.2: Develop evidence-based care pathways for common inpatient clinical processes, and incorporate into EHR tools and clinical workflows		✓	✓
7.3.2.3: Promote sharing and implementation of discharge planning best practices across VAMCs	✓	✓	✓
7.3.2.4: Increase off-hours coverage of clinical services including specialist consults, allied health evaluations, and imaging/diagnostics	✓	✓	

D.4 Description of Discharge Planning Site Visit Assessment Workshop Improvement Idea Generation Process

Our site visits provided an opportunity to generate potential improvement ideas with front-line staff members familiar with the discharge challenges affecting their facility. As part of each on-site discharge planning assessment workshop (N=20), we facilitated a conversation regarding barriers to effective LOS management and care transitions at their facility and then asked participants (approximately 125 total staff members composed of physicians, nurses, social workers, UM nurses, case managers) to generate improvement ideas that would strengthen

facility-level processes and outcomes. Upon completion of all site visits, we compiled the 327 proposed solutions and grouped similar improvement ideas to assess how often participants cited improvement ideas aligned with our recommendations. Data from this exercise is often included within the "summary of supporting evidence" sections for each sub-recommendation.

D.5   Additional Supporting Figures

Figure D-3. Illustrative Discharge Planning Checklist

Illustrative discharge planning checklist

Patient Name:_____
Planned Discharge Date:_____

M.D./ D.O./ Provider
- Written discharge instructions ☐
- Review medication list ☐
- Prescribe discharge meds/supplies ☐
- Discharge summary co-signed by PCP ☐
- Consult IV infusion services, if needed ☐
- Order home oxygen, if needed ☐
- Order wound care supplies ☐
- Schedule follow-up appointments ☐
- Non-VA funding requests ☐
- Complete discharge consults ☐

Pharmacy
- Medication reconciliation ☐
- Dressing supplies (Medicare / VA pay) ☐
- Medication teaching ☐

PT
- Home health recommendations ☐
- Equipment ordered ☐
- Caregiver training ☐
- Schedule outpatient follow-up ☐
- Discharge summary co-signed by PCP ☐

OT
- Home health recommendations ☐
- Durable medical equipment ordered ☐
- Caregiver training ☐
- Schedule outpatient follow-up ☐
- Discharge summary co-signed by PCP ☐

Speech
- Home health recommendations ☐
- Caregiver training ☐
- Schedule outpatient follow-up ☐

Nursing
- Start PM&R interdisciplinary discharge note ☐
- Patient / family teaching ☐
- Confirm transportation and discharge plan with family ☐
- Verify Medicare / VA pay ☐
- Order home health ☐
- Coordinate with IV nurse if needed ☐

Nutrition
- Diet / texture recommendation ☐
- Outpatient follow-up ☐

Psych
- Schedule outpatient follow-up ☐

Rec Therapy
- Outpatient follow-up ☐

Social Work
- Coordinate community resources ☐
- Arrange transportation, as needed ☐
- Arrange placement ☐
- Ensure means test done ☐

Appendix E   Additional Detail on Patient Experience

E.1   Comparison of VHA and HCAHPS Questions and Scoring and Detail of VHA's Methodology for Calculating Patient Satisfaction Scores

The order of measures is in line with Figure 8-1.[536]

Table E-1. SHEP and HCAHPs Questions and Methodology Comparison

Please answer the following questions about your stay at the hospital named on the cover. Do not include any other hospital stays in your answer.			
SHEP/HCAHPS Reporting measure	**SHEP/HCAHPS Survey Questions**	**SHEP/HCAHPS Scoring**	**SHEP methodology applied to HCAHPS**
Care Transition	**Question 1.** During this hospital stay, staff took my preferences and those of my family or caregiver into account in deciding what my health care needs would be when I left. **Question 2.** When I left the hospital, I had a good understanding of the things I was responsible for in managing my health. **Question 3.** When I left the hospital, I clearly understood the purpose for taking each of my medications.	**Questions 1, 2, 3** have the following response scale: Strongly disagree Disagree Agree Strongly agree	The score on each item is calculated as the percentage of responses that fall in the top category (Strongly agree). Care Transition is then calculated as the average of the site's scores on the three items.
Cleanliness of the Hospital Environment	**Question 1.** During this hospital stay, how often were your room and bathroom kept clean?	**Question 1** has the following response scale: Never Sometimes	The reporting measure is calculated as the percentage of responses that fall in the top two categories (Usually, Always).

---

[536] SHEP FY14 and HCAHPS training materials (HCAHPS.online.org)

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

Please answer the following questions about your stay at the hospital named on the cover. Do not include any other hospital stays in your answer.			
SHEP/HCAHPS Reporting measure	**SHEP/HCAHPS Survey Questions**	**SHEP/HCAHPS Scoring**	**SHEP methodology applied to HCAHPS**
		Usually Always	
Communication about Medication	**Question 1.** Before giving you any new medicine, how often did hospital staff tell you what the medicine was for? **Question 2.** Before giving you any new medicine, how often did hospital staff describe possible side effects in a way you could understand?	**Questions 1 & 2** have the following response scale: Never Sometimes Usually Always	The score on each item is calculated as the percentage of responses that fall in the top two categories (Usually, Always). Communication about Medication is then calculated as the average of the site's scores on the two items.
Discharge Information	**Question 1.** During this hospital stay, did doctors, nurses, or other hospital staff talk with you about whether you would have the help you needed when you left the hospital? **Question 2.** During this hospital stay, did you get information in writing about what symptoms or health problems to look out for after you left the hospital?	**Questions 1 & 2** have the following response scale: Yes No	The score on each item is calculated as the percentage of "Yes" responses. Discharge Information is then calculated as the average of the site's scores on the two items.
Communication with Nurses	**Question 1.** During this hospital stay, how often did nurses treat you with courtesy and respect?	**Questions 1, 2, & 3** have the following response scale: Never Sometimes	The score on each item is calculated as the percentage of responses that fall in the top two categories (Usually, Always).

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

SHEP/HCAHPS Reporting measure	SHEP/HCAHPS Survey Questions	SHEP/HCAHPS Scoring	SHEP methodology applied to HCAHPS
	Question 2. During this hospital stay, how often did nurses listen carefully to you? **Question 3.** During this hospital stay, how often did nurses explain things in a way you could understand?	Usually Always	Communication with Nurses is then calculated as the average of the site's scores on the three items.
Communication with Doctors	**Question 1.** During this hospital stay, how often did doctors treat you with courtesy and respect? **Question 2.** During this hospital stay, how often did doctors listen carefully to you? **Question 3.** During this hospital stay, how often did doctors explain things in a way you could understand?	**Questions 1, 2, & 3** have the following response scale: Never Sometimes Usually Always	The score on each item is calculated as the percentage of responses that fall in the top two categories (Usually, Always). Communication with Doctors is then calculated as the average of the site's scores on the three items.

| Responsiveness of Hospital Staff | **Question 1.** During this hospital stay, after you pressed the call button, how often did you get help as soon as you wanted it? | **Question 1** has the following response scale: Never Sometimes Usually Always I never pressed the call button | The score on Question 1 is calculated as the percentage of responses that fall in the top two categories (Usually, Always); responses of "I never pressed the call button" are excluded from the denominator in the calculation of this percentage. |

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

	Question 2. How often did you get help in getting to the bathroom or using a bedpan as soon as you wanted?	**Question 2** has the following response scale: Never Sometimes Usually Always	The score on Question 2 is calculated as the percentage of responses that fall in the top two categories (Usually, Always). "Responsiveness" is then calculated as the average of the site's scores on the two items.
Willingness to Recommend Hospital	**Question 1.** Would you recommend this hospital to your friends and family?	**Question 1** has the following response scale: Definitely no Probably no Probably yes Definitely yes	The reporting measure is calculated as the percentage of responses in the top category (Definitely yes).
Pain Management	**Question 1.** During this hospital stay, how often was your pain well controlled? **Question 2.** During this hospital stay, how often did the hospital staff do everything they could to help you with your pain?	**Questions 1 & 2** have the following response scale: Never Sometimes Usually Always	The score on each item is calculated as the percentage of responses that fall in the top two categories (Usually, Always). Pain Control is then calculated as the average of the site's scores on the two items.

Overall Rating of Hospital	**Question 1.** Using any number from 0 to 10, where 0 is the worst hospital possible and 10 is the best hospital possible, what number would you use to rate this hospital during your stay?	**Question 1** has the following response scale: 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10	The reporting measure is calculated as the percentage of responses that fall in the top two categories (9, 10).

Quietness of the Hospital Environment	**Question 1.** During this hospital stay, how often was the area around your room quiet at night?	**Question 1** has the following response scale: Never Sometimes Usually Always	The reporting measure is calculated as the percentage of responses that fall in the top two categories (Usually, Always).

E.2 Best Practices and Benchmarks

We have identified several patient experience best practices and benchmarks in the following areas:

Table E-2. Patient Experience – Best Practices and Benchmarks

Category	Component	Best practice / benchmark
Organization	Strategic priority	Establish a system-wide approach to patient experience that goes beyond survey results and department-led initiatives to align the hospital's mission and vision statements to support patient and family engagement (The Beryl Institute, 2010)
Organization	Leadership	Drive cultural change from the top with strong executive leadership support (Singer, 2013) Designate a system- and facility-level position focused exclusively on patient experience (Cleveland Clinic, 2010 and Beryl Institute, 2010)
Organization	Performance management	Tie individual performance to patient experience and employee engagement performance outcomes
Organization	Interdisciplinary collaboration	Create cross-functional teams that include both operational and clinical leaders as well as front-line employees to focus on patient experience (Manary, 2014)
Organization	Activate patients in their own care	Engage an advisory council, including patients and families, to provide real-time feedback and creative solutions for patient experience challenges (engage the patient as an active participant) (Hibbard, 2013; Wolf, 2014)
Processes	Training	Mandate patient-centered training for all employees (Luxford, 2011) Provide management training for front-line supervisors to improve the relationship between the front-line and promote employee engagement (Luxford, 2011)

Category	Component	Best practice / benchmark
Processes	Rounding	Establish a cadence for leadership rounding on patients and staff; personalized recognition of high-performing staff (Singer, 2013)
		Provide immediate service recovery by rounding on patients several times per day (or even hourly) (Hibbard, 2013)
Processes	Patient and employee engagement	Employ a communication framework across staff to assist with patient interaction and promote immediate service recovery (Locatelli, 2014)
		Educate patients and family on discharge planning immediately following admission and throughout a patient's stay (Beryl, 2010)
		Empower front-line to develop and own performance improvement (potentially in an anonymous fashion) (Luxford, 2011)
Tools	Feedback solicitation	Solicit patient and employee feedback regularly (Beryl, 2010)
		Provide a real-time, or near real-time, view of patient and employee satisfaction (Beryl, 2010)
		Track performance improvement to patient and employee feedback (Beryl, 2010)
Tools	Careboards	Communicate with patients and family through updated white boards that indicate their provider team, plan. or discharge, approach to pain management, etc. (Locatelli, 2014)

E.3   Assessment Mapping to Choice Act Legislation

We have matched our findings and recommendations with the organization, workflow processes, and tools as outlined in the legislation.

Table E-3. Mapping to Organization, Workflow Processes, and Tools Domains Specified by the Statute

Findings and recommendations	Organization	Workflow processes	Tools
8.2.1: National and facility-level focus on the prioritization and provision of Veteran-Centered care has driven innovations in best practices			

Findings and recommendations	Organization	Workflow processes	Tools
8.2.1.1: Veteran-focused initiatives, developed locally at individual VAMCs, exemplify industry best practices at the bedside	✔		✔
8.2.1.2: Veteran-focused initiatives, developed locally at individual VAMCs, exemplify industry best practices at the bedside	✔	✔	✔
8.2.2: Adoption of best practices and engagement of Program Office support services are varied across VAMCs.			
8.2.2.1: Central Office reach is limited by the level of facility leadership engagement	✔	✔	
8.2.2.2: Structure to codify and share facility-driven initiatives across the system is limited	✔	✔	
8.2.2.3: Implementation of point-of-care feedback tools (e.g., GetWell Network, Truth Point) is varied across the system	✔	✔	✔
8.2.3: Challenges with respect to timeliness and specificity in the SHEP survey results limit VAMCs' ability to drive performance improvement			
8.2.3.1: SHEP results are often delayed by 3 to 6 months and reflect aggregate VAMC patient satisfaction scores (for example, data is not segmented by individual department or unit)	✔	✔	✔
8.2.3.2: Patient satisfaction metrics are not generally included in individual's performance reviews because SHEP data is aggregated at the VAMC level	✔	✔	
8.3.1: Collect more timely and relevant patient experience data to drive transparency and performance improvement at the facility, department, and individual levels			
8.3.1.1: Ensure VHA's patient satisfaction feedback tool(s) delivers survey results in a timely (real time or near real-time) and actionable format (for example, segmented at the VISN, VAMC, department and unit levels)		✔	✔

Findings and recommendations	Organization	Workflow processes	Tools
8.3.1.2: Include patient experience metrics in leadership and department level performance reviews	✓		✓
8.3.2: Strengthen national and facility-level support for patient-centered care programs to increase adoption			
8.3.2.1: Coordinate Veteran-centered initiatives across Program Offices	✓	✓	✓
8.3.2.2: Promote consistent leadership at the VAMCs	✓		
8.3.2.3: Facilitate sharing of facility-driven best practices	✓	✓	✓

E.4   Past Findings and Recommendations Detail

Figures E-1 and E-2 below are illustrative of the types of issues identified and recommendations made in recent years, and are not comprehensive lists.

Figure E-1. Sample Patient Experience Issues Identified in Past Assessments

Prior patient experience findings

NOT EXHAUSTIVE

■ Identified in study

Related current finding	Sample past issues cited	2009	2010	2011	2012	2013	2014	2015
Finding 8.2.2	Excessive leadership and front-line staff vacancies				AL[2]			
	Insufficient staffing of patient advocates at some facilities			VOV[1]	AL[2]			
	Inability for facilities to deliver on new strategic initiatives because of considerable delays, close to 6 months, in receiving strategic plan from the VACO				AL[2]			
	Excessive number of performance measures				AL[2]			
	Difficulties in navigating the systems (e.g., incorrect room numbers)						Sara[3]	
Finding 8.2.3	Delayed SHEP reporting of 3 to 6 months, limits the application of performance metrics			VOV[1]	AL[2]

Appendix F   Additional Detail on Accurate Documentation and Subsequent Coding

F.1   Best Practices and Benchmarks

We have identified several documentation and coding best practices and benchmarks in the following areas:

Table F-1. Documentation and Coding – Best Practices and Benchmarks

Category	Component	Best practices / benchmarks
Organization	HIMS organizational structure	▪ Organize HIMS reporting structure to promote proper emphasis on documentation and coding from senior hospital leadership (Johns, 2013)
Organization	Performance management	▪ Promote provider buy-in on documentation and coding objectives through performance management and supporting incentives (Intermountain Healthcare Interview, 2015)
Organization	CDI program implementation	▪ Establish multi-disciplinary clinical documentation improvement (CDI) programs with emphasis on review of provider documentation, increased provider engagement, and education and training for non-coding staff (Arrowood, 2013; Danzi, 2000)
Workflow processes	Provider documentation training	▪ Conduct targeted provider documentation training sessions to teach and reinforce proper documentation patterns (Russo, 2013)
Workflow processes	Documentation quality assurance	▪ Maintain integrity of the medical record through effective quality review processes (Arrowood, 2013)
Workflow processes	Coding quality assurance	▪ Implement coder audits to ensure reliability of coding and to provide training and focused coaching for performance issues (Prophet, 1998)
Workflow processes	Provider query processes	▪ Clarify ambiguous or unclear documentation consistently to ensure that translation from medical documentation to codes is reflective of the patient's true clinical condition (Prophet, 2001)
Tools	Electronic health record (EHR)	▪ Standardize information capture to enable extraction of needed data from the medical record (e.g., for coding, quality measurement) (Clark, 2012) ▪ Incorporate program features that encourage proper documentation practices (e.g., automated copy-paste audits) (Arrowood, 2013)

Category	Component	Best practices / benchmarks
Tools	Coding software	▪ Incorporate resources within the core coding environment to facilitate proper code assignment (e.g., error checking, decision support) (Fletcher, 2002) ▪ Train coders adequately to ensure competency and promote targeted improvements, as needed (Santos, 2008)

F.2 Past Findings and Recommendations Detail

F.3   Assessment Mapping to Choice Act Legislation

We have matched our findings and recommendations with the organization, workflow processes, and tools domains outlined in the legislation.

Table F-2. Mapping of Drivers to Organization, Workflow Processes, and Tools Domains Specified by the Statute

Findings and recommendations	Organization	Workflow processes	Tools
9.2.1: Inconsistent focus on clinical documentation impedes consistent capture of complete clinical information, hindering appropriate resource allocation and revenue collection			
9.2.1.1: Limited direct integration of health information management (HIM) and finance functions	✓		

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

Findings and recommendations	Organization	Workflow processes	Tools
at the VAMC level weakens leadership prioritization of documentation			
9.2.1.2: Inconsistent provider education and training practices are not aligned with VHA's view of the high importance of clinical documentation	✓	✓	
9.2.1.3: Lack of performance management contributes to low priority on documentation	✓	✓	✓
9.2.2: Adoption of documentation best practices is variable, resulting in inconsistent quality of clinical documentation system-wide			
9.2.2.1: Inconsistent adoption of provider documentation best practices (e.g., template use, appropriate copy-paste) challenges effectiveness		✓	✓
9.2.2.2: Ineffective provider query practices and limited provider responsiveness at many facilities contribute to persistence of suboptimal documentation		✓	✓
9.2.2.3: Incomplete uptake of clinical documentation improvement (CDI) programs and variable best practice implementation has limited potential impact from these programs	✓	✓	
9.2.3: VHA's performance on coding accuracy and timeliness closely matches or exceeds private sector			
9.2.3.1: Visibility into performance through establishment of clear coding targets and performance tracking supports transparency and improvement	✓		✓
9.2.3.2: Regular application of coder auditing by internal coding experts at the facility-level yields feedback loop to identify inaccuracies and improve performance		✓	
9.2.3.3: Use of coding software that incorporates best practice features (e.g., error checking, decision support) facilitates coding accuracy			✓
9.3.1: Increase local prioritization of clinical documentation through acceleration of national CDI program and targeted provider education and training,			

Findings and recommendations	Organization	Workflow processes	Tools
supported by performance management at the facility and provider level.			
9.3.1.1: Incorporate documentation metrics into regular performance reviews for both providers and facilities	✓	✓	✓
9.3.1.2: Reinforce CDI program by providing targeted guidance on national documentation priority areas and by creating a national information-sharing network for CDI best practice sharing	✓		✓
9.3.1.3: Develop and deploy provider educational and training programs to address unique VHA documentation needs and reemphasize the importance of documentation for Veterans and the organization	✓	✓	✓
9.3.2: Strengthen provider documentation standards (e.g., management of clinical templates, EHR review process) to promote optimal capture of patient information and improve resulting resource management.			
9.3.2.1: Eliminate duplicative clinical templates and standardize requirements for new template creation			✓
9.3.2.2: Strengthen EHR reviews to ensure appropriate use of copy-paste, including implementation of CPRS tool to automate the process	✓	✓	✓
9.3.2.3: Implement standardized processes for following up on outstanding provider queries and improve provider accountability for query responsiveness	✓	✓	

F.4 Description of Documentation and Coding Site Visit Assessment Workshop Improvement Idea Generation Process

Our site visits provided an opportunity to generate potential improvement ideas with front-line staff members familiar with the documentation and coding challenges affecting their facility. As part of each on-site documentation and coding assessment workshop (N=20), we facilitated a conversation regarding barriers to accurate documentation and coding at their facility and then asked participants (approximately 115 total staff members composed of physicians, medical

coders, utilization management nurses, and HIM chiefs) to generate improvement ideas that would strengthen facility-level processes and outcomes. Upon completion of all site visits, we compiled the 210 proposed solutions and grouped similar improvement ideas to assess how often participants cited improvement ideas aligned with our recommendations. Data from this exercise is often included within the "summary of supporting evidence" sections for each sub-recommendation.

F.5   Additional Supporting Figures

Figure F-3. Illustrative Template Review Checklist

A standardized template review process promotes appropriate and effective new template development

Sample considerations

General	• Is the template **duplicative** of another template? • Will the note trigger a **provider alert**?
Spelling	• Does the note avoid **inappropriate abbreviations**? • Are **acronyms** correctly spelled?
Format	• Is **punctuation** correct? • Does the template **flow logically**?
Grammar	• Is **use of tense** consistent? • Is the **use of gender** correct?
Review of note title	• Does the title accurately **reflect the contents**? • Is the title sufficiently **different from other titles**?

SOURCE: AHIMA, "Electronic Documentation Templates Support ICD-10-CM/PCS Implementation. Appendix C: Checklist for Template Review," Journal of AHIMA 83, no.10 (October 2012): expanded online version

Figure F-4. Illustrative Provider Query Follow-Up Process

Illustrative approach to following up on physician queries

Timing	Day 0	Day 2	Day 4	Day 7
Proposed actions	• Coder submits query to physician **via email**	• Coder **calls physician** to inform them of query submission	• Coder **contacts service line chief** • Service line chief **calls physician** to solicit response to the query	• Coder **abandons query** to permit timely closing of the record • Service line chief **notes physician non-response** and discusses with physician during next performance review

Prepared by:

Grant Thornton

**A Product of the CMS Alliance to Modernize Healthcare
Federally Funded Research and Development Center
Centers for Medicare & Medicaid Services (CMS)**

Prepared For:
U.S. Department of Veterans Affairs

At the Request of:
Veterans Access, Choice, and Accountability Act of 2014
Section 201: Independent Assessment of the Health Care Delivery
Systems and Management Processes of the Department of Veterans
Affairs

Assessment G (Staffing/Productivity/Time Allocation)

September 1, 2015

This page intentionally left blank

This report is the result of the contributions of several team members, who conducted site visits, processed and analyzed data, managed team activities, and enabled the Grant Thornton team to execute a rigorous study over a short period of time. The team was led by Grant Thornton, with integral support from team member FTI Consulting, and three independent contractors.

The views, opinions, and/or findings contained in this report are those of Grant Thornton and should not be construed as an official government position, policy, or decision.

This page intentionally left blank.

Preface

Congress enacted and President Obama signed into law the Veterans Access, Choice, and Accountability Act of 2014 (Public Law 113-146) ("Veterans Choice Act"), as amended by the Department of Veterans Affairs (VA) Expiring Authorities Act of 2014 (Public Law 113-175), to improve access to timely, high-quality health care for Veterans. Under "Title II – Health Care Administrative Matters," Section 201 calls for an Independent Assessment of 12 areas of VA's health care delivery systems and management processes.

VA engaged the Institute of Medicine of the National Academies to prepare an assessment of access standards and engaged the Centers for Medicare & Medicaid Services (CMS) Alliance to Modernize Healthcare (CAMH)[1] to serve as the program integrator and as primary developer of the remaining 11 Veterans Choice Act independent assessments. CAMH subcontracted with Grant Thornton, McKinsey & Company, and the RAND Corporation to conduct 10 independent assessments as specified in Section 201, with MITRE conducting the 11th assessment. Drawing on the results of the 12 assessments, CAMH also produced the Integrated Report in this volume, which contains key findings and recommendations. CAMH is furnishing the complete set of reports to the Secretary of Veterans Affairs, the Committee on Veterans' Affairs of the Senate, the Committee on Veterans' Affairs of the House of Representatives, and the Commission on Care.

The research addressed in this report was conducted by Grant Thornton LLP, under a subcontract with The MITRE Corporation. Grant Thornton also subcontracted with FTI Consulting and other independent contractors in the conduct of the assessment.

---

[1] The CMS Alliance to Modernize Healthcare (CAMH), sponsored by the Centers for Medicare & Medicaid Services (CMS), is a federally funded research and development center (FFRDC) operated by The MITRE Corporation, a not-for-profit company chartered to work in the public interest. For additional information, see the CMS Alliance to Modernize Healthcare (CAMH) website (http://www.mitre.org/centers/cms-alliances-to-modernize-healthcare/who-we-are/the-camh-difference).

Executive Summary

In a health system comprised of more than 150 hospitals and nearly 1,400 community-based outpatient clinics, Vet Centers and domiciliaries,[2] determining the staffing levels, caseload, and productivity required of VHA providers to meet the needs of over nine million enrolled Veterans[3] is a complex task. Yet, adequate provider staffing levels and a health care system that enables its clinicians to be productive in delivering VHA's population health focused model of care are essential to meeting the goal of timely, high quality care for our Veterans. This report details an assessment of the staffing levels, caseload, and productivity of providers across the VHA health care delivery system, and the allocation of providers' time between delivery of patient care and other tasks such as administration, education, and research. This assessment addresses section 201(G) of the Veterans Access, Choice and Accountability Act of 2014 (Veterans Choice Act).

Congress enacted the Veterans Choice Act to improve Veterans' access to timely, high-quality health care. It included a request for an independent assessment of several aspects of the VHA health care delivery system. Part G of Section 201 requires an independent assessment of "the staffing level at each medical facility of the Department and the productivity of each health care provider at such medical facility, compared with health care industry performance metrics, which may include an assessment of the case load and number of patients treated by each health care provider, time spent by health providers on matters other than caseload, including time spent at an affiliate, conducting research, training, or supervising other health care professionals of the department."

To address this requirement, and under contract to the MITRE Corporation, the Assessment G team, led by Grant Thornton LLP, in partnership with FTI Consulting, and three independent contractors, conducted an assessment of current provider staffing levels, caseload, and productivity, in comparison to health care industry benchmarks. This included an in-depth assessment of nurse staff resource allocation, decision-making, and processes which impact provider productivity and efficiency. The Assessment G team's approach involved both quantitative analyses (for example, benchmarking against nationally recognized industry benchmark surveys), as well as qualitative data analyses (root cause analysis review of data collected from over 700 interviews at 24 site visits, as well as data collected from VHA subject matter experts at VHA Central Office).

The Assessment G team had several key findings and observations pertaining to the core assessment objectives: staffing, productivity, and time allocation.

Staffing

The Assessment G team analyzed VHA provider staffing levels and compared them to the private sector (using physician per population ratio industry comparisons) and identified some

---

of the challenges VHA faces in ensuring it has sufficient providers to meet demand. In summary, VHA's provider staffing mix reflects VHA's care model and the needs of the Veteran population, but conclusions from Assessment G about the adequacy of provider staffing levels and the impact of contract providers are difficult to make without consideration of the results of Assessment A (Demographics) and Assessment B (Capacity). VA medical centers face issues with provider vacancies, lengthy hiring processes, and competitive compensation, each of which can contribute to provider shortages. Key findings with respect to the VHA provider staffing levels are:

- **Finding 1:** VHA specialties with the highest provider full time equivalent (FTE) levels include medicine specialties, mental health, and primary care, consistent with VHA's care model and the needs of the Veteran population. Social Workers also represent a significant portion of provider FTEs. (See Section 2.2.2)
- **Finding 2:** VHA does not systematically track fee-based provider productivity, and does not capture FTE level information for fee-based care providers. (See Section 2.2.3)
- **Finding 3:** VHA physician staffing levels per population are, in most specialties, lower than industry ratios. These ratios are not sufficient to establish whether VHA is staffed to meet demand. One factor to consider is that even industry physician supply is not sufficient to meet demand in many specialties. Another factor to consider is that VHA uses Advanced Practice Providers (APPs) extensively, but APPs are not included in industry ratios. (See Section 2.2.6.)

Productivity

The Assessment G team assessed the productivity of VHA providers in comparison to providers in the private sector. This assessment used several common health care industry productivity measures: encounters (count of direct provider-patient interactions in which the provider diagnoses, evaluates, or treats the patient's condition), work relative value units (wRVUs—a measure of a provider's output which takes into account the relative amount of time, skill, and intensity required to complete a given procedure), and primary care panel size (the number of unique patients for whom a care team is responsible). The Assessment G team considered VHA's care model, benchmarked providers accordingly, and considered the barriers VHA faces in delivering care at a rate of productivity that matches health care systems in the private sector. In summary, we found that the average caseload or panel size of primary care providers is slightly below the level expected, but VHA's target panel size is comparable to the private sector considering the type of patient population served and the findings described in the body of this report. VHA mental health providers are generally more productive than many of their peers in the private sector. VHA specialty providers on the other hand tend to lag the private sector in their productivity, although providers at high complexity VA facilities tend to have high productivity.

There are several operational constraints or barriers which may explain these differences, such as: insufficient exam rooms and clinical or non-clinical support staff, and a lack of standard practices for managing daily staff absences. Based upon the Assessment G team's observations and the findings of Assessment F (Clinical Workflow), we have concerns that providers may not be properly documenting all of their workload, which may explain some of the difference in

productivity. The accuracy of documentation and coding shouldn't be just considered for the sake of measuring wRVUs; coding is important to measuring whether clinical pathways are being appropriately followed and understanding care outcomes. Key findings with respect to the caseload and productivity of VHA providers are:

- **Finding 4:** VHA measures the performance of its PCPs using panel size. VHA calculates a modeled panel size for providers based on a variety of factors at each facility. The model was developed based on research into the appropriate panel size for the unique needs of Veterans. (See Section 2.3.5.2)

- **Finding 5:** In accordance with policy, VHA facilities establish a maximum panel size for each primary care provider which is often lower than the modeled panel size. The maximum figure takes into account specialized panel needs (for example, a geriatric population) and other factors deemed appropriate by the facility. (See Section 2.3.5.4).

- **Finding 6:** The actual panel size of VHA primary care providers is lower than internal and external benchmarks. (See Section 2.3.5.5)

- **Finding 7:** When compared to the private sector using wRVUs, there is a productivity gap in VHA specialty care. (See Section 2.3.6.3)

- **Finding 8**: When encounters (visits) are used as a measure, the gap shrinks and VHA specialty care compares more favorably to the private sector. (See Section 2.3.6.4).

- **Finding 9**: VHA mental health providers are more productive than academic medical center (American Medical Group Management Association [AMGMA]) benchmarks, as measured by both wRVUs and encounters. (See Section 2.3.6.5)

- **Finding 10:** Overall, VHA specialty care providers are producing fewer wRVUs than private sector benchmarks; however, VHA specialty care providers at the highest complexity facilities are more productive than their peers. Further, the most productive VHA providers (those at the 75th percentile of VHA providers) are often more productive than the private sector. (See Section 2.3.6.6)

- **Finding 11:** Productivity and access are important measures in population based health models like VHA that focus on patient outcomes, rather than volume. VHA's Office of Productivity, Efficiency, and Staffing (OPES) reports on productivity and access offer tools for use by medical facilities. With some improvements to expedite adoption and regular use by medical centers, these tools could become key resources in optimizing productivity and maximizing access to care. (See Section 2.3.6.8)

- **Finding 12:** VHA dentists see fewer patients on average than private sector benchmarks, but serve a population with special needs. The dentistry patient population of VHA generally has a compensable service-connected dental disability, is older, has more complex injuries, and may present for dental care following years of dental neglect. (See Section 2.3.7.4).

Key findings with respect to the barriers VHA faces in delivering care that is equally as productive as the private sector are:

- **Finding 13:** Insufficient exam rooms and poor configuration of space limits providers' productivity, ability to maximize patient throughput, and reduces patient access. (See Section 2.3.8.3)

- **Finding 14:** Clinical and administrative support staff ratios are insufficient and may limit provider productivity. (See Section 2.3.8.4)

- **Finding 15:** Insufficient clinical and administrative support staff results in providers and clinical support staff not working to the top of their licensure. (See Section 2.3.8.4.1).

- **Finding 16:** While there has been widespread implementation of the Patient Aligned Care Team (PACT) model in primary care clinics and the National Nurse Staffing Methodology in many areas of inpatient care, there are no current VHA standards for staffing levels and/or mix in specialty clinics, with the exception of eye clinics. Furthermore, VHA OPES has developed state of the art tools for managing staffing and productivity, but these tools will require improvements for leaders to more effectively leverage them in resource decisions. (See Section 2.3.8.4.2)

- **Finding 17:** Organizational siloes and separate reporting lines exist for physicians, nurses and medical service administrators at a majority of VA Medical Centers (VAMCs). As a result, service chiefs do not have control over the resourcing and performance of their clinical support staff (nurses) or clerical and administrative support staff. (See Section 2.3.8.4.3)

- **Finding 18:** Many facilities do not have a centralized staffing office or nurse float pool to address daily staff variances or absences. (See Section 2.3.8.4.4)

- **Finding 19:** During site visits and interviews with VHA Central Office leaders, we consistently heard concerns that providers do not fully document and accurately code all of their clinical workload. (See Section 2.3.8.5)

Provider Time Allocation

The Assessment G team assessed how VHA providers spend their time, to include the time that VHA providers spend on non-patient care activities, particularly time spent on education and research activities, as well as time spent overseeing residents in a clinical setting, and time spent at academic affiliate medical centers. We compared VHA providers' clinical time to private sector data, as well. In summary, we found that VHA providers spend approximately the same proportion of their time on clinical care activities as the private sector, despite a rich research output. Key findings with respect to VHA providers' time allocation are:

- **Finding 20:** VHA physicians spend a comparable proportion of total time devoted to clinical activities as private sector physicians. There is some potential difference in the definition of direct patient care used by the private sector, specifically with respect to training, teaching and research, but we believe this represents only a small proportion of a provider's direct patient care time. (See Section 2.4.2)

- **Finding 21:** Across all VHA providers, less than two percent of time is devoted to research. Since provider time spent devoted to clinical care activities is comparable to the private sector, it does not appear that research activities reduce providers' time spent treating patients. Despite the overall low proportion of time spent on research, the

accomplishments of VHA's research program, and contributions to advancing care for Veterans, are numerous. (See Section 2.4.4)

Recommendations

Several recommendations and best practices were identified to address the findings of this assessment. These should be considered in concert with the findings and recommendations of other Veterans Choice Act Assessments (Assessments E-Scheduling, F-Clinical Workflow, and H-Technology). In formulating these recommendations, the Assessment G team considered the findings and recommendations of the other Veterans Choice Act Assessments, prior reports by the VA Office of the Inspector General (OIG), the Government Accountability Office (GAO) and other government bodies, together with promising VHA practices identified in the course of our site visits, and best practices from external health care organizations identified through the course of our literature review.

The Assessment G team offers five overarching recommendations to VHA. In Section 3 we identify the supporting evidence for each recommendation, relevant promising or best practices, and potential near-term actions or next steps. We also provide a discussion of cross-cutting implementation considerations that may be used to develop, enhance, or speed implementation. By implementing these recommendations, along with the recommendations of the other Veterans Choice Act Assessments, VHA can with the support of Congress evolve into a consistently high performing health system, enabling access to high quality care in an efficient and cost effective manner.

1.   **VHA should improve staffing models and performance measurement.**

This assessment recommends that VA conduct an evaluation of the design and implementation of current VHA staffing models to determine the extent to which they are sufficient to meet the goals of VHA's population health focused model and ensure all eligible Veterans have access to high quality, timely care. VHA should conduct a program review of the implementation of the PACT staffing model in primary care to identify the causes of the gaps between actual, facility maximum, modeled and external benchmarks, the impacts of these performance gaps on access to quality care, the appropriateness of current guidelines and performance standards, and determine areas for improvement. VHA should develop and implement staffing models for outpatient specialty care services and improve existing performance measurement systems to realize the benefits of specialty care staffing models. VHA should refine and implement the National Nurse Staffing Methodology across inpatient services and improve the performance measurement system to realize the benefits of the methodology. We further recommend that VHA mandate all VAMCs adopt and report nursing quality metrics to a national database to compare VHA to other external health organizations.

To improve staffing and productivity measurement and better determine the capacity of VHA specialty clinics, this assessment recommends that VHA gather data and assess the productivity of fee-based providers, as well as conduct a work measurement study (or confirm existing workload data) to determine the volume and distribution of workload annually to better match staffing requirements to demand. For future reporting, OPES should complete the development of the APP productivity cube, to include completion of business rules that would allow APPs to be mapped to a specialty designation and included in OPES specialty group practice and facility

productivity reports to accurately reflect care teams' overall effort and present a combined provider (doctor of medicine [MD] and APP) productivity view.

2. **VAMCs should create the role of clinic manager and drive more coordination and integration among providers and support staff.**

This assessment identifies recommendations for increasing the level of teamwork and accountability among all outpatient clinic staff, especially in specialty care services. This might be achieved by creating multidisciplinary management teams for specialty clinics that include a physician leader, nurse leader, and business administrator. Alternatively, specialty clinics might establish a single or dual reporting line and operating a model for providers and their clinical and non-clinical support staff, so that all of the members of the specialty clinic team have more accountability to each other and the Service Chief of the specialty.

3. **VA Medical Centers should implement strategies for improving management of daily staff variances, and include a replacement factor for all specialties, including PACT.**

With respect to managing staff absences, this assessment makes recommendations for improving the management of daily staffing variances by implementing several strategies that include intermittent float pools of support staff and the inclusion of a replacement factor across all staffing methodologies/models, to include PACT.

4. **VA Medical Centers should implement local best practices that mitigate space shortages within specialty clinics.**

This assessment identifies recommendations to help VA medical facilities mitigate space shortages within specialty clinics. These include strategies such as: standardized schedule templates, expanded clinic hours, increased use of non-face-to-face encounters for follow-up consults by specialty care, and system redesign initiatives to improve patient flow within clinics.

5. **VHA should improve the accuracy of workload capture.**

This assessment recommends that VHA conduct an audit of health record documentation and current procedural terminology (CPT®) coding accuracy and reliability to validate physician productivity measurement and that if the results support it, evaluate the ability of commercially available computer assisted coding (CAC) applications to assist providers with coding. The creation of the role of clinic manager for Specialty Care clinics should also be used to improve clinic management and coding practices.

1 Introduction

As the nation's largest integrated health care delivery system[4] – and one dedicated solely to providing care and support services to Veterans, their dependents and survivors – the roles and missions of the Department of Veterans Affairs (VA) are important to all Americans. VA endeavors to provide our nation's heroes with the highest quality health care possible. To do so, it must address the unique health care needs of Veterans while removing the barriers and challenges that hamper its provider's ability to deliver Veterans the timely, high quality care and positive patient experience they deserve. The Veterans Health Administration (VHA) offers care that is good or better than national benchmarks, and the majority report positive experiences with their health care providers. However, too many of our Veterans wait too long to receive the high quality care they deserve.

In a health system comprised of more than 150 hospitals and nearly 1,400 community-based outpatient clinics, Vet Centers and domiciliaries,[5] determining the staffing levels, caseload, and productivity required of VHA providers to meet the needs of over nine million enrolled Veterans[6] is a complex task. Adequate provider staffing levels and a health care system that enables its clinicians to be productive in delivering VHA's population health focused model of care are essential to meeting the goals of timely, high quality care for our Veterans. This report details an assessment of the staffing levels, caseload, and productivity of providers across the VHA health care delivery system, and the allocation of providers' time between delivery of patient care and other tasks such as administration, education, and research. This assessment addresses section 201(G) of the Veterans Access, Choice and Accountability Act of 2014.

1.1 Purpose, Scope, and Sub-assessments

1.1.1 Purpose

Congress enacted the Veterans Choice Act to improve Veterans' access to timely, high-quality health care. As the first step toward improving access, the Veterans Choice Act required an independent assessment of the VHA health care delivery system. In response, the MITRE Corporation brought together independent industry experts, to include Grant Thornton, to identify current practices and opportunities for improvement, as well as opportunities to scale best or promising practices. Part G of Section 201 requires an independent assessment of:

The staffing level at each medical facility of the Department and the productivity of each health care provider at such medical facility, compared with health care industry performance metrics, which may include an assessment of any of the following:

> (i) The case load of, and number of patients treated by, each health care provider at such medical facility during an average week.

---

---

(ii) The time spent by such health care provider on matters other than the case load of such health care provider, including time spent by such health care provider as follows:

(I) At a medical facility that is affiliated with the Department.

(II) Conducting research.

(III)Training or supervising other health care professionals of the Department.[7](113 U.S.C, Veterans Choice Act p. 16-17)

1.1.2 Scope

Pursuant to the language in Section 201 of the Choice Act, the scope of our assessment focuses on VHA provider staffing levels, caseload, productivity, and time in comparison to health care industry benchmarks. To further refine the legislative language, we developed the following assessment objectives and structured our study around them:

1. Describe the current state of VHA provider[8] staffing levels, as compared to industry standards, benchmarks, and metrics.
2. Assess VHA provider productivity as compared to industry standards, benchmarks, and metrics.
3. Describe the relative time spent by VHA providers on non-patient care activities.

In addition to completing benchmark comparisons, we assessed the drivers of productivity within VHA, and potential causes of differences between the productivity of VHA providers and the private sector. In doing so, we compared current VHA practices that impact productivity to accepted best practices drawn from literature and professional associations, as well as standard practices from benchmark data and surveys. We also considered promising practices observed at individual VAMCs we visited. This provided insight into alternative approaches and recommendations that could be implemented VHA wide to improve staffing and productivity practices. By implementing these recommendations, along with the recommendations of the other Veterans Choice Act Assessments, VHA can, with the support of Congress evolve into a

---

[7] Veterans Access, Choice and Accountability Act of 2014, 113 U.S.C. Congress § 3230. (2014). Retrieved from http://www.gpo.gov/fdsys/pkg/BILLS-113hr3230enr/pdf/BILLS-113hr3230enr.pdf

[8] ***Definition***: *VHA provider, for the purposes of this assessment, is defined as an independent licensed practitioner (Physician Assistants [PA], Nurse Practitioners [NP], Doctor of Medicine [MD], Physical Therapists, Psychologists, Social Workers), taking the Health Resources and Services Administration's [HRSA] definition of independent licensed practitioner to be "a physician, dentist, NP, nurse midwife, or any other individual permitted by law and the organization to provide care and services without direction or supervision, within the scope of the individual's license and consistent with individually granted clinical privileges." Clinical Nurse Specialists are excluded from this definition. The definition of a VHA provider includes providers employed full-time by VA. The scope of VHA providers includes inpatient and outpatient care, primary care, specialty care, dentists, and mental health providers. Although contract and fee providers are, in some facilities, a significant proportion of care delivery teams; they are deemed out of the scope of this assessment, due to an inability to quantify staffing levels (full time equivalent [FTE]), or hours worked, as VA does not track this information.*

---

consistently high performing health system, enabling access to high quality care in an efficient and cost effective manner.

Assessment G is closely connected to several other assessments requested within the Choice Act, including, but not limited to, assessments A (demographics), B (capacity and resources), E (scheduling), F (clinical workflows), H (information technology), and K (facilities). To avoid overlap and duplicative analysis, we completed our assessment in close collaboration with others. We have indicated key instances where further relevant analyses are included in related assessments, throughout our report.

1.1.3 Sub-Assessments

The scope of Assessment G can be broken into three elements, or "sub-assessments" which tie to the three main objectives of this assessment: provider staffing, provider productivity, and provider time allocation.

1.1.3.1 Provider staffing (Objective 1)

To assess the provider staffing levels at VHA, we report the current staffing levels across all VHA facilities, as well as at individual facilities, and averages across varying facility types, defined by the complexity of care provided. We also compared physician supply to population ratios of VHA with external benchmarks which provide an indicator of physician need (there are no comparison data available for advanced practice providers [APPs]). For primary care providers, we compared panel sizes which is a measure of both staffing and productivity – this analysis is provided in the subsequent section on provider productivity. Since part of our defined assessment scope was to understand how provider staffing might differ from the private sector to meet the unique needs of the Veteran populations, we used supplemental data on the needs of Veterans from Assessment A (Demographics) to explain differences in VHA's physician workforce compared to the private sector. We did not explicitly assess whether current physician staffing levels would enable VHA to provide timely and accessible care to Veterans as this is part of the scope of Assessment B (Capacity). However, we do elaborate on some of the challenges of assessing the adequacy of staffing levels. We did not assess projected staffing levels as this was also part of the scope of Assessment B. Lastly, we assessed the challenges that VHA faces in filling provider vacancies to meet mission needs, as reported on our site visits and supported by the data.

1.1.3.2 Provider productivity (Objective 2)

We assessed the productivity and caseload of providers, compared to the private sector. For specialty care providers, we analyzed the caseload and productivity relative to industry benchmarks using work relative value units and patient visits per year (encounters). Because VHA has a population based health care delivery model in which primary care providers are responsible for managing the health of a panel (the number of patients a provider a care team is accountable for)[9] of patients, we assessed the productivity and caseload of primary care

---

[9] A primary care panel is equivalent to the caseload definition used in specialty care.

providers by comparing primary care panel sizes to comparable private sector panel size benchmarks.

We also discuss VHA barriers to optimal productivity in detail as part of this report. We present the barriers identified through our site visits and through a comprehensive root cause analysis, and provide supporting evidence with supplemental data analyses. One of the key drivers we identified was the presence of adequate clinical support staff. Provider productivity is enhanced by the right number, composition, and use of clinical support staff. Variations from best practice support staffing ratios result in workflow inefficiencies that reduce productivity, result in fragmentation of care, and decreased access. Because this issue was one of the most significant barriers, we conducted a more focused review of it. This part of the study was also conducted in especially close coordination with Assessment F and included separate objectives and assessment questions, listed in Appendix B. The results of this sub-study are presented within the overall barriers section.

1.1.3.3   Provider time allocation (Objective 3)

The Assessment G team analyzed VHA provider time allocation to determine the percentage of provider time spent in non-clinical care activities. Specifically, we calculated the proportion of provider time spent across each category of clinical, administrative, research, and teaching activities. We compared VHA provider clinical time to an industry survey. We also assessed, by way of a case study, VHA providers' time spent at academic affiliate institutions (medical schools and their associated medical centers). We assessed how VHA uses academic affiliations, as well as opportunities for providers to conduct research and teaching, as recruitment tools to secure providers and other clinical staff, and their importance to VHA's objective of leading the nation in research on the unique needs of Veterans.

1.2   Approach

Our team followed a four-phased approach to conduct the staffing assessment: discovery, analysis, findings and conclusions, and recommendations. This section provides an overview of the Assessment G team's approach, broken out by these four phases. For a more detailed review of the methodology, to include additional detail on data sources, definitions, and approaches to reviewing, aggregating, adjusting, analyzing and reporting data, as well as study limitations, please reference Appendix B.

1.2.1   Discovery

Key activities conducted during the discovery phase of the assessment included:

- Background research: The Assessment G team conducted background research on VHA provider staffing and productivity during the discovery phase of this project. This research included reviews of VHA policies and directives as well as management reports to determine the business rules that influence staffing levels and productivity measurement of VHA providers. We also reviewed reports related to staffing, productivity and access from GAO, VA Inspector General Reports, Congressional testimonies, Institute of Medicine, and other relevant sources.

- Interviews: The team interviewed VHA policy leaders and subject matter experts from the major specialties as well as the leaders of the program offices responsible for reporting VHA staffing levels and provider productivity.[10] Through these interviews, the team identified clinical policies and administrative requirements that could potentially impact the productivity of VHA providers.

- Data collection: We obtained staffing, workload, and time allocation data of VHA providers from VHA for fiscal year 2014. The sources and definitions of the data are described in detail in Appendix B. All provider data was de-identified by VHA, (for example, individual provider names were removed).

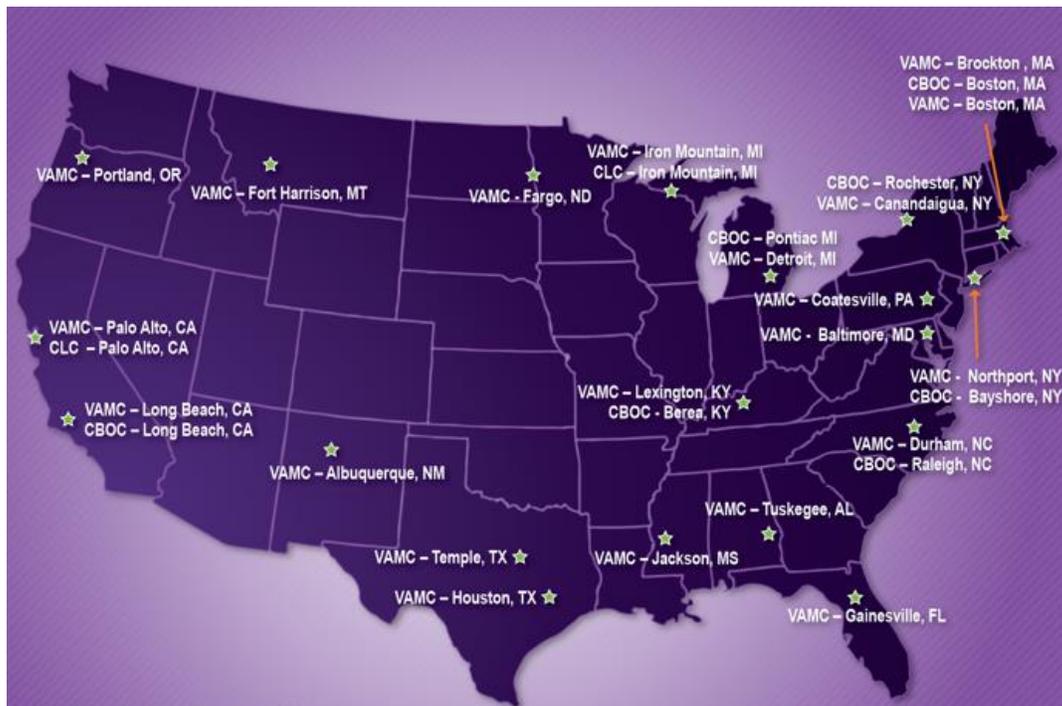
- Identification of benchmark surveys: The team identified potential external health care industry performance benchmark surveys to compare to VHA. These included the most current (2014 report using 2013 survey data) Medical Group Management Association (MGMA) Physician Compensation and Production Survey (the most widely used benchmarking survey) and Academic Practice Compensation and Production Survey, and 2010 American Dental Association (ADA) Survey of Dental Practices, as well as primary care panel benchmarks from MGMA surveys, as well as the American Medical Group Association (AMGA), Kaiser Permanente Medical Group Northern California, and American Academy of Family Physicians. In addition, we used several sources for supplemental comparisons related to staffing and productivity. These are detailed throughout the report and in the methodology (Appendix B).

- Site selection: In coordination with other independent assessment teams, the Assessment G team selected 24 VAMCs and community based outpatient clinics (CBOCs) to visit. The purpose of the site visits was to interview local facility leaders and providers to understand the differences between VHA provider staffing, caseload and productivity levels from the private sector. The team also used VHA management reports of provider productivity to identify trends and outliers across each of the specialty groups across VHA. The Assessment G team then selected for interviews the service leaders and providers from a range of trend groups, to include highly productive specialties, low productivity specialties, specialties with good Veteran access to care, and poor Veteran access to care.

Figure 1-1 depicts the facilities that the Assessment G team selected and subsequently visited during the analysis phase of the assessment.

---

[10] These offices included: Primary Care, Office of Specialty Care Services, Mental Health, Dentistry, OPES, the Managerial Cost Accounting Office (MCAO), Surgery, Geriatrics, Physical Medicine and Rehabilitation, Women's Health, Telehealth, Workforce Management, and offices within VHA that oversee research, academic affiliations, and medical coding.

Figure 1-1. Assessment G selected site visits


1.2.2   Analysis

The team used a combination of quantitative and qualitative analysis techniques to address the Assessment G objectives.

1.2.2.1   Quantitative Analysis

We employed several quantitative methods, to include:

Provider Staffing Levels (Objective 1):

- Aggregate staffing levels: We calculated aggregate staffing levels across seven categories of physicians and APPs (primary care, hospital based specialists, non-hospital based specialists, social workers, mental health, and dentistry) using VA's Personnel and Accounting Integrated Data (PAID) FTE data.
- Comparison to Industry ratios: We calculated the number of physicians (by specialty) per 100,000 enrollees and compared to an industry ratio.
- Staffing Levels by facility: Using the aggregate staffing levels data, we broke out staffing levels by facility.

Provider Productivity (Objective 2):

- Benchmarking: The team calculated total encounters and work relative value units (wRVUs) per provider across each specialty and facility using individual provider workload as reported in VHA productivity cubes and provided by VHA OPES. The team validated the wRVU data using total encounters obtained for each provider.

- o Our team applied relevant adjustments (modifiers, gap and imputed codes, and duplication of workload credit to multiple providers) to the VHA wRVU data set to allow the most accurate comparison to external benchmark surveys. For encounter productivity analysis, the Assessment G team was unable to apply the same level of rigorous validation and adjustment as was applied to the wRVU data.
  - o The team also used benchmarking data from external benchmark surveys and calculated VHA provider productivity percentiles relevant to these benchmark data sets (using both wRVUs and encounters).
- Primary care panel comparison: The team obtained actual and modeled panel sizes for VHA primary care providers from VHA's Office of Information and Analysis and calculated averages and benchmarked them.

Provider Time Allocation (Objective 3):

- Allocation of time across labor mapping categories: We calculated the allocation of VHA provider time between patient care, research, education, and administration using VHA labor mapping data from its Decision Support System (DSS). We compared this time to an industry survey.
- Time spent at an affiliate: We calculated time spent by a sample of providers at an affiliate institution using data collected from a site visit.

1.2.2.2 Qualitative analysis

We used several qualitative methods, to include:

- A literature review of relevant VHA policies and directives that impact provider staffing and productivity.
- A literature review of relevant best practices across external health care industry organizations. In collaboration with other assessment teams and the Integrator, the team also visited two of the nation's leading health care systems to glean additional leading practices.
- Interviews with VHA national policy and operations leaders and staffing and productivity subject matter experts.
- Site visits to VA medical facilities and CBOCs which included interviews with VHA medical facility leaders and providers. The Assessment G team interviewed 355 providers, 279 facility leaders, and 94 nurse executives, for a total of more than 700 interviews across all site visits.
  - o Content analysis: We analyzed content to identify themes from the interviews (by the frequency with which various themes were raised by leaders) and the use of a weighting tool to categorize, aggregate and prioritize a set of contributing factors to provider productivity and patient access. These contributing factors were considered potential causal areas to focus on in a root cause analysis.
  - o Root cause analysis: We used root cause analysis to understand the "who, what, where, how and why" of provider productivity gaps and to introduce systems-

based thinking into the analysis of potential factors that make it difficult for certain VHA specialties to match the private sector on productivity. The team used the potential causal areas and preliminary fishbone diagrams to identify additional questions to ask facility leaders and providers regarding possible contributing factors to further the evidence base.

1.2.3 Documentation of findings and conclusions

The Assessment G team documented its findings using data and evidence from the quantitative and qualitative analyses. The findings address the requests articulated within Section 201(G), as well as qualitative and quantitative findings which help to explain *why* the staffing level, productivity, and time allocation data is as presented, or other notable observations relevant to the subject matter studied. The latter findings are especially important as they map to recommendations and provide insights into *how* productivity, staffing, or time allocation issues or deficiencies may be addressed. Findings are listed throughout the report, alongside the relevant analyses, and in the order of the assessment objectives.

At the completion of the analysis phase, the Assessment G team conducted a full team meeting to review the findings and the tentative conclusions with respect to each assessment objective. At this early May meeting, the team discussed and validated each key finding and tentative conclusion, which were drawn from both quantitative and qualitative analyses. This formed the basis of the findings and conclusions documented within the assessment report.

1.2.4 Documentation of recommendations

To inform the development of recommendations, the team identified promising practices related to provider staffing and productivity during site visits and combined them with external best practices identified earlier during the literature review of external health care industry organizations, and from the site visits to two high performing health systems.

Physician practice specialists, health data analysts and statisticians, health care delivery consultants, and clinician team members who participated in the site visits and quantitative data analyses reviewed the key findings, tentative conclusions, and internal and external leading practices. Using the promising or best practices research – documented both internally and externally, we identified recommendations. We developed the recommendations for groups of findings – and in some cases, for individual findings, that would benefit from being addressed. In several cases, findings identified a positive outcome and did not need to be addressed with a recommendation. The team identified the supporting evidence for each recommendation, relevant promising or best practices, and potential near-term actions or next steps. Finally, the team discussed cross-cutting implementation considerations that may be used to develop, enhance, or speed implementation.

2 Findings

In this section, we provide our key findings and observations related to VHA provider staffing, productivity, and allocation of providers' time. This section is broken out into four sub-sections, the VHA care model followed by the three assessment objectives. We intentionally describe the care model within VHA first, because the needs of VHA's patient population, which dictate the need for a care model that is somewhat different from many private health care systems, is the foundation for how VHA staffs its medical centers and CBOCs, which subsequently can impact both productivity and time allocation.

To see where we explicitly address the requirements within the Section 201(G) legislation, please refer to the table at the bottom of the report's table of contents.

2.1 VHA's Personalized, Proactive, Patient Driven Care Model

Fundamental to understanding how VHA resources its medical centers to meet patient needs is first understanding its population health focused model of care delivery. This model places primary care providers as the central access point and accountable party for a Veteran's care, and influences how VHA serves Veterans, to include the types of care it provides, in other environments. VHA endeavors to provide care to Veterans through a primary care-driven, population health focused model. This model of care is similar to that adopted by other leading health care systems, such as Kaiser Permanente, Geisinger, and Cleveland Clinic. The population health approach aims to enhance the health and well-being of the Veteran population by achieving the first goal within VHA's current strategic plan to "provide Veterans personalized, proactive, patient-driven health care."[11] These three tenets are of utmost importance, and are defined as follows within VHA's current strategic plan:

- **Personalized**: a dynamic adaptation or customization of recommended education, prevention and treatment that is specifically relevant to the individual user, based on the user's history, clinical presentation, lifestyle, behavior and preferences.

- **Proactive**: acting in advance of a likely future situation, rather than just reacting; taking initiative to make things happen rather than just adjusting to a situation or waiting for something to happen.

- **Patient-driven**: an engagement between a patient and a health care system where the patient is the source of control such that their health care is based in their needs, values, and how the patient wants to live.[12]

The current VHA strategic plan further elaborates on several objectives that fall under this first goal, which cover key aspects of a population health focused care model, such as:

- Partnering with patients in care delivery;

---

[11] U.S. Department of Veterans Affairs. (2013). VHA Strategic Plan FY2013-2018. p1. Retrieved from http://www.va.gov/health/docs/VHA_STRATEGIC_PLAN_FY2013-2018.pdf

[12] Ibid.

- Communicating the care model to stakeholders and the workforce;
- Clearly defining the care model and ensuring that it is understood by stakeholders and the workforce;
- Ensuring that Veterans have convenient access to information, and support to make informed decisions as well as implement their personal health plans;
- Ensuring Veterans receive timely, high quality, personalized, safe, effective and equitable health care;
- Driving an improvement culture across the organization; and,
- Strengthening collaborations with communicates and other organizations.

This approach is grounded in VHA's patient centered medical home (PCMH) model, known as PACT, which VHA began implementing across facilities in 2009. The PACT model was implemented in all facilities, but level of implementation maturity varies.

VHA's specialty care transformation initiative has focused on building a stronger interface with PACT to make care more Veteran-centered, timely, coordinated (less fragmented) and accessible. To enhance access to specialties, especially in rural areas, VHA has increased the use of telehealth and other non-face to face modes and modalities of care delivery (for example, secure messaging) for providing specialty care services.[13] While primary care at VHA has developed specific staffing guidance as part of PACT, specialty care lags behind primary care in that most specialty clinics lack specific staffing guidance, though the delivery model is meant to be patient centered and promote close collaboration with a patient's primary care provider and other care team members. Appropriate staffing and resourcing guidance or models are an important element of enabling a care model to be effective.

> **What is a model of care?**
>
> A "model of care" generally defines how health services are delivered, based on theoretical and evidence-based principles, and reflecting the preferences of patients, providers, and policy makers.

VHA faces challenges in the development and maintenance of demand forecasting models, as well as staffing and resourcing guidance due to the fact that most Veterans have more than one possible source of health coverage and may receive some portion of their health care from external providers using other health care coverage; for example, private insurance or TRICARE (see Assessment A by RAND).

---

Many Veterans, including a percentage of those enrolled in VHA care, receive their health care from non-VA sources, including from non-VHA providers Medicare and Medicaid benefits.[14] In other words, there is a large number of co-managed patients at VHA, far more than patients who rely solely on VHA. Additional studies have reported on the reliance of Veterans on VA versus other health care sources. The American Community Survey found that more than one third of VA enrollees receive care from other programs.[15] Another survey of Veterans found that a third of respondents were enrolled in Medicare, and over half received insurance from a current or former employer.[16]

Of those Veterans who choose to have all or a portion of their care covered by VA, certain Veterans are permitted to choose care outside of the VA system and have their provider of choice paid for by VA, as a result of the Veterans Choice Act passage, and initiation of the Choice Card Program. More specifically, Veterans who live more than 40 miles from a VA health care facility are eligible to receive non-VA care using their Choice card. Although the Choice Card program and broader non-VA programs offer valuable care options to Veterans in need, when Veterans are receiving care from multiple fragmented sources, it can create a co-managed care system that relies on the input and collaboration of providers in and outside of the VA system, and raises the potential difficulty of ensuring continuity of care.

A population health care model (for example, PCMH) is tailored to serve the unique needs and requirements of a population that it serves. Of the total Veteran population of 21 million, approximately 9 million are enrolled in VA health care, almost 7 million access VA care for certain conditions or types of treatment, and approximately 2 million use VA health care exclusively.[17] The Veteran population who use VA health care is changing. According to RAND's Assessment A report, the mean age of Veterans using VA health care will increase slightly over the next ten years and the Veteran population will have a higher proportion of both older and younger Veterans. Care models and the staffing and resourcing plans that accompany them will need to change to adapt to these changing Veteran demographics and needs.

---

VHA's Office of Rural Health (ORH) has studied the rise of Veterans using both VA and non-VA health care providers, an especially important topic for rural Veterans who have reduced access to health care overall. ORH notes that many of the critical relationships required between VA health care and local and private sector health care systems to ensure delivery of comprehensive, quality health care to these Veterans are underdeveloped. ORH states that improving relationships between VA and private health care systems by enhancing communication and coordination, as well as identifying dual use in Veteran populations, is crucial for improving health outcomes and avoiding potential pitfalls in care of rural and highly rural Veterans.[18]

---

[18] Retrieved July 10, 2015 from http://www.ruralhealth.va.gov/resource-centers/central/comanagement-toolkit.asp

Table 2-1 compares the benefits of population health oriented model, like what VHA strives to be, and co-managed care models, which may be more similar to the context in which many VAMCs are currently operating.

Table 2-1. Care model benefits

Care Model Benefits	
Population health model[19]	Co-Managed/Dual Use Care[20]
• Fewer emergency department (ED) visits • Reduced hospital admissions • Reduction in specialist utilization • Fewer inpatient hospital days • High return on investment for disease management programs	• Patient preference • Patient has more provider options for care • Higher patient access to care • More continuity of care for families (as families could receive care from one common provider) • Access to certain very specialized care

With a large portion of the Veteran population receiving outside care, VHA's vision of a population health care model is misaligned with the current state of co-managed care. For VHA to enable successful execution of co-managed care models, it will need to continue to address the issues raised by ORH and to foster relationships with the community, matching infrastructure needs to support these relationships (for example, IT systems that enable more seamless transfer of information).

VHA's population focused care model has key implications for this study. Namely, it dictates various staffing requirements that influence differences between VHA provider staffing levels and the private sector, as well as influence the productivity of its providers. For example, VHA has developed specialized PACTs for unique Veteran health needs, such as geriatrics. These PACTs, termed "geri-PACTs" have unique staffing requirements that may differ from the private sector, influencing both staffing levels and productivity, as support staff is a key driver of productivity. Conversely, because Veterans are given many options for access to care, to include accessing care in the community, providers are sometimes forced into a co-managed care model, which can be significantly less productive as VHA providers lose time looking for test results and care documentation from Veterans' private sector providers. Perhaps more importantly, we provide context of VHA's care model at the start of this report because it is important in reviewing benchmark comparisons of VHA against the private sector, which primarily consists of a volume-driven, non-population health oriented environment, in which

providers are incentivized not on patient outcomes or satisfaction, but on volume of services provided.

2.2 Provider Staffing Levels (Objective 1)

In this section, we report the provider staffing levels of VHA, by specialty and specialty grouping, and by both individual facilities and facility complexity level. We also compare VHA physician to Veteran enrollee population ratios with national private sector physician to population ratios. In our analysis of how VHA compares to industry, we considered the differences in the needs of the VA population that may dictate a need for higher or lower ratios of certain physician types (for example, significantly fewer Veterans are female than compared to the private sector population, meaning that there is a lesser need for gynecologists per population than in the private sector). Because a key measure of provider staffing for primary care is the size of a provider's panel (the number of patients for which a particular care team is accountable) we also compared VHA primary care provider panel sizes to benchmarks – since panel size is both an indicator of staffing and productivity, this information is presented later in the report (see Section 2.3.5.5). We conclude this section with a discussion of the challenges which VHA faces in ensuring it has sufficient providers to meet demand.

2.2.1 Summary of VHA provider staffing level findings

The Assessment G team's findings as they relate to VHA provider staffing levels are listed below:

- **Finding 1.** VHA specialties with the highest provider paid FTE levels include medicine specialties, mental health, and primary care, consistent with VHA's care model and the needs of the Veteran population. Social Workers also represent a significant portion of provider FTEs. (see section 2.2.2)

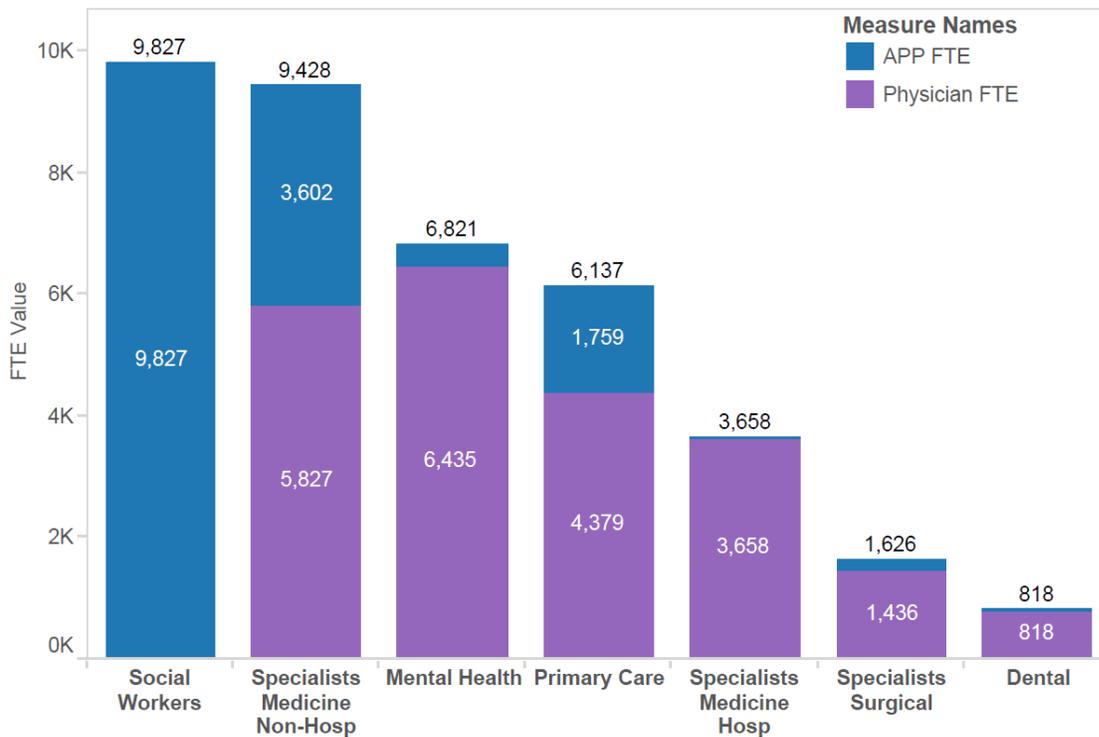
- **Finding 2.** VHA does not systematically track fee-based provider productivity, and does not capture FTE level information for fee-based care providers. (see section 2.2.3)

- **Finding 3.** VHA physician staffing levels per population are, in most specialties, lower than industry ratios. These ratios are not sufficient to establish whether VHA is staffed to meet demand. One factor to consider is that even industry physician supply is not sufficient to meet demand in many specialties. Another factor to consider is that VHA uses APPs extensively, but APPs are not included in industry ratios. (See Section 2.2.6)

2.2.2 Overall provider staffing generally reflects Veteran needs (Finding 1)

VHA specialties with the highest provider FTE levels include medicine specialties, mental health, and primary care, consistent with VHA's care model and the needs of the Veteran population. Social Workers also represent a significant portion of provider FTEs.

Figure 2-1 illustrates that there were 28,490 total FTE employed VHA providers,[21] working at VHA medical centers[22] across VHA (5,938 APPs; 22,552 physicians; and 9,827 social workers) in fiscal year 2014. The FTE total is based on total *paid* FTE which includes vacation, holiday, and other non-working time for which the provider is compensated; note that FTE is not the same as headcount. Contract or "fee-based" providers who provide care within VAMCs as a contractor rather than an employee are omitted from this count, as VHA does not have data available on the FTE level of fee-based providers).

Figure 2-1. Total provider FTEs (Paid) by major grouping, FY 2014[23]


We evaluated VHA provider FTE in more than 30 aggregate specialties, but present them as by major groupings of specialties. Social workers are categorized separately because the VHA data does not allow us to align them to a particular specialty care, and as a separate group are higher than all other major groupings. Specialties with the highest FTE levels include medicine specialties (includes internal medicine hospitalists and specialists), mental health (psychology, psychiatry) and primary care. Many patients require mental health services due to a high prevalence of mental health and psychiatric conditions in the Veteran population such as Post

---

[21] Providers primarily includes independently licensed practitioners; the complete definition is in Section 1.1.2.

[22] This number excludes those Without Compensation (WOC) providers serving in an administrative capacity at VISN offices and VA Central Office [VACO], who primarily do not provide patient care.

Traumatic Stress Disorder (PTSD), which explains the high number of mental health providers.[24] The Assessment A report includes an analysis which shows that Veterans have a significantly higher prevalence of mental health conditions as well as Posttraumatic Stress Disorder (PTSD) than non-Veterans, which further supports the higher number of mental health providers (see also the following section of the report which shows a high proportion of mental health providers per population compared to the private sector).[25] Assessment A also finds that Veterans also have a higher prevalence of undiagnosed health conditions, to include chronic diseases, for several conditions, such as Cancer, Chronic Obstructive Pulmonary Disease, Diabetes, GERD and hearing loss.[26] These types of conditions may require a need for more primary care providers and medicine specialists, which is seen in the predominance of provider FTEs in these categories (when compared to non-hospital based specialists, i.e. radiologists and pathologists, and surgical specialists). This is explored further in section 2.2.6. The low number of dental specialists can be explained by a small number of Veterans eligible to receive dental care from VHA. This is further explained in section 2.2.5

Table 2-2 illustrates the total provider FTE and clinical provider FTE (total FTE aligned to clinical care activities) by specialty. Note that in Table 2-2, primary care is included within internal medicine.

2.2.3   VHA has limited information on fee-based providers (Finding 2)

VHA does not systematically track fee-based provider productivity, and does not capture FTE level information for fee-based care providers.

Providers who work in VAMCs as non-employees on a contract basis, termed fee-based providers, are not included in staffing information maintained by VHA. More specifically, VHA

---

[27] Assessment G team analysis of Provider Labor Detail, provided by VHA OPES, April 9, 2015

The views, opinions, and/or findings contained in this report are those of Grant Thornton should not be construed as an official government position, policy, or decision.

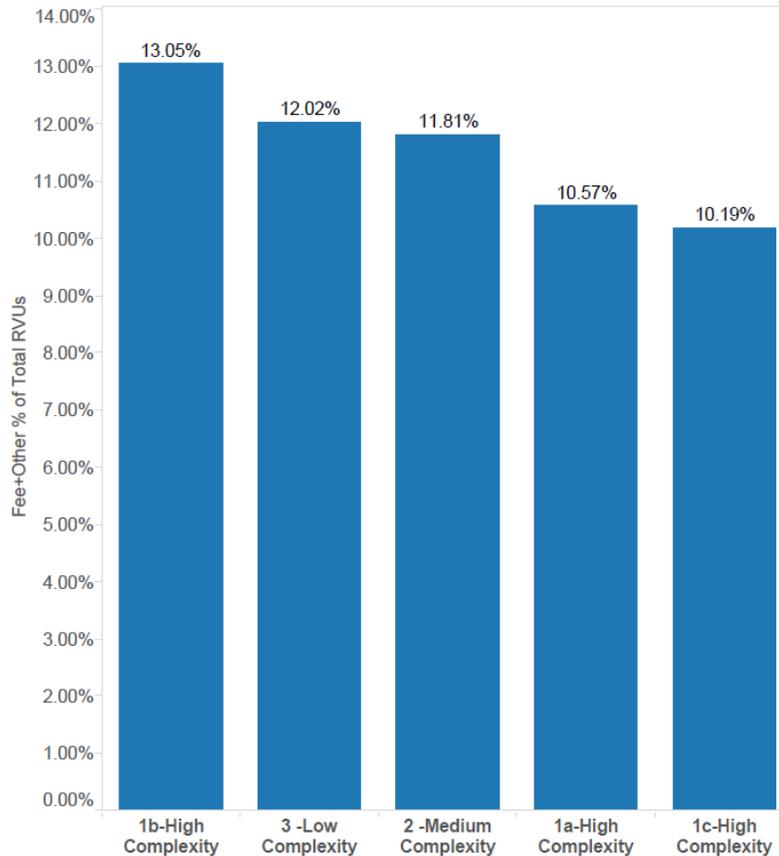
does not keep total FTE data for fee-based providers,[28] nor does VHA systematically track the productivity of these providers. VHA also does not have this information on providers who may generate workload but who do not have a labor mapping. VHA terms these providers "without compensation," or "WOC" providers, and they include providers who may, for example, work in an administrative capacity at VHA Central Office, do not have a labor mapping, yet work a few hours per month as a provider seeing patients at a nearby medical center. It could also include providers with a labor mapping at one facility, but who see patients sometimes at another facility and this time is not accounted for. For the purposes of this section, we refer to these providers as fee-based providers and other providers without a labor mapping. VHA does have information on the encounters and wRVUs generated by this part of the workforce; however, without knowing how many hours these providers spend generating these wRVUs, it is difficult to reliably determine how productive they are. OPES has developed a methodology for imputing presumed FTE levels to include these providers in internal VHA reports, which, given the available information, may be a best practice.

For our assessment, we determined the best course of action was to eliminate these key members of the provider workforce because rather than to make assumptions about the FTE levels. As such, fee-based providers and other providers without a labor mapping (those whom we do not know how many hours they work to generate wRVUs) are excluded from the scope of this report. Although the proportion of the workforce that these providers comprise is unknown, they do produce nine percent of the wRVUs generated across all of VHA, with a higher contribution in certain specialties. The lack of transparency around these providers' time represents a missed opportunity for VHA to better understand their performance relative to VHA employed providers and potential opportunities to improve productivity and reduce costs. It also limits the ability to have a comprehensive picture of the true provider workforce.

Figure 2-2 shows the proportion of total workload generated by fee/other providers (those who do not have a labor mapping) by facility complexity level. Overall, the proportion of workload generated by these providers is relatively consistent across facility complexity levels at approximately nine percent (13 percent for physician only workload and six percent for APPs only), with the exception that complexity level 1b facilities appear slightly higher.

---

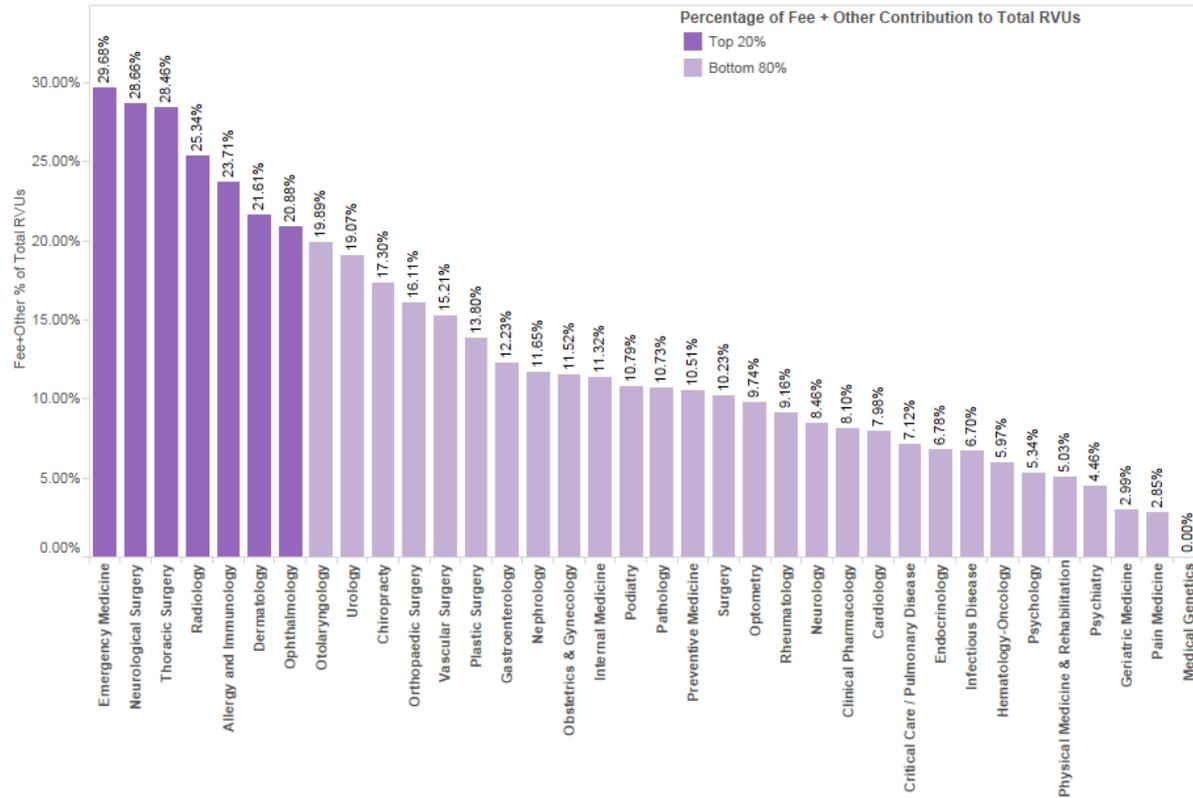
[28] Fee-based providers work as a contractor, typically on a fee-for-service basis, providing care in a VAMC. These providers are not non-VA care providers in the community who are paid through various VHA purchased care contracting mechanisms.

Figure 2-2. Proportion of wRVUs generated by non-labor mapped providers[29]


Although the overall proportion of workload generated by these providers (relative to wRVUs generated by all providers) is low, in some facilities, these providers may constitute an entire specialty or large portion of a specialty's provider workforce. More specifically, (in certain specialties), the proportion of total wRVU-based productivity generated by fee-based and other non-labor mapped providers is significantly higher. Figure 2-3 shows the proportion of total wRVUs which are generated by fee-based providers and other providers without a labor mapping, for specialties with the highest proportion of wRVUs generated by these providers.

---

[29] Assessment G analysis of Provider Detail FY14, provided by VHA OPES, February 26, 2015.

Figure 2-3. Proportion of wRVUs generated by non-labor mapped providers by specialty[30]


[30] Assessment G analysis of Provider Detail FY14, provided by VHA OPES, February 26, 2015

The views, opinions, and/or findings contained in this report are those of Grant Thornton should not be construed as an official government position, policy, or decision.

20

Figure 2-3 illustrates that fee-based providers and other non-labor mapped providers appear to be used more widely in emergency departments, as there is a higher proportion of wRVUs generated by them, given total emergency medicine provider wRVUs. Of note, anesthesia was excluded from this figure as anesthesiologist productivity is not measured only by wRVUs. Other specialties with a high proportion of wRVUs generated by fee-based and other non-labor mapped providers may reflect that certain specialties require augmentation with additional support to meet demand (dermatology, ophthalmology, otolaryngology) or use of these providers in lieu of hiring VHA employed providers for specialties with lower demand (neurological surgery, thoracic surgery).

> "*There is a shortage of ophthalmologists, hospitalists, emergency medicine physicians, gastroenterologists, and psychologists; these positions are difficult to recruit and are currently filled by fee-for-service contracted providers.*" - Facility leader at a rural VAMC

Some of these specialties may also be specialties that are more difficult to recruit into VHA due to larger differences in earning potential. We would recommend VHA consider a further examination of the performance of, use of, and impact of fee-based providers across VHA to better understand how they are being used, whether their usage is cost effective and the appropriate scenarios in which to augment the provider workforce with fee-based providers.

2.2.4 Provider staffing levels vary between VA medical centers

Figure 2-4 through Figure 2-8 depict the total quantity of provider FTE (Paid) in each facility. The facilities are sorted by facility complexity level. The highest range of FTE raises dramatically according to the complexity level with the maximum FTE of a complexity level 1a facility over 800 FTE and the maximum FTE of a complexity level 3 facility just under 200 FTE. This is not surprising since higher complexity facilities typically see a much higher volume of patients.

Figure 2-4. Total provider FTEs (Paid), by facility, at level 1a facilities[31]

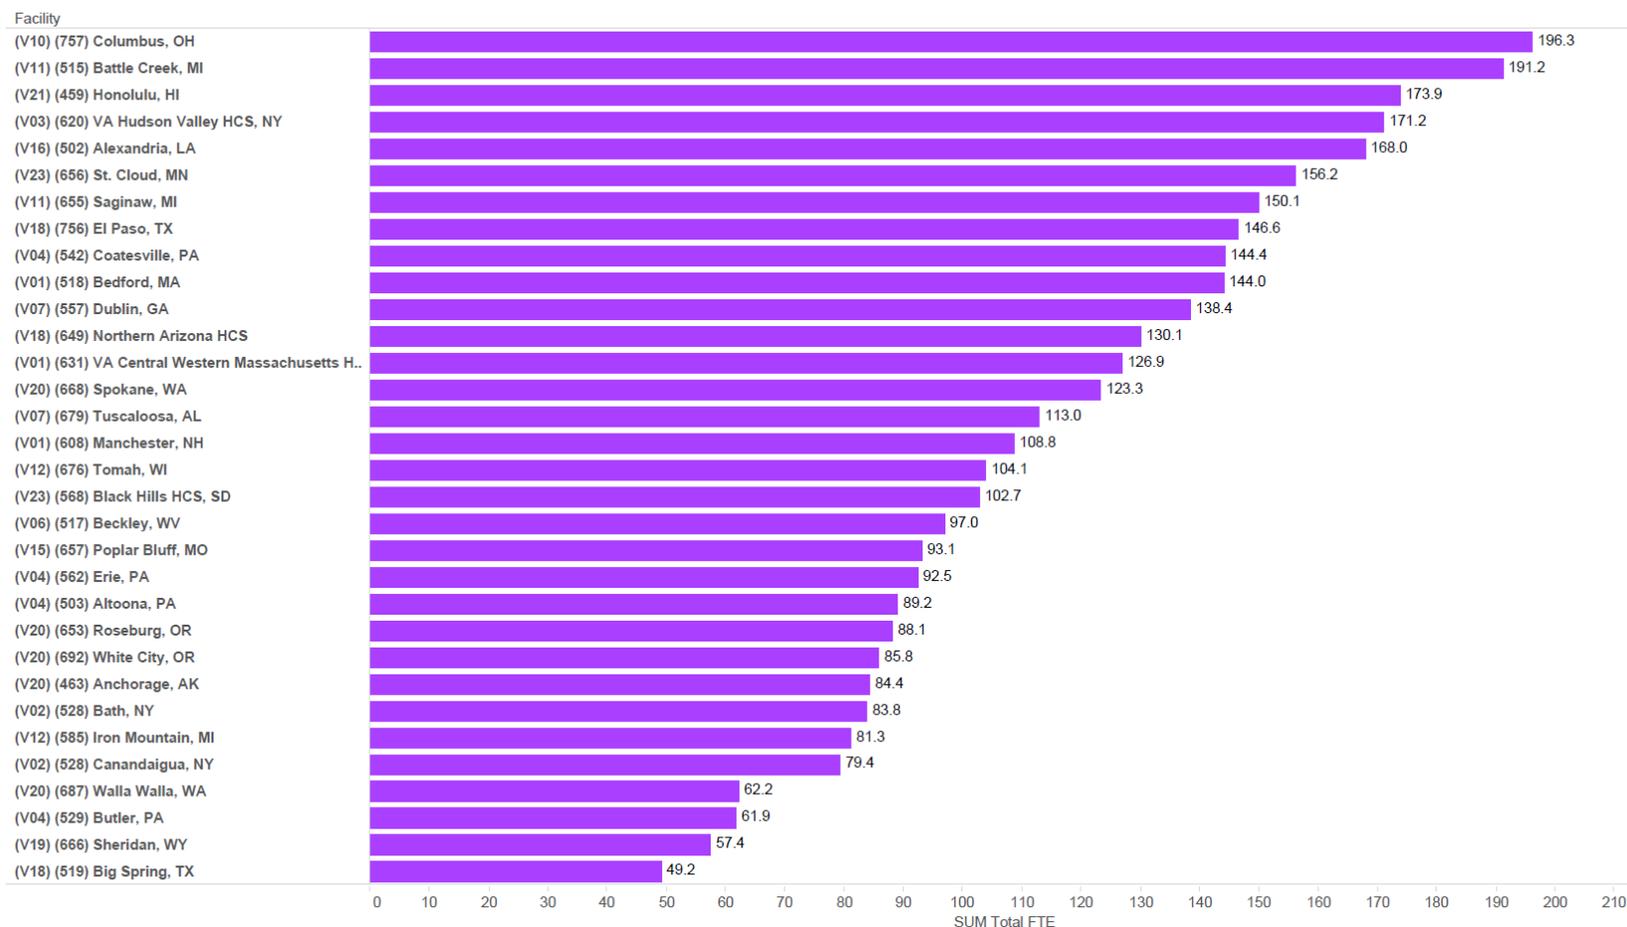
SUM Total FTE

---

[34] Assessment G team analysis of Provider Labor Detail FY14, provided by VHA OPES, April 9, 2015. Complexity level derived from VHA FY11 facility complexity level designations.

The views, opinions, and/or findings contained in this report are those of Grant Thornton and should not be construed as an official government position, policy, or decision.

Figure 2-8. Total provider FTEs (Paid), by facility at level 3 facilities[35]


2.2.5 VHA dental staffing reflects unique Veteran needs for sub-specialists

The goal of VHA Dental Services is to provide high quality, cost-effective and evidence-based dental treatment to eligible Veterans.[36] The majority of Veterans are not eligible for dental care; however, of the 1.7 million Veterans who are, approximately 450,000 unique Veterans receive dental care each year from the approximately 818 dental Worked FTEs employed at VA medical centers across the country.[37] Staffing in VHA dental clinics includes dentists and dental subspecialists (general dentistry, oral and maxillofacial pathology, radiology surgery, endodontics, periodontics, and prosthodontics). Dental hygienists, dental assistants, and dental laboratory technicians provide essential support in operating VHA dental clinics.

Many dental specialists are employed on a part-time basis, with the average specialist in FY 2014 being employed as a 0.55 total FTE per VHA staffing and productivity data provided by VHA. This is not surprising given the low number of patients served and spread across the country. Most major facilities offer dental care,[38] though the demand at any given facility may not be high enough to warrant a full time dental specialist provider.

Comparisons between VHA staffing levels and private industry are difficult to model accurately. There is not a well-aligned published comparison group considering the unique dental population of VHA as well as the heavy inclusion of teaching and residency programs. However, it is possible to draw some comparisons to private industry while keeping these limitations in mind.

- In examining the breakout of specialists within the dental workforce, VHA has a higher proportion of specialists compared to industry norms (25 percent of VHA dental workforce compared to 18 percent of the private sector workforce, according to ADA data).

- Correspondingly, VHA's general practice dentists make up 75 percent of their workforce, compared to the private sector where general practice providers make up closer to 82 percent.[39]

- When examining specific specialties, VHA staffs a significantly higher proportion of prosthodontists compared to the proportion seen in the private workforce. In the private sector, there is a larger proportion of orthodontists in the community vs. the proportion staffed at VHA. This corresponds with the differences in the patient populations – VHA patients are generally older, and possibly possess combat related injuries, versus a private sector population that includes children (with a higher demand for orthodontics, for example), and adults seeking cosmetic dental services.

---

Otherwise, the overall breakdown of the specialist work force to total workforce is comparable between VHA and the community. In Figure 2-1 we display overall FTE and clinical FTE figures per VHA specialty, and in Figure 2-9 we show this comparison between VHA dental providers and private sector providers (comparison data comes from the ADA).[40]

Table 2-3. FY14 Dental Worked FTE levels[41]

	VHA Dental Specialty	Total FTEs	Clinical FTEs
1	Dental Public Health	6	5
2	Endodontics	10	9
	General Practice*	610	525
3	Oral and Maxillofacial Pathology	5	5
4	Oral and Maxillofacial Radiology	2	1
5	Oral and Maxillofacial Surgery	52	44
6	Orthodontics and Dentofacial Orthopedics	3	2
7	Periodontics	41	33
8	Prosthodontics	83	72
9	Oral and Maxillofacial Surgery – OMFS	6	5
	Total	**818**	**701**

"Dentists – General Practice" and "Dentists – Not Specified" from our VHA data set were combined into a single "General Practice" category since they both represented non-specialty care Dentists.

Each specialty total FTE and clinical FTE are rounded to the nearest whole FTE. Totals may not add up perfectly due to rounding. FTE calculations based on worked hours.

Figure 2-9. Dental specialty staffing comparison between private sector and VHA[42]

The views, opinions, and/or findings contained in this report are those of Grant Thornton should not be construed as an official government position, policy, or decision.

2.2.6 VHA physician staffing per population is lower than industry (Finding 3)

VHA physician staffing levels per population are, in most specialties, lower than industry ratios. These ratios are not sufficient to establish whether VHA is staffed to meet demand. One factor to consider is that even industry physician supply is not sufficient to meet demand in many specialties. Another factor to consider is that VHA uses APPs extensively, but APPs are not included in industry ratios.

The physician to population analysis using the Truven Health Analytics Report and VHA Physician FTE per enrollee indicates that VHA is marginally understaffed compared to the private sector. Furthermore, Truven data on physician demand indicate that the private sector is understaffed to meet its demand in 12 out of 34 specialties – in other words, even the private sector supply, in several specialties, are not sufficient to meet demand.[43] Comparisons presented in this section should not be used as an indicator of appropriateness or ability to meet demand, as we did not assess the demand for physicians in VHA. Additionally, physicians are only part of the provider workforce. We did not include the other key members of the provider workforce, APPs, because there is no comparison data set, and because VHA uses APPs extensively (they make up more than 20 percent of the total provider workforce, when social workers are excluded).[44]

We compared the ratio of VHA's employed physicians (using paid physician staffing levels from FY 2014) and the Veteran enrollee population to the physician supply (FTE) from the Truven Health Analytics report,[45] based on robust internal Truven physician FTE supply databases from 2014. The Truven supply is calculated as the number of practicing physicians by zip code, specialty and site of service. The supply was then aggregated to the national level and divided per 100,000 population.[46] Providers known to be assigned to VAMCs were removed from the Truven FTE supply. Future analyses may consider comparing VHA ratios at the zip code level as well, since it may reveal geographic (for example, urban versus rural) patterns of under- or over-staffing. Initially we considered several other published physician to population ratios; since the Truven data was most recent, we analyzed VHA against it rather than the others (additional detail is found in the methodology on other ratios reviewed).

The Truven ratio is calculated as the supply of physicians relative to 100,000 population per specialty (using 2014 data). The VHA ratio is calculated as the number of physician FTE to the 2014 Veteran enrollee population (total enrollees is 9,111,955)[47] per specialty. We applied the Truven ratios to the VHA enrollee population using a multiplier to calculate a Truven

---

'recommended providers' quantity. We subtracted the VHA physician FTE supply levels from the recommended Truven provider quantity and analyzed the differences. With the exception of Internal Medicine and Psychiatry, VHA exhibited lower physician ratios than the Truven industry ratios of physicians per the US population. Figure 2-10 shows the difference in the benchmarked ratio between VHA physician staffing and the Truven Health Analytics ratio per specialty. Of note, since these data exclude non-labor mapped providers (for example, contract or fee-based providers), some of these ratios may not reflect a complete staffing picture where there is a greater presence of contract or fee-based providers.

Figure 2-10. Difference between VHA physician staffing and Truven Health Analytics ratio[48]

Specialty	VHA FTEs	Difference
Allergy and Immunology	33.22	-95
Cardiology	590.05	-191

Rheumatology	152.21	-2
Urology	261.14	-75

VA FTE - Truven Recommended Providers

We also note the several key observations from this analysis:

---

[48] Assessment G analysis of Provider Labor Detail FY14, provided by VHA OPES, April 9, 2015 (for provider FTE); Bagalman, Erin. (2014) The Number of Veterans That Use VA Health Care Services: A Fact Sheet. p3. Congressional Research Service. Retrieved from https://www.fas.org/sgp/crs/misc/R43579.pdf (for VHA enrollee population); and Truven Health Analytics Population Planning Data Module, February 2015. © 2015 Truven Health Analytics Inc. (for comparison benchmark).

- Notably, VHA has significantly more physicians per population in internal medicine and psychiatry. This is expected given VHA's care model and population needs; internal medicine includes primary care providers, and VHA has a population health focused care model which promotes access to Primary Care and therefore Internal Medicine providers (this high number of primary care providers is also seen in the section above on staffing levels). VHA also makes considerable effort to respond to their mental health patients as quickly as possible. In many facilities, this effort translates into guaranteed appointments for walk-ins seeking mental health care.[49] A small proportion of total wRVUs generated in psychiatry are generated by contract and fee-based providers, or others without a labor mapping (who are not included in the total count of provider FTE in this comparison); therefore, their impact would be low.

- On the lower ratio end, our team expected and confirmed that VHA has fewer obstetricians and gynecological physicians than industry recommendations, attributable largely to the smaller proportion of women to men in the VHA Enrollee population. According to the RAND Assessment A (demographics) analysis. More than 93 percent of Veterans are men compared with 40.5 percent of civilians, per the Medical Expenditure Panel Survey.[50] Since 11.5 percent of total obstetrics and gynecology wRVUs are generated by contract and fee-based providers, it is possible that this also makes the VA physician supply appear lower.

- Figure 2-10 also shows that the ratio of VHA emergency medicine physicians per 100,000 enrollees appears to be significantly lower than the Truven ratio. The Assessment G team believes this may be due to a higher proportion of fee-based and other non-labor mapped physicians (who are excluded from this analysis) supporting VHA's emergency departments; in other words, in this particular specialty, the ratio below does not comprehensively capture the true staffing ratio due to fee-based providers making up a more significant part of the care delivery team in emergency departments (see Section 2.2.3). More specifically, more than 29 percent of all wRVUs generated by emergency medicine providers are generated by contract or fee-based providers.

- The higher proportion of fee-based and other non-labor mapped physicians employed in the VHA specialties of orthopedic surgery, ophthalmology, dermatology and allergy and immunology may also account for lower ratios of these physicians compared with the Truven benchmark.

Our charge was to assess how VHA compares to the private sector on staffing, rather than to assess whether physician supply is sufficient to meet patient demand. As we note above, these ratios are not sufficient to establish whether VHA is staffed to meet demand. More specifically, there are several limitations of making these types of comparisons for the purpose of assessing supply adequacy:

---

[49] Observational data gathered from site visits.

[50] Rand Corporation. (2015). Veterans Choice Act Assessment A Final Report.

- The Veteran population is not similar to the general civilian population; Veterans have different (and sometimes unique) health needs due to differences in demographic composition, military experiences, preexisting health conditions, and health behaviors.[51] As such, there is no single population or benchmark data set comparable to Veteran enrollees seeking care from VAMCs.

- The comparisons we made do not consider geographic differences, since we could only report data aggregated nationally; a more in depth study would need to consider local demand and demographic shifting patterns to reflect where demand is.

- Making such comparisons is further complicated by the complexity in measuring demand for services (VHA is a "leaky" system - the majority of Veteran enrolled users of VA medical care seek care outside the system), and the recent implementation of the Choice Card Program, which allows Veterans even greater access to care outside VHA, makes it difficult to tie a population to a medical center or particular region to calculate more specific ratios which tie patients to the specific providers who may treat them. This is further detailed in Section 2.1.

- Additionally, there is no single benchmark data set that comprehensively captures the full provider workforce; available provider staffing ratios tend only to include physicians. Considering that APPs make up 20 percent of the total provider population at VHA (excluding social workers), this is a limitation of these comparisons. Fee-based providers also cannot be quantified as part of the comparison, even though they serve as key members of the provider workforce within VHA and produce nine percent of the workload. Lastly, available benchmark physician to population ratios are all relatively dated and may not reflect the current needs of populations.

We recommend that VHA consider improvements to its current demand forecasting capabilities (See Assessment A), as well as to data that more comprehensively reflects the true supply of the provider workforce. With accurate, real time data on both the supply and demand, VHA would be able to understand whether its current staffing is appropriate for the population it seeks to serve. We also recommend that rather than comparing to dissimilar civilian populations by using private sector ratios which only illustrate a comparison, VHA and Congress should focus on comparing VHA demand to VHA supply using analytic models to determine whether staffing is appropriate to meet demand.

2.2.7 VHA struggles to fill provider vacancies

VHA is struggling to fill its provider vacancies. Provider shortages, in some specialties are a nationwide challenge that many health care systems are currently grappling with, making for an even more competitive provider hiring landscape. To add to the challenge, VHA has lengthy

---

[51] For additional information on this topic, please see the Veterans Choice Act Assessment A Final Report, conducted by the RAND Corporation.

hiring processes and offers potential candidates a lower earning potential, further limiting competitiveness for top talent in the marketplace.

As of January 6, 2015, VHA had 16,995 vacancies, to include providers and clinical support staff-that have been open for over 180 days. (Section 301 report, p. 9)[52] As described by McKinsey & Company in the Assessment F report, VHA's vacancy rates are generally higher than their private sector benchmarks, ranging from less than a 3 percent difference for physicians and nurses, to a 9 percent difference for pharmacists.[53] Some VISNs have fewer than 300 vacancies, while other VISNs had over 1,000 vacancies.[54] The number of provider vacancies is even more compelling. In some VISNs, the number of provider staff vacancies is equivalent to 25 percent of providers in the facility.[55] In fiscal year 2014, 24 percent of total VHA vacancies were for providers (excluding nurse practitioners and nurse midwives).[56] VHA has conducted hiring surges to fill specific vacancies. In 2012, President Barack Obama signed an executive order to increase VHA mental health providers and support staff to fill 2,000 vacancies. Following the conclusion of the initiative, over 4,000 mental health providers were hired.[57]

> *"We need additional providers; we are currently treading water; we are utilizing residents and fee-based providers from the academic affiliate to plug in where there are gaps in staff coverage."* – VAMC Physician

Despite the success of this initiative, VHA continues to struggle to fill vacancies. Overall provider shortages, coupled with burdensome hiring processes, and lower earning potential increase VHA's challenge.

2.2.8   Provider shortages nationwide

The Assessment G team found that physician staffing levels per population are, in most specialties, lower than industry ratios. We frequently heard on our site visits about challenges in staffing to meet demand. Insufficient provider staff in specialty care, primary care, and mental health, can result in patient care delays, over reliance on fee-based providers, disruption to the population health care model, and inefficient clinic operations as too few providers attempt to cover all consults.

[56] Ibid.

[57] U.S. Department of Veterans Affairs. (2014) 2014 Work Force Succession Strategic Plan. Retrieved from http://www.vacareers.va.gov/assets/common/print/2014_VHA_Workforce_Succession_Strategic_Plan_EBook.pdf.

Nation-wide provider shortages in some specialties mean that the challenge VA medical centers face in having enough staff is not unique to VHA. In fact, many specialties in the U.S. have high wait times and poor access as a result of workforces shortages, especially in certain markets; in a 2013 survey, the average cumulative wait time to see a physician for five specialties in 15 markets was 18.5 days, with higher averages in certain specialties for example 28.8 days for dermatology.[58] Further, the number of unfilled provider positions in the U.S. nationwide is projected to grow between 2013 and 2025, based on predicted supply and demand.

Some of these national challenges are outlined in a March 2015 report by the economic modeling and forecasting firm IHS Inc.[59] The physician shortage will persist under every likely scenario that IHS Inc. considered, including increased use of advanced practice nurses (APRNs); greater use of alternate settings such as retail clinics; delayed physician retirement; rapid changes in payment and delivery, for example, accountable care organizations (ACOs) and bundled payments. Addressing the shortage will require a multi-pronged approach that requires innovation in delivery; greater use of technology; improved, efficient use of all health professionals on the care team; and an increase in federal support for residency training. The study's results confirm that no single solution will be sufficient on its own to resolve physician shortages. Because physician training can take up to a decade, a physician shortage in 2025 is a problem that needs to be addressed in 2015. Figure 2-11 presents several of the challenges outlined in the IHS report.

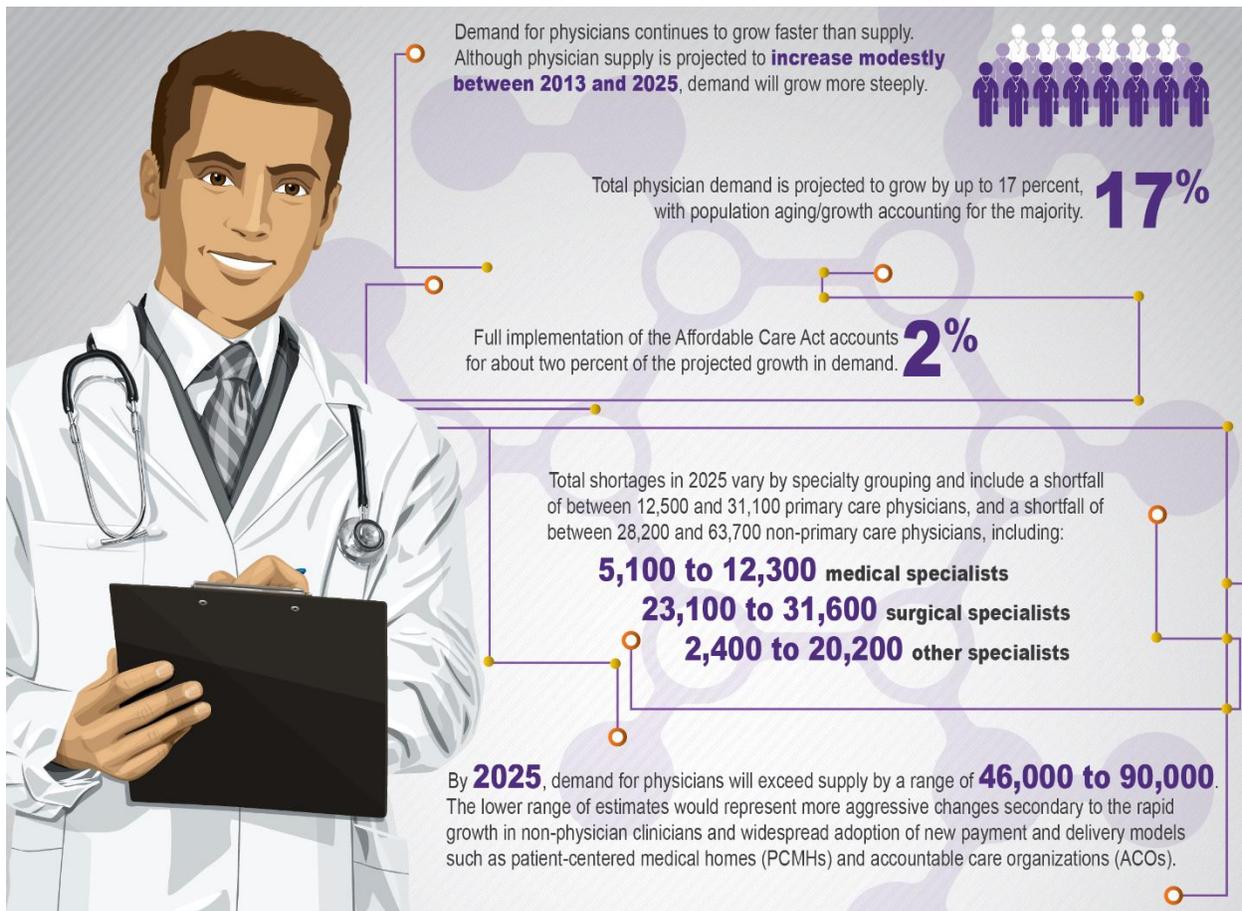
https://www.aamc.org/download/426260/data/physiciansupplyanddemandthrough2025keyfindings.pdf

Figure 2-11. Physician shortage predictions[60]


Because we did not study VHA future demand projections in relation to supply, we cannot definitively quantify the potential impact of the physician shortage on Veteran access to care. Yet, the IHS findings, particularly when taken in combination with the findings of the previously presented comparison of VHA and private sector physician supply per population ratios, and staffing challenges reported by VAMC leaders on our site visits, illustrate the challenging context in which VHA is operating.

In the following section, we describe some of the specific challenges that VHA faces in ensuring that it has sufficient providers to meet demand; namely, lengthy hiring processes and non-competitive compensation, each of which can contribute to provider shortages in VA medical centers.

2.2.9 Lengthy hiring processes may contribute to provider shortages

VHA's role as a government-administered health system creates unique challenges which other private sector health systems do not typically face. To fulfill its mission, VHA must hire large

---

[60] Association of American Medical Colleges. The Complexities of Physician Supply and Demand: Projections from 2013 to 2025. Retrieved from https://www.aamc.org/download/428622/data/20150401_projbriefingbio.pdf

---

numbers of clinicians while simultaneously abiding by federal personnel regulations and statutes. These requirements, among others, lead to lengthy hiring processes, which are often cited by VAMC staff as a significant challenge in recruiting providers and providing timely care to Veterans. In response to section 203 of the Veterans Choice Act, a Northern Virginia Technology Council report stated, "From General Schedule (GS)-5 clerks to senior clinicians, the hiring of needed staff proceeds too slowly. The causes are complex, but much of the delay can be traced to redundant, inconsistent, and inefficient hiring processes."(NVTC, p.12)[61]

> "*Recruitment for vacancies are challenging; Recruitment takes approximately 4 months, including USAjobs.gov posting, requirement to post as internal position for 14 days, 5 days to close CERT, manager subsequently reviews for 5 days – only after this is the position reposted as an external position; Because of the delays and lengthy timing, this facility is not competitive for new graduates.*" – VAMC Senior leader

VHA does not have an enterprise position management system, which limits the organization's ability to provide quantitative data surrounding the length of the hiring process; however the Assessment G team consistently heard from VHA employees that it can take several months.[62] The McKinsey & Company Assessment F team conducted a more in depth review of the hiring process and timeline, finding that VHA's hiring timeline spans 4-8 months while a typical private sector organization hires staff between 0.5 and 2 months. The Assessment G team notes that the major drivers of the extended VHA hiring time are the human resources (HR) certification process of the applicant's credentials, and the VetPro background check.[63]

> "*Recruiting into the VA is challenging - we don't do a good job of advertising and reaching out for provider recruitment. Using USAjobs for recruitment? That is not how recruitment is done in the private sector.*" – VAMC Service Line Chief
>
> "*The HR process is incredibly slow, which includes the hiring process; It can take up to six months after selection of a new hire for the hire to actually step foot in a VA facility; This drives away many candidate*s." – VAMC Service Line Chief

Provider and support staff recruitment and hiring challenges were echoed consistently by multiple staff and virtually all medical centers visited by the Assessment G team. VHA is actively taking steps to improve the timeliness of filling vacancies, many of which VHA outlined in its

[62] As reported during Assessment G site visit interviews.

[63] McKinsey & Co. (2015). Veterans Choice Act Assessment F Final Report

Section 301 response to the Veterans Choice Act,[64] submitted to Congress earlier this year. These efforts include recruitment, retention, and compensation planning efforts, such as:

- Increasing entrance survey participation among new employees and encourage facilities to improve recruitment planning based on findings[65]

- Leveraging the National Recruitment Program to recruit clinical and executive positions via private sector recruiting best practices[66]

- Implementing Pathways Internship Program to increase the pipeline of candidates to VHA's workforce[67]

- Conducting and analyzing the results of exit surveys to improve retention programs[68]

- Utilizing the Education Debt Reeducation and Student Loan Repayment Program[69] to recruit highly skilled employees

- Providing the MyCareer@VA portal to offer long-term career growth tools and development to current VHA employees

- Increasing pay ranges for physicians and dentists who provide direct patient care[70]

- Leverage the Physician and Dentist Steering Committee to develop recommendations for each specialty's pay ranges

The Assessment G site visit teams heard positive feedback on a number of these recruitment and retention programs, as well as indicators of gaps where these programs could be expanded. Specifically, a VAMC service chief suggested that the debt reduction programs were a positive incentive for recruiting both physicians and mid-level providers at his facility. Another VAMC section chief praised the debt reduction programs as a helpful recruitment tool to compensate for the pay disparity between VHA physicians and those in the private sector. The team also heard suggestions for how these programs could be expanded, and suggestions for

---

improving programs. With respect to areas where VHA should focus in the future, a member of a VAMC leadership team specified that career fulfillment is an essential element in maintaining provider and staff morale, and an area VHA should try to improve.

2.2.10 Less competitive pay may contribute to provider shortages

Provider earning potential for VHA providers is significantly lower for VHA providers than the private sector. While VHA offers, in many cases, greater work life balance, and unique opportunities for research, teaching, and the opportunity to serve a formidable mission to care for our nation's Veterans, the lower salaries may reduce VHA's competitive edge in the marketplace when trying to attract top provider talent.

The Department of Veterans Affairs Health Care Personnel Enhancement Act of 2004 (Pub. L.108-445) established provisions for a new pay system for VHA physicians and dentists consisting of base pay, market pay, and performance pay. The base pay component is set by statute, while market pay is intended to reflect the recruitment and retention needs for the specialty or assignment of a particular physician or dentist at a facility. Performance pay is intended to recognize achievement of specific goals and performance objectives prescribed annually. With the passage of this law, lawmakers set to establish a pay system driven by both market indicators and employee performance, while recognizing employee tenure in VHA.

In accordance with 38 U.S.C. 7431€(I)(A), the Secretary must prescribe Department-wide minimum and maximum amounts of annual pay for physicians and dentists. Further, 38 U.S.C. 7431€(I)(B) allows for the prescription of separate minimum and maximum amounts by specialty designation or assignment.[71] Specific goals and performance objectives, as they pertain to performance pay, are generally developed at the local level. They cover a wide range of categories including research achievements, reduction in wait times, and patient satisfaction. At the conclusion of the fiscal year, the provider's supervisor evaluates the extent to which each goal was demonstrated or achieved by the individual. If performance pay is granted to the provider, it cannot exceed $15,000 or 7.5 percent of his or her salary, whichever is lower.[72]

The most recent update to the annual pay ranges tables was completed in November 2014. As part of the update, VHA identified and utilized survey data from the Association of American Medical Colleges (AAMC), Hospital and Health care Compensation Service, Sullivan, Cotter, and Associates, MGMA, Physician Executive Management Center, and the Survey of Dental Practice published by the ADA. VHA collectively utilized these surveys as benchmarks from which to prescribe annual pay ranges for physicians and dentists across the scope of assignments/specialties within VHA. While aggregating the data, VHA more heavily weighted

---

those surveys which most directly resembled the environment of VHA.[73] In the recent update, some physician and dentist specialty grouping pay tables increased by $20,000 to $35,000 annually. There was no change to pay tables for physicians serving in leadership roles, such as a Veteran Integrated Service Network (VISN) or VAMC Director.[74]

Despite these adjustments, VHA still falls far below the average provider salary ranges for many specialties relative to the industry. Figure 2-12 shows the difference between the VHA-approved physician pay ranges[75] and the MGMA Physician Compensation and Production Survey, which includes average physician salaries, for a subset of specialties. We compared the top salary tier for VHA providers against the MGMA surveyed 90th percentile salaries in dark purple. The figure shows the lowest salary tier for VHA providers against the MGMA surveyed 10th percentile salaries in light pink. A value of zero indicates no difference between VHA top and bottom tier salaries and the private sector. Dark purple peaks below zero highlight the earning potential gap for VHA providers. This graphic does not depict observed top salaries of VHA providers against private sector providers, but offers insight into the earning potential gap between VHA and private sector.

In analyzing the differences in salaries, our team concluded that VHA is often able to provide physicians an entry salary industry comparable or better to industry, but that VHA physicians' earning potential is dramatically below those of their private sector peers. At the top of the salary ranges, VHA providers made less than their counter parts by up to $310,000 and on average, $74,631. The only specialties where VHA physicians made equal to or more than industry averages were anesthesiology, nephrology, ophthalmology, and psychiatry. To see a table with all specialties, please reference Appendix A.

To address staffing shortages, section 301 of the Veterans Choice Act also allows for increased recruitment and appointment of providers.[76] The inability to provide competitive salaries has resulted in difficulties in recruiting these positions, specifically in areas with a high number of outside health care systems, which may decrease Veterans' access to care. VA facilities have come up with creative ways to get around this barrier, most predominantly, using part-time providers or fee-based providers. Providers may be offered more research and teaching time, and/or a dual-affiliation with a neighboring institution to help attract candidates.

Based on site visit interviews and data reviewed, and notwithstanding the fact that many providers choose to work at VHA because of the important mission and culture, compensation

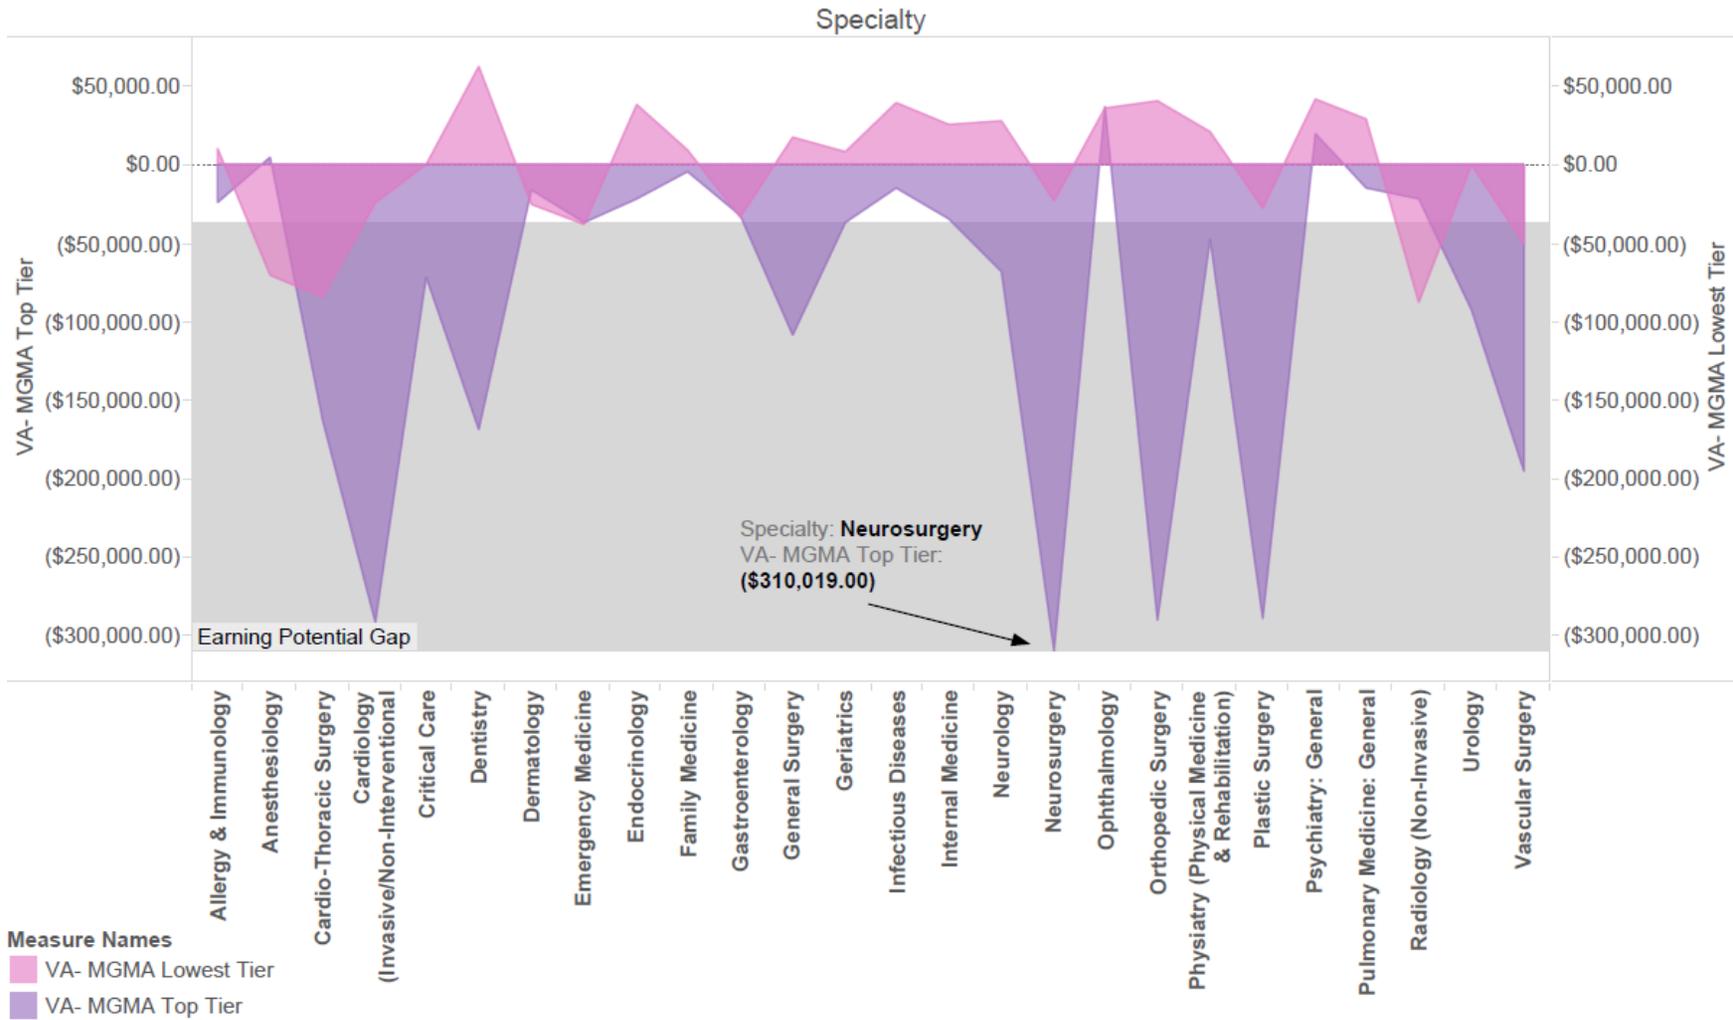
does seem to be a factor which should be further examined by Congress and VA leadership to understand how much of an impact it has on provider recruitment and retention.

Figure 2-12. VHA provider salary comparison to MGMA


2.3 Provider Productivity (Objective 2)

Comparing the productivity of VHA providers to the private sector requires an understanding of available productivity measures, the limitations of each, available benchmark surveys, and the comparability of benchmark data. Below we summarize productivity measurement in the health care setting, how it is applied as a performance measure, and the use of benchmark data sets.

2.3.1 Productivity measurement is associated with reimbursement

Productivity is a measure of the output, for example, procedures or tests, that can be produced given a certain combination of inputs (number of professional minutes/hours and supplies/resources). Typically, productivity is measured for a specific input, such as labor. It is also possible to consider "system productivity" – the productivity of spending in a hospital, physician practice, or health system – by looking at the output achieved for any given amount of resources devoted to health care services.

- Measurements of productivity generally correspond to the reimbursement system. In the private sector, the common reimbursement models and measures of productivity are based on episodes of care, such as a physician office visit.
- The industry is moving closer to a value based reimbursement system that pays for maintaining and improving the health status of a defined population. As an industry, these reimbursement models and the related performance measures are still in the early stages of development and wide spread acceptance.

A systematic review conducted by Hussey, et al. of the RAND Corporation found that over 97 percent of productivity measures tracked only the utilization of health care services as the output from hospitals and other medical institutions. "Those measures include cost per hospital discharge, cost per outpatient visit, relative value units (RVUs) per physician per month, patient visits per physician per month, average length of stay per discharge, and similar metrics."(McKeller et al., 2013, p2)[77]

2.3.2 Productivity should not be considered in isolation from process and outcome measures

There are several well-defined measures of provider productivity used in the private sector, many of which have robust comparison data sets. Provider productivity measurements offer useful tools for physician compensation package design, administrative decision making (workload management, resource allocation, and cost accounting), or other uses, such as: economic profiling, workforce planning, documenting the level of activity treating patients, or research.

---

[77] McKellar, R., Chernew, M., & Colucci, J. (2013). Productivity Measurement in the United States Health System. p2. Retrieved from https://www.newamerica.org/downloads/McKellar_Chernew_Colucci_NAF_10_2013.pdf

Productivity is impacted by a wide range of independent variables to include the patient population and characteristics the organization in which the provider practices. In the private sector, physicians and hospitals operate in a largely fee-for-service environment, creating an incentive to increase utilization of services, and so to increase throughput. In fact, in its 2014 Review of Physician Recruiting Incentives, Merritt Hawkins found that in 57 percent of the physician search assignments it conducted between April 1, 2013 and March 31, 2014, a salary plus a production bonus was the form of compensation offered to physician candidates.[78]

VHA operates closer to a population-based care model where process and outcome measures related to managing patient health becomes a higher priority than procedure based measures of activity; however, there are currently no widely accepted productivity measures based on the population health approach. As the industry migrates from volume-based to value-based care, new measures of provider productivity which consider quality, service, access and outcomes will be critical elements to future performance management and incentive structures.

2.3.3 Provider productivity can be measured in many ways

Specialty care providers are typically measured on caseload or other measures of productivity, whereas primary care providers are typically measured by their panel size. This is because primary care providers typically have a consistent set of the same patients for whom they are accountable to (called a panel), while specialists are more likely to treat patients on a short term basis and have greater fluctuation in unique patients (this set of patients is termed their caseload). Measures of productivity typically used in for specialists include: visits/encounter counts, charges, collections, and work relative value units (wRVUs). Although use of multiple measures provides a more robust picture, the industry standard for benchmarking productivity is wRVUs, especially for specialists. The relative value unit (RVU) system was developed as part of the resource-based relative value scale (RBRVS) by CMS and is currently used as the basis for reimbursement by most third-party payers in the U.S. The RVU system considers three categories that inform the value of health care services: physician work (denoted as work RVU, or, wRVU), practice expense, and malpractice insurance.

The advantage of using wRVUs as a measure of productivity is that they are independent of any dollar amounts involved, so they are not affected by the limitations associated with measuring charges or collections.[79] Another wRVU advantage is that they reflect the acuity of the patient population (subject to accurate and comprehensive coding documentation practices), providing higher value or CPT® Evaluation and Management codes which reflect higher acuity.

[79] Physician Productivity Paper. Retrieved from http://www.migrantclinician.org/files/resourcebox/PhysicianProductivityDiscussionPaper.pdf

---

In capitated systems (a capitated model is one in which whole networks of hospitals and physicians band together to receive single fixed monthly payments for enrolled health plan members)[80] and other environments where the emphasis is not on maximizing the number of patient encounters and on coding to the highest CPT® E/M level, wRVUs may not serve as the most appropriate measure of comparison due to misalignment of incentives. In these cases, panel size or the number of encounters per provider may be more appropriate. However, these measures have limitations as measures of comparison. One limitation of panel sizes as a measure of productivity, is that the provider may have little or no control over the size of their panels and it is not a measurement of activity. Another limitation is that comparability is limited unless one can risk adjust for patient acuity, and compare to benchmarks that represent organizations with similar care models. Encounters and visit counts are limited as they do not reflect acuity; however, if providers do not code accurately, acuity would not be reflected completely in wRVU data either.

2.3.4 MGMA and AMGMA are appropriate benchmarks for productivity

The most reputable (most used and have the largest sample sizes) are: MGMA's Physician Compensation and Production Survey, MGMA's Academic Practice Compensation and Production Survey [AMGMA]), and AMGA Medical Group Compensation and Financial Survey.

- MGMA Physician Compensation and Production Survey:[81] The survey includes both a single specialty practice edition and a multi-specialty practice edition. The survey includes 4,197 medical groups and 66,299 providers (2,518 multispecialty groups representing more than 44,000 providers). The survey is conducted across primary care and specialty care and a wide range of geographies. This survey is the most commonly used survey of all existing physician performance and compensation benchmarking options. It includes data that highlight staffing, cost, and productivity data points.

- MGMA Academic Practice Compensation and Production Survey:[82] MGMA's academic survey (referred to as AMGMA) includes 20,876 providers and 1,996 administrative staff. This survey includes those multi-mission providers that include clinical, research and teaching time. This survey group, while smaller than MGMA, is in some important aspects most similar to the VA health care system, especially VHA's most complex and affiliated (level 1 and 2) medical centers. This survey is also valuable to understanding the relationship between clinical production and additional responsibilities held by academics such as research and teaching.

---

- **AMGA Medical Group Compensation and Financial Survey:**[83] AMGA is the industry group in which most large health systems and medical groups have membership. Only providers can be members, while other industry professionals may purchase access to the information. AMGA's annual survey includes responses from 289 medical groups including 73,700 providers for an average group size of 255. This survey has been conducted since 1986. Respondents tend to be larger organizations. Unlike the other two benchmark sets, data is published demonstrating quartiles, rather than individual provider percentiles.

Note: The Assessment G team was not granted permission to publish data from the AMGA surveys as comparisons to VHA data, although we did conduct an analysis using it.

To describe how productive VHA providers are in comparison to relevant industry benchmarks, the team conducted separate analyses of primary care and specialty care. We used panel size for primary care and encounters and wRVUs for specialty care, as measures of productivity, and benchmarked primarily to AMGMA and MGMA surveys, as well as Kaiser Permanente Northern California, and American Academy of Family Physicians (AAFP) for primary care panel size recognizing the limitations described above.

2.3.5   Primary care

For primary care, panel size is an appropriate measure for comparing both staffing levels and provider performance (productivity) in health care systems that care for a defined patient population, such as VA. Panel size is defined as the number of unique patients for whom a care team is responsible. To assess the provider staffing and productivity of VHA primary care as compared with the private sector, we first examined the characteristics of VHA's primary care model (PACT) and the ways in which it has been adapted for the needs of special populations (women, geriatrics, and Veterans with mental health needs). We considered the ways in which VHA's panel size for primary care providers has been adjusted based upon the demographics and unique health care needs of the patients it serves. We then benchmarked the panel size of VHA primary care providers with comparable industry benchmarks.

2.3.5.1   Summary of findings and analysis for primary care

We synthesized data and observations from benchmarking and site visits into the following three key findings. The sub-sections that follow describe the findings for primary care in detail. Information on the factors that we believe to be the drivers of these findings are presented below.

- Finding 4. VHA measures the performance of its PCPs using panel size. VHA calculates a modeled panel size for providers based on a variety of factors at each facility. The model was developed based on research into the appropriate panel size for the unique needs of Veterans. (See Section 2.3.5.2.)

---

[83] AMGA (2014) *2014 Medical Group Compensation and Financial Survey: 2014 Report Based on 2013 Data*. Alexandria, VA, American Medical Group Association.

- **Finding 5.** In accordance with policy, VHA facilities establish a maximum panel size for each primary care provider which is often lower than the modeled panel size. The maximum figure takes into account specialized panel needs (for example, a geriatric population) and other factors deemed appropriate by the facility. (See Section 2.3.5.4.)

- **Finding 6.** The actual panel size of VHA primary care providers is lower than internal and external benchmarks. (See Section 2.3.5.5.)

2.3.5.2   VHA's primary care model establishes the panel size of providers (Finding 4)

VHA measures the performance of its PCPs using panel size. VHA calculates a modeled panel size for providers using a variety of factors at each facility. The model was developed based on research into the appropriate panel size for the unique needs of Veterans.

In October 2009, as part of the Veterans Health Administration Transformation 21 initiative, VHA adopted and customized the Patient Centered Medical Home (PCMH) model of care within its primary care clinics, branding its PCMH model as PACT (Patient Aligned Care Team).[84] Through the use of the PACT model, VHA delivers a team of health care professionals who provide comprehensive primary care in partnership with patients, and who manage and coordinate comprehensive health care services consistent with the agreed upon goals of care. The PACT model aligns with VHA's strategic goal to provide personalized, proactive, patient-driven health care. Each PACT team, known as a 'teamlet' typically consists of a Primary Care Provider (PCP), Registered Nurse Case Manager, Clinical Associate (LPN, LVN, or Heath Technician, and Administrative associate [clerk]). The PCP can be a physician or APP.

Each teamlet consists of a panel of patients under the direction of the PCP. Figure 2-13 shows the VHA-recommended PACT teamlet model and the model's inter-relationship with the patient. A recent study funded by VHA Health Services Research and Development found that Veterans in clinics with the highest medical home adoption had positive health outcomes – they had significantly lower Ambulatory Care Sensitive Conditions rates[85] (20 per 1,000) compared to Veterans in clinics with the lowest (25 per 1,000) and medium (26 per 1,000) adoption of medical home features.[86]

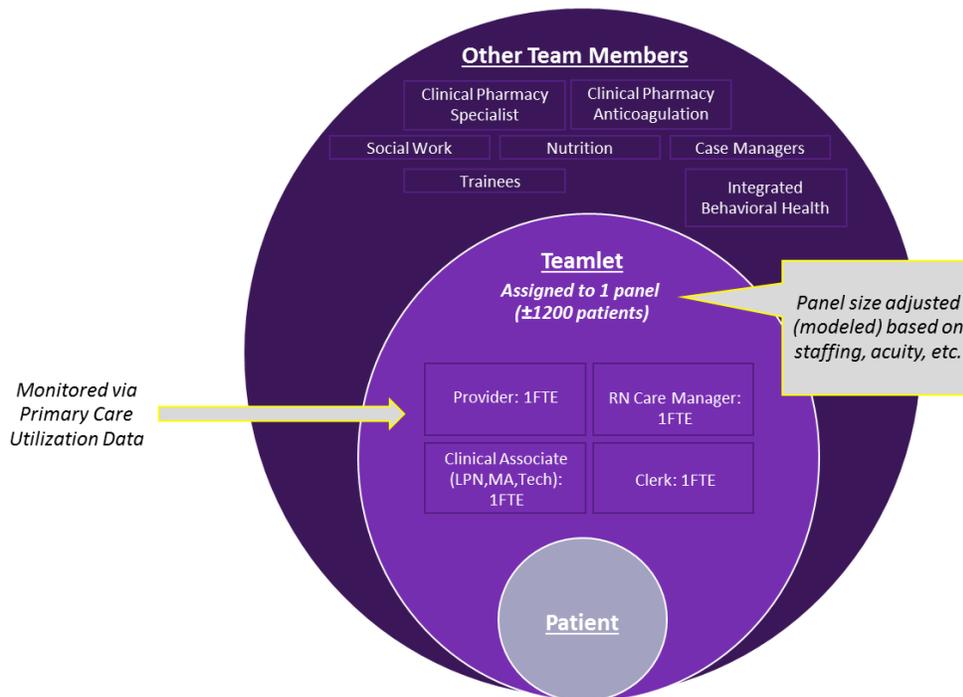
Figure 2-13. PACT teamlet model[87]


Note: Each parent facility has an HPDP Program Manager, Health Behavior Coordinator, and MyHealtheVet Coordinator

VHA's Office of Primary Care does not measure the productivity of its PCPs using wRVUs. In our discussions with them, VHA primary care leadership expressed significant concerns in using wRVUs to measure productivity, as many clinical activities done by PCPs do not have an associated wRVU value.[88] Furthermore, comparisons to systems which do not operate on a value-driven or patient centered model, are not comparable. In a white paper provided by VHA's Office of Primary Care Services and Office of Primary Care Operations, VHA stipulates that, "as a capitated health care system, management of a population and hence panel size is much more relevant than RVUs."[89](VHA, 2015). Perhaps not surprisingly, the only entities the Assessment G team identified as having methodologies for establishing panel sizes were those health care systems that care for defined patient populations. In analyzing these external entities alongside the VHA Primary Care approach, our team determined that panel size was the most appropriate measure of productivity within VHA Primary Care.

[88] Telephone Interview with several leaders from VHA Office Primary Care Services and Office of Primary Care Operations (January 7, 2015) and Assessment G site visit interviews.

[89] Veterans Health Administration. Panel Size: Private Sector & VHA, White Paper, provided by VHA, January 2015.

VHA modifies primary care panel sizes based on several factors:

- Primary Care intensity score (reflects patient population acuity)
- Support staff ratios
- Number of clinic rooms and other physical support infrastructure
- Presence of newly hired providers
- Specialized panels (a panel which serves a special population, such as a Geri-PACT)

Text box citation: U.S. Department of Veterans Affairs. (2009) VHA PCMM Handbook 1101.02. Retrieved from http://www.cobooks.net/d/vha-handbook-110102-primary-care-management-module-pcmm-579895/

VHA utilized the Primary Care Management Module (PCMM) to compute a modeled panel size (division modeled capacity) for PCPs at each facility. To develop VHA's modeled panel size, VHA compared itself in 2003 to MGMA and U.S. Army Medical Command and made modifications based on factors known to affect physician productivity, for example, patient characteristics, support staff, and exam room ratios. In 2012, a follow up study was conducted that included Santa Clara Valley Medical Center, a county health system with patients who primarily have chronic diseases in Los Angeles County.[90] As reported in VHA's Primary Care Management Module Handbook, "For sites with a patient population reflecting the norms for disease severity and reliance on VHA and who have current norms of 2.17 support staff per 1.0 FTE provider and 3.0 clinic rooms per 1.0 FTE provider, an expected panel would be 1,200 patients for a full-time, established primary care physician. After adjustment for the factors identified, expected panels for VHA primary care providers largely fall in the range of 1,000 to 1,400."[91](VHA Primary Care Management Module [PCMM] Handbook, 2009). For APPs, this translates to roughly 900 patients (75 percent of a physician's panel size) per primary care APP.

2.3.5.3 Facilities can customize primary care models for special populations

In considering the staffing levels and productivity of primary care clinics across VHA, it is important to understand both the general PACT model and specialized models for unique or special populations, which may have different staffing requirements and care models. Special populations are cohorts of patients who meet VHA national or locally approved and published criteria to receive care from a special population PACT. Special population PACTs may include: Women's Health (WH), Geriatric (GERI), Home-based Primary Care (HBPC), Infectious Disease (ID), Post-deployment Care (PD), Renal/Dialysis, Serious Mental Illness (SMI), and Spinal Cord Injuries and Disorders (SCI/D).[92] WH-PACTS represent the largest proportion of specialized

---

population panels. They make up 28.8 percent of PCP FTE (both Physician and APP FTE). The remaining specialized population panels, when combined, make up 9.4 percent of PCP FTE.

These specialized PACTs are unique because their panels are composed of special populations that require more complex primary care. Special population PACTs tend to have smaller patient panels than their traditional primary care counterpart panels (which generally range from 1,000 to 1,400 patients),[93] and may also have different staffing and support staffing requirements. Further, exact staffing models for PACTs may vary by facility (see discussion of Facility Maximum versus VHA Modeled Panel Size in Section 2.3.5.4); however, according to VHA Handbook 1101.10, staffing decisions must optimize PACT function. VHA Handbook 1101.02 provides procedures for determining and adjusting panel sizes and primary care direct patient care time and prorating of support staff FTE based on dedicated primary care clinical activities.

Women Veterans are a relatively small proportion of the total Veteran population (they represent approximately 6 percent of VHA patients),[94] but have specific health care needs served through a certified WH physician. 27.41 percent of primary care physician FTE serve on WH-PACTs. Each WH-PACT has a physician certified in women's health and 10 percent or more women patients. More than 80 facilities across VHA also have comprehensive women's health clinics, with VA requiring each site of care to have a designated women's health provider. Female Veterans that are victims of physical assault, battery, or sexual harassment occurring during active duty or active duty for training receive specialized physical and mental health care through WH-PACTs.[95] Separate of these unique needs, women Veterans tend to be younger (the average age of female Veterans in 2013 was 48, whereas the average age of male Veterans was 63).[96]

Staffing to meet demand is a particular challenge in some women's health clinics due to the increasing influx of women Veterans to the VA system.[97] In fact, since 2000, the number of female Veterans using VA health care has more than doubled, outpacing the growth rate of the male Veteran population. On the other hand, overall demand is low relative to other specialties, so some facilities may not have enough demand for providers to appear productive. The Office of Women's Health and Office of Primary Care recommend a 4:1 ratio of staff for

PCPs for women's health PACT teamlets in contrast to a 3:1 ratio for regular PACT teams.[98] A unique feature of staffing in a women's health clinic is that a female chaperone is required to be in the room with the provider when certain procedures or exams are being performed.[99] This can impede productivity compared to caring for the male Veteran population, as in some cases where a chaperone is not readily available, the provider and patient must wait for a chaperone to become available.[100]

There is a shortage of specialized geriatric care across the country, with private sector systems and VHA having similar challenges.[101] Today, VHA leads the nation in the provision of specialized geriatric care, with 45 FTE geriatric/palliative providers across the VA system.[102] At present, there is no health system with as many care teams, known in VHA as Geri-PACTS, dedicated to the geriatric population. Geri-PACTS can be established for any geriatric team that assumes responsibility for comprehensive, coordinated primary care and specialized geriatric care of an assigned panel of patients. It is important to note that geriatric services for Veterans in VHA are not limited to only those services provided by Geri-PACTs; however, few VHA geriatricians practice outside of Geri-PACTs. Geri-PACT teamlets typically have a panel of 642 patients and include 1.0 FTE geriatric PCP, 1.0 FTE registered nurse case manager, 1.0 FTE clinical associate (LPN/LVN/Health Tech), social worker, and clinical pharmacy specialist.[103] Discipline-specific team members, such as registered dieticians, geriatric psychiatrists, geriatric psychologist, hospice and palliative care provider, or physical medicine and rehabilitation services clinicians may also be part of the care team.[104]

Panel sizes for Geri-PACTS may not exceed two thirds of the PACT panel size at the site.[105] When assessing the productivity of providers in Geri-PACTs, it is important to note that there are several CPT® codes which do not have wRVU values (for example, S0250 – team assessment) that constitute the workload of Geri-PACTs. Another key aspect of geriatrics care is the purchased care program. Long term care support is supported by over 10,000 home health care workers at 2,500 community nursing homes, 130 VA CLCs and 130 State Veterans homes.[106] The Office of Geriatrics and Extended Care Services is making significant efforts to

---

better monitor whether community nursing home facilities meet eligibility requirements, provide high quality care, and do so in a cost effective manner.[107]

VHA recently initiated a special PACT model for Veteran patients with serious mental illnesses called SMI-PACTs. In a SMI-PACT, the Veteran's mental health care is planned and delivered by a team of mental health professionals, including psychiatrists/mental health advance practice nurses, psychologists, RNs, LPNs/Health Techs, therapists, and others. Because persons with SMI have premature mortality rates much higher than the general population, and may be more likely to have difficulty navigating the VA system, VHA is testing the SMI-PACT model. This project, led by a physician at the VA Greater Los Angeles Health care System, "will partner leadership at two medical centers to implement SMI-PACT, with the goal of improving health care and outcomes among people with SMI, while reducing unnecessary use of emergency and hospital services. Evidence-based quality improvement strategies will be used to reorganize processes of care. In a site-level controlled trial, this project will evaluate the effect, relative to usual care, of SMI-PACT implementation on (a) provision of appropriate preventive and medical treatments; (b) patient health-related quality of life and satisfaction with care; and (c) medical and mental health treatment utilization and costs."[108](Young, 2014). In most instances, the mental health team will not be providing the primary care services to the Veterans in SMI-PACTs, but incorporating providers with privileges and scopes of practice that include providing these services.[109] However, depending on the results of the study, which ends in 2018, VHA may move toward providing care to this population through more SMI-PACTs.

2.3.5.4 VHA facilities establish a maximum panel size for primary care providers (Finding 5)

In accordance with policy, VHA facilities establish a maximum panel size for each primary care provider which is often lower than the modeled panel size.

According to the Office of Primary Care, VHA central office calculates a modeled panel size (capacity) for a general primary care physician at each facility using the factors described above in Section 2.3.5.2. The Office of Primary Care issues the modeled panel size to each facility, along with guidance (the VHA PCMM handbook) on how the model may be modified by the facility. Each VHA facility has the flexibility to sets its own maximum capacity for its providers (physicians and APPs) based upon local situational factors and using the guidance in the PCMM handbook (such as, applying guidance to adjust for special PACT presence.) For example, a facility may set a lower maximum panel size for a new provider, or a panel serving a population with special needs, or in order to have capacity for new patients.

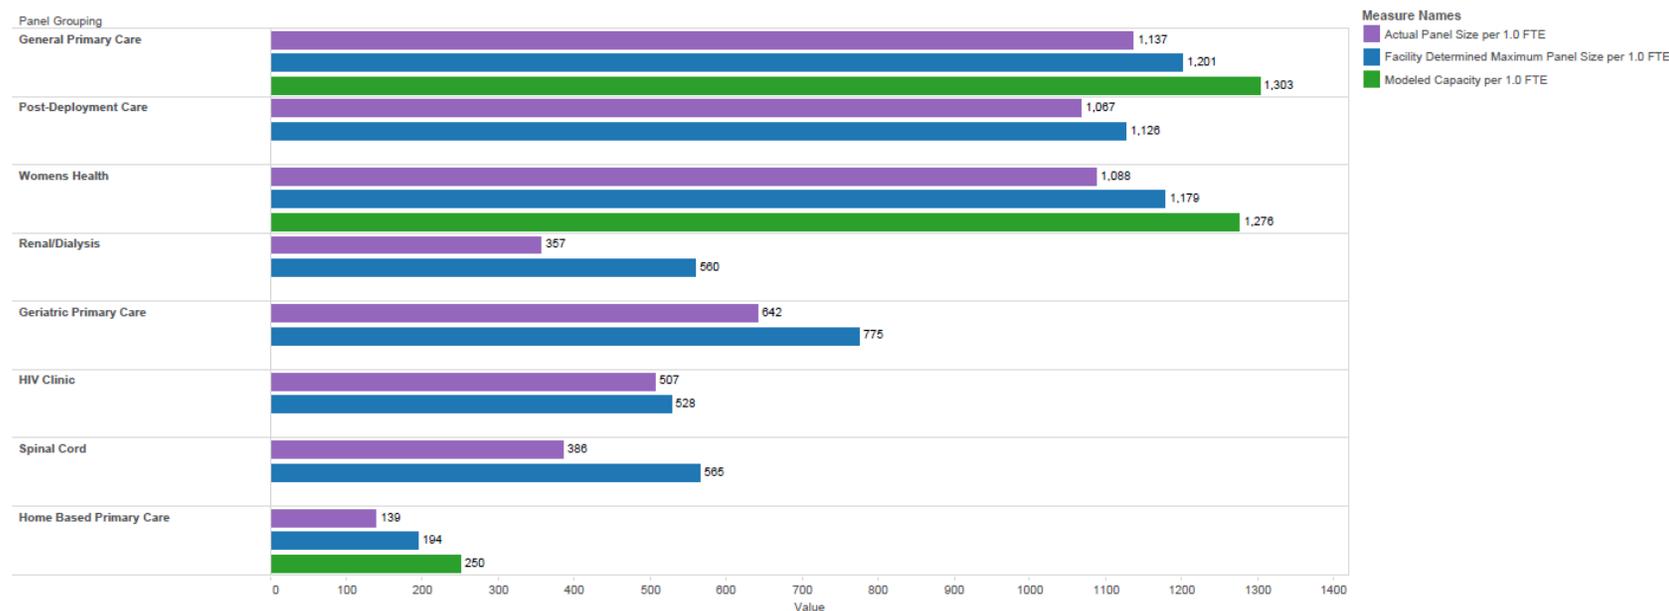
http://www.va.gov/vhapublications/publications.cfm?pub=2.

As depicted in Figure 2-14, nationally, VHA's average modeled capacity is 1,306 patients per primary care general practice physician FTE. Whereas the average facility determined maximum capacity is 1,207 patients per general practice physician. Comparing them, the average facility maximum is 99 (8 percent) fewer patients per physician FTE than VHA's modeled panel size.

In Section A.3, we report the maximum and modeled capacity at each facility. The difference between the VHA-modeled capacity and the facility maximum can vary significantly. On the low side, we found a facility maximum capacity could be 462 patients fewer per physician FTE than the VHA-modeled capacity for the same facility. On the high side, we found a facility maximum could be 954 patients more per physician FTE than the VHA-modeled capacity for the same facility.

Figure 2-14. Summary of panel grouping


One consideration which facilities take into account in developing the facility maximum is the prevalence of special populations, which have different expectations for panel size (see VHA's PCMM Handbook). While 68.1 percent of PCP (physician) FTE are in general primary care PACTs, 27.4 percent are in WH-PACTs and 4.5 percent are in other special population PACTs. As depicted in Figure 2-14, the average facility maximum capacity per physician FTE is lower for all specialty population PACTs than the average VHA modeled capacity for general primary care providers.

Our team was further able to calculate the national modeled capacity for WH-PACTs and HBPC-PACTs using the recommended modifiers in VHA's PCMM Handbook. The modeled capacity for both WH-PACTs and HBPC-PACTs was higher than the facility reported maximums. The modeled capacity is depicted as a green bar in the graphic above and exists only for the WH-PACTS, HBPC-PACTS, and General Primary Care PACTs, since specific inputs for modifications to modeled panel size are not provided in the VHA PCMM or PACT Handbooks. Instead, either general guidelines are suggested or discretion is left to local leadership.

2.3.5.5 VHA's actual primary care panel size is lower than expected (Finding 6)

The actual panel size of VHA primary care providers is lower than internal and external benchmarks.

We completed our analysis of VHA PCP panel size by comparing it to the private sector using three approaches; first, we conducted research on panel sizing, and provide that information below for comparison. Second, we reviewed VHA's methodology for developing its panel sizing approach, and compared VHA's panel sizes to existing benchmarks (recognizing that some comparison sets operate very different models of care); and lastly, we used a formula to calculate ideal visits per year, and compared that to the current visits per year in primary care.

To summarize the research on appropriate panel sizes:

- A 2012 Annals of Family Medicine study by Altschuler, et al. reported the average US panel size was 2,300, but noted that this was too large to deliver quality care under a PCMH. Using peer reviewed sources regarding the number of hours per patient per year needed to perform preventive, chronic, and acute care, it also reported that panels can range from 983 to 1,947, dependent upon delegation of tasks to various non-physician members of a primary care team. It recommends that the low-overhead ideal medical practice have somewhat larger panel sizes (than a concierge medical practice with panel sizes of 200 to 600) but typically fewer than 1,000 patients.
  - Under a non-delegated model, and assuming primary care providers work 2,025 hours per year and provide an average of 2.06 hours of service per patient per year, primary care physicians can care for a panel of 983 patients.
  - On the opposite end of the spectrum, with the most ambitious assumption about the degree of delegation possible, a physician could reasonably care for a panel of 1,947 patients.[110]
  - It further noted that adjusting for the age and acuity of VHA's patient population supports VHA's panel size of 1,200 if work is delegated to non-clinicians.[111]
- A 2013 published blog by the Medical Group Management Association (MGMA) reported an unadjusted median panel size of 1,906 and average panel size of 2,184 patients per full time provider, sourcing from the 2012 MGMA Cost Survey for Primary Care Practice.[112] This number seems to be on the rise in single and multispecialty group practices with

---

primary care. The 2014 MGMA Cost Survey reports that primary care practices have 2,505 patients per FTE physician.[113]

- A 2013 presentation by RAND Health researchers on implications of new models of care on the primary care workforce observed that ideal panel sizes vary between 1,387 and 1,947, and that adopting the PCMH model may reduce panel size by 23 percent.[114] It also noted that medical homes, in general, appear to have smaller panel sizes.

- A 2012 *Health Affairs*[115] article cites a 2009 study from Duke University published in *Preventing Chronic Disease*[116] which states that a primary care physician with an average panel of 2,000 patients would spend 17.4 hours per day providing recommended acute, chronic, and preventive care. The *Health Affairs* article further stipulates that if a reasonable work day for a primary care practitioner is eight hours per weekday in direct patient contact – excluding paperwork and other responsibilities, then the appropriate panel size should be lower than 2,000.

- The Assessment G team compared VHA modeled panel sizes to a population health model system - Kaiser Permanente Medical Group Northern California (average), [117] the MGMA 2014 Compensation and Production Survey (median), and AMGA 2014 Medical Group Compensation and Financial Survey (median). Additionally, we calculated an "ideal" panel size benchmark for VHA using equations published by Murray et al in the *Family Practice Management.*[118] See Figure 2-15 for comparisons.

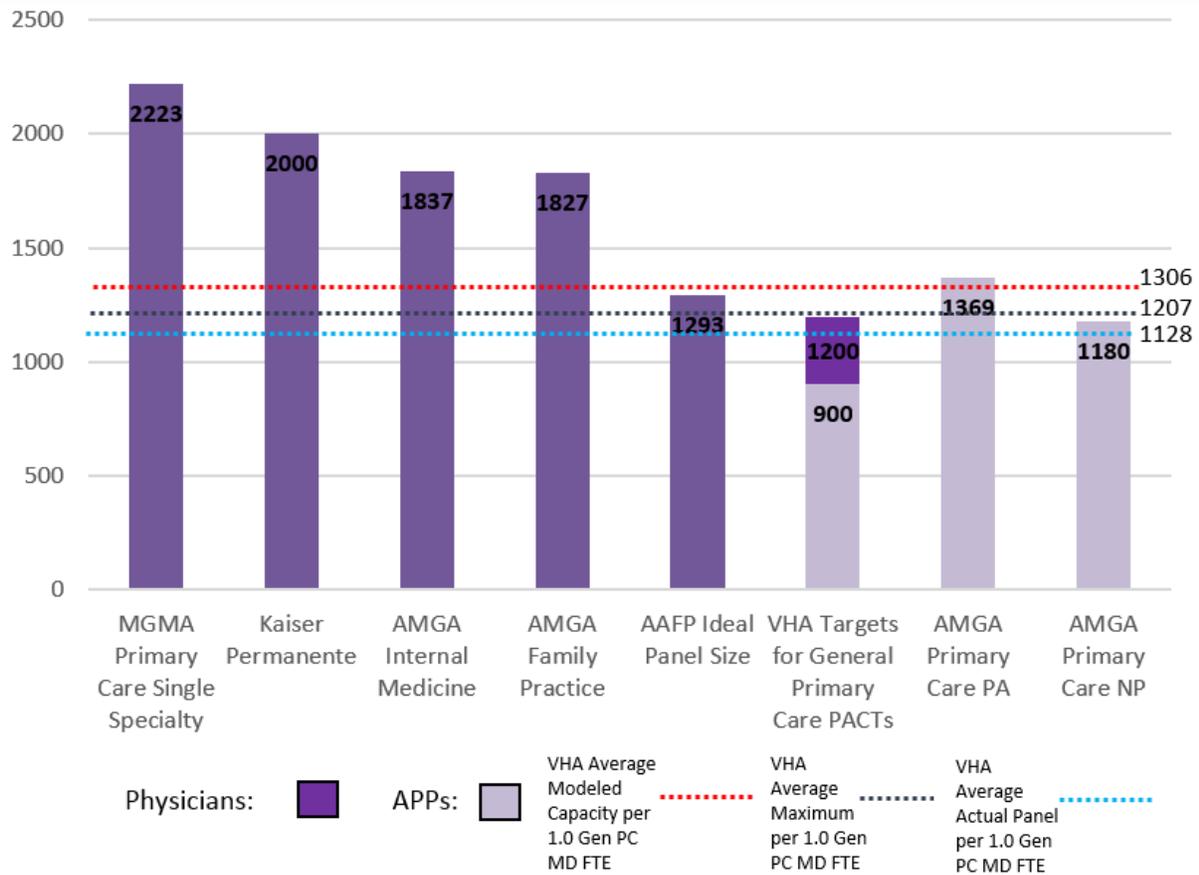
Figure 2-15. Panel sizes - VHA vs. benchmarks[119]


According to the AAFP, there are several additional variables which may be used to determine the ideal panel size:

Visits per patient per year: To increase the size of the panel that a provider can successfully care for, the number of visits per patient per year can be decreased by improving continuity (when patients see their own provider they require fewer visits),[120] lowering the visit return

[119] Assessment G benchmark analysis uses MGMA survey, data from Kaiser Permanente Northern California Group site visit, AMGA 2014 Medical Group Compensation and Financial Survey. (2015, June 9). Retrieved from http://www.aafp.org/fpm/2007/0400/p44.html

rate, such as the percentage of visits for which the provider requests a follow-up visit,[121] providing more services at each visit, increasing cohesion of care teams[122] teamwork, and using alternatives to traditional visits such as secure messaging, telephone care and other telehealth modalities, and group visits.[123]

Provider Visits per day: This variable can be increased by optimizing care delivery models, decreasing the no-show rate, offering more appropriate support staff so that providers can reduce individual visit length,[124] improving the workflow by reducing bottlenecks and providing more "just in time" support, optimizing the number of exam rooms,[125] and removing unnecessary work (escorting patients between the waiting and exam rooms, prepping rooms, or scheduling appointments), from the providers to allow them to maximize appointment supply.[126] The number of patients seen per day may also depend on such factors as: appointment length, clinic hours of operation, scheduling practices (for example, double booking, or no show), space, and the presence of residents, fellows, and/or APPs. Unfortunately, there is a lack of information on the leading best practice for the number of patients per day. Best practices may also not be applicable to the VHA patient population, which may differ from other health care systems, specifically around age, co-morbidities, and social determinants of health, for example, employment, and housing.

Provider days per year: This variable is determined by the number of days a provider's schedule was booked for patient visits per year. It can then be adjusted for changing expectations about the number of days that should be booked with appointments, as well as critical decisions about how provider time will be distributed, for example, shifting providers away from nonclinical duties in favor of clinical duties.[127]

---

AAFP recommends using these variables to determine an "ideal" panel size, and further suggests performing age adjustment via adjusting the 'visits per patient per year' metric.[128] The ideal panel size is one in which supply and demand are balanced. The following equation can be used to derive ideal panel size based on the provider's historical level of productivity: Panel size × visits per patient per year (demand) = provider visits per day × provider days per year (supply). For the purposes of aligning VA demographics to outside benchmarks, the Assessment G team applied an adjustment for males aged 60 to 64 (based on VA median age and sex):

2.38 (current VA primary care outpatient visits per year) [129] **x 1.17** (AAFP adjustment factor based on VHA paneled member age and sex) [130] = **2.78** (calculated adjusted VHA visits per patient per year)

The Assessment G team made an additional adjustment to the 'provider visits per day' metric. Currently, VHA providers are expected to see between 10 and 12 patients per day.[131] In the typical fee-for-service care model in the private sector, it is common to plan for 24 visits per day (at least 3 patients per hour with 15 minute appointment times). Given the acuity, age, comorbidities, and overall disease state of VHA patients, the "ideal" does not reflect the true need of Veteran patients. Not surprisingly, VHA primary care appointments are more commonly 20-30 minutes in length.[132] Based on the assumption that appointments are typically 20-30 minutes, it is reasonable to assume that a VHA PCP would be able to see 15 patients per day (resulting in scheduling 2 patients per hour, with 8 hour clinical work days and time for additional administrative responsibilities). Table 2-4 shows the calculations and inputs for the "ideal" VHA metrics, based on the aforementioned methodology:

Table 2-4. Calculated ideal VHA metrics[133]

Metrics	VHA
Expected visits per patient per year	2.78
Potential provider visits per day	15.0
Provider days worked per year	240.0

Metrics	VHA
Calculated ideal panel size for VHA providers	1,293
VHA's modeled panel size per general practice physician 1.0 FTE (Standard Deviation = 71.8)	1,306
VHA's average facility maximum panel size per general practice physician 1.0 FTE (Standard Deviation = 161.8)	1,207
VHA's average panel size per general practice physician 1.0 FTE (Standard Deviation = 165.8)	1,128

Nationally, VHA's average modeled panel size for general practice physicians is similar to the calculated ideal panel size, which is the external benchmark derived from the American Academy of Family Physicians. The maximum panel size established by VHA facilities is usually lower than VHA's modeled panel size for general practice physicians at the same facility (the internal benchmark) as well as the ideal panel size for VHA providers (the external benchmark).

The actual panel size for VHA general practice physicians is 13 percent below the VHA-modeled panel size, 12 percent below the external benchmark, and 5 percent below the facility maximum. This analysis is based upon September 30, 2014 data provided by VHA and panel sizes may have changed since this time. As discussed above, a range of factors should be considered when comparing the panel size of facilities, including: patient characteristics (including special populations) support staff and exam room ratios, the experience level of the physician in the clinic, as well as the utilization of APPs by the facility.

In Section A.3 we depict the actual versus modeled and maximum panel sizes per general practice physician 1.0 FTE at each facility.

We elaborate on some of the barriers that VHA faces in increasing the productivity of its primary care providers in Section 2.3.8, several of which parallel the levers noted by AAFP.

2.3.6 Specialty care

For specialty care, wRVUs, encounters and access are appropriate measures for comparing provider performance (productivity). To assess the provider productivity of VHA specialty care as compared with the private sector, we used industry accepted benchmark data sets: the Academic MGMA survey (which includes academic medical centers), and MGMA survey (which includes many smaller single or multispecialty group practices, but has a much larger sample size than the AMGMA survey). We compared the wRVUs and encounters generated by VHA providers in each major specialty with these industry benchmarks. We then benchmarked VHA specialty care providers from high, medium and low complexity facilities with the industry benchmarks to determine if providers in these different cohorts of VHA facilities compare differently to the private sector.

2.3.6.1 Summary of findings and analysis for specialty care

We have synthesized data and observations from benchmarking and site visits into the following findings. The sub-sections that follow describe the findings for specialty care in detail. Information on the some of the potential reasons for the differences between the productivity of VHA specialty care providers and the private sector are presented in Section 2.3.8.

- **Finding 7.** When compared to the private sector using wRVUs, there is a productivity gap in VHA specialty care. (See Section 2.3.6.3)

- **Finding 8.** When encounters or visits are used as a measure of productivity, the gap shrinks and VHA specialty care providers compare more favorably to the private sector. (See Section 2.3.6.5).

- **Finding 9.** VHA mental health providers are more productive than academic medical center (AMGMA) benchmarks, as measured by both wRVUs and encounters. (See Section 2.3.6.6).

- **Finding 10.** Overall, VHA specialty care providers are producing fewer wRVUs than private sector benchmarks; however, VHA specialty care providers at the highest complexity facilities are more productive than their peers. Further, the most productive VHA providers (those at the 75th percentile of VHA providers) are often more productive than the private sector. (See Section 2.3.6.7).

- **Finding 11.** Productivity and access are important measures in population based health models like VHA that focus on patient outcomes, rather than volume. VHA OPES reports on productivity and access offer tools for use by medical facilities. With some improvements to expedite adoption and regular use by medical centers, these tools could become key resources in optimizing productivity and maximizing access to care. (See Section 2.3.6.8).

2.3.6.2 Common productivity measures for specialists are wRVUs and encounters

Specialty care providers represent 46 percent of VHA providers (excluding social workers, dentists, and medical hospital specialists, such as radiologists and pathologists) in FY2014.[134] Please see Section 2.2 for additional detail.

Common indicators of specialty care provider productivity used by VHA and the private sector are wRVU production,[135] encounters per provider FTE, and patient access. The Assessment G team compared VHA provider encounters and wRVUs by specialty against industry accepted benchmark data sets: the Academic MGMA survey (which includes academic medical centers), and MGMA survey (which includes many smaller single or multispecialty group practices, but has a much larger sample size than the AMGMA survey). The AMGMA survey offers a more

appropriate comparison for VA's higher complexity (level 1 and 2) facilities, which tend to be affiliated with academic medical centers that have trainees and teaching programs, whereas the MGMA survey is more appropriate to compare to VA's lower complexity (level 3) facilities. However, the accuracy of benchmarking surveys is relative to the number of responses; it should be noted that there are VHA specialties in AMGMA with samples sizes that are too small to benchmark.

We benchmarked the productivity of each specialty practice at the individual provider level (each individual provider's workload). Only VHA providers were included; contract and fee-based (non-employee) providers were excluded, as were fellows and residents.[136] Several specialties, such as emergency department or urgent care, hospitalists (defined as family practice and internal medicine physicians without a designation as a primary care provider), critical care radiology and pathology, were separated from the benchmarking, since encounter and wRVU data for these specialties are difficult to accurately measure and tend to skew the productivity data. For the purposes of this report, we call these "Hospital Based Specialties" and we separate them out in the productivity benchmarks.

We compared encounters to both MGMA and AMGMA benchmarks. While MGMA has updated the encounter definition in its Physician Compensation and Production Survey to include Telehealth and e-consults in its most recent survey (2014), MGMA has not updated its definition as such in its Academic Practice Compensation and Production Survey (AMGMA). Our team was unable to distinguish Telehealth and e-consults in the encounter data set as CPT® level detail was not included. As such, we were unable to adjust when comparing to AMGMA. We were able to quantify the volume of Telehealth and e-consults to be about 2.7 percent of total wRVUs. These telehealth and e-consults may cause VHA providers to appear more productive than the AMGMA benchmark, though the impact does not appear to be significant.

2.3.6.3   A productivity gap exists between VHA specialists and the private sector (Finding 7)

When compared to the private sector using wRVUs, there is a productivity gap in VHA specialty care.

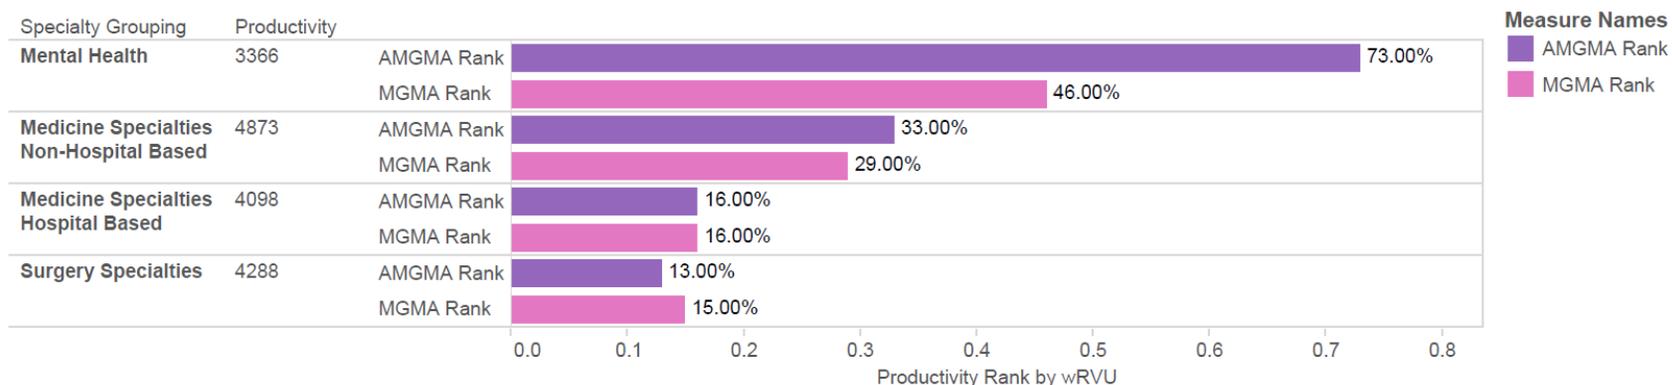
We compared wRVUs per VHA provider (using clinical, Worked FTE as basis) with AMGMA and MGMA benchmark surveys. The Assessment G team calculated the wRVUs based on VHA wRVU data from the same core data set used to calculate the staffing level and encounters of specialty care providers. The VHA wRVU data was adjusted to account for modifiers, gap (non-traditional CPT® codes) and imputed codes, to make the data more comparable to the benchmark data sets. However, the team was not able to adjust wRVU data to ensure encounters are not double counted for RVU credit; according to VHA OPES, this issue only affects 2.9 percent of encounters or 3.4 percent of total wRVUs produced (See Appendix A for additional detail).[137] Grant Thornton urges readers of this report to carefully consider the

---

[136] Resident workload is attributed to attending physicians, both in VHA, and in the private sector.

[137] Analysis of multiple provider wRVUs by stop code, provided by Jim Campbell, VHA OPES, March 27, 2015.

limitations of the VHA provider productivity data, its comparability to these benchmarks, and to consider the findings detailed below that explain the differences between VHA provider productivity and private sector providers (limitations are further described in the methodology section). The wRVU productivity benchmark data for each aggregate specialty group is provided in Section A.1. The aggregate wRVU data for providers at each VAMC is presented in Section A.2. We grouped the specialties presented in Figure 2-15 into mental health, medicine specialties (non-hospital based), medicine specialties (hospital based) and surgery specialties. These specialty groupings are typical in health care and allowed us to understand general patterns in the productivity of VHA specialty providers. Nevertheless, this high level view may mask variations in productivity at the specialty and provider level.

Figure 2-16. External productivity rankings by wRVUs and specialty grouping[138]


The Assessment G team found that VHA medical and surgical specialists are less productive than many providers in the private sector when comparing wRVU production to AMGMA and MGMA benchmarks. VHA medical specialists are less productive than the median of academic medical providers (AMGMA survey) and providers in the MGMA survey, producing wRVUs at 33rd and 29th percentiles of survey respondents, respectively. VHA surgical specialists are also less productive than the median of academic medical providers (AMGMA survey) and providers in the MGMA survey, producing wRVUs at the 13th and 15th percentiles of survey respondents, respectively. On the other hand, hospital-based specialties, for example, radiology and pathology, compare to the 16th percentiles of both the AMGMA and MGMA benchmarks.

The wRVU calculations for certain surgical specialties (in particular, the Thoracic, Neuro, and Orthopedic surgical specialties) may be affected by the methodology that the Assessment G team used to account for the number of surgical assists performed by non-resident/non-fellow physicians. The Assessment G team used a standard modifier used by Centers for Medicare and Medicaid, which discounts the wRVUs generated for a surgical procedure (for example, a bilateral knee replacement) when a second physician

---

[138] Assessment G analysis of Provider Detail FY14 provided by VHA OPES, February 26, 2015; Provider Labor Detail FY14 provided by VHA OPES April 9, 2015; AMGMA survey 2014; and MGMA survey 2014.

assists. In the case of VHA, this may over-adjust the productivity of these specialties because the assist is more often performed by a resident or fellow, neither of whom will generate wRVUs for the encounter. While accounting for this difference would drive productivity higher in the surgical specialties, the team determined the overall impact on the percent rankings compared to benchmarks was minimal (generally in the bottom quartile across benchmark sources). For details on modifier adjustments and VHA's response, please see Appendix B.2.5.3.

VHA mental health providers are more productive than many providers in the private sector when comparing wRVU production to AMGMA and MGMA benchmarks. They are more productive than the median of academic medical providers (AMGMA survey) and as productive as the providers in the MGMA survey, producing wRVUs at 73rd and 46th percentiles of survey respondents, respectively.

2.3.6.4 The productivity gap is smaller when VHA specialists are compared on encounters (Finding 8)

When encounters or visits are used as a measure of productivity, the gap shrinks and VHA specialty care providers compare more favorably to the private sector.

The Assessment G team analyzed encounters per provider FTE (clinical time, worked) compared with AMGMA and MGMA benchmarks as one measure of specialists' productivity. The encounters per provider comparison is shown in aggregate per facility in Section A.2

Figure 2-17. External productivity rankings by encounters[139]

Specialty Grouping	Productivity		
Mental Health	1710	AMGMA Rank	100.00%
		MGMA Rank	72.00%
Medicine Specialties Non-Hospital Based	3145	AMGMA Rank	72.00%
		MGMA Rank	43.00%
Surgery Specialties	1867	AMGMA Rank	54.00%
		MGMA Rank	36.00%

		MGMA Rank	34.00%

Measure Names
AMGMA Rank
MGMA Rank

Productivity Rank by Encounter (axis: 0.0 to 1.1)

Overall, VHA medical and surgical specialties, excluding anesthesiology and hospital-based specialties for example, radiology and pathology, compare favorably to academic medical center (AMGMA) benchmarks. VHA specialists see more encounters per FTE than the median private sector academic medical providers (AMGMA). When compared to the MGMA benchmark, VHA specialists drop to the 43rd and 36th percentile for non-hospital medicine specialties and surgical specialties, respectively. On the other hand, hospital-based specialties compare to the 39th and 34th percentiles, respectively.

---

[139] Assessment G analysis of Provider Detail FY14 provided by VHA OPES, February 26, 2015; Provider Labor Detail FY14 provided by VHA OPES April 9, 2015; AMGMA survey 2014; and MGMA survey 2014.

One reason for the variance between the non-hospital-based medicine and surgical specialties and the private sector may be VHA's PACT and population health focused care model. VHA's focus on the primary care medical home and the "gate keeper" role of the PCP as the key source of referrals may result in lower numbers of encounters downstream in specialty care which is reflected in the AMGMA survey and even more so in the MGMA benchmark, where specialists may operate more independently of primary care.

2.3.6.5   VHA mental health providers are more productive than industry (Finding 9)

VHA mental health providers are more productive than academic medical center (AMGMA) benchmarks, as measured by both wRVUs and encounters.

Similar to the wRVUs generated by VHA mental health providers, they see more encounters per FTE than almost all private sector academic medical providers. They are producing at the 100th and 72nd percentiles compared to AMGMA and MGMA surveys. Although some caution should be used when interpreting the AMGMA finding, since telephone encounters or "e-consults" were not included in the AMGMA survey, but account for an unknown proportion of VHA mental health encounters. One contributing factor to the higher number of VHA encounters may be the shift of VHA mental health providers to utilize more evidence based practices to increase access; this shift has resulted in more group therapy visits which increases the number of unique encounters compared to the private sector. Additionally, due to a higher incidence of psychological disorders, demand, and subsequently throughput, may also be higher for mental health specialists.

Overview of VHA telehealth encounters

VHA is a national leader in the use of telehealth. Its use has allowed VA facilities, especially rural hospitals and clinics, to address gaps in access to specialty care services; resulting in an increase in the number of encounters seen by providers. There are currently three distinct national telehealth platforms: Home Telehealth (HT), Clinical Video Telehealth (CVT), and Store-and-Forward Telehealth (SFT). These platforms are in place across 150 VAMCs and over 400 CBOCs. VHA's goal in FY15 is to provide elements of care to 1 million Veteran patients — 20 percent of its enrolled population — through telehealth services.[140] Since the PACT model was implemented in 2009, non-face to face care utilization has significantly increased. For example, while the total number of PACT patients has increased by approximately 10 percent, the number of telephone encounters has increased by over 10 times, and the number of secure messages has increased from just over 1,000 in 2010, to almost 600,000 in 2014.[141]

Tele-Ophthalmology and Tele-Dermatology are the two most used types of SFT. Tele-Ophthalmology takes an image of the back of eye or retina services and stores the image in the

[141] Shear, J. Clinical Program Manager, VHA Office of Clinical Operations, VHA. (n.d.).VHA Transformation to a PCMH Model of Care Presentation. Retrieved from v.congresocronicos.org/documentos/ponencias/joanne-shear.pdf.

---

patient's electronic health record (EHR). This allows a provider at another location to read the images and communicate findings and recommendations to the primary care provider. Similarly, Tele-Dermatology utilizes photo imaging of skin conditions and abnormalities, such as skin lesions or dermatitis, and sends the image via the patient's EHR to a specialist provider at another location. Telehealth service platforms of care such as those using SFT, increase access to care, providing Veterans with specialized services that may otherwise be unavailable (this is especially relevant for rural Veterans). With respect to HT services, there is initial evidence that the provision of HT services decreases mortality and reduces costs.[142,143]

> According to Darkins in the article, *"The Growth of Telehealth Services in the Veterans Health Administration Between 1994 and 2014,"* in FY 2013, 45 percent of Veteran patients whose care was supported by VHA telehealth lived in rural areas.

National patient satisfaction surveys conducted by VHA's National Telehealth Services Office[144] reflect high Veteran satisfaction with telehealth services. Additionally, although more studies need to be done in this area, there appears to be a correlation between telehealth and productivity; telehealth has the potential to positively impact productivity. For example, rather than hire a provider, a provider with extra capacity can care for the additional patients at satellite facilities (this is particularly applicable with SFT telehealth services, as providers can see SFT patients during any unscheduled downtime in between patients). To comprehensively assess the impact on productivity, VHA will need to work on standardizing coding policies for telehealth services and ensuring that all sites of care and their providers are aware of and understand these policies.[145]

The utilization of telehealth to address Veteran demands for care helps alleviate common access challenges due to geographic location (patient does not reside near a VAMC) and provider shortage issues that mostly afflict rural Veterans. For example, VA Montana HCS has two telehealth Outreach Clinics: Hamilton CBOC and Plentywood CBOC. Both are located in rural areas, with a population of less than 5,000 in Hamilton, MT, and less than 2,000 in Plentywood, MT. [146] As such, there is low demand for VA health care; yet, those Veterans who

---

do live in the area are able to access care at these CBOCS. These clinics have limited hours of operation and are run by a small team (Registered Nurse [RN] and telehealth operators) and provide only telehealth visits.[147] This allows for Veterans to access their providers for episodic care (e.g. colds, consults) that does not require them to travel, in some cases, hundreds of miles to the main VAMC facility.

2.3.6.6 The most productive VHA specialists are often more productive than private sector benchmarks (Finding 10)

Overall, VHA specialty care providers are producing fewer wRVUs than private sector benchmarks; however, VHA specialty care providers at the highest complexity facilities are more productive than their peers. Further, the most productive VHA providers (those at the 75th percentile of VHA providers) are often more productive than the private sector.

VA medical facilities can vary widely in terms of their size and complexity of services offered, (VA groups its 151 medical facilities into highly complex - level 1a, 1b, and 1c, moderate complexity - level 2, and low complexity - level 3, facilities). More complex facilities tend to have academic affiliations, with teaching and research programs, whereas lower complexity level facilities may be located in more rural areas and do not have these programs. The larger, more complex facilities (1a complexity vs. 2 complexities) compare better using both encounters and wRVUs. One factor may be that these facilities simply have higher patient demand and consequently clinic throughput. This would tend to increase the number of encounters per provider. The larger facilities may treat patients with a wider variety of diseases and conditions simply due to the number of specialties offered, and tend also to have a larger number of providers who are dual appointees and have strong relationships with their affiliate institutions. Dual appointees may carry over certain behaviors such as chart closure within 24 hours, accurate charge capture, and physician involvement in denial management that encourages workload capture and consequently generates more wRVUs.

> A Service Chief stated that *"Part Time providers from [the affiliate] across the street know how to [code]....We need to get with the coders to [understand how to educate] providers on how to maximize documentation."*

---

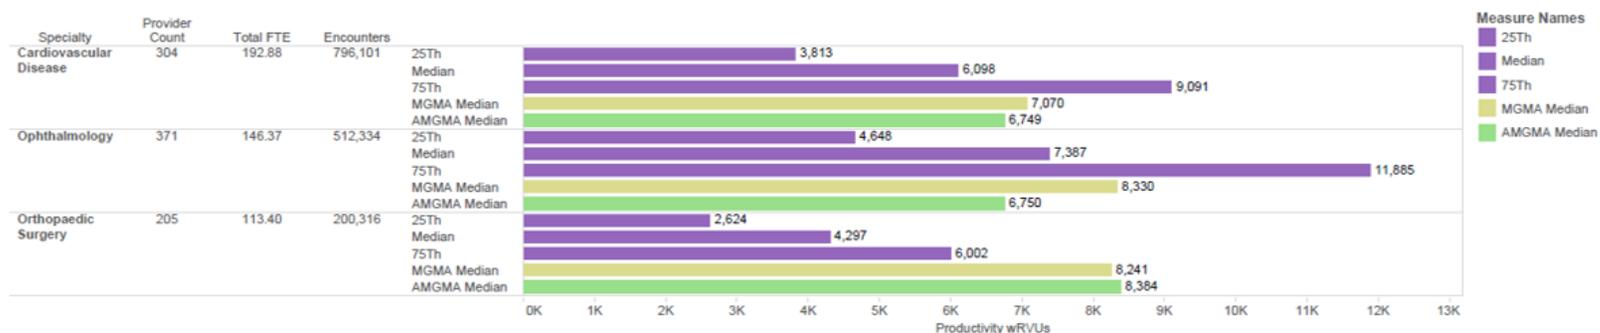
[147] As observed on Assessment G site visits.

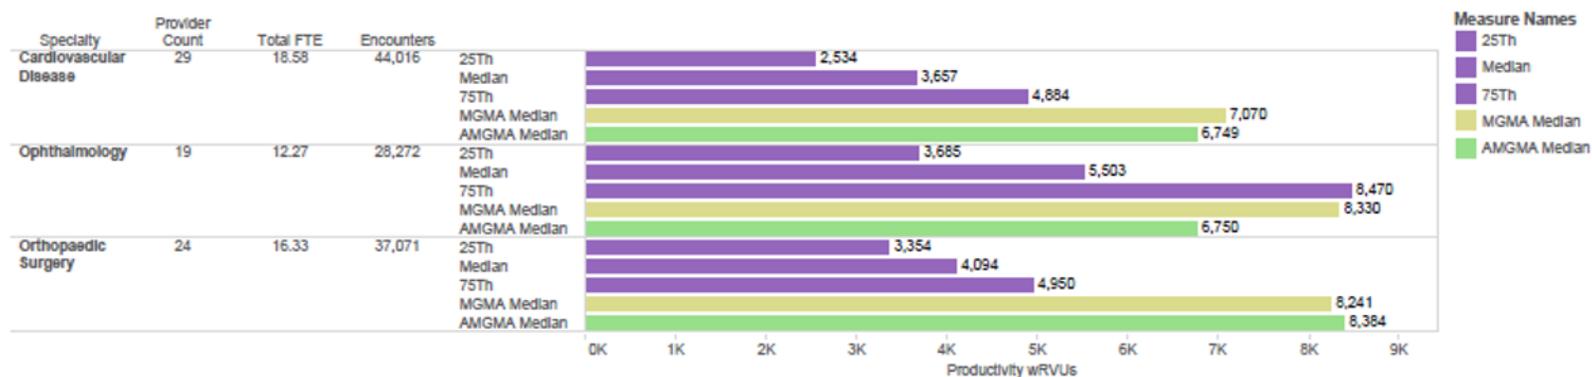
> **_Promising Practice: John D. Dingell VAMC – Detroit_**
>
> At the John D. Dingell VAMC in Detroit, facility leaders found productivity within a specialty clinic was below the national median for VHA. They investigated and found that workload within the clinic was not being captured accurately. The Section Chief trained providers in better coding practices. The accuracy of productivity measurement, and consequently the clinic's ranking, increased.
>
> _Value_: The facility highlighted this success story to other clinics and as a result clinic leaders' awareness of the importance of accurate coding to measure productivity improved.

The Assessment G team compared the productivity of VHA specialties (measured in wRVUs) at Level 1a (high complexity) and level 3 (low complexity facilities) with external benchmarks (AMGMA and MGMA). A case study analysis of wRVUs per provider FTE (clinical, worked) is provided for three specialties (cardiovascular disease, ophthalmology, and orthopedic surgery) in Figure 2-18.

For Figure 2-18, Assessment G analysis Provider Detail FY14; provided by VHA OPES, February 26, 2015 and Provider Labor Detail FY14 provided by VHA OPES April, 9, 2015; AMGMA survey 2014; and MGMA survey 2014.

Figure 2-18. Benchmark case study - level 1a and level 3

Level 1a Complexity Facilities


Level 3 Complexity Facilities


For cardiovascular disease, providers at VA complexity level 1a facilities are just as productive as the median of MGMA and AMGMA providers, for example 6,098 versus the median of 6,749 wRVUs for AMGMA providers. However, the providers at VA complexity level 1a facilities benchmarking above the median (75th percentile of VHA providers) produce significantly more wRVUs than the rest of the industry for example, 9,091 versus the median of 6,749 wRVUs for AMGMA providers. When comparing complexity level 1a facility providers using encounters as a measure of productivity, they have 1.7 percent more encounters than the median of MGMA providers and 26 percent more encounters than the median of AMGMA providers. One explanation for this result may be the care needs of a sicker Veteran patient population, with higher rates of cardiovascular disease and other co-morbidities (see Assessment A) which results in more referrals, follow-up visits and higher intensity visits to manage chronic heart conditions.

At VA complexity level 3 facilities, providers specializing in cardiovascular disease produce only half of the median production of MGMA and AMGMA providers. The median wRVUs of the most productive VHA providers (those at 75th percentile) at complexity level 3 facilities is closer to external benchmarks, for example, 4,884 versus the median of 6,749 wRVUs for AMGMA providers. When comparing complexity level 3 facility providers using encounters as a measure of productivity, they look more similar to industry: VHA providers produce encounters at 63 percent and 78 percent of MGMA and AMGMA providers, respectively (Note: encounter benchmark data is not shown).

For ophthalmology, a specialty that tends to be highly productive (when measured by wRVUs) due to the demand at VA facilities, providers at complexity level 1a complexity facilities compare favorably with industry benchmarks. At VA complexity level 1a facilities, providers specializing in ophthalmology are move productive than the median production of AMGMA providers and produce at the 89th percentile of MGMA providers. Similarly, providers at complexity level 1a facilities at the 75th percentile of VHA providers produce significantly more wRVUs than the rest of the industry, for example, 11,885 versus the median of 6,750 wRVUs for AMGMA providers and 8,330 wRVUs for MGMA providers.

At VA complexity level 3 facilities, the majority of providers specializing in ophthalmology produce only 81 percent and 66 percent of wRVUs produced at the median of AMGMA and MGMA providers, respectively. The most providers at VA complexity level 3 facilities at the 75th percentile of VHA providers are more productive than the rest of the industry, for example, 8,470 versus the median of 6,750 wRVUs for AMGMA providers and 8,330 for MGMA providers.

For orthopedic surgery, a specialty that tends to be highly productive due to the number of outpatient procedures performed in the private sector, providers at VA complexity level 1a and level 3 facilities produce approximately half of the wRVUs compared to the rest of the industry. The most productive providers (those at the 75th percentile of VHA providers) at VA complexity level 1a facilities are closer to the median external benchmarks; VHA providers at the 75th percentile are producing 72 and 73 percent of the wRVUs of the AMGMA and MGMA median benchmark. Comparing encounters, the median productivity of VHA providers at complexity level 1a facilities increases to 68 percent of the median of AMGMA providers. For VHA

providers at complexity level 3 facilities, productivity as measured by encounters increases to 82 percent of the median of AMGMA providers.

The differences from the private sector may be the result of lower utilization of elective procedures performed at VAMCs. Since VHA's population health focused model emphasizes management of chronic disease to prevent overutilization of services to improve patient outcomes, lower utilization of elective procedures would not be surprising. This finding is also observed in general surgery and otolaryngology. Surgical specialties that are highly utilized on an encounter per FTE basis in both the private sector and VA, include colorectal surgery, ophthalmology, hand surgery, and vascular surgery. Additionally, the shortage of specialty providers, such as orthopedic surgeons, in rural communities, may account for the higher numbers of encounters seen by complexity level 3 facility providers.

Additional detailed review of encounters is needed to better understand the relationship between encounters and Veteran access to care. Higher numbers of (than benchmark) encounters, but low patient access may be a result of inefficient scheduling processes, but would require an in depth analysis to confirm. Managing patient access requires a delicate balance between new and established or return patients. Too much of one or the other can decrease access to care. For example, if you increase the number of new patients from 2 to 4 seen by a provider in a given afternoon clinic which is traditionally 4 hours, there will be fewer appointments available for established patients as new patient appointments traditionally are longer, 30 minutes vs. 60 minutes respectively.

2.3.6.7 Productivity should be looked at in combination with access

Access is often considered as a key performance measure, along with productivity. Further, the ability to see more patients by increasing or improving access should result in higher RVU production. However, higher productivity is not necessarily associated with better access to care. Similar barriers might affect both access and productivity, such as: insufficient numbers of providers, insufficient numbers of clinical and/or administrative staff, and/or inconsistent clinic hours of operation and poor scheduling practices. Providers might be incentivized to focus on high wRVU procedures, at the expense of patients seeking access to care for simpler (lower wRVU) conditions.

High performing health care systems are increasingly looking at access in conjunction with productivity. By comparing these two measures, clinic leaders can better understand provider behavior and set targeted productivity goals or implement changes to improve access, such as: freeing up appointment slots for new patients, providing extended hours, or making changes to support staff mix.

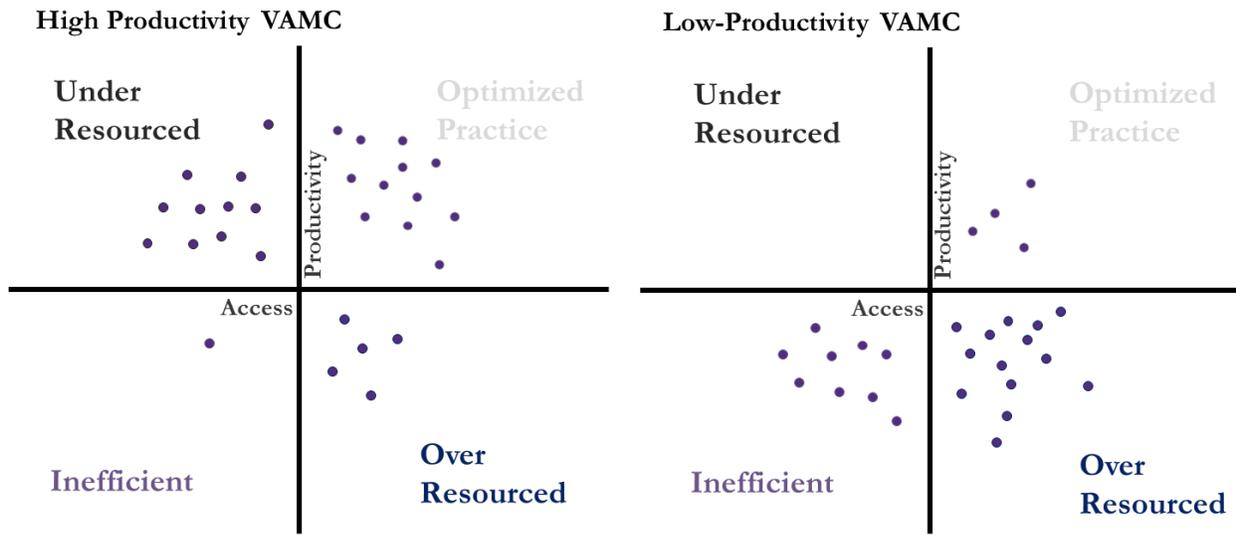
Combined analysis of productivity and access is an important component in population health and/or value-based care models, which, like VHA, focus more on patient outcomes over volume. Minimum volume thresholds are still needed to maintain cost effectiveness and quality, as well as justify staffing ratios.

2.3.6.8 VHA's framework of productivity and access measures is a best practice (Finding 11)

Productivity and access are important measures in population based health models like VHA that focus on patient outcomes, rather than volume. VHA OPES reports on productivity and access offer tools for use by medical facilities. With some improvements to expedite adoption and regular use by medical centers, these tools could become key resources in optimizing productivity and maximizing access to care.

VHA OPES has developed a Relative Value Unit based modeling tool (SPARQ) to measure specialty provider group practice level based productivity, staffing and access. Assessment G used the SPARQ tool (see Figure 2-19) to assess the difference between a specialty group practice's productivity and access levels, and projected resource needs. The SPARQ tool combines practice-level productivity and access metrics into an Importance-Performance Analysis (IPA) framework, a two-dimensional Cartesian coordinate system divided by two axes that form four quadrants. Scores representing productivity are plotted on the vertical axis (y axis) and scores representing access on the horizontal axis (x axis). To understand how productive specialty practices are, the SPARQ tool uses probability distributions, a way of calculating the probability of a given productivity or access level occurring. The SPARQ tool makes the assumption that productivity and access are normally distributed by complexity group and specialty, or facility. Therefore, the SPARQ tool measures practices on the normalized scores referred to as the z-scores for productivity and access. The z-scores follow standard normal distribution and are calculated as practice productivity (or practice access, defined by one of five different measures) minus the mean productivity (or mean access), divided by the respective standard deviation.

Each specialty is categorized into a quadrant based on whether it has high or low access, and high or low productivity. However, neither productivity nor access alone tell the whole story.

Figure 2-19. SPARQ tool example[148]


If we use dermatology as an example (see Figure 2-19), there are twelve facilities with high productivity, but decreased access to care (low proportion of patients seen within the 30 day access standard). These dermatologists see his/her full capacity of patients/day, but cannot meet patient demand. In this case, the SPARQ tool scores these facilities as potentially having insufficient resources. However, further examination may uncover operational inefficiencies such as truncated clinic hours, space issues, and/or insufficient clinical staff. Note that the example presented here for dermatology is not a direct extract from VHA's SPARQ tool but symbolizes a visual depiction of real data.

The Assessment G team also analyzed how access and productivity differ within specialties across all facilities and all complexities. Figure 2-20 compares the access metric, Patients Wait between 0- 30 Days[149] to wRVU Productivity (this is the wRVUs per clinical FTE) for cardiology. Of note, VHA cannot validate the reliability Patients Wait Between 0- 30 Days metric as it is a provided output of a SPARQ report; as such, this data must be considered carefully.[150]

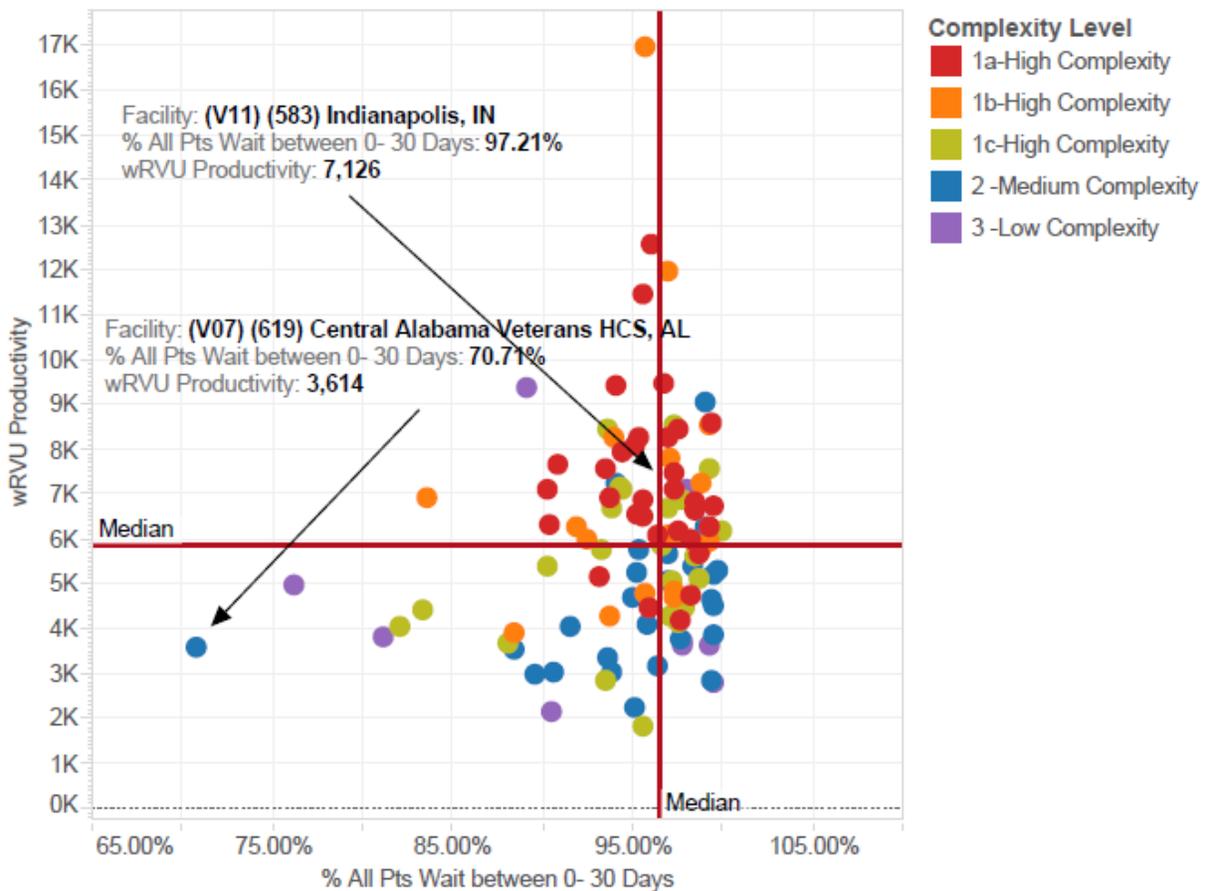
---

[148] Figures were created by the Assessment G team using VHA OPES SPARQ tool reports from two facilities.

[149] This measure is one of five available access measures available in OPES SPARQ reports, and is managed by VHA's Access and Clinic Administration Program. It indicates the percentage of all patients who are able to obtain an appointment within 30 days of request (effectively the percent who receive an appointment within VHA's access standard of 30 days).

[150] McKinsey & Co. (2015) Veterans Choice Act Assessment E Report

---

Figure 2-20. Productivity vs. access analysis - cardiology[151]


Facilities that fall toward the lower right quadrant of the graph exhibit lower productivity (below the median of VHA cardiology providers of 5,841 wRVUs) but generally good access (above the median, more than 96 percent of cardiology patients are seen within 30 days). This placement could be a result of low patient demand. For example, VA specialty funded or mandated clinics may implemented by facilities without consideration of demand. Additionally, our team recommends future analysis on the effect of a 40 hour work week on access and productivity. To increase access, some private sector health care systems have been increasing clinical contact hours from 32 to 40 hours a week. As a result of this private industry trend toward more clinical contact hours, hours worked is no longer a valid measure to assist in driving access or as a measure of productivity.

Facilities that fall in the upper left quadrant exhibit higher productivity (above the median of VHA cardiology providers) and poor patient access (below the median, less than 96 percent of

---

cardiology patients are seen in 30 days). These facilities are productive but may need additional staff, space, or resources to open up slots for patient access. Facilities that fall in the upper right quadrant appear to have high access and high productivity. These facilities represent the highest performers. Further study of the unique characteristics of practice arrangements and service line operations within these facilities will allow VHA to identify replicable best practices.

Generally, facilities with lower complexity levels (Level 2 and Level 3, see blue and purple dots, respectively) appear less productive (above the median of VHA cardiology providers), but have good patient access (96 percent of cardiology patients seen within 30 days). Lower complexity facilities will typically have fewer highly complex, heavily procedural medical and surgical specialties which tend to generate more wRVUs. Good patient access may be a result of the implementation of local policies and procedures that open up slots for new and established patients.[152]

2.3.7   Dental Providers

For dental care, patient visits per year is an appropriate measure for comparing VHA dentists with industry providers. To assess the productivity of VHA dentists, we considered the ways in which VHA measures the performance of its dental providers. We found that VHA has developed an RVU metric, as well as metrics for procedures performed per year and average number of patient visits per year. We found that dental productivity measures do not typically exist in the private sector. We were able to obtain benchmarks from the American Dental Association for dental providers' average number of annual visits, which we compared to VHA dentists.

2.3.7.1   Summary of findings and analysis for dental

Data and observations from benchmarking and site visits yielded the following main finding. The sub-sections that follow describe the findings for dental providers in detail. Information on the factors that we believe to be the drivers of these findings are presented in Section 2.3.7.5.

Finding 12. VHA dentists see fewer patients on average than private sector benchmarks, but serve a population with special needs. The dentistry patient population of VHA generally has a compensable service-connected dental disability, is older, has more complex injuries, and may present for dental care following years of dental neglect. (See Section 2.3.7.4).

2.3.7.2   VHA has industry leading productivity measures

A total of 818 VHA dentists (based on FY14 Worked FTE figures) provide dental care for approximately 450,000 Veterans at VA medical facilities nationwide each year. There are 22 classifications of eligibility for dental care that can be grouped into five major scopes of care, with Class I, IIA, IIC, and IV designating eligibility for comprehensive, life-long dental benefits. VHA has industry leading productivity measures and tracking tools to inform and manage the performance of its dental providers. VHA has developed a set of productivity measures for its

---

[152] New patients seeking care wait 30 days or less for an appointment.

dental providers that include wRVUs, procedures performed per year, and average number of patient visits per year. Dental productivity measures do not typically exist in the private sector.

2.3.7.3 Limited benchmarks exist for dental provider productivity

Unlike other health care specialties, where wRVUs and other productivity measures are widely available and used, productivity is not typically measured in the private sector for dental providers. As such, there were limited studies available for benchmarking. A study of 829 Oregon general dentists conducted in 2006 on hours worked, practice size, payment and patient mix, prices, dentist visits, and dentist characteristics, is one of the few studies available, separate of the ADA data.[153] However, the only available and nationally collected metric utilized (which comes from ADA) is visits per year. While VHA tracks procedures per year, there is no applicable external benchmark or industry performance metric to which comparisons can be made. Additionally, there is no dental relative value unit (RVU) scale managed by CMS, as is the case in other health care specialties.

VHA developed a method for assigning relative value units (RVUs) for dental work completed more than ten years ago, and has continually refined this method.[154] As an internal system, these RVUs have not been adopted by the general dental community and thus are only used to make comparisons on an internal system level. This represents an area where VHA is the leader in developing best practices for review methodology, and one that they utilize extensively to internally benchmark their providers and use as a tool to assess and manage productivity.

VHA developed its RVU scale and standards for facilities and VISNs after several meetings with VHA dental specialty leaders, and in 2011, conducted a comprehensive assessment of productivity across the system.[155] That study observed significant variation in dentist productivity between sites with residency programs and those without, and resulted in the creation of two models for dental programs; one for each group. The study also provided valuable insight into strategies for increasing productivity per provider, one of which involved increasing assistant to dentist ratios. For example, it noted that there is a significant increase in productivity when the ratio of assistants to dentists is at or greater than 1.75:1.[156]

At a national level, the office of the Assistant Under Secretary of Health for Dentistry actively monitors productivity of provider groups across VHA, and provides tools that facilities can use. They created an internal tool to identify outliers, particularly sites that may be at risk. This tool includes patient demand and RVUs over the last 12 months, comparing internal performance to non-VHA care (more specifically, the proportion of care being sent for non-VHA care).[157] Although we noted that productivity monitoring and decision tools for other specialties created

by OPES have varied use (these were created much more recently), we frequently observed that dental service leaders at facilities are actively involved in monitoring their practice productivity using the tools provided by the dental leadership in VHA.

Providers are measured in RVUs per hour, and are actively involved in managing their own productivity. National leadership consults with facility leadership when headquarters observes outliers. We consistently noticed on site visits that dentists were aware of their productivity performance, and that dental service chiefs were actively monitoring the performance of their clinics, and taking steps to improve performance when it was out of range compared to national VHA dental productivity and peer facilities.[158]

2.3.7.4 VHA dentists see fewer patients than private sector benchmarks, but serve a population with special needs (Finding 12)

VHA dentists see fewer patients on average than private sector benchmarks, but serve a population with special needs. The dentistry patient population of VHA generally has a compensable service-connected disability, is older, has more complex injuries, and may present for dental care following years of dental neglect.

The majority of VHA dental providers' number of annual visits are comparable to industry when benchmarked to the 2010 American Dental Association Survey of Dental Practices. While variances exist between dental subspecialties, the majority of dental providers employed by VHA (75 percent) are classified in the "Generalist" category of dentists, and compare significantly more favorably (81 percent of the ADA benchmark average) compared to their specialist counterparts overall to industry peer productivity. The largest groupings of providers that lag behind expected visits per year (caseload) are the specialists, where there are fewer providers employed in the system (such as endodontics, with only 10 worked FTEs across the nation). The surgical subspecialties in particular lag industry visits per year, though significant differences in the delivery model and capabilities on-site are factors that must be considered when evaluating dental productivity. Additionally, the specialist benchmark for average patient visits per year is significantly higher (4,146 visits) compared to the benchmark for general practice dentists (2,224). With significant financial pressures in the private practice to see as many patients as possible for specialty care, direct comparisons to the VHA model of care delivery for similar specialties may not be as applicable. Table 2-5 shows VHA dental productivity and staffing compared to the benchmarks.

"Dentists – General Practice" and "Dentists – Not Specified" from our VHA data set were combined into a single "General Practice" category since they both represented non-specialty care Dentists. Table represents Assessment G analysis of VHA dental data, specifically Aggregate Dentist FY14, provided by VHA Office of Dentistry, April 13, 2015, and ADA survey data (2010). FTE Totals calculated from Worked Hours.

2.3.7.5 Several factors may contribute to the differences between VHA dentists and the private sector

Some of the key reasons for the differences between VHA dental providers' patient visits and the private sector relate to the characteristics of the patient population. There are 22 classifications of eligibility for VHA dental care, with Class 1 eligibility (full dental care coverage) requiring the Veteran to have a compensable service-connected dental disability.[159] Class IV eligibility (which covers all other medical disabilities) is the most common classification, representing approximately 70 percent of all patients who receive dental care.[160] As a result, the dentistry patient population of VHA is generally older, has more complex injuries, and may present for dental care following years of dental neglect.[161] In contrast, according to the 2010 ADA Dental Survey the majority of patients seen (64.9 percent) in the private sector are under the age of 55. In addition, the private sector population is 55.6 percent female, with only 6 percent of patients having public-assisted insurance (63.6 percent covered by private insurance and 29.4 percent covered by self-pay). Further, only 38.4 percent of private practice dental providers saw any patients who were covered through public assistance.[162] These are significant differences compared to the VHA population, especially those who qualify specifically for full Class 1 eligibility.

> *"The main difference between VHA dental care and a private setting is the fact that we do not sell dental services. For example, many private offices will push whitening and diagnostic procedures such as tongue scanning on their patients. Here at the VHA, there is no pressure to drive revenue, so we can practice dentistry and do what is needed for our patients."*
> *– VHA Dentist at a Level 1 Facility*

In addition to hearing about the major differences in dental patient population from VHA senior leadership, we consistently heard similar experiences from dentists and dental service line leaders during our site visits. These significant differences in prevalence of co-morbidities and physical debilitations can frequently make the delivery of care time consuming and challenging. The prevalence of mental health disorders amongst the population base also contributes to longer visit times. For example, one dentist reported that being exposed to a drill can evoke a significant amount of distress and discomfort tied to Post Traumatic Stress Syndrome and other disorders. Another dentist noted that procedures can sometimes take two-to-four times as long as the private sector for these types of reasons; the same provider noted that the dentist may sometimes have to consult the patient's primary care provider in the middle of the appointment, adding additional time to appointment length. One dental chief at a complexity

---

level 1 facility specifically described how his productivity is hampered by certain aspects of the VHA patient population. He noted that he often spends time allowing some patients to relax in the dental chair while waiting for their blood pressure to go down before he can begin procedures.

2.3.8   Barriers to VHA providers' productivity

The Assessment G team conducted research to identify the factors that may impact the productivity of VHA providers and help explain why there are differences with private sector benchmarks of productivity. In doing so, we conducted:

- Literature reviews of VHA policy documentation and directives

- External literature reviews

- Participation in site visits to High Performing Health Care Systems

- Interviews with VHA central office leaders and subject matter experts

- VHA site visit observations at 24 VA medical centers and CBOCs

- Interviews with over 700 providers and facility leaders at VA medical centers and CBOCs

- More in-depth reviews of nurse staffing practices at seven VA medical centers

We conducted a root cause analysis exercise to determine those factors which contributed most to the differences between VHA provider productivity and external benchmarks. The key findings are summarized first, followed by a detailed discussion of our findings.

2.3.8.1   Summary of findings

We have synthesized the findings from our assessment to identify what may be the most important drivers of the productivity of VHA providers. These are listed here.

- **Finding 13.** Insufficient exam rooms and poor configuration of space limits providers' productivity, ability to maximize patient throughput and reduces patient access. (See Section 2.3.8.3)

- **Finding 14.** Clinical and administrative support staff ratios are insufficient and may limit provider productivity. (See Section 2.3.8.4).

- **Finding 15.** Insufficient clinical and administrative support staff results in providers and clinical support staff not working to the top of their licensure. (See Section 2.3.8.4.1).

- **Finding 16.** While there has been widespread implementation of the PACT model in primary care clinics and the National Nurse Staffing Methodology in many areas of inpatient care, there are no current VHA standards for staffing levels and/or mix in specialty clinics, with the exception of eye clinics. Furthermore, VHA OPES has developed state of the art tools for managing staffing and productivity, but these tools will require improvements for leaders to more effectively leverage them in resource decisions. (See Section 2.3.8.4.2)

- **Finding 17.** Organizational siloes and separate reporting lines exist for physicians, nurses and medical service administrators at a majority of VAMCs. As a result, service chiefs do

not have control over the resourcing and performance of their clinical support staff (nurses) or clerical and administrative support staff. (See Section 2.3.8.4.3)

- **Finding 18.** Many facilities do not have a centralized staffing office or nurse float pool to address daily staff variances or absences. (See Section 2.3.8.4.4)
- **Finding 19.** During site visits and interviews with VHA Central Office leaders, we consistently heard concerns that providers do not fully document and accurately code all of their clinical workload. (See Section 2.3.8.5).

2.3.8.2 Providers identified several barriers to optimizing productivity

The Assessment G team interviewed over 700 providers and facility leaders through the course of twenty four site visits to VA medical facilities. In doing so, we identified several barriers to optimizing productivity.

The following two figures illustrate the ten most common issues or barriers to optimizing productivity, as reported by providers, and by facility leaders, on our site visits. There was a high degree of consistency between the factors identified by providers and facility leaders.

Many of these barriers are not unique to VHA; in fact, private sector health care systems face the same barriers to provider productivity. It is also important to note that these barriers are in many cases, highly interdependent. As such, addressing one barrier, may not mitigate productivity challenges, and could even exacerbate another issue. For example, if a facility lacks adequate support staff, adding additional support staff may not increase productivity if there are not additional rooms for those support staff to use; for example, if a provider has one exam room in clinic, but no clinical support staff, he or she likely retrieves patients from the waiting room and checks vitals and take the patient's history himself/herself. If that provider was allocated a nurse, but no additional room; the provider still could not have a nurse preparing the patient while he/she was seeing another patient. Below we elaborate on each barrier, and the associated findings. Figure 2-21 and Figure 2-22 were created using Assessment G analysis of site visit data.

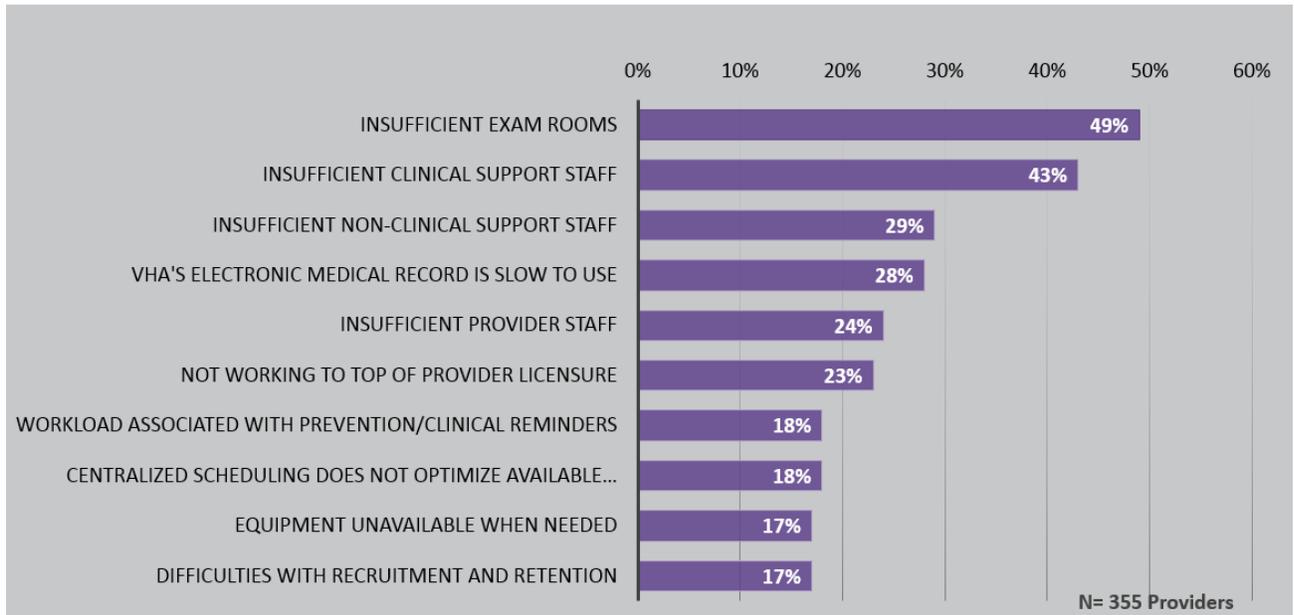
Figure 2-21. 10 Most common productivity issues or barriers according to providers


Figure 2-22. 10 Most common productivity issues or barriers according to facility leaders
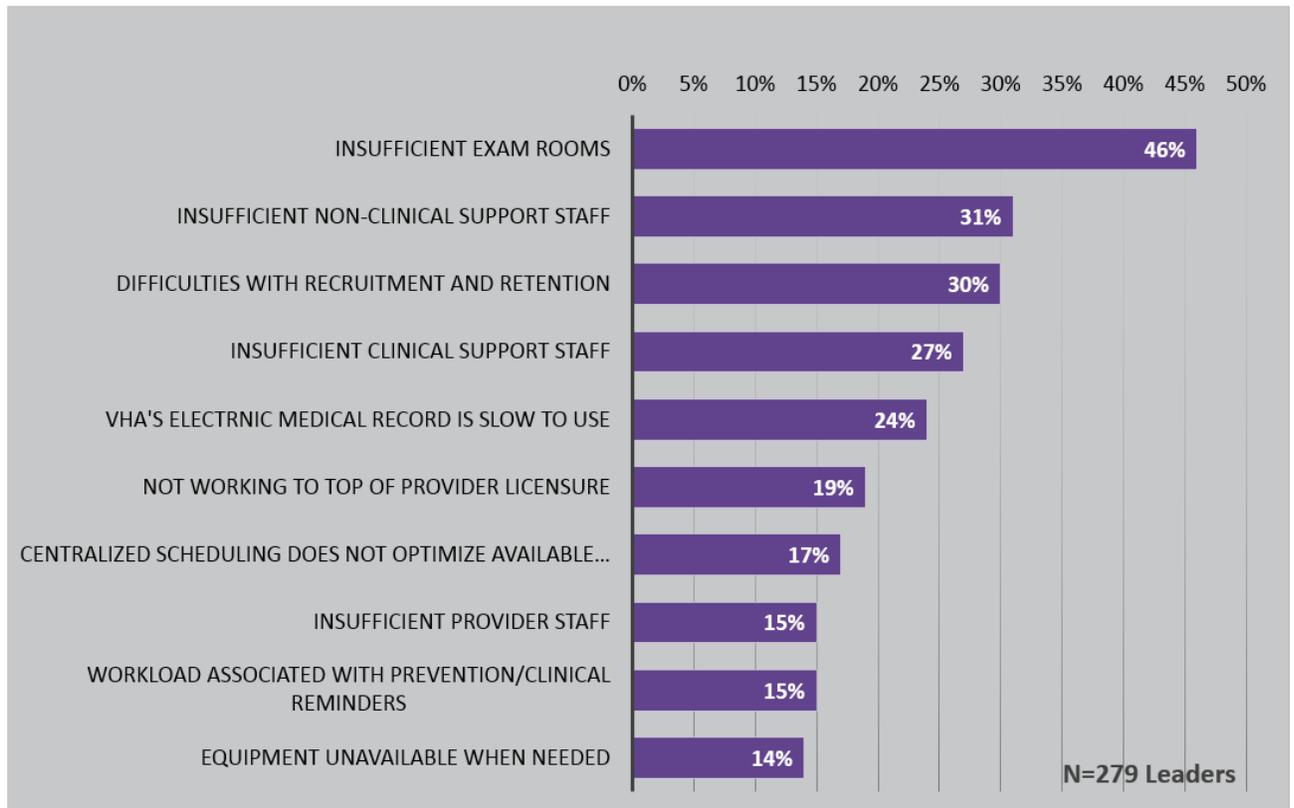


2.3.8.3 A shortage of exam rooms and poor configuration of space limits productivity (Finding 13)

Insufficient exam rooms and poor configuration of space limits providers' productivity, ability to maximize patient throughput and reduces patient access.

On our site visits we observed that although there are some similarities in facility design between hospitals built during the same time period (and most VAMCs were built in the 1950s post WWII era), no VAMC looks the same. Space is utilized differently between facilities and clinics, and there is variation in room ratios as well as equipment availability. Overall, we found that space is often limited in clinics or is not configured appropriately to optimize efficient patient throughput. Space limitations (insufficient number of exam rooms) was the factor most often identified by providers (49 percent) and facility leaders (46 percent) as a barrier to provider productivity. For example, a provider at a VAMC stated "there is only one exam room per physician; we are unable to put multiple patients in different rooms waiting to be seen at one time; there are therefore a lot of providers waiting for the patient to come to their office". Another provider at VAMC stated "the exam room often doubles as the provider office; there is also not a table present in the exam room, which makes it difficult to perform certain procedures as needed. Providers also frequently (17 percent) mentioned difficulty locating mobile equipment; for example, imaging equipment, medical instruments, furniture and computer hardware. We observed that necessary equipment was sometimes lacking in specialty clinics. Although our team received multiple anecdotal comments regarding the impact of equipment on provider productivity, further analysis is needed to determine the direct impact of this issue to productivity.

> *"How do you retrofit a hospital from the 1950s to function in a modern era without actually modernizing the building? The majority of VA facilities were built beginning as early as the 1930s and are trying to accommodate new era processes and technology. Space is consistently a limiting factor, but it is difficult to expand a footprint that does not exist."* – Chief of Medicine, Complexity Level 1 Facility

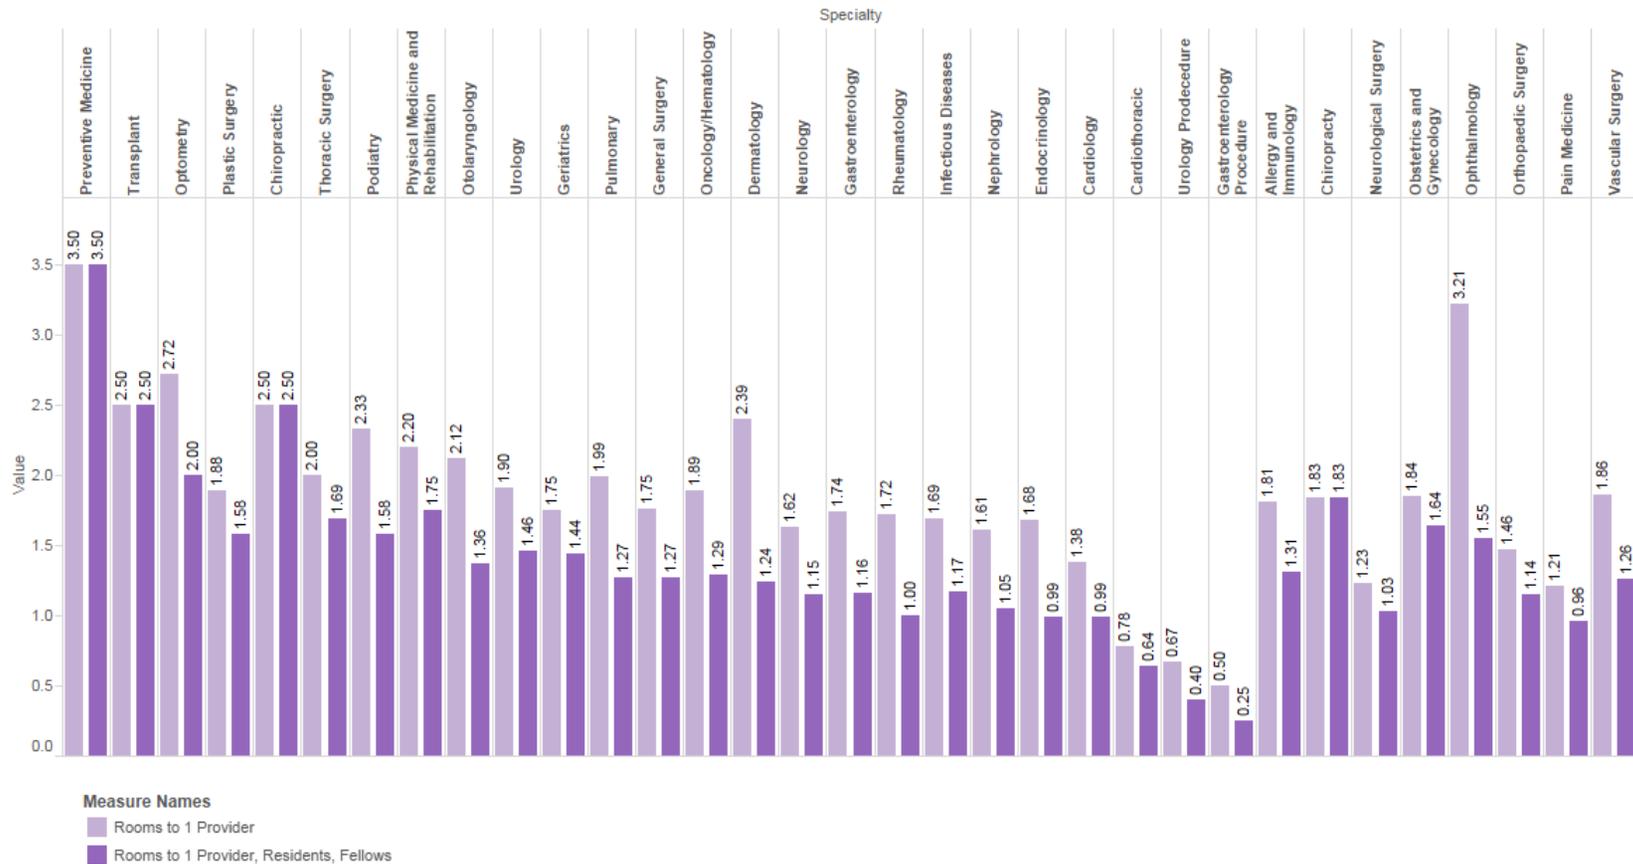
Insufficient exam rooms and ineffective space planning and configuration in specialty, mental health and primary care clinics limits patient throughput and may result in VHA providers waiting to see patients while an exam or procedure room is cleaned and prepared or a nurse conducts intake and vitals with a patient. During our site visit interviews, concerns about clinic space were more prevalent among specialty care providers than primary care providers (PCPs). This may be because space for primary care clinics is guided by the PACT model handbook which recommends 3 rooms per 1 FTE provider (with 2.17 support staff). Of note, primary care provider panel size is adjusted down when providers have fewer than three rooms available.[163]

In a separate study conducted in early 2015 for VHA, Grant Thornton assessed the ratio of rooms to providers for a sample of specialty outpatient clinics at 48 medical centers across the

---

[163] U.S. Department of Veterans Affairs. (2009). VHA Handbook 1101.02 PCMM. Retrieved from http://www.va.gov/vhapublications/ViewPublication.asp?pub_ID=2017

country, with varying complexity levels. **Figure** 2-23 shows the ratio of rooms to providers from the sampled facilities (for all complexity groups). The figure illustrates both the ratios of rooms per provider (physicians and APPs) for a subset of sampled specialties (light purple bars) and the ratio of rooms per providers, fellows and residents combined (dark purple bars).

Figure 2-23. Provider room ratios[164]


The results of the Specialty Care Services study, which are supported by evidence from the Assessment G team's interviews with providers during our 24 site visits, found the room to provider/fellow/resident ratio in VA clinics is typically, for the subset of sampled specialties, 1.28:1 (roughly one room for each provider), resident and fellow, and the ratio of rooms to providers only (without residents and fellows) is 1.87:1. At the higher volume and most complex facilities (level 1A facilities), the ratio of rooms to providers, residents and fellows falls to 1.05:1. This contrasts with room ratios in efficient external health care organizations of 3:1. In other words, for a no delay practice, the ratio of exam rooms should be one physician to three exam rooms.[165] Having multiple rooms enables the provider to see one patient while a nurse or health technician conducts intake with the next patient in another room.

> ***Promising Practice: Boston VA Health Care System***
>
> At the Boston VA Health Care System in Massachusetts, clinic space is at a premium. Exacerbating the space shortage is the age of the facility. An average room at the facility is 500 square feet, whereas the industry standard is 1,000 square feet. To work around the space shortage in its outpatient clinics, the Boston VA has expanded clinic hours to provide appointments in the evening and weekends, a strategy rarely used by VA medical facilities.
>
> ***Value***: This is highlighted as a promising practice because many VA facilities face a similar space shortage. Since VHA construction projects can take a prolonged amount of time to be planned, designed, and constructed, extending clinic hours is a feasible solution. This best practice can be leveraged across facilities, but successful implementation depends on providers' availability and willingness to take on non-traditional work hours, and flexibility of unions in allowing these practices.

2.3.8.3.1 Inefficient clinic workflows may exacerbate space shortages in VHA clinics

We observed on our site visits that clinic workflow in primary care and specialty care outpatient clinics was largely inefficient, resulting in negative impacts to productivity as well as a provider-centric, rather than patient centric workflow. In the primary care setting, it appears that this inefficient workflow may be exacerbating space shortages as a whole, as space is used inefficiently, limiting the space that could otherwise be used to see additional patients. In the specialty care setting, a lack of exam rooms and clinical support staff may contribute to inefficient clinic workflow, as providers are forced to bring patients back and forth between the exam room and the waiting room themselves, because, in many cases, they only have one room and do not have the support staff to bring the patients to the exam room. Below, we describe the observed current state and ideal future state of primary care clinic workflow in detail.

---

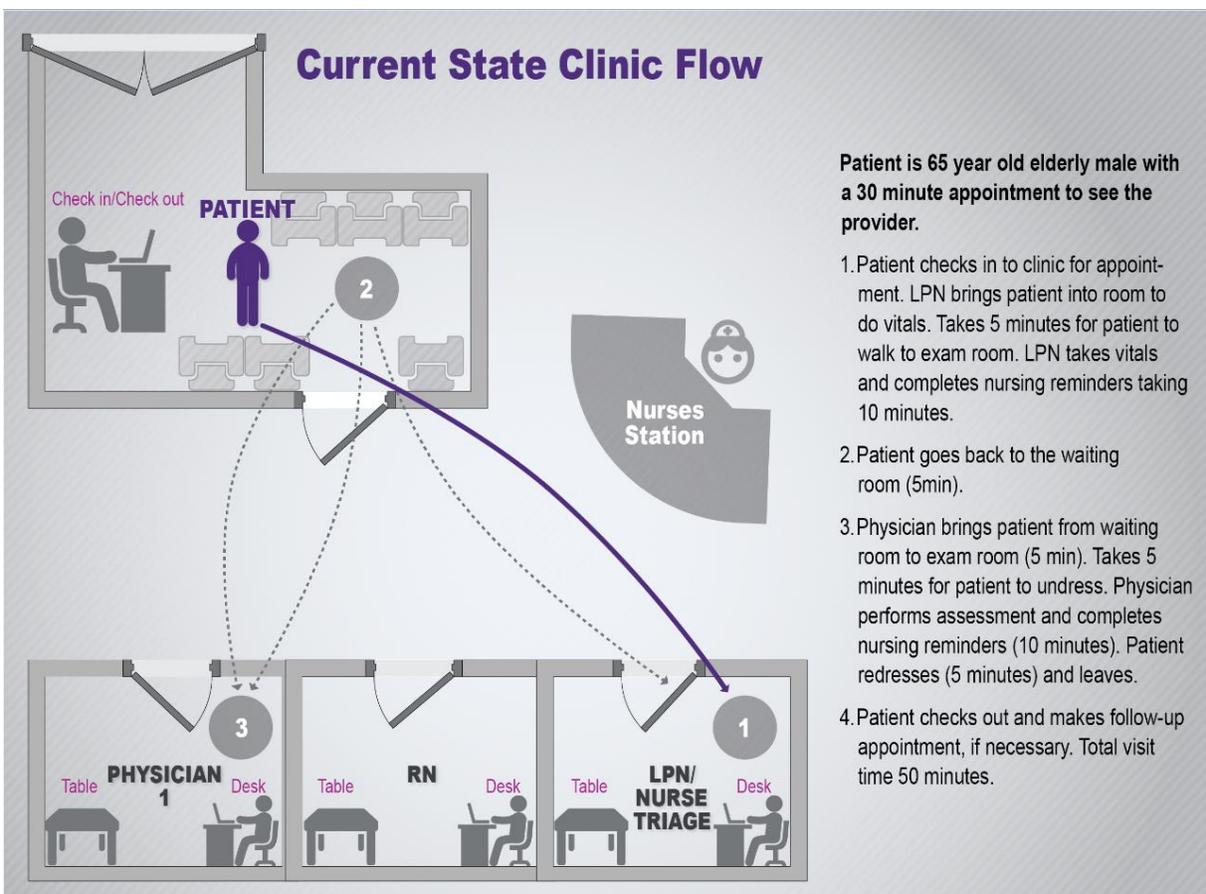
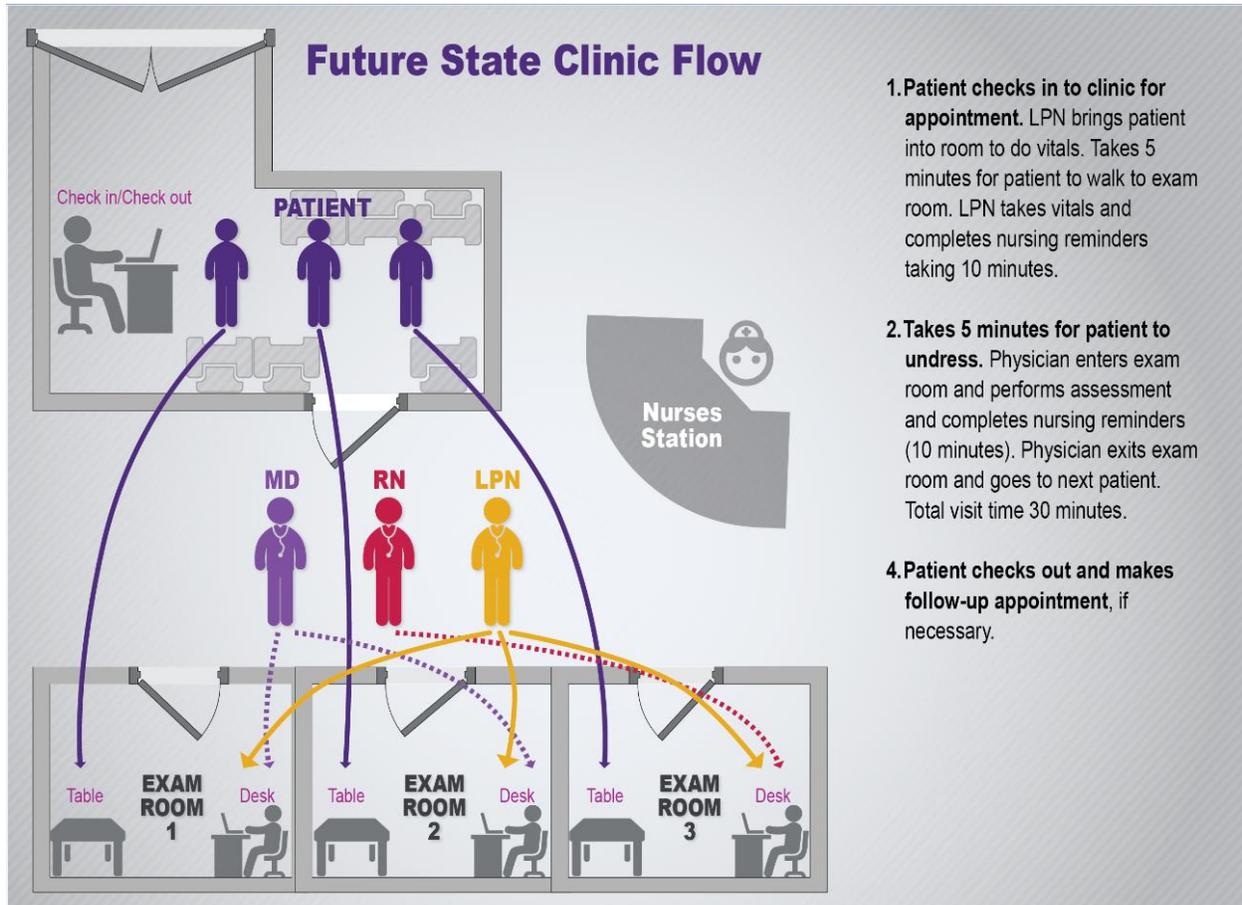
Figure 2-24 shows current patient throughput in a primary care clinic as observed by the Assessment G team during site visits to VA medical centers. Per PACT guidelines, each clinician has his or her own room. Ideally, the patient is brought in from the waiting room by the RN to begin the patient workup for example, vitals, initial screening. Once completed, the patient returns to the waiting room until called by the provider (Medical Doctor or Nurse Practitioner) to begin the patient visit. Depending on the presence of resident or fellows and if a procedure is required, a patient could change rooms at least three or four times. This heavily provider-centric flow, in which the patient is brought from room to room, can be especially time consuming given the VHA patient population. Older patients take longer to dress and undress, causing a bottleneck in the provider room, extending wait times for scheduled patients and limiting the number of walk-ins that can be seen.

Figure 2-24. Current state primary care clinic flow


Alternatively, Figure 2-25 shows the recommended future state flow that is often seen in the private sector (figure compiled based on input from Assessment G subject matter experts). This best practice is patient-centric, with providers moving from room to room, instead of the patient, increasing patient throughput by untethering the provider from the room and allowing multiple patients to be worked up.

This flow works best when the exam rooms are only for patients and do not double as offices, and the EHR system has flexibility (Single Sign-On) and mobility (computers on wheels [COWs] or tablets).

Figure 2-25. Ideal future state primary care clinic flow


In many VA medical centers are aged, having been built in the post-World War II boom of the 1950s, with the average age of a medical facility approaching 60 years.[166] Initially focused heavily on inpatient care and as long term living spaces for providers, with amenities such as barber shops, bowling alleys, and recreational swimming pools, today VAMCs primarily provide outpatient care (more than 99 percent of care provided is in the outpatient setting).[167] Due to changing patient needs over time, these facilities are no-longer configured to meet modern day patient needs. As a result, many facilities are forced to repurpose space for new uses, without being able to modify that space to optimize patient throughput. Using square footage as a

[167] Based on analysis of 2013 data from Selected Veterans Health Administration Characteristics: FY2002 to FY2013, retrieved from http://www.va.gov/vetdata/utilization.asp on May 13, 2015.

measure of available space does not offer a complete picture of available space to provide patient care, since many VAMCs still have some of the same amenities of an era in which facilities focused on long term care and domiciliary type care (it should be noted, however, that we observed on our site visits that these amenities are in fact still being utilized by Veterans – and may also contribute to the high patient satisfaction rates - particularly the Patriot Café (cafeteria) and Patriot Clips (barber shop). Often inpatient wards have been converted to outpatient clinics, so they may have bathrooms or other features typical of an inpatient room, making it appear that the provider has more space for patient care. We frequently observed in facilities, and heard from providers, that space was not configured properly for the type of care they were providing.

> ### Promising Practice: Mitigating Limited Space at Portland VAMC
>
> The Portland VA Medical Center established scheduling processes for outpatient specialty clinics to provide efficient delivery of different services in clinics with limited space and time. For example, the facility moved away from scheduling fixed day and time slots for each specialty to a compressed schedule that accommodated patient appointment preferences for the upcoming weeks.
>
> *Value*: Resulted in better utilization of available space and increased patient access.

2.3.8.3.2 Insufficient availability of equipment may limit provider productivity

The number of patients seen by a provider can be impacted by several different factors, one of which is equipment availability. Equipment is defined as imaging equipment, medical instruments, and furniture and computer hardware. Limited access to equipment such as X-rays and ultrasound machines, as well as lack of access to specialized equipment for specialty care, can cause bottlenecks in patient throughput, particularly on high-volume days. At one facility, 50 percent of dental clinic exam rooms were equipped with X-ray machines, resulting in frequent delays as patients had to wait if an X-ray was needed and they were in a room without an X-ray machine. During site visit interviews we heard that VA vendor contracting processes regarding ordering equipment valued at less than $3,000, for example, scalers for dentistry, can be confusing and lengthy, leading to shortages in equipment and delays in clinic as equipment is located. Delays in sterile processing was also indicated by providers as an issue pertaining to equipment availability.

In conjunction with exam room configuration, standardization of supplies and tools within exam rooms may increase efficiencies. Lack of day-to-day supplies due to clinic space sharing can cause delays in throughput when providers and/or clinic staff leave the exam room to obtain desired items.

Age of the plant and inefficient configuration of space requires VHA providers to utilize technology such as secure messaging (email and/or instant messaging) to efficiently communicate with each other during a patient visit. We observed varied utilization of real-time instant messaging between medical support assistants (MSAs), nurses, and providers during our

site visits. Technology should also include adjustable features for patient information sharing.[168] If a quick question can be sent to a team member using technology and that team member has an available resource, information can be shared with the patient in real time and care plans can be developed. The technology in place and patient satisfaction with how they "feel" in the room while in communication with their provider can greatly affect their perception of the visit.

In the recommendations section, we provide specific recommendations on how VHA can address space related issues (shortage of appropriately equipped exam rooms and inefficient use of available space). Our findings and recommendations are consistent with those of the Assessment K report, which studied facilities (construction, leasing and space) more comprehensively.

2.3.8.4   There is insufficient clinical and administrative support staff (Findings 14 -18)

Clinical and administrative support staff ratios are insufficient and may limit provider productivity.

The Assessment G team found that 43 percent of the 355 providers interviewed perceived insufficient clinical support staff (for example, nurses) to be a barrier to their productivity. A further 27 percent of the providers interviewed perceived insufficient non-clinical support staff (for example, clerks or schedulers) to be a barrier to their productivity. Many of the 279 facility leaders interviewed also shared these perceptions (29 percent and 31 percent, respectively).

The lack of clinical support staff (registered nurses, licensed practical nurses, medical technicians) and to some extent, not having the right skill mix and roles defined for these staff, can result in providers not using their time or skills (licensure) efficiently within the clinic. For example, providers may perform patient intake procedures themselves, or conduct routine patient care tasks more appropriately performed by a nurse, thereby reducing the efficiency of the clinic, and diminishing both productivity and patient access.

A cardiologist at a VA facility stated, "There is a need for additional support staff to allow providers to operate at the top of their licensure. Currently, in addition to providing patient care, the provider needs to schedule their own appointments, put in orders, and type notes into Computerized Patient Record System (CPRS)." A Hematologist/Oncologist at a VAMC stated "one of the biggest barriers is the shortage of clinical support staff. We would like to have at least one additional registered nurse that could alleviate the burden of administrative duties by triaging patients, making phone calls, and doing medicine reconciliation."

Such problems can be exacerbated by a shortage of non-clinical support staff (medical service administrators, clerks) creating inefficient patient management and clinic workflows in which

---

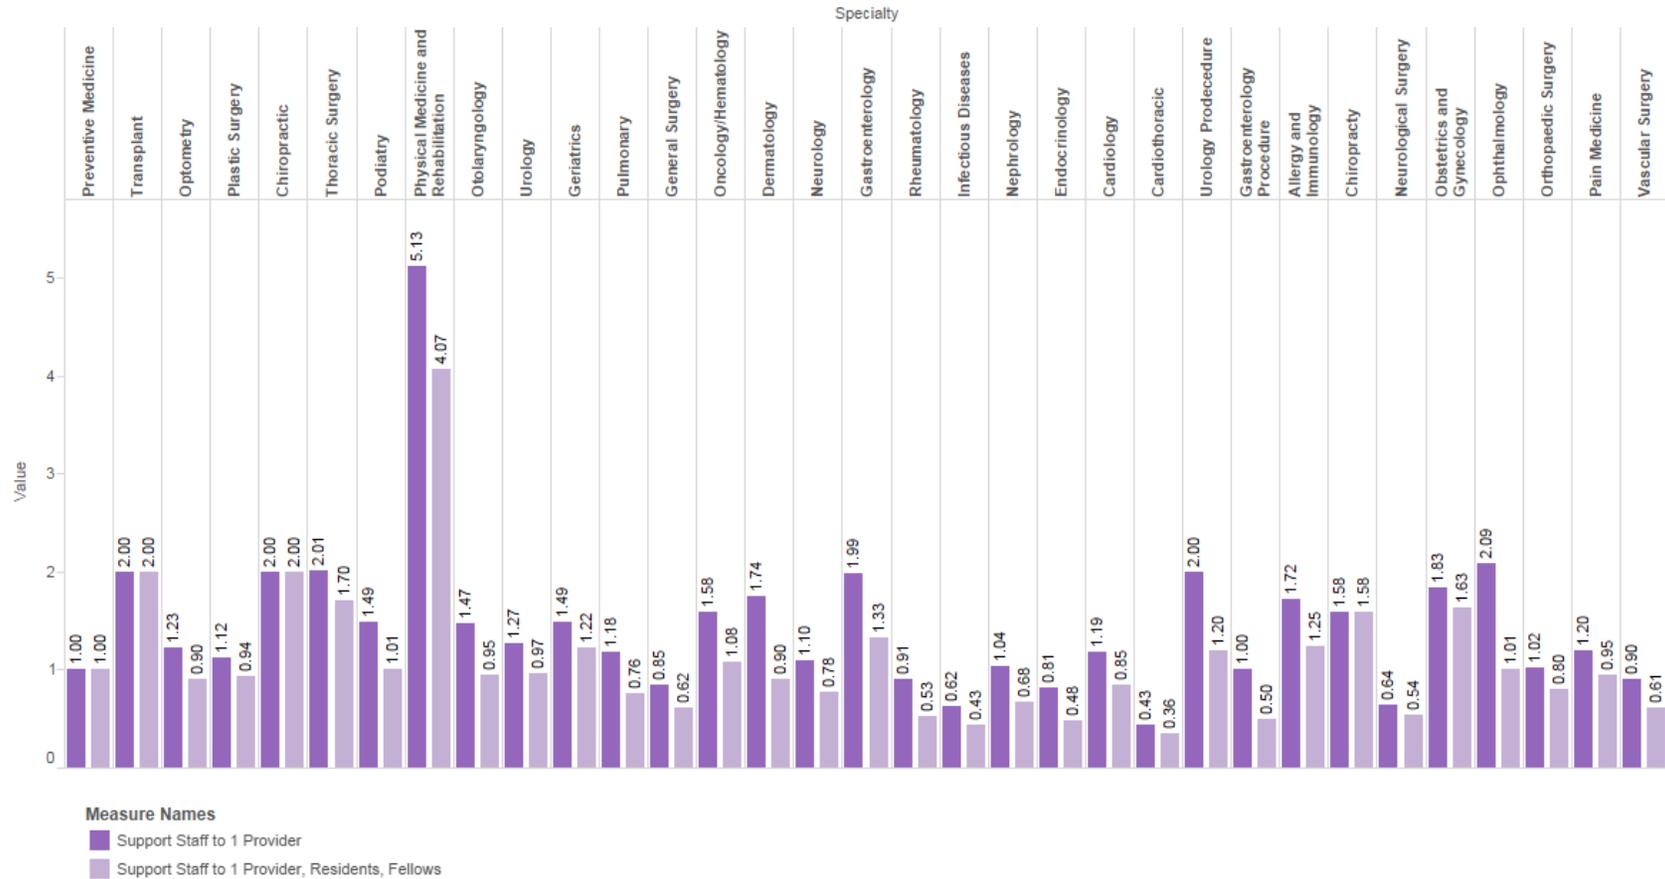
nurses, and to some degree providers, perform administrative functions such as scheduling, patient check-in and check-out and room preparation.

A primary care provider at a VAMC stated, "More clerks are needed, especially to implement the PACT model. Providers could be more efficient if there were more staff to support physicians and enable them to avoid clerical work that impacts their productivity." An ophthalmologist at a VA facility stated, "The providers at this facility have little administrative support; this has directly led to the doctors having to perform secretarial work instead of focusing efforts on delivery of care." A Service Line Chief at a VAMC stated, "Nursing staff members are moved to more administrative duties when they underperform in their clinical duties, instead of allowing for attrition; this impacts the availability of clinical support staff."

In a separate study conducted in early 2015 for VHA, Grant Thornton assessed the ratio of support staff to providers for a sample of specialty outpatient clinics at 48 VA Medical Centers across the country, with varying complexity levels. Figure 2-26 depicts the total support staff (clinical and non-clinical) to provider ratio observed recently for 34 VHA medical and surgical specialties across 48 facilities. The average number of support staff (clinical and non-clinical) assigned to each provider at VHA was observed to be 1.28 support staff per provider across all specialties in the sample subset. When provider was defined to include providers, residents, and fellows the ratio was observed to be less than one (0.87). The ratio was even lower at the higher volume and most complex (level 1A) facilities, where the average ratio was 0.71 providers, residents and fellows to each support staff member. The figure below shows the support staff ratios observed from this study, including support staff per provider only (dark purple bars) and per providers, residents and fellows (light purple bars).This is significantly lower than the ratio of support staff to providers found in the private sector. For instance, the 2014 MGMA survey reported an average of 3.68 total support staff to each provider in multispecialty practices operated by hospitals or integrated delivery systems comparable to VHA.[169]

---

[169] MGMA. (2013) Academic Practice Compensation and Production Survey for Faculty and Management: 2014 Report based on 2013 Data. Retrieved from http://www.mgma.com/Libraries/Assets/Store/Surveys/8743-2014-Key-Findings-Academic-Practice.pdf

Figure 2-26. VHA support staff ratios[170]


2.3.8.4.1 Insufficient support staff may prevent providers working to the top of their licensure (Finding 15)

Insufficient clinical and administrative support staff results in providers and clinical support staff not working to the top of their licensure.

Through the course of the team's root cause analysis, we identified that a lack of clinical and non-clinical support staff results in providers and nurses not being able to work at the top of their licensure. When VAMCs do not have adequate support staff for clinics, there is a cascade effect of staff not working to the top of their license and consequently limiting the productivity of providers. An Advisory Board study found that 36 percent of tasks routinely performed by nurses across the industry could be delegated to non-licensed staff, which then provides time for nurses to accept greater responsibilities and increase productivity. [171]

The Assessment G team observed numerous examples during site visits of VHA providers and clinical support staff performing tasks that might not reflect the highest and best use of their skills or license when compared to private sector practices. Table 2-6 lists tasks and their typical owner in the private sector versus the potential owner of these tasks at VHA facilities.

Promising Practice: Nurses defining optimal staffing mix at Fargo and Palo Alto VAMCs

Established process to define optimal staffing mix to promote nurses to work at the top of their licensure:

- Identify all tasks/patient care interventions conducted per unit/clinic based on patient population
- Map tasks to role (e.g. RN, LPN, Support staff) and calculate staff mix based on HPPD or task time
- Update job descriptions to include specific tasks
- Conduct education sessions to teach staff how to delegate.

Value: Optimizes nurse and support staff roles/responsibilities, clarifies delineation of tasks between licensed and non-licensed staff, reduces costs by hiring more support staff, and promotes nurses working at the top of their license, which results in increased provider productivity.

2.3.8.4.2   VHA lacks staffing models to forecast provider staffing needs (Finding 16)

While there has been widespread implementation of the PACT model in primary care clinics and the National Nurse Staffing Methodology in many areas of inpatient care, there are no

current VHA standards for staffing levels and/or mix in specialty clinics, with the exception of eye clinics.

Through the course of our root course analysis we identified that a lack of staffing models results in VAMCs being unable to predict, identify, and justify the need for resources. Although VHA has a data tool that VHA facilities can use to better understand resourcing and productivity, low confidence in the accuracy of the data results in low usage by facility leaders. Further, the lack of coordinated governance structures between clinical support staff, non-clinical support staff, and provider staff renders an inability to flex resources across service lines, and optimize coordination of care.

The Office of Nursing Service (ONS) recently developed staffing guidance for the Emergency Department, and the Office of Mental Health Services is testing various staffing models in mental health clinics, for example, the Behavioral Health Interdisciplinary Model (BHIP). Of the service chiefs we spoke with on our site visits, none reported that they had formulas for determining the optimal number and mix of providers and support staff for their clinics. Most interviewees said that these decisions were left to the facility, and were not VISN based or VA Central Office mandated. This lack of definitive guidance and requirements for staffing level and mix of providers, as well as clinical and non-clinical support staff, makes it difficult for service chiefs to understand how many and what kind of staff they need, and for them to make the business case for more resources. It can also result in clinics lacking the appropriate number of clinical support staff, non-clinical support staff, as well as providers and support staff not working to the top of their licensure or highest functional level.

VHA facility leaders are not universally leveraging data tools to support staffing decisions.

VHA OPES has established a suite of web-based tools for facility and service level leaders for managing clinic access, productivity, and efficiency. This suite includes the Specialty Productivity-Access Report and Quadrant (SPARQ) tool, and several workforce reports. The SPARQ tool allows a facility management team to compare one of their specialty practices to specialty peer groups, or to compare all facility specialties to facility peer groups to compare performance on productivity and access measures. The tool also calculated 39 measures of specialty practice workload, workforce, productivity, access, demand, physician compensation, fee care expenditures, and facility reliance on fee care. The reports available from OPES are industry leading tools; however, decision support and management reports such as these are only as good as the underlying data which feeds them and factors such as: business rules, roles and responsibilities, and training. These factors may affect facility management's perceptions about the reliability of data and consequently their reliance on these important tools.

VHA recently established productivity standards for each specialty provider group practice, by facility complexity level. Recently published VHA guidance defines VHA's policy for monitoring and assessing productivity and associated staffing.[173] The guidance dictates that each medical

---

[173] U.S. Department of Veterans Affairs. (2015).VHA Directive 1065, and VHA Handbook 1065.01. Productivity and Staffing Guidance for Specialty Provider Group Practice. Retrieved from http://www.va.gov/vhapublications/ViewPublication.asp?pub_ID=3103

facility director monitor and assess specialty care provider group practice productivity on an annual basis, at a minimum, using standardized methods. Specialty provider group practices should achieve a yearly clinical productivity value higher that 1 standard deviation below the level of the mean specialty productivity level (current productivity levels are based on fiscal year 2013 data, as a baseline).[174] Facilities with specialties that fall below should develop a remediation plan.

These requirements represent early steps in a movement toward institutionalizing productivity as one measure of performance at the facility level and nationally. As such, VHA Central Office encourages facilities to use the tools developed by OPES to regularly monitor productivity, and to ensure labor mapping, VHA's cost accounting method of aligning provider time to clinical activities, is accurate, as this forms the denominator of provider productivity calculations. OPES also encourages VA medical center leaders to ensure that providers' person classification code is recorded accurately with credentialing and privileging, as inaccurate person class mapping will result in specialty practice wRVUs being misattributed to a specialty.

Despite these efforts, the Assessment G team received varied reports from facility leaders on whether they are using these tools. The team consistently heard from facility leaders that they are not regularly using these tools for decision support or day-to-day management of clinic staffing. There is a perception that the underlying data that feeds these tools can be unreliable. Some of the reasons given are: differences in the way data is captured by the facility, lack of staff to manage clinic productivity, limited understanding of how to use the tools, and an increased focus on making decisions based solely on access (if patients cannot be seen within 30 days, provide a referral for purchased care, rather than use as a justification for additional staff or need to improve productivity). It also appears that clinic business managers have limited bandwidth to support this type of data drive decision making and management. VHA recently began to implement a Clinic Group Practice Manager Model, which is modeled after a successful U.S. Air Force initiative. At present, it does not appear that VHA has tied additional funding for more resources to this initiative; as such, it is not clear how its success will be measured.

VHA is well ahead of the industry in the development of tools that facilities can use, but may have opportunities to improve the tools to better cater to the needs of facility leaders. A separate study by Grant Thornton in support of the Office of Specialty Care Services recently assessed the validity of the labor mapping data that feeds reports by the Managerial Cost Accounting Office (MCAO) and OPES, as well as how and if facilities are complying with the labor mapping guidance and using OPES tools. That study will include a report to OPES with strategies for improving OPES reporting tools.

2.3.8.4.3   Organizational siloes and separate reporting lines exist (Finding 17)

Organizational siloes and separate reporting lines exist for physicians, nurses and medical service administrators at a majority of VAMCs. As a result, service chiefs do not have control

---

[174] Ibid.

over the resourcing and performance of their clinical support staff (nurses) or clerical and administrative support staff.

Through the course of our root course analysis we identified that organizational siloes and separate reporting lines result in clinical leaders not having sufficient visibility into clinic staffing and not having the span of control or authority needed to manage all of the staff in their clinics. The Assessment G team frequently observed a siloed management structure of providers and clinical and non-clinical support staff. The typical reporting structure has clerks and support staff reporting to medical administrative service (MAS), nurses (Licensed Practical Nurse [LPN]/Licensed Vocational Nurse [LVN] and Registered Nurses [RNs]) reporting to nursing service (led by the Chief Nursing Executive) and most providers reporting to (physician) service chiefs who report to the Chief of Staff. As a result, service chiefs do not have control over the resourcing and performance of their clinical support staff (nurses) or clerical and administrative support staff. Further, service chiefs may have limited influence over who is assigned to their unit and the continuity of those staff.

The lack of oversight of clinic staff by service chiefs can make it difficult for them to understand the complete staffing in a clinic and limit their ability to optimize staff roles and responsibilities. This can lead to issues such as:

- Inefficiencies in executing scheduling protocols and other administrative tasks commonly performed by non-clinical support staff
- Inefficient patient flow within the clinic
- Failure to flex resources across service lines or clinics to meet needs.

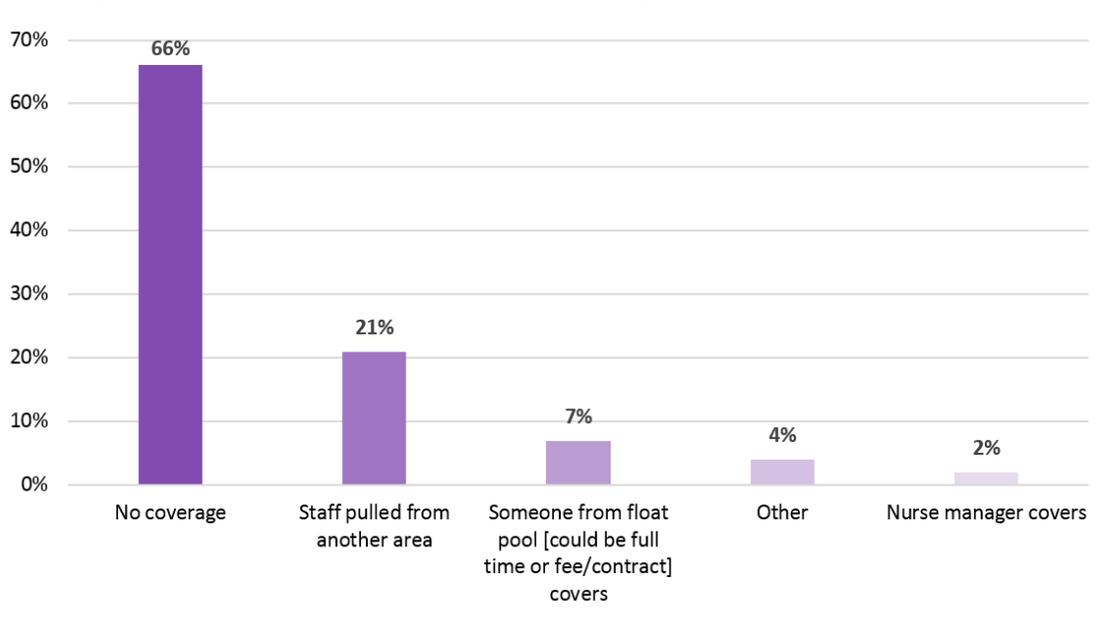
2.3.8.4.4 Daily staffing variances create staff shortages (Finding 18)

Many facilities do not have a centralized staffing office or nurse float pool to address daily staff variances or absences.

Through the course of the team's review of nurse staffing practices at VA medical centers, we identified that facilities do not have a centralized staffing office and rarely utilize a nurse float pool to address daily staffing variances. This results in shortages of clinic support staff, which can reduce the productivity of providers. Ineffective management of staff absences can disrupt patient care teams and cause stress for nursing staff who are pulled from their unit to cover short-staffed units with different team members, processes and unit layouts.

A neurologist at a VAMC stated "there are not enough clinical support staff and the number available is not reflective of the workload; there is no ability to flex up the number of nursing support staff depending on the number of patient encounters – the same number of nurses are available, regardless of demand."

A face-to-face survey of 1,791 clinical support staff conducted by Grant Thornton in early 2015 in support of VHA's Office of Specialty Care Services found that there were frequently no plans in place to manage daily staff absences. Figure 2-27 shows that 66 percent of surveyed clinical support staff in specialty care outpatient clinics reported that when they are absent, there is no one who covers for them.

Figure 2-27. Specialty clinic absence coverage for clinical support staff[175]


Daily staff variances appear to be an issue for both inpatient and outpatient clinic environments and do not appear to be addressed in current VHA staffing models. Our team observed that VHA's national nurse staffing methodology, the PACT model in primary care, nor any staffing method in specialty care clinics, had a replacement factor to address staffing variances.

With respect to inpatient care, the target nursing hours per patient day (NHPPD) produced by VHA's nurse staffing methodology is not tied to facility budgets. This leads to ineffective management of staff costs per day and staffing gaps. For example, at the medical surgery (Med-Surg) inpatient units we visited the nurse staffing methodology produced greater than expected target NHPPD variances among similar units. At one Med-Surg unit, the target NHPPD was as low as 6.6 hours, but a similar unit's NHPPD was 9 hours. When units were unable to meet their targeted NHPPD, they often used overtime or closed beds because they lacked a flexible workforce to fill staffing gaps.

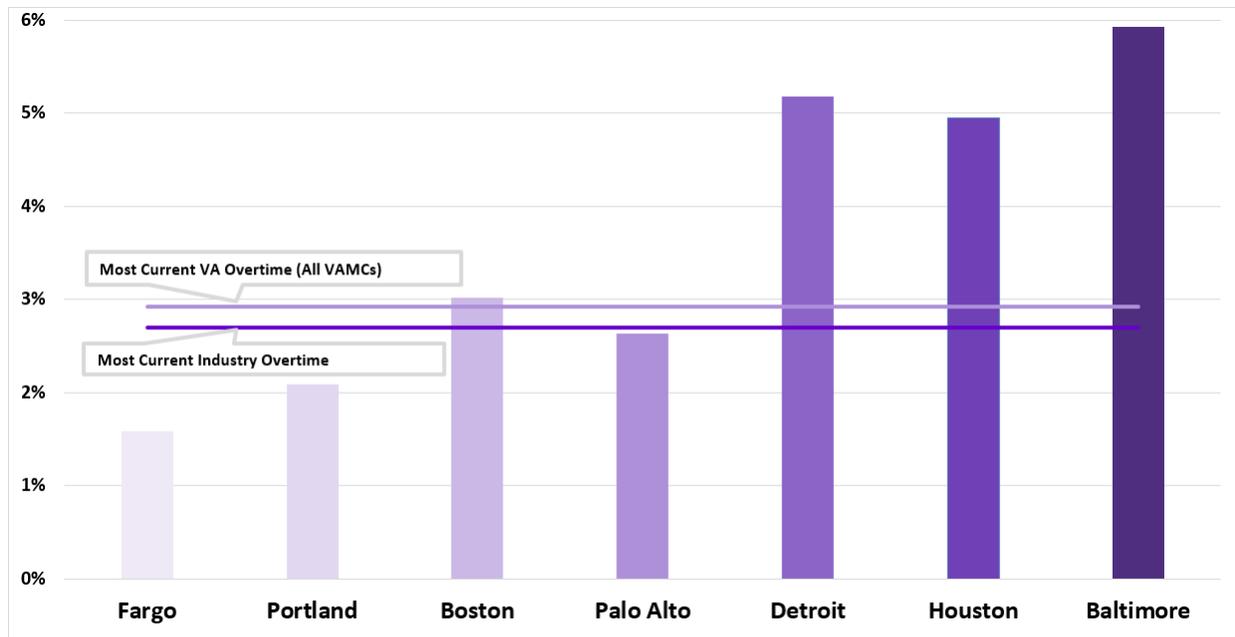
Even when units meet their target HPPD, clinical leaders do not have good data with which to assess adequate staffing because overtime is included in their total hours. Overtime usage across VAMCs can vary significantly. Current national overtime rates for VHA are marginally higher than the rest of the health care sector (2.92 versus 2.86 percent), but can vary significantly by VA facility.[176] Figure 2-28 provides an example of the level of variation in the use

---

[175] Grant Thornton analysis of staff coverage conducted on behalf of VHA's Office of Specialty Care Services, draft data, July 6, 2015.

[176] U.S. Department of Veterans Affairs, (2015) ProClarity Briefing Book. VANOD Administrative Indicators Briefing Book.bbk.

of overtime by VA facilities. Overtime ranged from less than 2 percent at the Fargo VAMC to almost 6 percent at the Baltimore VAMC.

Figure 2-28. Overtime rates for select VAMCs (March 2015)


2.3.8.5 Providers may not be fully documenting their clinical workload (Finding 19)

During site visits and interviews with VHA Central Office leaders, we consistently heard concerns that providers do not fully document and accurately code all of their clinical workload.

These observations are similar to the results of Assessment F (Clinical Workflow). Failure to fully document clinical workload may impact the accuracy of wRVU productivity measurement and the ability of medical facilities to properly manage providers' availability. Coding accuracy is also important to measuring whether clinical pathways are being appropriately followed and understanding care outcomes. According to Assessment F, VHA has a Clinical Documentation Initiative (CDI), however only 46 percent of VA Medical Centers participate. Methods to determine nurse/support staff mix may not fully capture workload (Labor Management Institute [LMI] ratios may not cover continuous observation [CO] needs). VHA also lacks a local infrastructure to assist providers and nurses to accurately capture workload and coding.

Inaccurate workload capture was reported by many providers across virtually all medical centers visited by the Assessment G team. Interviewees gave many reasons for inaccurate workload capture, including a lack of understanding of the policies, preference to spend time treating patients, and a distrust in the data integrity. Additionally, some staff expressed displeasure in not knowing who views productivity data and what levels it is reported to. Limited provider training and lack of systems to assist providers in documenting comprehensively and accurately limits the accuracy of workload capture.

Other factors raised by providers during site visit interviews include: data such as charge capture reports and other wRVU-related measures are not relayed from the facility Business Office to the clinical service lines and back; reporting structures are disconnected between Business Office and clinical service lines where adequate feedback is not required from the Business Office to remediate potential coding errors; there is a lack of training in coding for providers; and there is a lack of tools to enhance coding and documentation, such as CAC programs, to assist providers in accurately coding, and processes such as charge tickets which group the most used ICD-9 or ICD-10 codes for imaging, procedures, and/or clinic visits are used sparingly at VHA.

2.3.8.6 VHA's electronic health record may limit provider productivity

VA first introduced its EHR – otherwise known as CPRS – across its facilities in 1997. Since then, CPRS has functioned as VHA's core EHR to house all patient- and care-related information. Although CPRS was developed in-house with the expertise of VHA providers and nurses, the system and supporting human resource and IT structures have not been updated consistently across facilities to sufficiently support providers' efficient care delivery. Additionally, providers have in some cases, not been adequately armed with the knowledge and skills to easily navigate the system to record patient information and optimally deliver personalized, proactive, patient-centered care. This, as a result, may impact providers' productivity levels across facilities. During site visit interviews with facility leaders and providers, the following issues with the CPRS were frequently raised:

Lengthy amount of time it takes to log-in to the IT system. Providers stated that it can take up to 15 minutes to log-in to CPRS. The system automatically logs out providers if it is not being used for ten or more minutes. This especially reduces provider productivity if they need to log back into CPRS multiple times over the course of a patient visit.

Speed of system further diminished when utilizing two or more modules simultaneously. Providers stated that if they have one or more applications open in addition to CPRS, then CPRS operates more slowly. For example, some facilities use the Dragon®NaturallySpeaking software to dictate notes into CPRS. While this software is designed to assist providers in capturing notes more efficiently, it has slowed CPRS because the IT system is not designed to support simultaneous module utilization.

Antiquated nature of the system. VHA's CPRS was released and implemented across its facilities in 1997. Although the EHR was designed in-house with the expertise of VHA providers and nurses, the system has not been updated to keep up with technological advances. Specifically, based on site visit observations and feedback, the user interface is not similar to private industry counterparts (e.g. EPIC, Cerner) and the time it takes for the software to log-in and log-out is prohibitive, in many cases, to efficiently using multiple rooms to see patients.

Lack of IT training for providers to manage view alerts and clinical reminders. Some providers stated that they can spend up to an hour or more on a daily basis going through their view alerts, but others stated that they can alter their filters so that they would not necessarily need to be alerted by low-priority messages. Although providers stated that they can spend a significant amount of time going through clinical reminders during each patient visit, many

---

stated that they are necessarily to provide comprehensive chronic care management and preventative care. Primary care providers have comparably more clinical reminders than specialty care providers, and LPNs can also manage some reminders.

Many providers stated that they do not know how to efficiently manage and work through their view alerts and clinical reminders, and would like to have training to better be able to manage these responsibilities. However, the centralized governance structure for IT resources limits accountability for developing and providing training for providers, and triaging IT issues for efficient resolution.

Extensiveness of electronic documentation. CPRS requires providers to enter an extensive amount of patient notes. This heavy amount of documentation is often exacerbated when patient information does not transfer seamlessly between systems. Our team heard that there is no bi-directional feed between different electronic modules and that providers need to document notes in Caretracker and then copy and paste the information into CPRS. Another provider stated transferring reports between systems is too time-consuming.

2.3.8.7 Scheduling inefficiencies may limit provider productivity

Efficient scheduling processes, procedures, templates, and tools are essential for optimizing provider time by maximizing utilization and availability for patient care. Our team found that scheduling inefficiencies were a significant barrier to productivity, at many facilities, according to the providers that we interviewed. More specifically, in their opinions, the processes in place and infrastructure in support of VA's current scheduling system reduces the ability of clinics to make the best use of available provider time and thereby maximize the efficiency of clinics.

In our interviews, providers appeared to be less satisfied when scheduling functions were handled outside of the clinic or by a pool of staff who rotated through different clinics. Where call centers existed, the Assessment G Team, along with the Assessment E team, observed that these call centers supported different services and functions depending on the facility. The staff had different approaches to interacting with clinics and different degrees to which clinics had codified their business rules. Clinics reported that this could, at times, result in incorrect scheduling practices.

Another regular complaint by providers was the movement and/or reassignment of staff who provide scheduling support to clinics. Providers expressed a preference for having dedicated scheduling staff who understand their clinic scheduling needs and preferences. Alternatively, standardization in clinic profiles, templates, tools, and training of staff, might mitigate centralized scheduling woes, without the need for dedicated schedulers assigned to specific providers or a group of providers. Below we elaborate on two sub-areas that we observed; however, the Assessment G team defers to the findings and recommendations offered in more depth within the Assessment F team report.

2.3.8.8 Schedules are not developed to optimize providers' available time

This is amplified by limited visibility into the total supply of available appointments within the VistA scheduling system. The VistA scheduling system also inhibits the ability to vary

appointment length to match patient acuity, resulting in less than optimal use of available provider time within master scheduling templates. The inability to view access in aggregate may contribute to slow reactionary needs to Veteran demand, and VA's responsiveness to shifting open appointments.

VHA providers express particular frustration with the scheduling process and feel their ability to deliver care in an efficient and productive manner is reduced by VA scheduling practices relative to typical private sector scheduling processes.[177] Furthermore, according to McKinsey's Assessment E (provider availability section), only 56 percent of all providers believe schedulers are adequately trained. According to one provider, "the scheduling system restricts the ability to identify an appointment slot by patient acuity, which is specific to the Veteran population. The master scheduling template is not flexible." Less common in the private sector is the incidence of clinic cancellations, since cancelled clinics directly result in lost revenue in those settings. In VHA, the Assessment E team consistently noted that changes in provider availability and management of provider availability is a significant issue.[178] MSAs manage providers' schedules, and they may not have a strong working relationship with the clinic staff nor have a full understanding for the clinic culture because they report to the facility's business office. Providers cannot optimize their schedules to see as many patients as possible, which, as a result, negatively impacts their productivity

2.3.8.9 Patient follow up procedures are not in place to manage no-shows

When a patient fails to keep an appointment, in the private sector, it is termed a "no show." VHA refers to no shows as missed opportunities. No shows can result in underutilized provider time and poor patient access (as patients who could have had an appointment scheduled, do not). No shows present a constant challenge to providers' ability to manage their day-to-day schedules. Although no shows are a complaint across the industry, no show rates appear higher in VHA than in other systems across the nation. Even VHA's target missed opportunity rate is higher than national no show rates in the industry. In an Assessment E analysis of a sub-set of facilities and clinic environments, 35 percent of visits did not occur as scheduled, with half of those being no shows or 24 hour cancellations (for additional detail on this topic, see the assessment E Scheduling Process section for more detail).[179]

2.3.8.10 Nurse staffing shortages

Through the course of the team's root course analysis we identified a number of factors that may contribute to shortages of clinical support staff, which leads to lower productivity of providers:

- Incomplete implementation of VHA's Nurse Staffing Methodology
- Insufficient budgets to hire nursing staff

---

[177] Assessment G site visit interviews.

[178] McKinsey & Co. (2015). Veterans Choice Act Assessment E Final Report.

[179] Ibid.

- Lengthy hiring processes for nurses

- Absenteeism and turnover of nurses

- The lack of a quality journey designation to attract nurses

- Diminishing continuing education opportunities for nurses

Our team conducted interviews with VHA nurse leaders at the national level, as well as site visits to examine nurse staffing practices at seven VA medical facilities, in order to explore these issues. Our findings are summarized below.

2.3.8.10.1 Implementation of VHA's Nurse Staffing Methodology is incomplete

VHA Directive 2010-034[180] mandates the development of nurse staffing plans by each facility. We reviewed the implementation of the nurse staffing methodology at seven VA facilities. During site visits, we consistently heard that budget constraints and cumbersome hiring processes resulted in the disapproval of FTE requests and unfilled positions for nurses. Facilities that had fully implemented the nurse staffing methodology continue to struggle to provide adequate nurse and support staff persisted. The national nurse staffing methodology mandate did not include the funding for the methodology, processes for developing a training plan, or continuous monitoring and oversight of the implementation.

VHA's ONS is deploying the Nurse Staffing Methodology (VHA Directive 2010-034) using a phased approach, with phase one implementing across inpatient units. Phase two expands the implementation to the operating room (OR), ED, ambulatory and specialty care areas. Phase three provides guidance to implement a fully-automated system to determine adequate nurse staffing for all points of care. The ONS explained that four years after the adoption of the directive by VHA, many medical centers have not fully implemented the nurse staffing methodology.

ONS recently conducted an evaluation of the VHA Nurse Staffing Methodology, (*Evaluating the VHA's Staffing Methodology Model: A Reliable Approach, 2015*). The study noted that facility compliance in meeting target staffing levels varied widely and fluctuated over time. It also noted that high turnover among VAMC nurse executives hindered the implementation of VHA Directive 2010-034. Further, a recent study found that VHA's nurse staffing methodology increased the absolute number of Nursing Hours per Patient Day (NHPPD) by a full hour, but did not necessarily result in actual increases of RN hours per patient day across all units and nursing personnel.[181]

Retrieved from http://www.medscape.com/viewarticle/840990_5

2.3.8.10.2   Insufficient budgets may contribute to shortages of support staff

Budget limitations may constrain facilities' ability to reach adequate support staff levels. Implementation of VHA Directive 2010-034 is resource dependent; yet, the mandate remains unfunded.[182] In the inpatient setting, medical centers we visited were following the VHA Staffing Methodology Directive and utilized the FTE calculator tools to determine their target HPPD and FTE needs per unit. However, the availability of sufficient budget for inpatient nurse staffing varied by facility. If VA medical centers cannot align their budgets with target FTE needs they will likely not achieve the benefits of the standardized nursing staffing methodology. Consequently, units will have inadequate clinical support staff, which may impact provider productivity.

Nurse executives we interviewed during site visits expressed fewer concerns about budget constraints in primary care. This is because, in contrast to the VHA nurse staffing methodology, the PACT model used in primary care, was a funded model when it was implemented. The Veterans Choice Act included funding for primary care and specialty care staffing which we expect will improve VA medical centers' ability to budget for clinical and non-clinical support staff.

2.3.8.10.3   Hiring processes may contribute to shortages of support staff

Lengthy recruiting, hiring, and onboarding processes and delays were a frequently reported barrier to adequate nurse staffing by facility nurse executives. Primary recruitment challenges that VHA faces include: limited nurse candidates (particularly in rural areas); steep competition for talent in urban academic centers; and non-competitive salaries. A nurse executive at one facility mentioned that managing the number of qualified Veteran applicants who applied for clinical support staff positions further delayed the hiring process due to declination rates as high as 90 percent. In FY 2014, VHA hired 6,688 nurses. The average speed of hire was 39 days.[183] The lengthy onboarding process caused delays, which result in a loss of qualified candidates. These challenges contribute to a high number of vacancies.

At a complexity Level 1 facility, we were told that a VHA surgeon technician's average salary was 30 percent lower than the salaries offered by local hospitals.

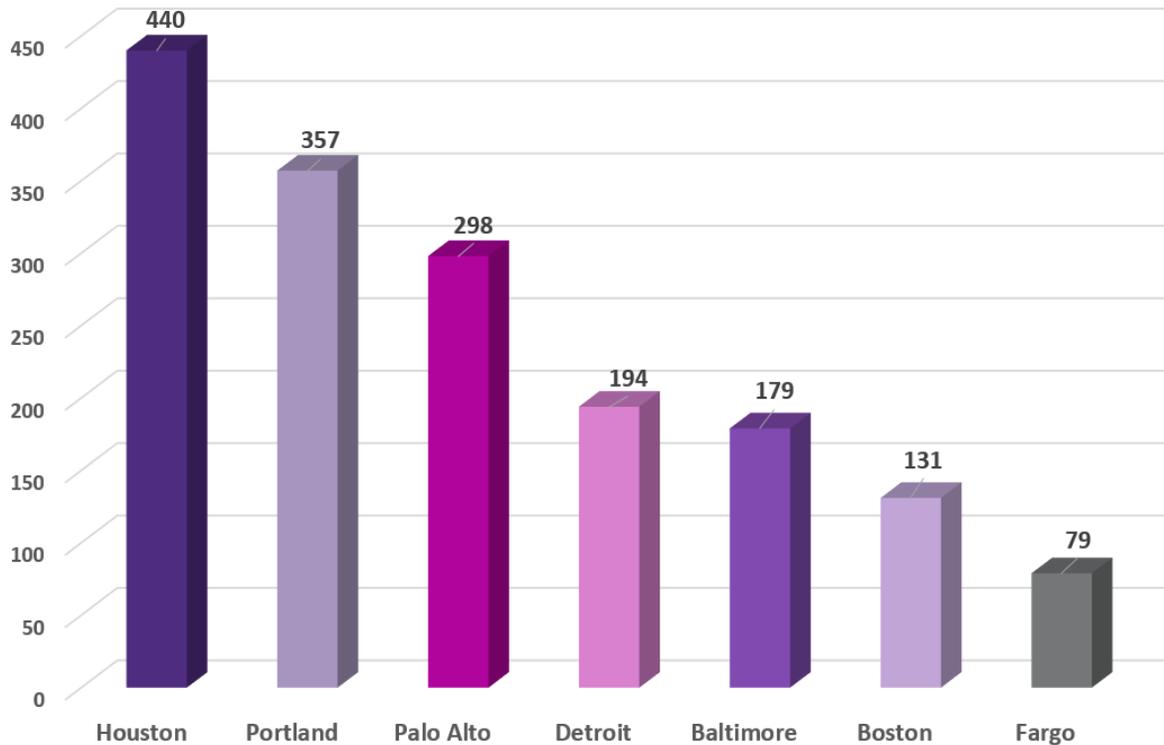
At another facility, we were told that nurses were offered $25,000 sign-on bonuses from local hospitals to recruit them because of their valuable VHA work experience. Nurse executive salaries can be $100,000 higher at local hospitals compared to VHA.

---

[182] Interview with Office of Nursing Services, February 12, 2015.

[183] Certain data used in this study were supplied by Truven Health Analytics. Any analysis, interpretation, or conclusion based on this data is solely that of the authors, and not Truven Health Analytics. Data was obtained from Truven Health Analytics ActionOI®(2015) Facility Indicators All Beds Report, provided by FTI Consulting. Data not available to the public.

As of March 2015, the total number of nurse, practical nurse and nursing assistant vacancies across all VA medical centers was 16,676, which represents approximately 20 percent of VHA's nursing staff workforce.[184] Figure 2-29 depicts the number of nurse, practical nurse, and nursing assistant vacancies for seven of the VA medical centers we visited to examine nurse staffing practices. These high vacancy numbers make it difficult for VAMCs to adequately staff units and clinics.

Figure 2-29. VAMC vacancies for nurses, practical nurses, and nursing assistants


2.3.8.10.4 VHA nurse turnover is marginally higher than industry, but varies across VAMCs

Nurse turnover can be an important contributor to staff shortages. Figure 2-30 shows the national average nurse turnover rate for VHA as well as the turnover rate at seven of the VAMCs where we examined nurse staffing practices. VHA's national nurse turnover rate is marginally higher than industry (17 versus 14 percent) but varies across individual VAMCs. For example, nurse turnover was just over 8 percent at VHA's Boston Health Care System, but

---

[184] U.S. Department of Veterans Affairs, (2015, March 17) VHA Talent Management. Onboard FTE Turnover by Facility FY14.xlsx

almost 20 percent at the Palo Alto VAMC.[185] According to nurse executives, the bulk of nursing staff losses are the result of an employee leaving VHA to take a role at another health care organization. The 2015 National Health care Retention and RN Staffing Report showed that the cost of RN turnover ranges from $36,900 to $57,300 per nurse, which results in an average $6.2M loss for hospitals. The cost of turnover can range up to two times annual salary for professional positions.[186] Turnover could represent a significant drain on a VAMC budget.

We were unable to quantify the absenteeism rate for VHA nurses. We recommend it be studied by VHA since it may also be an important contributor to shortages of clinical support staff. A higher incidence of unfilled shifts and overtime at some facilities is likely to contribute to higher workload for nursing staff. Workload is considered a source of occupational stress and has been linked to nurse burnout and absenteeism.[187] Other research has shown that nurses reported greater job dissatisfaction and emotional exhaustion when they were responsible for more patients than could safely care for.[188]

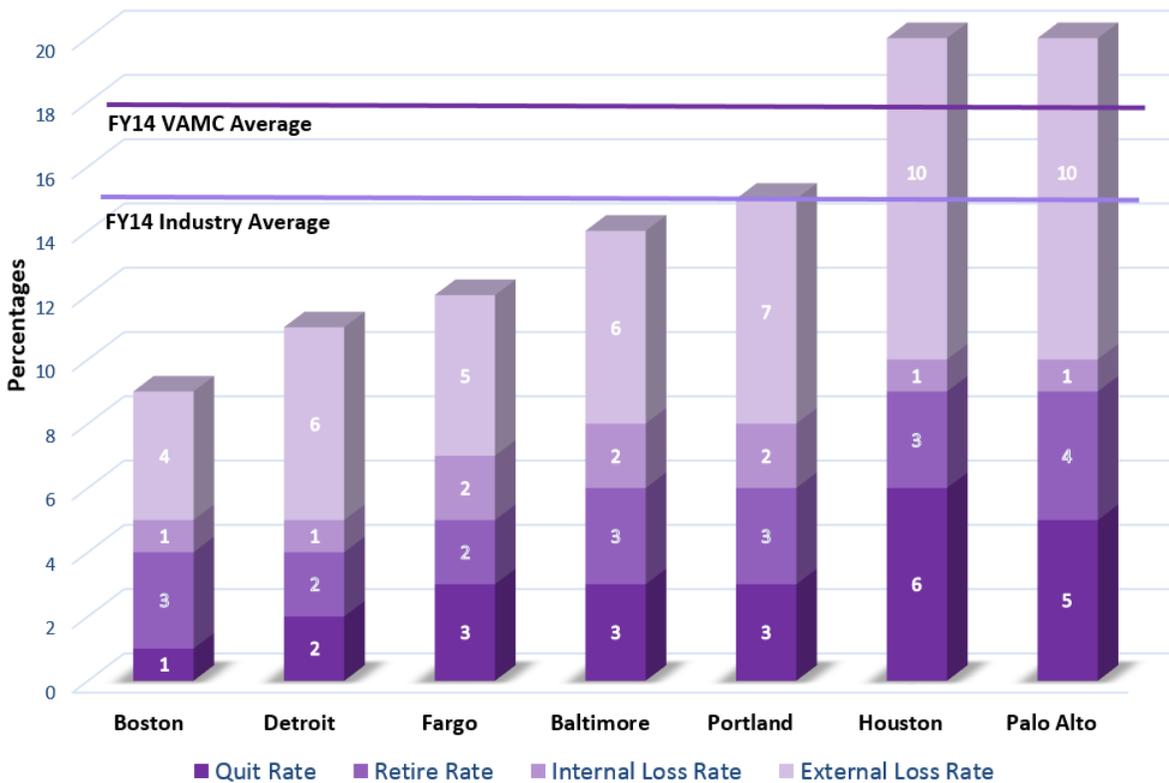
Figure 2-30. Nurse turnover rates for select VAMCs


2.3.8.10.5 Too few VHA facilities have a Magnet status®

Our team found that only a small number of VHA facilities have a quality journey designation such as ANCC (American Nurses Credentialing Center) Magnet Status®, [189] or ANCC Pathway to Excellence®.[190] ANCC reports that over 400 hospitals hold this designation in the United States. However, according to VHA there are only three VA medical centers with a Magnet designation: Houston, Portland and Atlanta. Madison VAMC is pursuing Magnet status and Fargo VAMC is pursuing the ANCC Pathway to Excellence.

The Magnet program was developed by ANCC (American Nurses Credentialing Center) to recognize hospitals and health care organizations that provide nursing excellence. ANCC considers Magnet Recognition® to be the highest and most prestigious distinction a health care organization or hospital can receive for nursing excellence and outstanding patient care. According to ANCC, the Magnet Model focuses on five areas:

- Transformational leadership

---

[189] American Nurses Credentialing Center. (2015, May). Magnet Recognition Program. Retrieved from http://www.nursecredentialing.org

[190] American Nurses Credentialing Center. (2015, May). Pathway to Excellence Program. Retrieved from http://www.nursecredentialing.org/pathway

---

- Structural empowerment
- Exemplary professional practice
- New knowledge, innovations and improvements
- Empirical outcomes.

While we recognize that the Magnet journey is a resource intensive process, and may not always be appropriate for smaller facilities, it has benefits for patient care and can be an important factor in recruiting and retaining nurses. Consequently, it could play a valuable role in helping VHA facilities to address their support staffing shortages.

2.3.8.10.6 Continuing education opportunities for nurses have become more limited

As of May 2014, only 43 percent of RNs across all VAMCs have a BSN degree.[191] Facilities no-longer provide or have reduced nursing educational benefits (along with educational support for many other job positions). Although scholarships are available, the application process may be complex, re-imbursement for certifications or conferences has been eliminated at some facilities, and there is little access to systems training. Several facility leaders admitted that while they acknowledge high achievers, they are unable to support their efforts monetarily.

> Senior leadership at one facility identified that nurses funding is not made available for nurse education, even though providers are budgeted $1,000 per year for training.

Research has found that facilities with a higher proportion of nurses holding a baccalaureate degree had lower surgical mortality and failure-to-rescue (that is, death following the development of a complication).[192] A better educated nurse workforce will be able to accept additional responsibilities to fill a range of new roles in patient care, prevention, and care coordination. If VHA is to help achieve the Institute of Medicine's (IOM) recommendation that the proportion of nurses in the U.S. who hold at least a baccalaureate degree be increased to 80 percent by 2020, greater support of nurse education and advancement must be provided and championed.[193] Greater education and advancement opportunities would potentially improve morale, and subsequently, retention of nurses.

> ***Promising Practice: Benefits of BSN Educated Nurses at Houston, Atlanta, and Boston***
>
> Houston, one of VHA's Magnet® Designated facilities, achieved re-certification twice and reached its goal of 82 percent of its RNs holding a baccalaureate (BSN) degree. Atlanta VAMC is another Magnet recognized facility that reports their NSI data to NDNQI®. Atlanta's current education level of RN's with baccalaureate degrees is 85.7 percent and exceeds the goal of 80 percent compliance by 2020.
>
> Two BSN educated RNs at Boston identified a technological tool to improve provider-nurse communications through a lightweight, wearable, voice activated device used to communicate hands-free, which the entire facility now uses.
>
> ***Value:*** The benefits of having RNs with baccalaureate degrees is that for nurses to remaining current on cutting edge concepts, evidenced based practices, innovative technology, or new equipment in maintaining excellence in their practice. Nurses with BSNs and other degrees also prepares them for driving improvement initiatives and becoming leaders in the organization.

2.4   Provider Time Allocation (Objective 3)

This portion of our report covers our third objective to describe the relative time VHA providers spend on non-patient care activities. This responds to the Section 201(G) requirement for an assessment of provider time on non-case load activities, to include time at affiliate medical affiliates, research time, and time training and supervising others. To do so, we compared overall clinical and non-clinical time between VHA and the private sector using VHA's cost accounting (labor mapping) data and published data from the 2008 Health Tracking Physician Survey conducted by the Center for Studying Health System Change[194]. Our findings show that VHA physicians are generally meeting or are on par with the private sector on time spent and allocated to clinical or direct patient care. Additionally, our site visit research supports the finding that VAMCs affiliated with a medical school may have a competitive advantage for recruitment and retention (see case study later in this section for more detail), and that VA-funded research is a key provider retention tool.

Both our assessment and Assessment L (leadership) findings provide additional evidence that providers are often attracted to work at VHA due to work life balance opportunities not offered in the private sector. When providers are hired into VHA, they sign a contract, which includes the allocation of time they are expected to allocate to patient care, as well as research, education and administration activities. Because we heard that these non-patient care activities may be key attractors for a provider to come to VHA, we assess the time that providers spend

---

[194].Center for Studying Health System Change. Health Tracking Physician Survey. (2008) ICPSR27202-v1. Ann Arbor, MI: Inter-university Consortium for Political and Social Research [distributor], 2010-02-16. http://doi.org/10.3886/ICPSR27202.v1

---

on these types of activities (i.e. conducting research and training residents) by considering their contributions to attracting top talent. Of particular note:

- In considering the time providers spend on non-patient care activities, we describe the VHA research program in depth, and how it contributes to advancing state of the art Veteran care and serves as a recruitment and retention tool for VHA.

- We also review affiliate relationships and provider time mentoring and training students, residents and fellows in a clinical setting. In addition to the mission of serving Veterans and their families, VHA leads the nation in integrating medical affiliations with clinics to provide a well-rounded learning environment, which improves provider retention.

While the majority of a provider's time is dedicated to providing care to Veterans, provider satisfaction (and therefore retention) is often increased when there is an opportunity to conduct research and/or have a medical school affiliation. In this section, we report the time providers spend on these activities, and the potential impact of these opportunities.

VHA: Educating and Training the Nation's Future Clinicians

According to a VHA report, 70 percent of all VHA staff physicians have a dual appointment (for research, teaching, and/or clinical services) with an affiliate university. VHA's relationship with academic affiliates dates back to the post-World War II era. Today, VHA has over 8,000 agreements with affiliate institutions at more than 1,800 universities/institutions and supports the training of 120,000 trainees annually (VHA Procurement & Logistics Office, Affiliate Guide to VHA Contracting, retrieved from http://www.va.gov/oaa/sole_source_contracting.asp). These relationships serve as a recruitment tool for VHA. In fact, providers who complete a clinical traineeship with VHA are nearly 30 percent more likely to consider future employment with VHA.

2.4.1   Summary of time allocation findings and analysis

We have synthesized data and observations from our analysis into the following findings. The sub-sections that follow describe the findings for VHA provider time allocation in detail.

- **Finding 20.** VHA physicians spend a comparable proportion of total time devoted to clinical activities as private sector physicians. There is some potential difference in the definition of direct patient care used by the private sector, specifically with respect to training, teaching and research, but we believe this represents only a small proportion of a provider's time (See Section 2.4.2)

- **Finding 21.** Across all VHA providers, less than two percent of time is devoted to research. Since provider time spent devoted to clinical care activities is comparable to the private sector, it does not appear that research activities reduce providers' time spent treating patients. Despite the overall low proportion of time spent on research, the accomplishments of VHA's research program, and contributions to advancing care for Veterans, are numerous. (See Section 2.4.4)

2.4.2   VHA providers' clinical time is on par with the private sector (Finding 20)

VHA physicians spend a comparable proportion of total time devoted to clinical activities as private sector physicians. There is some potential difference in the definition of direct patient care used by the private sector, specifically with respect to training, teaching and research, but we believe this represents only a small proportion of a provider's direct patient care time.

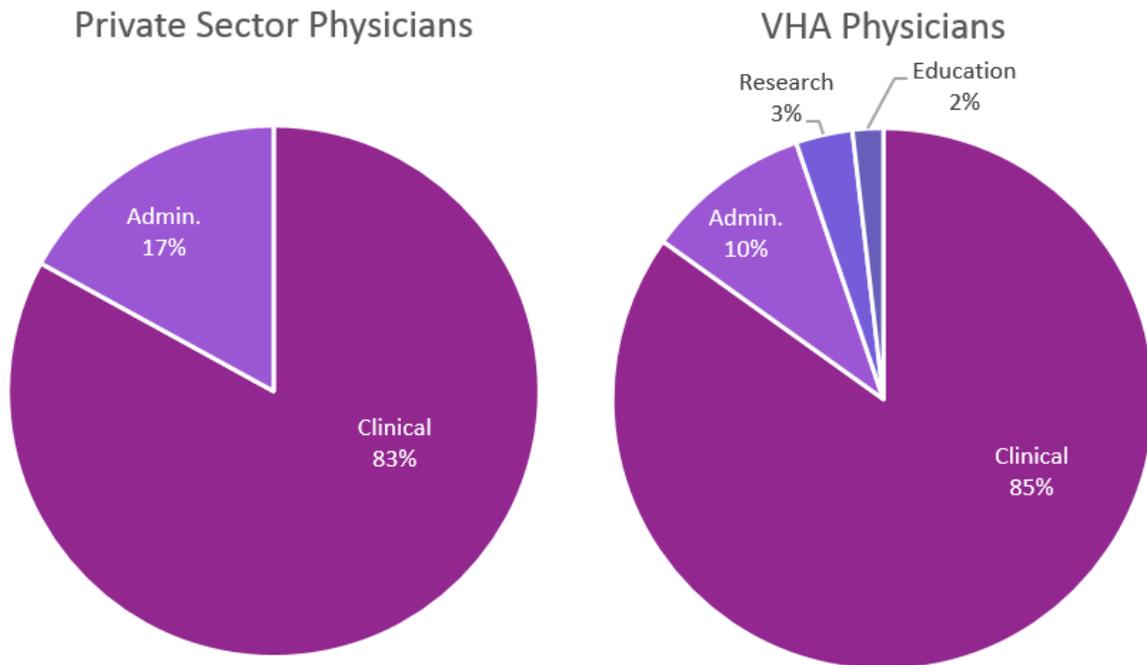
To meet the Section 201(G) requirement to assess VHA provider time spent on activities other than their case load, we analyzed VHA's cost accounting (labor mapping) data and compared it to the 2008 Health Tracking Physician Survey of 4,720 physicians (survey excludes residents and fellows). The physician survey includes time spent on patient record-keeping and patient-related office work, but excludes time spent on training, teaching and research from its definition of direct patient care activities (See Table 2-7). In comparison, VHA's definition of direct patient care includes training and research activities where they have a direct relationship to patient care. Through the course of site visits to VAMCs and interviews with over 350 providers we concluded that training, teaching and research are activities that generally occur outside of patient care hours, and usually represent a relatively small portion of a provider's direct patient care time.

We also considered the amount of VHA providers' time that is devoted to administrative activities. Frequently on site visits, VHA providers reported that the time they devoted to direct patient care is consumed by activities which are administrative in nature (e.g., charting, taking patient calls or booking a patient's follow up appointment). These administrative activities reported by VHA providers are similar in nature to the patient-related office work and record keeping that the industry survey defines as direct patient care (See Table 2-7).

Figure 2-31 highlights the percentage of time VHA physicians spend in clinical activities, in addition to administrative, education and research activities, and compared to the private sector. VHA physicians spend, on average, 85 percent of their time doing clinical work, based on labor mapping data, compared to 83.40 percent of physician time spent in clinical activities in the private sector.[195] In other words, comparing VHA physicians to the private sector highlights that VHA providers are spending a similar or slightly higher proportion of their time on clinical duties. For the reasons noted above, we do not believe that differences in the definition of activities that are included in "direct patient care" or "clinical time" are a significant factor when comparing VHA with the industry survey. Survey data on the time allocation of private sector physicians to education and research isn't available, since the survey did not break out teaching and research from what it defined as "administrative time" that is "medically-related".

---

[195] Woolhandler, S., & Himmelstein, D. (2014). *Int J Health Serv* October 2014 vol. 44 no. 4 635-642. doi: 10.2190/HS.44.4.a. Retrieved from http://joh.sagepub.com/content/44/4/635

Figure 2-31. Physician time allocation[196]


The proportion of VHA clinical or direct patient care time may be even higher when all VA providers are considered, as APPs tend to have a higher proportion of clinical time, and they represent 20 percent of the VHA providers. We did not include this comparison since APPs are not included in the private sector survey.

In VHA, "direct patient care" or "clinical" time (otherwise known as clinical FTE, cFTE) includes time overseeing residents, as well as completing "non-workload generating" tasks such as patient charting or making follow-up calls to patients. Administrative time includes tasks such as serving on hospital oversight committees, or completing required training. As noted above, some variance between provider clinical and administrative time in the private sector survey and VHA is due to the private sector survey not breaking out teaching and research time and differences in what VHA considers administrative time. Table 2-7 below displays the survey definition of direct patient care or clinical time and the VHA definition.

---

[196] Assessment G analysis of VHA labor mapping data , Provider Labor Detail FY14, provided by VHA OPES April, 9, 2015 and Woolhandler, S., & Himmelstein, D. (2014). *Int J Health Serv* October 2014 vol. 44 no. 4 635-642. doi: 10.2190/HS.44.4.a.

Table 2-7. Time allocation definitions private sector vs. VHA

	Definition from Health Tracking Physician Survey[197]	VHA Definition[198]	Key Differences
Direct Patient Care or "Clinical Care"	Direct patient care includes seeing patients, performing surgery, and time spent on patient record-keeping, patient-related office work and travel time connected with seeing patients. It does not include time spent in training, teaching, or research, any hours on-call when not actually working, and travel between home and work at the beginning and end of the work day.	Includes time to prepare, provide, and follow-up on the clinical care needs of patients, and includes: • Time spent in reviewing patient data • Consulting about patient care with colleagues (includes telephone clinics or calls consulting with consultants or staff members) • Reviewing medical records, charting patient treatments, and ordering and reviewing patient tests and consultations • Reviewing medical literature • Providing patient care, or contacting the patient or caregivers to discuss their needs • Supervising house staff residents providing care in a clinical setting, or medical students, while providing patient care • Attending educational programs designed to maintain or improve clinical skills, or participating in staff meetings focused on patient care delivery.	Provider time attending educational programs designed to maintain or improve clinical skills is included in the VHA definition but not in the survey definition. Additionally, the survey definition includes travel time connected with seeing patients; however, the VHA definition does not.

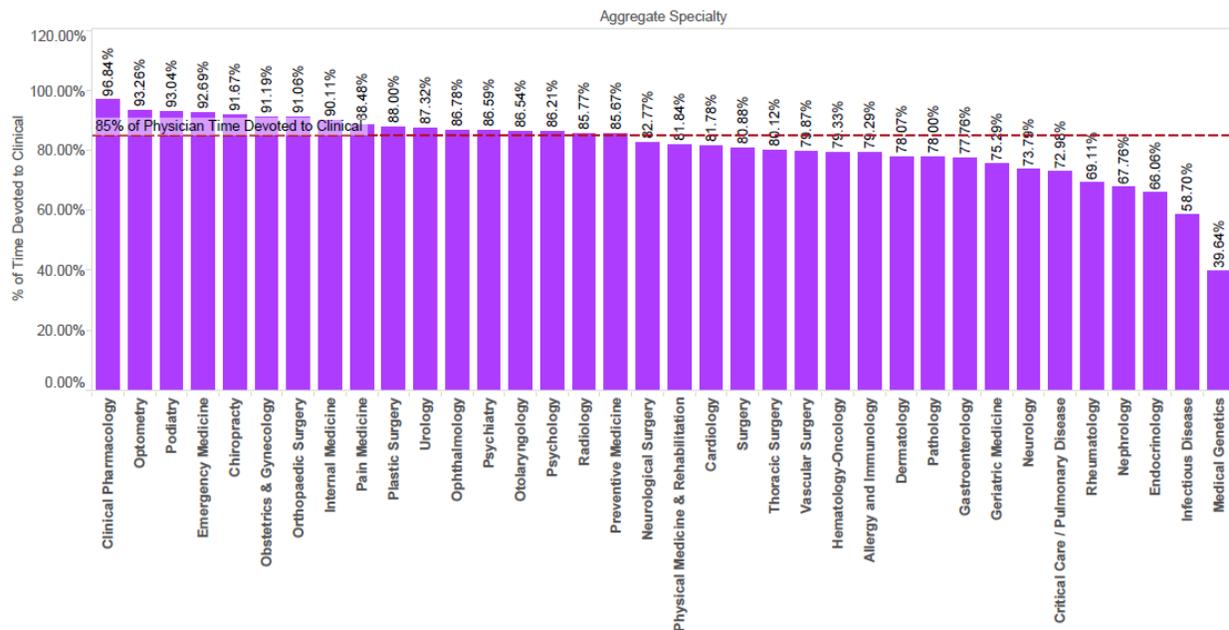
[198] U.S. Department of Veterans Affairs. (2011). VHA Directive 2011-009 Physician and Dentist Labor Mapping. Retrieved from http://www.va.gov/vhapublications/ViewPublication.asp?pub_ID=2384

The views, opinions, and/or findings contained in this report are those of Grant Thornton should not be construed as an official government position, policy, or decision.

	Definition from Health Tracking Physician Survey[197]	VHA Definition[198]	Key Differences
Administrative	Time spent on administrative tasks and professional activities that are medically-related.	Time spent on managerial or administrative duties at the department, service, facility, VISN, or national level both within and outside of VA. These duties include: • Performance reviews and reporting requirements • Managing a program within a clinical department, service or hospital • Serving on state and national committees, advisory boards, or professional societies.	VHA definition is more explicit in excluding medically-related administrative tasks from the definition.
Teaching/ Education	Not defined.	Time spent providing formal didactic education, both preparation and actual classroom time. This includes conferences in the community or nationally and classroom time teaching medical school curriculum.	Not able to assess.
Research	Not defined.	Time spent performing formal, approved health care research, or in activities in direct support of approved research. This includes: • Working on research projects approved by VAMC Research and Development Committee which does not produce recorded patient care encounter workload • Working in a research laboratory or controlled setting that involves no direct patient care • Serving on a hospital or affiliate research committee • Supervising a trainee's non-clinical research • Writing for publications or grants • Attending meetings for research activities and/or presenting papers • Sitting on a national study or grant approving board.	Not able to assess.

VHA physicians have, on average, 81.2 percent of their work time devoted to clinical duties. Out of all physician labor mapped time, 85 percent is clinical. Figure 2-32 breaks out the average proportion of time allocated to clinical activities by specialty, for physicians (it does not include APPs).

Figure 2-32. Percentage of physician FTE devoted to clinical by aggregate specialty[199]


The average U.S. physician spends 8.7 hours per week doing administrative tasks in a typical 53 hour work week.[200] In comparison, the average VHA physician spends 3.42 hours of an average 40 hour work week doing administrative tasks.[201] The additional time spent on administrative tasks in the private sector would typically be spent conducting research or educational activities, such as giving didactic lecture, within VHA. Additional information about providers' time spent conducting research, engaging in educational activities, as well as time spent overseeing residents and trainees in clinic, is provided in subsequent sections, as specifically requested by the Veterans Choice Act, Section 201(G). In the immediate subsequent section, we review providers' relationships with and time commitment to affiliated academic medical centers.

2.4.3 VHA facilities leverage affiliate relationships to serve Veterans

Since the end of the Second World War, the mission of VA has been tied to developing our nation's health care provider workforce. Many VA facilities across the country have close ties to academic medical centers and training programs across virtually every specialty and level of licensure. VHA's relationship with academic affiliates is a mutually beneficial relationship for all parties: "the best level of health care is provided in an environment in which the spirit of inquiry and investigation exists in combination with teaching and learning."(VHA Manual M-8, p.2)[202] The policy memorandum for affiliate relationships from the 1940s has remained largely unchanged since the 1940s, with the exception of one addition in the 1980s.[203] With this comes a provider workforce that splits their professional time between academic and VHA facilities, with various degrees of financial remuneration. VA conducts the largest education effort for health care in the United States through clinical training programs in association with the nation's leading academic institutions.

Based on labor mapping data, we found that, of all VHA providers (physicians and APPs), 1.09 percent of their VHA labor mapped (working) time was devoted to education activities, as defined by VHA. The graph below shows the allocated time to education (or training) based on specialty grouping, and was determined by taking the education FTE per specialty divided by the total labor mapped time (clinical, administrative, research, and education FTE) and grouped by Primary Care, Medical Specialty (hospital based), Medical Specialty (non-hospital based), Surgical Specialty, Mental health, and Dental. The percentage of physician time devoted to education/training (conducting educational activities with trainees in the classroom, for example, giving didactic lecture or Grand Rounds) is shown in Figure 2-33. This does not include time spent overseeing residents in the clinical setting.

Although we requested data specifically identifying which providers held dual appointments with affiliated academic medical centers, and the proportion of time spent at each from each VAMC we visited, the data we received was sporadic and incomplete. We received data from our site visits from eight facilities; however, the most detailed information came from the Durham VAMC. We have compiled a case study detailing the Durham VAMCs affiliation relationships, which was selected primarily due to its historical relationships and breadth of affiliations with surrounding institutions.

Case Study: Leveraging Dual Affiliations at Durham VA Medical Center

Building on established relationships with Duke University Hospital and University of North Carolina at Chapel Hill and affiliations with multiple departments, the Durham VAMC leverages these relationships for recruitment and retention purposes. These affiliations are cited as a successful recruitment tool by producing positive care delivery, quality of care, and increases to provider productivity.

The Durham VAMC is a strongly affiliated VA facility serving Veterans in the Durham, North Carolina area. Located across the street from Duke University Hospital, numerous providers hold dual-appointments between the two facilities. The dental program is affiliated with the University of North Carolina at Chapel Hill (UNC). The Durham VAMC has academic affiliations for multiple departments, outside of medical residencies, including audiology and speech pathology, imaging, psychology, nursing (anesthesia and auxiliaries), optometry, pharmacy, and

---

[207] Assessment G Data collected through pre-site visit data call to Durham VAMC, March 2015.

---

rehabilitation. In total, there are 2,027 trainees currently practicing and/or rotating at the Durham VAMC. This includes 748 medical residents, 429 medical students, 300 nursing students, 115 pharmacy trainees, and 79 physician assistants in training.[208]

The following specialties shown in Table 2-9 provided data to inform this case study:

Table 2-9. Durham case study specialty and data elements used[209]

Specialty	Data Element
Anesthesia	− 12 out of 17 physicians hold dual appointments with Duke − Range from .125 FTE to .875 FTE employment at Duke
ED	− 7 out of 15 physicians hold dual appointments with Duke
Geriatric Research and Clinical Centers (GRECC)	− 8 out of 8 physicians hold dual appointments with Duke − Range from .25 FTE to 1.0 FTE at VA
Greenville CBOC	− 9 physicians on-site (specialties unclear) hold dual appointments with Duke
Mental Health Service Line (MHSL)	− 28 physicians hold dual appointments with Duke
Pathology	− 3 physicians hold dual appointments with Duke
Primary Care	− 24 out of 36 physicians in the department hold dual appointments, though only 1 was paid by Duke
Radiology	− 30 out of 34 providers in the department hold dual appointments − Range from .125 FTE to 1.0 FTE at VA
Surgical Services	− 29 out of 34 surgeons in the department hold dual appointments − Range from .125 FTE to 1.0 FTE at VA − 2 out of 34 in the department were 1.0 FTE

Through interviews with over 55 providers, the site visit team was able to gain valuable insight into the role that dual-affiliation (dual affiliation allows a provider to teach and/or practice at the affiliate institution) plays at the Durham VAMC. A majority of physicians who are employed at the Durham VAMC have dual-appointments, and indicated that the prestige and opportunities that arise from time practicing at both locations was essential to their job function. Our interviews with providers and facility leadership surfaced several themes regarding the impact of an academic affiliation on provider productivity, which included topical areas of recruitment and retention, teaching and education, research, and quality of care – all

---

[209] Assessment G Data collected through pre-site visit data call to Durham VAMC, March 2015.

---

of which were expressed with a positive perspective. Similar responses were echoed at many other facilities with dual affiliations as well.

A number of respondents indicated that the close affiliation with Duke University in particular was essential for recruitment and retention. In comparison with other facilities, the Durham VAMC does not experience difficulties in attracting qualified talent. The ability to have an active role in research opportunities and an affiliation with a nationally recognized medical institution, both for providers and nursing staff, were discussed as chief reasons for having a high volume of applicants. These themes were consistent across our site visits where there were academic affiliations.

Many respondents also viewed the affiliation with Duke to be tied into the unique mission of the VA, which calls not only to care for Veterans but to train the next generation of health care providers. While some respondents did cite that the heavy integration with residency programs can diminish productivity due to the length of time trainees can take to see patients, the majority felt it was a major positive in all aspects of care delivery. In particular, interviewees felt that having a robust residency program and ties to prominent medical training centers such as Duke and UNC led to boosts in recruiting, quality of care, productivity, and care delivery practices. Some response examples from facility leaders and providers include:[210]

Recruitment:
- "The proximity to Duke University has a very positive effect on the facility overall. The facility is able to recruit top-notch residents and there is enhanced collaboration between the two institutions."
- "The Duke affiliation is a huge boost to our recruiting – other VHA locations have a much more difficult time finding providers to hire. This is not just on the MD level, many NP/PAs and Nurses want to get Duke on their resume for experience. As a result, the Durham VAMC does very little recruitment for providers."
- "It is very easy for this VAMC to recruit physicians as there is an academic affiliation with Duke; the only issues that come with recruitment are due to natural attrition and turnover. By comparison, [VAMC without an affiliation] struggle due to the lack of an academic affiliation."

Care Delivery Model:
- "I am able to run a Telehealth clinic here at the VA which is not available at Duke."

Quality of Care:
- "The academic affiliation with Duke has been a major positive for quality of care. There are even volunteers from Duke who are world-renown for their work and research, which boosts the care delivered at the VHA as well as its profile nationally."
- "The affiliation with Duke is a major positive for quality of care and for attracting/recruiting providers."

---

[210] Quotes from providers interviewed on site visit to Durham VAMC, March 2015.

Productivity:

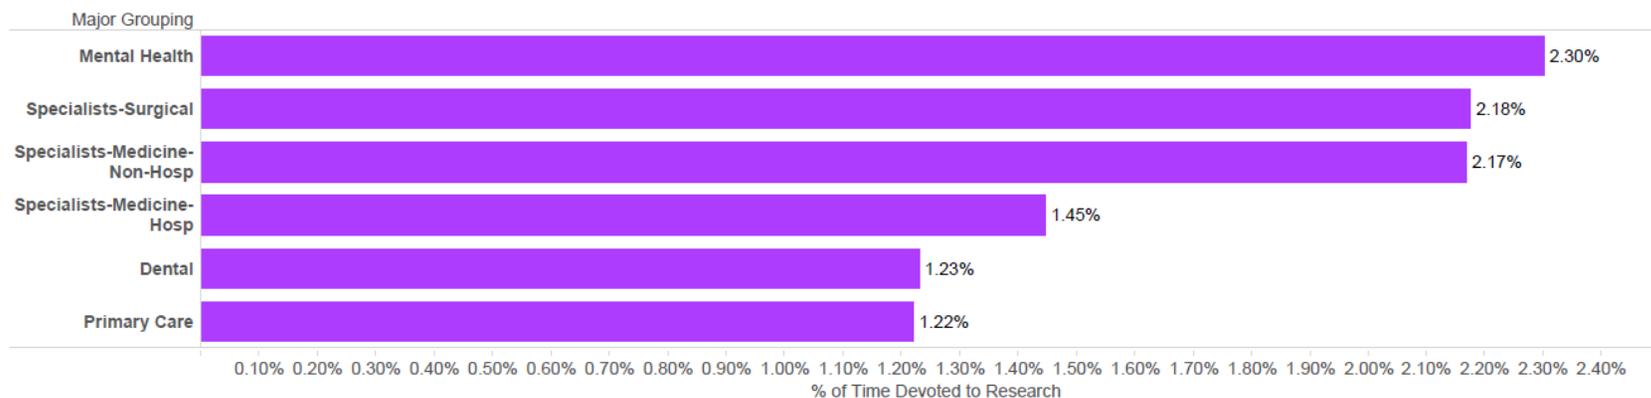
- "The attending/resident relationship allows for great productivity in certain specialties."
- "The close relationship with the Academic program can take additional time, and supervision can detract from productivity."

2.4.4 VHA providers advance Veteran care through research (Finding 21)

Across all VHA providers, less than two percent of time is devoted to research. Since provider time spent devoted to clinical care activities is comparable to the private sector, it does not appear that research activities reduce providers' time spent treating patients. Despite the overall low proportion of time spent on research, the accomplishments of VHA's research program, and contributions to advancing care for Veterans, are numerous.

To meet the requirements of Section 201(G) with respect to providers' time spent on research activities, we analyzed VHA's cost accounting (labor mapping) data. VHA's labor mapping data identifies individual provider research Account Level Budgeter Cost Centers (ALBCCs); as such, individual provider time conducting research was calculated by the summation of individual provider research ALBCCs.

We found that across all VHA providers, 1.97 percent of their time was devoted to research, per VHA's definition of research time. Figure 2-34 shows a breakout of provider work time allocated to research by specialty grouping, which was determined by taking the research FTE per specialty divided by the total clinical, administrative, research and education FTE, and grouping that by primary care, medical specialty (hospital based), medical specialty (non-hospital based) surgical specialty, mental health, and dental.

Figure 2-34. Provider percentage of time devoted to research[211]


Despite an overall low proportion of labor mapped time spent to research, VHA providers support a myriad of research projects in support of Veterans' unique health care needs.[212] Mental health providers have the highest proportion of time devoted to research out of all major specialty groups.

There are over 19,000 ongoing funded research studies at VA Medical Centers across the country.

---

[211] Assessment G analysis of Provider Labor Detail FY14, provided by VHA OPES April, 9, 2015.

[212] Clinically mapped time can include time spent conducting research, when research involves provision of care to patients (i.e. clinical trials).

In fiscal year 2015, VA will fund $600 million in research, with an additional $500 million provided through medical care support for research, and $700 million from other organizations ($500 million of which is from government entities, such as the National Institutes of Health [NIH]).[213] VHA and the Office of Research and Development (ORD)-funded research has grown from $581 million in fiscal year 2010, to an estimated $600 million in fiscal year 2016, an increase of 3.4 percent.[214, 215] There are currently 1,248 VA funded investigator clinicians, and an additional 972 VHA funded non-clinicians, for a total of 2,220 VHA funded investigators. This is an increase of approximately 11 percent from FY 2010.[216] An additional 1,091 funded investigators receive funding from NIH.[217] ORD estimated in 2010 that there were an additional 5,000 researchers not funded by ORD, but who use VA facilities, equipment, and the Veteran patient population to conduct their research.[218] Today, there are currently 19,406 ongoing funded research projects ongoing across VHA.[219] This research is ongoing at 104 VAMCs.

An evaluation of VHA's research portfolio conducted by Abt Associates in 2012 describes the impact of VHA's medical research and development (R&D) program. Specifically, Abt found that "in 2010 there were nearly 7,000 publications listing a VA address, which were cited almost 17,000 times. ORD-funded Principal Investigators (PIs) published, on average, 1.5 papers per year, a rate similar to NIH-funded investigators. The papers appeared in journals with high impact factors. Also in 2010, ORD received 10 patents and 169 licenses and filed 31 patent applications. The federal clinical trials database reported 28 Phase IV clinical trials conducted by VHA, of which 11 were marked as completed. It should be noted that this is not a definitive list of all clinical research funded by ORD." [220,] Figure 2-35 shows the research and development awards and advancements of VHA.

Figure 2-35. VHA research and development[221]

1940s
- Developed and tested **effective therapies for tuberculosis**
- Developed the **first rehabilitation program for blind persons** and standards for better-fitting, lighter artificial limbs

1950s
- Contributed to the development and **early use of the implantable cardiac pacemaker**
- **Linked smoking with cancer** of the respiratory tract and

1960s
- Performed the **first successful liver transplant** and developed anti-rejection techniques
- Pioneered concepts leading to the development of the CAT (CT) scan

1970s
- Identified **best treatments** for colon cancer, stable angina, high blood pressure, and other conditions
- **Nobel Prizes in Medicine** awarded to VA researchers Andrew Schally, Ph.D., and Rosalyn Yalow, Ph.D

1980s
- **Developed the nicotine patch** and other therapies to support smoking cessation
- Developed a computer-controlled ventilator system that improved patient outcomes
- **Developed the Seattle Foot**, a prosthesis that allows amputees to run and jump

1990s
- Found that the insulin pump is more effective than multiple daily injections for patients with diabetes
- **Identified genes for schizophrenia**, dementia, laryngeal cancer, Werner's syndrome, and Alzheimer's disease.
- **Developed an electrical stimulation system** that helps patients move paralyzed limbs
- **Nobel Prize in Medicine** awarded to former VA researcher Ferid Murad, M.D., Ph.D

2000s
- Showed the effectiveness of a new vaccine for shingles, a painful skin and nerve infection that affects older adults
- Identified a protein derivative that disrupts memory in an animal model of Alzheimer's disease and offers promise for developing early-detection tests or new drugs
- **Announced major funding initiatives for research on neuro-trauma**, chronic pain, and other health problems prevalent in combat-wounded Veterans returning from Afghanistan and Iraq
- Launched a multisite trial to **test robotic therapy for stroke rehabilitation**
- Demonstrated that a behavioral therapy called prolonged exposure is effective for treatment of PTSD
- **Developed high-performance prosthetic devices**, such as a bionic ankle that helps propel users forward
- Showed that implantable cardiac defibrillators decrease the risk of death in those with advanced chronic heart failure

---

Research as a recruitment and retention tool:

- **78 percent** of VHA providers state that research was a factor in their decision to come to VA
- **92 percent** state that it is an important factor in their decision to remain at VA

Of particular importance to any evaluation of staffing within VHA health care delivery system is the impact of a strong research program on recruitment and retention. VHA's research program was established in the 1920s to attract academic clinicians to the VHA system. The Abt study found that the research program is indeed a powerful recruitment and retention tool. Specifically, "87 percent of respondents [to the Abt survey] believed that the program was important or very important to the recruitment and retention of talented clinicians to VHA. In

---

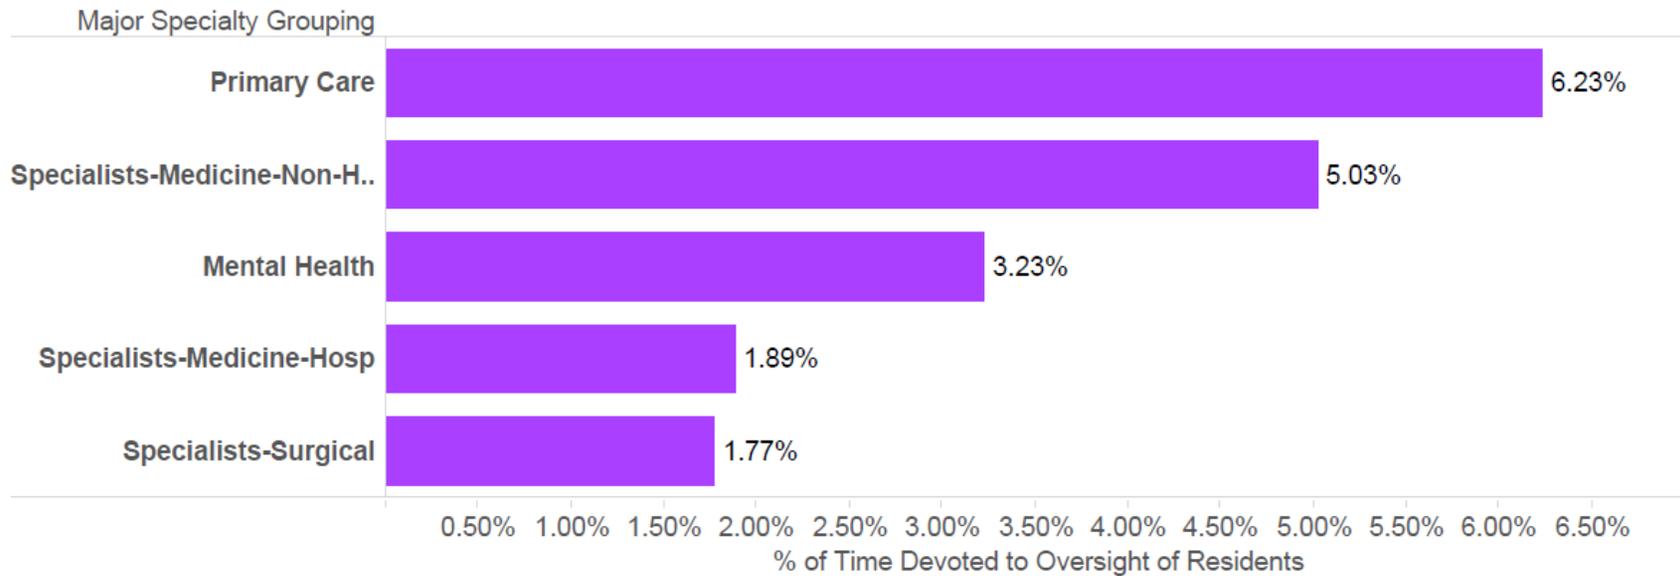
addition, the vast majority of researchers said that research was a factor in their decision to come to (78 percent) and to remain at (92 percent) VHA."[222]

2.4.5 VHA has a statutory mission to educate the nation's health professionals

VA has a statutory mission to "educate [health professionals] for VA and for the nation." This mission is codified in Title 38 U.S.C. Through its partnerships with affiliated academic institutions, VA conducts the largest education and training effort for health professionals in the nation.[223] Section 2.4.3 above details many benefits of this training program, particularly as tools for provider recruitment and retention. Because section 201(G) of the Veteran's Choice Act requests that we report on the time providers spend training health care professionals (i.e. residents), we report that 19 percent of providers spent some of their clinical time overseeing residents and trainees. For those providers, they spent 5 percent of their overall time training these health professionals.

It is difficult for providers and clinic business managers to quantify the amount of time that providers oversee residents, fellows, trainees, and clinical support staff as it is ingrained with other clinical duties. However, providers can be mapped within their clinical time to time spent training residents and trainees, using an ALBCC suffix which denotes clinical education (ED). We used this time as an estimation of time spent training and supervising other health care professionals of the department.

According to FY 2014 Worked Data (labor mapping), 19 percent of providers (physicians and APPs) spent clinical time dedicated to educating/training residents and other trainees. The time spent in a clinical training capacity totaled 5 percent of their allotted yearly time. We present in Figure 2-36 the total time spent overseeing residents and trainees in clinic, by provider, by specialty grouping (primary care, medical specialty (hospital based), medical specialty (non-hospital based), surgical specialty, mental health, and dental).

Figure 2-36. Provider oversight of residents and trainees in clinic by specialty grouping[224]


Major Specialty Grouping

	% of Time Devoted to Oversight of Residents
Primary Care	6.23%
Specialists-Medicine-Non-H..	5.03%
Mental Health	3.23%
Specialists-Medicine-Hosp	1.89%
Specialists-Surgical	1.77%

---

3 Recommendations

VHA's staffing and productivity practices have multiple stakeholders: congress and the executive branch, VA Central Office (VACO), VISN leadership, and VAMC leaders and staff. Reducing the barriers to provider staffing and productivity, encouraging innovation and addressing challenges, will require collaboration between all of these groups, and a commitment to making difficult, long-term change. The Assessment G recommendations should be considered in concert with the findings and recommendations of the other Veterans Choice Act Assessments (Assessments E-Scheduling, F-Clinical Workflow, and H-Technology).

By implementing these recommendations, along with the recommendations of the other Veterans Choice Act Assessments, VHA can evolve into a consistently high performing health system, enabling access to the high quality care in an efficient and cost effective manner.

3.1 Summary of Recommendations

We make five key recommendations for ways to reduce the barriers and address the challenges to provider staffing and productivity:

1. VHA should improve staffing models and performance measurement. (See Section 3.2)

2. VAMCs should create the role of clinic manager and drive more coordination and integration among providers and support staff. (See Section 3.3)

3. VAMCs should implement strategies for improving management of daily staff variances, and include a replacement factor for all specialties and PACT. (See Section 3.4)

4. VAMCs should implement local best practices to mitigate space shortages within specialty clinics. (See Section 3.5)

5. VHA should improve the accuracy of workload capture. (See Section 3.6)

In formulating these recommendations, our team considered the findings and recommendations of the other Veterans Choice Act Assessments, prior reports by VA's OIG, GAO and other government bodies, together with promising VHA practices identified in the course of our site visits and best practices from external health care organizations identified through the course of our literature review. For each recommendation, we identify the supporting evidence, relevant promising or best practices, and potential near-term actions or next steps.

To help VHA implement our recommendations, we have also included a discussion of cross-cutting implementation considerations that may be used to develop, enhance, or speed implementation.

3.2   VHA Should Improve Staffing Models and Performance Measurement

Insufficient use of staffing models and performance measurement tools (for example, SPARQ reports) limits VAMCs understanding of staffing and productivity gaps and the ability of medical centers to forecast staffing needs. To address this gap, VHA should evaluate its current staffing models and develop and implement outpatient specialty care staffing models, where few currently exist. Following this, VHA should improve performance measurement systems for productivity and staffing, incorporate fee-based providers in productivity measurement, refine and fully implement the nurse staffing methodology, and consider a work measurement study to confirm existing workload data. For future reporting, OPES should complete the development of the APP productivity cube, to include completion of business rules that would allow APPs to be mapped to a specialty designation and included in OPES specialty group practice and facility productivity reports to accurately reflect care teams' overall effort and present a combined provider (doctor of medicine [MD] and APP) productivity view.

3.2.1   Summary of supporting evidence

- **Finding 3.** VHA physician staffing levels per population are, in most specialties, lower than industry ratios. These ratios are not sufficient to establish whether VHA is staffed to meet demand. One factor to consider is that even industry physician supply is not sufficient to meet demand in many specialties. Another factor to consider is that VHA uses APPs extensively, but APPs are not included in industry ratios. (See Section 2.2.6)

- **Finding 6.** The actual panel size of VHA primary care providers is lower than internal and external benchmarks (See Section 2.3.5.5). Nationally, VHA's average modeled panel size for general practice physicians is similar to the calculated ideal panel size, which is the external benchmark derived from the American Academy of Family Physicians. The maximum panel size established by VHA facilities is usually lower than VHA's modeled panel size for general practice physicians at the same facility (the internal benchmark) as well as the ideal panel size for VHA providers (the external benchmark). The actual panel size for VHA general practice physicians is 13 percent below the VHA modeled panel size, 12 percent below the external benchmark, and 5 percent below the facility maximum.

- **Finding 16.** While there has been widespread implementation of the PACT model in primary care clinics and the National Nurse Staffing Methodology in many areas of inpatient care, there are no current VHA standards for staffing levels and/or mix in specialty clinics, with the exception of eye clinics. Furthermore, VHA OPES has developed state of the art tools for managing staffing and productivity, but these tools will require improvements for leaders to more effectively leverage them in resource decisions. Without staffing models or guidance (for most specialties), and tools that facilities will use, service chiefs do not have sufficient data to justify the number of resources needed to meet patient access standards.

- **Finding 14.** Clinical and administrative support staff ratios are insufficient and may limit provider productivity. (See Section 2.3.8.4). The ratio of support staff to VHA specialty

care providers is significantly lower than in the private sector (1.22:1 versus 2.5:1 in nonsurgical specialties and 3.68:1 in multispecialty practices) and the ratio is worse (1.16:1) in the larger and more complex level 1A VHA facilities. Further, the Assessment G team found that 43 percent of the 355 providers interviewed perceived insufficient clinical support staff (for example, nurses) to be a barrier to their productivity. This issue has persisted even with the implementation of the nurse staffing methodology.

- **Finding 15.** Insufficient clinical and administrative support staff results in providers and clinical support staff not working to the top of their licensure. (See Section 2.3.8.4.1). When VAMCs do not have adequate support staff, providers and nurses are unable to work at the top of their licensure, subsequently creating a cascade effect of staff not working to the top of their skill-level and ability and limiting productivity.

- **Finding 18.** Many facilities do not have a centralized staffing office or nurse float pool to address daily staff variances or absences. (See Section 2.3.8.4.4). Most VAMCs do not have effective strategies for addressing daily staff variances, resulting in breaks in the continuity of care, as staff are redeployed to cover absences, as well as higher use of mandated overtime, under or over staffing clinics, and over reliance on shared support staff across clinics. Sixty six percent of clinical staff surveyed in VHA specialty care outpatient clinics report that when they are absent, there is typically no one who covers for them.

- **Promising VA Practices** that were identified by the Assessment G team and are relevant to these recommendations are: the PACT II specialty care clinic model at the Southern Arizona VA Health Care System in Tucson, Arizona; the staffing model for specialty care clinics developed by the Portland VA Health Care System in Oregon; and the Magnet® recognized VA facility in Atlanta, Georgia, that tracks and reports Nursing Sensitive Indicators (NSI) data to VHA's National Database of Nursing Quality Indicators (NDNQI®). These practices are described in more detail in Appendix D.

- **External Leading Practices** that were identified by the Assessment G team and are relevant to these recommendations are: the PCMH model implemented by the Military Health System (MHS) and the measurement of the Primary Care Manager's (PCM's) continuity; the approaches to staffing models at Kaiser Permanente Medical Group Northern California and Mayo Clinic; and the quality journey designations used by health care organizations to drive organizational, staffing and quality improvements. These practices are described in more detail in Appendix D.

3.2.2 Potential near term actions

- Within 12 months, VACO should conduct an evaluation of the design and implementation of current VHA staffing models, such as PACT, BHIP, and PCMH, and the National Nurse Staffing Methodology, to determine the extent to which they are sufficient to meet the goals of VHA's population health focused model and access to care. Through this evaluation, identify whether gaps exist between policy directives and the implementation of these models. For example, identify whether the models have been implemented with:
  - o Adequate local data on patient demand, including special populations.

The views, opinions, and/or findings contained in this report are those of Grant Thornton and should not be construed as an official government position, policy, or decision.

131

- o Appropriate level and mix of clinical and non-clinical support staff.
- o Proper delineation of roles and responsibilities so that each team member performs to their highest functional level.
- o Sufficient clinic space and exam rooms.
- o Effective practices to ensure the continuity of staff and manage daily staffing variances.
- o Adequate training in the implementation of the staffing model.
- o Appropriate metrics to measure and monitor implementation and outcomes.

- Within 12 months, VACO should conduct a program review of the PACT program and the implementation of the PACT staffing model across facilities to identify the causes of the gaps between actual, facility maximum, modeled and external benchmarks, the impacts of these performance gaps on access to quality care, the appropriateness of current guidelines and performance standards, and determine areas for improvement.

- Within 12 months, VACO should develop and implement staffing models for outpatient specialty care services across VHA that can be used by medical centers to staff clinics efficiently to meet access standards. These models should be customized to meet the patient demand and care practices of different specialty clinic types. These models should by flexible, accurate, data driven, and scalable, as emphasized in VA's Section 301 report to Congress on March 9, 2015.

- Within 24 months, VISNs and VAMCs should improve existing performance measurement systems in order to realize the benefits of specialty care staffing models. For instance, increase the utilization of VHA's SPARQ reports by medical center leadership in staffing decisions by developing a performance management infrastructure around these tools. The performance management system should include: standard operating procedures, business rules, roles and accountabilities, data quality assurance and training.

- Within 24 months, VACO should assess the productivity of fee-based providers within VA clinics to properly reflect the staffing, productivity and capacity of VA clinics. Understanding the contribution of fee-based providers to the productivity of clinics will be important to determining the capacity of VA specialty clinics to meet VA's access standards. VACO should develop a tracking mechanism to regularly monitor the productivity and FTE level of these providers so that facilities can make appropriate make vs. buy decisions.

- Within 24 months, VACO should continue to refine and implement the National Nurse Staffing Methodology (VHA Directive 2010-034) across the Operating Room and Emergency Departments. We also recommend that the Office of Nursing Services continue to evaluate the implementation of the nurse staffing methodology throughout each implementation phase to: 1) assess the adoption rate of the methodology across VAMCs, 2) identify training/implementation support needs, and 3) identify lessons learned to further improve and enhance the staffing methodology deployment.
  - o To improve VHA's quality and performance measurement systems to realize the benefits of the Nurse Staffing Methodology, our team recommends VHA implement

the following actions: establish a target NHPPD range by level of care and service area; tie the NHPPD to facility budgeting and staff/workforce planning; mandate all VAMCs adopt, set targets and report NSIs to a national database such as NDNQI® in order to compare VHA's nurse quality and performance internally and externally; and pursue a quality journey designation, such as Magnet® or Baldridge, on order to drive improvements using National Nurse Staffing Methodology and nursing quality data.

o To improve the performance management systems to realize the benefits of the National Nurse Staffing Methodology, we recommend VHA continuously monitor actual FTE/HPPD to target FTE/HPPD variances, determine the VA national target HPPD range by reviewing external benchmarks (NDNQI®, LMI, Truven ActionOI®, etc.) by level of care and service area, and update the VHA Directive 2010-034 to align with the VHA national target HPPD range. In outpatient care, since there are currently no well-established nursing quality metrics reported or benchmarked in the industry, VHA should continue to conduct research and investigate how to develop appropriate nursing quality measures for outpatient care.

- Within 24 months, VACO should conduct a work measurement study (or confirm existing workload data) to determine the volume and distribution of workload annually to better match staffing requirements to demand. This will provide visibility in areas where core and surge resources may be needed and can inform the development of alternative staffing models. Understanding the workload distribution will also provide insights in how scheduling practices may be revised to maximize coverage.

3.3   VAMCs Should Create the Role of Clinic Manager and Drive More Coordination and Integration among Providers and Support Staff

Organizational siloes and separate reporting lines exist for physicians, nurses and medical service administrators at a majority of VAMCs. Additionally, there is frequently no dedicated manager responsible for the operations of VHA outpatient clinics. This makes it difficult for service chiefs and administrators to properly understand current clinic staffing and performance, coordinate daily staffing, and predict the future staffing needs of clinics. To address this gap, within 12 months VHA should create the role of clinic manager for specialty care clinics within each medical center. Under the general supervision of the physician leader, the clinic manager will be responsible for the supervision, direction, and coordination of the day-to-day operations of the clinic, including staffing and productivity.

To create more coordination and integration among providers, nursing staff, and medical service administrators, VAMCs could create multidisciplinary management teams for specialty clinics that include a physician leader, nurse leader, and business administrator. Alternatively, VAMCs could establish a single or dual reporting line and a service-line operating model (emphasizes groupings of specialties based on a care continuum, such as cardiac care) for providers and clinical and non-clinical staff, so that all members of the specialty clinic team have greater accountability to each other and to the service of the patient. The service chief could direct all staff in their daily patient care activities. The nurse executive position could be retained in the organizational structure to guide nursing staff in the scope of their practice. The

operating model should define: 1) span of control across the care continuum 2) the alignment of performance incentives 3) standardized roles and titles 4) standardized usage of data tools and metrics for clinics.

3.3.1   Summary of supporting evidence

- **Finding 17.** Organizational siloes and separate reporting lines exist for physicians, nurses and medical service administrators at a majority of VAMCs. As a result, service chiefs do not have control over the resourcing and performance of their clinical support staff (nurses) or clerical and administrative support staff. (See Section 2.3.8.4.3). This makes it difficult for service chiefs and administrators to properly understand current clinic staffing, coordinate daily staffing, and predict future staffing needs. Local clinical leaders reported that separate reporting lines make it more difficult to create a shared sense of accountability among clinical and non-clinical staff for the performance of clinics. Additionally, we observed that few clinics had a formal clinic manager who worked in partnership with the physician leader to manage the day-to-day operations of the clinic

- **Promising VA Practices** that were identified by the Assessment G team and are relevant to these recommendations are: the Fargo VA Health Care System in North Dakota realigned MSAs under the responsibility of a physician leader, the Service Line Chief; at the Huntington VA Medical Center in West Virginia, specialties were organized along service lines (groups of related specialty services provided by an interdisciplinary team of providers). These practices are described in more detail in Appendix D.

- **External Leading Practices** that were identified by the Assessment G team and are relevant to these recommendations are: the Walter Reed National Military Medical Center in Bethesda, Maryland, organizes clinical support staff and administrative staff for each specialty service under a physician service chief, or administrative officer that reports to the service chief, if the clinic is larger; at the Kaiser Permanente Medical Group Northern California Region, outpatient nursing and administrative staff are employed by the physician-owned Kaiser Permanent Medical Group, not the hospital, and report to the physician leader of each specialty clinic. These practices are described in more detail in Appendix D.

3.3.2   Potential near term actions

- Within 12 months, VACO should conduct a review of organization reporting structures within VAMCs and following the results of this exercise convene a meeting of clinical and administrative leaders from across the VISNs to develop agreed-upon options for implementing the clinic manager role and achieving greater coordination and integration between physicians, nursing and administrative staff at the clinic level.

- Within 12 months, VACO should develop and publish a directive which details the agreed-upon options for meeting the goals of coordination and integration.

- Within 12 months, VACO should develop a job description and staff classification for the role of clinic manager.

- Within 24 months, VAMCs should incorporate the role of clinic manager into budgets and develop a plan to recruit and staff this role.

3.4 VAMCs Should Implement Strategies for Improving Management of Staff Variances and Absences

Ineffective management of daily staff variances exacerbates staff shortages. We did not find facilities had a centralized staffing or nurse float pool to address daily staff variances or absences. Lack of such a strategy can result in breaks in the continuity of care, as staff are redeployed to cover absences, as well as higher use of mandated overtime, under or over staffing clinics, and over reliance on shared support staff across clinics. To address this gap, within 24 months, VHA should improve the management of daily staffing variances by implementing strategies that: assess the appropriate mix of staff for inpatient care based on census variation; implement a float pool; include a replacement factor in staffing models; and developing a consistent staffing approach for continued observation (CO).

3.4.1 Summary of supporting evidence

- **Finding 18.** Many facilities do not have a centralized staffing office or nurse float pool to address daily staff variances or absences. (See Section 2.3.8.4.4). Most VAMCs do not have effective strategies for addressing daily staff variances, resulting in breaks in the continuity of care, as staff are redeployed to cover absences, as well as higher use of mandated overtime, under or over staffing clinics, and over reliance on shared support staff across clinics. Sixty six percent of clinical staff surveyed in VHA specialty care outpatient clinics report that when they are absent, there is typically no one who covers for them.

- **Promising VA Practices** that were identified by the Assessment G team and are relevant to these recommendations are: the Fargo VA Health Care System in North Dakota, used several techniques, for example, float pools, to flex nursing staff to address daily staffing variances across inpatient units and outpatient clinics; the VA Medical Center in Houston, Texas, used CareWare®, a commercially available nurse staffing software to monitor and address daily staffing variances.

- **External Leading Practices** that were identified by the Assessment G team and are relevant to these recommendations are: Aultman Hospital, an 800+ bed Magnet® facility, implemented a central staffing office and a specialized float pool where financial incentives were provided for part-time nurses to pick up additional shifts; using a float pool has become a major strategy for health care organizations to help staff the facilities replacement factor for leaves for example, sick call-ins, vacations, or to cover high-volume needs.

3.4.2 Potential near term actions

- Within 12 months, VACO should assess the appropriate mix of full-time, part time, and intermittent staff for inpatient care based on census variation. Our team observed that

---

VHA is already following some best practices to address daily variances such as conducting daily bed management meetings and cross-training staff to work in multiple units/clinics.

- Within 12 months, VAMCs should establish a central staffing office and float pool in the medical center that includes full-time, part-time, and intermittent staff to achieve the targeted HPPD.

- Within 12 months, VACO should include a replacement factor across all staffing methodologies/models. In the inpatient setting, consider funding the float pool with the replacement factor as identified in the National Nurse Staffing Methodology. In the outpatient setting, develop a replacement factor methodology (the PACT model does not include a replacement factor).

- Within 24 months, VACO should evaluate CO (continual observation) utilization based on historical usage, estimating potential reduction in those hours based on protocol development and develop a flexible staffing methodology to address CO needs (include CO workload into the float pool).

3.5   VAMCs Should Implement Best Practices to Mitigate Space Shortages in Specialty Clinics

A shortage of exam rooms and poor configuration of space may limit provider productivity. Insufficient exam rooms and poor configuration of space limits provider productivity and their ability to maximize patient throughput while reducing patient access. To address this gap, within 24 months, VAMCs should develop and implement strategies to mitigate the impact of space shortages within specialty clinics. VAMCs should consider strategies such as: 1) Expanded clinic hours of operation; 2) Standardized schedule templates to optimize the use of exam rooms; 3) System redesign initiatives to improve patient flow within the clinic; 4) Increased use of non-face-to-face encounters in specialty care for follow-up consults; 5) Evaluating the changing of return visit interval when appropriate and/or change mode of return visit, for example, alternatives to face-to-face visit, such as telephone or secure messaging; 6) Developing exam room ratios to meet the needs of staffing models.

3.5.1   Summary of supporting evidence

- **Finding 13.** Insufficient exam rooms and poor configuration of space limits providers' productivity, ability to maximize patient throughput and reduces patient access. (See Section 2.3.8.3).

- **Promising VA Practices** that were identified by the Assessment G team and are relevant to these recommendations are: the Boston VA Health care System in Massachusetts, in order to work around space shortages, expanded clinic hours to provide care in the evening and weekends

- **External Leading Practices** that were identified by the Assessment G team and are relevant to these recommendations are: at the Kaiser Permanente Northern California Region, outpatient specialty clinics have implemented care models that use multiple

modes to deliver patient care for example, group visit, individual office visit, telephonic and video consultations, and secure email. These multiple modes are important to make the most efficient use of clinic space and to maximize access to face-to-face appointments for first-time patients. The Mayo Clinic in Rochester, Minnesota has addressed space utilization by moving away from standard room ratios to a utilization standard (percentage of the day that a clinic uses a room). Based upon the utilization metric, rooms can be given to a clinic and taken away based on this standard.

3.5.2   Potential near term actions

- Within 12 months, VACO should conduct a review of clinic space configuration, with particular emphasis on specialty care. Following the results of this assessment, VACO should convene a meeting of VISN clinical, administrative, and facilities engineering and space planning leaders to review the findings and develop national standards for clinic space configuration.

- Within 12 months, VACO should assess alternate strategies to optimize existing space and alleviate the demand on clinic space. This study should examine internal and external best practices for strategies such as: 1) Expanded clinic hours of operation; 2) Standardized schedule templates to optimize the use of exam rooms; 3) System redesign initiatives to improve patient flow within the clinic; 4) Increased use of non-face-to-face encounters in specialty care for follow-up consults; 5) Evaluating the changing of return visit interval when appropriate and/or change mode of return visit, for example, alternatives to face-to-face visit, such as telephone or secure messaging; 6) Developing exam room ratios to meet the needs of staffing models.

- Within 24 months, VACO should develop a directive with national guidance for optimizing existing clinic space and alleviating demand on clinic space.

- Within 24 months, VAMCs should review the directive and customize and implement the recommended strategies for optimizing their existing space and alleviating the demand on clinic space.

3.6   VHA Should Improve the Accuracy of Workload Capture

Providers may not be fully documenting their clinical workload. This may impact the accuracy of wRVU productivity measurement and the ability of medical facilities to properly manage providers' availability. It is also important to measuring whether clinical pathways are being appropriately followed and understanding care outcomes. To address this gap, VHA should conduct an audit of medical record documentation and CPT® coding and diagnosis accuracy/reliability to validate physician productivity measurement. Further, VHA should evaluate the ability of commercially available CAC applications to assist providers, or professional coders, with coding.

3.6.1 Summary of supporting evidence

- **Finding 19.** During site visits and interviews with VHA Central Office leaders, we consistently heard concerns that providers do not fully document and accurately code all of their clinical workload. (See Section 2.3.8.5).

- **Promising VA Practices** that were identified by the Assessment G team and are relevant to these recommendations are: at the VAMC in Detroit, Michigan, facility leaders found productivity (wRVUs) within the Nephrology clinic was 12 percent off the national median. They investigated and found that workload within the Nephrology clinic was not being captured accurately. The Section Chief worked with the providers to address the coding issue and productivity increased from 12 to 94 percent. The facility highlighted this success and other clinics, as a result, became more aware of the importance of accurate coding.

- **External Leading Practices** that were identified by the Assessment G team and are relevant to these recommendations are: Coding Assistance Applications (otherwise known as computer assisted coding, or CAC) are increasingly being used by the private sector to improve coding consistency and reduce errors; at the Kaiser Permanente Northern California Region, coding is not used for the purposes of billing. The principle purpose of coding is to create a database of discrete, specific, and identifiable clinical activities. For clinicians, the goal of coding is to measure and understand clinical demand, the specific care activities provided and to track clinical outcomes for specific groups of patients. Additional uses are for the appropriate regulatory, business and financial needs of Kaiser Permanente.

3.6.2 Potential near term actions

- Within 12 months, VACO should conduct an audit of medical record documentation and CPT® coding and diagnosis accuracy/reliability. It should use the results of this assessment to further validate physician productivity measurement.

- Within 12 months, VACO should evaluate national and facility-level coding policies and procedures. VHA should use the results of these studies to improve provider training in coding and develop improved and standardized procedures for workload capture and validation across the VHA system.

- Within 12 months, VACO should evaluate the ability of commercially available CAC applications to assist providers, or professional coders, with coding.

- Within 24 months, VACO should work with VAMCs to procure and implement CAC applications in medical facilities.

3.7   Implementation Considerations

As previously noted and in alignment with Section 201 of the Choice Act, the assessments, findings and recommendations were developed independently. We therefore expect the recommendations for Assessment G will need to be refined and integrated by VHA leadership into ongoing change efforts (for example, MyVA). There are a number of cross-cutting

implementation considerations for the successful adoption of the recommendations described in Section 3.6. These implementation considerations may be used to develop, enhance, or speed implementation. They are described here:

3.7.1 Understand the systemic nature of the issues and the solutions needed to address them

Current approaches to dealing with staffing and productivity challenges typically prompt leaders to initiate a series of discrete change initiatives with specific technical and tactical interventions. These discrete initiatives may result in new roles and responsibilities, training, or a national policy or mandate for medical facilities to follow. Experience shows that these initiatives will have varying degrees of success because they frequently do not address the underlying problems of "whole systems". To enhance the chances of success for the recommendations outlined in this assessment, we recommend that VHA leaders adopt a "whole systems" perspective and engage those involved in the problems or issues (facility leaders, physician leaders, providers, clinical support staff, administrative support staff,) in co-creating the solutions to these issues. The solutions to these issues are best when they emerge from the interactions of divergent points of view in service of an overarching goal.

3.7.2 Seize the opportunity to bring stakeholders together to co-create solutions

Co-creation has been increasingly embraced by government as an opportunity to solve complex challenges and transform government. For example, the White House Open Government Initiative has involved more than 42,000 citizens in more than 300 challenge competitions to help solve some of the most challenging and important problems facing the nation. The NASA Center of Excellence for Collaborative Innovation uses public participation through competitions to help NASA extend and accelerate innovation, increase its problem solving capacity, generate ideas, and solve vexing problems. VA's Center for Innovation (VACI) has since 2010 worked to identify, test and evaluate new approaches to the agency's most pressing challenges. VACI holds employee competitions each year which target innovations for health care and VA business processes and practices.

Many leaders assume, incorrectly, that solutions to problems proposed by a limited set of players can be propagated throughout the agency. They label people with dissenting points of view, who may hold insights into how the changes can be improved, as obstacles to change. The co-creation approach on the other hand recognizes that everyone who is involved in the problem must be involved in the solution.

3.7.3 Understand the resource implications of new and existing mandates

It is critical that leaders understand the resource implications for medical facilities of new directives and initiatives from central office. Unfunded mandates were seen as a significant challenge by leaders and staff at the VAMCs we visited. For example, the Assessment F team found that mandated clinical staff positions for primary care PACT were reported by providers to have been filled by pulling clinical staff from other programs and from the inpatient setting.

Similarly, the implementation of the national nurse staffing methodology was undermined by the failure to fund this mandate. While these are only two examples from interviews on site visits, it is clear that facilities are feeling challenged in their ability to execute against multiple mandates. In any instance where targeted new initiatives and mandates, such as those recommendations above, are being contemplated, congress and VACO should strongly consider whether additional resources are required and provide them as needed.

Appendix A   Supplemental Provider Productivity Data

This appendix contains additional content, tables, and figures used to inform findings.

A.1   Productivity (wRVU) by Specialty

Figure A-1 provides additional detail in support of Section 2.3.6, Specialty Care. The graphs illustrate wRVU productivity internal and external benchmarks for all providers, by specialty, at complexity level 1A facilities. It also includes, for each specialty: total headcount of providers, total paid FTE (includes non-working compensated time), and total encounters generated during FY 2014. It depicts the internal percentiles of wRVU productivity, alongside the median performance in MGMA and AMGMA survey benchmark data sets. These graphs highlight instances in which a particular specialty may have lower median productivity than benchmark data sets, yet have higher productivity at the 75th percentile relative to the benchmark medians. Of note, since APPs cannot be mapped to an individual specialty, they are excluded from this analysis, both in the VHA data and in the benchmarks. Primary care providers have been removed from this data set; as such, the internal medicine category would include primarily hospitalists or other internal medicine providers not working in a primary care setting.

Following, Figure A-2 shows the same data for complexity level 3 facilities.

Figure A-1 and Figure A-2 show the results of an Assessment G analysis which used Provider Detail FY14 provided by VHA OPES, February 26, 2015, and Provider Labor Detail FY14 provided by VHA OPES, April, 9, 2015, as well as the 2014 AMGMA and MGMA surveys for benchmarking.

Figure A-1. Internal and external productivity benchmarks by wRVUs, complexity level 1A facilities

Figure A-2 provides additional detail in support of Section 2.3.6, Specialty Care. The graphs illustrate wRVU productivity internal and external benchmarks for all providers, by specialty, at complexity level 3 facilities. It also includes, for each specialty: total headcount of providers, total paid FTE (includes non-working compensated time), and total encounters generated during FY 2014. It depicts the internal percentiles of wRVU productivity, alongside the median performance in MGMA and AMGMA survey benchmark data sets. These graphs highlight instances in which a particular specialty may have lower median productivity than benchmark data sets, yet have much higher productivity at the 75th percentile relative to the benchmark medians.

A.2 Productivity (wRVU and encounters) by facility

The productivity graphs below depict the total productivity generated at each facility sorted by facility complexity level (this includes physicians and APPs, as well as all specialties, and primary care). Productivity was calculated both using encounter and wRVU totals. Productivity by Encounters is calculated using the total encounters per facility divided by the total adjusted clinical FTE. Similarly, the Productivity by wRVU is calculated using the total adjusted worked RVUs divided by the adjusted clinical FTE. The productivity levels increase according to the complexity level of the facility however productivity does not rise as dramatically as overall FTE levels per facility.

Figure A-3. Productivity by wRVU for level 1a facilities

A.3   Primary care panel size by facility

The following figures show the panel size comparison by facility, grouped in VISN. Figures present the actual panel size, the facility determined maximum panel size, and the modeled panel size (recommended by VHA's PCMM tool) per 1.0 FTE, as of September 30, 2014.

Figure A-13. Facility average panel size and modeled panel size per FTE

Measure Names
- Actual Panel Size per 1.0 FTE
- Facility Determined Maximum per 1.0 FTE
- Modeled Panel per 1.0 FTE

Appendix B   Methodology

B.1   Overview

The Assessment G team used a combination of quantitative and qualitative methods to address the objectives and research questions of the report.

Our quantitative calculations are derived from a variety of VHA sources: site visits, VHA labor mapping encounters, wRVU and FTE data, site visits data and data reported in prior VHA reports. We obtained benchmark data published from sources such as MGMA and AMGMA, among others. In working with our data sets, our team calculated time allocation of VHA providers, FTE totals, and productivity of providers by encounters and wRVU industry benchmark rankings, and comparison of salary ranges and salary percentiles using benchmark surveys. Prior to our calculations, our team cleaned/defined our data sources, determined appropriate aggregate and major groupings of specialties and applied relevant adjustments to VHA workload data for comparability to industry (modifiers, gap and imputed codes, and duplication of workload credit to multiple providers).

Qualitative methods used by the team include: a literature review of relevant VHA policies and directives related to staffing and productivity, a literature review of relevant best practices across external health care industry organizations, interviews with VHA national policy and operations leaders and staffing and productivity subject matter experts and site visits which included interviews with VA medical facility leaders, health care providers, space, content analysis of the interview results and a root cause analysis of identified barriers.

Our team developed objectives and research questions for our overarching study, as well as for a separate sub-study of nursing staff.

Figure B-1 depicts the relationship between the Assessment G objectives and research questions, and the quantitative and qualitative methods employed in the study.

Figure B-1. Methodology Overview

OBJECTIVE:

Describe the current state of VA provider staffing levels, as compared to industry standards, benchmarks, and metrics.

Identify and analyze the provider productivity within VHA as it relates to specialty and provider specific metrics.

Describe the relative time spent by providers on non-patient care activities.

QUESTION

Is provider staffing similar to the private sector relative to the number of patients served?

If provider staffing and productivity levels differ from the private sector, what are the unique characteristics of VA and the patient population it serves that contribute to these differences?

Are VA providers as productive as similar providers in the private sector?

What is the relative proportion of time that provider staff spend on activities other than direct patient care in a VA medical facility and how does this compare to health care industry performance metrics?

How does the unique mission of VA or other factors explain the time spent on activities other than direct patient care within a VA medical center?

DATA

Conduct benchmark study of VA salaried providers compared to MGMA, AMGMA, AMGA, other industry accepted benchmark data sets

Compare ratios of physician supply per population to benchmark data sets

Using benchmark study, assess what percentile VA providers fall in relative to the private sector. (Providers compared by specialty of practice)

Using VA cost accounting system data find proportion of time providers spend on activities not related to patient care, and compare to benchmark data sets

DOCUMENT

Literature review of VHA policies/directives

Review of external best practices

Interviews w/ national, facility-level leadership, providers, and support staff

Conduct Root Cause Analyses of productivity barriers identified in interviews

marketing/deliverables/choiceact/assessmentG-04

Our assessment of overall staffing and productivity included analyses of the methodology, metrics, data sources, and decision-making processes that are utilized by VA medical facilities to determine staffing levels and budget allocations for nursing support both in inpatient and outpatient clinical areas. Our team paid special attention to decision drivers for nursing support because clinical support staff were found to be important influences of provider productivity. Nursing objectives and developed research questions are shown in Table B-1.

Table B-1. Nurse staffing objectives and developed research questions

Objective	Research Questions
Assess the methodology, types of data and decision making processes used by Medical Centers to allocate budgets and determine staffing levels for inpatient and outpatient nurse[225] staff.	What is VHA's methodology for nurse staffing of inpatient and outpatient clinics (primary and specialty care)?
	What directives, policies, and management reports govern safe and effective inpatient and outpatient nurse staffing decision making?
Describe the unique factors which impact VA budget allocation decisions and inpatient and outpatient nurse staffing decisions.	What nursing-sensitive indicators, care paths, and evidence based practices does VA develop that, in turn, drive nurse staffing processes?
	What are the nursing-sensitive quality measures that align with national performance measures to ensure adequate nurse staffing?

---

[225] **_Definition_**: _VHA nurses, for the purposes of this assessment, are defined in nurse staffing categories that include: Assistant Nurse Manager (while performing direct patient care), Charge Nurses, Clinical Nurse Leaders, staff registered nurses (RNs), graduate nurses (not yet licensed), Licensed practical nurses (LPNs) or vocational nurses (LVNs), Nursing Assistants (NAs) or Certified Nursing Assistants (CNA); excluding Nurse Managers, Assistant Nurse Managers (while performing administrative activities), Advanced Practice Nurses (Nurse Practitioners, Clinical Nurse Specialists) unit secretaries/clerks, monitor technicians, sitters, escorts, students (who are fulfilling educational requirements), and therapy assistants. Nurses are licensed by National Council Licensure Examination (NCLEX) examination and licensed in their resident state or by Nurse Licensure Compact (NLC), which allows RN nurses and licensed practical/vocation nurses (LPN/VN) to have one multistate license providing them with the ability to practice in both their home state and other NLC states. Nursing practice is described as the protection, promotion, and optimization of health and abilities, prevention of illness and injury, alleviation of suffering through the diagnosis and treatment of human response, and advocacy in the care of individuals, families, communities, and populations. VHA nurses are employed full-time by VA and some are employed on a contract basis._

Objective	Research Questions
	What best practices and challenges has VHA encountered in adopting the VHA Directive 2010-034 nurse staffing methodology and other nurse staffing methodologies for outpatient settings (i.e., specialty and primary care)?
Describe and compare VA's methodology and decision-making processes for staffing allocations and determining inpatient and outpatient nurse staff ratios with private sector best practices.	What industry best practices align with the VHA nurse staffing methodology?
	How have external health care organizations addressed similar challenges and barriers in their nurse staffing methodology?
Identify potential opportunities for enhancements.	How can strategies developed by external health care organizations be applied by VHA to address its nurse staffing challenges and barriers?

The remainder of Appendix B is organized around the core assessment objectives. Each section describes the data definitions, sources of data, data quality, assumptions, and approach to analyzing data, for that objective. Following, we articulate our approach to selecting and executing site visits and analyzing data from the site visits.

B.2 Provider staffing levels (Objective 1)

Section 201(G) of the Veterans Choice Act requests "the staffing level at each medical facility of the Department and the productivity of each health care provider at such medical facility, compared with health care industry performance metrics…" The Assessment G team broke this into two separate requirements – staffing levels and productivity. The methodology for determining staffing levels of providers at each medical facility of the Department is included in this section. The methodology for determining provider productivity, compared to industry performance metrics, is included in the subsequent section. Staffing levels analyses include the total paid FTE, by specialty, groupings of specialties, and by facility, and a comparison to industry population based staffing ratios. In addition to assessing staffing levels, we also assessed several barriers to appropriate staffing levels. One potential barriers to reaching adequate staffing levels is salary for providers. To compare salary of VHA providers to industry, we conducted a separate analysis, which is also described in this section.

B.2.1   Definitions

Staffing level is defined as the sum of VA *paid* FTE (employees) who meet the definition of provider. This excludes fee-based providers under contract to provide care within VA facilities, (as they are not employees and there is no FTE information available on them), as well as non-VHA providers serving Veterans under contract in the community or at medical affiliates. One FTE equates to 2,080 hours per year, and includes paid benefit time (for example, paid vacation and holiday time). The staffing level calculations aggregate all FTEs, meaning all full and part time employees are totaled. For all calculations, we report average staffing levels over FY 2014.

Provider is defined as an independent licensed practitioner (Physician Assistants [PA], Nurse Practitioners [NP], Doctor of Medicine [MD], Physical Therapists, Psychologists, Optometrists, Dentists, Podiatrists, Social Workers) as noted in the glossary of Appendix G. Although contract and fee providers are, in some facilities, a significant proportion of care delivery teams (for example, an acute, complexity level 3 facility with a low demand for a service may be staffed in a particular specialty with only one fee-based provider who works only part time), they are deemed out of the scope of this assessment, due to the inability to quantify staffing levels (Worked FTE), or hours worked, as VA does not track this information.

Paid FTE is defined as the total number of hours for which a provider is paid by VHA. The paid FTE includes provider leave hours taken during FY 2014

Major Specialty Groupings: are categories for each specialty in VHA. Primary care is considered one of the Major Specialty Groupings but it was grouped and analyzed separately after each primary care provider was flagged in the data file. Table B-2 defines which specialties are included in which major grouping:

Table B-2. Specialties in major grouping

Specialty	Specialty Grouping
Addiction Psychiatry	Mental Health
Adolescent Medicine	Specialists-Medicine-Non-Hosp

List developed based on internal Assessment G expertise of common industry groupings.

B.2.2 Data sources

For the staffing level analyses, to include FTE analyses and fee-based provider wRVU analyses, we used three key data sources:

- VHA OPES Labor Mapping Data File run for pay periods corresponding with FY2014, entitled, "Provider Labor Detail FY14"This file includes the individual cost accounting codes and allocation of hours to each for each provider. A data definitions sheet accompanied this file.

- VHA OPES Productivity Data File for FY2014, entitled "Provider Detail FY14". This file includes information on wRVUs, encounters, specialties and FTEs. This file also included an accompanying data definitions file.

- Dental FTE calculations used the de-identified dental hourly and productivity data from the OPES Decision Support Extract File, entitled "201G FY14 Aggregate Dentist" and an associated file, "Dental Data Dictionary."

We reviewed and considered:

- The Graduate Medical Education National Advisory Committee (GMENAC) Study: Conducted in 1980 at the behest of Congress to determine the number of physicians needed per 100,000 population. [226]

- Journal of the American Medical Association publication from 1996: The Goodman ratio is derived from Dr. David Goodman's 1996 published findings in the Journal of the American Medical Association on the providers needed for a national fee-for-service community. [227]

- Journal of Health Care Management 1989 publication: The Hicks and Glenn ratio comes from a 1989 publication in the Journal of Health Care Management where Dr. Hicks and Dr. Glenn studied physician per population needs based on the current rate of patient visits to specialists as determined by the Department of Health and Human Services. [228]

- Thomson Health Care Study: The Solucient ratio is generated from a 2003 health care consulting firm study called Solucient (later acquired by Thomson) which assessed patient to physician visits using National Ambulatory Care Administration and Medical Group Management Association data.

- Truven Health Analytics: Truven has calculated ratios using 2014 data on the supply of physicians across the United States from internal Truven physician FTE databases and population data sourced from The Nielsen Company. Because the Truven data was the most recent ratio, we elected to use this ratio, though the others were analyzed initially, but excluded from the final report.

We assessed how VHA salary ranges compare to the private sector. For this analysis, we used:

- VA Salary data used the Final Approved Pay Ranges for Physician and Dentists effective January 11th, 2015[229]

- Industry Salary Data used the most recent AMGMA compensation and production survey entitled[230]

B.2.3 Assumptions and limitations

FTE calculations: The staffing level data does not include fee-based providers because FTE cannot be calculated without collecting extensive amount of data from querying individual medical centers across the Department, which would not be feasible given the time allotted.

[230] AMGMA Academic Practice Compensation and Production Survey for Faculty and Management: 2014 Report Based on 2013 Data.

The staffing levels aggregates specialties into major specialty groups and exclude clinical nurse specialists. The crosswalk of Major Specialty Groupings is listed in the definitions sections.

Comparing VHA Staffing to Industry: The comparison of VHA staffing levels to industry ratios used the physician FTEs relative to the 2014 VHA medical care enrollee population of 9,111,955.[231] Some VHA specialties were excluded because our team limited our comparison to the specialties with comparison data available. All VHA specialties that had at least one industry specialty represented in the Truven Study are included. Physician supply per 100,000 population ratios are commonly used by hospitals and health care systems as one input to identify staffing needs, and for community health needs assessments required for not-for-profit health systems under the Affordable Care Act. Typically, physician-to-population ratios are considered an indicator of physician need, but not a definitive benchmark, because they do not factor in demand. To more comprehensively understand need and to develop complete medical staffing plans, health care organizations should make projections at a local/community level, with a comprehensive assessment of local/geographic patient needs such as disease incidence and patient demographics, and demand for services, as well as physician demographics and practice styles, payment systems and other unique market factors.[232, 233]

B.2.4   Approach

Staffing Levels (FTE) Analysis: Our team analyzed the total FTEs by major specialty grouping by summing the VA-paid FTEs. We developed six major specialty groupings. We first mapped providers to a specialty using VHA's person classification codes, which denote a specialty or category of provider (i.e. Physician Assistant) for each provider. This information was provided to us by VHA along with data definitions. Using that mapping, we mapped specialists to the major grouping categories we created. We excluded clinical nurse specialists since they are not licensed independent providers. We separated social workers (normally grouped with APPs) from any of the major specialty groupings and depicted them in their own group. We also distinguished physician FTEs from APP FTEs.

Fee-based Provider Analysis: In Figure 2 2. Proportion of Total Workload Generated by Non-employed Providers, our team calculated the percentage of overall time that fee-based and others not otherwise accounted for in our provider data contribute to total RVUs. We displayed our findings by facility complexity. In Figure 2-2, our team determined the proportion of total wRVUs generated by fee-based providers (and other providers without a labor mapping). We highlighted the specialties with the highest proportion of wRVUs generated by these providers.

[233] Merritt Hawkins. (n.d.). A Review of Physician to Population Ratios. 1-2. Retrieved from http://www.merritthawkins.com/pdf/a-review-of-physician-to-population-ratios.pdf

---

In order to display these findings at the aggregate specialty level, our team mapped VHA specialties to aggregate specialties and summed wRVUs.

To calculate FTE levels for dental providers, the Assessment G team used de-identified dental hourly and productivity data compiled from a labor map extract provided by VHA and compared it to transactional procedural information from the Dental Reporting and Analytics System (based on data from the Corporate Data Warehouse (CDW) dental domain. This data was presented on a pay period level of detail. Providers who had productivity indicators (such as RVUs, Visits, or Procedures) but 0 hours recorded for a pay period were removed from the analysis. The pay periods were then rolled up into FY 2014 totals for every provider to establish total hours worked for the year. These figures were then divided by a standard of 2,080 hours (assuming a normal workweek of 40 hours per week, 52 weeks per year) to establish FTE counts. FTE counts were established on a specialty basis, and Total FTE, Clinical FTE, Administrative FTE, and Research FTE counts were all calculated based on the provided data.

Physician Staffing Supply to Industry Comparisons: To depict the difference in physician staffing between VHA and industry standards, our team used the Truven ratio (the most recent of the available industry benchmarks) and compared VHA's current FTE levels per enrollee population to the Truven calculated FY14 supply of physicians per population. Our team applied the Truven ratio to the 9,111,955 enrollees and subtracted this quantity from the current VA FTE levels. In instances where the Truven ratio volume exceeded current VHA FTE levels, a negative value is displayed in red hues. In instances where the Truven ratio proposed volume was less than current VHA FTE levels, a positive value is displayed in blue hues.

Salary Comparisons: Our team compared compensation between VHA providers and industry by focusing on existing VHA salary requirements and 2013 AMGMA surveyed salary data. In Figure 2-7 the values in light pink represent the difference between VHA Tier 1 and AMGMA salary at the 10th percentile. The values in dark purple represent the difference between VHA Tier 3 and AMGMA salary at the 90th percentile. Negative values indicate that AMGMA salaries at the 10th or 90th percentile exceed VHA physician salaries at either the 1st or 3rd tier respectively.

B.2.5   Provider productivity (Objective 2)

Section 201(G) of the Veterans Choice Act requests "the staffing level at each medical facility of the Department and the productivity of each health care provider at such medical facility, compared with health care industry performance metrics…" The Assessment G team compared VHA provider productivity to industry performance benchmarks. This included measurement of caseload or panel size, encounters, and wRVUs for primary care and specialty care. We also assessed dental provider productivity primarily using visit data. Below we provide a brief review of key information to consider in conducting provider productivity analyses which informed the basis of our approach.

Measuring Provider Productivity

There are a variety of ways to measure productivity of physicians and APPs. Common measures used by health care delivery systems include: visits/encounters, charges, collections, procedures, ambulatory/hospital encounters, patient panel size, and wRVU values. Utilizing multiple indicators can provide a robust picture; however, in most cases the industry standard for benchmarking productivity remains wRVU values. The RVU system was developed as part of the RBRVS and is currently used as the Medicare physician reimbursement formula (most commercial and Medicaid systems follow as a methodology). The RVU system assigns weightings for each clinical activity which a provider performs based on time and complexity. Furthermore, RVUs offer the only non-financial method of quantification that takes into account time and complexity of the clinical activity of the provider.

In private industry, monitoring provider productivity can be one element in tracking a practice's financial health and is becoming the basis for provider compensation or bonuses.[234] Providers are typically measured by aggregation of annual wRVU totals for all procedures on an annual basis, as a measure which informs both total compensation and bonuses. Although VHA does not measure its providers individually on productivity or provider performance bonuses based on productivity, this widely accepted measure of productivity provides a medium for a meaningful comparison between the productivity of VA staff providers to productivity of providers practicing in the same areas of medicine and health care in private industry. As wRVU is the most common industry standard for comparison, the Assessment G team used wRVU as one measure of productivity, particularly for specialty care providers. (The RVU system is further described below in the definition section).

Work RVUs as a measure have some drawbacks. Specifically wRVUs may undervalue the medical decision-making component of a visit or service and may not account adequately for other cognitive activities such as care coordination and team care models of practice.[235] Given VHA's population focused care model, this is a particular concern of VHA's Office of Primary Care and a key reason why that office does not measure its primary care providers using wRVUs. Any potential undervaluation should be reflected in comparison benchmark data from industry standards because the same relative valuation of clinical productivity will be utilized, if coding and documentation is comprehensive and accurate. Since wRVUs are dependent on accurate and thorough coding and documentation practices, and the vast majority of VHA encounters are not audited or checked for accuracy, it cannot be determined whether wRVUs accurately reflect VHA provider workload. For this reason, we have included both encounters and wRVUs for specialty care. Primary care providers are measured by panel size, which is, by many definitions, roughly equivalent to caseload for primary care providers.

Industry Productivity Performance Metrics

---

[234] Rodegero, J. A. (1999). Benchmarking Physicians' Practices: Trends toward the Millennium. *Journal of Health Care Finance*. 25 (4), pp. 15-37.

[235] D'Alessandri R. M., Albertsen, P., Atkinson, B.F., Dickler R.M., Jones, R. F., Kirch, D.G.,… Longnecker, D.E., Zuza K.L., (2000) Measuring contributions to the clinical mission of medical schools and teaching hospitals. *Academic Medicine*. 75(12) p1231-1237.

As noted above, the Assessment G team used two well-known benchmark data sets to compare productivity (encounters and wRVUs) for specialists and primary care providers. These include the Medical Group Management Association (MGMA) Physician Compensation and Production Survey, MGMA Academic Practice Compensation and Production Survey (commonly known as "AMGMA"). Additionally, primary care providers were also compared (by panel size) to these surveys, as well as Kaiser Permanente Northern California Medical Group, and a calculated panel size using a formula from AAFP. We did initially compare to the AMGA Medical Group Compensation and Financial Survey; however, due to lack of permission to share this benchmark data externally, we did not include the specialty comparison in the report. We do include AMGA benchmarks for primary care. Additional information on these benchmark surveys is provided below in the definitions section. In addition to these large national surveys, certain specialties have their own trade groups that generate their own benchmarking information. These benchmarks typically have a much smaller sample size and often have a similar distribution; as such, we elected to use the aforementioned surveys to compare groups exclusively. Because dentists are not included in these benchmark data sets, we did benchmark them separately against 2010 data provided by a survey from the American Dental Association.

B.2.5.1   Definitions

Physician specialty: Physician Specialty is determined by aggregating the Health Care Provider Taxonomy, which is linked to each provider's National Provider Identifier (NPI) in a separate field.[236] Each physician "person class" from the VHA Person Class file is mapped to a specialty that is defined by the American Board of Medical Specialties. OPES aggregates minor classifications into broader categories, known as aggregate specialty, for reporting. In this assessment, we mapped providers to determine aggregate specialty FTE and productivity levels.

Encounter: VHA defines an encounter as "a professional contact between a patient and a practitioner vested with responsibility for diagnosing, evaluating, and treating the patient's condition. Encounters occur in both the outpatient and inpatient setting."[237] VHA further defines an encounter by the environments in which it can occur, specifically, "Encounters occur in outpatient and inpatient settings (including Residential Rehab Treatment centers). (1) Contact can include face-to-face interactions or those accomplished via telecommunications technology. (2) Contact can be through Secure Messaging which is available through the My HealtheVet (MHV) personal health record (PHR). These non-urgent communications must meet the definition of an encounter. A review of the health record is done by the physician or qualified non-physician and clinical decision making is performed at some level. The care plan is communicated with the patient electronically. (The Secure Message that is related to a visit within the last 7 days cannot be captured as workload as it is considered part of the actual face-to-face visit.) (3) Encounters are neither occasions of service nor activities incidental to an encounter for a provider visit. For example, the following activities are considered part of the encounter itself and do not constitute encounters on their own: taking vital signs, documenting

---

[236] National Uniform Claim Committee (NUCC) maintains the Health Care Provider Taxonomy.

[237] U.S. Department of Veterans Affairs. (2013). VHA Site Classifications and Definitions, *VHA Handbook 1006.02*, Retrieved from http://www.va.gov/vhapublications/ViewPublication.asp?pub_ID=2970

chief complaint, giving injections, pulse oximetry, administering medications, etc. (4) A telephone contact between a provider and a patient is only considered an encounter if the telephone contact is documented and that documentation include the appropriate elements of a face-to-face encounter, namely history and clinical decision-making. Telephone encounters must be associated with a clinic assigned to one of the DSS Identifier telephone codes and are to be designated as count clinics. *NOTE: Count refers to workload that meets the definition of an encounter or an occasion of service. The American Medical Association (AMA) changed the definition of the 2008 CPT® Telephone Call codes. Many of VHA's performance monitors require follow-up care delivered by telephone, therefore, the 2008 CPT® telephone codes are to be used as previously defined."*[238] This is consistent with MGMA's encounter definition (however, the Academic MGMA survey does not include telephone encounters).

Workload relative value unit (wRVU): In 1988, Hsiao et al. detailed a RBRVS that is now the basis for reimbursement by third-party payers in the U.S.[239] The unit of measurement, RVU, has three categories that inform the price for health care services: physician work (denoted as work RVU, or, wRVU), practice expense, and malpractice insurance. Since VHA providers do not hold individual or corporate liability for malpractice insurance or practice infrastructure, the malpractice and practice overhead RVU components are not relevant. WRVU encompasses the relative amount of time, skill, and intensity required to complete a given procedure. This sub-component of the RVU accounts for 52 percent of the total value. To account for changes in practice patterns and medical technology the Relative Value Update Committee, a group of physicians sponsored by the American Medical Association, recommends updates to RVU values to CMS every year.

Medical Group Management Association (MGMA): MGMA is an industry group that provides publications, seminars, conferences and surveys/benchmarks to physician practices on practice operations, cost containment, revenue cycle, provider productivity and compensation. On an annual basis, MGMA issues the Physician Compensation and Production Survey (inclusive of non-physician providers such as PA, NP, CRNA, etc.) as well as the Academic Practice Compensation and Production Survey.

MGMA Physician Compensation and Production Survey:[240] Includes 4,197 medical groups and 66,299 providers. Across primary care and specialty care and a wide range of geographies. This survey is the most commonly used survey of all existing physician performance and compensation benchmarking options.

---

<u>MGMA Academic Practice Compensation and Production Survey:</u>[241] MGMA's Academic survey includes 20,876 providers and 1,996 administrative staff. This survey includes multi-mission providers who have clinical, research and teaching time. This survey is valuable to understanding the relationship between clinical production and additional responsibilities held by academicians, such as research and teaching.

<u>American Medical Group Management Association (AMGA)</u>: The AMGA is the industry group that most large health systems and medical groups belong to. AMGA offers a forum to connect providers with each other and to make them aware of best practices and to spread information nationally. Only providers can be members, though other industry professionals can purchase access to the information AMGA providers.

<u>AMGA Medical Group Compensation and Financial Survey:</u>[242] AMGA's annual survey includes responses from 289 medical groups including 73,700 providers for an average group size of 255. This survey has been conducted since 1986, and includes a wide range of organizational structures and geographies. Respondents tend to be larger organizations. Unlike the other two benchmark sets, data is published demonstrating quartiles, rather than as individual provider percentiles. We did compare to the AMGA survey; however, we were not able to publish the results for specialty care.

<u>Panel</u>: A panel is the set of patients assigned to a specific primary care provider or care team. Panels are typically used in health maintenance organizations (HMOs) and health care systems implementing a Patient Centered Medical Home (PCMH) model.

B.2.5.2 Data sources

To calculate FTE levels needed for measuring productivity by provider adjusted clinical FTE (cFTE), the Assessment G team used the labor mapping data provided within the VHA OPES Productivity Data File (Provider Detail FY14) and the VHA OPES Labor Mapping Data File (Provider Labor Detail FY14). Each provider's productivity calculation (whether based on encounters or wRVUs), used clinical Worked FTE as the denominator, which excludes vacation and holidays and other non-direct patient care time. It also excludes bed days of care (inpatient rounding time) for some specialties. Using clinical FTE (cFTE) differs from the staffing levels FTE calculation described above, as only worked hours in the clinical environment (direct patent care hours, in accordance with VHA's labor mapping definitions) are included in productivity calculation.

To calculate the total VHA cFTE providers, the Assessment G team used the labor mapping for each provider as contained within the VHA OPES Productivity Data File and the VHA OPES Labor Mapping Data File. The labor mapping file was extracted by VHA OPES from the Decision Support System (DSS) within VHA's CDW that contained labor mapping hourly details. Within

---

[241] MGMA. (2013) *Academic Practice Compensation and Production Survey for Faculty and Management: 2014 Report based on 2013 Data.* Retrieved from http://www.mgma.com/Libraries/Assets/Store/Surveys/8743-2014-Key-Findings-Academic-Practice.pdf

[242] AMGA (2014) *2014 Medical Group Compensation and Financial Survey: 2014 Report Based on 2013 Data*. Alexandria, VA, American Medical Group Association.

DSS, all costs (measured in time per resource) including physician and dentist labor are mapped into ALBCCs. Labor ALBCCs are mapped to the Direct Patient Care or Indirect Administration, Education, or Research account codes that represent production units for related work activities. All time spent by all full and part-time VHA-employed physicians, APPs and dentists (except Without Compensation providers who do not have a labor mapping) is categorized into Direct Patient Care, Administration, Research, and/or Education. The percentage of time for each physician, APP and dentist spent in each of these categories is captured in combined ALBCC hours.[243]

The VHA OPES Labor Mapping Data File included pay periods 13-26 (September 22, 2013) through 14-25 (September 20, 2014) and were sorted on a pay period level. This time period corresponds roughly to Fiscal Year 2014; however, the dates do not align exactly due to a difference in when the pay period closed from the fiscal year. The pay periods were aggregated into FY 2014 totals for every provider's productivity calculations. Table B-3 shows the data fields provided for all APPs and physicians.

To calculate dental productivity, our team used the de-identified Dental Hourly and Productivity Data File (201G_AggregateDentistFY14.xls) from the OPES Decision Support Extract as well as the 2010 ADA Survey of Dental Practice: Characteristics of Dentists in Private Practice and their Patients (for benchmarking). The data fields within the Dental Hourly and Productivity Data File are shown in Table B-4.

In assessment productivity of Primary Care Providers, our team used a file of Division Modeled Capacity extracted from the Primary Care Management Module (PCMM). OPES also provided our team a file of actual and facility determined maximum panel sizes by provider. This file identified characteristics such as location, team type, self-reported FTEs and a Physician or APP designation.

Table B-3. APPs and physician data fields within VHA OPES labor mapping data file[244]

Data Field	Definition
PhysicianID	De-identified provider social security number, as noted on VHA encounters with CPT® codes

---

[243] U.S. Department of Veterans Affairs (2011) VHA Directive 2011-009 Physician and Dentist Labor Mapping. Retrieved from http://www.va.gov/vhapublications/ViewPublication.asp?pub_ID=2384

[244] Data definitions provided by VHA OPES, April 9, 2015

Data Field	Definition
Sta3n	The raw "3 digit" parent station numbers on the encounter record. In general, the 3 digit station number will identify the 'administrative parent facility'. Exceptions are VISN 2, VISN 15, and VISN 23.
Sta6a	6-digit station number used within VHA to identify point of service. One 'administrative parent' may have several of these.
PayPeriodStart	This is a date field that represents the first day of the pay period.
BudgetObjectCode	Budget Object Classification (BOC) codes are used to report VA's personal services, supplies or services. Any cost center/budget object code combination is acceptable, unless specifically identified in the Unique Cost Center/Budget Object Code Combination Table. (Reference: VA Handbook 4671.2).
ALBCostCenter	The DSS ALBCC Code is composed of three parts: ▪ The three-character prefix is the 2nd through 4th characters of the VA Cost Center (VACC) (omitting the leading "8") indicating the clinical service that manages the Production Unit. ▪ The two-character DSS Production Unit Code reflects the work unit nationally and identifies the clinical activity. ▪ The division suffix which can be one or two characters, as needed, to reflect the division of the main station (VA medical facility) number.

Data Field	Definition
Albcc_h	FY14 worked hours allocated to the ALBCC from linking DSS Labor mapped percentage of time to pay period hours. Leave and annual leave are not included within this measure.
ALBCC_Normal_h	FY14 normal paid hours allocated to the ALBCC from linking DSS labor mapped percentage of time to pay period hours.
ALBCC_Regular_h	FY14 paid additional hours allocated to the ALBCC from linking DSS labor mapped percentage of time to pay period hours. This measure contains additional hours worked by part time employees beyond their typical (normal) hours.
PctALBCostCenter	Percent of hours allocated to the ALBCC.

Table B-4. Dental Productivity Data Fields and Definitions from Dental Hourly and Productivity Data File[245]

Data Field	Definition
VISNSID	The VISN number where care was provided and workload recorded.
FCDMAdminParent	The administrative parent facility where care was provided and workload recorded.
PersonClass	The predominant person class specialty during pay period.
PersonClassSpecialty	The predominant person class specialty (i.e. Dentist – General, Dentist – Endodontics, etc.) during that pay period.
DentalLvl1	First level dimension hierarchy (Dentist, OMFs).

---

[245] Data summary used MITRE 201G Team: Dentists Data Definitions, provided by VHA Office of Dentistry, March 17, 2015.

Data Field	Definition
DentalLvl2	Second level dimension hierarchy (i.e. Dentist, Orthodontist, etc.).
UniqueDentalStaffID	A de-identified key integer representing the provider at that administrative parent site.
PPStart	The starting data of the two week pay period.
TotalHours	The total number of aggregated labor mapped hours for the pay period.
ClinicalHours	The aggregated number of labor mapped hours in clinical product units for the pay period.
AdministrativeHours	The aggregated number of labor mapped hours in administrative product units for the pay period.
EducationHours	The aggregated number of labor mapped hours in education product units for the pay period.
ResearchHours	The aggregated number of labor mapped hours in research product units for the pay period.
PersonClassCode	The VA person class code standardized in VistA.
SumRVUs	The aggregated sum of RVUs applicable to the procedures performed and/or personally supervised by the attending dentist for the pay period.
SumProcedures	The aggregated sum of CPT® codes applicable to the procedures performed and/or personally supervised by the attending dentist for the pay period.
SumVisits	The aggregated sum of patient visits performed and/or personally supervised by the attending dentist for the pay period. Each patient counted no more than once per day per site even if additional encounters.

Data Field	Definition
Grouping	General grouping categorization of pay period activity. When there is clinical activity with no clinical mapping, generally this is attributable to care provided by an on-site contract/fee provider.
Total FTE (FTE)	Actual <u>worked</u> hours are converted into FTE. Annual FTE is calculated by taking the actual worked hours of the provider divided by 2080, where 2080 is the available hours to work for the fiscal year (26 pay periods *80 hours).
Clinical FTE (FTEc)	Actual clinical <u>worked</u> hours are converted into FTEc. Annual FTEc is calculated by taking the labor mapped clinical worked hours of the provider divided by 2080, where 2080 is the available hours to work for the fiscal year (26 pay periods *80 hours).
Admin FTE (FTEa)	Actual administrative <u>worked</u> hours are converted into FTEa. Annual FTEa is calculated by taking the labor mapped administrative worked hours of the provider divided by 2080, where 2080 is the available hours to work for the fiscal year (26 pay periods *80 hours).
Education FTE (FTEe)	Actual education <u>worked</u> hours are converted into FTEe. Annual FTEe is calculated by taking the labor mapped education worked hours of the provider divided by 2080, where 2080 is the available hours to work for the fiscal year (26 pay periods *80 hours).
Research FTE (FTEr)	Actual research <u>worked</u> hours are converted into FTEr. Annual FTEr is calculated by taking the labor mapped research worked hours of the provider divided by 2080, where 2080 is the available hours to work for the fiscal year (26 pay periods *80 hours).

To calculate cFTE levels for providers, the Assessment G team used the APP and physicians FTE data from the VHA OPES Labor Mapping Data File as well as FTE data from VHA OPES Productivity Data File. The FTEs reported from the Productivity extract reflected worked FTEs. By applying leave factors (percentages which allowed worked hours to be converted to paid hours) derived from the Labor data extract (by physician), the PAID FTE amounts were calculated. In addition, some other FTE refinement occurred for providers that were listed more than once within the Productivity extract. This refinement was done to ensure that the total FTE for any given provider was presented accurately. After these steps were taken, the FTE data was extracted from the Productivity data. For auditing purposes, the VHA OPES Productivity Data File FTE totals were compared to the VHA OPES Labor Mapping Data File, specifically the FTE hours and FTE categories. A basic validation was completed and the labor hours and classifications were determined to be closely correlated with the VHA OPES Productivity Data File FTE information.

The productivity extract data file was matched to the labor mapping file (using the same provider de-identifiers) and included the following fields shown in Table B-5.[246]

Table B-5. Productivity data fields and definitions; from VHA OPES productivity data file

Data Field	Definition
PhysicianID	De-identified provider social security number, as noted on VHA encounters with CPT® codes.
NPIFlag	Provides a yes/no indicating whether the provider had an NPI number listed in the data warehouse.
ProviderType	Provides a category for the provider workload as one of the following: ▪ Resident Only = no VA 'attending' provider on encounter but has a resident. ▪ VA = If not "Resident Only" AND matches with DSS created Labor Map file in CDW. ▪ Fee = If not "Resident Only" AND no match with DSS Labor Map file but find provider in Fee files. ▪ Other = does not meet any of logic above.

---

[246] Productivity data definitions "Data Definitions-Physician Detail RVU, Encounter and FTE" VHA OPES, February 26, 2015.

Data Field	Definition
Sta3n	The raw "3 digit" parent station numbers on the encounter record. In general, the 3 digit station number will identify the 'administrative parent facility'. Exceptions are VISN 2, VISN 15, and VISN 23.
LegacySta3N	The 3 digit station number used to identify the legacy administrative parent facility.
AggregateSpecialty	Maps the minor specialty, based on the provider's person classification/taxonomy into one of 38 specialties.
Specialty	Extrapolated from the person classification, this is the specialty of the provider. There are 77 specialties.
PersonClass	Provides the 'person class' code associated with the providers on the encounter, from the CDW. The Person Class Mapping is the relevant reference file for this data point.
RVUSum	Sum of FY14 wRVUs based on CPT® codes and applicable RVU on each encounter.
NumEncountersRVU	Sum of encounter counts when the encounter has a CPT® that has an RVU value greater than zero per CMS, INGNEX Gap, or Imputed RVU schedules. Encounter sum is by unique provider.
NumEncountersNoRVU	Sum of encounter counts when the encounter does not have a CPT® with no RVU value per CMS, INGNEX Gap, or Imputed RVU schedules. Encounter sum is by unique provider.

Data Field	Definition
Total_FTE	The sum of Clinical FTE+ Admin FTE +Education FTE+ Research FTE +Other FTE. Actual <u>worked</u> hours are converted into FTE. Annual FTE is calculated by taking the actual worked hours of the provider divided by 2080, where 2080 is the available hours to work for the fiscal year (26 pay periods *80 hours) , thus the field represents the sum of worked FTE from DSS created Labor Map file in CDW per ALBCC logic.
Clinical_FTE	Direct patient care time to prepare, provide for, and follow-up on the clinical care needs of patients. (Note: clinical FTE includes bedday FTE). Actual worked hours are converted into FTE. Annual FTE is calculated by taking the actual worked hours of the provider divided by 2080, where 2080 is the available hours to work for the fiscal year (26 pay periods *80 hours).
BedDay_FTE	Time spent for inpatient bedside attending rounds. Actual worked hours are converted into FTE. Actual <u>worked</u> hours are converted into FTE. Annual FTE is calculated by taking the actual worked hours of the provider divided by 2080, where 2080 is the available hours to work for the fiscal year (26 pay periods *80 hours).

Data Field	Definition
AdjClinical_FTE	This field adjusts the Clinical_FTE for specialties that do or do not capture inpatient CPT® codes. It represents the Clinical MD FTE (C) that excludes Bedday FTE for Medicine & Mental Health Specialty areas and the Surgery Surgical Critical Care (183104) person class code. Actual <u>worked</u> hours are converted into FTE. Annual FTE is calculated by taking the actual worked hours of the provider divided by 2080, where 2080 is the available hours to work for the fiscal year (26 pay periods *80 hours).
Admin_FTE	Administrative time includes time spent on managerial or administrative duties, generally at the level of the department, service, medical center, network, or nationally, both within and outside VA. Actual <u>worked</u> hours are converted into FTE. Annual FTE is calculated by taking the actual worked hours of the provider divided by 2080, where 2080 is the available hours to work for the fiscal year (26 pay periods *80 hours).
Education_FTE	Education is defined as time spent providing formal training (didactic education). Actual <u>worked</u> hours are converted into FTE. Annual FTE is calculated by taking the actual worked hours of the provider divided by 2080, where 2080 is the available hours to work for the fiscal year (26 pay periods *80 hours).

Data Field	Definition
Research_FTE	Research is defined as time spent performing formal, approved health care research, or in activities in direct support of approved research. Actual <u>worked</u> hours are converted into FTE. Annual FTE is calculated by taking the actual worked hours of the provider divided by 2080, where 2080 is the available hours to work for the fiscal year (26 pay periods *80 hours).

A CPT® details data file ("VHA OPES CPT® Details Data File") was also provided by VHA. This allowed the team to validate the wRVU calculations within the VHA OPES Productivity Data File. The file also allowed the team to assess modifier adjustments (addressed below) and assess the impact of gap and imputed code based wRVU values. The fields submitted within the VHA OPES CPT® Details Data File are included Table B-6.

Table B-6. VHA OPES CPT® details data file[247]

Data Field	Definition
ProviderID	De-identified provider social security number, as noted on VHA encounters with Current Procedural Technology [CPT®] codes).
PersonClass	Provides the 'person class' code associated with the providers on the encounter, from the CDW. The Person Class Mapping is the relevant reference file for this data point.
Sta3n	The raw "3 digit" parent station numbers on the encounter record. In general, the 3 digit station number will identify the 'administrative parent facility'. Exceptions are VISN 2, VISN 15, and VISN 23.
LegacySta3N	The 3 digit station number used to identify the legacy administrative parent facility.
VisitCalendarYear	Calendar year of the visit

---

[247] Productivity data definitions "Data Definitions-Physician Detail RVU, Encounter and FTE" VHA OPES, February 26, 2015.

Data Field	Definition
CPT® Code	The procedure code relating to the record.
RVUType	Indicates the source of the wRVU value; "Gap", "Imputed" or "CMS".
WorkRVU	The wRVU Amount related to the CPT® Code.
CPTCnt	The Count of CPT® Codes.
RVUSum	The WorkRVU Times The CPTCnt.

For the productivity benchmarking comparison, the Assessment G team used the following industry data sets/reports:

- 2014 Physician Compensation and Production Survey, MGMA
- 2014 Academic Practice Compensation and Production Survey for Faculty and Management, MGMA
- 2010 Survey of Dental Practice: Characteristics of Dentists in Private Practice and Their Patients, American Dental Association

B.2.5.3 Assumptions and Limitations

The data sets for VHA productivity and the data sets for industry benchmarks exhibited significant differences. At an overarching level, comparing a population health oriented delivery system to benchmarks which primarily represent a fee for service model presents comparability issues. To increase comparability of the two data sets, our team applied several adjustments. We adjusted for the use of modifiers, gap codes/imputed wRVU values, and adjusted for duplication of workload credit. However, VHA productivity data extracts do not include modifiers, so we could not make modifier-related wRVU adjustments. Instead, we have applied CMS-based adjustments (described below) which primarily affect surgical specialties, but account for some of these differences.

Adjusting for provider workload double crediting

In the benchmark data sets, if multiple providers are associated with an encounter, only one provider receives workload credit. In the VHA data set, multiple providers can receive workload credit. As the Assessment G team could not fully adjust for the instances in which credit was given to multiple providers to make a direct comparison to the benchmark data set, the team asked OPES to analyze this data and provide an explanation that summarizes the potential impact to the data. OPES provided the following explanation:

> OPES uses the Corporate Data Warehouse to pull encounter-level data for physicians. OPES generates an encounter record for each physician on the encounter and assigns the sum of all relative value units (RVUs) to each physician. In fiscal year 2014, there were 63,220,165 unique encounters with at least one physician on the encounter. Of these encounters, 17,104,029 (27.1 percent) encounters had more than one physician on the encounter. Consistent

---

with OPES cube business rules (Providers are not given RVU credit for encounters when any of the following are true: (1) the primary stop code for the encounter is pathology; however, the provider's person class is not pathology; (2) the primary stop code for the encounter is radiology; however, the provider is not coded as the "doing" provider; (3) the primary stop code for the encounter is surgery and the provider's person class is pathology or radiology) the providers who were believed to be on the encounter as solely the ordering provider were removed and this number was reduced to 1,852,811 (2.9 percent). To assess the magnitude of assigning the total RVU sum to all physicians on the encounter, the sum of total RVUs associated with each unique encounter (62,376,746.36) was compared to the sum of total RVUs generated when each physician on the encounter gets credit for the total sum of RVUs (64,545,139.05). This resulted in a difference of 2,168,393 total RVUs, or a potential 3.4 percent increase in total RVUs.[248] (VHA OPES, 2015)

Adjusting for lack of modifier usage

Upon review, the Assessment G team uncovered three issues with the manner in which VHA captures physician work product and calculates that into wRVU values, which result in the VHA data not being comparable to the benchmarks. CMS utilizes a variety of modifiers typically utilized during the billing process to identify additional information on either the site of service or the role a provider may play in the provision of care. At this time, VHA **does not** capture, nor document, any modifier usage in its productivity reporting.[249] The benchmark surveys require adjustment of modifiers to maximize comparability; as such, the lack of modifier usage by VHA could have significant implications to the interpretation of the data. Depending on the type of service or the role, a provider may have a different wRVU value. The following two examples illustrate this:

- A modifier 50 is utilized to denote a bi-lateral procedure when two knee procedures are performed. While one CPT® code is utilized to denote the procedure, the bi-lateral modifier is used to assign a factor of 1.5 to the wRVU value. This relates to the efficiency that comes from providing the second procedure while already performing the first.

- The 80 series of modifiers denotes the use of a surgical assistant; either a physician or an APP. In the private sector, the provider generally will bill CMS under the same CPT® code; however, the provider will utilize an 85 modifier to denote that the activity was for an assist and not as a primary surgeon. This reduces the CPT® code by 85 percent and awards only .15 of the primary surgery CPT® code.

The lack of modifiers generally impacts surgical specialties more than non-surgical specialties. With acknowledgment of OPES and VHA that this information could not be provided to the Assessment G team, the Assessment G team developed a methodology to adjust for this data anomaly. CMS publishes a complete billing data set by code along with the frequency of

---

[248] Campbell, J. OPES (2015, March 9).Multiple Provider Analysis. Received via email communication.

[249] Choice Act 201G – OPES Data Discussions Continued, Notes and Action Items – Call March 9, 2015

modifier application by CPT® code. In the absence of modifiers, the team utilized the CMS Medicare 2013 utilization by CPT® code to adjust for the frequency by which codes were awarded to all providers at 100 percent value. Given a standard of care that is generally followed nationally, the CMS utilization rates were deemed appropriate for comparison purposes. The Assessment G team utilized the weighted average of the surgical assist codes by CPT® code to adjust for the wRVU value. An example follows in Figure B-2.

Figure B-2. CMS actual[250]

Code	Description					
27137	Revise Hip Joint Replacement					

Provider Type	VA RVUw	CMS RVUw w/ Modifier usage	MS Frequency		Weighting	
Primary Surgeon	22.700	22.700	4,974	64.78%	14.706	
Assistant Surgeon	22.700	3.405	2,704	35.22%	1.199	
		Total	**7,678**	**100.00%**	15.905	Weighted Average RVUw

The first row in the example represents the primary surgeon and the second row represents the assisting surgeon. VHA business rules dictate that wRVU credit be applied in the same amount of 22.7 for both the primary surgeon and assisting surgeon. This is inconsistent with business rules for the benchmark data sets used in this study. To make the data comparable, the Assessment G team applied the following modification approach to adjust the data received from OPES:

1. The wRVU for the assisting surgeon is modified to 3.045 (22.7 x .15).
2. A weighted average wRVU is calculated by applying the relative number of cases performed by primary surgeons (65 percent) and assisting surgeons (35 percent), yielding an overall weighted average wRVU of 15.90.
3. The weighted average wRVU (15.90) is applied to each CPT® code in the data set, thereby adjusting wRVU credit.

While this method has limitations on an individual provider basis (for example, there is no way to tell which provider is the assistant vs. the primary surgeon), it offers the most valid approach for overall comparisons by specialty, given the lack of data on modifiers in the VHA data set. See Figure B-3.

---

[250] Assessment G analysis which used CPT Detail FY14, provided by VHA OPES, March 5, 2015.

Figure B-3. wRVU with modified wRVU and percent of original[251]

Specialty	Original RVUw Total	Modified RVUw Total	% of Original RVUw
Thoracic Surgery	359,714	277,528	77.15%
Neurological Surgery	244,253	203,601	83.36%
Orthopaedic Surgery	1,197,013	1,055,807	88.20%
Clinical Genetics	2,130	1,888	88.63%
Colon and Rectal Surgery	99,289	91,140	91.79%
Vascular Surgery	601,644	554,807	92.22%
Surgery	1,404,862	1,313,468	93.49%
Surgical Critical Care	52,028	48,876	93.94%
Reproductive Endocrinology and Infertility	300	283	94.06%
Pediatric Surgery	1,796	1,731	96.38%
Urology	1,073,797	1,039,618	96.82%
Obstetrics and Gynecology	182,574	177,101	97.00%
Nurse Anesthetist CRNA	194,714	190,895	98.04%
Surgery of the Hand	61,539	60,448	98.23%
Plastic Surgery	269,187	264,809	98.37%
Otolaryngology	631,279	621,921	98.52%
Other (61 Specialties)	66,671,386	66,640,169	99.95%
Total	**73,047,504**	**72,544,090**	**99.31%**

VHA OPES later noted that due to the unique nature of their care delivery model, residents and fellows are more frequently utilized to perform these assist roles than physicians and APPs when compared to other health care systems, and provided additional detail containing the number of procedures completed in FY14 with a second physician serving as an assistant in surgery. Because residents and fellows are not assigned their own wRVU credit, and in the private sector, do not bill CMS for their services, VHA OPES conveyed that the Assessment G methodology utilized may over-represent the number of physician-performed surgical assists, which could lead to over-discounting of relative work value units for these surgical services may "over-discount" the true productivity of VHA providers. Of specific attention was the fact that Assessment Team G methodology resulted in a reduction of 22.9 percent of wRVUs for Thoracic Surgery, 16.7 percent for Neurological Surgery, and 11.8 percent for Orthopedic Surgery. VHA's internal methodology (based on stop codes) estimated that the wRVU discount applied to these service lines should instead be 5.9 percent, 1.5 percent, and 1.6 percent, respectively.

The Assessment G team applied these new discounts to the original wRVU data to determine the impact on our findings. Overall, the adjustments did not materially affect the findings or recommendations put forth in this report. We estimate that the average productivity of physicians in the associated surgical service lines would increase by approximately 500-800

---

[251] Assessment G analysis which used CPT Detail FY14, provided by VHA OPES, March 5, 2015.

wRVUs per year per Worked cFTE. However, the benchmarked percent ranks of these updated productivity figures would still fall below 27th percentile in both the MGMA and AMGMA comparison sets for all three specialties, with many falling in the 15th percentile rank and below. In all three specialties, average productivity per clinical FTE would result between 47 percent and 62 percent of MGMA or AMGMA medians. Details for the three specialties can be found in Table B-7.

Table B-7. Comparison of assessment G productivity benchmark methodology and application of OPES suggested methodology for benchmarking[252]

Specialty	Original wRVU Productivity Calculation	New wRVU Productivity Calculation	MGMA wRVU Median	Original MGMA Percent Rank	New MGMA Percent Rank	AMGMA Median	Original AMGMA Percent Rank	New AMGMA Percent Rank
Thoracic Surgery	3,629	4,428	7,121	14%	15%	8,156	10%	26%
Neurological Surgery	4,002	4,731	9,368	10%	14%	9,977	10%	15%
Orthopedic Surgery	4,385	4,894	8,241	10%	13%	8,384	14%	23%

VHA OPES also provided the Assessment G team with additional discount estimates for all specialties. While Assessment Team G acknowledges that the original methodology may over represent surgical assists by physicians, we determined that re-running all of the analysis to adjust for these discount factors would not result in material changes. This is based on the fact that the remaining specialties were not originally discounted to the same degree as the three surgical specialties outlined above (with many specialties not being discounted at all), and consequently the variances in discount percentages were not significant. Any changes in percent ranks compared to benchmarks would thus be minimal.

Application of Gap and Imputed Codes

VHA developed a series of CPT® codes to capture clinical work effort not otherwise captured or quantified by CMS. Furthermore, VHA engaged Cambridge Health Economics Group, a private firm that was acquired by Ingenix (now Optum) to calculate and establish RVU values for these GAP codes and utilize these codes in assessing provider productivity. Additionally, OPES has developed a wRVU value for Compensation and Pension (C&P) examinations, and selected Autopsy CPT® codes which are not weighted by CMS. OPES assigns a level 3 Office Consultation wRVU value of 1.88 for CPT® Codes 99455 and 99456-Disability Examinations (C&P) which currently have a CMS wRVU= 0.00. The Autopsy weights were developed by the VHA Pathology

---

[252] Analysis of Assessment G Benchmarking Exercise and Information provided by VHA OPES, Choice Act 201G Section – Data Validation Follow-Up, OPES Deliverables from Conference Call, July 27, 2015

Productivity Workgroup and are based on a study conducted by the Autopsy Committee of the College of American Pathologists (Accounting for the Professional Work of Pathologists Performing Autopsies, John H. Sinard, MD, PhD, for the Autopsy Committee of the College of American Pathologists, Arch Pathol Lab Med—Vol 137, February 2013, Autopsy RVUs—Sinard et al). The utilization of these GAP codes yield a net 2.4 percent variation to overall productivity with specialty specific breakdowns as follows in Figure B-4:

Figure B-4. CMS gap imputed, total, and gap imputed percent[253]

Specialty	CMS RVUw	Gap RVUw	Total	Gap %
Internal Medicine	8,440,368	263,225	8,703,594	3.02%
Psychology	6,147,099	255,782	6,402,880	3.99%
Psychiatry	6,096,483	43,999	6,140,481	0.72%
Radiology	3,363,881	63,455	3,427,337	1.85%
Optometry	2,728,225	29,317	2,757,541	1.06%
Family Practice	2,203,837	65,616	2,269,453	2.89%
Ophthalmology	2,029,684	9,931	2,039,615	0.49%
Gastroenterology	1,975,685	9,969	1,985,654	0.50%
Emergency Medicine	1,680,289	6,332	1,686,622	0.38%
Cardiovascular Disease	1,647,470	21,519	1,668,989	1.29%
Surgery	1,350,152	54,710	1,404,862	3.89%
Podiatry	1,355,448	3,197	1,358,644	0.24%
Pathology	1,083,682	178,243	1,261,925	14.12%
Orthopaedic Surgery	1,190,184	6,829	1,197,013	0.57%
Urology	1,069,616	4,181	1,073,797	0.39%
Neurology	923,032	40,648	963,680	4.22%
Other (55 Specialties)	11,155,816	266,896	11,422,713	2.34%
Total	**54,440,950**	**1,323,848**	**55,764,798**	**2.37%**

[253] Assessment G analysis which used CPT Detail FY14, provided by VHA OPES, March 5, 2015.

Although benchmark comparison generally excludes the use of Gap codes, we elected to utilize the appropriate values assigned by Ingenix in our data set given the unique care models required to support Veterans, nature of the services performed and lack of an alternative.

The Assessment G team believes that through utilization of the OPES business rules in addition to the approach to accounting for the lack of modifiers, the benchmarking data is comparable to the VHA data set.

B.2.5.4 Approach

Below we describe our approach to making productivity comparisons for primary care, specialty care, and dental.

Primary Care – Panel Size

For primary care providers, we measured productivity by comparing panel sizes to industry benchmarks from Kaiser Permanente Medical Group Northern California (average),[254] MGMA 2014 Compensation and Production Survey (median), and American Medical Group Association (AMGA) 2014 Medical Group Compensation and Financial Survey (median).

VHA targeted panel sizes of 1200 and 900 (for physicians and APPs respectively) are outlined by VHA Handbook 1101.02,[255] assuming optimal staffing and resource levels. It is noted that actual panel sizes may fluctuate. The calculated VHA average panel size (inclusive of APPs and Physicians) was estimated by taking VHA-provided average panel sizes per "Sta6" facility and calculating a weighted average based on total unique patients.

Our team calculated "ideal" panel size based on an equation published by the American Academy of Family Physicians. For VHA panel size, we used the average panel size by VISN as a means for comparison. The equation is: panel size × visits per patient per year (demand) = provider visits per day × provider days per year (supply).[256] The equation solves for the ideal panel size based on the provider's historical level of productivity. For the purposes of aligning to the general VA demographic, the Assessment G team applied an adjustment for males aged 60 to 64 (based on VA median age and sex). The Assessment G team made an additional adjustment to the 'provider visits per day'. VHA providers are expected to see between 10 and 12 patients per day[257] but based on literature review, the ideal number in a typical setting is

[256] Murray, M.D, Davies, M. & Boushon, B. (2007). Panel Size: How Many Patients Can One Doctor Manage? *Fam Pract Manag*.2007; 14(4); 44-51. Retrieved from http://www.aafp.org/fpm/2007/0400/p44.html#fpm20070400p44-bt2.

[257] Based on Assessment G site visit data gathered from primary care providers on 24 site visits

---

approximately 15 patients per day.[258]

Calculation:

2.38 *(current VHA primary care outpatient visits per year[259])* ***x 1.17*** *(AAFP adjustment factor based on VHA paneled member age and sex)[260] =* ***2.78*** *(calculated adjusted VHA visits per patient per year)*

The Assessment G team validated panel sizes using benchmarks published in the *Annals of Family Medicine* which provide insight into four models of care for primary care, dependent upon delegation of tasks to various non-physician members of a primary care team. The critical input of delegation assumptions estimates panel sizes ranging from 983 to 1,947, breaking out delegation tasks between preventive care, chronic care, and acute care.[261] It recommends that the low-overhead Ideal Medical Practice have somewhat larger panel sizes (than a concierge medical practice with panel sizes of 200 to 600) but typically fewer than 1,000 patients. According to the analysis, with an assumption of 2,025 work hours per year per primary care physician and an age-sex distribution of the patient panel similar to an analysis of the Duke University health system (0.71 hours, 0.99 hours, and 0.36 hours, respectively, for a total of 2.06 hours of service per year per patient), yields a physician ability to care for a patient panel of 983 patients under a non-delegated primary care model. With the most ambitious assumption about the degree of delegation possible, a physician could reasonably care for a panel of 1,947 patients.[262]

Primary Care – Panel Size Actuals, Maximum, and Modeled

In addition to comparing primary care panel sizes externally to benchmarks, the Assessment G team completed an internal analysis examining the PCMM computed DivisionModeled Capacity panel sizes assigned to providers at the facility level and compared that target to both actual panel sizes per provider and the facility-assigned maximum panel size targets. To do this, team G leveraged data provided by VHA's office of Primary Care via the Office of Productivity, Efficiency, and Staffing. OPES provided Assessment G the Modeled Division Capacity PCMM output for all facilities at the Sta6a level for September 2014 as well as a file containing actual and facility determined maximums at the provider level, by month. Data field and definitions are outlined below:

Table B-8. Data fields and definitions for primary care [263]

Data Field	Definition
FY	Fiscal Year (FY14)
FP	Fiscal Period starting with 1 = October and 12 = September
ProvCat	Designation of the category of provider either as a physician or a non-physician licensed provider acting as a primary care provider (APP).
TeamType	The type of special population the primary care team addresses. There are eight team types: General Primary Care, Home Based Primary Care, Women's Health, HIV Clinic, Post-Deployment Care, Renal/Dialysis, Geriatric Primary Care, Spinal Cord.
FTESummed	The amount of FTE that the individual provider was mapped to work in his/her primary care role and recorded in VISTA Legacy PCMM application. Because a provider can have more than one PCM Team, the amount of the individual's FTE would need to be summed. The FTE is manually entered into PCMM and is not pulled from DSS labor mapping.
PanelCountSummed	The number of patients actually assigned to a provider on the last day of the fiscal period. Because a provider can have more than one PCMM Teams, the amount of assignments to all teams is summed to a single record for the individual provider.
MaxCapacity	The numerical value entered in PCMM that represents the maximum number of patients that the team position for the primary care provider can have assigned to it. It is summed by ProvSSN and Fiscal Period same as the FTE and PanelCount.
ModeledCapacity	The number of patients modeled to a panel size for a particular facility at the Sta6n level via PCMM. Target for 1.0 FTE MD is 1200, and 1.0 APP is 900. This is then adjusted up or down based on various factors, specifically the number of exam rooms, support staff, and division intensity.
ProviderID	Unique identifier for the provider. OPES completed de-identification of "ProviderID" to allow link with other files provided for the assessment. One provider can have multiple records if assigned more than one panel team type.

---

[263] Data Definitions sourced from Data Definitions – Provider Panel Size Data (version 3), Primary Care Data Sets to Choice Act 201 MITRE Teams, provided by VHA OPES, August 4, 2015

In order to keep data fields consistent and ensure an accurate comparison between actual panel sizes and division modeled capacity targets, our team limited the scope of the provider actual and maximum data to Fiscal Period (FP) 12 of Financial Year 14 (FY14), which corresponded to September of 2014. The filtered data included actual panel sizes at the provider level of detail, with flags for Physicians and APPs in addition to the separation of General Primary Care panels and Special Population Care Panels via the "Team Type" field. All providers are mapped to Sta3n and Sta6a levels.

Actual panel sizes, Total FTEs (which were self-reported FTE figures provided by the Office of Primary Care), and 'Maximum Capacity' size targets were rolled up to the Sta3n level of detail. Actual Panel sizes per 1.0 FTE were then calculated by taking the sum of all providers Actual Panels and dividing by the Sum of Total FTEs for each Sta3n. This calculation was completed for both MDs and APPs separately, for each of the 8 "Team Types" represented in the data set.

Similarly, the facility-set 'Maximum Capacity' was summed up the Sta3n level, and divided by the Sum of Total FTEs to set the Maximum Capacity per 1.0 Total FTE for MDs and APPs for each Team Type.

'Modeled Capacity' was the only figure not available at the provider level. Modeled capacity is a measure that remains at the Sta6a level of detail by Central Office. In order to compare actual panel sizes to PCMM division modeled capacity, our team calculated a weighted average for the Sta3n by weighing each Sta3n modeled capacity figure by the number of Total FTEs in each subsidiary Sta6n to their parent Sta3n. Our output was the weighted average Modeled Capacity for each 1.0 MD FTE for General Primary Care panels. To calculate APP Modeled Capacity, the team applied a 25 percent discount per VHA OPES guidance to account for APPs.

To estimate Modeled Capacity for the Women's Health panel teams, Assessment Team G referred to Directive 1330.01 which stipulates that any designated Women's Health panel be discounted by 20 percent of the number of women on the panel. To be considered a Women's Health panel, at least 10 percent of the panel must consist of female patients. While not provided the actual number of females on each panel, the team estimated that the minimum 10 percent of total modeled panel size was composed of women, considering only 6percent of all patients are female. The net result was that each modeled panel size was discounted by approximately 2 percent to account for this adjustment. For APPs assigned to a Women's Health panel, this figure was then discounted 25 percent further.

Modeled Capacity was set at 250 for Home-Based healthcare based on Directive 1140.07, with APPs Modeled Capacity set at 75 percent of that (187.5). Modeled Division Capacity was not calculated for the other Specialty PACTs due to the lack of specific inputs and calculations provided by VACO, as facilities are given leeway to set these panel sizes for their special populations.

In the main body of the report, Assessment G reported aggregate statistics relating to the analysis of Primary Care panels. Our team limited our aggregate findings specifically to General Practice Primary Care Physicians. Specifically, our team's actual and maximum panel size are the sum of the actual and maximum panels of General Practice Primary Care Physicians divide by the General Practice Primary Care Physicians FTE sum. The national modeled panel size is the

mean of the modeled capacity by facility. The standard deviation is calculated through the variance of the actual, maximum and modeled panel size for General Practice Primary Care Physicians by facility. The percentage break downs of each team type of panel is calculated by Physician FTE assigned to each.

Specialty Care Productivity – Encounters and wRVUs

For specialties other than primary care, we measured productivity using both encounters and wRVUs. The approach to these analyses is detailed below. Of note, the detail in the Appendix (Section A.2), which includes facility encounter and wRVU production, does include primary care providers. The specialty benchmarking in the productivity section of the document, however, does not include primary care providers.

Work RVU and Encounter Productivity Comparison

Work RVU values within VHA are calculated utilizing both CMS wRVU values for all services included within the CMS wRVU weighting schedule for 2013/2014 and additional homegrown codes called "imputed/gap" codes. These codes provide wRVU credit for clinical activity that is not otherwise captured and reimbursed under the CMS wRVU schedule. Each provider has an aggregate wRVU value based on his/her entire clinical work product, regardless of clinical work environment, for the fiscal year. The Assessment G team compared this wRVU amount to the three benchmark data sets (AMGMA, MGMA, AMGA), based upon the adjusted Worked cFTE. Each specialty and facility were compared in aggregate (to benchmarks) as well as by provider. As part of this comparison, our team calculated (described below) internal percentile ranks or benchmarks, comparing the productivity (either by wRVU or encounter) to other VHA specialties. To calculate the productivity of providers in the VHA data set, we:

1. Matched the VHA OPES Productivity Data File to cross-reference files provided by OPES (included within Data Definitions documents presented along with the data files) to determine Facilities, VISNs, and Complexity levels.

6. Removed duplication issues that occurred in the VHA OPES Productivity Data File when FTE information was compiled from the labor data. The VHA OPES Productivity Data File was delivered with the duplication issues stated above.

7. Matched Labor Detail Files, Productivity Files and CPT® Detail Files (as provided via the VHA OPES CPT® Details Data File). The CPT® Detail file enabled our team to map to the VHA OPES Productivity Data File, which enabled all the CPT® related activity to be analyzed, by provider.

8. Validated clinical FTE levels of all providers and summarized them at the Aggregate Specialty Level, for comparison to a Summary Report from VHA ProClarity Productivity Cubes. This validation was also performed for the Administrative, Research, and Teaching FTE summaries.

9. Additional clinical FTE validations were done at the VISN and STA3N levels. All validations were within a tolerance of 3 percent, indicating that the VHA OPES

Productivity Data File FTE information closely correlated with the FTE information within the Summary Report.

10. Validated wRVUs from the VHA OPES Productivity Data File by matching CPT® codes and comparing the reported wRVU amounts to CMS wRVU amounts for the appropriate years. This validation was performed by linking the VHA OPES Productivity Data File to the VHA OPES CPT® Details Data File.

11. Applied modifier adjustments to the data set by modeling CPT® and Modifier level CMS data, using approach described in prior section.

12. Applied leave factors to the Productivity data by matching the productivity data to the labor data by physician and then compiling leave factor percentages. This allowed FTE values to be converted from the Worked values reported within the VHA OPES Productivity Data File to Paid values which were used for other purposes outlined within this appendix.

13. Calculated Internal Benchmarks for all levels of analysis, including Complexity Level and Specialty. Internal Benchmarks include 25th Percentile, Median, 75th Percentile, Mean, and Standard Deviation. These Internal Benchmarks were created for both wRVU productivity and Encounter Productivity measurements.

14. Calculated Percentile Rankings at provider levels and all aggregate levels (including Facility, Complexity and Specialty) of analysis. Percentile Rankings were calculated for MGMA and MGMA Academic 2014 benchmarks. These Percentile Rankings were created for both wRVU productivity and Encounter Productivity measurements. (Reference to Figures 2-11 and 2-12).

15. Applied reference files (from the Data Definitions document provided by OPES) to the source data to flag Primary Care Physicians, Associate Providers and to create Specialties for Associate Providers.

16. Produced Data Marts with all variations of data and calculations (by complexity, facility, specialty, aggregate specialty) mentioned above at Primary Care, Specialty Care and All Care levels.

In instances where our team graphically displayed wRVU and encounters, we summed either wRVUs or encounters up the level of aggregation. For example, total encounters in the aggregate are presented in Section 2.3.6.4. The Assessment G team did not modify the VHA encounter data to exclude telephone encounters; The MGMA 2014 survey specifically includes telehealth and e-consults in its definition of encounters, whereas the Academic MGMA (AMGMA) survey definition has not yet been updated and consequently there is a potential margin of error with the benchmark finding, when compared to the AMGMA survey.

Figure 2-17 depicts the sum of encounters after our team mapped encounters at the specialty level to the major specialty grouping. In instances where percentile rank was depicted in aggregated form (Figure 2-11 and Figure 2-12), percentile rankings were recalculated at the major specialty grouping level and the MGMA and AMGMA benchmarks were mapped to the major specialty grouping level using weighted averages.

Encounter Methodology

The VHA OPES Productivity Data File was provided with encounter measures. There were two fields that contained encounter information ([NumEncountersRVU] and [NumEncountersNoRVU]).These fields provided encounter totals by physician for FY2014. By combining these two fields for each provider, total encounters were calculated. OPES provided these fields to allow us to distinguish between CMS wRVU and Non-CMS wRVU activity. However our team ultimately used a CPT® Details file provided by OPES to accomplish this task. Our team used the calculated total encounters (as aforementioned) to key our productivity measurements.

OPES did not provide our team any further means to validate encounter totals. We ensured that encounters aggregated by employing the same methodology as FTEs and wRVUs (which did tie to OPES validation reports). No adjustments (such as modifier adjustments used for wRVUs) were made to encounter totals from the point of delivery until the final analysis point. For MGMA and AMGMA benchmarking purposes, total encounters were divided by adjusted cFTEs (as described above) to provide a normalized basis for measuring productivity.

Encounters were compared to both MGMA and AMGMA benchmarks. It should be noted that while MGMA has updated the encounter definition in its Physician Compensation and Production Survey to include Telehealth and e-consults in its most recent survey (2014), MGMA has not updated its definition as such in its Academic Practice Compensation and Production Survey (AMGMA). Our team was unable to distinguish Telehealth and e-consults in the encounter data set as CPT® level detail was not included. As such, we were unable to adjust when comparing to AMGMA. Telehealth and e-consults may cause VHA providers to appear more productive (when using encounters) relative to the AMGMA benchmark, although the size of this impact is unknown.

The other steps for compiling encounter information are contained within the "Work RVU and Encounter Productivity Comparison" section above.

Please note that from the data provided, our team was not able to distinguish which CPT® codes were related to [NumEncountersRVU] and which were related to [NumEncountersNoRVU].

Comparison of High and Low Complexity

Using the approach detailed above under "Work RVU and Encounter Productivity Comparison," our team analyzed the internal and external productivity benchmarks at a variety of levels. In Figure 2-18, our team highlighted a three specialties at the most complex (1A) and least complex (3) facility levels. Our team ranked each aggregate specialty by productivity as calculated by wRVU (as opposed to encounter) and displayed provider count, total FTE and encounters for reference.

Dental Productivity Analysis

Using the same Dental Hourly and Productivity Data File and the 2010 ADA Survey of Dental Practice: Characteristics of Dentists in Private Practice and their Patients files, our team

analyzed dental productivity by analyzing visits per provider. Dental data was sorted by per site visits which included the Worked FTE totals and number of visits. The patients' visits per provider per year were summed to the dental specialty level. Our team summed all provider visits within each specialty and divided all visits by the number of clinical FTE per specialty to determine the visits per provider. We then calculated the average patient visits per clinical FTE by dental specialty and compared these to the ADA benchmarks.

Productivity and Access Analysis

Our team analyzed the relationship of productivity and access by plotting the productivity (measured using wRVUs) against the proportion of patients able to obtain an appointment within 30 days of requesting it. In our case study, facilities of different complexity were identified by color. The wait time data was obtained from FY14 SPARQ report data and compared to our internal productivity calculation described above. Because each facility had its access value, no aggregation or calculation was performed on the access data. As previously described, the productivity calculation required the aggregation of wRVUs and cFTEs by facility. In Figure 2-20 Productivity versus Access Analysis – Cardiology, each dot represents a facility and the color of each dot represents a facility of a particular complexity level.

Unlike the productivity data, our team did not receive scheduling data and was unable to validate the access data. Our team understands there are several issues regarding the accuracy of the FY14 access data. We did not validate the accuracy, nor do we present this data as a means to draw conclusive findings; rather, we present it to illustrate the importance of considering access in conjunction with productivity.

Space and Support Staff Ratio Analyses

Assessment G included preliminary findings on space and support staff from a separate study conducted in 2015 for VHA assessing the ratio of providers to rooms and support staff for a sample of specialty outpatient clinics at 48 medical centers across the country, with varying complexity levels. This data was collected on behalf of VHA Office of Specialty Care Services, by Grant Thornton and is currently in draft form. In reporting space ratios by aggregate specialty, Grant Thornton received space quantities from nurse managers at the visited facilities and physically confirmed the space quantities. The ratio considers the number of physicians, APPs, residents and fellows that each specialty clinic reported as having against the number of rooms. The total number of providers (physician, APP, fellow, resident) for each specialty was divided by the total room quantities. The full analysis also reports these space ratios at the facility level and up to the complexity level.

In reporting support staff quantities, Grant Thornton interviewed nurse managers at the selected facilities and inquired about the levels of dedicated staff at that clinic. The site visit teams confirmed the quantity of dedicated support staff they observed on that day. The ratio considers LPNs, RNs, Clerks, Technicians, occupational therapists, and PTs as support staff and physicians and APPs as providers. We also present administrative and clinical support staff separately. The site visit teams specifically asked for dedicated support staff as delineated from shared support staff. The ratios were calculated as the total dedicated support staff divided by

the total providers for each specialty. The full analysis also reports these support staff ratios at the facility level and up to the complexity level.

B.2.6   Non-clinical provider time

Section 201(G) of the Veterans Choice Act requests an assessment of "…the time spent by such health care provider on matters other than the case load of such health care provider, including time spent by such health care provider as follows:

(I)   At a medical facility that is affiliated with the department
(II)   Conducting research
(III)   Training or supervising other health care professionals of the Department."

In response, we used data from VHA's cost accounting system, DSS, which is maintained by the MCAO, to report non-clinical provider time. DSS is a managerial workload and cost accounting system that connects labor hours to activity to estimate the cost of providing services. Labor mapping is the method by which labor hours, and the associated labor costs, are assigned to ALBCCs. All physician, APP and dentist time is allocated to ALBCCs classified as Direct Patient Care, Indirect Administration, Research, or Education. Local DSS teams at VAMCs provide self-reported labor mapping data into DSS. We use this data to report the research and training/supervision time.

VHA does not keep central data on the time which VHA providers (who also have appointments at affiliate institutions) spend at those institutions, as these providers are generally paid by the affiliates during this time. In the absence of such data, the Assessment G team surveyed the facilities which it conducted site visits to. We selected one facility as an example to analyze and present this facility as a case study.

B.2.6.1   Definition

Labor Mapping: The method by which VHA labor hours, and the associated labor costs, are assigned to an ALBCC. Each ALBCC is broken into one of the following categories: direct patient care, administration, research, or education. In accordance with VHA Directive 2011-009,[264] those are defined as:

Direct Patient Care time: time to prepare, to provide for, and follow-up on the clinical care needs of patients and includes: time spent in reviewing patient data, consulting about patient care with colleagues, reviewing medical literature, contacting the patient or caregivers to discuss their needs, and the labor hours provided by a physician or dentist who is supervising house staff residents providing care in a clinical setting.

Administration time: Administrative time includes time spent on managerial or administrative duties, generally at the level of the department, service, medical facility, VISN, or nationally, both within and outside VHA. This time for professional staff is

---

[264] U.S. Department of Veterans Affairs Health Administration (2011) VHA Directive 2011-009 Physician and Dentist Labor Mapping. Retrieved from http://www.va.gov/vhapublications/ViewPublication.asp?pub_ID=2384

allocated as administrative time. Administration examples are time spent: in support of service-wide administrative activities, such as completing performance reviews, and medical center and VA Central Office reporting requirements; managing a program within a clinical department, service, or hospital; working on service or hospital-wide committees; and serving on state and national committees, advisory boards, or professional societies.

Education time: Education is defined as time spent providing formal training (didactic education). This includes preparation as well as actual classroom or lecture time for educators or presenters. Examples of education time spent are giving conferences in the community or nationally; in a classroom teaching medical school curriculum; in a classroom teaching residents and fellows; in managing a resident, fellow, or other type of student teaching program; and working on medical school committees.

Research time: Research time is defined as time spent performing formal, approved health care research, or in activities in direct support of approved research. Formal, approved research is research that is approved through the hospital's research review process. Support activities include time spent by the investigator in direct support of research activities. Research can be laboratory, clinical, or health services research. However, direct VHA patient care research time must be mapped as direct patient care time when workload is recorded in VistA as an encounter. Examples of Research time spent are working on research projects that have been approved by the local VA medical center Research and Development Committee which does not produce recorded patient care encounter workload in VistA; working in an actual research laboratory or in a controlled setting that involves no direct patient care or treatment; serving on hospital or affiliate research committees; supervising a student's, resident's, or fellow's non-clinical research; writing for publications or grants; attending meetings explicitly related to research activities; presenting papers at research meetings; and sitting on a national study section or grant approving board.

Affiliate: An affiliate refers to an institution with which a VAMC has an affiliation with. Per VHA Directive 2004-066,[265] an affiliation is a relationship between VHA and an educational institution or other health care facility for the purposes of enhanced patient care and education. It may also involve research. VHA and the affiliated educational institution have a shared responsibility for the academic enterprise.

Non-Clinical Time: For purposes of this assessment, this is reported as the overall portion of time VHA providers have labor mapped to all ALBCCs other than direct patient care (administration, research, and education). This includes only working time; it does not include paid time off. It should be noted that there is "non-productive" (non-workload generating) time captured in these ALBCCs; as such, the Assessment G team also qualitatively assessed factors that impact productivity.

---

[265] U.S. Department of Veterans Affairs Health Department. (2004) VHA Directive 2004-066 Education Affiliation Agreements. Retrieved from http://www.va.gov/vhapublications/ViewPublication.asp?pub_ID=1198

<u>Time spent at a medical facility that is affiliated with the Department</u>: For purposes of this study, this is reported as the average portion of an FTE that each part time VA provider, from the sampled facility, who has a dual appointment with an affiliate, represents. This data is not statistically significant and therefore not generalizable to the VA provider population.

<u>Time spent conducting research</u>: For purposes of this study, this is reported as the overall portion of that providers have labor mapped to research ALBCCs.

<u>Time spent training or supervising other health care professionals of the Department</u>: For purposes of this study, this is reported as the overall portion of time that providers have clinical time labor mapped to an ALBCC that is designated as education (meaning oversight of residents). While there is a comprehensive and quantitative way to determine provider time spent performing clinical, educational, research and administrative tasks (as defined by VHA), it is difficult to directly calculate the time spent by each provider "training or supervising other health care professionals of the department." According to the Accreditation Council for Graduate Medical Education (ACGME), clinical supervision is defined as "a required faculty activity involving the oversight and direction of patient care activities that are provided by residents/fellows."[266] For the purposes of this assessment, we have assumed this definition of supervision, and have analyzed provider time dedicated to overseeing residents and trainees in clinic, which would be considered part of direct patient care time per VHA's definition.

B.2.6.2   Data Sources

To calculate other non-clinical time, the Assessment G team used the labor mapping data provided by FTE, which is described in the Staffing Levels Methodology section.

B.2.6.3   Assumptions and limitations

One limitation is that the patient care ALBCC time includes several non-workload generating (non-productive) hours which are not spent directly with a patient, such as time completing patient documentation or following up with the laboratory or diagnostics unit for test results. As such, this time cannot be quantified.

The accuracy of VHA's labor mapping and person classification codes (taxonomy), data is currently under study by VHA's Office of Specialty Care Services. This assessment did not study the accuracy of the data and cannot comment on the quality or accuracy of it.

B.2.6.4   Approach

To calculate time allocation proportions, the Assessment G team did the following:

---

[266] Accreditation Council for Graduate Medical Education (2013). *Glossary of Terms*. Retrieved at
   https://acgme.org/acgmeweb/Portals/0/PFAssets/ProgramRequirements/ab_ACGMEglossary.pdf

Clinical Time, Administration Time, Research Time, and Supervision Time:

1. From the VHA OPES Labor Mapping Data File, all ALBCCs were categorized into clinical, education, research, or administration categories based on extracting the production unit from the ALBCC. Hours were the basis for these categories.

2. From the VHA OPES Productivity Data File, the FTEs were provided, already split out into the categories listed above. The VHA OPES Productivity Data File FTE information was based on FTEs (not hours).

3. For auditing purposes, the information from the VHA OPES Labor Mapping Data File was matched up to each physician in the VHA OPES Productivity Data File and the hours were converted to FTEs.

4. A basic validation was completed and the labor hours and classifications were determined to be closely correlating with the VHA OPES Productivity Data File FTE information.

5. The FTE Categories and FTE Totals were then multiplied by a leave factor (determined by provider, within the VHA OPES Labor Mapping Data File) to convert from Worked FTEs (as reported in the VHA OPES Productivity Data File) to Paid FTEs.

6. The Paid FTE categories and totals from the above step were then utilized for this time reporting process.

In Figure 2-32, our team calculated the percentage of clinical physician and APP (provider) time out of total paid FTE. The reference line addresses the average of all percentages across the aggregate specialties. Similarly, our team also calculated time devoted to education and research using the same approach as used for clinical time reporting. However, rather than reporting up to the aggregate level, our team reported education findings at the major specialty grouping level (refers to Figure 2-33).

We also analyzed the percent of time spent training or supervising other health care professionals. This analysis is outlined in Figure 2-36. To calculate this metric, our team used the VHA OPES Labor Mapping Data File to identify ALBCCs ending with an "ED" suffix. The suffix indicates a provider is training or supervising time of other health care professionals during direct patient care time. Our team compiled the worked hour totals of the ALBCCs with instances of the ED suffix. We sorted this category of paid hours by physician and location and mapped it to our VHA OPES Productivity Data File In applying this mapping, some clean-up of provider records, primarily relating to duplication was required. Once we had the paid hours corresponding to training or supervising other health care professionals, we divided them by 2080 as our data sets are for a year to determine the Oversight of Residents FTE. The Oversight of Residents per year was grouped into the major specialty groupings and divided by the total FTE for the major specialty groupings. The resulting percentages speak to the percentage of time devoted to the oversight of residents.

Medical Affiliate time:

Following a data call as part of our site visits, we reviewed files received from several sites which were requested to include de-identified paid dual appointees, and their fractional FTE at

VA as well as the affiliate. Upon doing so, it was determined that the data was not in an analyzable or comparable format for most sites. We identified one site, the Durham VAMC, with high quality data, and determined that we could instead use this data as a case study. For the case study, we followed these steps:

1. Converted FTE fractions into hours.

2. Summed hours for VA time.

3. Summed hours for affiliate time.

4. Calculated total hours in data set (sum of all hours).

5. Calculated proportion of VA time and affiliate time, by dividing VA hours by total hours, and affiliate hours by total hours.

6. Calculated total FTE at medical centers included in the data set, using staffing levels data set.

7. Calculated proportion of FTE that are dual appointees (divide VA hours by total hours for the medical centers included in the analysis).

B.2.7 Site Visit Methodology

The Assessment G team conducted site visits to VAMCs and CBOCs to identify VHA best practices, contributing factors and root causes of the differences between VHA provider staffing and productivity and the private sector. Specifically, the site visits addressed two of the five research questions for this assessment:

- If provider staffing and productivity levels differ from the private sector, what are the unique characteristics of VA and the patient population it serves that contribute to these differences?

- How does the unique mission of VA or other factors explain the time spent on activities other than direct patient care within a VA medical facility?

Seven site visits also addressed the supplemental more focused study of nursing staffing practices.

B.2.7.1 Site Visit Selection

VA medical facilities selected for site visits were identified using the following steps and resulted in a sample of 50 facilities:

1. A preliminary random stratification of inpatient facilities, with Veterans Integrated Service Network (VISN) as strata.

2. Random selection of VISNs performed thereafter to further reduce the sample size of the initial output.

3. Chi-square testing on each of the identified variables, in an effort to solidify an equitable distribution of sites to include VISN, urban vs. rural, adjusted admissions, VHA

complexity rating, adjusted length of stay, adjusted patient satisfaction, cumulative access score, and facility age.

4. A review of the subsequent list with internal and external subject matter experts.

5. The team further refined and balanced its site selection to 20 VAMCs, 7 CBOCs, and 2 Community Living Centers (CLCs) based on VHA's three complexity groups. (VHA classifies each medical center into a complexity level from 1A - most complex - to 3 - least complex, based on seven variables: number of patients; case-mix; intensive care unit level; referral center status, such as cardiac surgery center; research capacity; number of medical residents; and breadth of specialty training programs.)

6. We additionally selected seven VAMCs to conduct a more detailed review of nurse staffing practices. The selected facilities included two VA hospitals with Magnet recognition from the American Nurses Credentialing Center (ANCC). We identified these facilities based on a magnet-status, complexity grouping, and presence of inpatient nursing units that were included in the earlier GAO pilot study[267]OR, ED, SCI unit, and Med-Surg.). The purpose of these site visits was to understand best practices and challenges VHA has encountered in adopting VHA Directive 2010-034 Staffing Methodology for VHA Nursing Personnel.

B.2.7.2 Specialty Selection Methodology

The Assessment G team used VHA management reports of provider productivity from the Office of Productivity Efficiency and Staffing (OPES) to identify trends and outliers across each of the specialty groups (e.g., facilities with specialty groups that reported productivity, access, or allocation of provider time well outside VA national averages). Specialty groups identified as outliers were selected for interviews during site visits. Using this approach the Assessment G team interviewed service leaders and providers from highly productive specialties, low productivity specialties, specialties with good Veteran access to care, and poor Veteran access to care. Specialties were selected based on the following criteria and are listed in priority order:

1. (SPARQ) Score

2. Productivity (highest to lowest)

3. Unique Patient Volume (volume of unique patients, meaning the number of individual patients who visited that facility within the most recent fiscal year)

---

[267] Government Accountability Office. (2008). VA health care: Improved staffing methods and greater availability of alternate and flexible work schedules could enhance the recruitment and retention of inpatient nurses. (No. GAO-09-17). Washington, DC: Government Accountability Office. Retrieved from http://www.gao.gov/new.items/d0917.pdf

---

4. Percentage of All Patients Wait Between 0- 30 Days (proportion of patients who are able to obtain an appointment within 30 days of scheduling)

The number of selected specialties was determined by the facility complexity. For all Complexity 1 facilities, two specialties within each SPARQ score were chosen. Utilizing SPARQ and Capacity data, the Assessment G team selected the specialties and interviewed providers, Service Chiefs, and Administrative Officers. To obtain an understanding of the unique challenges and productivity drivers in a range of settings and resource arrangements, the Assessment G team randomly selected up to one specialty from each SPARQ quadrant (see Figure B-6 and Figure B-7) to obtain a comprehensive understanding of unique challenges and productivity drivers in a range of settings and resource arrangements, allowing the team to speak with optimized practices, under resourced practices, over resourced practices, etc. Collectively, the team sampled a sufficient number of specialties, as well as a sufficient number of optimized practices, potentially under resourced practices, potentially over staffed practices, and inefficient practices. Additional detail about the interview questions is in Appendix C.

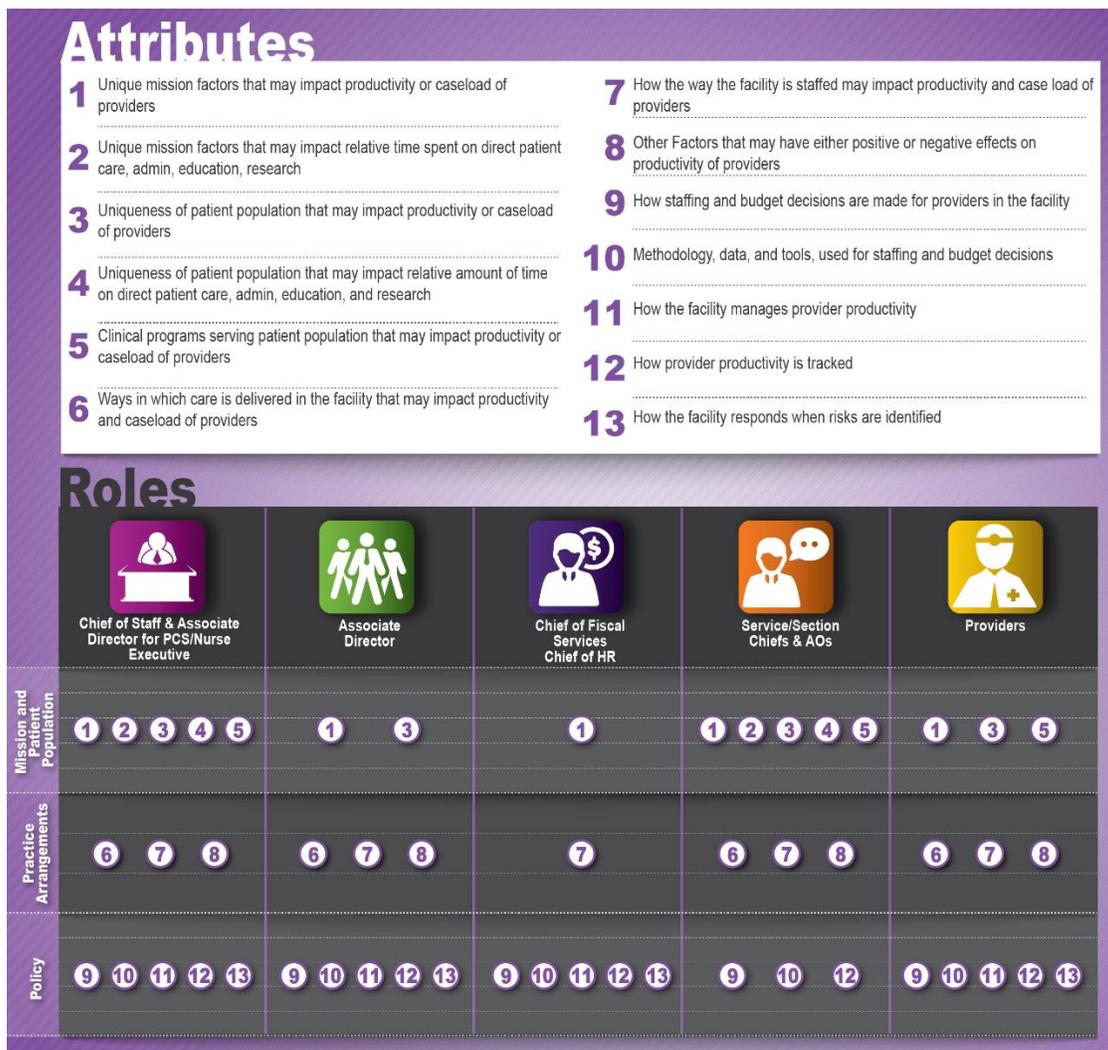
Source: SPARQ and Capacity for VISN23.xls provided by MITRE.
Site Visit Team assumes Productivity and Access metrics are accurate and complete for all VISNs. Specialties not reported in the SPARQ report
 (e.g. Specialties with a score of NULL) were excluded from the selection methodology above. Specialties are subject to change as additional data is reviewed.

B.2.7.3   Interview Framework and Strategy

The Assessment G team conducted role-based interviews at VA medical facilities with senior leadership, section chiefs, administrative officers, service chiefs, and providers. The framework for the interviews (See Figure B-8) covered a range of attributes organized into three domains (mission and patient population, practice arrangements, and policy). Interviews with senior leadership were used to understand mission-related factors, productivity drivers, and methods and management reports used to manage staffing and provider productivity across the facility. Interviews with section chiefs, administrative officers, service chiefs, and providers were used to understand unique mission-related factors, patient-related factors, and productivity drivers within their patient care environments. Interviews with senior leadership and other clinic leaders averaged 30 minutes. Interviews with providers averaged 10 minutes. Specific interview questions can be viewed in Appendix C.

Figure B-8. Assessment G site visit framework


In addition, our nursing practices focused study visited seven VAMCs to understand best practices and challenges VHA has encountered in adopting the VHA Directive 2010-034 nurse staffing methodology, and to identify other nurse staffing methodologies utilized in the inpatient and outpatient settings. Intended interviews at the VAMC facility level included the facility's Chief Financial Office, and the Chief Nursing Executive (CNE) or the Associate Director for Patient Care Services. Interviews for a sample of unit level management were conducted to discover the methodology used and how it was implemented for each nursing unit. Inpatient and outpatient unit level leadership were interviewed during the VAMC site visit.

B.2.7.4   Root Cause Analysis

The Assessment G team used the root cause analysis technique to introduce systems-based thinking into our analysis of potential factors that may explain the differences between VA provider productivity and the private sector. Root cause analysis is a rigorous, systematic approach widely used in health care settings and by The Joint Commission. It is used to develop an in-depth understanding of an issue, problem, or event being investigated and to reach those fundamental reasons why a problem or issue has occurred. It asks a series of "why" questions about a sequence of events or factors involved in a problem until the root causes and contributing factors are identified.

The Assessment G team used the interview results from the site visits to identify those factors that facility leaders and providers believed impacted (either positively or negatively) the productivity of providers. We analyzed the frequency with which these issues were raised by leaders and providers at facilities. We categorized these findings into best practices or potential causal areas to focus on in the root cause analysis. We used these findings to inform our initial understanding of the "who, what, where, how and why" of provider productivity gaps and to develop a preliminary fishbone diagram of the factors impacting provider productivity.

The Assessment G team used the potential causal areas and its preliminary fishbone diagram to identify additional questions to ask facility leaders and providers regarding possible contributing factors, examples and supporting evidence. The team used the "five whys" technique in facility interviews to check the team's logic, eliminate potential causes, refine its understanding of cause-effect relationships, and pinpoint potential root causes.

B.2.7.5   Site Visit Process and Procedures

Each site visit was conducted with the same processes and procedures. The Assessment G team followed pre, daily, and post site visit checklists to ensure that interviews were conducted in a consistent manner throughout the site visit. Interview documentation was uploaded to a SharePoint document platform during the site visit.

B.2.7.6   Pre-Visit Processes and Procedures

Site visits were coordinated through MITRE established channels and in accordance with MITRE site visit planning policies. Several documents, policies, and procedures were established to govern the planning and execution of site visits as part of the Grant Thornton independent assessment. The authoritative source for all site visit planning was the MITRE Veterans Choice

Act Collaboration site, Site Visits page. Documents at this site were continually updated to provide team members with the latest site visit guides and planning calendars.

B.2.7.7   Site Visit Execution

Site visit execution included onsite coordination, interviews, documentation, and debriefs with VAMC and MITRE point of contacts.

B.2.7.8   Post-Visit Distillation of Findings

At the end of each site visit week, the Assessment G team participated in a debrief meeting with MITRE site visit coordinators. This meeting discussed lessons learned and follow-up actions.

The Assessment G team used interview guides and a template to aggregate and categorize interview responses and examples.

Two specific questions were used for creating and indexing categories of potential causal factors. The following question was selected as a primary source for determining priority enablers and inhibitors for productivity and staffing: '*what three things would enable you to be more productive?'* The second question that was selected as a secondary source was: *'what other factors have either positive or negative effects on productivity compared to non-VA health systems?'* The interviewee's response to these questions were indexed into the categories listed in the figures below and subsequently marked with a numeric '+1' or '-1'; the numeric positive or negative sign indicates whether the identified category enabled the provider to be more productive (negative sign), or if the identified category was a current enabler of productivity (positive sign). Qualitative data was indexed to generate analytical categories linked to the private sector.

Grids were developed to track identified categories from each interview. These grids were delineated by management and providers, and were populated by facility, for each interviewee. Team debriefs that transpired for each site visit required a designated analyst to collate all findings for the respective visit, review the data for any inconsistencies, and subsequently finalize the category matrix. The designated analyst was responsible for complete oversight of the category matrix; centralizing this role minimize the number of touches and subjective impact on objective, qualitative findings. Lastly, a final count of each category across the site visit was totaled, in effort to determine trends across each site visit as well as in totality across all site visits. The embedded excel file shows the observational categories from management interviews and shows the observational categories from the provider interviews. Also included in the file are the aggregate results of the provider interviews.

ObservationalCatego rieswithAggregateRes

Appendix C   Interviews, Lists, Questions, Teams

Appendix C provides information surrounding Assessment G interviews, including stakeholder interviews, site visit interviews, and site visit teams. The following interviews were conducted between the dates of December 30, 2014 – May 13, 2015 to support the qualitative data collection of the Assessment G Staffing and Productivity report.

C.1   VHA Stakeholders

Table C-1. List of Assessment G VHA interviewees

Name of Interviewee	Title
Dentistry: *Interview Dates 12-30-2014 and 01-05-2015*	
Patricia Arola, DDS	Assistant Under Secretary for Health for Dentistry
Susan Bestgen, DDS	Director of Operations
Terry O'Toole, DDS	Director, Dental Informatics and Analytics
Greg Smith, DDS	Associate Director, Dental Informatics and Analytics
Mental Health: *Interview Date 01-05-2015*	
Dean Krahn, MD	Director, Office of Mental Health Operations
Jodie Trafton, PhD	Director, VA Program Evaluation and Resource Center
David Carroll, PhD	National Mental Health Director, Program Integration – Acting Director of Operations
DSS: *Interview Date 01-06-2015*	
Eric Burgess	Director, Managerial Cost Accounting Office
Larry Nedzbala	DSS Technical Support Staff
Roger Tillson	VHA MCAO
Primary Care: *Interview Date 01-07-2015*	
Joanne Shear, MS, FNP-BC	Clinical Program Manager
Lisa Skomra	Primary Care Operations Specialist/National
Betsy Lancaster	VSSC Mgmt. & Program Analyst
Freddy Kirkland	Program Analyst

Name of Interviewee	Title
Richard Stark	Executive Director for Primary Care Operations
Gordon Schectman, MD	Chief Consultant, Primary Care Services
Physician Productivity –Specialty Care Services: *Interview Date 01-09-2015*	
Eileen Moran	Director, OPES
Imran Ahmed	CBI NAM Accountant
Lori McDonald	HIM Specialist
Eric Burgess	Director, MCA Office
Michael Doukas, MD	Chief Consultant, Specialty Care Services
Leonard Pogach, MD	Specialty Care Services
Omar Cardenas	Specialty Care Services
Office of Academic Affiliations: *Interview Date 01-12-2915*	
Robert Jesse, MD, PhD	Chief Academic Affiliations Officer
Karen Sanders	Deputy Chief Academic Affiliations Officer
Sheila Jackson	Management Analyst, Academic Affairs Officer
Surgery: *Interview Date 01-12-2015*	
William Gunnar, MD	National Director of Surgery
Geriatrics: *Interview Date 01-30-2015*	
Richard M. Allman, MD	Chief Consultant, Geriatrics & Extended Care Service
Physical Medicine & Rehabilitation: *Interview Date 02-02-2015*	
Lucille Beck, MD	Chief Consultant for Rehabilitation Services
Office of Women's Health: *Interview Date 02-24-2015*	
Patricia Hayes, PhD	Chief Consultant for the Women Veterans Health Strategic Health Care Group
Health Services Research & Development: *Interview Date 02-25-2015*	
David Atkins, MD	Director of Health Services Research & Development
Office of Nursing Services: *Interview Dates 02-12-2015, 03-17-2015*	
Donna Gage	Chief Nursing Officer, ONS
Office of Nursing Services: *Interview Dates: 03-10-2015, 03-31-2015*	
Beth Taylor	ONS Director of Workforce and Leadership

Name of Interviewee	Title
VHA Office of Workforce Management: *Interview Date: 05-07-2015*	
Elias Hernandez	Chief Officer of Workforce and Management and Consulting
VHA Office of Research and Development: *Interview Date 04-10-2015*	
Kathlyn Sue Haddock, RN, PhD	VHA ACOS for Research
VHA VISN Leadership: *Interview Dates 04-07-2015,04-08-2015*	
Amy Smith	Chief Nursing Officer of VISN 16
Judy Finley	Chief Nursing Officer of VISN 7
Portland VAMC Leadership: *Interview Dates 02-27-2015*, *04-22-2015*	
Kathleen Chapman	Chief Nurse Executive at Portland VAMC
Christy Locke	Portland VAMC Data Coordinator
Office of Telehealth: *Interview Date 05-13-2015*	
Carla Anderson, Pamela Stressel	VHA VACO Telehealth Team

C.1.1 Interview Questions for VHA Stakeholders

Table C-2. Questions for VHA stakeholders

Dentistry	Mental Health	Managerial Cost Accounting Office	Primary Care	Physician Productivity - OPES	Office of Academic Affiliations
Please provide a summary profile of VA dentistry providers: FTE, type of providers, locations, FT/PT, staff/contract and fee	What staffing models are currently in place for mental health? Is there a standard staffing model across all facilities? Are any staffing models being tested or piloted?	Can you provide an overview of the MCA system and how it documents and measures time allocation for providers?	How is panel size determined?	What are some of the key challenges in optimizing productivity and staffing?	VA conducts the largest education and training effort for health professionals in the nation. How does VA affiliate with academic institutions? ▪ What are the models for those partnerships? ▪ Is there any standard MOU language used for academic affiliations?
How does VA measure the case load and productivity of VA dentistry providers?	How are mental health services organized at medical centers and clinics?	Does MCA account for variable labor costs and fixed labor costs?	What are the current optimum levels of support staff per PCP and rooms per PCP?	Do you have data on how much time VHA providers spent per patient?	What percentage of VA medical centers have academic affiliations?
Is there any standardized staffing model used for dentistry in VA?	How is productivity measured/calculated for mental health? ▪ How is this monitored?	What changes did the 2013 directive on productivity have on labor mapping? ▪ Are there concerns about the variations in documenting administrative and clinical time?	What are the key challenges associated with optimizing staffing in the field?	Do you have data to support quality measures?	The academic mission of VA is very strong. We understand that every year, over 100,000 residents, fellows, and associated health students receive clinical training in VA facilities. As potential future VHA providers, what are

Dentistry	Mental Health	Managerial Cost Accounting Office	Primary Care	Physician Productivity - OPES	Office of Academic Affiliations
					students/trainees taught so that they are prepared to care for the Veteran population? ■ How are they being prepared to treat Veterans/patients under new care models?
What are the key metrics and performance reports? Please provide us with copies of these reports.	What are the core data streams used to calculate productivity?	How do facilities look at or use MCA data to make resourcing decisions?	Have you compared VA staffing, case load and productivity with the private sector? What were the results?	Have you compared VA staffing, case load and productivity with the private sector? ■ What were the results?	What are the benefits to VA, Veterans, and the community for having strong academic affiliations?
How is each productivity metric calculated?	What are the key challenges with implementing new productivity standards?	Is MCA involved in the operational or functional side of time allocation management? Does MCA analyze or trend time allocation by provider of by facility?	What key elements or factors should we consider in making these kinds of comparisons? ■ What is unique about VA care delivery models/structures?	What key elements or factors should we consider in making these kinds of comparisons? ■ What is unique about VA care delivery models/structures?	Could you tell us about dual appointment providers? ■ How many are there? ■ What do we need to know about dual appointment providers in looking at productivity, case load, and overall staffing in the medical centers?
Where is the productivity data for VA dentistry providers sourced from?	What are the key challenges associated with optimizing staffing in the field?	What are the problems with labor mapping for VHA?	What factors unique to VA impact the staffing, case load, and productivity of VHA providers when compared to the private sector? These factors may	Have you done any comparisons with other government agencies?	How does OAA ensure that residents/fellows are trained to identify the appropriate attending on encounters/notes?

Dentistry	Mental Health	Managerial Cost Accounting Office	Primary Care	Physician Productivity - OPES	Office of Academic Affiliations
			include: mission, policies and directives, patient population served, models of care, practice arrangements, number of support staff, number of exam rooms, clinic configuration, etc.		
Have you compared VA dentistry staffing, case load and productivity with the private sector? What were the results?	Have you compared VA staffing, case load and productivity with the private sector? What were the results?	What are the factors unique to VHA that impact labor mapping or time allocation?	Are there VA medical facilities that are especially good examples of these unique factors?	Care coordination is a big focus. What is your hypothesis about whether this coordination affects productivity?	How does working in a facility with an academic partnership change/affect the provider's day-to-day operations? ▪ How much time, on average, does this take away from direct patient care on a regular basis? ▪ Do you find that providers' productivity is significantly hampered by time spent supervising residents?
What factors unique to VA impact the staffing, case load, and productivity of VA dentistry providers when compared to the private sector? These factors may include: mission, policies and directives, patient	What key elements or factors should we consider in making these kinds of comparisons?	We understand that MCA performs periodic audits of labor mapping in the field. What do these audits entail and what have they revealed?	Can you walk us through the functionality of PCMM? How is PCMM data used at the national or program level?	Does VA have a risk adjusted model that they use?	Are there any, if known, differences in operations or staffing models for facilities with academic affiliations?

The views, opinions, and/or findings contained in this report are those of Grant Thornton and should not be construed as an official government position, policy, or decision.

Dentistry	Mental Health	Managerial Cost Accounting Office	Primary Care	Physician Productivity - OPES	Office of Academic Affiliations
population served, models of care, practice arrangements, number of support staff, number of exam rooms, clinic configuration, etc.					
Are there VA medical facilities that are especially good exemplars of these unique factors?	What is unique about VA care delivery models/structures?	Is MCA able to determine if providers have administrative or research funding associated with them?	Contract providers are also tracked in PCMM correct? Are contract CBOCs held to the same panel size standards?	Why not hire more coders?	Have any studies been conducted to compare facilities with academic affiliations to those without academic affiliations?
Are there any specialties that do not perform any general work?	What factors unique to VA impact the staffing, case load, and productivity of VHA providers when compared to the private sector? These factors may include: mission, policies and directives, patient population served, models of care, practice arrangements, number of support staff, number of exam rooms, clinic configuration, etc.	How are support staff accounted for in MCA?	What factors affect the quality of data and performance metrics for VA Primary Care?		Can you provide examples of VA medical facilities with especially strong or unique academic affiliations? ▪ What makes these relationships strong or unique?
Is there a long waiting list for dental care?	Are there VA medical facilities that are especially good exemplars of these unique factors?	Would you like to expand upon the recent hypothesis submitted to MITRE about the reasonable models for measuring productivity?	How is productivity measured/calculated for primary care?		Could you please provide us with a list of facilities that have academic affiliations and any key information about those programs?

Dentistry	Mental Health	Managerial Cost Accounting Office	Primary Care	Physician Productivity - OPES	Office of Academic Affiliations
Do you have the staffing ratios and the number of rooms per provider housed in a general database?		Has MCA conducted any external benchmarking studies on time allocation?			Is there anything we did not address that you would like to share?
Can you send us the slides/reports discussed in today's meeting?		Does MCA data undergo any transformation or enter the CDW before being used in the OPES productivity cubes?			
You created a system that isn't based on CMS. How is the system constructed, and what is the data source?					
How data is captured from a clinician's perspective?					
Do you perform similar studies into large variances in productivity, not just coding?					
Are these reports discussed at national level to address any anomalies?					
When calculating productivity, are you only counting the RVU done directly? Or those which done while overseeing a resident?					

Dentistry	Mental Health	Managerial Cost Accounting Office	Primary Care	Physician Productivity - OPES	Office of Academic Affiliations
Brief demo on how/why some facilities may not show high productivity					
Is there a lot of turn-over among dentists?					

Continued VHA Stakeholder questions.

Surgery	Geriatrics-Palliative	Physical Medicine & Rehabilitation	Office of Women's Health	Health Services Research & Development
If you could give us a history of staffing models in surgery overview and what work is currently underway to standardize staffing models for surgery?	How are geriatrics and extended care services organized at medical centers and associated clinics?	How are PM&R services organized at medical centers and associated clinics? We understand that PM&R can include preventive, rehabilitation, adjustment, and maintenance care through inpatient, residential, and outpatient services.	Women are the fastest growing group within the Veteran population. The number of women Veterans seeking VA care continues to increase. Can you describe the range of services offered to the women Veteran population? ▪ Do these services vary across facility complexity levels? ▪ Vary between facilities and their associated CBOCs?	Is VA required to spend a specific amount of time doing research or are there specific research projects that are mandated? ▪ Are there requirements for (or limits on) the amount research medical centers can conduct?

Surgery	Geriatrics-Palliative	Physical Medicine & Rehabilitation	Office of Women's Health	Health Services Research & Development
What are key challenges associated with optimizing staffing in the field?	We understand that GEC encompasses a number of services, categorized as home and community based services, and those services occurring in the nursing home (e.g., CLC) and residential settings. How does the range of GEC services offered differ across facility complexity levels?	How does the range of PM&R services offered differ across facility complexity levels?	What are the legislative or other requirements for care provision to Women Veterans within VA?	At the provider level, are there limits on the amount of time providers can spend doing research?
Can you name some key challenges to optimizing productivity and staffing?	What are the optimum levels of support staff per geriatrician? ■ Can you explain the Geri-PACT model?	What are the optimum levels of support staff per PM&R provider? Are there any care models specific to PM&R?	Can you describe the optimum levels of support staff per women's health provider to deliver comprehensive primary care services? ■ We understand that this is delivered by a designated women's health primary care provider, who manages a panel of patients.	Do the HRS&D Center annual reports and project final reports have metrics for time spent on research activities? ■ Do you use any particular metrics or data streams to look at staffing and productivity in relation to research activity?
What are key challenges with implementing new productivity standards?	If a geriatrician does not work within a Geri-PACT, how is his/her level of support staff determined. How is caseload determined?	Are panel sizes or teams used in PM&R?	Are target panel sizes per WH PCP established at the local level?	Are there any, if known, differences in operations or staffing models for facilities with research programs?

Surgery	Geriatrics-Palliative	Physical Medicine & Rehabilitation	Office of Women's Health	Health Services Research & Development
Comparison to the private sector: Comparison of VA staffing, case load and productivity with the private sector. If analyses have been conducted, what were the results?	Are panel sizes used in geriatrics beyond Geri-PACTs?	What are the key challenges associated with measuring productivity in PM&R?	What percentage of VA medical centers have Women's Health Centers (WHC)? ■ Can you provide us with a list of facilities with WHC's? ■ Are there metrics that compare care for women Veterans at facilities with WHCs to non-WHC facilities? ■ Are there any, if known, differences in operations or staffing models for facilities with WHCs? ■ Are there certain space requirements for configuring WHCs and other women-focused health care areas?	Have any studies been conducted to compare facilities near HRS&D Centers of Innovation to facilities that do not have local access to these centers?

Surgery	Geriatrics-Palliative	Physical Medicine & Rehabilitation	Office of Women's Health	Health Services Research & Development
Were there factors unique to VA impact the staffing, case load, and productivity of VHA providers when compared to the private sector? ■ These factors may include: mission, policies and directives, patient population served, models of care, practice arrangements, number of support staff, number of exam rooms, clinic configuration, etc. ■ Are there VA medical facilities that are especially good exemplars of these unique factors?	What are the key challenges associated with measuring productivity among geriatricians?	What are the key challenges associated with optimizing PM&R staffing in the field?	"All enrolled women Veterans need to receive comprehensive primary care from a designated women's health primary care provider, irrespective of where they are seen (freestanding medical centers, primary facilities, CBOCs, and independent clinics)." (VHA HANDBOOK 1330.01) ■ Does this impede the ability to get enrolled women health care?	Can you provide examples of VA medical facilities with especially strong or unique research programs? ■ What makes them strong or unique?

Surgery	Geriatrics-Palliative	Physical Medicine & Rehabilitation	Office of Women's Health	Health Services Research & Development
Are there factors affecting the quality of data and performance metrics for VA surgery staffing?	What are the key challenges associated with optimizing GEC staffing in the field?	Have you compared VA staffing, case load and productivity with the private sector? ▪ What were the results?	"A female chaperone must be in the examination room during examinations, procedures, or treatments involving the breast and genitalia, regardless of the gender of the provider." Female chaperones can be health technicians, nurse's aides, Licensed Practical Nurses or a "Female Volunteers". (VHA HANDBOOK 1330.01) ▪ Do "Female Volunteers" usually serve as the chaperones or is it often done by a health tech, nurse aide, or LPN? ▪ Does this impede productivity within medical facilities? ▪ Do optimum support staff levels differ for women's health care providers as a result of this requirement?	There are three main types of HSR&D programs which include: programs that directly support scientific research and development, programs that build health services research capacity within VA, and programs that strengthen VA's health services research infrastructure. Do facilities tend to focus on specific types of research over others? Is the encouragement to pursue one type over another?
Is the use of OPES or SPARQ data used operationally to inform staffing/hiring decisions?	Have you compared VA staffing, case load and productivity with the private sector? ▪ What were the results?	Have you compared VA staffing, case load and productivity with the private sector? ▪ What were the results?	Can you provide examples of VA medical facilities with particularly strong women's health programs? ▪ What makes them strong?	How are research programs organized at medical centers and associated clinics?

Surgery	Geriatrics-Palliative	Physical Medicine & Rehabilitation	Office of Women's Health	Health Services Research & Development
Does surgery use any other internal data sets to measure staffing and productivity?	What are the unique factors of VA (e.g., mission, policies and directives, demographics/population served, number of support staff, number of exam rooms, delivery models/structures) that need to be considered when making these comparisons?	Have you compared VA staffing, case load and productivity with the private sector? ▪ What were the results?	What are the key challenges associated with measuring the productivity of women Veteran health care providers? ▪ Are there requirements or statutes that would either hamper or increase productivity of these providers?	Is there a Field Facility R&D Officer at all facilities with research programs? Can you provide us with the contact information for the officers at the sites we are visiting?
	Our site visit teams will be traveling to a number of facilities, to include VAMCs, CBOCs, and CLCs. Are there particular CLCs that are especially good examples of these unique factors?	Do you use any particular metrics or data streams to look at staffing and productivity at a national level?	What have we not asked that you feel is important for us to know/address?	Most HSR&D Centers have academic affiliations, which tend to indicate higher facility complexity levels. How else do the range of research programs differ across facility complexity levels?
	Do you use any particular metrics or data streams to look at staffing and productivity at a national level?	How is time allocated for PM&R providers to spend time on administrative, research, and training tasks? ▪ How does this impact productivity?		Have you compared the time that VHA providers spend on research activities to providers in the private sector? ▪ What were the results?
	How is time allocated for geriatricians to spend time on administrative, research, and training tasks? How does this impact productivity?	What have we not asked that you feel is important for us to know/address?		Our site visit teams will be traveling to a number of facilities over the next several months. Are there particular examples of HSR&D Centers that we should visit?

Surgery	Geriatrics-Palliative	Physical Medicine & Rehabilitation	Office of Women's Health	Health Services Research & Development
	What have we not asked that you feel is important for us to know/address?			What have we not asked that you feel is important for us to know/address, given the scope of our study?

C.2   Selected Facility Type and Location

Table C-3 shows a list of the selected facilities for Assessment G.

Table C-3. Selected facility type and location

VISN	Official Station Name	City	State	Facility Type
1	Boston VA – Brockton	Brockton	MA	VAMC
1	Causeway VA Clinic	Boston	MA	CBOC
2	Canandaigua VA	Canandaigua	NY	VAMC
2	Rochester VA Clinic	Rochester	NY	CBOC

C.2.1   Interview Questions for VAMC or CBOC Leadership

The following questions were asked during the onsite visits at VA medical centers. Interviews ranged from twenty minutes to one hour depending on the availability and scheduling constraints of the facility.

Table C-4. Interview questions for VAMC or CBOC leadership

Associate Director	Chief of Staff	Chief of Human Resources	Chief of Fiscal Services	Associate Director for Patient Care Services (Nurse Executive)
What is unique about the mission of VA that may impact productivity of providers relative to non-VA health systems?	What is unique about the mission of VA that may impact productivity of providers relative to non-VA health systems?	What is unique about the mission of VA that may impact productivity of providers relative to non-VA health systems?	What is unique about the mission of VA that may impact productivity of providers relative to non-VA health systems?	How are staffing decisions made by this facility for determining staffing levels for nursing (inpatient, specialty, and primary care)?
What is unique about the patient population served by this VA Medical Center that may impact productivity of providers compared to non-VA health systems?	What is unique about the patient population served by this VA Medical Center that may impact the productivity of providers compared to non-VA health systems?	How does the way this facility/service is staffed impact provider productivity compared to the private sector?	How does the way this facility/service is staffed impact provider productivity, compared to non-VA health systems?	Does your facility use the national nurse staffing model (expert based unit panel) for nursing staffing decisions?
How does the way care is delivered in this facility impact productivity of providers, compared to the private sector?	How does the way care is delivered in this facility impact the productivity of providers, compared to non-VA health systems?	How are staffing and budget decisions made for providers in this facility? 	Can you provide us the list of providers who are VA employees with a dual appointment?			

C.2.2 Interview Questions for VA Providers, Service Chiefs and Section Chiefs

Assessment G team asked the following questions to VAMC providers; Chiefs of Medicine, surgery, primary care, mental health, and dentistry; section chiefs, and AOs during the onsite visits to VAMCs. (Table C-5). Interviews with providers were kept short, between five to seven minutes, to avoid disruption to patient care. Pre-scheduled interviews with Service and Section Leadership were up to thirty minutes in length.

Table C-5. Interview questions for VHA providers, service chiefs, and section chiefs

Providers	Service Chiefs and Section Chiefs
What three things would enable you to be more productive?	What is unique about the mission of VA that may impact productivity of providers relative to non-VA health systems?
How many patients do you see in an average week?	What is unique about the patient population served by this VA Medical Center that may impact the productivity of providers compared to non-VA health systems?
(FOR PCP/DENTAL ONLY) What's your panel size?	How does the way care is delivered in this facility impact the productivity of providers, compared to non-VA health systems?
Do you have a dual appointment with an affiliate university? ▪ If yes, on an average week how do you split your time between the university and facility? ▪ How are your university and facility responsibilities determined?	How does the way this facility/service is staffed impact provider productivity, compared to non-VA health systems?
What other factors have either positive or negative effects on productivity compared to the private sector?	How does the way this facility/service is staffed impact the performance of this facility in meeting the access standard?
	What other factors have either positive or negative effects on productivity compared to non-VA health systems?
	How are staffing and budget decisions made for providers in this facility?
	What methodology, data, and tools are used?
	How are these decisions made for nursing staff (inpatient, specialty, and primary care)?
	How does this facility manage and track provider productivity?
	How does this facility respond when productivity issues or inefficiencies are identified?

Table C-6. Additional Focused Assessment - Nursing Interview Questions

Chief Financial Officer	Nursing Supervisor	Chief Nurse Executive	Systems Redesign Coordinator	Head Nurse Outpatient	Inpatient Nurse Manager
Can you describe the facilities budget allocation process to address the staffing methodology needs?	We understand inpatient units are using the staffing methodology to establish their FTE's. Have you found that the staffing methodology has increased staffing on off shifts?	We understand you follow the nurse staffing methodology for inpatient and primary care for outpatient. Can you describe the nurse staffing model used in specialty care outpatient clinics?	Can you explain how the systems redesign group supports the VHA in organizational transformation?	Does your unit follow the TIDES model where a Mental Health licensed social workers or Psych nurse practitioners work with Primary Care providers to assess patient needs for appropriate care? If yes, why did you implement the TIDES model? What issues occurred that resulted in this implementation? If no, have you encountered issues with patients being referred from Primary Care to the Mental Health clinics?	Has this unit adopted the nurse staffing methodology? (e.g. establishing a unit based panel, using tools such as FTE calculator, metrics such as NDPPD and the minimum replacement factor)

Chief Financial Officer	Nursing Supervisor	Chief Nurse Executive	Systems Redesign Coordinator	Head Nurse Outpatient	Inpatient Nurse Manager
Does your budget accommodate nursing education and/or certifications?	Do you think the inpatient methodology can help VA achieve its goal of adequate nurse staffing? If not, how could this be improved?	Can you describe how this model established adequate staffing for different clinics such as procedural clinics vs. clinics with lower workloads?	Do you support any initiatives related to nurse staffing? If so, can you describe?	What nurse staffing model has the clinic adopted?	For inpatient, if the nurse staffing plans have been approved and require additional nurses, does the budget accommodate these increases? If not, what are the barriers and constraints to funding nurse staffing needs?
What are the barriers or challenges to fully funding nurse staffing levels per the staffing plans? (e.g. VHA Nurse Staffing Methodology, PACT, etc.)	How has the implementation of the staffing methodology impacted patient outcomes?	For inpatient, if the nurse staffing plans have been approved and require additional nurses, does the budget accommodate these increases? If not, what are the barriers and constraints to	We understand the systems redesign group has targeting outpatient specialty care and mental health as a priority in your Access Partnership initiative, can you describe the goal of these efforts?	What guidance do you have to determine your nurse staffing? (Directives, Policies Guidelines)	What are the barriers and constraints to filling nurse staffing vacancies according to the staffing plan needs?

Chief Financial Officer	Nursing Supervisor	Chief Nurse Executive	Systems Redesign Coordinator	Head Nurse Outpatient	Inpatient Nurse Manager
		funding nurse staffing needs?	What impact does this have on nurse staffing?		
	How has the implementation of the staffing methodology impacted nurse satisfaction?	For outpatient, if the nurse staffing plans have been approved and require additional nurses does the budget accommodate these increases? If not, what are the barriers and constraints to funding nurse staffing needs?	Has the systems redesign group assisted in the implementation of the standardized nurse staffing methodology? If so, can you describe how you supported tis effort?	Can you describe the nurse staffing model/method used in specialty care outpatient clinics? (ONLY SPECIALTY CARE)	What are your top three issues to providing adequate nurse staffing?
	Do you use a standardized scheduling database for bed management and staffing allocations for off shifts?	What are the barriers and constraints to filling nurse staffing vacancies according to the staffing plan needs?	Does the system redesign group support any data collection efforts for nurse staffing? If so, can you describe?	Can you describe how this model establishes adequate staffing for different clinics such as procedural clinics vs. clinics with lower workloads?	Does this unit use NHPPD for tracking, monitoring and addressing daily variances?
	What staffing reports are	What are your top three issues to	We understand that space or geography	For outpatient, if the nurse staffing	How does your unit determine

	generated for off shifts? (e.g. to track number of contract nurses, overtime, sick calls, etc.)	providing adequate nurse staffing?	can be a challenge to deliver quality care with in one specific unit or having to deliver care in multiple units. Can you give an example of how you've been able to support nurses having adequate space for providing care?	plans have been approved and require additional nurses, does the budget accommodate these increases? If not, what are the barriers and constraints to funding nurse staffing needs?	the staffing mix?
	What are the top three barriers or challenges that have hindered your ability to adequately staff nurses during off shift hours?	Do you collect any nursing quality metrics in your outpatient clinic? If so, what are they?		What are the barriers and constraints to filling nurse staffing vacancies according to the staffing plan needs?	MED SURGE ONLY – Can you share the staffing grid for Med Surg units that tracks the daily NHPPD to determine what their planned versus actual NHPPD is over a period of time? (e.g. last quarter, months, etc.?)

Chief Financial Officer	Nursing Supervisor	Chief Nurse Executive	Systems Redesign Coordinator	Head Nurse Outpatient	Inpatient Nurse Manager
	What are the top three best practices or success stories that you're most proud of?	How do you compare/benchmark your nursing quality metrics to other VAMCs		What are your top three issues to providing adequate nurse staffing?	How do you compare/bench mark your nursing quality metrics to other VAMCs?
		Do you compare/benchmark your nursing quality metrics to external health care organizations? (e.g. state association or organization such as Mass State HC Association for Nurse Executives)		Do you collect any nursing quality metrics in your outpatient clinic? If so, what are they?	Do you use intermittent staff? If yes, how are you using them to fill temporary vacancies (e.g. sick leave, vacations)?
		Does the facility collect and report their NSI's to the NDNQI®? If yes, what nursing units submit their NSIs to NDNQI®? What database captures these NSIs? (e.g. national vs. local databases)		How do you compare/benchmark your nursing quality metrics to other VAMCs?	Do you conduct daily bed management meetings with all nurse managers to make decisions on staffing needs for that day?

Chief Financial Officer	Nursing Supervisor	Chief Nurse Executive	Systems Redesign Coordinator	Head Nurse Outpatient	Inpatient Nurse Manager
		If no, what are the barriers or challenges to reporting NSIs to the NDNQI®?			
		Are you reviewing Nursing Quality Metrics during your VISN meetings? If yes, are action plans discussed in response to reducing negative outcomes?		Do you use intermittent staff? If yes, how are you using them to fill temporary vacancies (e.g. sick leave, vacations)?	Do you affiliate with local nursing schools to provide potential resources to fill vacancies?
		Do you have a central staffing office that schedules nurses to fill the gaps in the unit schedules?		Do you conduct daily bed management meetings with all nurse managers to make decisions on staffing needs for that day?	Do you establish a nurse residency program?
		Do you use float pools to remediate variances in nurse staffing levels?		Do you affiliate with local nursing schools to provide potential resources to fill vacancies?	Do you provide for cross-training of staff to work in multiple inpatient units

Chief Financial Officer	Nursing Supervisor	Chief Nurse Executive	Systems Redesign Coordinator	Head Nurse Outpatient	Inpatient Nurse Manager
					and outpatient clinics?
		Do you use intermittent staff? If yes, how are you using them to fill temporary vacancies (e.g. sick leave, vacations)?		Do you establish a nurse residency program?	What % of BSNs do RN's have at this facility? What strategies have you put in place to increase the % of BSNs?
		Do you conduct daily bed management meetings with all nurse managers to make decisions on staffing needs for that day?		Do you provide for cross-training of staff to work in multiple inpatient units and outpatient clinics?	What strategies do you use to improve nurse staffing? What strategies do you use to improve nurse satisfaction?
		Do you affiliate with local nursing schools to provide potential resources to fill vacancies?		What % of BSNs do RN's have at this facility? What strategies have you put in place to increase the % of BSNs?	What strategies do you use to improve patient outcomes?
		Do you establish a nurse residency program?		What strategies do you use to improve nurse staffing?	

Assessment G (Staffing/Productivity/Time Allocation)

Chief Financial Officer	Nursing Supervisor	Chief Nurse Executive	Systems Redesign Coordinator	Head Nurse Outpatient	Inpatient Nurse Manager
				What strategies do you use to improve nurse satisfaction?	
		Do you provide for cross-training of staff to work in multiple inpatient units and outpatient clinics?		What strategies do you use to improve patient outcomes?	
		What % of BSNs do RN's have at this facility? What strategies have you put in place to increase the % of BSNs?			
		What strategies do you use to improve nurse staffing? What strategies do you use to improve nurse satisfaction?			
		What strategies do you use to improve patient outcomes?			

Additional questions asked of the Chief Nurse Executive:

1. Does this facility follow the California state mandated nurse ratio?
2. Does this facility use NHPPD for tracking, monitoring and addressing daily variances?
3. Is the nurse staffing mix predetermined with ratios/percentages or does the unit determine the staffing mix?
   o If pre-determined, what method is being followed?
4. If the unite determines the staff mix, is a process used to capture nurse tasks/interventions and map them to nurse roles?
5. Does the facility/unit develop action plans/initiatives to address low Nurse Satisfaction? Are the results of the action plans reported up to the VISN or VACO?

C.2.3   Site Visit Interview Teams

Grant Thornton deployed three teams to conduct VA medical center site visits, beginning February 3, 2015 and ending May 13, 2015. Each team had a team lead, advisor, and analyst. Team leads and analysts were senior executives with advanced experience as former medical center or clinician leaders, well versed in VHA operations. They served as interview leads and were responsible for guiding team when communicating with facility leadership. Analysts were responsible for logistics and documentation, to include coordinating logistics and taking notes as well as documenting information during/after interviews, and conducting interviews as required.

Appendix D   Leading Practices

D.1   Staffing Models

VA Leading Practices

The Southern Arizona VA Health Care System (SAVAHCS) in Tucson, Arizona implemented a locally developed specialty care clinic model, known as "PACT II." Derived from the PACT teamlet model implemented across VHA for primary care, PACT II aims to extend the multidisciplinary team based model to sub-specialties, and create integration between specialty care and primary care.[268] The Director at SAVAHCS implemented the creation of a Triad model for PACT II. "We've developed a Triad and placed key nursing staff with sub specialty medicine, sub specialty surgery, and are in the process of setting up a special procedure unit. That is the "barrier buster" concept which means that Triad in sub-specialty medicine has a position; a nurse and a business service line person and they manage that group so that if staff have issues with a specialty activity, they go to them. They are empowered to address issues such as scheduling or a situation where things aren't working right and someone needs assistance or advice."[269]

Triad members act as mid-level managers between services chiefs and providers and support staff. The leadership at SAVAHCS noted that before the Triad was established, clinics relied heavily on Administrative Officers (AOs) for staffing and other clinic management concerns, resulting in an isolated structure with a presence only where staff shortages were occurring, and limiting visibility. Triad members hold weekly meetings with each other and with service chiefs to discuss on-the ground operations, needs and issues within clinics. Each PACT II teamlet consists of providers (mixture of physicians and primarily NPs), and is assigned one RN, LPN, and MSA for the teamlet. Nurses, while technically assigned to a teamlet, can cover other teamlet clinics if there is unplanned or planned leave. [270]

Figure D-1 illustrates the Triad Governance Model, and relationship with service chiefs and teamlets.[271]

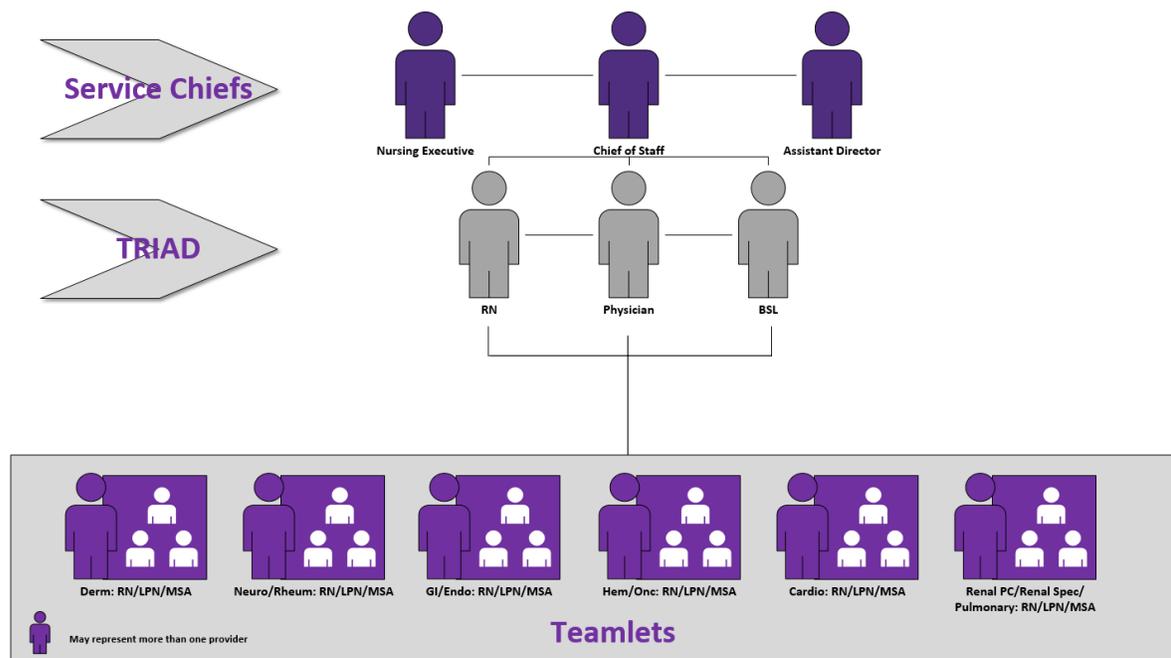
[270] Interview with Mary Ann Mason, Dr. Stephen Thomson and Jeff Schnell, March 24, 2015, VHA Specialty Care Gap Analysis Site Visit.

[271] Ibid.

Figure D-1. Triad governance model[272]


The Triad oversee the operation of the PACT II model (aka Specialty Care Teams). There are 6-7 teamlets in Medical Specialty clinics, organized as follows:

- Dermatology (in the process of splitting into two teamlets, one for procedural, and one for medicine)
- Neurology/Rheumatology (in the process of splitting into separate teamlets)
- Gastroenterology/Endocrine
- Hematology/Oncology
- Cardiology
- Renal Primary Care/Renal Specialty/Pulmonary (in the process of splitting into separate teamlets)[273]

In addition to the PACT II model described above, Triad members believe the implementation of the following has helped with proficiency in the medical specialty clinics:

- E-consults
- Telehealth
- Telephone visits

---

[272] Graphic created based on data collected from Grant Thornton specialty Care gap analysis in support of VHA Office of Specialty Care Services.

[273] Interview with Mary Ann Mason, Dr. Stephen Thomson and Jeff Schnell, March 24, 2015, VHA Specialty Care Gap Analysis Site Visit.

- Secure messaging[274]

This is highlighted as a best practice as there are no standard VHA specialty care staffing model. This may be scalable across facilities, but successful implementation depends on the availability of staff with the right skillsets, leadership support, and buy-in from specialty care providers and support staff.

At the Portland VA Health Care System in Oregon, the nurse executive developed a staffing model to meet the support staffing needs of specialty care clinics. Clinics were re-organized with a surgical and medical services structure, where an RN director managed the staffing needs for multiple procedure and non-procedure clinics grouped in shared clinic spaces. Staffing levels were determined by patient volume, patient acuity (workload) and available space across several specialty clinics. Table D-1 is an example of how the Portland VA determined the estimated workload required for each service line to identify nursing and administrative support staff needs.

---

[274] Interview with Mary Ann Mason, Dr. Stephen Thomson and Jeff Schnell, March 24, 2015.

Table D-1. Estimated workload required to identify nursing and administrative support staff needs

Category Simple (2-4) to Complex Clinics	2	3	4
Workload specifics for Patient complexity in SC	Liver, Cardio, Pulm, Diabetes, Plastics/Hand, Podi, ENT, Gen Surg, Neuro, Rheum, Seizure, Stroke, Derm, EPO, Renal, NW Pain, Ostomy	INF DX, ALS, Dementia, Geri, MS, Ortho, PAD	Nurse TX, Urology, Vascular, Wound Care, Nail Care, Sulptra
Clinical Reminders	∗	∗	∗

Xrays, Sutures, Staples	∗	∗	∗
Lab Specimens			∗
Time Outs	∗	∗	∗
Chaperoning	∗	∗	∗
Wnd-Vacs & cath procedures			∗
Admin involvement & room turnover	∗		∗
Utilizing Lift Equipment		∗	∗
Meter downloading	∗	∗	∗

Category Simple (2-4) to Complex Clinics	2	3	4
CBGs for steroid injury		*	*
Patient Education	*	*	*
Complex Wound Care		*	*
Call report to floor Admits/ED		*	*
ED/Casting/Amb Transport	*	*	*
Nurse Contact Time	~15 minutes	~20 to 30 minutes	40 to 60 minutes

This promising practice was developed as Portland's staffing model for outpatient clinics to address a range of factors known to impact provider productivity and patient access, including patient volume, patient acuity (workload) and available clinic space. It also supports staff flexibility because nursing staff is cross-trained to operate in multiple clinics and work at the top of their licensure.

Portland is one of VA's Magnet® Designated facilities that participates in NDNQI®. The Portland VAMC implemented a data verification/reporting process for NSI's that are submitted to NDNQI®. Portland also created an Access Database to track all information related to specific incident for example, a patient fall, hospital acquired pressure ulcers (HAPU), etc. The following depicts the data verification process that this facility created and currently follows for all nursing outcome metrics.

1. Incident occurs (e.g. falls)

2. The nurse on assigned unit completes CPRS episode note to document incident

3. The unit nurse(s) are alerted to complete a Chart Review to determine if the data definition (e.g. NDNQI® criteria) of the incident aligns with the incident that occurred (e.g. determine if the fall was actually considered a fall). Only staff trained on quality metric reviews and data definitions and entering data into the Access Database can perform Chart Reviews. Unit nurses were included in this training to promote ownership among the staff for data collection.

4. After meeting the definition of the incident, the unit nurse sends the incident data to the Patient Safety Officer to add into the Incident Reporting System.

5. Unit nurse enters the chart review incident data into the database that tracks all information related to the incident. Parts of these data elements are submitted to NDNQI®.

The value in submitting complete and verified data to organizations such as NDNQI® allows VAMCs to compare nursing quality performance nationally. Tracking incident information in one database also enables staff to determine root causes of incidents and develop preventative strategies. Our team considers these Portland practices easily replicable in other VA medical facilities.

The Atlanta VAMC is another Magnet® recognized facility that reports their NSI data to NDNQI®. Atlanta's current education level of RN's with baccalaureate degrees is 85.7 percent and exceeds the 2020 goal of 80 percent. The following NSI outcome results in Atlanta's Med-Surg units support Linda Aiken and colleagues 2002 research that higher proportion of nurses holding at least a baccalaureate degree are associated with improved patient outcomes[275]:

- Total patient falls per 1,000 patient days was **less than** the NDNQI® aggregate mean between FY12-FY13
- Overall percent of HAPUs **was less** than the NDNQI® aggregate mean between FY11-FY13
- The Restraint prevalence **was less** than the NDNQI® aggregate mean between FY12-FY13
- The Med-Surg CAUTI rate was **zero** since 2012

The benefit of having RNs with baccalaureate degrees is that it can encourage nurses to remain current on cutting edge concepts, evidenced based practices, innovative technology, or new equipment in maintaining excellence in their practice. Nurses with BSNs and other degrees can also be prepared for driving improvement initiatives and becoming leaders in the organization.

External Leading Practices

The MHS implemented within its PCMH model a measure of PCM or provider continuity. One of the core principles of the PCMH model is that patients have a consistent relationship with the same PCM or Provider who delivers proactive, preventive and chronic care management in a continuous patient-provider relationship. The MHS measures the rate of all appointments in primary care that are with the enrollee's assigned PCM and reports this data through its TRICARE Operations Center. Since PCM continuity was first measured in 2010, PCM continuity has improved from 41 to 60.9 percent in FY2014.[276]

---

At Kaiser Permanente's Northern California region, staffing models for specialty clinics are provided as guidance to clinics who are empowered to innovate to meet their local needs. There is not a mandated clinical support staff to provider ratio in specialty clinics as the goal is to have dynamic clinics that are innovating around patient care and access, rather than emphasizing fixed behaviors by providers and staff. Clinics are physician centered, but employ NPs and PAs, and clinics and their physician chiefs have the flexibility to determine the optimal mix.[277] Outpatient nursing staff are employed by medical groups and report to the physician leader, rather than a nurse manager, who will direct nursing activities. Independent medical groups typically employ physicians, NPs, RNs, and technicians and have their own managers that oversee the actions of the practice.[278]

At the Mayo Clinic in Rochester, Minnesota, support staff ratios for specialty clinics are typically based on a modeled staff ratio. In a specialty clinic at the Mayo Clinic, you will find physicians, APPs (PAs and NPs), RNs (used more frequently than LPNs), and clinical assistants (CAs). CAs are an important part of the Mayo Clinic staffing approach. They fall on the spectrum between clerk and medical assistant. At Mayo, CAs are responsible for check-ins/check-outs, taking patient vitals, medication reconciliation, gathering patient history and helping patients fill out medical questionnaires.[279] The number of CAs is dependent on multiple factors, including the number of providers, patient volume, and types of procedures. On average, there are 6-8 CAs assigned to a specialty clinic. CAs are managed centrally by hospital Desk Operations, not by the clinics.[280]

Mayo predominately uses RNs as support staff for specialty clinics, but LPNs are used in less procedure-intense clinics because care is not as complex or as specialized.[281] RNs assist in procedures, where LPNs are seen as "super" medical assistants. Surgical outpatient clinics typically have two LPNs to support post-operative care. Nurses are hired and supervised through the Department of Nursing. There is usually 1 RN to 1 or 2 surgeons; the 2 surgeons will switch clinic days off and on and the RN will cover clinic the entire time, ensuring patient continuity of care. Nurses are not shared with other specialty clinics, instead, they are assigned to a specialty/subspecialty clinic, and work with a team of RNs to cover that service for a number of providers. This helps to maintain institutional knowledge of that specialty

To obtain approval for additional support staffing, Mayo clinic managers must submit to an Internal Resource Committee a comprehensive business justification that includes patient volume, consult fill rate, patients per provider and must show that the clinic is on a growth pattern that cannot be maintained with current resources. The clinic must show staff members are practicing to the top of their functional ability provide a cost-effectiveness justification, for example, hiring an RN that could do the majority of the work of an NP.

Many hospitals across the industry have achieved a quality journey designation such as ANCC Magnet® Recognition Program, Baldrige Performance Excellence, and ANCC Pathway to Excellence to drive organizational, staffing and quality improvements. Table D-2 shows some benefits for hospitals and nurses that purse national quality journey designations.

Table D-2. Benefits for hospitals and nurses that pursue quality journey designations

Magnet®[282]	Baldrige[283]	Pathways to Excellence[284]
• Higher nurse satisfaction • Better nurse engagement • Lower nurse to patient ratio • Better nurse retention • Fewer complications • Fewer falls, fewer pressure ulcers, lower mortality • Higher patient satisfaction • Better financial performance and lower cost of care • Shorter length of stay	• Made a personal commitment to lead their organizational transformation • Aligned people at multiple levels to the organization's vision, mission and values • Fostered a culture focused on organizational learning and improvement • Continually motivated, inspired and engaged their workforce • Built a results focus and processes for driving personal and organizational accountability	• Improve nurse satisfaction • Retain choice nursing staff and leaders • Cultivate inter-professional teamwork Support business growth

One criteria included in the Magnet® designation, which aligns with IOM's recommendation, is that hospital RN workforces consist of 80 percent BSN degrees by 2020.[285] The benefit of having RNs with baccalaureate degrees was established in 2002 when Linda Aiken and colleagues first demonstrated empirically that a higher proportion of nurses holding at least a baccalaureate degree were associated with improved patient outcomes such as lower surgical patient mortality and failure to rescue.[286]

D.2   Aligning Organizational Reporting

VA Leading Practices

At the Fargo VA Health Care System in North Dakota, MSAs were realigned under the responsibility of a physician leader, the Service Line Chief. According to a Service Line Leader at the facility "MSAs need to be a part of the team." Aligning MSAs under the Service Line Leader helped the Fargo VA Health Care System to better manage the efficiency of its specialty care clinics by increasing coordination and accountability between providers and administrators in managing appointment schedules so that patients were balanced between available providers and patient access to appointments was improved. This represents a best practice as it simplifies reporting relationships, increases accountability, teamwork and responsibility between providers and their administrative support staff. It further reflects a practice that is commonly found in the health care industry.

At the Huntington VA Medical Center in West Virginia, specialties were organized along service lines (groups of related specialty services provided by an interdisciplinary team of providers). Providers, nurse case managers and clinical and non-clinical support staff were aligned under service lines. For example, the Rehabilitation Service Line included a Service Line Chief, Physical Therapists, Occupational Therapists, Speech Pathologists, Nurse Case Managers, and support staff. This represents a best practice since creates a team-based care model in specialty care that includes interdisciplinary providers and their support staff. It represents a practice that is well established in many other health care systems.

External Leading Practices

The Walter Reed National Military Medical Center in Bethesda, Maryland, organizes clinical support staff and administrative staff for each specialty service under a physician service chief, or administrative officer that reports to the service chief, if the clinic is larger. This practice of aligning providers and dedicated support staff under the service chief is designed to promote teamwork, continuity of patient care, and development of specialized care knowledge among all support staff so they can practice at their highest functional level. The nurse executive of the facility maintains professional responsibility over the scope of practice by nurses, but staffing and day-to-day patient care is under the direction of the service chief.

At the Kaiser Permanente Northern California Region, outpatient nursing and administrative staff are employed by the physician-owned Kaiser Permanente Medical Group, not the hospital, and report to the physician leader of each specialty practice. This reporting structure is designed to reinforce teamwork, communication, and accountability to the specialty service. The Director of Nursing guides nurses in their scope of practice, which is required by law. Inpatient support staffing differs from ambulatory services, in that inpatient support staff are employees of the hospital and have different reporting lines to providers, who are employed by the physician-owned Kaiser Permanente Medical Group. Although reporting lines are different, all inpatient providers and support staff are expected to build trusting relationships and work effectively as a team.

D.3 Managing Staff Variances

VA Leading Practices:

At the Fargo VA Health Care System in North Dakota, nurse administrators use several techniques to flex nursing staff to address daily staffing variances across inpatient units and outpatient clinics. These techniques include: designated intermittent staff assigned to specific inpatient units; a certified nursing assistant (CNA) float pool; 0.3 part-time FTE staff scheduled that could flex up to 0.5 FTE to address staffing variances; cross-trained staff to flex across similar units/services; and staggered/overlapping shifts to handle increased patient volume due to admission and discharges (e.g. transition between day and evening shifts). This represents a best practice because it provides proactive strategies to manage staff absences and reduces the reliance on redeploying staff from one unit/clinic to staff another. Float pools represent a practice commonly found in the private sector.

At the Houston VA Medical Center in Texas, nurse administrators use CareWare, a commercially available nurse staffing software to monitor and address daily staffing variances. This staffing software is utilized for nurses and support staff across all inpatient and outpatient care areas. The benefits of this software have been particularly realized in the Med-Surg units, where daily staffing variances are more unpredictable due to patient acuity, patient volume, and other patient needs (e.g. CO's). In the Med-Surg units, nurse managers work with the staffing coordinator(s) to address staffing variances on a shift-to-shift basis. Nurse and support staff schedules are entered and tracked in CareWare. Any unfilled shifts are "red-flagged" so the nurse managers and staffing coordinators know where their vacancies are per shift. Before the end of each shift, the designated nurse manager updates the patient acuity and census in their software, which automatically updates the target NPPD/FTE needs for the next shift. Then the software alerts nurse managers to identify any additional staff needed or extra nurses that could be moved to fill a gap in another unit. Since all of their nurses are cross-trained, nurse managers are able to continuously flex and move their staff to address variances on a shift-to-shift basis.

External Leading Practices:

At Aultman Hospital, an 800+ bed Magnet® facility, implemented a central staffing office and a specialized float pool where financial incentives were provided for part-time nurses to pick up additional shifts. Aultman Hospital's staffing methods have increased nursing autonomy, which has improved nursing satisfaction scores and turnover rates which remain below other Magnet®® hospitals' average turnover rate.[287]

Using a float pool has become a major strategy for health care organizations to help staff the facilities replacement factor for leaves for example, sick call-ins, vacations, or to cover high-volume needs. [288]

A best practice from the private sector is to have a standardized policy for tracking and monitoring planned (vacation time) and unplanned absences (sick calls) in clinics to minimize the impact of staffing gaps. The policy addresses vacations and paid time off within which vacations need to be reported at least 90 days prior and sick days are reported as soon as possible. An issue for VHA is the overtime policy which states that provider overtime must be compensated in time within a week. For example, if the provider works 4 hours of overtime this week, they are entitled to 4 hours paid time off next week. This causes problems in the efficient scheduling of clinic hours. Using private sector practices, VHA can measure staffing gaps or provider cancelled clinics. These gaps can be compared monthly with how many clinics a provider cancelled against the clinic target (<8 percent). This is helpful to also link targeted direct clinic hours to actual direct clinic hours. Provisions to the policy governing gaps would include a clause that states, for example, every cancelled clinic, the provider needs to make up the clinic within a month, for example.

D.4   Mitigating Space Shortages

VA Leading Practice

At the Boston VA Health care System in Massachusetts, clinic space is at a premium. An average room at the facility is 500 square feet, whereas the industry standard is 1,000 square feet. Outpatient space is small and inpatient areas have four-bed wards. To work around the space shortage, the Boston VA has expanded clinic hours to provide care in the evening and weekends, a strategy rarely used by VA medical facilities to alleviate space shortages for specialty clinics. This is highlighted as a best practice because many VA facilities face a similar space shortage. Since VHA construction projects can take a prolonged amount of time to be planned, designed, and constructed, extending clinic hours is a feasible solution. This best practice can be leveraged across facilities, but successful implementation depends on providers' availability and willingness to take on non-traditional work hours.

External Leading Practices

At the Kaiser Permanente Northern California Region, outpatient specialty clinics have implemented care models that use multiple modes to deliver patient care (face-to-face, telephone, and direct messaging). These multiple modes are important to make the most efficient use of clinic space and to maximize access to face-to-face appointments for first-time patients. Kaiser Permanente has in the past implemented standards where every provider had one office and two exam rooms. However, with the growing use of other modes for delivering care, especially for follow-up patient appointments, they experienced too many underutilized rooms.[289] Kaiser Permanente found that many clinics can achieve exam room rations of two rooms per provider if call centers are used effectively and technology, such as eConsults or direct messaging, is used to provide existing patients with alternate ways to communicate with their provider. For example, today Orthopedics clinics typically have two rooms per provider to

---

[289] Interview with Mary Ann Mason, Dr. Stephen Thomson, and Jeff Schnell, March 24, 2015.

reflect a need for more procedures requiring face-to-face appointments, whereas endocrinology often has room ratios below 1.5 rooms per provider due to the greater use of eConsults and direct messaging.[290]

The Mayo Clinic in Rochester, Minnesota has addressed space utilization by moving away from standard room ratios to a utilization standard (percentage of the day that a clinic uses a room). Based upon the utilization metric, rooms can be given to a clinic and taken away based on this standard.[291] Mayo uses a hoteling concept for clinic areas; exam rooms are clustered by hallways and clinics may be in hallway A one day and hallway B the next day. Typically, there are 4 exam rooms per cluster, and providers move back and forth.[292] Physicians have academic offices, APPs and RNs have shared office spaces, LPNs and CAs have workstations in the clinical area, and residents use work rooms in the clinical space.[293] Since the hotel model means that you may be in a different area on any given day, clinical teams work in the centrally located and shared clinical space, and physicians may go to their academic offices when not seeing patients.

D.5 Improving Accuracy of Workload Capture

VA Leading Practices

At the Detroit VAMC in Michigan, facility leaders found productivity within the Nephrology clinic was 12 percent off the national median. They investigated and found that workload within the Nephrology clinic was not being captured accurately. The Section Chief worked with the providers to address the coding issue and productivity increased from 12 to 94 percent. The facility highlighted this success and other clinics, as a result, became more aware of the importance of accurate coding.

This is highlighted as a best practice because many facilities we visited may not be capturing workload accurately, thus inadequately (and negatively) representing their productivity. It is important that clinic leadership and providers participate in understanding the workload capture process, whether or not it represents their true workload, and take an active role in ensuring workload is accurately documented in coding.

Nurses at Fargo and Palo Alto defined an optimal staffing mix by establishing a process to promote nurses to work at the top of their licensure. The first process step was to identify all tasks/patient care interventions conducted per unit/clinic based on patient population. They then mapped tasks to role (e.g. RN, LPN, support staff) and calculated staff mix based on HPPD or task time. Additionally, the nurse managers updated job descriptions to include specific tasks with functional statements. Finally, the nurses conduct education sessions to teach staff how to delegate tasks mapped to non-licensed staff. The value of this process optimized nurse and support staff roles/responsibilities, clarifies delineation of tasks between licensed and non-licensed staff, reduces costs by hiring more support staff, and promoted nurses working at the

[292] Interview with Mary Ann Mason, Dr. Stephen Thomson, and Jeff Schnell, March 24, 2015.

[293] Ibid

top of their license, which results in increased provider productivity by alleviating the provider workload.

External Leading Practices

CACs are increasingly being used by the private sector to improve coding consistency and reduce errors. The AHIMA Foundation and Cleveland Clinic reported the results of a 2013 study of the impacts of implementing CAC software in the Journal of AHIMA.[294] The study found that CAC software, when paired with professional coders, reduced coding time, improved coding consistency, and resulted in fewer missed or incorrect codes over time.

At the Kaiser Permanente Northern California Region, coding is not used for the purposes of billing. Kaiser Permanente uses coding to improve outcomes, track what has been done consistently, generate information about patient care practices that can be correlated to outcomes, drive performance improvements, and accurately report the risk profile/acuity of their patient population to Centers for Medicare and Medicaid Services. Kaiser Permanente does not employ professional coders; physicians code their own patient encounters. Kaiser physicians, for the last five years, have been coding using a proprietary software application, sometimes referred to as "their secret weapon." This application prompts physicians on how to code an encounter, and physicians together decide what they will title each of the operations.

In a recent study, a hospital utilized a clinical database to track and calculate nurse workload measures such as total treated patients, midnight census, and admission, discharges, and transfers. These measures were tracked as a unit activity index to identify nursing workload. These indexes were compared over time, by shift, day of week, and month within the intensive care and medical-surgical units. Between 1994 and 2006, the unit activity indexes increased, which required additional staffing needs. This study showed how using technology can help capture nurse workload to facilitate staffing decisions.[295]

Appropriate skill mix allows nursing staff to work at the top of their licensure, which provides efficiency and optimal leveraging of overhead. Nurses delegating tasks to support staff can streamline their workload to expand their roles and accept added responsibilities and help lighten the providers' workload.[296]

Appendix E   Prior Report, Assessments, and Recommendations

The Assessment G team reviewed prior reports, assessments, studies, recommendations, and investigations related to VHA provider staffing and productivity to make informed decisions for this report's research, findings, and recommendations. Unique VA mission impacts on productivity were surveyed, to include medical research, medical student education, and patient care of the Veteran population.

Reports and recommendations for nationwide VHA physician staffing methodology and physician productivity standards date back to 1981.[297] In 1991, the Institute of Medicine published a report that suggested a methodology for calculating the number of physicians required, by specialty grouping, to meet VA's mission and responsibilities for patient care, education and research,[298] but it was not until January of 2002 that Section 124 of Public Law 107-135 mandated VHA establish nationwide policy to ensure that medical facilities had adequate staff to provide quality care to Veterans.[299] Each VAMC was and still is responsible for its own staffing and productivity measurements based on its facility complexity, local Veteran population, and staffing needs. Specific staffing requirements and standards exist in some settings, namely the inpatient setting, where quality dictates the number of nurses and other clinical support staff required to staff patient beds, and in the ED. In January of 2003, the Deputy Under Secretary of Health for Operations and Management charged a VHA Advisory Group on Physician Productivity with developing productivity models for physicians in VHA.[300] Staying consistent with external benchmark data from the MGMA, this advisory group developed an RVU-based model for measuring the productivity of VHA physicians. In 2007, VHA established the Office of Productivity, Efficiency, and Staffing (OPES) and began using a new, Specialty Productivity-Access Report and Quadrant (SPARQ) tool, developed to serve as a decision support tool for VAMCs to manage staffing by demonstrating possible efficiencies and inefficiencies when access measures and productivity measures are combined. The tool was designed to capture physician productivity workload for physician specialties by measuring workload by work Relative Value Units (wRVUs), number of encounters, and number of

---

individual patients.[301] The PACT model was formally created in 2009, dictating staffing requirements for primary care clinics.[302] At this time, there still is no standard staffing requirements or models for specialty outpatient clinics.

As physician productivity relies heavily on the support staff (includes clinical, nurses, and non-clinical, such as schedulers and other clerical support) surrounding each physician, it was important for the team to assess the nurse staffing methodology currently in place in VHA. VHA describes its nurse staffing methodology as the process for determining staffing levels based on an analysis of multiple variables to include patient or resident needs, environmental and organizational supports, and professional judgement to recommend safe and effective staffing levels at various points of care. A principal policy document for nurse staffing is VHA Directive 2010-034 Staffing Methodology for VHA Nursing Personnel.[303] It addresses staffing levels at all points of care, including inpatient units, ambulatory clinics, specialty treatment and diagnostic areas, CLCs, home care, and within the telehealth medium.

Within the last decade, the release of reports from the OIG and GAO, a Congressional mandate, and an internal Office of Nursing Services (ONS) study, has prompted the ONS to develop a standardized nurse staffing methodology. To address nurse staffing concerns, VHA Directive 2010-034 was issued in 2010 by the ONS, directing VAMCs to implement a nationally standardized nurse staffing methodology. The intent of VHA Directive 2010-034 is to standardize information data management strategies that facilitate analyses of relationships among staffing numbers, skill mix, care delivery models, and patient outcomes for multiple points of care. The ONS's plan is for each facility to utilize VHA directive 2010-034 to develop their nurse staffing plan(s).

Historically, VHA facilities have received little guidance on staffing for their facilities and have had flexibility to develop local staffing plans, as long as plans fit within their budget requirements. VHA Directive 2009-055, which expired in November of 2014, provided general directions and national assistance for medical facilities on the development, implementation, and review of staffing plans using a combination of "evidence –based professional judgment, critical thinking, and flexibility"(U.S. Dept. of Veteran Affairs Health Admin. 2009, p.1).[304] In June of 2012, a Specialty Care Physician Productivity and Staffing Plan Task Force was asked to further refine the methodology for specialty care physician productivity and staffing. At that

---

time, focus was given to specialties without developed staffing methods. VHA reported, as of March 2013, 54 percent of specialties had standards in place to measure their productivity and efficiency.[305] As of July 2015, 34 of VHA's 35 aggregate specialties have established standards. The standards were based on the median productivity for those practices, by complexity grouping, for the prior year. The only specialty outstanding is anesthesiology, for which a standard is being developed using the American Society of Anesthesiologists Physical Status classification system.[306]

<u>Previous Assessments</u>

To ensure that the Assessment G recommendations are supported by additional reviews, we reviewed several prior reports s related to provider and nurse staffing and productivity in VHA. The reports date back to 1981. Out of the 18 reports, 15 of the reports had direct research and findings on VHA providers, while the remaining contained valuable information for nursing. Recommendations stemming from these previous assessments include 1) establish a uniform method for productivity measurement, 2) create workload and productivity standards for individual specialties, and 3) provide guidance on development and review of staffing models. These provide additional support to the Assessment G findings and recommendations.

Pre 2010-2015: Provider Staffing

Past recommendations:

- Expand and implement staffing models
- Improve the human resources and recruiting process
- Improve organizational structure and alignment

Appendix I   Glossary

Ambulatory Care Sensitive Conditions:	Age standardized acute care hospitalization rate for conditions where appropriate ambulatory care prevents or reduces the need for admission to the hospital per 100,000 population younger ha age 75 years.
Business service metrics	Measures of the availability or performance of a business service as provided by an application
Clinic stop	One encounter of a patient with a health care provider. The clinic stop is the workload unit of measure for space planning. One individual patient can have multiple procedures/suite stops in a single visit or in one day.
Complexity level	VA groups its 151 medical facilities into highly complex - level 1a, 1b and 1c, moderate complexity - level 2, and low complexity - level 3, facilities
labor mapping	Each VA provider's time is captured in the DSS system based on the time they spend in each activity. Clinical time, administrative time, education time, training time are all tracked through the DSS system and "mapped" back to the employee.
model of care	A "model of care" broadly defines how health services are delivered, outlining best practice care delivery by applying service principles across identified clinical streams and patient flow continuums.
provider	VA provider, for the purposes of this assessment, is defined as an independent licensed practitioner (Physician Assistants [PA], Nurse Practitioners [NP], Doctor of Medicine [MD], Physical Therapists, Psychologists, Social Workers), taking the Health Resources and Services Administration's [HRSA] definition of independent licensed practitioner to be "a physician, dentist, NP, nurse midwife, or any other individual permitted by law and the organization to provide care and services without direction or supervision, within the scope of the individual's license and consistent with individually granted clinical privileges." Clinical Nurse Specialists are excluded from this definition. The definition of a VA provider includes providers employed full-time by VA. The scope of VHA providers includes inpatient and outpatient care, Primary Care, specialty care, dentists, and mental health care providers. Although contract and fee providers are, in some facilities, a significant proportion of care delivery teams; they are deemed out of the scope of this assessment, due to an inability to quantify staffing levels (full time equivalent [FTE]), or hours worked, as VA does not track this information.

Space gap   Space needed based on the 2023 projected workloads

Space gap as a %   space gap / total projected 2023 need
of need

Telehealth   The use of electronic information and telecommunications technologies to support long distance clinical health care, patient and professional health-related education, public health and health administration. *www.hrsa.gov/**telehealth***

Total projected   Total adjusted inventory + total planned new space
inventory

Total projected   Total projected 2023 need – total projected inventory
2023 need

Appendix J   Acronyms

AAFP	American Academy of Family Physicians
ACO	Accountable Care Organization
ADA	American Dental Association
ALBCC	Account Level Budgeting Cost Center
AMGA	American Medical Group Association
AMGMA	American Medical Group Management Association
APP	Advanced Practice Provider
BHIP	Behavioral Health Interdisciplinary Program
CA	Clinical Assistant
CAC	computer assisted coding
CAMH	CMS Alliance to Modernize Health Care
CBOC	Community Based Outreach Clinic
CDI	Clinical Documentation Initiative
CDW	Computer data warehouse
cFTE	clinical full time equivalent
CLC	Community Living Center
CMS	Centers for Medicare & Medicaid Services
CNA	Certified Nurse Assistant
CNE	Chief Nursing Executive
CPRS	Computerized Patient Record System
CPT	current procedural terminology
ED	Emergency Department
EHR	Electronic Health Record
FFRDC	Federally Funded Research and Development Center
FTE	full time equivalent
FY	fiscal year
GAO	Government Accountability Office
GMENAC	Graduate Medical Education National Advisory Committee
HAPU	hospital acquired pressure ulcers
HBPC	Home-based Primary Care
HHS	Department of Health and Human Services
HMO	Health Maintenance Organization
HRSA	Health Resources and Services Administration
HT	Home telehealth

ICU	Intensive care unit
ID	infectious disease
LMI	Labor Management Institute
LPN	Licensed Practical Nurse
LVN	Licensed Vocational Nurse
MCAO	Managerial Cost Accounting Office
MD	Doctor of medicine
Med-Surg	Medical surgery
MGMA	Medical Group Management Association
MH	Mental Health

Prepared for:
U.S. Department of Veterans Affairs

At the Request of:
Veterans Access, Choice, and Accountability Act of 2014
Section 201: Independent Assessment of the Health Care Delivery
Systems and Management Processes of the Department of Veterans
Affairs

Assessment H (Health Information Technology)

September 1, 2015

This page intentionally left blank.

Preface

Congress enacted and President Obama signed into law the Veterans Access, Choice, and Accountability Act of 2014 (Public Law 113-146) ("Veterans Choice Act"), as amended by the Department of Veterans Affairs (VA) Expiring Authorities Act of 2014 (Public Law 113-175), to improve access to timely, high-quality health care for Veterans. Under "Title II – Health Care Administrative Matters," Section 201 calls for an Independent Assessment of 12 areas of VA's health care delivery systems and management processes.

VA engaged the Institute of Medicine of the National Academies to prepare an assessment of access standards and engaged the Centers for Medicare & Medicaid Services (CMS) Alliance to Modernize Healthcare (CAMH)[1] to serve as the program integrator and as primary developer of the remaining 11 Veterans Choice Act independent assessments. CAMH subcontracted with Grant Thornton, McKinsey & Company, and the RAND Corporation to conduct 10 independent assessments as specified in Section 201, with MITRE conducting the 11th assessment. Drawing on the results of the 12 assessments, CAMH also produced the Integrated Report in this volume, which contains key findings and recommendations. CAMH is furnishing the complete set of reports to the Secretary of Veterans Affairs, the Committee on Veterans' Affairs of the Senate, the Committee on Veterans' Affairs of the House of Representatives, and the Commission on Care.

The research addressed in this report was conducted by The MITRE Corporation.

---

[1] The CMS Alliance to Modernize Healthcare (CAMH), sponsored by the Centers for Medicare & Medicaid Services (CMS), is a federally funded research and development center (FFRDC) operated by The MITRE Corporation, a not-for-profit company chartered to work in the public interest. For additional information, see the CMS Alliance to Modernize Healthcare (CAMH) website (http://www.mitre.org/centers/cms-alliances-to-modernize-healthcare/who-we-are/the-camh-difference).

The views, opinions, and/or findings contained in this report are those of The MITRE Corporation and should not be construed as an official government position, policy, or decision.

Executive Summary

Assessment H (Health Information Technology) responded to language in Title II, Section 201, of the Veterans Choice Act of 2014 that mandated an independent assessment of "the information technology strategies of the Department with respect to furnishing and managing health care, including an identification of any weaknesses and opportunities with respect to the technology used by the Department, especially those strategies with respect to clinical documentation of episodes of hospital care, medical services, and other health care, including any clinical images and associated textual reports, furnished by the Department in Department or non-Department facilities."[2]

To gain comprehensive insight into Department of Veterans Affairs (VA) health information technology (IT) and the strategies that guide its implementation, the Assessment H team conducted 185 interviews in the course of site visits to Veterans Integrated Service Networks (VISNs), VA Medical Centers (VAMCs), and community-based outpatient clinics (CBOCs), as well as VA's Office of Information and Technology (OI&T). The team also reviewed plans, reports, audits, and protocols procured from OI&T and the Veterans Health Administration (VHA), as well as external reports and journal articles relevant to health IT and complex system development. Further, the team compared its observations and findings against lessons learned and best practices identified by executives, administrators, clinicians, and IT professionals at high-performing private health systems. Because IT touches nearly every aspect of operations at VHA, the data gathered by Assessment H generally support the qualitative evidence related to IT collected by the other assessments.

Findings

Several decades ago, VA led the development of electronic health record (EHR) technology with its Veterans Health Information Systems and Technology Architecture (VistA) system and Computerized Patient Record System (CPRS). Most VHA clinicians have a high opinion of the clinical applications and databases enabled by VistA and CPRS, as well as VA's newer technologies such as telehealth and mobile applications (apps). Numerous Assessment H interviewees attributed the success of the early VistA and CPRS development efforts to the close working relationship between VistA/CPRS developers and clinicians. This collaboration seems to have degraded with the centralization of IT in 2006, resulting in uncoordinated execution of health IT strategy and limited development of new and improved capabilities for VistA/CPRS. During the past decade, VistA and CPRS development has been confined to point solutions and minor enhancements.

Clinical users have become increasingly frustrated by the lack of any clear advances during the past decade. Numerous VHA clinicians have experience with commercial EHR systems and want the same level of features, modern clinical capabilities, integration, and mobility they see emerging in the commercial marketplace.

---

[2] United States. Congress. Veterans Access, Choice, Accountability, and Transparency Act, 38 U.S.C. § 1701 (2014) (Pub. L. No.113–146, 128 Stat. 1754).

VHA and OI&T do not collaborate effectively with respect to the planning and execution of IT strategies for managing and furnishing health care. Although the goals of OI&T and VHA do not conflict at the strategic planning level, the organizations often do not agree on priorities for executing the strategic plans.

During the past decade, VA's ability to deliver new capabilities for its VistA system to meet changing Veteran health care needs has stalled. As a result, VA/VHA health care systems are in danger of becoming obsolete. The VistA/CPRS systems are based on a tightly integrated, monolithic architecture and design with numerous and diverse functional components and associated interdependencies. These characteristics impose significant barriers to modernizing these systems. In addition, the high cost of infrastructure operation and maintenance (85 percent of the total IT budget) reduces funding available for new development efforts.

Maintenance and data sharing are further complicated because most VAMCs have customized their local versions of VistA, leading to approximately 130 different instances of VistA across the country.

Overly demanding processes for system development, as defined by OI&T's Project Management Accountability System (PMAS), impede cost-effective delivery of new health IT capabilities and limit VA's ability to measure the value of IT investments. The PMAS process is schedule driven and risk averse, leading many project managers to limit the amount of functionality in each release, thereby increasing the total time for any capability to be released.

The lack of standard clinical documentation has made it harder to develop effective clinical decision-support systems and hinders EHR information exchange among VAMCs, between VA and non-VA facilities (including those of the Department of Defense [DoD]), and between VA and the individual Veteran. The lack of data standards presents challenges to using comparable data for analysis and disparities among the 130 tailored local instances of VistA, complicating information sharing, data aggregation, and analytics. The outdated technology underlying VistA weakens VHA's ability to leverage powerful new technologies for extracting information from free-form text, processing genomic data and images, and extracting and analyzing data from personal health monitoring devices.

While VA has successfully developed and deployed telehealth capabilities and mobile apps, it does not effectively assist end users of these technologies, and it does not match the pace of the commercial marketplace. VA's support for telehealth users (patients and clinicians) is weak, understaffed, and poorly integrated with IT systems. In addition, barriers associated with providing VISN-to-VISN telehealth make optimizing the caseload across VISNs more difficult, creating unnecessarily long waits for care in certain regions. VA has the opportunity to apply mobile technology at a low price point, but the previously mentioned issues with the PMAS process prevent VA from realizing the strategic value of mobile technologies as an enabler of both Veteran access and Veteran satisfaction.

Recommendations

VA/VHA must resolve IT challenges comprehensively, targeting solutions to the entire system rather than seeking to solve isolated problems. To their credit, many leaders within OI&T and VHA, as well as administrators, health information management and IT professionals, and users at the facility level, recognize the need to address these issues. This report describes a future vision for VA/VHA as a high-performing health care system and a continuously learning health system that implements enterprise IT service management best practices.

At the strategic level, VA and VHA need to transform IT strategy, planning, and execution in a systematic manner with dedicated executive-level leadership. Specifically:

The VA chief information officer (CIO) should select a CIO for VHA to manage and advocate for VHA's IT needs and assist in transforming the VA IT strategy to a model based on enterprise IT service model standards and best practices. The VHA CIO acts primarily as an advocate and facilitator between OI&T and VHA to ensure both organizations are successful in meeting health IT needs. The VHA CIO will not move IT operations to VHA nor decentralize the organization. This involves taking the following actions, explained in more detail in this report:

- The VHA CIO should facilitate the requirements collection and prioritization within VHA with final approval provided by the VHA Under Secretary for Health and establish IT service level agreements that are mutually acceptable between OI&T and VHA and optimize the services for effectiveness.
- Refine the planning and budgeting process to ensure that business needs are effectively identified, prioritized, funded, and used to drive health IT investments.
- Develop a governance policy to ensure the strategic plans are executed well and in a timely manner.
- Establish product (capability)-focused teams to ensure delivery of needed capabilities to users.
- Refine VA's development process from a document-and-schedule focus to a delivery focus.

The VHA CIO, in partnership with the VA CIO, should oversee a comprehensive cost-versus-benefit analysis among commercial off-the-shelf (COTS) EHRs, Open Source EHRs, and continued in-house custom development of the VistA EHR currently in use. The analysis should take into account all the complexities of the VistA/CPRS architecture and infrastructure and known issues with performance, scalability, extensibility, interoperability, and security. It should also address full life-cycle costs, including development time (based on recent delivery trends), availability of development resources, maintenance and licensing costs, and infrastructure costs. The VHA CIO should participate in the VHA requirements collection to fully understand strategy and needs. Prioritization and final approval will be provided by the VHA Under Secretary for Health (USH).

The VA and VHA CIOs should conduct site visits and review the successful IT practices implemented at high-performing health care systems (including VISN 4), to inform their

---

strategies for effective approaches and potential contributions that IT can provide to improve the treatment of Veterans today.

The VA CIO and VHA CIO should report to Congress at the end of fiscal year 2016:

- Evidence provided by both VHA USH and VA CIO that the VHA CIO serves as an effective advocate for the IT needs for health care delivery. This should include, but not be limited to, a description of the requirements for an effective health care management system that annually provides advancement to VHA mission and goals.
- Actions taken and evidence that OI&T acts as a service provider and delivers IT capabilities and IT services that improve health care delivery to Veterans. Evidence should include results of clinician and Veteran surveys confirming the quality of and satisfaction with the newly delivered capabilities and services.
- Results of the cost-versus-benefit analysis between the COTS, Open Source, and VistA EHRs.

VA should implement a broad process, inclusive of clinicians, to pursue requirements that support clinical documentation best practices and improved functionality and usability while considering the positive aspects of existing systems. Although providers can continue to leverage the free text capability available in the current EHR, it must be augmented with discrete, structured data capture using industry standard definitions to increase the interoperability with other systems inside and outside of VHA. This is especially critical due to the increased use of non-VA care.

VHA should accelerate efforts to establish semantic definitions for data elements through the use of standard nomenclatures, terminologies, and code sets. By doing so, VA can ensure consistency and integration across multiple systems, leverage follow-on IT products, and facilitate analytics for clinical decision making.

VA/VHA should assess the effectiveness of analytical products in driving health and business outcomes. They should identify and recommend improvements needed in the information systems that serve as the sources of the data to improve the reporting capabilities. VA/VHA should track actions taken as a result of the analytical products and quantify how effective those actions were in improving health and business outcomes.

To provide greater access through telehealth technology and reduce the number of Veterans who abandon these services, VA should offer technical support to Veterans, should make testing a connection between Veterans and providers easier for all parties, and should better integrate telehealth technologies across VA medical facilities and VISNs. Assisting Veterans with using this technology should improve the Veteran experience and reduce health care costs. VA should also address the challenges that complicate telehealth appointments between VISNs.

VA should explicitly identify mobile applications as a strategic enabler to increase Veteran access and satisfaction and help VHA transition to a data-driven health system. Mobile technology could effectively leverage patient-generated data to augment the data captured in the EHR to feed the learning health system.

1   Introduction

Published reports of long wait times for medical appointments, accusations of Veterans dying while waiting for care, and evidence of "secret" waiting lists prompted Congress to pass the Veterans Access, Choice, and Accountability Act of 2014 (hereafter the "Veterans Choice Act"). Section 201, Title II – Health Care Administrative Matters, of the Veterans Choice Act, called for an independent assessment covering 12 aspects of the health care and other services that the Department of Veterans Affairs (VA) delivers to the nation's Veterans. This report documents the results of Assessment H (Health Information Technology [IT]). As directed by Section 201, Assessment H focused on:

> The information technology strategies of the Department with respect to furnishing and managing health care, including an identification of any weaknesses and opportunities with respect to the technology used by the Department, especially those strategies with respect to clinical documentation of episodes of hospital care, medical services, and other health care, including any clinical images and associated textual reports, furnished by the Department in Department or non-Department facilities.[3]

1.1   Scope

Assessment H examines VA health IT on two levels, where the first level plays a critical role in the success of the second level:

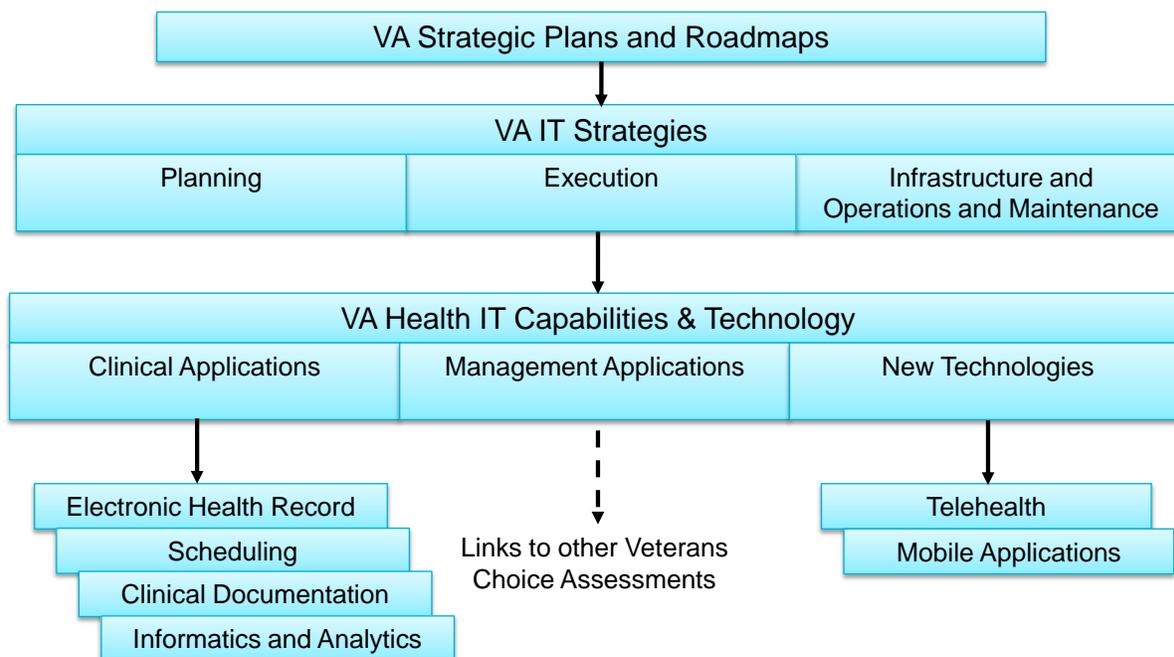
1. **IT Strategies:** The methods, processes, objectives, and metrics used to plan, implement, operate, manage, and measure health IT capabilities and technologies for Veterans.

2. **Health IT Capabilities and Technology:** Computerized systems, applications, databases, and other IT for delivering and managing Veteran health care.

VA's overarching strategic plans and roadmaps include descriptions of IT investments and expected outcomes, emphasizing Veteran health and satisfaction. These VA strategic plans should provide direction for VA and Veterans Health Administration (VHA) health IT strategies. These plans should identify health IT investment priorities and associated outcomes that form the basis for planning, implementation processes, and value measurement of resulting health IT clinical applications and new technologies. Assessment H focuses on these health IT strategies and resulting health IT capabilities and outcomes. Assessment H also identifies links to other Veterans Choice Act assessments that examine management applications related to health IT. The Assessment H study covers the electronic health record (EHR), scheduling, clinical documentation, and informatics and analytics. In addition, it examines the new technologies of telehealth and mobile applications (apps). The assessment does not include general aspects of the infrastructure, such as architecture, networks, performance, and reliability. Figure 1-1 summarizes Assessment H's scope.

---

[3] United States. Congress. Veterans Access, Choice, Accountability, and Transparency Act, 38 U.S.C. § 1701 (2014) (Pub. L. No.113–146, 128 Stat. 1754).

Figure 1-1. Assessment H Scope


1.2 Document Organization

Following this introductory section, Section 2 explains the methodology applied to conduct the Assessment H study on VA health IT. Section 3 summarizes VA's strategic plans and roadmaps, focusing on direction in those plans for improving outcomes in Veteran health through improvements to VA IT strategies and implementing advanced health IT capabilities and technology. Section 4 addresses VA's strategies for delivering health IT capabilities and technology. Sections 5–8 describe VA's major clinical applications, including the EHR, scheduling, clinical documentation, and informatics and analytics. Sections 9 and 10 describe new VA health IT technologies: telehealth and mobile applications. Sections 4–10 also present findings and recommendations relevant to the topics examined.

Section 11 outlines a future vision for transforming VA into a high-performing health care system (based on a current VHA exemplar), a learning health system, and an organization that applies industry best practices for enterprise IT service management across the life cycle of all its IT systems.

Appendix A contains white papers developed as part of Assessment H to capture detailed descriptions of VA's IT strategies and underlying software infrastructure for health IT. This information supplements the findings in Sections 4–8. These white papers address:

- VA Project Management Accountability System (PMAS)
- VA/VHA IT infrastructure and operations and maintenance (O&M)
- EHR/Veterans Health Information Systems and Technology Architecture (VistA).

Appendix B contains additional white papers developed as part of Assessment H to support analysis of current and future VA/VHA IT strategies and health IT capabilities and technology. These white papers cover:

- Industry outreach
- Common failure and success factors for large-scale EHR systems
- Return on investment (ROI) in health IT.

This page intentionally left blank.

2   Methodology

To evaluate VA's IT strategies and health IT capabilities and technologies, the Assessment H team collected qualitative data through 185 interviews—117 during site visits to six Veterans Integrated Service Networks (VISNs), 11 VA Medical Centers (VAMCs), and two community-based outpatient clinics (CBOCs)—and the other 68 during visits to Office of Information and Technology (OI&T) and VHA leaders. The team reviewed more than 200 artifacts (strategic and operational plans, reports, audits, and protocols) procured from OI&T and VHA and more than 100 external reports and peer-reviewed journal articles to derive comparative information on topics such as IT expenditures for private sector health systems, IT implementation success and failure factors, and related issues.

The Assessment H team compared its observations and findings against lessons learned and best practices gathered from chief information officers (CIOs) known for their innovation and industry leadership (15 interviews), as well as executives, administrators, clinicians, and IT professionals at high-performing health systems (The Permanente Medical Group, Cleveland Clinic, and Geisinger Health System). In addition, as noted, the team linked its findings to those of other assessments in the present series.

2.1   VA/VHA Health IT Evaluation Process

The Assessment H team used the data collected from site visits, interviews, and document reviews to identify and document findings based on insights, observations, and evaluation of detailed technical data. The team then derived recommendations to address the findings related to VA/VHA IT strategies and health IT capabilities and technology.

2.2   Interviews

2.2.1   VA/VHA Staff

The Assessment H team developed specific lines of inquiry during semi-structured interviews with staff at VA/VHA sites. The interviews gathered a wide spectrum of stakeholder perspectives on topics from planning to outcomes. Interviewees played a representative variety of roles at centers and sites and included:

- Leaders of OI&T and VHA who develop the IT visions and strategies (planners)
- IT professionals who design, develop, and implement information systems, technology, and architecture (builders)
- Clinicians who use health IT (users).

The team conducted its interviews over the telephone or in person at the VA Central Office (VACO) and during site visits to VISNs, VAMCs, and CBOCs. Appendix C lists sites visited by the Assessment H study team.

Assessment H considered the generic roles of planners, builders, users, and others. To ensure that the team could gather honest and candid information from the interviewees, team members assured interviewees that no comments would be directly attributed to them.

However, for evidentiary purposes, the team had to tie comments made by the interviewees to certain roles so that the weight of their comments could be taken in the context of those roles. Among the different types of interviewees, the team chose the roles of planners, builders, and users. Table 2-1 illustrates the role categories aligned to critical health IT functions and the rationale for their inclusion in Assessment H interviews.

Table 2-1. Role Categories Mapped to Assessment H Interviews

Critical IT Aspect	Stakeholder Category	Description
Planning *Business Focus*	**Planners**	Involved in strategic planning; business requirements analysis; prioritization and allocation of resources (funding and/or staffing). Examples include the VA CIO; VHA directors and management; OI&T directors and management.
Execution *Technology Focus*	**Builders**	Involved in IT/software requirements analysis; development project planning and execution; software development, integration, testing, and deployment. Examples include PMAS project managers, software development project leads, software developers, and so on. Involved in development and operations (DevOps) activities and the sustainment of IT assets, including software applications, in the deployment environments (e.g., data centers, Clinical Operational Environments, and so on.).
Using the System *Patient Focus*	**Users**	Staff at VAMCs and sites, including directors, Chief of Medical Operations, clinicians, schedulers, and so on.

2.2.2 Chief Information Officers

The team interviewed CIOs from both health care and non-health care institutions who were selected because they had developed and implemented innovative IT solutions. They provided valuable insights, lessons learned, and best practice IT strategies. Their input, summarized in a white paper on industry outreach in Appendix B, helped the team to compare VA's IT effectiveness with that of the private sector.

2.3 Document Reviews

2.3.1 VA/VHA Artifacts

The Assessment H team reviewed VA-level strategic plans, health IT strategic plans, health IT business requirement documents, and internal assessment reports related to IT strategies and health IT capabilities and technologies.

2.3.2 External Documents

The Assessment H team reviewed the following types of external documents for specific purposes.

- **Assessments and Audits** from sources such as the VA Office of the Inspector General (OIG), Government Accountability Office (GAO), and the Office of Management and Budget (OMB) contained numerous previous findings that could be compared to the Assessment H team's findings and recommendations to determine VA/VHA progress toward remedying identified problems over the years.

- **IT Spending Profiles and Health Care Quality/Performance Metrics** yielded basic insights into costs, benefits, and software development results for comparison to VA/VHA information.

- **Software Quality and Development Efficiency Metrics** presented measurements that could be used to establish OI&T's and VHA's ability to develop, test, integrate, deploy, and sustain quality software and obtain the desired outcomes efficiently and cost effectively.

- **Published Case Studies of IT and Health IT Projects**, representing a large collection of peer-reviewed and grey literature, identified critical success and common failure factors based on analysis of numerous health IT and non-health care IT projects.

2.4 Findings and Recommendations

The *GAO High Risk* series (GAO, 2015a) calls attention to more than 100 recommendations for VA health care that have yet to be resolved in five areas, including IT. This strongly suggests that developing more pairs of findings and recommendations would not prove particularly effective, especially since many of the Assessment H findings are consistent with existing recommendations from oversight organizations such as GAO or VA's OIG. Thus, rather than match recommendations to specific findings, many Assessment H recommendations are combined to provide a more holistic approach to resolving findings in this report.

3 VA Strategic Plans and Roadmaps

3.1 IT Investments for Veteran Health Outcomes

VA's strategic planning documents and roadmaps are generally acceptable products. These documents and roadmaps articulate desired business and Veteran health outcomes based on IT investments in terms of: (1) improved Veteran access to care; (2) better care for Veterans; (3) better Veteran health; (4) improved Veteran health care experience; (5) increased Veteran satisfaction; and (6) increased cost effectiveness of VA and VHA health IT. Of these outcomes, VA considers Veteran health and satisfaction as important measures of effectiveness and success of health-related IT strategies and resulting health IT capabilities and technologies produced by these strategies.

Figure 3-1 illustrates relationships among the most significant VA strategic planning documents and roadmaps.

Figure 3-1. Relationships Among VA Strategic Planning Documents

Source: MITRE summary of interview data and documentation relationships outlined in the VHA Health Information Strategic Plan; Information Resources Plan; VA, 2014c; and VA, 2015c.

VA's strategic planning documents are comprehensive in terms of the IT topics they address and generally reflect similar goals, objectives, and outcomes. However, they do not consistently inform, align, and support each other. For example, in many cases, multiple levels in the VA

organization develop independent strategic plans with limited alignment with one another, resulting in competing or conflicting priorities for the same funding. Although these documents represent an ambitious approach to strategic planning for a large, complex enterprise, they also create a need to coordinate and orchestrate 70 goals and 156 objectives as well as an additional five goals and 14 objectives reflected in the *Federal Health IT Strategic Plan (2015– 2019)* (VHA, 2014a). Successfully executing all these plans would prove challenging for any organization.

3.2   VA Centralization of IT Organization

In 2006, the current OI&T became a centralized component of VA and was assigned responsibility for delivering, operating, and managing IT capabilities across the department. The division of health IT responsibilities and concerns between VHA and OI&T has created a situation where each has its own values and priorities, and these may diverge. For example, improving the quality, safety, and efficiency of health care delivery and management is the top priority for VHA but not necessarily for OI&T, which is also responsible for delivering IT capabilities to other major VA organizations.

3.3   Execution of Strategic Plans

OI&T and VHA struggle to identify, prioritize, and translate clinical goals and strategic initiatives reflected in VA's overarching planning documents into buildable, testable health IT requirements that result in measurable health care outcomes for the Veteran. Although the goals of OI&T and VHA do not conflict at the strategic planning level, the organizations often do not agree on priorities for executing the strategic plans.

4   IT Strategies

VA introduced the Project Management Accountability System (PMAS) in 2009 to improve its strategies and processes for delivering IT capabilities. VA Directive 6071, issued February 20, 2013, mandated the use of PMAS in all IT projects (VA, 2013d). PMAS requires that projects be completed in increments not exceeding six months and be validated and accepted by the customer. This time-bound requirement aligns with OMB guidance designed to reduce investment risk, deliver capabilities more quickly, and facilitate the adoption of emerging technologies (OMB, 2012). This guidance states, "All projects (regardless of whether they use modular development principles) must produce usable functionality at intervals of no more than six months." Section A.1 of this Assessment H report provides a more detailed review of PMAS.

4.1   Findings

The PMAS Guide 5.0 (VA OI&T 2014e) documents the current IT life-cycle management process, governance mechanisms, participant roles and responsibilities, and reporting requirements. PMAS is supplemented by ProPath, a repository that contains the detailed artifacts, processes, and procedures to execute PMAS (VA, 2015h). ProPath also includes more than 400 documents and templates to assist project teams, 60 of which are deemed essential to support PMAS milestone reviews. A web-based PMAS dashboard presents an authoritative view of all PMAS data, giving senior leaders visibility into the current status of projects. VA submits PMAS dashboard data to the Federal IT Dashboard via the OMB 300B process.

Finding 4.1.1: VHA and OI&T are not effectively collaborating with respect to the planning and execution of IT strategies for managing and furnishing health care.

Effective planning starts with clear business objectives, which case studies have consistently identified as a critical success factor for IT projects (see Section B.2.4). Conversely, lack of clear business objectives is a top failure factor (Standish Group, 2011). Ineffective collaboration between VHA and OI&T has limited VA's ability to establish and communicate clear business objectives to ensure IT investments align with its health care objectives. During Assessment H interviews, 28 of the 62 planners and builders (or 45 percent) in OI&T and VHA (e.g., CIO, director-level, deputy-level, chief-level, lead, senior adviser, program manager, project manager) provided unprompted comments about the problems with collaboration and communication.

Effective IT planning requires clear goals and objectives to guide the schedules and resource allocation needed to successfully execute the plans. The large number of goals, objectives, and measures listed below obscure the highest priorities:

- At least 70 goals and 156 objectives in VA/VHA/OI&T strategic planning documents
- An additional five goals and 14 objectives in the Federal Health IT Strategic Plan (VHA, 2014a)
- Currently 382 measures in its 10-N National Measures Report (see Assessment L [Leadership]).

When asked about these planning documents, key OI&T leads referred to the documents as "dated" and "useless," noting that "the value of our documents is very questionable." Regarding collaboration, key OI&T leads indicated they were not aware of VHA's *Blueprint for Excellence* at all or had heard about it only on the day it was published.

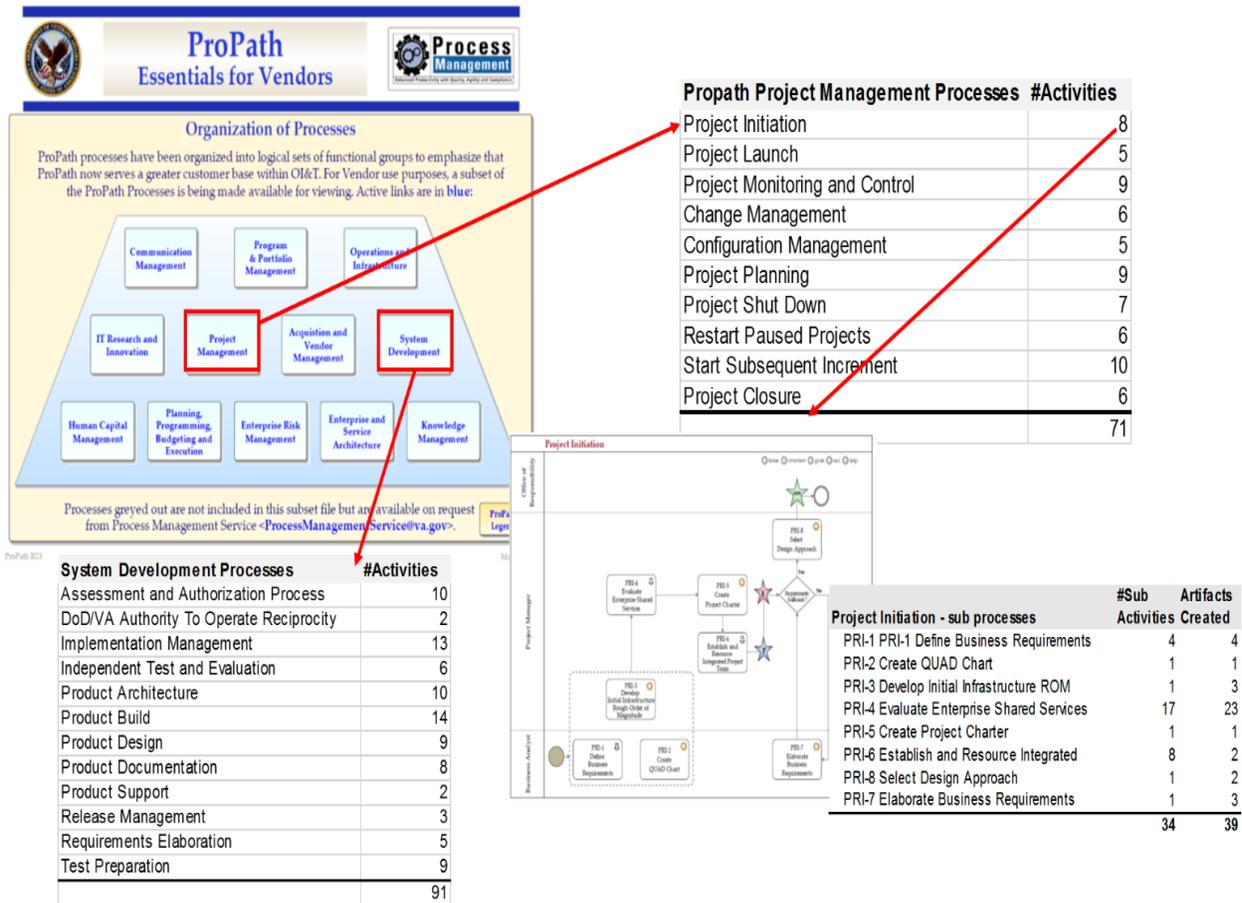
VHA stakeholders offer a different perspective regarding requirements. VHA provides business requirement documents, but Assessment H could find no evidence of communication between the VHA and OI&T teams to confirm that the technical requirements reflect or are updated to reflect the business requirements through agile development. The Assessment H team found no evidence of a joint health care architecture or a joint IT investment management process to improve their communication and collaboration. This also relates to VA OIG findings (OIG, 2015c) on cyber security, which identified ineffective communication with field offices as a reason for the inconsistent adherence to cyber security policies.

Many Assessment H interviews revealed perceptions that a risk-averse culture and a lack of trust between OI&T and VHA undermine effective collaboration. Of the 185 individuals interviewed, 88 (or 48 percent) volunteered statements that indicated some degree of discord between OI&T and VHA. These perceptions apply equally to both VHA and OI&T leaders. Neither organization appeared solely responsible for the lack of clear communication and collaboration, but poor collaboration clearly curtails the ability to plan and develop new IT capabilities to assist clinicians and Veterans.

Finding 4.1.2: VA's project management and execution processes are document centric, emphasize schedule over results, and fail to deliver capabilities called for in VHA health care strategies.

During Assessment H interviews, 15 of 46 planners (33 percent) and 17 of 26 builders (65 percent) indicated that, although PMAS improves accountability and transparency, it has become overly complex and burdensome and reduces project success rates. Both planners and builders indicated that process-focused meetings and documentation consume a significant percentage of each six-month increment, along with several months required for contracting. Interviews with OI&T leaders indicated they recognize these issues and have a working group assessing ways to simplify the process.

The complexity of PMAS, conveyed in Figure 4-1, creates excessive overhead for small projects, lowering the effectiveness of rapid prototyping and other means of increasing technical innovation. "Project Management" and "System Development" are two of the primary process areas described in PMAS. The Project Management process consists of 71 separate activities and the System Development process involves 91 activities to produce deliverables or artifacts required to design, develop, test, and implement a solution. Assessment H interviewees indicated that PMAS overemphasizes schedule while accommodating little evaluation of the quantity or quality of functionality delivered. As a result, many project managers include less functionality in each increment to ensure that they meet their schedules.

Figure 4-1. PMAS and ProPath Complexity


Source: Graphics from VA, 2015h.

Agile development approaches typically generate frequent modifications to project artifacts such as the Requirements Specification Document and the System Design Document, leading to redundant reviews for the same project. PMAS guidance indicates that tailoring might allow smaller projects to reduce the documentation required. Unfortunately, Assessment H interviews uncovered cultural reluctance to tailoring. Each modification involves extensive reviews and burdensome documentation requirements.

PMAS limits projects to a 24-month duration. Even if business requirements remain unfilled, managers must close the project and initiate a new project to deliver the remaining functionality. Although projects can request two-month extensions, longer term projects potentially require multiple cycles of initiations and closeout. Thus, while this approach reduces the risk of long project overruns, complex projects may require repetitive startup and closure documentation and activities. The PMAS process for achieving Initial Operational Capability (IOC) and release (depicted in Figure 4-2) identifies more than 61 separate activities and provides another example of the high overhead incurred by PMAS.

Figure 4-2. PMAS Mandatory Activities

Pre-IOC	IOC	Release

Pre-IOC

Development Activities:
- EDE Training, EDE ETS, EO Perf, & Vista Installs (1 week); Smoke Tests (1 week)
- ETS Testing & Defect Development/Test (4 weeks)
- EO Performance & 508 Testing (1 month)
- Security Testing – WASA, SwA V&V w/Fortify & Nessus scans and remediation (1 month)
- EO Performance, 508, & Security Testing (4 weeks)
- Proxy/Dev Accounts Created & Tested (2 weeks)
- EO Pre-Prod install and smoke test (2 weeks)
- IOC Test VistA Install (1 week)
- Pre-Prod Testing (3 weeks)
- ESE Training Development & dry runs (8 weeks)

PMAS & ProPath Activities:
- Complete/updates to RSD, SDD, OAP (8 weeks)
- SEDR Review Process (8– 12 weeks)
- ID Test Sites; Complete MOUs (2 – 3 weeks)
- Testing Intake Assessment; Independent Testing
- Perform CARA Analysis (2 – 4 weeks)
- IV&V, ORR, Final UFT (8 weeks)
- Complete National Release & ORR Checklists (2 – 3 weeks)
- Conduct ORR PMAS Readiness Review (1 day)
- Prepare IOC Entry/Exit Summary (1 week)
- Master Test Plan (1 week)
- Coordinate and Verify ATO (4 – 8 weeks)
- SQA Checklist (1 week)
- Define ESE Training Plan (2 – 3 weeks)
- Coordinate ATO Activities (2 months)
- Update System Security Plan (SSP) (1 Month)
- Update Privacy Impact Assessment (PIA) (3 weeks)

IOC

Development Activities:
- EO Prod Install & IOC Prod VistA Install (2 weeks)
- Training (2 weeks)
- Production Testing (3 weeks)
- Collect Concurrences and IOC Capability Evaluation Data (1 week)

PMAS & ProPath Activities:
- Confirm ATO (2 – 3 weeks)
- IOC Entry/Exit Summary (1 week)
- Request VHA Release Management Approval for IOC Entry (2 weeks)
- Meeting with Health Systems Rep. (1 day)
- IOC Kick-off meeting with test sites (1 week)
- Perform Testing (2 weeks min.)
- Update Issues, Anomalies, Exceptions and Risks (1 week)
- Documentation for IOC Exit Approval (1 week)
- Finalize Transition Plan (2 – 3 weeks)
- Create/Finalize Deployment Plan (3 weeks)
- Finalize OAP (2 – 3 weeks)
- Submit Final National Release Checklist (1 day)
- NSD Updates (1 week)

Release

Development Activities:
- Site coordination/Training roll-out (1 – 5 months)
- Prepare and Distribute Release (1 – 5 months)
- Monitor Installation Activities (1 – 5 months)
- Execute Backout/Roll Back/Rework Procedures (1 – 5 months)

PMAS & ProPath Activities:
- Release Site Readiness (1 – 2 weeks)
- Health Product Support Approval (2 weeks)
- VHA Release Team Mgmt. Approval (2 weeks)
- ESE Release Office Approval (2 weeks)
- Final Customer Acceptance Form (1 week)
- Lessons Learned Report (1 week)
- Milestone 2 Review (1 day)
- Initiate Change Request (1 day)
- Verify Final Configuration (1 – 2 weeks)
- Distribute Release (1 – 5 months)
- Close Change Request (1 day)
- Notification of Successful Release (1 day)
- Milestone 3 Review* (1 day)

Source: VA OI&A, PMAS IOC Mandatory Activities (briefing presented during Assessment H interview)

VA naturally considers the delivery of useful capability as the primary metric for agile software development. However, during Assessment H interviews, 36 planners, builders, and users provided unsolicited insights suggesting that an over-emphasis on schedule diminishes the incentive to deliver working software demonstrably suitable for its intended purpose.

- Planners with the most insight into funding allocations for business requirements described PMAS as a broken process due to its over-emphasis on time-bound deliveries, which forces projects to drop functionality, creating a backlog of unmet requirements. They noted similar problems with testing that depended on the missing functionality; as a result, the tests would fail, but no funding or time would remain to fix the problems that were uncovered.

- One planner stated, "Over 80% of projects are meeting their milestones but are delivering 10% of what we wanted. The increments have so little in them. We're not delivering anything of major significance." This perception was corroborated by interviews with users who claimed that VA has made no significant updates to the legacy health IT

systems and that only 20 percent of Computerized Patient Record System (CPRS) feature requests have been implemented in the past three years. Finding 5.1.1 contains additional details.

- Other planners claimed that business owners are sometimes pressured into "signing off" on deliveries; otherwise, they will lose funding. The Assessment H team observed that many health care business owners resided at VACO, served as a business owner for multiple projects, and had other leadership responsibilities. In other words, they had little time to devote to each task and were far removed from the clinical environments they were intended to represent. In contrast, visits to high-performing health care systems revealed that these organizations typically establish dedicated teams focused on specific IT initiatives with complete participation from the business owners who drove prioritization of requirements.

A January 2015 follow-up audit of PMAS by the VA OIG had similar findings and reported that, for VA's portfolio of IT development projects totaling $495 million, VA and OI&T leaders "lacked reasonable assurance that development projects were delivering promised functionality" on time and within budget (VA OIG, Office of Audits & Evaluations, 2015).

Finding 4.1.3: The current OI&T IT service management (ITSM) philosophy is that of an internal project-focused organization rather than that of an IT service provider focused on the enterprise, customer needs, and service delivery to both VHA personnel and Veterans.

Today's best-practice concepts for enterprise ITSM are based on a discipline for managing IT services centered on the customer's perspective regarding IT's contribution to the business. Section 11.2 of this report further describes enterprise ITSM standards and best practices.

Infrastructure and O&M

Many of VA's current technical challenges stem from the decentralized approach to IT that VA adopted during the 1990s. At the time, the decentralized approach was credited with VA's dramatic turnaround in health care services (Walters, 2009). In addition, the characteristics of self-organizing teams; small-scale, close user engagement; and continuous delivery of useful software were precursors of what would later be termed "agile software development" and produced an effective breeding ground for innovation and rapid advancements in health IT. However, this also created the foundation for maintenance difficulties because, according to Walters, "new applications were popping up sporadically and haphazardly." The lack of standardization and effective IT governance ultimately created significant technical complexity in the form of a "sprawling, aging, and unwieldy system of computer and communications technologies spread across the department's more than 1,000 medical centers, clinics, nursing homes, and Veterans' centers" (Walters, 2009).

VA recognized the need to overcome these technical problems, but high-cost, software-intensive consolidation initiatives failed (GAO, 2008) and contributed to Congress directing VA to adopt a centralized approach to IT in 2005 (U.S. House of Representatives, 2005a). However, Assessment H findings suggest that VA has not achieved sufficient improvements with respect to these enterprise integration and modernization efforts despite the centralization of IT

---

authority, a sustained VA IT emphasis on consolidating and integrating IT solutions (VA, 2007), and billions of dollars in IT funding.

Finding 4.1.4: Earlier decentralized software-development approaches and continued evolution of VA's custom-built health IT systems have created infrastructure complexity that poses significant challenges for VA's ability to effectively execute IT strategies.

An unintended consequence of VA's decentralized IT development in the 1990s was the creation of a custom health IT system consisting of many versions of numerous different software modules with many different dependencies between these modules. Although this decentralized approach quickly satisfied local requirements for IT to help in managing and furnishing health care, it established inconsistencies that undermined enterprise-wide data sharing and innovative applications.

A gold-standard VistA activity has consolidated nearly 60 percent of these software modules (VA, 2015g) and is currently being deployed across the enterprise to reduce the numerous variations that emerged during the previous era. Even so, Assessment H found that VA's IT and software infrastructure remains an extremely intricate, heterogeneous mix of software frameworks and technologies.

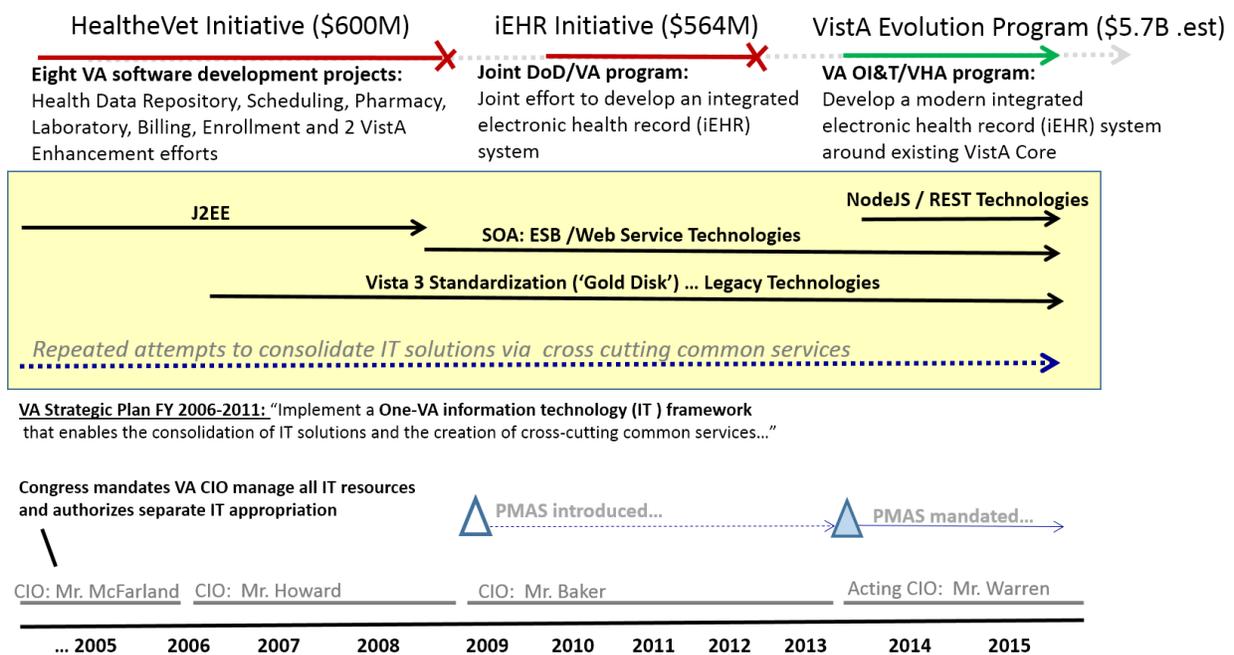
The scheduling system currently used by VA offers one example of the problems caused by these complexities. This scheduling system is approximately 30 years old and has more than 1,000 integration points (VA, 2014d)—locations in software where one software module depends on the functionality implemented in another software module. The system relies on 31 different software modules, and 71 software modules depend on the scheduling module (VA OI&T, 2014c). The number of dependencies exceeds 100 because different versions of these modules exist and must be addressed. The gold-standard VistA activity intends to reduce the number of different versions of each module, but the roughly 100 integration points will remain. As GAO recently noted (GAO, 2015a), the tangible impact of this programming complexity is that:

> VA undertook an initiative to replace its scheduling system in 2000 but terminated the project after spending $127 million over 9 years due to weaknesses in project management and a lack of effective oversight. The department has since renewed its efforts to replace its appointment scheduling system, including launching a contest for commercial software developers to propose solutions but VA has not yet purchased or implemented a new system.

Dependencies among the many VA software modules have an impact on the cost of change associated with enterprise-scale software, which is considered one of the highest software-related cost factors and is closely correlated with the dependencies among the software modules. These dependencies also raise the cost of integration, which directly affects the ability to integrate commercial off-the-shelf products into VA's health IT systems. All these complexity factors explain why replacing the VA scheduling system remains a costly and highly technical challenge (Booch, 2015; Knoernschild, 2012). Section 6 of this Assessment H report provides more information on IT aspects of VA's scheduling capability.

The enterprise perspective on VA IT adopted by Assessment H is critical to understanding the scale, scope, and complexity of the technical challenges OI&T has faced in accomplishing its decade-long strategic IT objective to create "One-VA" (VA, 2005). In theory, One-VA will transition VA "from disparate stovepiped processes and systems to a unified environment of integrated, interoperable business processes and technical services" (VA OI&T, 2014a). The approach requires special expertise and appropriate IT processes for successful large-scale, centralized IT management; large-scale software infrastructure; and large-scale software development. However, these capabilities are not well aligned with the expertise and processes required for the decentralized IT and local software customizations that created the successful health IT solutions in the 1990s.

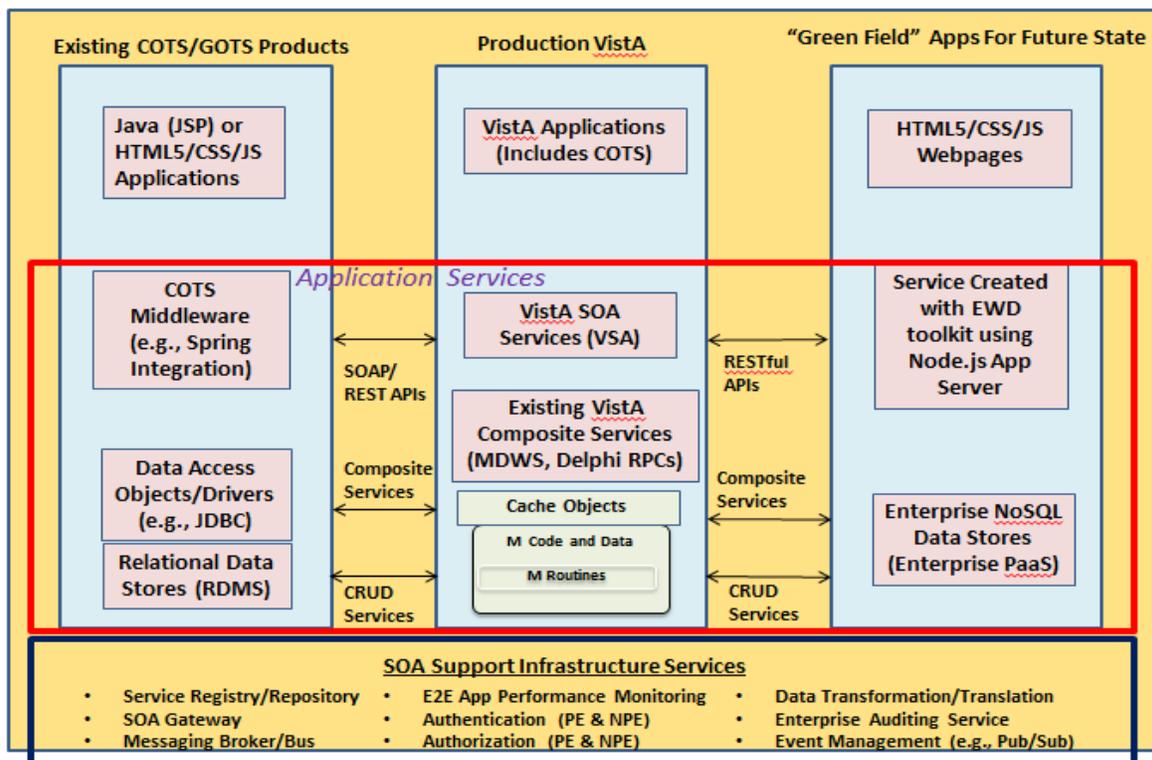
Figure 4-3 shows a graph of VA's ongoing struggle to transition from a distributed approach to an enterprise approach. During the period shown, each new CIO attempted consolidation using new infrastructure technologies. Unfortunately, none of the consolidation attempts was completed, resulting in even greater software complexity and more challenges for the next CIO.

Figure 4-3. Timeline for VA IT Modernization Using a Mix of Technologies


Source: MITRE rendition of data from planning documents and reports.

The simplified version of the VA software health architecture in Figure 4-4 illustrates the lack of standardization created by the mix of technologies introduced over the past decade. The software stack on the left of the diagram represents the results from VA's move toward a service-oriented architecture (SOA) and web services. The software stack in the middle represents the legacy software (without the hundreds of modules and their many different versions). The software stack on the right shows the recent move toward a modern

infrastructure technology called "Node.js," which has emerged as one of the most popular technologies in today's open source software community.

Figure 4-4. VA's Heterogeneous Software Architecture


Source: OI&T ASD, VistA 4 Product Architecture Review Triad Meeting Winter 2015 (briefing), January 27, 2015.

This mix of software stacks reflects a "non-standardized infrastructure," which has been identified in industry case studies as a common failure factor for IT projects (Standish Group, 2011). As noted in Figure 4-3, VA's efforts to transition from small scale to large scale have increased software complexity due to implementing multiple software application and infrastructure technologies over a 10-year time span. Instead of consolidating the software infrastructure, VA has expanded it, creating more challenges that impede VA's ability to upgrade and extend the existing software systems. Figure 4-4 illustrates this mix of software applications and infrastructure (e.g., Java J2EE Technology, SOA: Enterprise Service Bus (ESB)/web service technologies and Node.js/REST Technologies) that VA must now simultaneously maintain as a non-standardized infrastructure. Consequences of such a non-standardized software infrastructure include increased time and cost to implement changes due to complexity and duplication of efforts, higher costs to maintain teams with multiple skill sets, and greater challenges to establish effective cyber security across multiple technologies.

Increasing O&M Costs

VA's enterprise IT infrastructure includes the combination of hardware, software, networks, and facilities required to develop, test, monitor, secure, support, control, and operate VA's IT

---

services. VA's annual IT spending published on the Federal IT Dashboard can be organized into four categories (SemanticInfo, 2015):

- **New/Upgrades Spending for Mission Area**: Program costs for new investments, changes, or modifications to existing systems reported as IT investments directly supporting an agency-designated mission area.

- **New/Upgrades Spending for Infrastructure**: Program costs for new investments, changes, or modifications to existing systems identified as IT investments supporting infrastructure, strategic management of IT operations, or a grants management system.

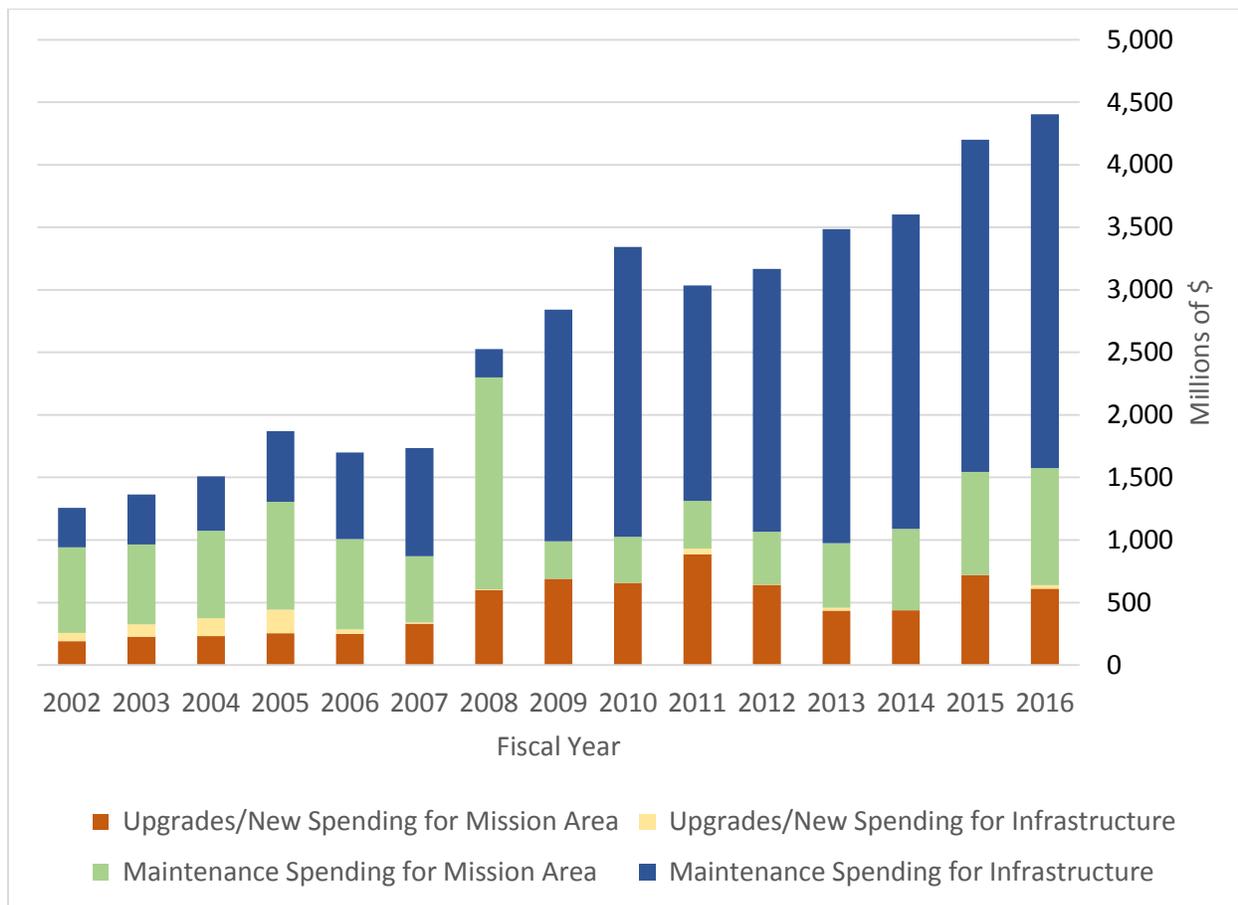
- **Maintenance Spending for Mission Area**: Spending covering maintenance and operation (O&M) costs at current performance level for systems reported as Mission Area Spending.

- **Maintenance Spending for Infrastructure**: Spending reported as IT investments supporting infrastructure, strategic management of IT operations, or a grants management system.

A detailed assessment of VA's enterprise IT infrastructure and itemized annual IT O&M spending was beyond the scope of Assessment H. Because OI&T provides infrastructure and mission area capabilities for the Veterans Benefits Administration (VBA), the National Cemetery Administration (NCA), and VHA, the proportion of IT spending for health care capabilities and infrastructure cannot be discerned from available data. However, analysis of VA IT spending trends found that maintenance costs have grown almost continually since 2002, as shown in Figure 4–5. More troubling, spending on upgrades or new capabilities for the VA mission now represents only 15 percent of the total IT budget. During Assessment H interviews, several stakeholders, including those directly involved with IT investment planning and funding allocations, echoed concerns that O&M funding is "eating up our development, modernization, and enhancement funding." As a result, the growing cost of operating and maintaining the complex infrastructure reduces the availability of funding for new IT capabilities needed to manage and meet health care needs.

The views, opinions, and/or findings contained in this report are those of The MITRE Corporation and should not be construed as an official government position, policy, or decision.

19

Figure 4-5. VA IT Spending on Upgrades vs. Maintenance


Source: MITRE graph derived from data collected from the Federal IT Dashboard 2015, https://itdashboard.gov/

Increases in the cost of VA IT infrastructure have continued despite several IT initiatives to reduce them, such as:

- **Physical consolidation of enterprise IT infrastructure assets:** Since 1998, VA has attempted to consolidate its distributed physical servers (and software applications) into four regional data centers (GAO, 1998) with completion originally planned by 2010 (OMB, 2008). VA described this cost cutting in a 2008 OMB Exhibit:

  > *To address [costly existing model], VHA is moving to a Regional Data Processing Center (RDPC) model of centralization of VHA health information data processing by co-locating and/or integrating services to a smaller number of data centers (from 128 to four, nationwide).*]

  As of 2014, this consolidation remains far from complete (VA Enterprise Centers, 2014). Phase 1 of the National Data Center Program (NDCP) consolidation effort completed 18 VistA migrations, and Phase 2 is slated to migrate an additional 52 instances "subject to funding availability." According to the fiscal year (FY) 2016 Enterprise Operations Business Plan, "Enterprise Operations (EO) supports development of the VA National Data Processing Strategy, which over time will consolidate more than 80 data centers within the Franchise Fund." EO is responsible for infrastructure investments, including

---

modernization and consolidation, at a cost exceeding $300 million per year per the FY15 Pre Volume II Medical Programs and Information Technology Programs Congressional Submission—the highest line item in the FY15 O&M budget. VA was unable to clearly demonstrate the cost-cutting aspects or ROI gained from these efforts to date.

- **Ruthless Reduction Task Force**: VA established this task force specifically to eliminate hardware and software redundancies within the VA enterprise (Miller, 2011). The group's focus included consolidation of IT contracts where possible, IT virtualization, elimination of desk-side printers, and purchase of more multi-functional devices (e.g., printers with fax capability). Although OI&T leaders indicate some costs were reduced, the overall growth of maintenance costs continued.

Despite increased spending on IT infrastructure, Assessment H interviewees expressed dissatisfaction with OI&T's ability to meet local IT infrastructure needs as illustrated by the following examples.

- VA has disparate telephone technologies at various levels (local/site, regional, VISN, administration). At one VAMC, a leader indicated, "We have three incompatible phone systems in the VAMC that OI&T won't replace, so we cannot transfer calls from Veterans to a department using one of the other phone systems."
- Sites have insufficient resources to meet local requirements, such as increased bandwidth for telehealth deployments, scanners, and telephone upgrades.
- Sites lack sufficient local IT staff to assist users with infrastructure needs.

4.2 Recommendations

Key findings regarding IT strategies in Assessment H echo previous reports over the past decade and also reflect top failure factors identified in a large body of published case-study analyses of large-scale IT projects. Assessment H findings reveal complexities and limitations in key aspects of IT planning and execution that affect business (patient-facing clinical systems) and IT (system-engineering processes). These recurring findings indicate high-risk exposure in the form of chronic, fundamental problems that discrete recommendations cannot adequately address.

In light of these recurring findings, the resulting high-risk exposure, and the obvious limited value of repeating individual recommendations previously made, Assessment H recommends an integrated transformation involving executive-level leadership to address numerous findings associated with VA/VHA IT strategies. These recommendations are summarized as follows:

1. Select a CIO for VHA to manage and advocate for VHA's IT needs.

2. Transform the VA IT strategy to a model based on enterprise ITSM standards and best practices that includes the following actions:
   - Establish mutually agreed-upon service level agreements and optimize them for effectiveness.
   - Refine the planning and budgeting process to ensure business needs are effectively identified, prioritized, funded, and used to drive IT investments.

- o Develop a governance policy to ensure the strategic plans are executed well and in a timely manner.
- o Establish product (capability)-focused teams to ensure delivery of needed capabilities to users.
- o Shift the focus of VA's agile development process from documentation and schedule to service delivery.

Recommendation 4.2.1: The VA chief information officer should select a CIO for VHA to manage and advocate for VHA's IT needs and assist in transforming the VA IT strategy to a model based on enterprise IT service model standards and best practices.

Subject to the oversight and direction of the VA CIO, the VHA CIO acts primarily as an advocate and facilitator between OI&T and VHA to ensure both organizations are successful in meeting health IT needs. The VHA CIO will not move IT operations to VHA nor decentralize the organization. The VA CIO will define the specific roles and responsibilities of the VHA CIO. In the interest of consistency, VA should consider appointing equivalent CIOs for VBA and NCA.[4]

VHA needs a dedicated executive who can understand the changing health care needs that the complex VHA organization must meet, establish the IT priorities needed to address the ever-evolving health care challenges, and advocate for IT investments at the department level with the VA CIO. In addition, the VHA CIO should monitor delivery of the OI&T organization on behalf of VHA to ensure projects and services are completed or updated in a timely manner and deliver the needed capabilities. This recommendation is consistent with the requirements of the Federal Information Technology Acquisition Reform Act (FITARA) and the Clinger-Cohen Act[5] as implemented by recent OMB guidance[6] that expects departmental CIOs will appoint "bureau CIOs" or, in the case of VA, administration CIOs.[7]

Recommendation 4.2.2: VA should transform its IT strategy for delivering and managing health IT capabilities and technologies to a model based on enterprise ITSM standards and best practices.

[7] "Official with the title or role of Chief Information Officer within a principal subordinate organizational unit of the agency, as defined in Section 20 of OMB Circular A-11, or any component organization of the agency (contrast with "agency CIO") OMB M-15-4, Attachment B at 18; OMB Circular A-11 provides: "Bureau means the principal subordinate organizational units of an agency." OMB Circular A-11 (2015) at Page 4 of Section 20, available at: https://www.whitehouse.gov/sites/default/files/omb/assets/a11_current_year/s20.pdf

Acting upon this recommendation should improve VA's ability to effectively and cost-efficiently plan and execute IT strategies for delivering and managing clinical applications, management applications, and new technologies. Key objectives should include developing modular IT system architectures, open and well-defined interfaces, and standardized infrastructure.

A key aspect of the recommended transformation is to establish clearer roles, responsibilities, and accountability between VHA and OI&T. This should improve the working relationship and provide transparency in process and decision making. Ultimately, such changes should help to create a culture that ensures joint, collaborative efforts focused on service to the Veteran—clearly the driving goal of all the VA staff interviewed during the Assessment H study.

The selection of a VHA CIO should ensure that VA acquires and allocates health IT resources in a manner commensurate with VHA program requirements. This would entail establishing clear responsibilities and ensuring that everyone understands them. Staff in VHA and OI&T need to know that other parts of the organization can and will deliver on their commitments. Further, with respect to the definition and execution of IT strategies, each organization's expectations must be unambiguous and widely disseminated.

VA must unambiguously define OI&T accountability for service agreements. Specifically in the case of VHA, service agreements should be driven by health care needs identified by VHA. OI&T should implement a comprehensive portfolio-management business model that allocates investments and delivers services based on business priorities as established by the VHA staff under the leadership of the new VHA CIO. Key features of this model include accountability to health care business owners, metrics, and controls. Industry outreach interviews described IT departments' clear accountability to the business owners for outcomes. Most of these organizations also have standard metrics by which they gauge performance of IT products and the IT delivery process.

OI&T should establish service-level measurement programs jointly with VHA to include:

- **Business outcomes** (tangible, delivered IT capabilities with an assigned business value shown to have an impact on health IT)
- **System performance** (for example, user response times, processing times, capacity, bandwidth, availability, scalability, and security)
- **Service management** (for example, service desk support, incident management, problem resolution)
- **User satisfaction**.

Joint agreements between OI&T and VHA should define the metrics as well as openly shared measurements, trends, and plans to address shortfalls. The agreements should resemble industry standards. Failure to meet the intent of service agreement should have consequences, such as contracting with a different provider who can meet the service agreement measures.

Recently OMB published a memorandum (Donovan, 2015) that emphasizes the importance of understanding business needs and implementing metrics to measure and improve outcomes and customer satisfaction. The above recommendation to align the VA IT function "with the needs of VHA organizations" reflects this guidance aimed at assisting "agencies in establishing

management practices that align IT resources with agency missions, goals, programmatic priorities, and statutory requirements."

OMB published this guidance in the form of a memorandum to implement FITARA, which significantly enhances the authorities of the CIO to assure that the CIO plays a central role in the program planning, budget, acquisition processes, and the Clinger-Cohen Act, whose terms (when read together with FITARA) require the CIO to use the enhanced authorities to support "agency missions, goals, programmatic priorities and statutory requirements" and that the Secretary "[is] responsible for . . . carrying out the agency's information resources management activities to improve agency productivity, efficiency, and effectiveness."

The OMB guidance mandates that the CIO report directly to the Secretary "to carry out the responsibilities of the agency under this subchapter" and to "establish and maintain a process to regularly engage with program managers to evaluate IT resources supporting each agency's strategic objective" and share responsibility with program managers "to ensure that legacy and ongoing IT investments are appropriately delivering customer value and meeting the business objectives of programs."

In summary, the OMB memorandum on FITARA (Donovan, 2015) indicates:

> World-Class Customer Service Agencies shall discuss how their portfolio management practices emphasize the customer-centric themes of the U.S. Digital Services Playbook,[8] OMB's capital planning and investment control guidance,[9] and the Smarter IT Cross-Agency Priority (CAP) Goal.[10] Agencies should describe where in their policies the following are implemented: the Playbook's 'Understand what people need,' the capital planning guidance requirement for major investments to measure customer satisfaction performance metrics, and the Smarter IT CAP Goal's focus on improving outcomes and customer satisfaction with Federal services.

A detailed substantive discussion of the recently issued OMB guidance is outside the scope of this Assessment H study and would in any case be incomplete in that the guidance will be extensively supplemented in the future. However, an initial review of its provisions makes clear that the Secretary of the VA has authority and tools to develop an "inclusive governance process" that will be sufficiently flexible to adapt to VA's and VHA's unique mission requirements and to ensure that the CIO and OI&T are accountable for aligning IT resources with VHA mission and program requirements.

The following specific actions supplement the Assessment H recommendation for transforming VA/VHA IT strategies based on enterprise ITSM standards and best practices.

Optimize IT service agreements. The VHA CIO should facilitate the requirements collection and prioritization within VHA, with final approval provided by the VHA Under Secretary for

---

[9] IT Budget Capital Planning Guidance available at: https://www.whitehouse.gov/omb/e-gov/strategiesandguides.

[10] Smarter IT Delivery Cross-Agency Priority Goal, available at:
http://www.performance.gov/node/3403?view=public#overview.

Health; establish IT service level agreements (SLAs) that are mutually acceptable between OI&T and VHA; and optimize the services for effectiveness. OI&T should ensure that service agreements support the clinical environment and decrease overhead, bureaucracy, and the number of processes involved. For example, with respect to telehealth, as VHA increases virtual access for the delivery of care, a National Telehealth Services Agreement would eliminate the need for separate agreements between VHA, IT Development, and IT O&M.

Refine the planning and budgeting process. VA should revise the planning and budgeting process to ensure business needs are effectively identified, prioritized, funded, and used to drive IT investments—while simultaneously avoiding the proliferation of the "local site" optimizations that created some of the underlying problems identified in Assessment H key findings. VA should ensure identification and prioritization of health care objectives with more accurate cost and outcome analysis (e.g., better use of the existing planning and budgeting process). Industry outreach interviews indicated that all successful organizations tightly align IT investment to the organization's strategic plans and needs.

Develop a governance policy to ensure the strategic plans are executed well and in a timely manner. The VHA CIO should facilitate VHA measurement of services to ensure compliance with the agreements. Fifty-one percent of the VHA CIO performance will be based on how well SLAs with VHA are being met by OI&T. SLAs would cover support for requirements development, project cost estimation, health IT systems project design and delivery, and the quality and performance of the health IT systems. Performance would also be measured by how well the CIO understands the current and future health IT needs of VHA to improve care delivery for the Veterans.

Establish product (capability)-focused teams. Product or capability teams would execute their tasks under the authority of a business owner fully accountable for the product's entire life cycle, from identifying priority requirements through planning, delivering, and verifying measurable health care outcomes in patient-facing clinical environments. The teams must actively and sufficiently represent all relevant stakeholders associated with the product and include embedded, collocated IT staff (e.g., software developers) in critically necessary but subordinate roles. The tight coupling of planners, builders, and users would facilitate more effective identification and translation of prioritized objectives outcomes—essentially, more effective collaboration between "business" and "IT."

Each product-focused team should be allocated to, responsible for, and exclusively dedicated to the planning, execution, and full life-cycle delivery of integrated, end-to-end, top-to-bottom, working products with verified outcomes. These teams should focus on "vertical" business needs with tight coupling to the enterprise technical leads for consistent, effective integration with the cross-cutting IT needs.

The teams must actively and sufficiently represent all relevant stakeholders associated with the product and include tightly integrated IT staff (e.g., software developers).

VA OI&T has discussed emerging ideas for incorporating product-focused teams and has introduced a similar concept. However, OI&T's approach must define the critical responsibilities of the business owner and effectively communicate the importance and details of a product-

focused approach. Finally, the approach must incorporate cross-cutting architecture and integration activities to ensure that the IT infrastructure evolves consistently and acceptably.

Refine VA's development process. VA can improve the PMAS process by incorporating best-practice agile principles for delivering prioritized, measurable outcomes into the operational environments (in the case of VHA, the patient-facing clinical environment) in the context of VA's enterprise IT development. The suggested refinements would specifically work in conjunction with the product-focused teams that address vertical business requirements and the enterprise technical teams that address cross-cutting concerns associated with an integrated, unified IT framework.

Assessment H's recommended transformation of IT strategy retains aspects of VA's existing agile approach but incorporates key principles from best-practice strategies for scaling these processes to accommodate their effective use in large-scale enterprise modernization efforts. These refinements essentially eliminate the current fragmented approach when combined with the vertical product-focused business teams and horizontal IT-focused technical teams (holistic approach). They should also incorporate the flexibility required to accommodate small-scale innovative development activities that should not require the overhead imposed by PMAS—a common source of complaints by VA stakeholders during Assessment H interviews. OI&T should turn to small-scale, rapid development and verification of innovative health IT concepts that could subsequently be incorporated into the enterprise-level product-driven process.

While industry uses some prescriptive enterprise agile models (for example, Scaled Agile Framework [SAFe], Disciplined Agile Delivery, and Large Scale Scrum), Assessment H does not recommend that VA shift to one of these scaled agile development processes. Instead, OI&T should modify the existing PMAS process to reduce the risks and learning curve associated with shifting to a completely new methodology. Assessment H recommends the following refinements to PMAS:

- **Adopt an enterprise agile model that implements portfolio and program team structures** to coordinate efforts of multiple teams that simultaneously develop products with mutual dependencies. The enterprise agile model would clearly define the structure of the program teams and describe how to allocate business goals to the teams for execution. VA OI&T and each of its business partners (VHA, VBA, NCA) should work together to identify the right portfolio/program/project structure.

- **Create agile teams that effectively collaborate with the enterprise software architect** (and team) to ensure OI&T receives the feedback required for evolution of the enterprise architecture.

- **Establish a sufficiently defined and implemented enterprise-level technical infrastructure** to support agile delivery, which includes use of more effective development and operations practices.

- **Evolve PMAS to support enterprise agile development**:
  - Accommodate more complex portfolio/program/project structures so that the business owner and other stakeholders can see a complete picture of the entire implementation plan for a business endeavor.

- o Identify meaningful agile project performance metrics and adapt PMAS to support the definition, capture, and analysis of those metrics.
- o Allow tailoring of PMAS documents and schedule and encourage tailoring for small or unusually large projects.
- o Accelerate PMAS enhancements already identified by OI&T that are consistent with these goals.
- o Evolve contracting practices that facilitate enterprise agile development.

The Assessment H team recognizes the difficulty of instituting cultural changes and implementing agile technical practices in a large organization. Attempts to create such fundamental shifts through self-teaching and self-monitoring would likely fail. Assessment H therefore recommends that VA:

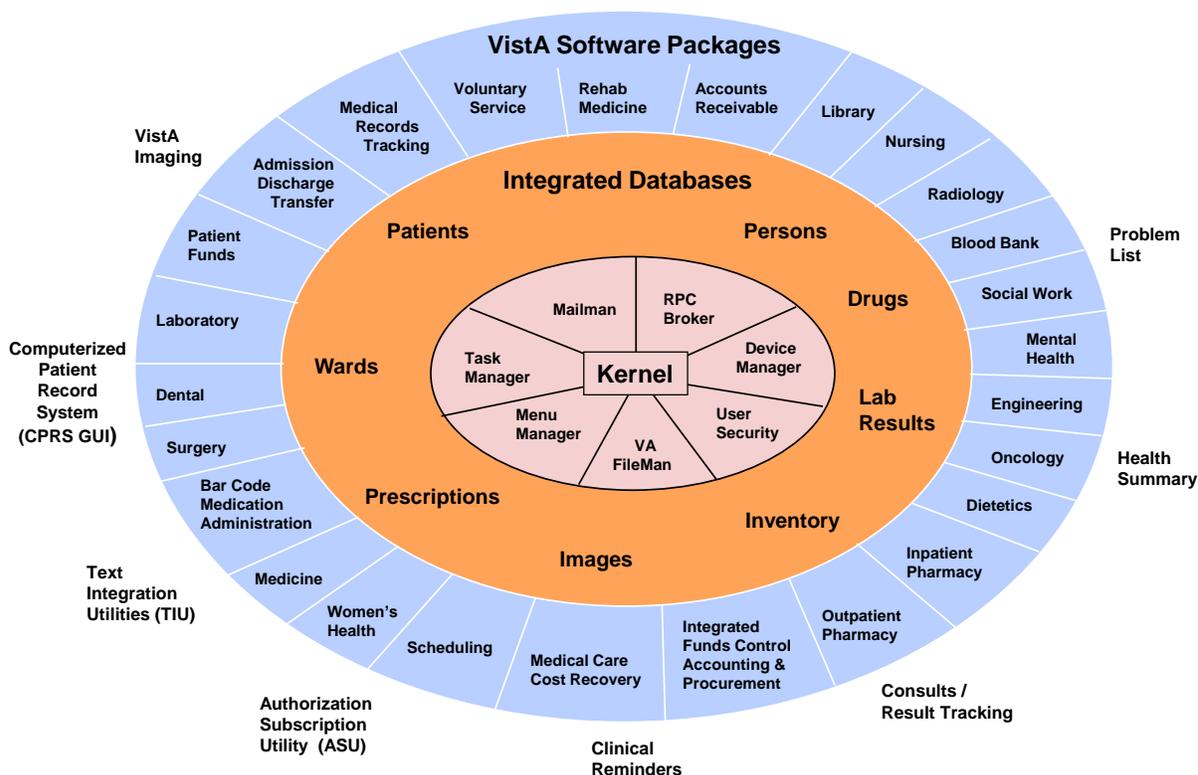
- Seek external training and consulting to establish the desired agile culture, practices, and the technical infrastructure needed to support an enterprise agile endeavor.
- Retain appropriate consultant(s) to conduct periodic reviews of progress and recommend how to improve the adoption of agile processes.
- Test the new practices in small scale pilot projects prior to deployment across the entire organization. An enterprise agile consultant could assist with project selection and organizational rollout strategy.
- Establish an agile-focused Program Management Office (PMO).

An effective enterprise agile approach will place more emphasis on deliverables and cost and less emphasis on schedule. It will also provide greater flexibility for particularly large or particularly small projects because current approaches tend to focus on the average size project.

This page intentionally left blank.

5   Electronic Health Record

Veterans Health Information Systems and Technology Architecture (VistA) encompasses EHR data, several associated applications, and other databases that furnish and manage health care at VHA. As shown in Figure 5-1, VistA has a highly sophisticated architecture with a kernel that provides low-level services; shared databases that contain patient, facility, and other information; a large suite of applications that serve clinical and management needs; and the Computerized Patient Record System (CPRS) component that presents a modern user interface.

Figure 5-1. VistA Technical Architecture


Source: MITRE rendition of VistA specifications

Discussions of health care systems can lead to confusion because the term "EHR" can be used to specify the contents of one person's health record, the database of all health records within an organization, or the combination of data and applications described by a system such as VistA. This Assessment H report uses EHR to describe a complete system, such as VistA, including health data, health IT applications, related management applications, and several databases that support applications.

5.1   Findings

Several decades ago, VistA and CPRS led the development of EHR technology. Many commercial off-the-shelf (COTS) EHRs are based on the concepts and even the code introduced by VistA.

Almost all VHA clinicians interviewed by the Assessment H team preferred VA's CPRS over other EHR user interfaces because of its flexibility and functionality, which resemble those of a paper patient chart.

Several interviewees attributed the success of the early VistA and CPRS development efforts to the close working relationship between VistA/CPRS developers and clinicians. This collaboration seems to have degraded with the centralization of IT, which has resulted in disconnects and limited new capabilities developed for VistA/CPRS. Also, during the past decade, VistA and CPRS development has been confined to fixes and minor enhancements.

Finding 5.1.1: During the past decade, VA applied the majority of its development resources to HealtheVet (not the same as My HealtheVet) and the integrated EHR (iEHR) projects, both of which failed. This delayed further development and improvement of VistA and CPRS so that they are no longer leading-edge products and are in danger of becoming obsolete.

Clinical users remain fairly pleased with VistA and CPRS but have become increasingly frustrated by the lack of any obvious advances over the past decade. Numerous VA clinicians have experience with commercial EHRs and want the same level of features, modern clinical capabilities, integration, and mobility they see emerging in the commercial marketplace. A majority of Assessment H interviews across nine VAMCs and five VISNs indicated that users are unaware of and uninvolved in any major VA EHR modernization and development efforts.

As shown in Table 5-1, information from VHA's Office of Strategic Investment revealed that in the last three years, VA has addressed only 44 out of 225 CPRS requests ranked as high priority, which amounts to only 20 percent of the high-priority requests for the main clinical system seen by end users.[11] In addition, both interviews and literature studies indicated that system usability suffered due to the lack of a continuous development and improvement process. As described in Section 4 of this report, users noted that the PMAS process requires such significant overhead that it reduces the resources actually contributing to development. Users also characterized the PMAS process as schedule focused and risk averse and believed that this leads many program managers to limit the amount of functionality in each release, thereby increasing the total time to complete any *useful* capability.

---

[11] VHA, Office of Strategic Investment (10P2e) 10 June 2015.

Table 5-1. CPRS Request Satisfaction for Past Three Years (2013–2015)

5	Requests to be satisfied in CPRS v30b
8	Requests to be satisfied in CPRS v31
30	Requests to be satisfied in CPRS v32
1	Requests closed (Code Space Expansion)
44	Total requests addressed in the last three years by CPRS planned releases
225	Number of CPRS requests ranked high priority by Clinical Capability Management Board plus number of new requests that have not been reviewed to date
$\frac{44}{225} * 100\% = 20\%$	Percentage of CPRS requests in the last three years have been addressed or are being addressed

The results in Table 5-1 do not reflect the level of effort required to satisfy each request. OI&T does not track this information as part of the PMAS reporting process, so there is no existing way for users to assess the degree of difficulty or impact of delivered CPRS services. Additionally, "product effectiveness" assessments are only conducted when requested by the project manager and are not a required step of the current PMAS process. Thus, data are not readily available to show the extent to which requests are satisfied from a user's perspective. In interviews, some users expressed frustration about the lack of feedback on the usability or impact of new CPRS capabilities.

Users noted that, over time, CPRS has developed usability issues, including excessive alerts, poor alerts, too much unfiltered data, and a lack of assistance for the clinical workflow. Some clinical users reported that these usability problems created potential safety risks; for example, the large number of alerts prompted users to turn off alerts altogether, and clinicians encountered problems when trying to copy and paste information between records. Interviewees emphasized the importance of involving subject matter experts in such areas as clinical decision support, human factors, and clinical documentation improvement to ensure a balance between prescriptive practices and system usability.

Finding 5.1.2: The complex and obsolete technologies underlying VistA and CPRS make it difficult to maintain resources and adopt mainstream software coding and security tools to aid in development.

Much of the VistA and CPRS software code is written in the MUMPS (Massachusetts General Hospital Utility Multi-Programming System) programming language. Because MUMPS is not broadly offered in college curricula and is not widely used by other organizations, the software ecosystem of books, tools, services, training classes, and experienced programmers is limited compared to that of more mainstream languages (e.g., Java, C, C++, Python). Similarly, only a few productivity and quality improvement tools are available for MUMPS; for example, there is

a lack of automated tools for testing, behavior-driven development, code coverage, and performance tuning.

Finding 5.1.3: VistA skills are essential for developing future capabilities, and these skills require several years to develop. VA currently has no formal program to predict the attrition and need for developers and to train their replacements.

VA needs to migrate the current VistA and CPRS EHR to a more capable health IT and EHR system based on a flexible, modular design and modern system and software technologies to achieve its strategic health objectives and to meet the 2014 National Defense Authorization Act (NDAA, 2013), Section 713, mandate to deliver a modernized VistA system by December 31, 2016.

Finding 5.1.4: The complexity of VA's underlying software infrastructure (e.g., multiple access layers, multiple software technologies, and numerous diverse functional components) and the existence of approximately 130 VistA instances across VAMCs compound the difficulty of developing an EHR on time with the reliability and performance required by its clinical users.

These many points of complexity significantly reduce maintainability, extensibility, and scalability of VistA/CPRS. Effectively managing federated health records across 130 instances of VistA (Fihn et al., 2014) requires complex integration schemes to achieve performance goals and reduce network latency. This complexity increases the cost to develop, manage, and troubleshoot applications.

Finding 5.1.5: The differences among approximately 130 instances of the VistA/CPRS system are not well documented, complicating efforts to upgrade and maintain the system and to conduct end-to-end testing outside of the operational environment.

The CPRS fat client architecture and associated stateful design constrain performance of the current VistA/CPRS, which may not scale to support thousands of users (or tens of thousands of users via telehealth and mobile applications).

Recent VistA performance statistics indicate that the current VistA system availability has ranged from 99.4 to 99.9 percent. Assessment H interviews indicated that a majority of the outages were due to network issues that resulted in days of manual data entry, possibly introducing data errors and impacting patient safety.

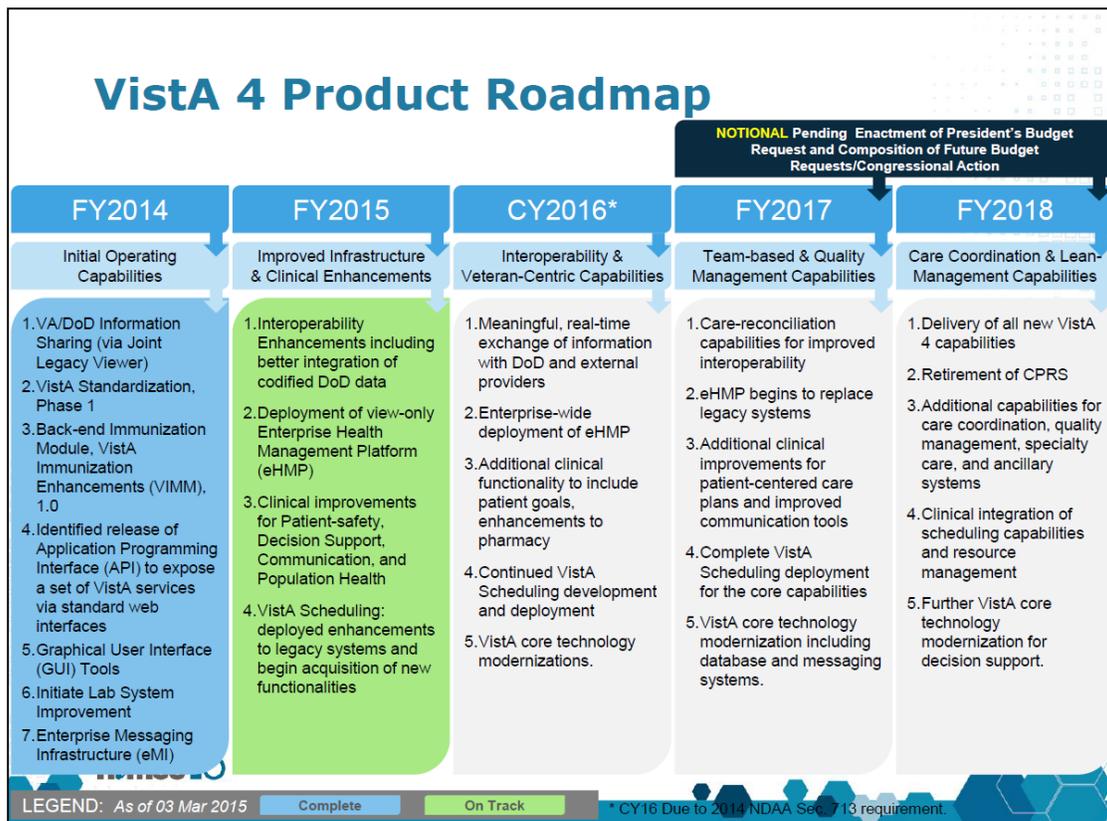
Assessment H interviewees stated that VA has no environment in which all system components can be tested end-to-end before going into production. An initial field test of the enterprise Health Management Platform (eHMP) at Hampton Roads, Virginia, brought the production CPRS system down for several hours, and identifying a root cause of the event took several weeks.

VA established the VistA Evolution program in 2014 to oversee modernization of VA's EHR system—the third EHR modernization program in the past 10 years. VistA Evolution is a joint program of OI&T and VHA and is intended to provide interoperability with the DoD EHR systems and with the systems of other health care partners to promote better outcomes in quality, safety, efficiency, and satisfaction in health care for Veterans, service members, and their dependents.

The VistA Evolution program includes plans to upgrade the technical infrastructure for health data interoperability while reducing overall system complexity, converting to standards-based services, formats, protocols, and data models, and enabling expanded and improved data exchange with partner providers. VA must maintain the current VistA/CPRS operating environment while the VistA Evolution program simultaneously modernizes key components of those legacy systems and integrates them with newly developed software applications across the enterprise.

The VistA Evolution replacement component for CPRS is a web-based platform that, as currently designed, may encounter even greater problems in meeting performance and scalability of VA's EHR system due to the stateful design of the overall VistA system, which is not compatible with modern web-based technologies. This issue is discussed in more detail in Section A.3. Assessment H interviews and project documentation reviews indicated that few VA staff understand the optimization that will be required to handle the user loads and workloads for a web-based system with data aggregation from multiple systems versus a single system today.

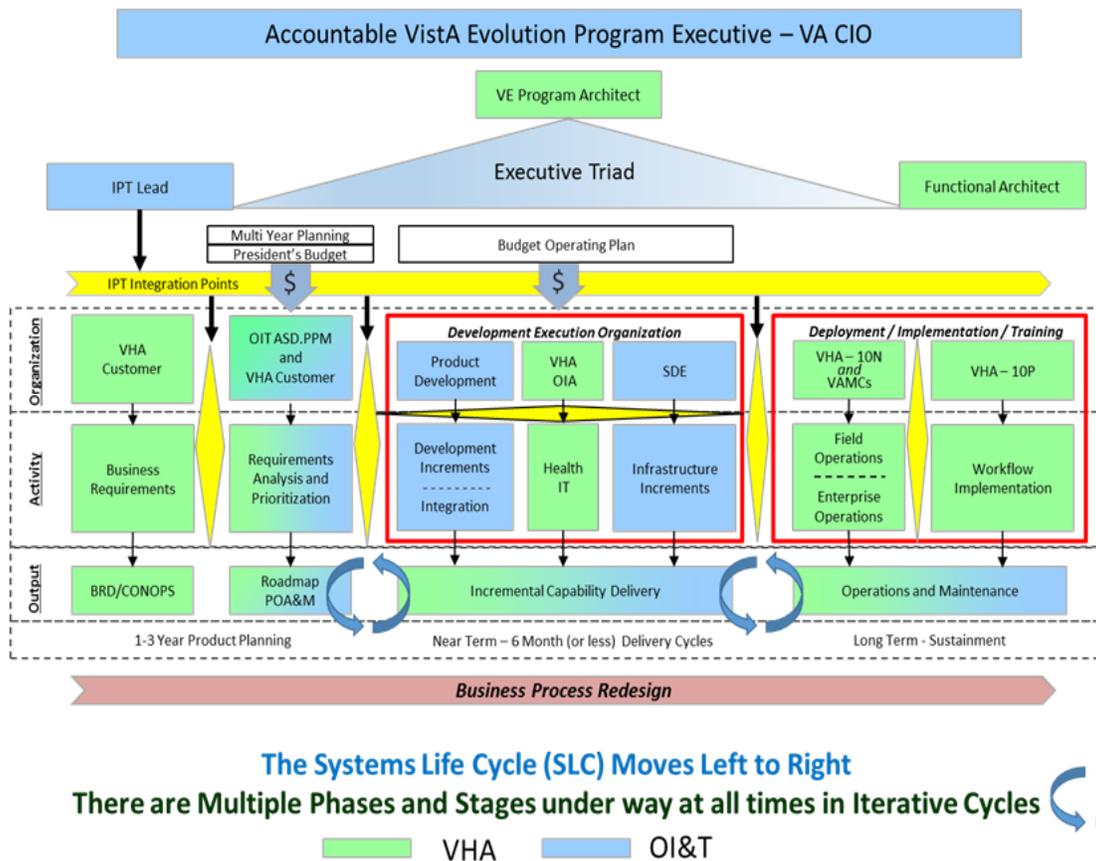
As explained in Figure 5-2, VistA Evolution will develop and deploy capabilities in four major feature increments over five to six years, completing in fiscal year 2018.

Figure 5-2. VistA Evolution Roadmap


Source: Drew & Nebeker, 2015

Finding 5.1.6: The VistA Evolution program is not adequately organized or staffed to successfully manage the development and integration of such a large complex software program, which increases the risk of schedule delays or failed delivery of clinical IT capabilities.

VistA Evolution is managed by a matrixed organization, with the VA CIO acting as the single point of accountability. As depicted in Figure 5-3, the VistA Evolution Program Executive Triad reports to the VA CIO and oversees activities related to budget, scope, schedule, objectives, strategy, and internal prioritization of program activities related to acquisition, implementation, and sustainment of the EHR and ancillary health IT systems.

Figure 5-3. VistA Evolution Program Triad


Source: Cullen & Constantian, 2015

VistA Evolution is attempting to use the Triad and a capability team development approach to continually design, develop, and deploy functional product lines that integrate and test all layers of a solution. Examples of product lines may include clinical core systems (eHMP and Clinical VistA), clinical ancillary systems (e.g., laboratory, pharmacy, radiology, and scheduling), population analysis and management systems, shared services (e.g., enterprise Messaging Infrastructure), and health IT infrastructure.

Assessment H interviews with VistA Evolution project development and program management staff indicated that the initial creation of the VistA evolution program was not sequenced properly. Business requirements were given priority over technical dependencies, and capabilities were built before the underlying infrastructure was completed. VistA Evolution is beginning to correct these mistakes now that the VistA Evolution Triad is providing clear direction. The Triad is engaging senior leadership at the department level to increase program support. However, even with an OI&T member as part of the Triad, several senior OI&T leadership officials indicated during Assessment H interviews that they do not feel adequately engaged and empowered in the current VistA Evolution Triad structure, reducing team and program efficiency.

Neither the 2014 VistA Evolution Program Plan (OIT 06) nor the 2015 Program Charter (OIT 07) designates a single program manager or integration lead responsible for oversight and integration across all VistA Evolution projects. These omissions increase the risk of incompatibilities, duplicated effort, and rework and are magnified because the VistA Evolution architecture is not fully approved. As a result, individual teams may make incompatible design decisions or may delay making decisions until the architecture is completed.

Neither OIT 06 nor OIT 07 includes specific documentation or reporting requirements, so information maintained on the internal VA VistA Evolution SharePoint site was outdated and missing critical program documentation. The Assessment H team could find no evidence that VistA Evolution performs frequent analysis of project schedules, and this reduces the program's ability to assess delivery across the program. An April 2015 VistA Risk Register (OIT 08) report indicated that "VistA Evolution lacks foundational documentation to clearly articulate program expectations and scope to the execution teams." For example:

- "The Program Work Breakdown Structure has been weakly supported and poorly communicated and still lacks reasonable leadership input for scope definitions."
- "The VistA Evolution Integrated Master Plan has not been completed and injects a significant level of risk exposure to the VistA Evolution Program."
- "A VistA Evolution Program Integrated Master Schedule (IMS) that is resource loaded, with dependencies and milestones and is tied to the budget has not been developed."

The assessment team reviewed a May 2015 IMS (OIT 10), developed with Microsoft Project, that was not resource loaded, did not provide all cross-project dependencies, and lacked sufficient detail to generate a critical program path. VistA Evolution risk documentation indicates that "the quality of some information received related to contracts and the lack of key decisions impede the ability to provide a true programmatic path." Timelines are difficult to meet given the large magnitude amount of work and large number of dependencies across the enterprise.

5.2   Recommendations

VA was a thought leader in health IT development for many years but, during the past decade, delayed development of VistA and CPRS has brought these key system components to a point where they are practically obsolete. Failures of major programs during the past decade have

The views, opinions, and/or findings contained in this report are those of The MITRE Corporation and should not be construed as an official government position, policy, or decision.

35

demonstrated that these systems cannot be modernized and have resulted in a complex set of EHR components built on outdated software. The VistA Evolution program represents another attempt to upgrade these systems, but VA has proven unable to develop and execute a health IT strategy to evolve with rapidly changing technologies. Further, as explained in Appendix A.3, the VistA Evolution program exhibits several failure factors seen in industry and encountered on prior VA initiatives of equivalent size and complexity. Industry articles reviewed by the Assessment H team and interviews of VA staff indicated that several technical issues, in particular the architectural complexity of the platform, constituted major contributing factors to failures of previous attempts to modernize the VistA/CPRS system.

The complexity of VA's underlying EHR software infrastructure—a large heterogeneous mix of software frameworks and technologies—makes the infrastructure difficult to efficiently develop, modernize, and manage. These risks will be magnified by the lack of a single VistA Evolution integration lead responsible for managing cross-project dependencies and failure to develop the tools (i.e., IMS, Integrated Master Plan, common project technical/program repositories) needed to effectively manage the 30–40 dependent projects across the program.

Recommendation 5.2.1: The VHA CIO, in partnership with the VA CIO, should oversee a comprehensive cost-versus-benefit analysis among COTS EHRs, Open Source EHRs, and continued in-house custom development of the VistA EHR currently in use.

The analysis should take into account all the complexities of the VistA/CPRS architecture and infrastructure and known issues with performance, scalability, extensibility, interoperability, and security. The analysis should also address full life-cycle costs, including development time (based on recent historical trends), availability of development resources, maintenance and licensing costs, and infrastructure costs. The analysis should consider the need to share data among the clinical and business activities within VA and to exchange data across the VA system, with third-party providers, with DoD, and with payers. The VHA CIO should participate in the VHA requirements collection to fully understand strategy and needs. Prioritization and final approval will be provided by the VHA USH.

This Analysis of Alternatives (AoA) should be led by an organization capable of assessing the total cost and return on investment of acquiring and implementing an integrated COTS EHR suite and best-of-breed solution, compared to continued in-house custom development. This requires an organization with:

- The clinical expertise needed to assess requirements supporting VA's clinical structure, treatment modalities, practice workflow, and business management.

- Expertise with operating large health care systems to assess the approaches to automate and integrate both clinical and business functions across the system.

- Experience with large-scale COTS EHR implementations to assess the technical and operational impact of adapting the VHA practice workflows and the COTS default settings to meet VHA needs.

- Technical expertise with systems development, large-scale system integration, health IT interoperability (i.e., health information exchange), clinical data standards, data conversion, and data migration.

- Federal acquisition and security expertise to assess the impact and cost of meeting unique government requirements.

Additional factors that the AoA should address include:

- The importance that VA accords to maintaining core competencies in EHR development and health IT leadership, even if this proves more expensive than procuring and integrating COTS technology.

- The extent to which continued in-house system/software development provides VA with greater freedom to develop a learning system focused on clinician and patient needs and driven less by commercial business and billing requirements. The AoA should also weigh the option of having VA share its vision with a vendor who can build these requirements into an existing product for VA's use.

- The impact of losing VA-unique capabilities associated with VistA.

- The extent to which a COTS EHR would provide immediate automation of VHA business processes that are currently mostly manual.

- The possible advantages of building on DoD's EHR Request for Proposal for an integrated best-of-breed solution. This proposal aligns with many of VA's requirements, including longitudinal patient data, medical device integration, ancillary services, scheduling and (VA-DoD and VA-Private Provider) interoperability (DoD, 2014).

- The rapid maturation and improving interoperability of COTS EHRs. Assessment H industry outreach interviewed 14 provider organizations and found that 11 of them already use COTS EHR solutions. Of the remaining three, one was actively moving to a COTS solution and one plans to do so in the next few years. Procuring a COTS EHR could provide continuous alignment with industry standards (i.e., ICD [International Classification of Diseases]-10, Meaningful Use [MU]) and would allow VA to focus IT development on innovation and VA-unique capabilities.

- The value of implementing industry best practices (i.e., care plans, workflow, and team management) by adopting a solution driven by the large private sector provider ecosystem.

- The ability of a joint VA and DoD COTS EHR purchase to provide significant leverage for influencing data ownership, vendor development, and modernization priorities.

- The long-term (20-year) impacts of licensing and maintenance on reducing VA's O&M costs, which currently prevent developing modernized and new capabilities and technologies.

- The ability of VA's networks, system infrastructure, and centralization strategy to support a COTS procurement.

The VA and VHA CIOs should conduct site visits and review the successful IT practices implemented at high-performing health care systems (including VISN 4), to inform their strategies for effective approaches and potential contributions that IT can provide to improve the treatment of Veterans today.

The VA CIO and VHA CIO should report to Congress at the end of fiscal year 2016:

- Evidence provided by both VHA USH and VA CIO that the VHA CIO serves as an effective advocate for the IT needs for health care delivery. This should include, but not be limited to, a description of the requirements for an effective health care management system that annually provides advancement to VHA mission and goals.
- Actions taken and evidence that OI&T acts as a service provider and delivers IT capabilities and IT services that improve health care delivery to Veterans. Evidence should include results of clinician and Veteran surveys confirming the quality of and satisfaction with the newly delivered capabilities and services.
- Results of the cost-versus-benefit analysis between the COTS, Open Source, and VistA EHRs.

Recommendation 5.2.2: VHA should select a program executive to oversee and coordinate the more than 40 independent projects and initiatives related to EHR modernization, regardless of whether VHA continues in-house development or pursues a COTS solution.

Any program of the size and complexity of the EHR modernization requires program executive and lead integration roles and governance processes to manage integration across the many interdependent projects and initiatives. VA must create a program structure that scales to address the challenges of developing and integrating a large software system.

6   Scheduling

VHA relies on a VistA scheduling package to provide Veterans with access to health care. Attempts to modernize and improve access have a history of delayed and inadequate product delivery, highlighted in reports by the GAO (2012), the VA OIG (VA OIG, 2014), and the Northern Virginia Technology Council (NVTC, 2014). Currently, tools for access to health care and operational support, such as reporting and resource allocation, do not fully support goals related to business processes, access, and satisfaction of both internal and external customers. The VistA system does not *prevent* scheduling of outpatient appointments, but its technologies exacerbate existing issues with access to appointments (as described in detail in Assessment E [Workflow – Scheduling]).

VistA Scheduling was initially developed in the 1980s and was not designed to handle the complexities and volumes required by over 100 million appointments in fiscal year 2014 (OI&T Product Development, 2014). Current operations involve workarounds and rework, producing inefficiencies and unsatisfactory results.

From a strategic standpoint, VHA has a commitment to improve scheduling and access for Veterans and recognizes that the current system may be incapable of providing the robust infrastructure necessary for the envisioned future state. For example, VistA is not aligned with the *Blueprint for Excellence* statement:

> Scheduling capabilities will need to include assessing provider productivity as related to virtual care, as well as management of virtual care encounters (resource management). Limitations of the current system include inadequate capture of provider supply and demand, as well as lack of ability to schedule resources across the system (VA, 2014c).

Currently, VistA Scheduling also performs poorly in terms of integrating mobile, web, and telehealth scheduling.

6.1   Findings

Several recent reports have highlighted challenges with VA's development and deployment of scheduling improvements. Not originally designed as a scheduling system, over time VistA has evolved into a system that does not optimally support processes or allow for efficient scheduling of appointments. Over the past decades, VA/VHA has made several attempts to modernize its scheduling system as described in the following paragraphs.

Scheduling Replacement Project

VA's Scheduling Replacement Project initiative, underway during 2002–2009, failed after VA had invested $127 million. The GAO report on this project (GAO, 2010) cited several key factors:

- The project suffered from managerial issues (no acquisition plan, ad hoc acquisition activities, and lack of competition).
- System requirements were incomplete and not sufficiently detailed.
- Earned value management data did not serve as a reliable indicator of project performance.

- Even though VA had a plan and process for managing project risks, it did not identify key risks or take steps to mitigate them.

- Although VA recognized major issues with the project through several external reviews, the lack of effective institutional oversight allowed the project to continue unchecked and, ultimately, to fail.

This project included efforts to develop requirements for the scheduling product and program, which led to the Medical Appointment Scheduling System (MASS) Request for Proposal (RFP) package under source selection as of June 2015.

The NVTC report on scheduling for medical examinations in 2014 (NVTC, 2014) noted that "VA's exam-scheduling processes are insufficiently enabled by state of-the-art technologies or (consistently applied) standard operating procedures." The report cited outdated software, inadequate performance measurement, and poor system usability as IT functions that VHA should address. NVTC also suggested that VHA improve call centers and telephone systems and adopt a system-wide approach to redesign. According to NVTC's summary of a follow-up with VA stakeholders, current or future initiatives address many of the issues noted in the report, although VA also considered some recommendations not feasible.

HealtheVet Scheduling Program

Following the failure of the Scheduling Replacement Project, VA completed an AoA in 2009 to evaluate five potential options (developed by an OI&T study team) (VA OI&T and Office of Enterprise Development AoA Study Team, 2009). In 2011, under the HealtheVet Scheduling Program, VA initiated efforts to replace the VistA Scheduling capability through a Request for Information and other measures to upgrade its legacy scheduling system.

After evaluating the HealtheVet Scheduling Program with respect to performance, cost, and schedule, VA decided to pursue a COTS solution, ultimately leading to the current and ongoing technical evaluation for MASS. An interim report by the VA OIG in May 2014 (VA OIG, 2014a) cited wait-time concerns related to deficiencies in electronic wait list management, as well as process and procedural practice issues, and made recommendations about monitoring and wait list management.

VistA Scheduling Enhancements

VHA launched the development and implementation of a VistA Scheduling Enhancements (VSE) project (due fall 2015), which will lead to some improvements. As noted above, VHA has a major technical evaluation in progress for a COTS solution for MASS that will replace many current interfaces, improve administrative functions, and automate and improve business rules, but seemingly will still rely heavily on interfacing with VistA. According to requirements for the new COTS scheduling solution, when implemented, the new product is expected to move VHA from primarily a face-to-face appointment model to a coherent, resource-based system with broad opportunities for improved services across VA stakeholders (OI&T, Product Development, 2014).

The MASS Business Requirements Document (BRD) designates the Access and Clinic Administration Program (ACAP) as the business owner for scheduling initiatives. ACAP is "a

single entity responsible for defining, standardizing and coordinating system-wide administrative clinic operations and management" (VA, 2015g). ACAP will cover outpatient access standards and workload capacity alignment, with the highest priorities being primary care, mental health, and call-center operations to include triage, queuing, and standard operating procedures. Specialty care clinic access will include establishing tracking and monitoring standards. ACAP, in collaboration with OI&T, will also serve as VA's business owner and manager for medical appointment scheduling.

Additionally, ACAP is expected to bridge the gaps and disconnects between policy and operations necessary to comprehensively define and coordinate the transformation of clinic operations. This will require standardization through consistently implemented policies, reliable and actionable performance measures, and reporting structures that facilitate accountability. The resulting fundamental business processes will ensure standardization of clinic practices across VA health care systems and will focus proactively and strategically on systemic improvements to Veterans' access to care. Assessment E (Workflow – Scheduling) contains extensive details about ACAP and its process efforts.

MASS

VHA is acquiring MASS as a COTS solution to replace VistA Scheduling over the next few years. According to section 3.1.1 of the Performance Work Statement (PWS) (OI&T Product Development, 2014),

> The objective of the MASS program is to acquire a COTS medical scheduling application, integrate it with VA enterprise, build out all required portions of VA infrastructure, and implement the MASS solution within VHA's clinical and administrative operations. Implementation includes all activities needed to deploy and install the infrastructure, configure the COTS application, and train staff who will use and maintain MASS.

Assessment H limitation: The ongoing acquisition process prevented the Assessment H team from conducting a full-scope review of the current plan to acquire MASS.

Legal constraints surrounding the technical evaluation for MASS prevented the Assessment H team from interviewing key members of the MASS team who are sequestered during the procurement. These MASS team members were involved over the life of the RFP development (initiated May 2014), and some have had a far longer involvement in VHA Scheduling and other related VHA/OI&T programs and projects. As of late June 2015, the technical evaluation continued. Therefore, the Assessment H team could not:

- Gain a deep understanding of how key VHA, VA, and OI&T integrated product team (IPT) members worked together and of successes and challenges during the requirements development process.

- Evaluate early design plans and ascertain how and/or how well the new vendor will be able to begin development and integration.

- Discover the opinions of key IPT members as to the completeness of the RFP, key factors in a successful rollout, any changes critical to success, and the readiness of both VHA and OI&T for such a large-scale rollout if/when an award is granted.

This group could have provided significant insight, given that members have decades of experience in program, project, and IT implementations, and understand the strengths, challenges, and opportunities of MASS.

VistA Evolution Program

Under the VistA Evolution program, VSE will also support MASS procurement and will ensure that any COTS products adhere to the VistA 4 roadmap (see Section 5 and Appendix A.3 of this report for more information on the VistA Evolution program). Notional roadmaps and interviews indicate that VSE and MASS will produce some improvements for schedulers, in particular an improved graphical user interface, as early as fall 2015.

Telephony

Telephony plays an integral role in scheduling, as many Veterans make VHA appointments on the telephone via schedulers and various call center systems. This section briefly examines aspects of VHA telephony IT, but an evaluation of VA's telephone systems does not fall within the scope of Assessment H. Additionally, while these dependencies exist, fixing VA's telephone issues lies outside the scope of MASS.

Outdated technology hinders VHA telephony from achieving enterprise-wide success because interim solutions are managed locally, which restricts some national-level initiatives and prevents VHA from realizing economies of scale. As detailed in a December GAO report titled "Reliability of Reported Outpatient Medical Appointment Wait Times and Scheduling Oversight Need Improvement" (GAO, 2012b), outdated technology, limited human capital, high call volumes, and lack of call centers had a negative impact on the Veteran experience. This GAO report recommended oversight and process changes in order to improve conditions and responsiveness, including VISN-level oversight and routine monitoring. Assessment E has detailed the current state of call centers, focusing on opportunities and weaknesses across VHA. Improvements to the phone systems must be prioritized appropriately against other expensive, pressing needs in CPRS, scheduling, cyber, and other areas.

Recent efforts to improve telephony have shown some successes through policy standardization, and some call-center pilot activities have had positive results. However, the Managing Veterans Access via the Telephone (MVAT) plan outlines an extended timeline and will require enterprise-level effort and funding. Existing artifacts produced by VA describe limitations to the current system in detail and indicate that the solutions noted will not be easily funded or implemented (VA, 2014d).

VA can and should address issues related to business and operations (discussed in Assessment E) with solutions that support IT modernization related to VHA phone systems.

Relevant Health Care Objectives and Business/Clinical Strategies

Future scheduling systems should reflect the overarching vision of VA to "improve the quality of care for Veterans with complex medical conditions through an evolving approach to personalized, proactive, and patient-centered care" (VA, 2014c). The current VistA scheduling system is difficult to use and does not provide adequate insight into business operations. Table 6-1 summarizes the strengths and weaknesses of VHA scheduling IT systems.

Table 6-1. Summary of VHA Scheduling IT System Strengths and Weaknesses

Strengths	1. ACAP is making process and policy changes that will complement ongoing and future IT improvements. The ACAP team has deep insight into the issues around scheduling and will provide strong insight as the MASS activity is initiated.
	2. Recent efforts have improved access to appointments for Veterans, and VSE will ameliorate some critical issues with scheduling when employed in the operating environment by fall 2015.
	3. The Scheduling Program Council (SPC) is addressing the larger concept of access via scheduling modalities across VHA, and is bringing together leadership with the authority and vision to drive change.
Weaknesses	1. Inconsistent/poor relationships between VHA and OI&T over the years have slowed initiatives and improvements in scheduling. This systemic organizational issue has manifested itself within scheduling.
	2. The current VistA scheduling system exacerbates inadequate processes and procedures that currently impede access to care.
	3. System-wide scheduling initiatives so far lack fully supported governance to guide prioritization, funding, resource allocation, etc.

Efforts to improve access to health services through the development of various scheduling products and enhancements have included some collaboration between OI&T and VHA. Misalignment of funding streams and accountability have led to delays in schedules, failed development and deployments, and failure to incorporate appropriate business requirements and features into the operating environment. Unless VHA and OI&T realign governance, funding, and accountability, any product development or implementation will risk delaying improvements in access and lead to inefficiencies and higher costs.

Finding 6.1.1: The RFP package for the COTS MASS scheduling product has been developed over several years and was built on decades of experience, lessons learned, evaluations, and analyses. However, without enterprise-level improvements in management processes and governance, there is a risk that the MASS project will not succeed.

Components of IT design, planning, and implementation that are not yet fully planned and funded, and whose scope is not understood, pose particular concern. Specific shortfalls include standardization of clinic profiles, education and training, policy changes, resourcing and budget allocation, organizational challenges, the effect of the COTS product on VistA, and full lifecycle cost assessments. VistA Evolution program evaluations included high-level ROI assessments for scheduling initiatives (VA, 2014); however, the Assessment H team could not discover a detailed, current analysis.

Finding 6.1.2: The deployment of the MASS COTS package will require significant adaptation of existing VHA scheduling processes and an unknown amount of custom software

development to achieve effective integration with other VA systems, including the multiple instances of VistA across VAMCs.

Section 4 describes factors that will likely affect a project as large as MASS, including the following:

- **Culture and Leadership.** Many Assessment H interviews across VA noted lack of effective collaboration between OI&T and VHA with respect to IT strategies. Like any large program, MASS must overcome process and cultural hurdles, but ACAP is adapting policies and procedures to satisfy requirements for the next phases of the program (see Assessment E). Top-down accountability and collaboration of both business and technical leadership will prove key to delivering business and technical requirements to the operational environment throughout the life of this project.

- **Planning.** Difficulties in translating clinical goals into IT requirements may complicate the implementation of MASS. While some reports indicated a good working relationship between OI&T and VHA during the RFP package development, history and the inability to gather firm evidence to the contrary (due to sequestration) would indicate that risks related to design and planning remain.

- **Resourcing.** According to interviews across VA, allocation of resources remains inconsistent and insufficient despite efforts to improve the process, and interviewees reported incomplete lifecycle planning pertaining to project funding. Considering the complexity and scope of MASS, the potential for scope and feature modification along the way, and the reported issues related to delivery of business requirements, consistent and adequate resourcing could pose concerns throughout the life of the project.

- **Implementation.** Currently VHA and OI&T take a fragmented approach to large-scale health IT development. MASS documents provide a great deal of information for potential vendors about integration points and related requirements, but VA so far has not succeeded in solving large-scale system problems, and governance issues noted could impact many facets of implementation. VHA and OI&T could ease implementation issues through ongoing efforts to coordinate business, technical, functional, and non-functional requirements across programs and offices.

- **Infrastructure.** Any implementation with the scale of MASS will require highly detailed plans and oversight at many levels and throughout the development and delivery process. The project will involve many technical challenges, including numerous dependencies and the need for many data exchanges. In an effort to improve and simplify some scheduling features across the system, ACAP has begun work on standardization that will support national-level business rules, data capture, and other aspects of MASS, as detailed in Assessment E.

Finding 6.1.3: VA does not yet have a robust, detailed strategy and roadmap for scheduling initiatives across VA that integrates Veteran access to scheduling via phone, telehealth, and mobile apps.

VHA envisions a "Single View of the Veteran" (described in the MASS Business Blueprint; VHA 2014b) that demands consistent, accurate, secure data capture and exchange for the Veteran

---

experience, including support for scheduling modalities. The MASS Business Blueprint and the MASS PWS (VA OI&T Product Development, 2014) note that the new MASS vendor must support web and mobile requests by Veterans, and as such the documents list such requests as unique, high-priority business needs. They also cite the need to support telehealth as a medium. While the Connected Health FY15-16 Operating Plan V19 delves deeply into mobile apps and serves as a roadmap for that program, it makes little mention of MASS or the larger scheduling initiative.

However, interviews conducted during the Assessment H study indicated that VA has recently made progress in its scheduling efforts. VA has tasked the Scheduling Program Steering Committee (SPSC) that supports the SPC with oversight of the individual ad hoc teams that will aid the SPC. The SPSC represents the major stakeholder groups that will integrate with MASS and scheduling initiatives, and it will likely include stakeholders from Connected Health, VSE, MASS, the HealtheVet (HeV) portal, and others. While the new SPC has had some difficulty gaining traction as a formal entity, limited reports indicate that the stakeholders have made inroads in recent weeks and months during the technical evaluation of MASS, and that leadership levels have achieved some concurrences around budgets and priorities.

Finding 6.1.4: VA must refresh the technology of its telephony system to support scheduling process changes. Some pilot projects that have developed call centers have succeeded, but resources (funding, human capital) and the lack of consistent guidance and prioritization have limited progress across the system.

The VHA phone system performs poorly in data collection, warm transfers, and other customer-facing features, as described in a white paper developed by the VHA Offices of Primary Care Service (10P4F), Primary Care Operations (10NC3) and Access and Clinic Administration Program (10NA12) in December 2014 (VHA, 2014d). Assessment H found the same challenges in leadership, funding, expertise, and prioritization described in this paper. The MVAT Project that supports the Telephone Access and Contact Management (TACM) Office is addressing some of these issues, but the timeline presented extends over 15 years with core concepts identified on a 7–10 year roadmap (VA, 2014d). VHA could shorten that timeline by dedicating additional resources, potentially increasing Veteran access and satisfaction.

6.2 Recommendations

The VA/VHA scheduling program reflects many of the same strengths and risk factors seen across other VHA programs. Recent and ongoing programmatic achievements such as VSE, on track to rollout enhancements by fall of 2015, and the MASS effort to date, highlight the enormous effort that VHA has devoted to improving a dynamic environment with unique drivers and metrics, a convoluted legacy infrastructure, embedded cultures, and the need to counter negative press. Still, risks inherent to the infrastructure, governance, and resource planning, along with lack of human capital, hamper the program's ability to plan, build, implement, and maintain systems and technology.

Modernization of scheduling and telephone systems should provide access for both new and established Veterans seeking care within VHA. Improvements to the existing scheduling program, as well as the planned phase-in of MASS, should lead to efficiencies, cost savings,

expanded access, and higher satisfaction from internal and external customers. These improvements should foster innovations in health modalities such as telehealth, virtual care, and mobile engagements. Development of key metrics and consistency in data capture and sharing should help VHA transition into a more data-driven organization and allow VHA to better forecast supply, demand, and other operational drivers.

Continued investments in phone systems over time, with strong considerations for a shorter timeline than is seen in current plans, should support VHA's goals of improved access and customer satisfaction. However, VHA makes these investments in scheduling and telephone systems at the cost of other investments; thus, an enterprise-level understanding of the costs and benefits across all VA projects will prove key to success. Without significant cultural and organizational changes, there is risk to any path forward for these initiatives. The SPC is making strides toward establishing accountability and governance at the appropriate levels, but will require time, effort, and resources to reach its potential.

A holistic approach to improving access through scheduling initiatives and modernization should provide VA/VHA with improved access and outcomes at a better cost over time. However, the lack of effective collaboration and high-level planning, difficulty in data translation, poor resource allocation, and an overly complex infrastructure hamper design, development, and execution. Table 6-2 shows a summary of VHA scheduling opportunities.

Table 6-2. Summary of VHA Scheduling Opportunities

1. VHA can provide cradle-to-grave support for scheduling initiatives once prioritizations are determined. MASS is currently under technical evaluation, creating opportunities to exploit new governance structures (SPC) and build the path forward through experience and action.
2. Through the SPC there is an opportunity to make impactful decisions that align business and clinical needs under a fully considered budget. This Council has the line authority and leadership-level vision to make the hard decisions that will be required to balance needs in scheduling against needs of EHRs, phone systems, innovations, cyber, and other high impact areas. Full support of this team at all levels of governance will ensure that the voice of the front line is recognized and considered within the existing fiscal constraints.
3. Improvements in scheduling should dramatically increase access and satisfaction, as well as data quality, productivity, and operational reporting capabilities.
4. Enhanced transparency will help to rebuild trust with the community of Veterans.
5. Developing/aligning scheduling capabilities across modalities (outpatient, telehealth, mobile apps, etc.) should provide the 21st century access that Veterans desire.
6. Broadening and improving scheduling capabilities will provide more opportunities for Veterans to become active partners in their own care.
7. VSE and MASS will improve operations and free up human capital, potentially leading to shorter wait times for traditional outpatient appointments, an increased capacity for telehealth and other provider/Veteran engagement modalities, and cost savings.
8. Heavier investments in telephone systems could improve access and shorten the timeframe for improving access and services, albeit at the expense of other projects.

Recommendation 6.2.1: VA should develop a more detailed strategy and roadmap encompassing outpatient scheduling, mobile apps, telehealth, and modernized phone systems to ensure success of the COTS MASS product acquired.

Without full support of an enterprise-level strategy and budget allocations, these ongoing and future efforts will produce only moderate gains in access to health services, Veteran satisfaction, and operational efficiencies. As previously detailed in this report, strengthening or modifying IT business and technical processes will aid delivery of capabilities into the operating environment. To do so, VA should take the following actions:

- Support the SPC (and SPSC) fully as soon as possible as this group has the appropriate level of vision and insight, as well as the authority and diversity, to initiate and drive change where and how it is needed. VA should address any outstanding concerns or leadership issues, and modify and formalize any charter and governance documents to ensure engagement.

- Refine the strategic funding and resource processes to align technical and clinical goals. VA should realign access and scheduling initiatives (MASS, mobile, telehealth, etc.) so that stakeholders understand all aspects and will support prioritization at an appropriate level.

- Once the contract for MASS is awarded, develop a roadmap to include all aspects of VHA scheduling (telehealth, mobile, phone systems, etc.) and use the roadmap to guide integration of scheduling across VHA clinics and management applications and new technologies as appropriate. VHA must integrate cross-program efforts, and this will demand a more robust strategy and roadmap that address all of the modalities involved. The SPC should make decisions soon after award about prioritizations related to MASS and scheduling across VHA. Through this, VA could gain better short-term and long-term insight into fiscal planning and requirements.

- Through the SPC or related efforts, align all OI&T and VHA activities related to access to execute a health IT strategy that will contribute to improving Veteran health. Better alignment of program business needs with technical requirements, specifically for MASS, mobile, web, and telehealth, could reveal economies of scale, provide insight into future collaborative efforts, support better prioritization, and spur innovation. This would help to associate IT outcomes more tightly with clinical outcomes to improve Veteran health and satisfaction.

- Perform regular assessments of scheduling-related core services of COTS versus continued in-house development to ensure that VHA delivers the best products at the best value to the operating environment. VHA should initiate this process as soon as possible after the launch of MASS, with evaluations at each step of design to determine and prioritize products best suited for funding. VHA should evaluate cost versus benefits of leveraging existing systems over new ones with consideration for all aspects of lifecycle costs and impacts. This may demand that the SPC conduct additional studies after the contract for MASS is awarded.

- Incorporate full lifecycle costs into integration and interoperability plans early on, providing insight into resource allocations and future funding requirements. This, too, may call for additional SPC studies after MASS contract award.

- Ensure that the portfolio of metrics developed for MASS provides an assessment of impacts on Veterans with each incremental deployment, as well as insight into costs, so that robust cost assessments can be used for decision making. With regular assessments of products and options, VHA could develop a well-balanced portfolio of COTS and in-house products that best meets the needs of Veterans and drives improvements in clinical outcomes.

7 Clinical Documentation

Clinical documentation includes clinical images and associated textual reports that cover clinicians' descriptions of episodes of hospital care, medical services, and other health care. This section examines clinical documentation practices within VHA, including the means by which clinical documents are created (the documentation process) and the documents produced by the system.

7.1 Findings

VHA was once a leader in clinical documentation, adopting best practices ahead of the majority of health care institutions in the United States. Unfortunately, in 2015, the clinical documentation produced by the VHA health system is, at best, average in terms of quality and support for data standards. VHA has lagged in the movement towards greater standardization of clinical documentation practices, particularly with respect to the incorporation of standard structured and coded terminologies. This lack of standardization has impeded communication inside the VHA system, made it harder to develop effective clinical decision support systems, and caused downstream challenges and shortcomings in health information exchange and analytics.

Capturing relatively little information in machine-readable form hampers VHA's ability to examine its clinical, operational, and financial performance and to exchange data among VA facilities and with third parties. Moreover, the failure to adequately utilize coded terminologies and standards in the capture of data during the clinical documentation process, as well as additional limitations in information exchange, reduce VHA's ability to measure outcomes of care and learn from them – impeding the creation of a continuously learning health system.

Observations regarding clinical documentation cover:

1. **Point of Care (POC) Documentation Systems.** The assessment of clinical documentation must consider: (1) the *practice* of documenting health information, whether on paper or through an information system; and (2) when electronic systems are used, the manner in which those systems support clinical documentation best practices. While Section 5 examines VA's EHR capabilities, this section centers on the ways in which clinicians use the current EHR to document care as well as on the quality of the clinical documentation produced by POC systems.

2. **Data Quality Management and Clinical Documentation Improvement (DQM/CDI) Programs.** The quality of clinical documentation depends on both the quality of the data and adherence to data standards that impose consistent syntax and semantics (i.e., harmonization of data definitions, as well as incorporation of standard nomenclatures, terminologies, classifications, and code sets). Monitoring data quality, documentation for coding, and adherence to data standards help identify any clinical documentation issues, as well as the appropriate interventions (e.g., face-to-face training programs vs. handouts) to address them.

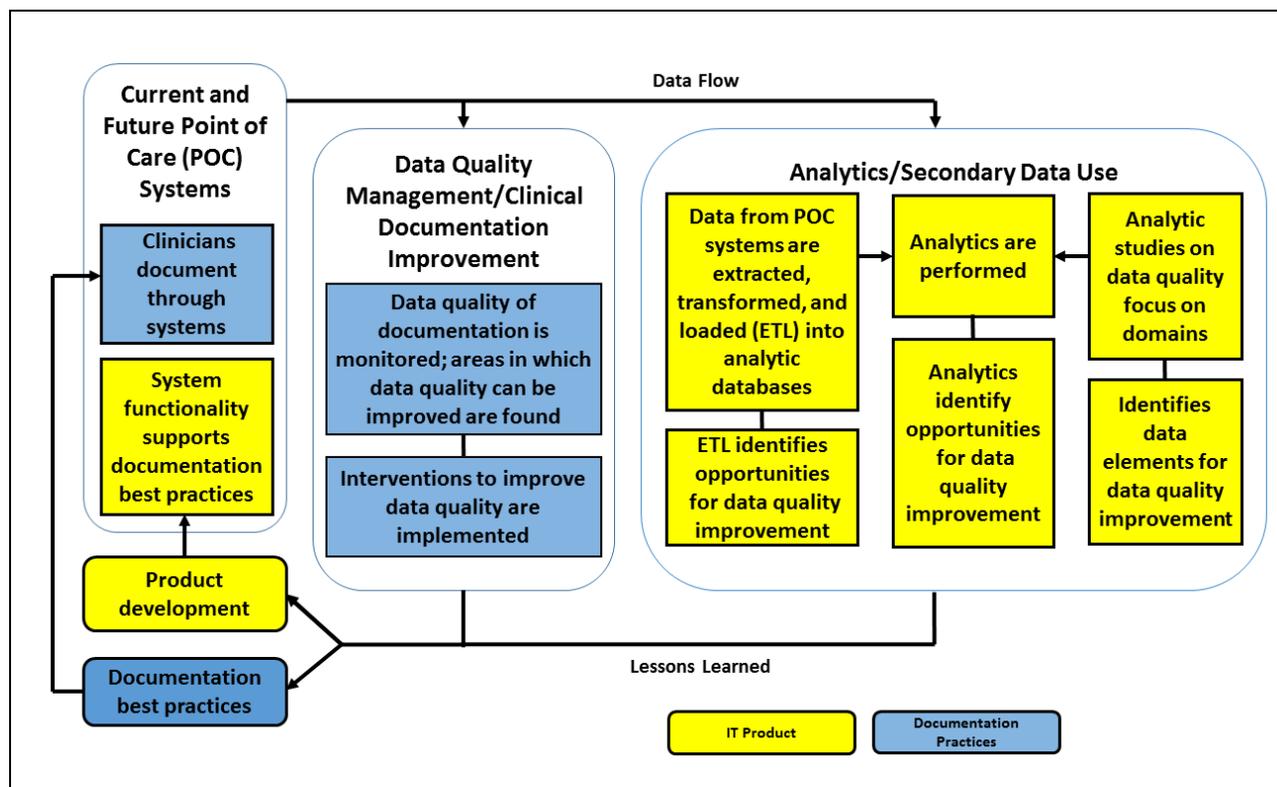
3. **Secondary Data Use.** VHA uses data from POC systems for analytics, reporting, and health information exchange. Each of these activities requires that data be cleansed and transformed for the particular purpose. These data cleansing and transformation processes yield valuable insights into the manner in which POC systems can collect data, balancing the data needs for health care delivery, transitions of care, and analytics.[12]

4. **Feedback Loop.** Feeding back the insights and lessons learned from DQM/CDI programs and secondary data use initiatives in the form of system requirements (e.g., data validation routines, standards-based copy-and-paste functionality, proper use of codes) can result in enhancements to IT systems such as VistA and CPRS, or in specifications for future IT products such as those planned for the VistA Evolution program. These insights can also suggest updates to clinical documentation best practices that will support clinical decision support in future systems.

The above components, as shown in Figure 7-1, demand a comprehensive, integrated, and collaborative approach among product development, health information management, and analytics staff, as well as the clinicians who use POC systems. Moreover, the implementation of these components in an integrated manner conforms to the principles of a learning health system.

---

[12] The description of analytics and secondary data use is provided as background on the analytics issues related to clinical documentation; it is not intended to describe the wider area of informatics and analytics. Section 8 contains a more detailed description of informatics findings and recommendations.

Figure 7-1. Assessment of Clinical Documentation


Source: MITRE rendition of VHA process.

Relevant Healthcare Objectives and Business/Clinical Strategies

The VA *Blueprint for Excellence* (VA, 2014c) advances four themes and 10 strategies that together frame a set of activities aimed at improving VHA health care, building a service culture, transitioning from "sick care" to "health care," and developing more agile, efficient business systems. Theme One of the *Blueprint* centers on improving the performance of VHA with respect to the current delivery system. The *Blueprint* states that:

> VHA is fortunate to have a longstanding electronic health record, offering the possibility of generating "big data" related to care and health. Advanced analytics should be used predictively to identify and intervene on risks, improving the outcomes for individuals, cohorts, and the overall population of Veterans enrolled for care within VA.

VHA captures the majority of data coming out of EHRs during the documentation of care in the form of clinical documents and reports. Thus, effective analytics have a critical dependence on the quality of clinical documentation (see Section 8).

Under Theme One, Strategy Three states: "Leverage information technologies, analytics, and models of health care delivery to optimize individual and population health outcomes." This strategy describes two transformational actions that rest squarely on best practices in the creation of clinical documentation: "Enhance the interoperability of Health Information with DoD and the Private sector" and "Enhance Clinical Decision Support using Analytical Systems and Predictive Analytics (VA, 2014c).

Finding 7.1.1: VHA lacks a comprehensive and collaborative approach for producing clinical documentation. Clinical documentation tools do not collect key data in a consistent or standardized manner and often lack the functionality to support current documentation best practices.

To assess the general quality of clinical documentation generated by VHA facilities, the Assessment H study team used the American Health Information Management Association (AHIMA) guidelines (AHIMA 2007), which assess clinical documentation according to parameters that include:

- Accuracy—Ensure data are the correct values, valid, and attached to the correct patient record.

- Accessibility—Data items should be easily obtainable and legal to access with strong protections and controls built into the process.

- Comprehensiveness—All required data items should be included. Ensure that the entire scope of the data is collected and document intentional limitations.

- Consistency—Value of the data should be reliable and the same across applications.

- Currency—Data should be up to date.

- Definition—Clear definitions should be provided so that current and future data users will know what the data mean. Each data element should have clear meaning and acceptable values.

- Granularity—Attributes and values of data should be defined at the correct level of detail.

- Precision—Data values should be just large enough to support the application or process.

- Relevancy—Data are meaningful to the performance of the process or application for which it is collected.

- Timeliness—Timeliness is determined by how and when the data are being used and the context.

The Assessment H study team identified documents containing similar guidance distributed by VHA. These documents conveyed clear expectations for clinical documentation generated at VHA facilities (VA_AssessH_COR_156, 2014); however, interviews indicated that Health Information Management (HIM) departments and staff at the VISN and hospital levels interpret these standards in different ways. Clinical documentation provided and related activities most often pursued at many hospital level HIM departments appeared to focus on the proper coding of diagnoses and testing for attributing costs, with less attention to the general quality of documentation from a clinical perspective as detailed in the AHIMA and VHA documents. By contrast, VA's Office of Information and Analytics (OI&A) emphasizes the structure and coding of clinical documentation to support clinical decision support and analytics. Most activity advocating standardization of key clinical data has come from OI&A. Thus, both AHIMA and VHA have established initiatives aimed at improving different aspects of clinical documentation. VHA would benefit from better planning, coordination, and collaboration between these and other groups that contribute to the quality of clinical documentation produced by VHA systems.

Finding 7.1.2: The quality of VHA clinical documentation produced by current systems does not support accurate and optimal analytics or clinical decisions. Unclear definitions of data elements and extensive free text entries within clinical documents impede the creation of effective analytic data resources.

As noted in Section 5, Assessment H interviews revealed that most clinicians are moderately satisfied with the flexibility and functionality of the CPRS user interface—their primary system for creating clinical documentation. VistA and CPRS capture some data in discrete fields and retain the data in coded form. However, clinicians enjoy the flexibility of entering a significant portion of the data as unstructured "free text," reporting that this allows them to convey a richer patient story and context that helps them better understand their patients.[13] This flexibility (1) introduces variability in clinical documentation; (2) demands greater effort to extract quantifiable data as well as monitor, cleanse, and transform the data downstream (VA OI&A, 2014b and 2014c); and (3) results in analytics or reports that contain different results although they were ostensibly drawn from the same data, undermining trust in the information.

Finding 7.1.3: Current VHA clinical documentation practices do not adequately support accurate measurement of quality, safety, or performance metrics.

Capturing information in a semantically clear, machine-readable form has an important impact on measurement of operational performance, quality, safety, costs, and support for general analytics. VHA's ability to provide these functions depends on making a greater portion of the data generated in the course of documenting care accessible in this form throughout VHA in order to assess these measures at a single site, within a VISN, or across the entire VHA system. Currently, the widespread use of unstructured, uncoded text in clinical documentation and the failure to support emerging clinical documentation exchange standards force VHA to exchange data in a manner that the data recipients cannot interpret without manual intervention (VA OI&A, 2014b and 2014c).

To enable large-scale measurement of performance, quality, and safety, and to build effective analytics, IT systems must capture data in a way that supports these functions. This usually means adhering to a standard for each data type, capturing information via the use of coded terminologies, and structuring forms to contain as much coded data as possible. However, requirements to capture too much data in coded structured form can slow down the physician and degrade the physician-patient interaction. It also can add time to the documentation process for busy physicians. Clinicians can easily enter certain data, such as problems and medications, in structured form, but other data types, such as medical history, are less suited to structured entry.

Ultimately, VHA must find a balance that captures useful information efficiently without compromising physician or patient experience (Rosenbloom et al., 2011). To improve speed, vendors and their physician users have developed various shortcuts for documenting care, such

---

[13] Section 5 contains a more detailed assessment of CPRS. The description of clinician use and satisfaction with VistA and CPRS in the present section is provided only as background on implications for clinical documentation.

as cutting-and-pasting of prior notes, "copy forward" functions, and macros that create large blocks of text quickly. While these techniques may accelerate the process, they result in large amounts of unnecessary text (so-called "note bloat") and sometimes introduce errors, while at the same time making it difficult for other clinicians to read and understand the patient's true situation. The Medical Informatics Committee of the American College of Physicians has developed guidelines to deal with this phenomenon (Kuhn, Basch, Barr, & Yacket, 2012).

Today's best systems balance all competing needs to produce high-quality clinical documentation (Schiff & Bates, 2010; Silow-Carroll, Edwards, & Rodin, 2012). VistA and CPRS capture some data types in coded form—most notably problems, laboratory data, medications, and allergies—but could capture more information in structured coded form without unduly burdening clinicians. Assessment F (Workflow – Clinical) found, "In spite of national efforts to address these issues [appropriate use of copy-paste functionality] through mandated monthly EHR quality reviews, VHA clinical staff and medical coders reported that challenges persist: 80 percent of sites reported limited template utilization or use of suboptimal templates and 55 percent reported inappropriate use of copy-paste."

Finally, many specialists at non-VA hospitals and practices increasingly use natural language processing to extract important data from free text records. This technology can sometimes extract coded concepts from text, freeing physicians from the need to laboriously enter this information themselves. Increasing use of this new technology should improve physician productivity and VA should explore its use.

Finding 7.1.4: The standards and terminology used in clinical documentation, as implemented by VistA and CPRS, do not suffice to enable interoperability across multiple systems within VA, as well as between VA and non-VA facilities, including payers, private sector providers, DoD, and individual Veterans.

VHA must exchange health-related data between VHA facilities and increasingly with non-VA health care facilities at which Veterans receive treatment. VHA facilities have difficulty exchanging data with each other and find it nearly impossible in most cases to send information electronically to outside health care facilities. This results in part from the lack of clear standards for the exchange of clinical documents between facilities.

Commercial vendors are rapidly adopting certain standards, such as the HL7 Consolidated Clinical Document Architecture (CCDA) and the Fast Health Internet Resources (FHIR) standard, which will soon allow far greater exchange of data. By embracing these standards and creating the necessary application programming interfaces (APIs) to support interchange using these standards, VHA would greatly enhance the communication and quality of care received by Veterans treated at multiple sites. Finally, beyond improving the quality of clinical documentation and the quality of care, greater exchange of data will also increase VHA's ability to measure health care results and use this information to improve future care.

Finding 7.1.5: Clinical imaging and document archival systems are functionally adequate; however, accessing raw images and reports from within clinical workflow processes can be awkward and often requires users to navigate multiple systems.

CPRS users wishing to access medical images and reports must often navigate to native VistA imaging systems and/or document archival systems—particularly when attempting to review third-party reports that are currently mailed and scanned for incorporation into VistA with little accompanying metadata. Researchers also have difficulty searching for the images they need and extracting data from images and associated text reports because CPRS lacks sufficient metadata on many of the images to make extraction practical. VHA is aware of these shortcomings and has planned for improvements both in current systems and as part of the VistA Evolution program.

Interviewees characterized support for other clinical imaging systems as adequate but providing little opportunity for substantive improvements or innovation. VHA currently has a project underway to create a centralized optical character recognition (OCR) capability that will securely scan and extract metadata, including encounter-level information that will give clinicians much faster access to data. Finally, the improvements noted above will create an opportunity for previously impossible image mining and analytics.

7.2 Recommendations

VHA should reduce the amount of unstructured data in clinical documentation by analyzing instances in which IT systems could collect currently unstructured data as discrete structured data and by changing the data field definitions over time. At the same time, VHA must consider the need to balance maintaining ease of documentation for clinicians and providing more computable data for downstream analytics needs.

Recommendation 7.2.1: VHA should implement a broad process, involving clinicians, to pursue requirements that support clinical documentation best practices and improved functionality and usability while taking into consideration the positive aspects of existing systems.

Where analyses conclude that unstructured text (free text) remains the best means for capturing detailed clinical data, VHA should accelerate informatics efforts to study and deploy emerging technologies (e.g., natural language processing) that can parse unstructured data and reliably extract computable structured data. Implementing a comprehensive integrated clinical documentation quality program and fully engaging stakeholders in IT product development will help VA/VHA balance ease of documentation with the collection of computable data and increase the potential for more robust software functionality in the VistA Evolution project.

Recommendation 7.2.2: VHA should accelerate efforts to establish semantic definitions for data elements through the use of standard nomenclatures, terminologies, and code sets to improve exchange of data and interoperability among VA facilities and with payers and non-VA providers.

VHA should incorporate current data standards into initial releases of VistA Evolution, rather than wait for later releases. By doing so, VA/VHA can ensure consistency and integration across multiple systems, leverage development and implementation of follow-on IT products, and facilitate clinical decision making, analytics, quality, safety, performance measurement, and health information exchange.

Specifically, VHA should invest in the technologies needed to exchange HL7 clinical documents containing more computable structured data. This may require developing business drivers that motivate non-VA facilities to implement HL7 CCDA, FHIR, and other applicable standards on their side of the exchange process. Exchanging more standardized computable data will promote interoperability in the health care industry and could position VA/VHA as an industry leader in this area. Engaging in industry-level data standards and information modeling initiatives (e.g., HL7, Clinical Information Modeling Initiative) should benefit similar VA/VHA efforts, promote adoption of data standards across the health care industry, and place VA/VHA in a leadership role.

The views, opinions, and/or findings contained in this report are those of The MITRE Corporation should not be construed as an official government position, policy, or decision.

56

8 Informatics and Analytics

VA formed OI&A in February 2011 to "Support patient-centered care by facilitating the deployment of innovative, secure health data systems and collecting, analyzing and disseminating the highest quality health information for Veterans, caregivers, clinicians and administrative staff for decision-making" (VA, 2014a). In December 2012 the majority of the Office of Health Information (OHI) was realigned with OI&A to leverage both health data and health IT.

Relevant Healthcare Objectives and Business/Clinical Strategies

OI&A provides capabilities and services that are critical to the themes, strategies and transformational initiatives described in the *Blueprint for Excellence* (VA, 2014c). Theme One of this *Blueprint* centers on improving the current delivery system. Under this theme, Strategy Three states: "Leverage information technologies, analytics, and models of health care delivery to optimize individual and population health outcomes." One of the transformational initiatives associated with this strategy, "Enhance Clinical Decision Support using Analytical Systems and Predictive Analytics" (VA, 2014c), depends heavily on OI&A. The third theme focuses on advancing health care innovation for Veterans and the country. OI&A contributions are also critical to the success of several transformational initiatives associated with Strategy Seven ("Lead the nation in research and treatment of military service-related conditions"): "Rapidly Translate Research Findings and Evidence-Based Treatments into Clinical Practice," "Conduct Veteran-Focused Comparative Effectiveness Research," and "Enhance VA Research with Health Informatics."

IT Systems Used for Informatics and Analytics

OI&A provides reporting and analytics capabilities through the:

- CDW (Corporate Data Warehouse): Data, infrastructure, and tools housed at the Austin Corporate Data Center Operations (CDCO), covering national clinical, financial, and administrative data from across the enterprise
- RDW (Regional Data Warehouse): Data, infrastructure, and tools housed in OI&T Regions 1–4 , covering VISN clinical, financial, and administrative data collected through the CDW process
- VINCI (Veterans Informatics and Computing Infrastructure): Data, infrastructure, and tools used to support the Health Services Research community as well as the advanced analytics needs of the enterprise

The VistA systems (described in Section 5.1) and the clinical documentation records (described in Section 7.1) feed the CDW, RDW and VINCI.[14] CDW consolidates the highest priority domains of key clinical and operational data and permits near-real-time analysis and reporting. VHA produces a number of dashboards, graphs, maps, and reports from CDW data. These products are aimed at assessing treatment safety and effectiveness, improving patient care, monitoring

---

[14] http://www.hsrd.research.va.gov/for_researchers/vinci/cdw.cfm

costs and efficiencies, and preparing for national emergencies. The consolidation of reporting systems and activities through the OI&A allows VHA to generate authoritative analysis with more consistent results.

Although the CDW was created primarily to support health care delivery, researchers also use its contents. VINCI provides secure workspaces for informatics researchers to use this data in experiments with advanced tools such as the Hadoop framework for processing large data sets across clusters of servers, machine learning software, Bayesian statistical analysis tools, human factors analysis, and natural language processing tools. In the research arena, analytics are moving from a traditional encounter-based view of patient care to a more longitudinal population-based view of groups that researchers could use to predict the outcome of care and assess health interventions in a risk-based way.

The numbers below, drawn from CDW training materials, provide a glimpse of the volumes of data stored:

- Unique Veterans: 20 million
- Outpatient encounters: 1.6 billion
- Inpatient admissions: 9 million
- Clinical orders: 3.2 billion
- Lab tests: 5.6 billion
- Pharmacy fills: 1.5 billion
- Radiology procedures: 162 million
- Vital signs: 2.3 billion
- Text notes: 2.0 billion.

8.1   Findings

OI&A seems positioned to lead VHA's transformation into a learning health system that can achieve better Veteran health, better care, and lower costs. However, the slow pace of VA's IT development, the constraints imposed by old systems that pre-date modern technologies and health data standards, and limits on resources constrain OI&A's ability to succeed.

Informatics and analytics capabilities in VHA leverage VistA, which became operational in 1985, and the associated CPRS user interface. Since 2004 VHA has used VistA/CPRS to document clinical activities, retrieve results, and enter orders for medications, procedures, and consultation. Local sites developed early analytical tools and used them to extract structured data, create facility-level reports, and identify practices that improve the quality of patient care. Although VHA has obtained some analytical value through these methods, technical limitations of VistA/CPRS continue to hamper true progress in advancing informatics and analytics (see Sections 5, 7, and A.3).

OI&A has formed some effective partnerships and shows evidence of producing analytic products for use across VHA (Findings 8.1.1 through 8.1.3). However, VHA's aging information systems limit its ability to keep pace with rapid advances in the field of health informatics and

analytics. Section 5 of this report describes the challenges and root causes of the issues with VHA's information systems, and the high cost of maintaining them. Findings 8.1.4 through 8.1.6 center on the impacts that these systems limitations have on the ability of VHA to perform accurate and useful informatics and analytics functions.

Finding 8.1.1: Research partnerships have proven effective in expanding and demonstrating the value of VA/VHA informatics and analytics capabilities.

OI&A occasionally partners with other components of VHA and with external health organizations to conduct analytic research on key health challenges of the Veteran population. An example is a recently published collaborative effort between the National Institute of Health, the VHA office of mental health operations, the VHA office of public health, VHA mental health services, OI&A, and VISN 2. The research team performed statistical analysis on clinical data from the VHA National Patient Care Database, a collection of integrated patient care data from all VistA systems. The study analyzed hundreds of variables, including clinical, demographic, military service history, behavior, mental health, and drug use factors. The model used succeeded in accurately predicting subgroups with suicide rates up to 80 times higher than VA patients as a whole, and found that current practices do not flag all patients in the high risks groups (McCarthy et al., 2015).

In FY14, VINCI supported over 600 Health Services Research & Development (HSR&D) projects. Projects included studies on self-directed violence and suicide, homelessness, post-traumatic stress disorder, military sexual trauma, end of life care, hepatitis C, acute kidney injury, and traumatic brain injury, just to name a few.[15] VHA has also established a set of policies and procedures that enable sharing of data in secure workspaces with research institutions, while complying with privacy and security regulations. One example mentioned during Assessment H interviews was a collaboration with IBM on application of the Watson predictive analytic capabilities to the health care domain, initially exploring the utility of Watson for post-traumatic stress disorder.

Finding 8.1.2: Strategic Analytics for Improvement and Learning Value Model (SAIL) reports supply valuable information across VA/VHA.

Operational Analytics and Reporting (OAR) within OI&A produces a quarterly report called SAIL, which offers high-level views of health care quality and efficiency at VHA. SAIL has grown and improved since 2012 with the addition of new measures and new facilities. As of June 2014, the SAIL reports included data from 128 VAMCs that provide acute inpatient medical and/or surgical care to Veterans and 19 facilities that do not offer acute inpatient medical and/or surgical care (VA, 2014c; VA, 2014d). SAIL reports are adapted from the Truven Health Analytics' Top Health Systems Reports,[16] and include all eight inpatient Truven measures as well as additional measures related to health care quality, employee satisfaction, quality of life, and efficiency. As of 2014, the reports included measures across the following domains:

---

[15] Research highlights for several of these projects can be found at
http://www.hsrd.research.va.gov/publications/forum/oct14/default.cfm.

[16] http://truvenhealth.com/

- Acute care mortality

- Avoidable adverse events

- CMS Risk Standardized Mortality Rate (RSMR) and Risk Standardized Readmission Rate (RSRR)

- Length of stay

- Performance

- Customer satisfaction

- Ambulatory Care Sensitive Condition (ACSC) hospitalizations

- Clinical wait times and call center responsiveness

- Clinical efficiency

- Administrative efficiency

Quarterly reports graphically depict both scores at each participating facility and aggregate scores, and show the degree of improvement from one quarter to the next. The reports highlight successful strategies of top performers and help facilities identify areas for improvement.

An investigation of the actual use of SAIL reports in each of the facilities was beyond the scope of the Assessment H study. However, other Section 201 assessments have found evidence that SAIL reports drive behavior changes in some facilities and that OAR should further improve the reports.

- Facilities view a high score on the SAIL report as a source of pride, suggesting that leaders pay attention to their reports and seek ways to improve their scores (Assessments F [Workflow – Clinical] and L [Leadership]).

- Some facilities have discovered inaccuracies in underlying EHRs from which SAIL metrics are derived and have taken steps to improve the accuracy of clinical documentation at the point of entry through better training and education (Assessment F).

- The sheer number of operational performance measures overwhelms some leaders, making it difficult to focus on the most important items. While SAIL has not replaced the existing hundreds of performance measures, the reports now align more consistently to the VHA mission and are seen as a foundation upon which improved target setting could be built. (Assessment L).

Finding 8.1.3: Analytical reports and products provide useful insight and support decision making by VA/VHA organizations.

The Business Intelligence Service Line (BISL) FY14 Annual Report (VA, 2014f) describes some of the standard analytical reports and products built from corporate and regional data warehouses. Those products align to Veteran health and VHA business outcomes as follows:

- Improved Veteran access:
  - Supervisory appointment tools improve efficiency and accuracy of appointment creation.

- Improved Veteran quality of care:
  - o Electronic Clinical Quality Measures allow near-real-time reporting of clinical performance measures on all Veterans.
  - o A follow-up dashboard on seriously mentally ill patients identifies Veterans who are living with serious mental Illness and who have not received outpatient or inpatient care at a VA facility for at least one year. The dashboard helps care providers proactively engage with patients who are at elevated risk of suicide or death.
- Improved Veteran safety:
  - o The Opioid Monitoring dashboard helps care providers monitor use of opioid medications and ensure safe and effective use of the drugs.
  - o The Time in Therapeutic Range Monitoring dashboard improves management of outpatient anticoagulation medication to reduce rates of adverse events such as stroke, blood clotting and major hemorrhaging.
- Improved financial management:
  - o The Non-VA Care Consult Program Management Report links non-VA care consults and fee basis claims authorizations and appointments for use in reconciliation of budget and cost processes.
- Reduced VA cost:
  - o Pharmacy Benefits Management monitors and analyzes pharmaceutical cost management programs to assess effectiveness.
  - o Prosthetics and Sensory Aids Management dashboards monitor and analyze the use of national contracts to ensure Veterans receive clinically appropriate devices at the best value consistently across the health care system.
- Improved operational efficiency:
  - o The VISN Morning Report provides daily updates of a variety of key patient care metrics.
- Emergency preparedness and response:
  - o The Ebola Situational Awareness report tracks suspected and confirmed Ebola cases across the United States.

Assessment H did not conduct a comprehensive survey of users to determine which reports and dashboards, if any, they consider most valuable and the actual impact of these tools. However, other assessments uncovered evidence of perceived value of some reports and dashboards, as well as improvements needed. For example:

- The Pharmacy Benefits Management reports are used to manage the pharmaceutical supply chain (Assessment J [Supplies]).
- Opioid Monitoring tools have proven effective in reducing the utilization of high-risk medications such as opioids and benzodiazepines (Assessment J).

- Senior leaders make increasing use of visual reports during daily performance meetings, which increases transparency and helps leaders and employees to focus on key metrics (Assessment L).

- Current decision support capabilities do not suffice to support oversight and management of Non-VA Care claims processing and payment. For example, VA cannot determine the reasons for denial or suspense of claims. This deficiency prevents VA from analyzing enterprise-wide denials (Assessment I [Business Processes]).

Finding 8.1.4: Problems with VistA/CPRS interoperability among VHA facilities and with external health care providers present challenges for data aggregation and analytics.

The interoperability problems identified in Section 5 will likely increase as Veterans increasingly seek care outside VHA from health care providers who produce either paper records or electronic records incompatible with VHA systems. Furthermore, over time variants of the VistA/CPRS system evolved across VAMCs, resulting in approximately 130 different instantiations of the system (Fihn et al., 2014). This poses significant challenges in integrating new technologies and data sources into VistA/CPRS and complicates VHA's ability to leverage powerful new technologies such as image processing analysis, language processing techniques for extracting information from free-form text, algorithms for processing genomic data, and analytic tools for extracting and analyzing data from personal health monitoring devices.

Finding 8.1.5: Aggregation of data across the entire VA system is problematic when each system conforms to different local data standards. This constrains the ability of VHA to conduct research, identify trends, identify best practices, and assess the effectiveness of treatments across the entire VA population.

A recent clinical code gap analysis commissioned by OI&A performed a thorough assessment of VHA's ability to electronically extract the required, standard data elements from the CDW for nine eligible provider (EP) meaningful use (MU) clinical quality measures (CQMs) and 16 eligible hospital (EH) CQMs. Key findings included (VA OI&A, 2014b and 2014c):

- Data capture can vary significantly across VISNs. This complicates data aggregation for metrics analysis and reduces data quality.

- VHA does not routinely use a Problem List or Medication List for each patient. As a result, clinicians cannot discern when a diagnosis becomes inactive. It is also difficult to determine which medications are currently active.

Most OI&A leaders interviewed cited the inconsistent use of industry data standards as a key challenge. The following comment provides an example of impact:

> …a greater issue is the lack of standardization of code sets. One aspect of data standardization is in lab tests – any given site may name it any number of ways, e.g., Hemoglobin tests. That site may know what it means. When you roll it up nationally – there is a lot of variability. Reference ranges can be different. Different sites use different lab instances.

Others described the growing challenges of integrating records from third parties:

> Imaging is a huge issue. There are lots of different images. Image information from 3rd party consult reports is not well integrated into VistA. Currently, 98% of reports are currently mailed in and scanned into a pdf in VistA with very little (if any) metadata [searchable, computable data about the image]. Users need to dig through the system which is a disaster.

Assessment I identified other consequences of the lack of standards. VA uses a mostly manual process for receiving claims and the supporting medical records for non-VA Care, because VHA cannot process electronic records that conform to private sector standards. This also can introduce errors in analytical products, which may fail to incorporate inputs from non-VA care providers. CDW represents a particular opportunity to focus effort on data quality and common data standards and to demonstrate immediate benefits to health outcomes from better enterprise-wide data management.

Finding 8.1.6: VA faces challenges in building and maintaining a workforce with skills in health informatics and analytics at the capacity needed for an evidence-based, data-driven learning organization.

Health informatics and analytics require advanced skills and experience across a number of domains, including clinical quality measures and decision support, health care operations, computer science (machine learning, data mining, data standards, natural language processing), and mathematics (statistics, algorithm development, analytical modeling). VHA has concerns about its ability to attract and retain sufficient numbers of staff with the right capabilities.

VA OI&A participates in a very competitive marketplace for talent. Health informatics and analytics depend on a discipline labeled as data science, which relies heavily upon elements of statistics, machine learning, optimization, signal processing, text retrieval, and natural language processing to analyze data and interpret results. Partly as a result of the explosion of data generated from smart devices, web applications, mobile devices, and social media, demand for data scientists is growing across a number of business sectors, including marketing, security, fraud detection, finance, insurance, health care and manufacturing. For example:

> According to Dr. Tara Sinclair, Indeed.com's chief economist, the number of job postings for data scientist grew 57% for the first quarter this year compared to the year-ago quarter. And searches for data scientist grew 73.5% for the same period (Darrow, 2015).

> Salaries rose 8 percent on average in the last year, with bonuses adding $56,000, according to a salary and employment survey released on Tuesday by Burtch Works, a recruiter of professionals with quantitative skills (Lohr, 2015).

> A McKinsey study predicts that by 2018, the United States alone faces a shortage of 140,000 to 190,000 people with analytical expertise and a 1.5 million shortage of managers with the skills to understand and make decisions based on analysis of big data (Strong, 2015).

> It's clear that talent equipped for these roles is in high demand and low supply across a number of industries as more agencies turn to data to inform creative and media strategies (Bruell, 2014).

VHA expressed concerns in written documentation and interviews about maintaining a sufficient number of well-qualified staff.

As of December 16, 2012, as part of VHA realignment which brought OHI into OI&A, OI&A had 680.73 Full-Time Equivalent Employees (FTEE). The authorized FTEE ceiling was 646.43. The Resource Management Committee (RMC) approved 22.0 FTEE above the limit for 36 months beginning January 1, 2012 (VHA, 2014e).

OI&A personnel also noted frustrations with OI&A staffing levels, for example:

We were created as an organization – but have been sorely under-resourced. We have been undersized. VA has done most investment in data collection and storage. We've got lots and lots of data—we tend to not use it very well. We touch 2% of the data we have. We don't do this as well as we should or could—because we are largely resource-constrained.

Assessment H interviewees also cited concern over getting the right types of skills.

We have a serious lack of talent in the organization – in the clinical and technical. Very few people left who understand our processes.

Getting the right skillsets is hard, e.g., in quality measurement. A mindset used to be— ordered measures, compliance mentality. Need to think about decision support, some analytic skillsets are required. We see a need for Bayesian analysis skills. It's a challenge in a government environment to hire the right folks.

The consumers of health informatics products and services at VA span VHA and VA OI&T and include nurses, pharmacists, physicians, dentists, and researchers who perform health informatics functions as at least part of their job responsibilities. In 2013, OI&A estimated the size of this population at some 6,000 individuals, based on the numbers of individuals culled from known informatics-related email distribution lists (VHA, 2014e).

The Health Informatics Initiative, established in 2011 within OI&A, is building the capacity to deliver informatics solutions for health care delivery. The Initiative conducted two workforce assessments, one in 2011 and one in 2013. The assessments included surveys to determine professional qualifications, health informatics roles, competence, and career and community development activities. OI&A uses the results of those assessments to decide on its workforce investments. As a result of these assessments, OI&A has implemented a number of training and awareness programs, increased engagements with professional organizations, and established career paths. The assessments also help VHA to anticipate workforce changes well in advance, so that interventions can be made early. For example, the 2013 assessment identified a risk of significant loss of talent due to retirements:

Approximately one-third (32%) staff expect to discontinue their role in health informatics at VA within the next five years and over half (59%) expect to leave their roles in the next 10 years. This is not surprising given the number of people who have had a role for over 10 or 20 years; it suggests that many respondents are coming up on retirement (VHA, 2014e).

8.2   Recommendations

OI&A is in a position to lead VHA in the transition to become a learning health system. With appropriate resources, leadership, and direction, the use of informatics and analytics has the potential to achieve the outcomes of better health, better care, and lower costs. Indeed, VHA

already produces and uses analytical products to improve Veteran health care and business operations. All leading private health care systems use data to drive improvements. In addition, VHA is well positioned to lead a comprehensive new initiative on "precision medicine" in response to the Presidential Initiative in Precision Medicine (IPM), 30 Jan 2015.[17] This section offers recommendations to build on and improve the current suite of VA/VHA analytical products, and overcome resource challenges. However, these recommendations will not be effective unless VHA also makes significant improvements to the information systems upon which it depends. Other sections note the steps necessary to improve VHA's health IT systems. These system improvements will be critical to the success of informatics and analytics at VHA.

Recommendation 8.2.1: OI&A should assess the quality and validity of analytical products and results across VHA and their effectiveness in driving health and business outcomes.

OI&A should engage with leadership and staff across VHA on a frequent basis and identify ways to make the products more useful. Evidence from other assessments indicates the value of continued outreach, education, and awareness campaigns. OI&A may have to make further incremental improvements in the types of metrics collected. Pruning less useful products will prove important for mitigating the sense of data overload that some leaders experience.

OI&A should also identify specific improvements needed in the information systems that serve as the sources of the data used for VHA analytics to generate more complete and accurate results. VHA should also track actions taken as a result of the analytical products and quantify how effective those actions are in improving health and business outcomes.

OI&A should expand its research to cover trends in the larger health informatics community, tapping into resources such as the Healthcare Information and Management Systems Society (HIMSS), which performs compensation surveys. Comparisons to leading health care providers should guide staffing targets and compensation within VHA.

Recommendation 8.2.2: OI&A should assess workforce needs in informatics and analytics on an ongoing basis to estimate future needs and acquire skilled expertise in a timelier manner.

Workforce assessments should consider a variety of factors that may influence employment decisions, such as compensation, work environment, demographics, technology resources, and research opportunities. As a government employer, VHA may have only limited ability to influence some factors, such as compensation. However, VHA should identify factors within its control to attract and maintain an effective health informatics and analytics workforce. For example, in many high technology fields the presence (or lack) of leading-edge information systems and tools within the environment influences decisions about where to accept employment. OI&A could consider offering scholarship programs in exchange for government services, similar to the U.S. Office of Personnel Management (OPM) Scholarship for Service (SFS) CyberCorps program[18] as a way to increase the pipeline of graduates to fill OI&A analytic positions.

---

[17] https://www.whitehouse.gov/the-press-office/2015/01/30/fact-sheet-president-obama-s-precision-medicine-initiative

[18] https://www.sfs.opm.gov/

Recommendation 8.2.3: OI&A should increase collaborative partnerships for analytics research with research institutions and other health care providers to better understand the value of integrated health data analytics.

OI&A should continue to develop collaborative relationships with research institutions offering advanced degree informatics programs and sponsor joint research. Assessment H research reviewed two examples of successful research partnerships: one with the National Institutes of Health and one with IBM. OI&A should increase the use of these types of partnerships as a way to improve research outcomes despite the constraints on internal staffing.

Expanded collaborative partnerships with health care providers could also help improve the exchange of electronic health records. Interviews identified one such pilot initiative with Walgreens. OI&A should increase the number and scope of these partnerships to enable integrated health data analytics across all providers of health services to Veterans, including VHA, the private sector, and DoD.

9 Telehealth

VA defines telehealth as:

> The wider application of care and case management principles to the delivery of health care services using health informatics, disease management and telehealth technologies to facilitate access to care and improve the health of designated individuals and populations with the intent of providing the right care at the right place and right time" (VA, 2014a).

In FY 2014, VA used telehealth to serve more than 690,000 Veterans, amounting to approximately 12 percent of the overall Veteran population. Of those, 55 percent were Veterans in rural areas (VA Office of Public and Intergovernmental Affairs, 2014). The total number represents an increase from 608,000 Veterans in FY13, approximately 11 percent of the overall Veteran population (Hall, 2014). As described in Assessment B (Health Care Capabilities), not only are more patients taking advantage of telehealth, but they also remain satisfied with the telehealth services.[19] Assessment H examines telehealth from the perspective of VA/VHA's ability to implement new technologies that could help achieve strategic VA health care outcomes.

VA provides three main types of telehealth services: Clinical Video Telehealth (CVT), Home Telehealth, and Store-and-Forward Telehealth. Table 9-1 (also included in Assessment B), describes these three categories and explains how each supports various health care objectives.

Table 9-1. Telehealth Definitions

Modality	Description	Health Care Objective
Clinical video telehealth	Use of real-time interactive video conferencing, sometimes with supportive peripheral technologies, to assess, treat and provide care to a patient remotely. Typically, clinical video telehealth links patient(s) at a clinic to provider(s) at another location; however, it can also connect a remote provider and a patient at home.	▪ Provide access to specialists practicing in regional medical centers ▪ Reduce travel burden for Veterans in remote or underserved areas
Store-and-forward telehealth	Use of technologies to acquire and store clinical information (e.g., high-resolution images, sound, and video) that is then made available to a provider at another location for clinical	▪ Provide access to specialists practicing in regional medical centers ▪ Reduce travel burden for Veterans in remote or underserved areas

---

[19] Assessment B describes VA's telehealth capabilities and utilization rates in greater detail.

Modality	Description	Health Care Objective
	evaluation. It is frequently used in radiology, dermatology, and diabetic retinopathy.	
Home telehealth	Applies care and case management principles to coordinate care using health informatics, disease management, and technologies such as in-home and mobile monitoring, messaging, and/or video technologies.	▪ Facilitate continuous (non-episodic care) to improve clinical outcomes ▪ Provide acute and chronic care management, and promote health and disease prevention

Source: The RAND Corporation, Assessment B.

9.1 Findings

VA was an early adopter of telehealth and has been a leader in this space for years, but many Assessment H interviewees expressed concern that VA could not stay at the forefront of telehealth. VA help desks do not offer technical support directly to Veterans who have difficulty using the telehealth service. Assessment H interviewees reported that:

> Telehealth appointments are typically scheduled one or, at most, two per hour and they can often take longer than in-person appointments because of the time it takes to get the equipment setup. The Permanente Medical Group (TPMG) reports they can see an average of six patients per hour via telehealth, compared with an average of 1.6 per hour for in-person visits (Tahir, 2015).

Table 9-2 summarizes telehealth strengths and weaknesses examined in the subsequent findings.

Table 9-2. Telehealth Strengths and Weaknesses

Strengths	1. VA was an early adopter of telehealth. 2. The National Telehealth Governance Board (NTGB), co-chaired by VHA and OI&T, is a useful forum for providing oversight of telehealth services. 3. Users view VHA's National Telehealth Technology Help Desk as responsive and helpful.

Weaknesses	1. VHA believes OI&T is slow to provide support to the VISNs, which has a negative impact on Veteran access to care.
	2. Veterans are not offered technical support for telehealth resulting in many Veterans abandoning telehealth.
	3. There are many challenges and correspondingly little incentive to provide care between the VISNs through telehealth.

In a 2014 internal survey conducted by VHA Telehealth Services, the VISNs reported "inadequate OI&T and Biomedical Engineering infrastructure and support" as a major barrier to the sustainment and expansion of telehealth (VHA Telehealth Services, 2014). Assessment H interviews with VAMC staff echoed this view.

Finding 9.1.1: Although providers report an unacceptable time to resolution for configuration requests, roles and responsibilities are uncertain, and National Service Desk ticket data do not track to the service level agreement (SLA) metrics, creating uncertainty whether service levels are being met.

The NTGB provides a useful forum to help align VHA clinical needs with OI&T infrastructure support, thereby increasing the likelihood that more Veterans can access care through telehealth in the future. However, users interviewed cited confusion about the roles and responsibilities of OI&T and Biomedical Engineering. This contributes to delays in problem resolution because both organizations must often assist with the same piece of equipment, since OI&T manages the general IT assets, such as the network, and Biomedical Engineering manages the medical devices, such as a telemedicine cart. One interviewee said, "It usually ends in a stalemate." Another site representative said that OI&T thought Biomedical Engineering was responsible for configuring the cart, but Biomedical Engineering said the responsibility belonged to OI&T.

As the National Service Desk consolidates (from over 100 help desks to one), disparities remain in help desk ticket data. Assessment H received ticket data from VA (VA SDE, 2015), but these data did not directly track to any of the metrics in the three telehealth-related SLAs (VA, 2013a, 2013c, and 2013d). Table 9-3 summarizes the service level targets defined in these three SLAs that specifically or logically should be measurable by National Service Desk ticket data.

Table 9-3. Service Desk Telehealth-related Service Level Targets

Metric	Service Level Target
CVT Endpoint Normal configuration request submitted by NTTHD once precondition checklist met	Completed within 20 business days after equipment arrives
CVT Endpoint Urgent configuration request submitted by NTTHD once precondition checklist met	Completed within 10 business days after equipment arrives

---

Metric	Service Level Target
SFT Acquisition Workstation Configuration: New User Requests	95% within 3 days
SFT Telereader Configuration: New User Requests	95% within 3 days
SFT Acquisition Site Configuration: New User Requests	95% within 3 days
HTH Virtual Private Network restore time	4 hours
HTH Average Speed of Answer	<60 Secs
HTH [call] Abandonment Rate	<5%
HTH First Contact Resolution Tier One	>70%

Finding 9.1.2: Lack of technical support to Veterans discourages Veterans from participating in home telehealth, thereby missing opportunities to reduce health care costs. Veterans cannot call a VA help desk to receive technical support.

VA screens Veterans to see if they have the videoconferencing technology and know how to use it for home telehealth and CVT. A Telehealth Coordination Technician (TCT) tests the technology with the Veteran in advance of an appointment with a health care provider. An Assessment H interviewee stated that the TCT schedules an actual appointment and notifies the provider separately that the interaction only represents a test and can be ignored. The TCT can provide guidance if the Veteran has difficulty with the technology, but the value depends on the technical abilities and willingness of the TCT to offer help. VISNs cited challenges in recruiting and retaining TCTs (VHA Telehealth Services, 2014). If this trend continues, VHA will have fewer TCTs and they will have even less time to spend helping Veterans use the technology.

If Veterans cannot install and use the videoconferencing technology, they are "screened out" of the telehealth appointment. This not only degrades the Veteran experience but also increases health care costs because home telehealth is a proven low-cost alternative to more traditional modes of care (VA OIG, Office of Audits & Evaluations, 2015a).

Finding 9.1.3: The barriers associated with providing VISN-to-VISN telehealth make it harder to optimize the caseload across VISNs, resulting in unnecessarily long waits for care in certain regions.

As discussed in Assessment B, only 1 percent of telehealth appointments happened across VISNs in FY14. This results in missed opportunities to balance the caseload nationally and results in long waits for care in certain areas and no waits in others. VA must make it easier for a patient in one VISN to receive care from a provider in a different VISN. The challenges that complicate telehealth appointments between VISNs include requirements around telehealth services agreements and rules governing provider privileges and credentials. Currently, every

pair of medical centers that plan to connect via telehealth must create a telehealth services agreement. Also, providers must be privileged and credentialed wherever the patient is located. In addition, once the appointment has taken place the provider cannot update patient records held by another VISN.

VA is moving in the right direction. For example, VA has a plan for a new Telehealth Scheduling System (TSS) that will pull all telehealth resources and telehealth service agreements together. However, several Assessment H interviewees expressed concern that TSS would not meet all their needs. For example, they feared that it would not allow them to determine if both a room and a technician would be available for an appointment. VA has an opportunity to assess the current and planned processes and systems to ensure they remove as many of the barriers to VISN-to-VISN telehealth as possible.

9.2 Recommendations

To take advantage of the full potential of telehealth to improve access to care, VA must make it easier for providers to treat their patients through telehealth. VA can expand telehealth to become more responsive to clinical needs. Table 9-4 summarizes the telehealth opportunities described in the subsequent recommendations.

Table 9-4. Telehealth Opportunities

Opportunities	1. VA can clarify telehealth-related roles and responsibilities.
	2. VA can strengthen the NTGB by identifying a lead from Biomedical Engineering to co-chair the NTGB with the Office of Telehealth Services and OI&T.
	3. VA can improve SLAs to ensure they meet the clinical need yet remain achievable and measurable.
	4. VA can offer telehealth technical support directly to Veterans.
	5. VA can improve policies, processes, and systems to make it more attractive to provide VISN-to-VISN care through telehealth.
	6. VA and private industry can both benefit from exchanging telehealth best practices.

Recommendation 9.2.1: To improve the execution of telehealth, VA should clarify roles and responsibilities between OI&T and Biomedical Engineering and reexamine service agreements. VA should identify a lead from Biomedical Engineering to co-chair the NTGB with the Office of Telehealth Services and OI&T.

VA must ensure that all stakeholders agree on service-level targets. Because VAMC staff believe IT support is too slow, representatives of VAMCs, the Office of Telehealth Services, OI&T, and Biomedical Engineering should examine the SLA targets to ensure they meet the clinical need. Once the stakeholders have set the service agreement targets, they must communicate them to the facilities so that each site can adjust its expectations. OI&T and Biomedical Engineering

must also communicate directly with any requestor of support to acknowledge the request and provide an approximate time to resolution. VA must then ensure measurement and reporting of service agreement compliance.

The NTGB would become an even more effective forum and could contribute to greater Veteran access to care if it added a Biomedical Engineering representative as a co-chair. First, this would ensure Biomedical Engineering participation in discussions of telehealth clinical needs and support to be provided by OI&T and Biomedical Engineering. Second, it would assist in clarifying and communicating roles and responsibilities of OI&T and Biomedical Engineering.

Recommendation 9.2.2: To provide greater access through telehealth technology and reduce the number of Veterans who abandon these services, VA should offer technical support to Veterans who have trouble using telehealth technology and make it easier for all parties to test a connection.

For VA to become truly Veteran-centric, it cannot screen out Veterans from telehealth simply because they cannot figure out how to use videoconferencing technology on their own. Assisting with use of this technology should improve the Veteran experience with VHA and reduce health care costs. This means that VHA should provide an easy mechanism for testing a telehealth connection with the Veteran without involving a provider. If a mechanism already exists for easily creating a test appointment without notifying the provider, VHA should ensure all TCTs are trained on how to use it.

Recommendation 9.2.3: To provide more care across VISN boundaries through telehealth, VA should revise policies, processes, and systems to migrate toward virtual access as the norm for the delivery of care.

VA should consider establishing a National Telehealth Services Agreement that would eliminate the need for agreements between each pair of sites, and grant providers national-level privileges and credentials rather than requiring privileges and credentials for each location. If national credentialing and privileging are not possible, VA should at least explore centralized administration of credentials and privileges as opposed to storing them locally in each VAMC.

The views, opinions, and/or findings contained in this report are those of The MITRE Corporation should not be construed as an official government position, policy, or decision.

72

10 Mobile Applications

The future of VA health care is a Veteran-centric system of care that treats the whole person regardless of their physical location. Technology innovations and consumer-demand are enabling this transformation. VA Connected Health virtual and mobile technologies are key elements of a healthcare environment that is supportive and responsive and that enhances relationships between Veterans and their providers. Connected health technologies offer powerful opportunities to extend access to health information, knowledge and support at the place and time when it is needed, and improve the interactions between patients, caregivers, and health care teams regardless of their physical location. The use of connected health technologies such as patient web portals, mobile applications (apps), video telehealth, sensors, wearable devices, and home monitoring systems have had significant impacts on VA health care processes and outcomes with encouraging results thus far. Strategically, VA seeks to expand the use of connected health technologies to support the transformation towards patient-centric and consumer-driven health care delivery for the benefit of Veterans, beneficiaries, and health care providers. (VA OI&A, 2014a)

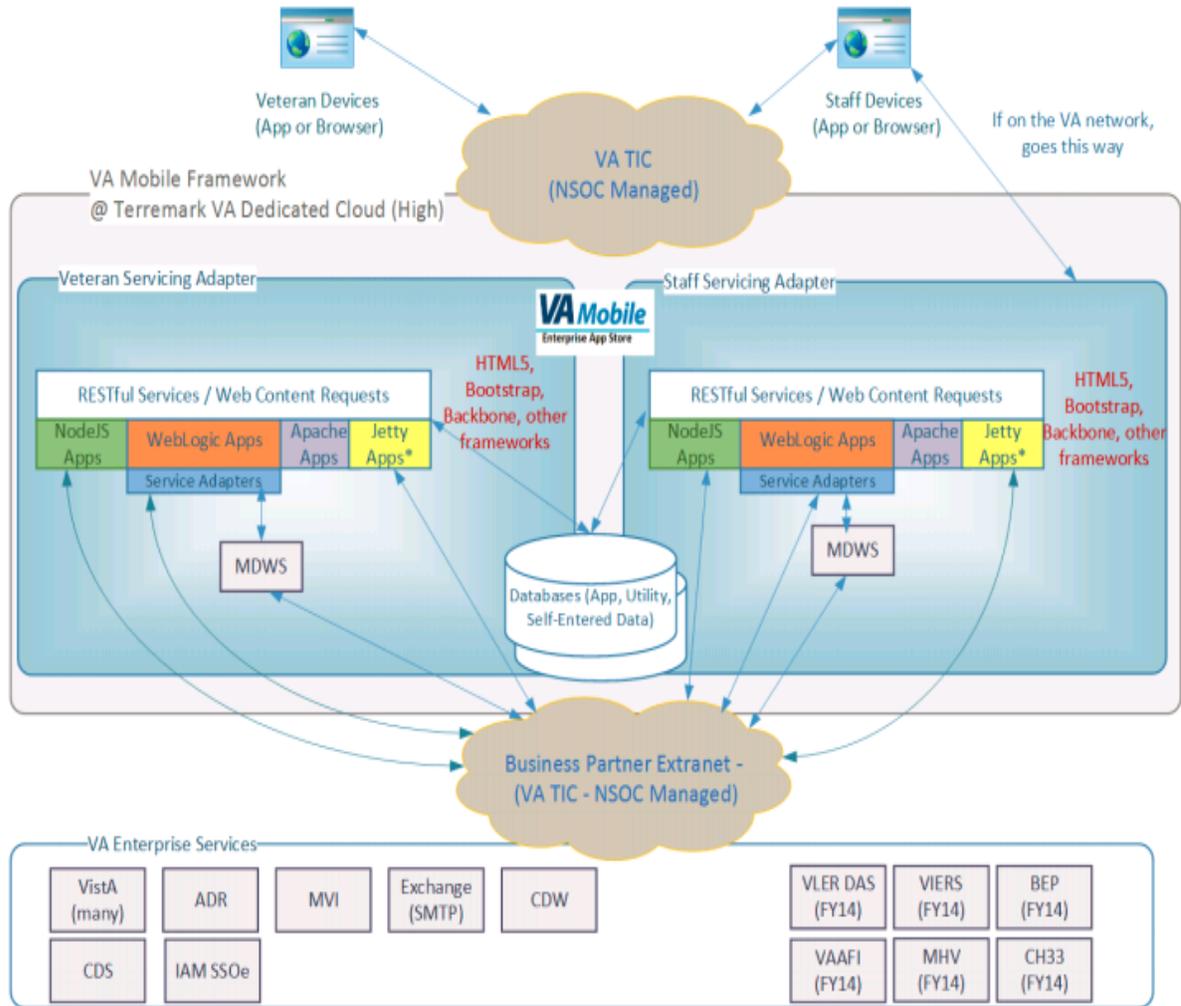
OI&A's Connected Health (OI&A/CH) organization, formed in 2012, has responsibility for web and mobile solutions, My HealtheVet, kiosks, and innovation. Several Assessment H interviewees cited the Connected Health management team as possessing the strength of personality to move the mobile application concept forward, noting that this team has given caregivers, providers, and Veterans initial mobile capabilities that improve access to VA-approved health care capabilities.

From a strategic planning perspective, Connected Health has mapped VA and VHA Strategic Plans (VA OI&T, 2013; VA 2014c) into its organizational operating plan. Specific actions and initiatives in the operating plan are derived from Connected Health's goals and assigned to Connected Health senior staff. Connected Health has identified key performance measures for its mobile technology offerings; each measure has a targeted quality threshold with specific staff assigned.

As a baseline, VHA operates a mobile application store from which Veterans and providers can download applications. According to a table in Assessment B, as of May 2015 over 300,000 downloads of publicly released mobile applications had taken place. Approximately half of the more than 20 released mobile applications are in a controlled roll out with no publicly available data. The Assessment H team also discovered that VA has approximately 30 additional applications in the release pipeline.

VA's mobile applications target only Apple or Android devices. Also, only mobile applications developed by VA personnel or contractors and qualified and certified by VA are available through the VA AppStore. However, several of these applications are also available through the Apple iTunes and Google Play stores.

The current VA Mobile Framework (VAMF) (VA OI&T ASD, 2014) shown in Figure 10-1 performs infrastructure services for all mobile applications. VAMF also provides an environment to meet OI&T's process for releasing mobile applications, which includes enterprise-level certification (testing, certification, and release).

Figure 10-1. VA Mobile Framework "As-Is" Logical Architecture


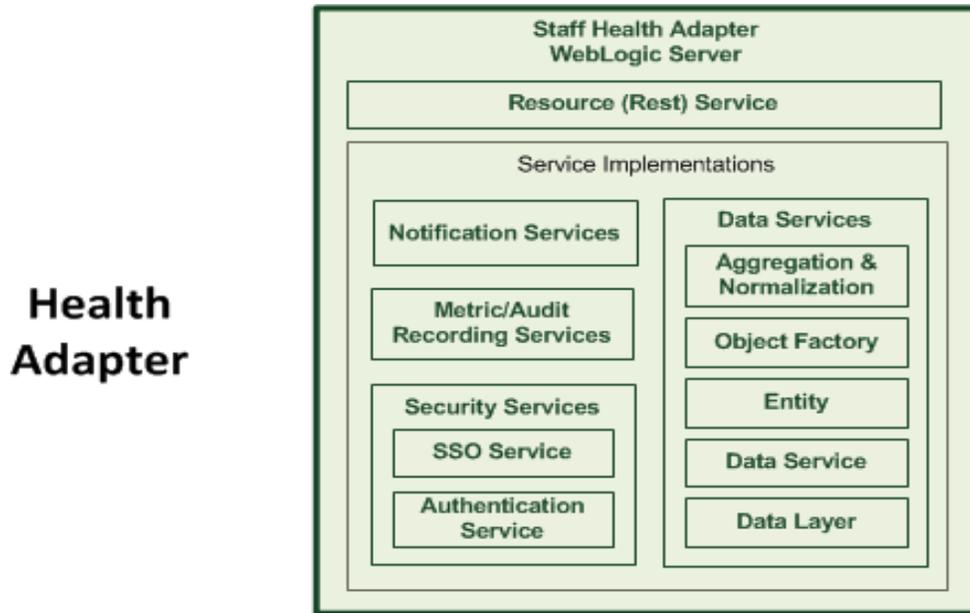
Source: VA OI&T ASD, 2014.

The Medical Domain Web Services (MDWS) provide the interface to VistA and other data stores and services. VAMF also maintains a local database to support self-entered and patient-generated data. The VA Mobile Application Environment (MAE) is a production and testing environment that consists of four separate environments to provide tools and services for testing and compliance of internal VA mobile applications. The environments are:

- Development
- Test (Federal Information Security Management Act [FISMA] Low)
- Integration
- Production (FISMA High).

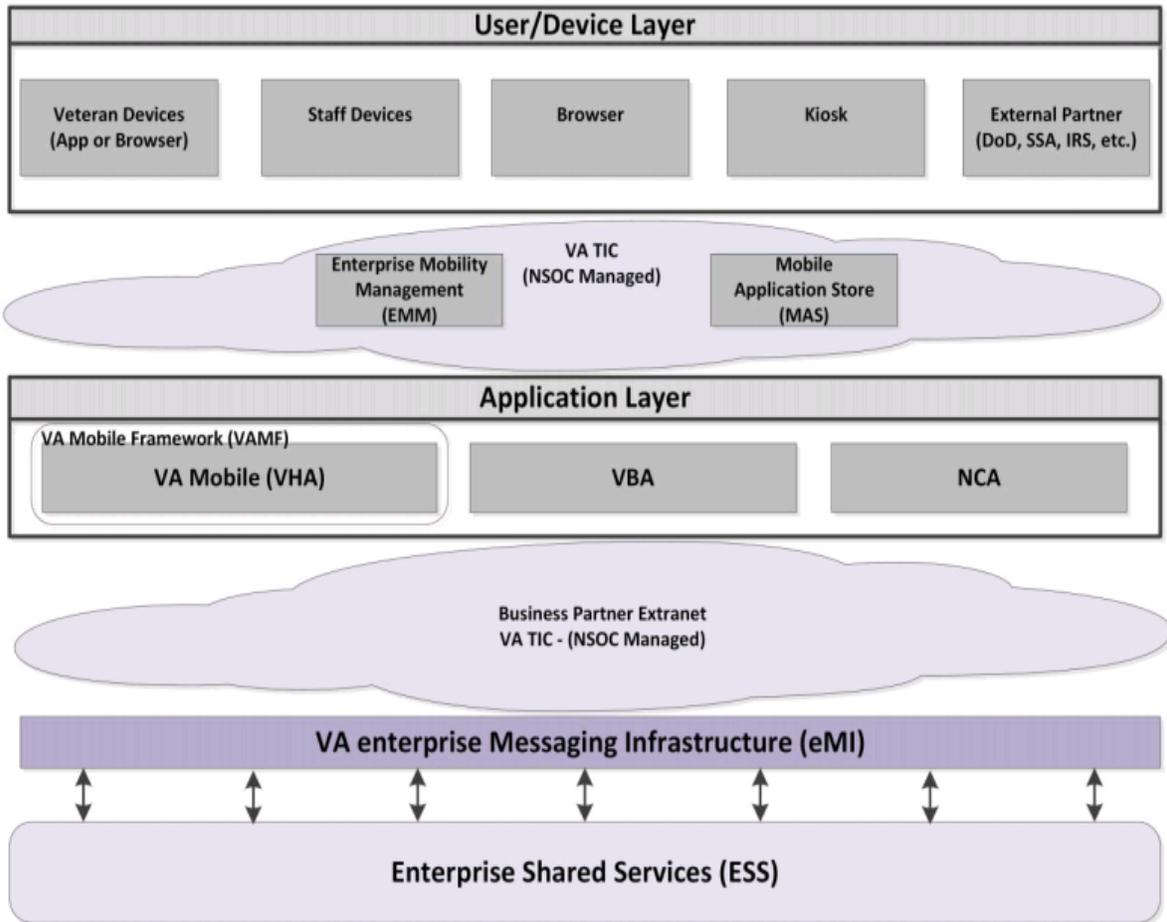
MAE also includes project management tools such (e.g., JIRA), the mobile solutions development wiki, and a documentation repository.

The high-level application design for each mobile application is provided through the HealthAdapter model depicted in Figure 10-2. "The HealthAdapter has been designed to decouple the service endpoints, business logic, and data sources from each other … decoupling data sources makes it easier to utilize the HealthAdapter for different needs" (VA, 2014l). Separate HealthAdapters are provided for Veteran-facing applications and staff applications.

Figure 10-2. Mobile Application Health Adapter


Source: VA, 2014l.

VA provides a "to-be" architecture (VA OI&T ASD, 2014) for enterprise mobile solutions (Figure 10–3) and evolving mobile capabilities and infrastructure to all VA Lines of Business (LOBs). The to-be architecture shows a uniform VA enterprise with a seamless network and data access experience across all Veteran- and clinician-facing applications regardless of user platform, role, or location, and a reliable user experience that conforms to and enforces standards (HL7, FHIR, etc.).

Figure 10-3. VA Mobile Framework "To-Be" Logical Architecture


Source: VA OI&T ASD, 2014.

The to-be architecture also allows high-level interactions between multiple users/devices on varying platforms accessing Enterprise Shared Services (ESS) through both internal and external applications. This is achieved through the respective LOB mobile environments contained within VAMF. VA is also developing further detailed guidance through capability-specific design patterns and through the implementation of the VA Mobile Application Reference Architecture (MARA).

Additionally, OI&T's Architecture, Strategy, and Design (ASD) team has identified a way forward that includes, but is not limited to, more robust mobile device management (MDM) for staff, mobile security, application management, deployment, certification, and governance.

10.1 Findings

Finding 10.1.1: VA mobile capabilities are extending health care delivery beyond physical facilities to Veterans. VA is releasing mobile applications that capture patient satisfaction but not patient-generated health data.

The Connected Health office has delivered more than 20 mobile applications to a user base that includes Veterans, caregivers, and other health care providers. The limited number of applications reflects VA's very recent adoption of mobile approaches and the rollout of state-of-the-practice mobile infrastructure and applications within VA. Connected Health and its partners within OI&T continue to deliver and execute pilot programs while increasing infrastructure capability. The partnership model at the working level between Connected Health and OI&T Product Development Mobile Infrastructure teams is based on mutual respect and strong leadership with commitment to success of mobile capability for VHA.

The initial Veteran-facing applications are simplistic relative to their interactions with clinicians and in general provide the ability to view patient (Veteran) data and (Veteran) self-management applications. Additionally, VA has embarked on developing a video visit capability to extend telehealth through the of use mobile sensing capabilities. Video Visits is the first mobile application that will use multiple sensors[20] (camera and microphone) to gather and exchange patient information.

VA is releasing mobile applications that capture patient feedback/satisfaction.[21] However, VA does not currently capture patient-generated health data. In the private sector, patient-provided data help create a data-driven health system and enable a shift from "sick care" to "health care."

Finding 10.1.2: Connected Health is underfunded and understaffed for achieving the aggressive initiatives and development activities identified in its operating plan. VHA should evaluate opportunities to enhance access and satisfaction through relatively small investments in mobile solutions.

According to its own operating plan (VA OI&A, 2014a), Connected Health is underfunded and understaffed with "$26.6 million of unfunded contracts… [and] experiencing a significant shortfall in personnel resources, particularly experienced program managers…" (VA OI&A, 2014a). In the same plan Connected Health sets forth an aggressive set of initiatives and development activities for the next two fiscal years. OI&T currently has difficulty filling open job requisitions, which reduces the efficiency of the organization. Thus, it cannot fill key positions, specifically engineering positions at the mobile infrastructure and technology senior leadership (Executive Director) levels. This inhibits the execution of mobile programs.

In general, mobile applications are small, self-contained capabilities, so development requires less investment to deliver focused, incremental capability, and can have higher proportional impact. For example, Business Solutions cites four specific areas where mobile apps have had a positive impact:
- **Addressing chronic disease**: An Accenture study of early trial data revealed a 15 to 20 percent reduction in hospital days and 30 percent fewer emergency room (ER) visits (Accenture, 2015).

---

[20] Typical mobile devices include several sensors, including microphones, cameras, ambient light, proximity sensor, gyroscope, and compass as well as Bluetooth, Wi-Fi, and GPS radios (from Apple iPhone 4 Specifications [https://www.apple.com/fr/support/]).

[21] https://mobile.va.gov/appstore

- **Avoiding non-urgent use of the ER**: iTriage, an app that offers a symptom checker, location of the nearest urgent care or retail clinics and ERs, and a comparative cost of those providers, boasts a potential savings of $300 to $3000 per visit (Aetna, 2015).
- **Reducing preventable readmissions**: The Mayo Clinic conducted a controlled study involving mobile monitoring applications for cardiac rehabilitation patients and found a 40 percent decrease in readmission for patients who did use the app, resulting in a significant reduction in costs and penalties (Mayo, 2014).
- **Improving prescription adherence**: An app with reminders could easily send push messages to the provider and patient to help improve prescription adherence rates (Lynch, 2013).

While mobile technology could have strategic importance to VA in increasing Veteran access and Veteran satisfaction, the *Blueprint for Excellence* (VA, 2014c) does not explicitly identify mobile application development as a priority.

Finding 10.1.3: While VA can develop and deploy mobile applications successfully, it cannot do so at the pace of the commercial sector.

The major contributors to delays in developing and deploying mobile applications appear to be PMAS's documentation, process, quality assurance, and certification requirements. As described in Section A.1 of this report, PMAS documentation and processes add overhead to any development project—including small-scale mobile app development projects. The required quality assurance processes for compliance and governance are based on governance policies and procedures for large IT systems. Mobile application projects must follow the same or similar PMAS steps/workflow as new capabilities for VHA/VBA/NCA. Thus, each mobile application release encompasses more than 50 discrete artifacts required for deployment to the user communities (VA, 2013b).

The Connected Health team seeks to follow commercial mobile delivery practices to speed delivery of mobile products that increase access and satisfaction for Veterans and clinicians/providers. Trends in mobile application development rely on user (i.e., Veteran) feedback and rapid application modification and deployment. Current practices in commercial industry indicate multiple releases per day is the norm for organizations adopting continuous delivery approaches. (Valasquez, 2014). For iOS applications, there is an additional one-to-two week delay for approval from Apple to include it in its AppStore (Apple, 2015b).

OI&T Product Development and Connected Health typically require fewer than six staff months and anecdotally as little as three months to develop a mobile application. However, quality assurance and certification requirements delay deployment over 90 days (VA OI&A, 2014a). This totals over nine months of development and certification time before an app can be deployed to the Google Play Store or to Apple for approval to put in its AppStore.

10.2 Recommendations

Recommendation 10.2.1: VA should explicitly identify mobile applications as a strategic enabler to increase Veteran access, satisfaction, and patient-generated data to help VHA transition to a data-driven health system.

Current technology trends include using and taking advantage of mobile devices as personal sensors and activity monitors to collect data to feed into health, fitness, and medical applications. These applications have become more powerful with innovative use of social media to gather community input and data to modify and expand options within a particular application. For example, an input option in diet applications can assess aspects of the food to be consumed.

As VA rolls out mobile applications, it has an opportunity to absorb data generated by Veterans to help clinicians proactively manage health outcomes. Mobile applications can contribute to increased personalized attention, better health outcomes, and greater Veteran satisfaction at a low price point. As in most areas of health IT, budget and staffing present challenges. VA should build out the mobile infrastructure and streamline the mobile release (qualification and certification) processes, tailoring them to enable faster approval while not increasing liability to VA.

Recommendation 10.2.2: VA should streamline PMAS methods for mobile applications and adopt an "automate quickly" mindset for mobile application qualification, vetting, and certification within OI&T to reduce application delivery timelines.

VA should investigate the application of commercial products for static code analysis and other methods to automate quality measurement, and explore the emerging commercial market for automated application vetting products and services. In doing so, VA should follow the principles in the Guide to Vetting of Security of Mobile Applications (NIST, 2015). VA should also investigate and adopt continuous integration and continuous delivery practices for mobile development *where appropriate*, recognizing the need to ensure patient safety and accuracy of the applications developed.

Recommendation 10.1.3: VA should open the development of VA mobile applications to third parties to increase delivery of health care to Veterans through innovative community-developed mobile solutions.

VA should explore the possibility of allowing external entities (third parties) to develop mobile applications that can be released via the VA AppStore. If the governing agreements properly address privacy and security concerns (NIST, 2015), this may enable increased delivery of health care to Veterans through innovative community-developed mobile solutions. VA must carefully review and test all applications to ensure a consistent level of quality (including privacy, security, patient safety, accuracy, etc.) prior to publication in the VA AppStore.

VA should publish standards, quality expectations, and interfaces to the ESS, MDWS, etc. to enable third-party development and integration. VA should consider publishing these data through the Open Source Electronic Health Record Alliance (OSEHRA).

VA should also investigate and adopt commercial practices where appropriate for mobile app store efficiencies, including investigating alternative licensing and pricing models[22] with third-party providers. Further, VA should evaluate COTS health, fitness, and medical mobile

---

[22] Alternative licensing and pricing model considerations is a continuing topic at the Federal Mobile Computing Summit series as well as the Federal CIO Council (Federal Mobile Computing Summit, 2014).

applications for use by Veterans and providers for ROI of build versus buy. VA could consider using existing third-party rating systems, such as iMedicalApps, to determine the potential value of third-party health and medical mobile applications.

11 Future Vision for VA and VHA

To significantly improve VA IT strategies and health IT, Assessment H recommends that VA emulate successful high-performing health care system (HPHS) organizations, implement enterprise IT service management as the organizational process for developing and managing delivery of VA health IT to achieve stakeholders' prioritized outcomes, and become a learning health system (LHS). As a part of this VHA should undertake an initiative on "precision medicine" to regain a cutting edge position in health informatics.[23] VA and VHA already have elements of these factors in place and can build upon them to create the future vision described in this section.

11.1 High-Performing Health Care System

Concept

In visits to centers with HPHSs, the Assessment H team observed a number of common attributes:

- **Incentive to improve.** Many of the HPHS organizations at one time faced serious financial difficulties, requiring them to transform their delivery model. The presence of a "burning platform" created the necessary willingness to make transformational changes.

- **Physician leaders.** Physicians played leadership roles in all key organizations, even the IT organizations. Because physicians are highly educated, they tend to learn the requisite skills rapidly, and because they understand the health care system and patient needs, they can prioritize activities and investments that will provide maximum benefit to patients. Later in the transformation, HPHS organizations identified physicians with leadership potential and placed them in a training pipeline to ensure availability of an adequate supply of trained, qualified leaders in the future.

- **Patient-centric.** The organizations established health care quality and patient satisfaction as their primary objectives. Decisions about investments and changes to processes were based on potential improvements in these two areas.

- **Same-day access.** Although the goals initially appeared impossible, HPHS organizations changed their models of supply and demand, shifted their priorities, improved their clinical workflows, and ultimately achieved their goals of same-day access.

- **Fully integrated IT system.** The organizations constantly updated their IT systems with the latest data. The systems shared data across all applications to minimize manual data entry. As a result, physicians entered diagnoses and treatments in the system, enabling rapid billing of insurance companies.

- **Data transparency.** The organizations made data broadly available to all providers and clinicians so they could observe quality and satisfaction by provider, clinic, and facility. The data also provided the basis for examining new health care approaches and collecting

---

[23] https://www.whitehouse.gov/the-press-office/2015/01/30/fact-sheet-president-obama-s-precision-medicine-initiative

evidence about which innovations improved quality and satisfaction. Ultimately, the integrated IT system provided the basis for an LHS system. The quality and patient satisfaction data for all providers was visible throughout the system. Physician leaders coached underperforming physicians rather than punishing poor performance. Highly performing physicians and teams shared their approaches so that everyone in the system improved. Because many physicians are high achievers, the mere ranking of their scores led to efforts to improve their results.

VHA Exemplar

A skeptic might dismiss the approaches of the HPHS organizations as feasible in the private sector but not realistic for VHA with its burden of federal regulations. However, at least one VISN has demonstrated the ability to overcome or work around the onerous regulations to achieve some of the best health care outcomes of any VISN in VHA.

Assessment H conducted an analysis to identify those VAMCs that have consistently demonstrated high performance at VHA. The team considered several sources of information and ranked the VAMCs across all of these factors. Key sources used for this analysis include:

- Veteran Affairs Site Tracking (VAST) FY15 – Complexity, rural/urban, VAMC classification
- American Hospital Association facility data, 2014 – Adjusted admissions, volume of patients, number of beds
- SAIL FY15, Q1 data (SAIL Value Data, 2015)
- Survey of Healthcare Experiences of Patients (SHEP) FY12, FY13, FY 14
- The Joint Commission top performers 2011, 2012, 2013 (The Joint Commission, 2015)
- Robert W. Carey Performance Excellence Award 2010, 2011, 2012, 2013 (Carey, 2015)
- Health Grove SMART Scores (HealthGrove, 2015)
- VHA leadership vacancy report as of 3/9/2015

The resulting analysis put several of the VAMCs at VISN 4 in the top tier:

- Five of the ten VAMCs with the most SAIL scores in the top 10 percent are located in VISN 4.
- The Erie VAMC has received several national awards, including the VA Secretary Robert W. Carey Performance Excellence Award in 1998 and 2000, in addition to receiving national recognition as one of the nation's top Homeless Care Programs and as a Top Performer in the Joint Commission's Key Quality Measures program in 2011 and 2012.
- VISN 4 leads the nation in non-recurring maintenance (NRM) investment and has the lowest facility deficiency rate of all VISNs (where the deficiency rate is defined as the total deficiency costs divided by the total replacement costs).

To understand the secret to their success, the Assessment H study team visited the VISN 4 leaders, the Pittsburgh VAMC, and the Erie VAMC. Findings indicated that VISN 4 and its VAMCs apply many of the approaches found in the private sector HPHS organizations.

- **Incentive to improve**. A large number of the smaller VAMCs faced declining Veteran populations. As a result, they realized it would be difficult to maintain key clinical skills at many of the hospitals because each VAMC would treat too few complex cases. Therefore, they transformed the delivery model in western Pennsylvania to a hub-and-spoke approach: the smaller VAMCs would provide standard services, but Veterans with the most complicated needs would be transferred to the Pittsburgh VAMC, which maintained an experienced cadre of physicians.

- **Leaders.** The leaders across VISN 4 and the nearby VAMCs have long tenure in VISN 4 and have built a strong rapport and trust. This improves collaboration and coordination compared to VISNs that have a higher rate of leadership turnover.

- **Patient-centric.** VISN 4 organizations established health care quality and patient satisfaction as their primary objectives. Most VA personnel are already committed to these objectives, but the VISN 4 facilities take steps to systematically measure and improve quality and satisfaction. For example, the Erie VAMC asks patients to fill out a small questionnaire on an index card to understand the patient's satisfaction with their visit. The Erie leaders hold periodic town hall meetings with the Veteran Service Organizations to answer questions and request suggestions on how to improve. The Erie VAMC also engages frequently with the local television, radio, and newspaper organizations to publicize health-related events and share information. This leads to strong rapport with and support from the Veterans in their area.

- **Same-day access.** VISN 4 recognized that Veterans would accept the hub-and-spoke approach only if the Pittsburgh VAMC could treat all high-acuity cases when they arrived. As a result, VISN 4 established an access objective of "Never Say No." The first step was to overhaul the rooms, pre-admission processes, and observation processes to make them sufficiently flexible to manage a broader range of conditions. Second, VISN 4 established agreements with local hospitals (in particular, the University of Pittsburgh Medical Center) to take lower acuity cases when needed to ensure available bed space for incoming patients. Finally, VISN 4 developed real-time reports based on the timely data managed at the VISN level to track discharges and admissions to ensure they had adequate beds available. The larger load of high-acuity cases has enabled the Pittsburgh VAMC to maintain a quaternary care certification.

- **Fully integrated IT system.** VISN 4 implemented an operational data store that contains centralized copies of all data (100 percent sampling) and is constantly refreshed with the latest data. The system shares data across applications to minimize manual data entry. Because the data are always current, changes in quality or in patient satisfaction are immediately visible. Likewise, if a facility deploys an innovative process to improve quality or satisfaction, the results are immediately apparent and available for sharing throughout the system. New applications and reports can be developed to monitor and control innovative processes.

- **Data transparency.** Using the VISN 4 operational data store, providers can see how they compare to their peers. While the system does not show the names of the peers, providers can observe whether they perform near the top or bottom among providers in

the VISN with respect to quality and satisfaction. This provides a powerful incentive for providers to improve. The leadership places emphasis on coaching the low performers on how to improve (as opposed to implementing punitive measures). However, the data also provide a means to hold physicians accountable if they make no effort to improve. In addition, the data serve as the basis for examining new health care approaches and collecting evidence about which innovations improved quality and satisfaction. Finally, the accurate, timely data serve as the basis for improving communications, responsiveness, and issue resolution on contracts with outside providers. In essence, the integrated IT system creates the foundation for an LHS.

- **Continuous process improvement.** Using the VISN 4 operational data store, staff can develop new applications and reports to monitor and control innovative processes. The leadership encourages a culture of innovation and the IT systems provide evidence of improvements. At the Erie VAMC, a robust lean improvement approach led to extraordinary improvements in hiring and food service built on strong employee engagement. At the Pittsburgh VAMC, evidence-based system redesign lay at the heart of achieving the "Never Say No" objective. A periodic forum called "Expoceptional" gives employees the opportunity to suggest improvement initiatives based on their familiarity with the front-line processes.

In summary, VISN 4 achieves excellent outcomes in quality and patient satisfaction for the Veterans it serves in many categories of service. An effective, experienced leadership team, enabled by effective IT services that allow leaders to monitor and control their processes in real time, drives much of this outstanding performance.

11.2 Enterprise IT Service Management

Concept

ITSM refers to a discipline for managing IT services centered on the customer's perspective regarding IT's contribution to the business. ITSM provides an enterprise framework to structure IT-related activities and the interactions of IT personnel with business customers and users. The current OI&T ITSM philosophy is that of an internal, project-focused organization rather than that of a service provider model focused on the enterprise, customer needs, and service delivery to both VHA personnel and Veterans.

The standard Information Technology Infrastructure Library (ITIL, 2011), Control Objectives for Information and Related Technology (COBIT), and International Standards Organization (ISO) 20000 contain ITSM best practice frameworks. These standards present an enterprise-level view and can help improve an organization's IT service delivery and support capabilities. All three offer a comprehensive set of best practices and practical guidance that could help OI&T oversee and manage all key aspects of its work, including governance, enterprise strategy and goals, tactical planning, and operations.

OI&T has defined processes for project management in PMAS which require an agile software development methodology. However, PMAS imposes numerous requirements for process steps and upfront documentation that undermine agile development. To improve design,

---

development, and deployment of IT services, systems, and products, OI&T could tailor its implementation of the ITSM framework to augment existing practices with industry best practices and achieve the best balance of enterprise IT management for VA.

Industry Standard

ITIL provides a full service lifecycle perspective on managing IT services at an enterprise level. ITIL lifecycle phases include Strategy, Design, Transition, Operations, and Continual Improvement. Each phase includes processes, activities, metrics, and technology considerations, as well as integration points to the other lifecycle phases.

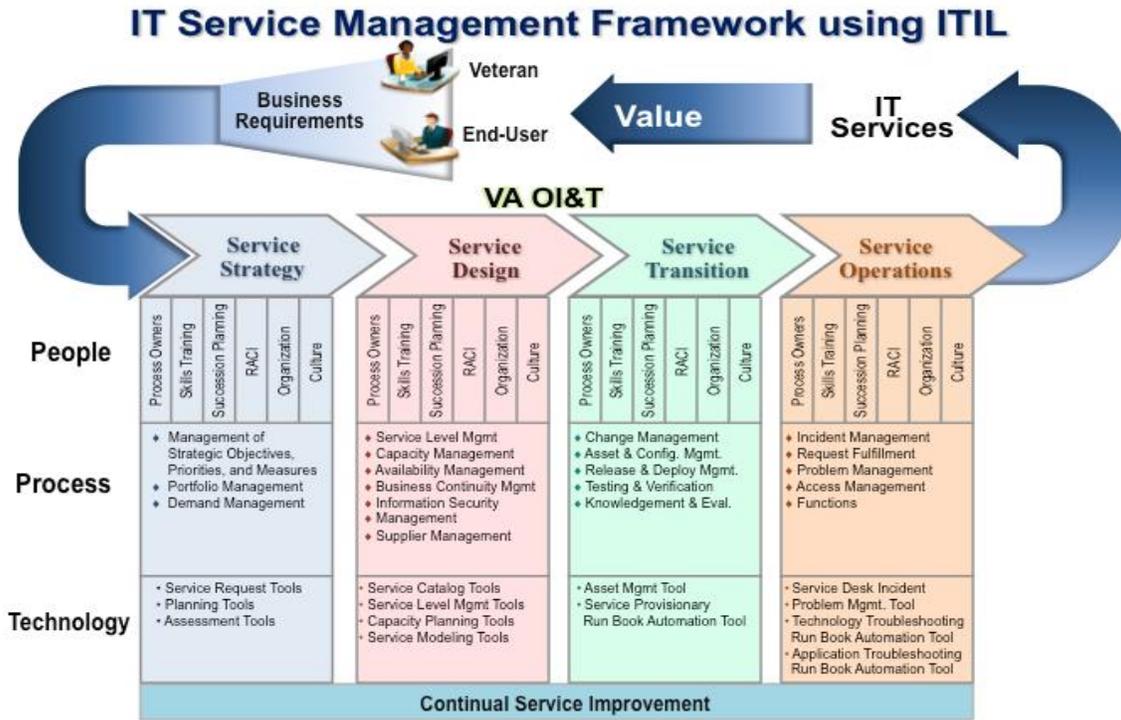
ITIL is the de facto industry standard for implementing ITSM best practices and can serve as a reference knowledge base of robust, mature, time-tested IT management practices that OI&T could harmonize with its current practices. Both federal agencies and private sector companies have implemented ITIL successfully.

Benefits for VA

An ITSM framework based on ITIL helps organizations manage and improve key areas such as IT governance, organization, processes, and technologies. OT&T could leverage ITIL to refine its definitions of services, standardize IT processes, define roles and responsibilities, establish a centralized IT governance and optimized IT support structure, and implement measures that focus on metrics relevant to Veterans and end users. By applying ITIL best practices, OI&T should realize the following benefits:

- Better alignment between OI&T services and VHA and Veteran priorities and needs
- IT acquisition and investment decisions that result in tangible and quantifiable business value
- Reduction in IT costs via improved planning and controls
- Secure and reliable operation of IT services, reducing failures and unexpected disruptions and meeting service levels
- Standardized, consistent IT processes implemented across OI&T groups with clearly defined roles and responsibilities
- Continuous service improvement through ongoing focus on improving quality, effectiveness, and efficiency of IT processes and services
- Improved communication and information sharing between OI&T and VHA business units
- Improved customer satisfaction for Veterans and end users.

Figure 11-1 provides a notional view of an ITSM framework using ITIL.

Figure 11-1. IT Service Management Framework


Source: MITRE rendition of ITSM as applied to OI&T

By adopting proven and tested ITSM best practices, OI&T could become a business-aligned, customer-focused, high quality provider of services and capabilities to VA, and position itself to become a trusted and capable mission-enabling partner.

11.3 Learning Health System

Concept

Since 2006, the Institute of Medicine (IOM) has promoted the learning health system (LHS) concept (Olsen et al., 2007). An LHS is

> . . . one in which science, informatics, incentives, and culture are aligned for continuous improvement and innovation, with best practices seamlessly embedded in the care process, patients and families active participants in all elements, and new knowledge captured as an integral by-product of the care experience (Roundtable, 2012).

Continuous learning enables organizations to:

- More quickly produce evidence of the effectiveness of treatment interventions and wellness programs, so that they can be adopted as early as possible to reduce deaths, improve patient health, and reduce cost
- Manage the increasing complexities in health care (i.e., increasing diagnostic, treatment, and care management options; technological advances in medicine; fragmented financing; and complicated clinical workflows (Smith et al., 2013)

- Manage unsustainable increases in health care costs (Smith et al., 2013)

Table 11-1 describes the characteristics of an LHS.

Table 11-1. Characteristics of a Continuously Learning Health System

Science and Informatics
Real-time access to knowledge—Continuously and reliably captures, curates, and delivers the best available evidence to guide, support, tailor, and improve clinical decision making and care safety and quality.
Digital capture of the care experience—Captures the care experience on digital platforms for real-time generation and application of knowledge for care improvement.
Patient-Clinician Partnerships
Engaged, empowered patients—Anchored in patient needs and perspectives; promotes the inclusion of patients, families, and other caregivers as vital members of the continuously learning care team.
Incentives
Incentives aligned for value—Incentives are aligned to encourage continuous improvement, identify and reduce waste, and reward high-value care.
Full transparency—Systematically monitors safety, quality, processes, prices, costs, and outcomes of care; makes information available for care improvement, informed choices, and decision making by clinicians, patients, and their families.
Continuous Learning Culture
Leadership-instilled culture of learning—Stewarded by leadership committed to a culture of teamwork, collaboration, and adaptability in support of continuous learning as a core aim.
Supportive system competencies—Constantly refines complex care operations and processes through ongoing team training and skill building, systems analysis and information development, and creation of feedback loops for continuous learning and system improvement.

Source: Grossman, Powers, & McGinnis, 2011.

A continuously learning health system requires a digital infrastructure (Grossman, Powers & McGinnis, 2011) that:

- Supports diagnosis (e.g., molecular diagnostics), treatment (e.g., individualized medicine), and research (e.g., genetics, genomics) that have high computational needs
- Integrates *intelligent* functionality into and across EHRs, personal health records (PHRs), telehealth and mobile health applications, and electronic monitoring devices, to better:
  - o Engage patients and guide them toward healthier lifestyles
  - o Coordinate care
  - o Anticipate resource needs of health care facilities as well as care needs of patients

o Predict outcomes of individual patients

- Provides large-scale, federated databases containing clinical, behavioral health, administrative, socio-environmental, and patient-generated health data that can be accessed by:

  o Clinicians from different facilities to get a comprehensive and longitudinal view of the patient

  o Clinical and health services researchers who can analyze the data to measure outcomes, program performance, post-market drug monitoring, and social determinants of health

- Enables seamless interoperability between electronic systems and health information exchange among providers, patients, payers, and researchers.

Transforming VHA into an LHS

The LHS can serve as an excellent transformation model for VHA as it strives to return to its previous status as a world-class health care delivery system. The Assessment H team found evidence that VHA aspires to be an LHS and has adopted LHS concepts. The VHA *Blueprint for Excellence* states that "[R]obust clinical and health services research supports VHA's efforts to be a learning health system" (VA, 2014c). Moreover, Strategic Initiative #5 (page 23) describes how VHA wishes to "foster an environment of continuous learning" and use it to improve organizational effectiveness, foster psychologically safe risk-taking, and increase personal accountability.

VHA deserves praise for adopting these important LHS concepts at the strategic planning level, but transforming into an LHS requires a fuller commitment to planning and, more important, to executing its concepts and tenets. *VHA would have less difficulty transforming into an LHS than other health systems once it makes such a commitment.* VHA already has many of the digital infrastructure building blocks of an LHS (Kupersmith, 2007); a fuller commitment would allow VHA to improve and then assemble these building blocks into a tightly integrated transformational model. Executing that model would then enable VHA to transform into an LHS over the next few years.

IOM reports dating back to 2007 (Olsen et al., 2007; Grossman, Powers& McGinnis, 2011; Smith et al., 2013) have highlighted excellent examples of how VHA had begun building LHS capabilities, including rapid learning (Etheredge, 2007a; 2007b). In addition, the reports cite VHA as one of the health systems in the United States with the best potential for becoming an LHS. Etheredge (2007a; 2007b) further suggests that VHA could become one of the public sector leaders in transforming into an LHS.

Transforming VHA into a Learning Health System

Clearly, VHA has the building blocks for an LHS. From a strategic planning perspective, the *Blueprint for Excellence* (VA, 2014c) states the aforementioned aspiration to become an LHS, as well as a strategic initiative (#5) that specifically calls for the application of LHS principles to achieve organizational effectiveness. However, the *Blueprint* contains other themes and

strategic initiatives that, while not called out as such, reflect LHS concepts and tenets. For example, it notes the need for evidence-based results as VHA:[24]

- *Transitions* from a "sick care" *to a "health care" model* (theme)
- Delivers *high-quality, Veteran-centered care* that compares favorably to the best of private sector in *measured outcomes, value, efficiency, and patient experience* (strategy #2)
- *Leverages information technologies, analytics,* and models of health care delivery to *optimize individual and population health outcomes* (strategy #3)
- Advances *personalized, proactive, and patient-driven health care*, and *engages Veterans,* inspiring them to their highest possible level of health and well-being (strategy #6)
- Leads the nation in *research* and treatment of military service-related conditions (strategy #7)

From a planning perspective these strategic initiatives set an excellent course for VHA to transform into an LHS. Fully committing to the LHS would require VHA to frame the above initiatives more extensively within the LHS vision and concept.

Leveraging VHA's Digital Infrastructure

VHA also has the essential components of a digital infrastructure for an LHS (Kupersmith, 2007). In addition, Assessment H's analysis of VHA's informatics and analytic capabilities, as well as VA's IT infrastructure and health IT applications, found the following more notable digital infrastructure capabilities:[25]

- A portfolio of IT applications—including VistA/CPRS, HealtheVet, and their telehealth and mobile applications—currently captures demographic, clinical, behavioral health, and administrative data, with VistA Evolution/eHMP positioned to do so in the future (digitally capturing the care experience, Table 11-1).
- VHA plans to use smartphone apps and monitoring devices (e.g., Fitbit) to capture patient-generated and other health data (Table 11-1).
- The Clinical and Regional Data Warehouses currently serve as large-scale databases, providing clinicians and researchers near-real-time access to knowledge (Table 11-1).
- VHA plans to conduct genomic research and perform individualized medicine (supporting research and clinical processes with high computational needs).
- VA's OI&A plans to build in intelligent functionality within VistA Evolution (new knowledge captured as a natural by-product of providing care).

Challenges in the Transformation to an LHS

While VHA may possess the essential components of an LHS, it must still develop or enhance other components. With regard to the characteristics of a continuously learning health system

---

[24] Italicized words tie back to the definition of an LHS stated above.

[25] Parenthetical statements tie back to Table 11-1 and LHS tenets stated above.

found in Table 11-1, VHA appears to have a good start on Science and Informatics, but given the current culture, resources, IT infrastructure complexity, and implementation issues described in Assessment H findings, a number of characteristics listed in Table 11-1 remain as challenges for VHA. For example, OI&T and VHA must work together to align incentives to support continuous improvement and reduce waste. Moreover, while OI&A truly aspires to monitor safety, quality, processes, and outcomes, it lacks sufficient resources and staff to create all the metrics needed to do so and generate the reports to monitor these areas. This lack of resources and staff also prevents OI&A from channeling process and quality improvements back to the clinicians in the field.

In addition, leadership committed to a culture of teamwork and collaboration must exercise stewardship of the continuous learning culture. Given the lack of effective collaboration between OI&T and VHA, these two entities must first rebuild their own levels of trust and collaboration before they can instill a culture of learning within the staff.

Summary

VHA aspires to become an LHS and already has many of the essential components to become one. In fact, LHS experts have stated that VHA is one of the few health systems in the United States with the best potential to become an LHS. However, transforming into an LHS requires a fuller commitment. VHA plans must more forcefully convey a concrete vision of VHA as an LHS and the actions VHA must perform to achieve that vision. Even more important is how VHA executes those actions. VHA must overcome the cultural, resource, staffing, infrastructure, and implementation issues identified in the Assessment H findings. By transforming into an LHS, VHA can regain recognized status as a world class health care delivery system.

Appendix A   Assessment H Background Data

A.1   Project Management Accountability System (PMAS)

A.1.1   Background

Prior to a congressionally directed internal review by the VA Office of Inspector General (OIG), VA's on-time IT project delivery success rate was in the mid-30 percent range. Many projects were delivering late, not delivering, or delivering inaccurate functionality resulting in millions of dollars being wasted or mismanaged with little or no accountability.

In response to the Congressional direction, the VA Office of Inspector General conducted an internal review of more than 280 IT development projects (VA OIG, 2009). OIG discovered that a major cause was the lack of timely, thorough IT development project reviews and poor management of project or program life cycle costs and schedules. OI&T implemented the Project Management Accountability System (PMAS) across all projects to address these issues and improve VA's IT on-time project delivery success rate.

Applicability

PMAS applies to all IT projects except those that are managing the sustainment of existing systems and that are not defined as product delivery projects. Infrastructure projects that provide new capability fall under the management discipline of PMAS. VA IT projects, whether funded by the IT Appropriation or any other appropriation, and that are resourced at a value greater than $250K (which includes both contract and full time equivalent) total lifecycle cost, must use PMAS.

Structure

PMAS focuses on delivering IT projects and recognizes that these programs fit into a larger VA planning, programming, budgeting and execution structure in which large collections of related work are represented in VA's multiyear plans. "A work stream represents the budget request, which identifies the specific goals within the Program or Initiative that VA will be achieving for the two-year budget cycle. Each project executes by increments, which are manageable subsets of project work delivered every six months or less." Each increment can then have releases, which are even smaller subsets of usable functionality put into production within each increment.

PMAS execution starts after the Initiative/Program and Work Stream levels and begins at the Project level, which is also when the PMAS project officially commences. Every PMAS project must have an Integrated Project Team (IPT) and associated leadership structure.

PMAS outlines a process for managing single projects in short six-month increments and relies on IPTs to manage integration across dependent initiatives. This approach does not scale for large, complex enterprise initiatives. For example, VistA Evolution is a large program comprising over 40 individual projects. PMAS is used to manage each project, but integration and management of dependencies across these projects is the sole responsibility of the IPT teams,

which provide little feedback and discussion. There is no overarching process outside of PMAS to establish program structure needed to manage multiple, complex initiatives as a program.

PMAS describes "project" processes, documentation, and roles and does not provide "program" specific governance or oversight. However:

- An IPT may be responsible for more than one project if it is established at the program level.

- A program level IPT could be chaired or co-chaired by the IT Program Manager (PM), while the IT Project Manager is the chair or co-chair for a project level IPT. The primary customer or Business Sponsor must serve as a member of the IPT and is frequently the co-chair with the IT PM.

- Program-level artifacts applicable to all programs and projects may be developed at the Data Access Service/Deputy CIO level.

- Projects are welcome to use program level artifacts, if applicable. Program-level artifacts promote consistency, save planning time, and improve quality through reuse. If a program-level artifact is being used for a project artifact requirement, the information must be clearly stated at the Milestone Review.

A.1.2   Principles and Objectives

PMAS's primary objective is to establish a disciplined repeatable approach to identify the processes, products and responsibilities of the IT project team, IPT, vendors, and all stakeholders responsible for achieving on-time project delivery. PMAS is based on eight major principles:

1. Incremental development - PMAS requires delivery of new capability or capabilities in increments of six months or less to reduce delivery risk.
2. Integrated teamwork across VA - All PMAS projects must have a fully functioning project or program level Integrated Project/Program Team (IPT) comprising all applicable stakeholders from OI&T, the Office of General Counsel (OGC), and the Office of Acquisition and Logistics (OAL), in addition to the Business Sponsor (VHA).
3. Accountability – PMAS teams continuously report and hold mandatory 60-day project assessments in addition to normal milestone reviews to assess schedule, cost and scope.
4. Resource management – Project increments will not start or maintain execution without the allocation of resources required to execute the project. Projects are provided resources by increment based on established OI&T project priorities.
5. Transparency – PMAS requires that each project publish cost, schedule, quality, scope, and resource status throughout the project's lifecycle. Projects are continuously monitored and flagged (Green, Yellow, and Red) to provide status and warn of increased risk and issues that require management intervention. This information is collected and published in the VA internal PMAS Dashboard for reporting both internal and external to VA—most notably to the Federal IT Dashboard and to Congress.
6. Senior leadership engagement – Leadership participates in major milestone reviews in addition to the continuous dashboard and reporting mechanism mentioned above.

---

7. <u>Direct participation by the customer</u> - Sponsors participate as member of the IPT, as reviewers for critical milestone decisions (e.g., New Start State, Closed State), participate in user testing and make the final decision to accept the delivery of capabilities.
8. <u>An emphasis on agile program and development practices</u>.

A.1.3   Management Process

The PMAS Guide 5.0 (VA OI&T, 2014e) documents the current process life cycle, governance mechanisms, participant roles and responsibilities and reporting requirements. PMAS is supplemented by ProPath,[26] a repository that contains the detailed artifacts, processes, and procedures to execute PMAS. An electronic web-based PMAS Dashboard is the authoritative source for all PMAS data. It captures not only project-level data, but also increment data. The PMAS Dashboard is also used to submit data to the Federal IT Dashboard via the OMB 300B process and provides senior leaders visibility into the current status of the projects.

PMAS defines four standard states: New Start, Planning, Active, Closed and two conditional states: Provisioning and Paused in which a program can reside. PMAS projects may be in only one of six states at a time. Advancement through the states is made by successful completion of the requirements for each state and through approval at the required Milestone Review.

Source: VA OI&T, 2014c.

New Start State, Planning State, and Closed State focus at the project level, while the active State focus is on increments and product delivery.

New Start – During the New Start State, the initial project scope and intent are defined by the Business Sponsor (who works with either the IT Program Manager [ITPROG] or PM within the Office of Responsibility [OOR]). Artifacts that are required prior to entry into the Planning State are listed in ProPath. Projects in the New Start State must be evaluated every 90 calendar days by the OOR.

Planning State – Projects that are performing initial planning activities including: Artifacts that must be completed during the Planning State, prior to entry into the Active State, are listed in ProPath.

Active State – A project cannot remain in the Active state for more than 24 months. The Active State has three PMAS applicable increment types: Delivery, Initial Operational Capability (IOC) and Deployment. The core business objective of these processes is to develop and deliver functionality within their increments. These are known as "Delivery" increments.

---

[26] https://www.voa.va.gov/DocumentView.aspx?DocumentID=223

- Delivery: A cycle of less than six months within the project schedule in which a project develops and deploys customer accepted functionality into production within the committed increment timeline. A Delivery increment may end at IOC Entry or Deployment.

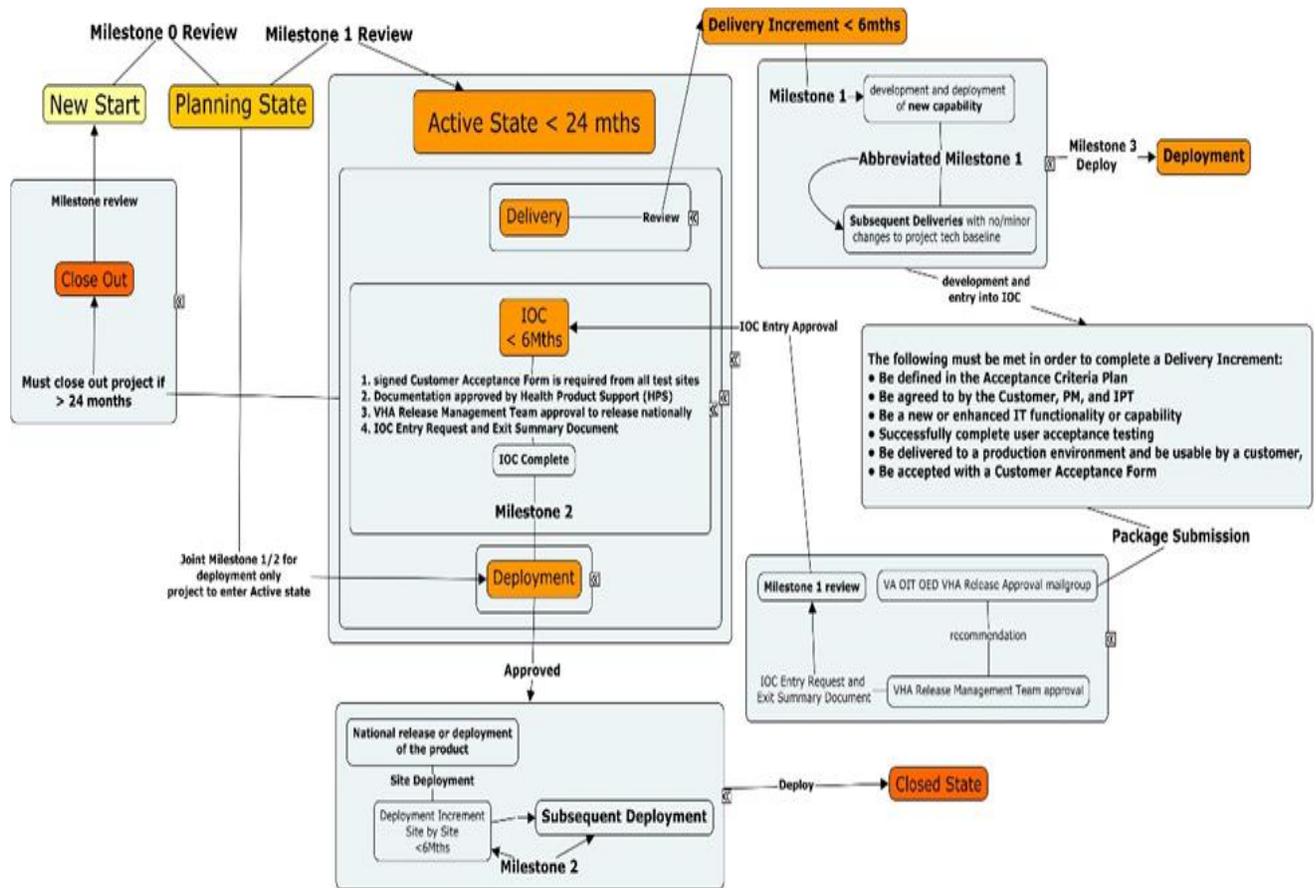
- IOC: A cycle within the project schedule for large or complex projects whose increments need to be placed into limited production environments of varying size and complexity. This is done to test the new functionality and determine if the features and functionality perform as expected and do not adversely affect the existing functionality of the product/system.

- Deployment: A cycle within the project schedule dedicated to deploying usable functionality to a system, data center, site, and/or product. Because of the nature of the functionality being deployed, the project may need to roll out its functionality in a deliberate area-by-area or site-by-site manner.

- Closed State - A project enters or is placed in the Closed State when the project objectives have been met, business priorities have changed or the project performance was poor and not meeting objectives.

An increment deliverable is defined as a new or enhanced IT capability used by one or more customers in production. This is true for software/system increment deliverables and for infrastructure upgrades, enhancements, or expansions. For some high-risk projects, delivery of a prototype or pilot may be an acceptable increment deliverable and would be approved as such during the Milestone 1 Review for that increment. For some complex systems for which field deployment is resource intensive, the increment deliverable may be defined as the first production deployment, also known as the alpha site.

Figure A-1 shows the PMAS project management lifecycle.

Figure A-1. PMAS Project Management Life Cycle


Source: MITRE summarization of PMAS and ProPath Guides process diagrams.

A.1.4   ProPath

The ProPath process supplements PMAS by providing a repository that contains artifacts, processes, and procedures. ProPath is the companion to PMAS and maps directly to the requirements outlined within the guide. It supports PMAS execution by providing the detailed processes and instructions, descriptions, roles and responsibilities required by PMAS policy and practice. It also provides a front-end Process Asset Library containing information regarding standard processes and over 400 artifacts and templates to assist project teams. Sixty of the over 400 documents and templates are deemed essential as part of the SDLC process to support PMAS milestone reviews.

Process Effectiveness

A 2009 GAO audit (US GAO, 2009) was conducted at the request of the CIO to evaluate the effectiveness of PMAS. The report indicated that OI&T created and instituted the PMAS concept without a roadmap, adequate leadership, and staff to effectively implement and manage the new methodology. Specifically, key management controls to ensure PMAS data reliability, verify project compliance, and track project costs had not been well established. Also detailed

guidance on how such controls should be used within the framework to manage and oversee IT projects had not been fully established.

In fiscal year 2011 OI&T reported that the on time delivery rate jumped to 89 percent, continued at 80 percent in fiscal year 2012 and was 82 percent in 2013. OI&T also reported that PMAS has delivered 97.3 percent of all IT commitments to its customers since its inception. However, a second follow up audit on OI&T implementation of the prior audits' recommendations (GAO, 2015b) pointed to continuing issues with process execution and impact.

The 2015 audit reported "OI&T has taken steps to improve PMAS. Although steps were taken to improve PMAS, more than five years after its launch, it still has not fully infused PMAS with the discipline and accountability necessary for effective oversight of IT development projects." OIG specifically identified that OI&T had not provide adequate oversight to ensure OIG's prior recommendations were sufficiently addressed and process controls were operating as intended; also, PMAS Guide enhancements were not implemented. OIG identified that "IT development projects are potentially being managed at an unnecessarily high risk."

PMAS does not have the proper balance between cost, schedule, and performance incentives. Incentives are weighted too heavily towards meeting the schedule. Several Assessment H interviewees reported that requirements are "deferred" to stay on schedule—"Over 80% of projects are meeting their milestones but are delivering 10% of what we wanted." Several interviewees felt that the resulting deliverables, while coming every six months, were often too short of value/capability to be useful for the cost of the deliverable increment and there was risk that the project would be completed without the minimum capabilities to be successful.

User satisfaction assessment is not mandated by the PMAS process making it difficult to understand the impact of product releases.

PMAS Efficiency

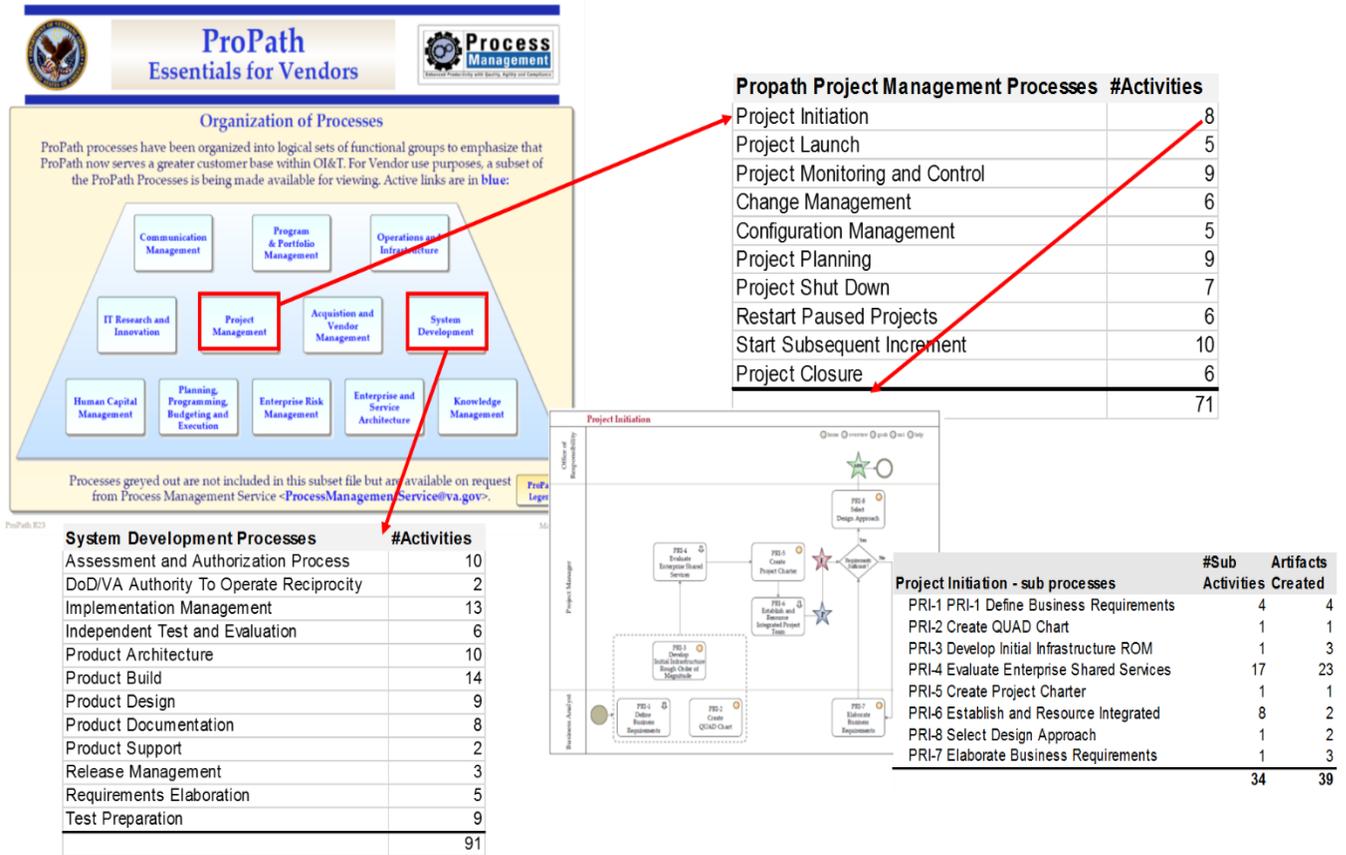
PMAS is overly complex and requires an immense amount of paperwork to complete, creating significant overhead for smaller projects – "PMAS has too much process overhead with 78 steps." In its existing form, PMAS cannot easily be tailored depending on the project's size, risk, and complexity. Most projects are smaller, putting a great burden on the projects' resources to abide by the PMAS process, to the point that in several reported cases - such as projects to quickly address defects or immediate needs, the effort to support PMAS requirements far surpassed the effort to delivering value for the project.

A recent VA OIG audit (OIG, 2013) of OI&T's PMAS implementation acknowledges that the implementation has come along since its inception, while additional work remains. Key gaps identified included lack of oversight tools, continued VA staff vacancies, and inadequate planning and compliance reviews.

PMAS has addressed several issues well. It stopped projects from living on for years and not producing anything. It accomplishes this by validating that projects have a plan, conduct regular reviews, and report progress providing greater transparency. Projects are regularly assessed when they fail to make delivery and must explain why and must produce a get-well plan. The

plan is reviewed and a decision is made as to whether to approve an extension or shutdown the project. However, Assessment H interviewees identified 15 of 46 Planners (33 percent) and 17 of 26 Builders (65 percent) who conveyed that, while PMAS improves accountability and transparency, it has become overly complex and burdensome and is impacting project efficiency. PMAS has also made many project managers risk averse and "very, very conservative." Several lead project managers acknowledged that many project managers schedule conservatively so the six months increments contain less functionality. The process needs some way to measure the quantity and quality of things being delivered.

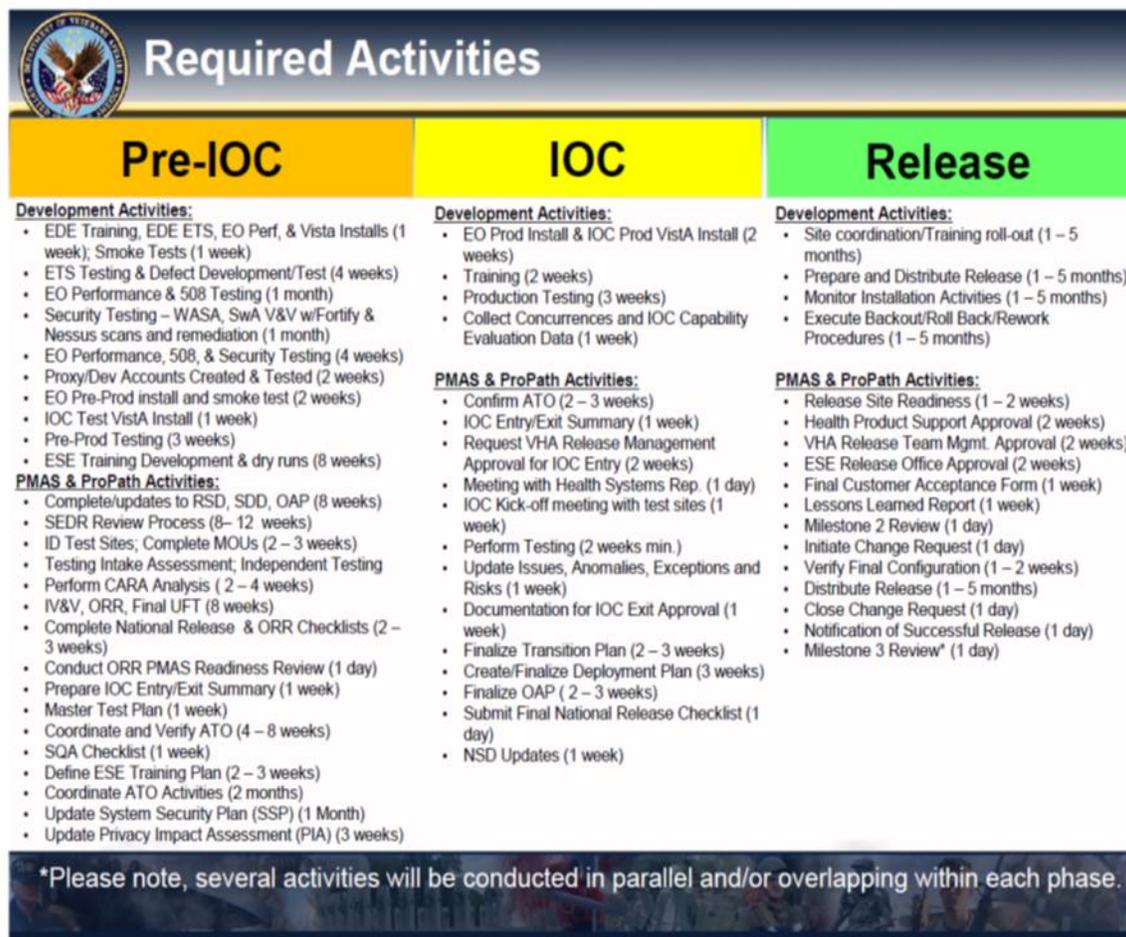
The true complexity of the management processes are captured in ProPath. The ProPath Project Management process consists of 71 separate activities focusing on the project life cycle to produce deliverables or artifacts to initiate, plan, and manage IT projects. ProPath System Development processes contain over 91 activities focused on the System Development Life Cycle producing deliverables or artifacts to design, develop, test, and implement the solution. Figure A-2 demonstrates PMAS and ProPath complexity. The top-level Project Management "Project Initiation" phase consists of eight major planning activities supported by 34 process tasks, generating or reviewing over 39 project documents or artifacts.

Figure A-2. PMAS and ProPath Complexity


Source: MITRE summarization of ProPath Guide Project Management and System Development Workflow diagrams.

PMAS is designed with some flexibility. If the specifics of the project do not require the use of all these documents and justification is given at the Milestone 1 Review, the Milestone 1 Review Board grants waivers for artifacts or ancillary processes. Projects in the Planning State must be evaluated every 60 calendar days by the OOR to determine if the project will remain in Planning, move to the Provisioning or Active State, be re-evaluated, or closed. For projects that will be technically complex, early engagement with the Architecture Engineering Review Board (AERB) is highly recommended but not required.

However, agile processes with frequent modifications do not fit well within the current PMAS process. Each modification requires extensive reviews and burdensome documentation requirements. The agile process causes frequent modifications to project artifacts causing redundant reviews. The CIO process incurs over 61 separate activities and is another example of the high overhead incurred by PMAS as demonstrated in Figure A-3.

Figure A-3. PMAS Mandatory Activities


Source: VA OI&T, 2014c.

A.1.5 How PMAS Supports Agile Development

PMAS strongly encourages adoption of agile practices during project development as one of the eight basic principles documented in the PMAS Guide. However, the PMAS guide and ProPath process contain little in the way of agile execution. Each project must assess and declare the development methodology it uses.

PMAS and ProPath documentation stipulate that not all projects require exactly the same artifacts. Agile project managers can select activities that best fit their requirements, as long as they adhere to mandated policies, such as PMAS, Information Security, or National Release policies. These policies mandate creation and completion of certain artifacts which reflect clearly established milestones necessary for both project funding and/or acquisition and to mitigate risks associated with deploying systems nationwide.

VA's OI&T established an Agile Lean Community of Practice (ALCP) to provide guidance to Program and Project Managers using Agile and Lean methodologies. The COP is supported by

the Agile/Lean Implementation Work Group (ALIWG) which comprises senior agile practitioners and holds to the principle that the Program and Project Mangers determine the appropriate methodologies to use for their assigned projects. The ALIWG leadership follows policies and procedures for oversight and review as outlined in the latest version of the PMAS Guide and ProPath processes and recommends changes as appropriate.

ALCP also provides an Agile Suitability and Maturity Guide and tools. The context for the document and tools is to help determine if a project should be managed using agile methods and how to measure that agility specific to VA.

- Agile Suitability Assessment tool provides a framework for assessing whether a project is suited for agile. Additionally, it supports decisions related to:

  o Identifying and mitigating risks specific to delivering a project using agile methodologies.

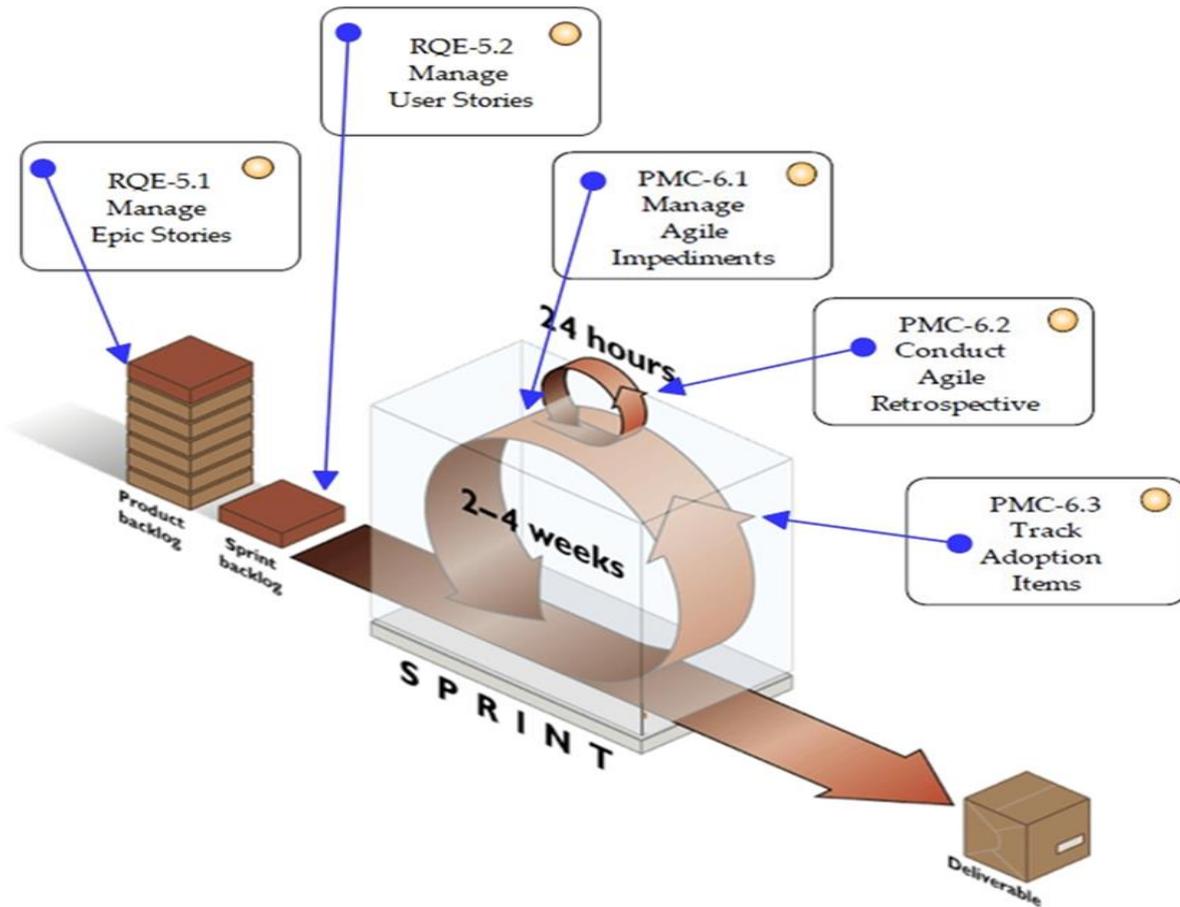
  o Pinpointing necessary changes to team and stakeholders' skill sets to support the use of agile.

- Agile Maturity Assessment tool provides a framework for assessing whether a project can be considered agile or not based on certain minimum characteristics of agile projects.

- Agile Project Characteristics Suitability and Maturity Guide provides guidance to help determine if a project should be managed using agile methods and how to measure that agility specific to VA.

The ProPath team has an active member on the ALIWG and is responsible for incorporating into ProPath the agile management guidelines, templates, and toolsets once determined and established by the ALIWG. Additional agile template and tools were added to PMAS and ProPath to adopt a more common agile approach and ensure projects are using the same measures to assess projects performance.

As shown in Figure A-4, these documents are meant to provide common agile management and measurements capabilities in the following areas of the PMAS process.

Figure A-4. PMAS Agile Management and Measurement Process


Source: VA, Agile Methodology and VA, 2015h.

The audience for these tools and the guideline are the project managers, development leads, and project oversight boards that make the decision on development methodology, often in consultation with their teams and the PMO. However, during Assessment H interviews, none of the 46 planners (i.e., architects, program managers/leads) or 20 builders (i.e., project leads, development staff, software engineers) mentioned the community of practice, the tools, or the ALIWG when specifically asked.

Is PMAS Agile?

The Agile Manifesto set down some simple objectives. ProPath strives to be SDLC agnostic and does not adhere to or endorse any specific development methodology (e.g., Waterfall, Rational Unified Process, or Agile). Agile project managers are expected to use their expert judgment and discretion to select those activities that best fit the project's needs and create project plans to meet the need of the selected development methodology. While sequencing of activities (and creation of artifacts) can be at the project team's discretion, ProPath provides a recommended sequencing of activities based on a logical progression of artifact development in

support of a project which does not support agile development. This process is serial in nature and overly focused on process and creating artifacts as opposed creating working software.

PMAS guidance emphasizes the need for good "customer collaboration," but over 60 percent of Assessment H interviewees indicated that customer interactions at the clinical working level (i.e., VAMC, VISN, Innovation Centers, Research Centers) are limited, sporadic, and usually unidirectional.

PMAS seems to address "working software" in the guidance, but the Assessment H study discovered that schedule drives delivery more (at the expense of working software) which is evident by the focus on schedule and financial process metrics used to track project status and the lack of customer satisfaction and content delivered.

The Agile Suitability Assessment tool, Agile Maturity Assessment tool, and Agile Project Characteristics Suitability and Maturity Guide provide common method to measure differing implementations and adoption of agile processes across projects.

Agile processes with frequent modifications do not fit with the current PMAS process. Each modification requires extensive reviews and burdensome documentation requirements. For example, because of the dependency on the Requirement Specification Document (RSD), a System Design Document (SDD) cannot be completed prior to the development of a RSD.

Doing Agile, but Not Being Agile

PMAS and the OMB guidelines for incremental development are basically trying to exploit aspects of 'agile' development, which emerged as a best practice over the past decade and has consistently been identified as a success factor for IT projects. However, *the highest priority for agile development is "to satisfy the customer through early and continuous delivery of valuable software."* In contrast, the highest priority for PMAS is meeting a complex schedule of milestones.

PMAS and supplemental agile related documentation align with the recommended set of principles in the Government Accountability Office (GAO) report on "Effective Practices and Federal Challenges in Applying Agile Methods." They center on the Agile Manifesto themes of small, frequent capability releases, a dynamic requirements process that allows for the continuous prioritization of requirements, active involvement from the user community throughout the development process, and commitment to delivering working software based on a time-boxed schedule. However, they fail to define and standardize agile-based practices to ensure a Department-wide consistent and common understanding of what constitutes an agile-based DoD program or project (Lapham, Williams, Hammons, Burton, & Schenker, 2010). This leads to misunderstanding and misrepresentation of agile principles. After defining the principles, VA needs to provide detailed guidance to the acquisition community that describes how to execute the agile acquisition processes within acquisition guidelines and regulations.

Adopting only a handful of agile practices without a broader agile strategy fails to achieve desired results. For example, one DoD early adopter initially attempted to implement agile practices by breaking large requirements into several four-week sprint cycles. However, the program lacked high-level agreement on what to develop in each cycle, and did not have a

robust requirements identification and planning process in place. Furthermore, the program lacked an organized user community and active user-participation throughout the development process—a fundamental agile tenet. As a result, the agile processes quickly degenerated and the program only delivered 10 percent of its objective capability after two years of failed agile development attempts. The program finally retreated to a waterfall-based process. It simply could not execute the agile strategy without the proper environment, foundation, and processes in place.[27]

The <u>primary metric</u> for true *agile* development is not based on rigid timelines – *the primary metric is whether or not working software actually exists and is demonstrably suitable for its intended purpose*; which should be determined empirically at the end of every increment. The insights above, combined with other findings, lead us to conclude that PMAS has simply incorporated the temporal aspect of agile development, but is not actually 'being agile' in the sense of incorporating best practice approach.

A.1.6   Summary

PMAS follows a waterfall project management approach which is a sequential process broken into stages. This typically includes eight stages; conception, requirements, analysis, architecture, development, testing, implementation, and maintenance. The steps in these processes are intentionally sequential, so that the team transitions from each step in directed order, with meticulous record keeping/documentation and shared awareness in capabilities so that the client knows what to expect. Software architecture is almost entirely focused on its one phase of a waterfall product management process. PMAS should be retooled to account for the documentation and process to support continuous planning, multiple sprints including design, development, integration, and test cycles that culminate in demonstration of capabilities to users and other stakeholders.

Agile is not an "all or nothing" approach for "all VA projects." However, once the decision to use an agile project management approach to manage <u>a project</u> is made, agile should affect every phase of a software project. Any constraints on agile project management processes which co-mingle waterfall processes will be a significant risk to realizing the benefits of using agile.

Properly implemented agile processes should result in capabilities developed and potentially shipped into the hands of users at the end of every sprint. Industry norms see these sprints range from four weeks, to as little as two weeks. Mixing successful agile processes with parts of the PMAS prescriptive IT development processes represent a risk to successfully using agile. The PMAS process will need to be enhanced to support and encourage more rapid software release processes for all projects so that agile development teams can easily deliver a "shippable product" as frequently as every two weeks. Operationally, successfully implemented agile project management will depend on strict adherence to well-known and well-understood practices for the engineering team. This should include software development coding conventions, software code complexity analysis, continuous integration servers that run unit

---

[27] (Defense Information Systems Agency, 2015)

test code upon every iterative check-in, strict adherence to reviewing delivered capabilities at the end of sprint burn-down meetings (as frequently as every two weeks), and transparent management of and technical debt that the team knowingly assumes.

The PMAS process is currently an impediment to more rapidly introducing new capability and collecting feedback from VA's users. This longer latency introduced in the PMAS processes represents an impediment in successfully implementing agile if VA is to see more software projects incrementally update their working software systems.

For instance, the Enterprise Health Management Platform (eHMP) is a VistA Evolution project that is taking significant steps to ensure the adoption of processes that align well with a stricter agile project management activity.

A cursory review of eHMP documents and team interviews indicated that the project uses many best practice development and management methodologies. eHMP is fully embracing agile development strategies, involving two-week sprints with demos to stakeholders at the end of each sprint for a tight feedback loop. Potentially Shippable Increment (PSI) planning sessions are conducted periodically at the end of several sprints to revisit and plan for new features, develop and update user stories, look for interdependencies with other projects, and prioritize development for the next PSI.

PMAS processes need to be more flexible with respect to the ability to rapidly change technologies used by software projects in the PMAS process. For instance, the PMAS process needs to reduce the impediments and latency associated with introducing new and emerging versions of software languages and frameworks.

It should be an aim of the PMAS process to identify and introduce a new version of a language or software framework in as little as two weeks. This would align with a more rapid software development process that VA software teams should also be striving to meet (bi-weekly software builds and associated releases). This additional flexibility would allow VA software teams to more rapidly incorporate capabilities into projects that will benefit Veterans.

VA must successfully align the incentives for contractors to use agile well within the bounds of government regulation. Contracts will need to be enhanced to align incentives for shared benefit to VA and VA's contractors when capabilities are delivered ahead of schedule, and under-cost. Alternatively, VA contracts may need to be more flexible if capabilities need to be extended either beyond the original Period of Performance or via increased mission scope based on positive user feedback.

Agile must be scaled to support complex enterprise initiatives and programs. To support increased program-level visibility of both interdependencies and overall program risk, VA should adopt any one of the scalable enterprise models including processes like "scrum of scrums." These agile processes allow teams to continue to maintain high velocity designing and developing the most relevant capabilities for their users. To address the need for heightened awareness and visibility into the activities of individual projects, "ambassadors" from the various teams conduct their own daily "read out" scrums to share all new and emerging decisions that the teams are incrementally making. This has the same benefit to managing risk as scrum does on the individual basis.

A.2   IT Infrastructure and O&M

A.2.1   Introduction

VA's IT infrastructure for its enterprise software architecture is large and overly complex with a heterogeneous mix of software frameworks and technologies, making it difficult to efficiently modernize health IT functionality and products that impact health care delivery. Impacts include:

- Sustainment costs are increasing and are unsustainable, taking resources away from new capability development.

- VA has not established the data standards required for intra-VA interoperability.

- The size and complexity of VA's enterprise IT infrastructure continues to impact their ability to effectively secure sensitive data within their information systems. Increased dependence on telehealth, mobile applications, and information exchange with external providers will increase their challenges with achieving an acceptable cyber security posture.

A.2.1.1   Historical Perspective

The Assessment H team found that VA's ability to <u>execute</u> IT strategies revealed significant challenges created by the compounding, accidental complexity resulting from the initial development approach and ongoing evolution of their custom-built software-intensive health IT system[28]. Related findings associated with this complexity include increasing O&M costs, intra-VA interoperability challenges, and the long-standing inability to effectively secure the sensitive data in VA's information systems.

Much of VA's current technical challenge stems from their *decentralized* approach to IT during the 1990s, which was credited with their dramatic turnaround in health care services during that time. It is important to note that *decentralization and autonomy were* the *most often cited reasons for that remarkable turnaround in VA health care during the 1990s* (Walters, 2009) -- and it was the local-scope, small-scale, decentralized approach to software development that produced an effective breeding ground for innovation and rapid advancements in health IT. However, this also created unsustainable IT cost via the *accidental software complexity* created as "*new applications were popping up sporadically, and haphazardly.*" The lack of standardization and effective IT governance ultimately created significant technical complexity in the form of a "*sprawling, aging, and unwieldy system of computer and communications technologies spread across the department's more than 1,000 medical centers, clinics, nursing homes and Veterans' centers*" (Walters, 2009).

VA's initial failed attempts to overcome this technical complexity via high-cost, major software-intensive consolidation initiatives such as '*HealtheVet'* contributed to Congress directing VA to adopt a centralized approach to IT in 2005 (U.S. House of Representatives, 2005a; GAO, 2008;

---

[28] VA is one of the only major health care providers that continues to build and integrate significant amount of custom software-intensive Health IT and other business line solutions

Walters, 2009). However, Assessment H findings suggest VA has achieved less-than-sufficient improvements with respect to these enterprise integration and modernization efforts, despite the centralization of IT authority, a perpetual VA IT priority to consolidate and integrate IT solutions (VA 2007; VA OI&T 2014), and billions of dollars in IT funding.

A.2.2   Complexity

There are too few common services and the software architecture remains insufficiently defined, implemented, and governed with respect to inter-module interfaces and rules of interactions.

VA's decentralized IT development in the 90's created a custom health IT system comprising *many different versions of many different software modules*, with *many different dependencies* between these modules. This was primarily the result of local, autonomous IT resources developing customized versions of these software modules to quickly satisfy local IT requirements for managing and furnishing health care. The *focus on 'local, small-scale' requirements* during VA's era of decentralized, autonomous software development was not consistent with the *'enterprise, large-scale' software complexity.*

While a 'Gold Standard VistA' has consolidated nearly 60 percent of these software modules (VA 2015) and is currently being deployed across the VA enterprise to consolidate the hundreds of variations that emerged during the previous era, Assessment H found that VA's IT and software infrastructure remain overly (unnecessarily) complex with a heterogeneous mix of software frameworks and technologies.

The current VA scheduling system is an example of technical complexity and its consequences. The scheduling system currently used by VA is approximately 30 years old (note that there have been repeated failed, high-cost attempts to replace this system). VA scheduling system has *over 1,000 integration points* (VA, 2014*)* which are basically locations in software where one software module depends on the functionality implemented in another software module (i.e., the dependent software module will not function without the software module its dependent on)*.* These integration points for VA scheduling system include those from *71 separate software modules that are depending on the scheduling module*, and *31 separate software modules that the scheduling system is depending on* (VA OI&T 2014). The dependencies are actually more complicated, because there are *different versions of each of these modules* which adds compounding degrees of complexity (in other words, each of those 71 + 31 modules is a different version). The 'Gold Standard VistA' will help address the additional complexity created by all the different versions of each of the separate modules but it does not address the dependencies between the Gold Standard versions of the 71 + 31 modules that will remain.

The many dependencies between the many VA software modules have a direct impact on what is referred to as the "*cost of change*" associated with enterprise-scale software, which is considered one of the highest software-related cost factors and is closely correlated with the dependencies (seams) between all the software modules. These dependencies (seams) also impact the "cost of integration," which directly impacts the ability to integrate COTS products into the health IT system. All these complexity factors explain why replacing VA scheduling

The views, opinions, and/or findings contained in this report are those of The MITRE Corporation should not be construed as an official government position, policy, or decision.

A-16

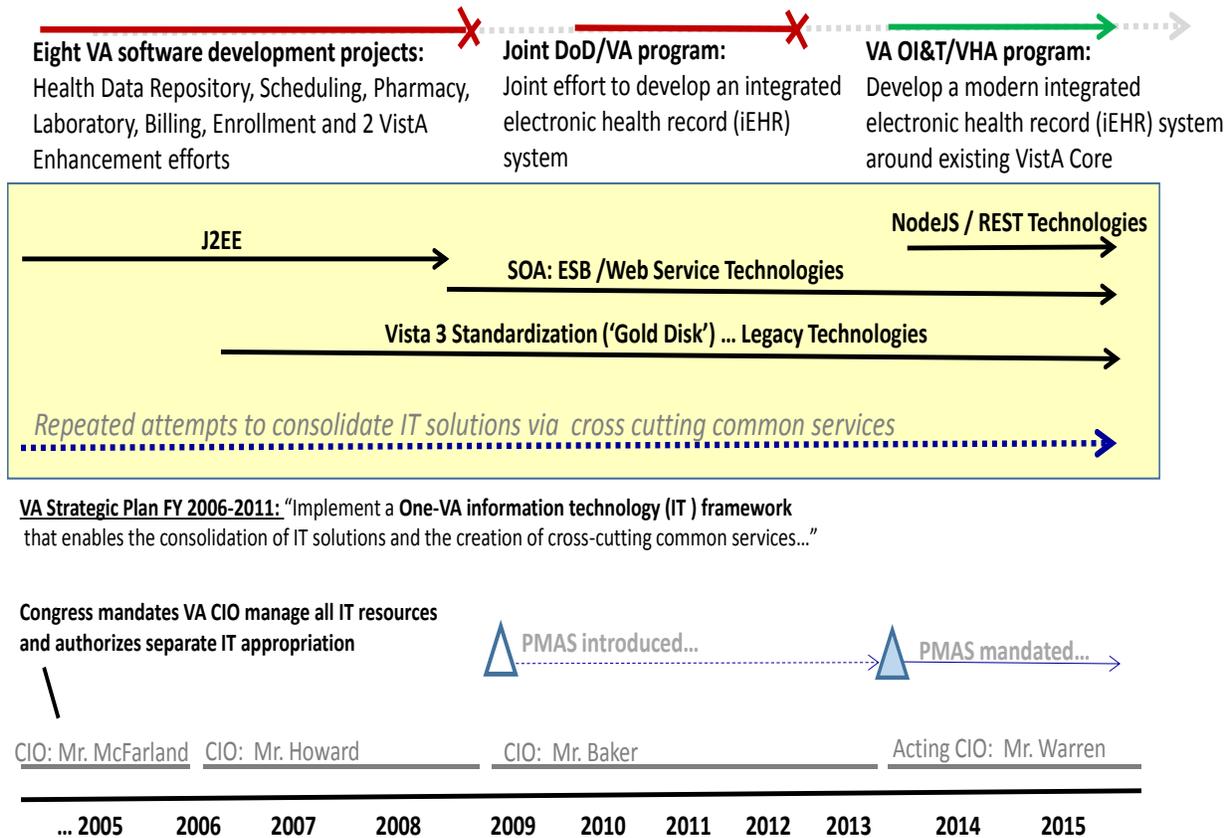
system remains a high-cost, highly-technical challenge. Similar 'dependency' challenges exist for other health IT applications in VA. It is also worth noting Assessment H related findings regarding the absence of a 'master integration plan' in VA's fragmented approach to IT project management (referring to their reliance on a multitude of discrete, separately managed software development efforts with no master integration schedule or plan), which aligns with GAO's repeated findings associated with VA's IT and software integration challenges.

Since the end of VA 1990s era of small-scale software development, VA has been trying to consolidate their entire collection of health IT solutions – which requires cross-cutting enterprise IT considerations for VHA, VBA, and NCA and significantly magnifies the IT and software complexity factors. This VA IT enterprise perspective is critical to understanding the scale, scope, and complexity of the technical challenges OI&T has faced in accomplishing their decade-long strategic IT objective to create a 'One-VA' (VA, 2005) that transitions VA "from disparate stovepiped processes and systems to a unified environment of integrated, interoperable business processes and technical services"(VA OI&T 2014). The approach requires special expertise and appropriate IT processes for successful large-scale, centralized IT management; large-scale software infrastructure; and large-scale software development – all of which represent a stark contrast to the expertise and processes required for the decentralized IT and local software customizations that created the successful health IT solutions in the 1990s.

Evidence of VA's ongoing struggle to transition from 'small-scale' to 'large-scale' is illustrated in Figure A-5, which provides an approximate timeline for the various infrastructure technologies VA has implemented. Instead of consolidating their infrastructure, VA has arguably increased the software complexity, creating more challenges. This evolution of technologies reflects an enterprise software anti-pattern[29] called "The Technology Alter" (Torkamani & Bagheri, 2014), where the enterprise ends up focusing on the underlying technologies instead of the business objectives. Assessment H interviews with VA stakeholders described this as "chasing shiny objects" and "bright shiny new things," referring to exactly the same concept embodied in the 'The Technology Alter' anti-pattern (chasing new technologies) with the same consequences (IT-driven, not business-driven). Further evidence of this was offered by OI&T leadership who told us that, in the absence of clear health care objectives from VHA, their IT development has been focused on building "flexibility into the infrastructure" while "[VHA] figures out what they want." Other Assessment H interviewees described the lack of defined measurable health care outcomes for driving IT investments. While VA has recently developed KPIs for driving IT development, "the approach will require implementing a process that has never been done before." These examples indicate problems ensuring business needs are driving IT investments, but OI&T's attention to increasing the 'flexibility' *of their enterprise software infrastructure is a positive finding*.

---

[29] Enterprise Software Anti-Patterns derive from analysis of the wide and ever-growing selection of repeated software failures in an attempt to understand, prevent, and recover from them. Anti-Patterns are a new tool that bridge the gap between architectural concepts and real-world implementations.

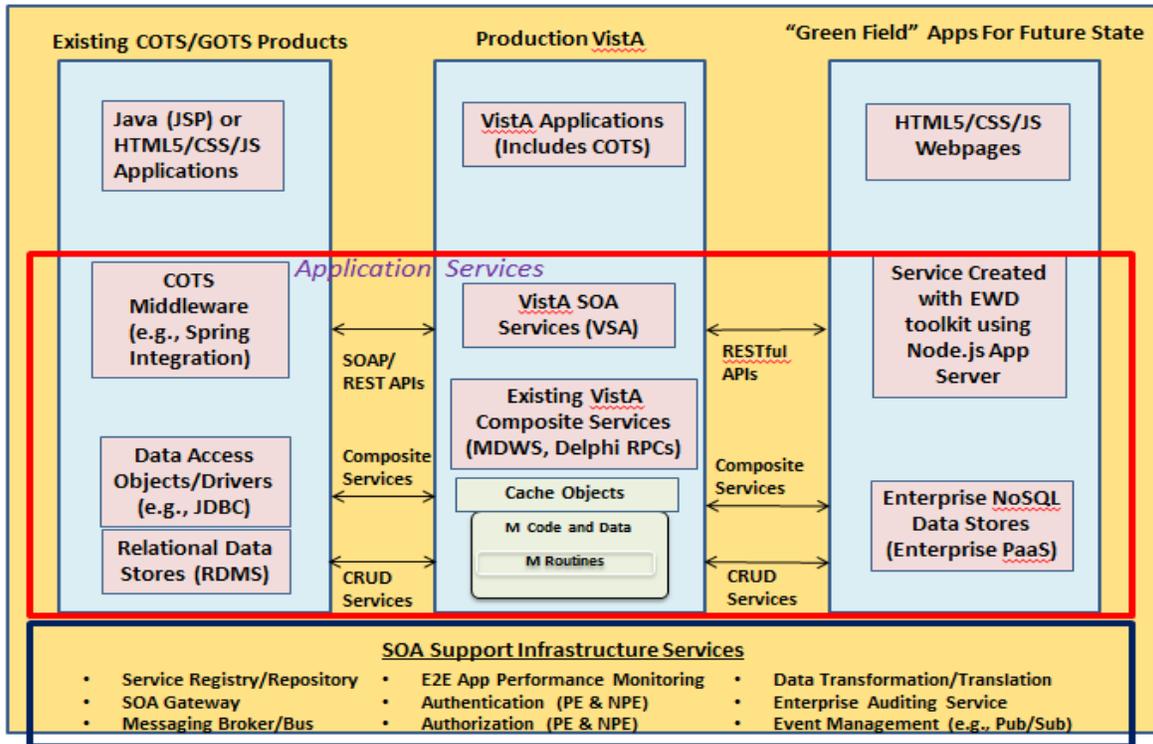
Figure A-5. Timeline for VA IT Modernization Using a Mix of Technologies


Source: MITRE rendition of data from planning documents and reports.

As a non-functional 'quality' attribute of a software architecture, flexibility does not directly impact the health care outcomes. However, the complexity described so far limits flexibility, which limits the ability to support evolving business needs. This increases the time and cost of delivering measurable outcomes exploit emerging, innovative health IT solutions – as VA was able to do so well with the inherent flexibility of the decentralized, small-scale development in the 1990s.

Assessment H revealed that VA's ongoing attempts to "*increase flexibility,*" along with their related ongoing attempts to overcome the accidental complexity created by the development of their legacy health care system, has produced the software health IT infrastructure illustrated in Figure A-6, which shows the lack of standardization created by the mix of technologies incorporated over the past decade. Note that this figure does not show the breadth and depth of VA's enterprise software infrastructure, which must incorporate many cross-cutting considerations for all VA business lines and also impacts their health IT efforts. The 'software 'stack' on the left of the diagram represents the results from VA's move towards SOA and web services; the software stack in the middle represents the legacy software, but does not show the hundreds of modules and their many different versions; and the software stack on the right shows the recent move towards a modern infrastructure technology called

'Node.JS,' which recently emerged as one of the most popular technologies in today's global open source software community.

Figure A-6. VA's Heterogeneous Software Architecture


Source: OI&T ASD, VistA 4 Product Architecture Review Triad Meeting Winter 2015 (briefing), January 27, 2015.

This mix of software stacks reflects what is described as a 'non-standardized infrastructure,' which has been identified in case studies as a common failure factor for IT projects. (Standish Group, 2011). As noted in Figure A-5, VA's efforts to transition from 'small-scale' to 'large-scale' have increased the software complexity due to implementation of multiple software application and infrastructure technologies over a 10-year time span. Instead of consolidating their infrastructure, VA has created more challenges that impede their ability to upgrade and extend their existing software systems.

Figure A-6 illustrates in more detail this mix of software applications and infrastructure (e.g., Java J2EE Technology, SOA: Enterprise Service Bus (ESB)/web service technologies and Node.js/REST Technologies) that VA must now simultaneously maintain as a 'non-standardized infrastructure.' This type of 'non-standardized infrastructure' has been identified in academia and industry case studies as a common failure factor for IT projects.

Consequences include the exponentially increasing 'time and cost of change' due to complexity and duplication of efforts; the variety of added costs required to maintain and manage multiple skill sets -- especially those required for VA's 30-year old technologies, where the pool of skilled resources are significantly decreasing (e.g., Mumps, Delphi); and a list of challenges with

respect to effective cyber security. Additional impacts were revealed from interviews with VA stakeholders, who described impacts from the lack of sufficiently defined and/or sufficiently implemented 'common services' required for accomplishing rapid, cost-effective development. Other stakeholders, including OI&T leadership also described the time and cost impacts related to the challenges with integrating COTS solutions into this infrastructure.

This finding also reflects a top failure factor for IT projects described as 'underestimating the technical complexities of large-scale IT infrastructure,' which is related to the inability to develop accurate cost estimates and effectively control the total software development and integration costs that emerge at enterprise scale. These impacts are reflected in several other Assessment H findings.

A.2.3   Increasing IT Maintenance Costs

VA's enterprise IT infrastructure includes the combination of hardware, software, networks and facilities required to develop, test, monitor, secure, support, and control VA's IT services. VA's annual IT spending published on the Federal IT Dashboard can be organized in four categories (SemanticInfo, 2015):

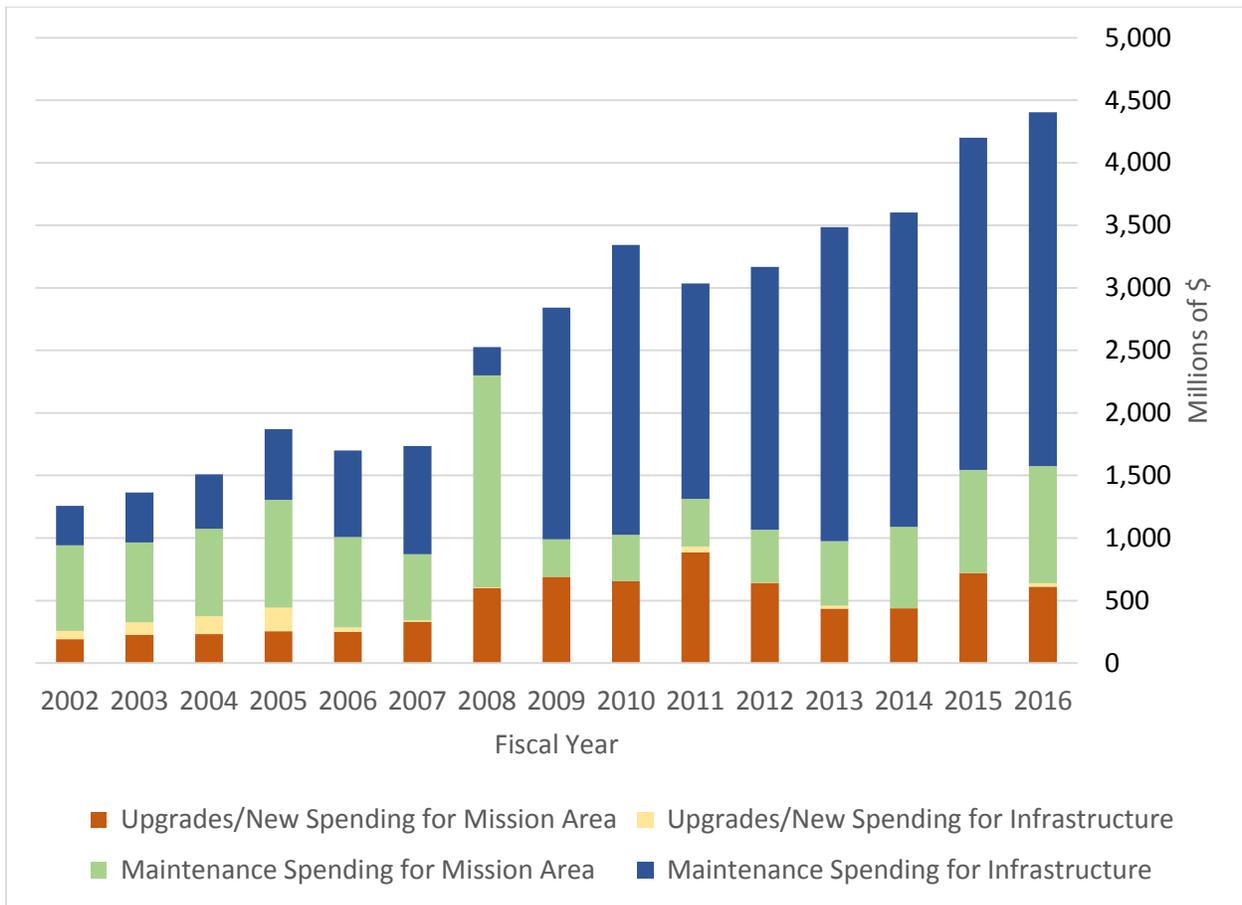
- New/Upgrades Spending for Mission Area – Program costs for new investments, changes or modifications to existing systems reported as IT investments directly supporting an agency-designated mission area.

- New/Upgrades Spending for Infrastructure – Program costs for new investments, changes or modifications to existing systems identified as IT investments supporting infrastructure, strategic management of IT operations, or a grants management system.

- Maintenance Spending for Mission Area – Spending covering maintenance and operation costs at current performance level for systems reported as Mission Area Spending.

- Infrastructure Spending – Spending reported as IT investments supporting infrastructure, strategic management of IT operations, or a grants management system.

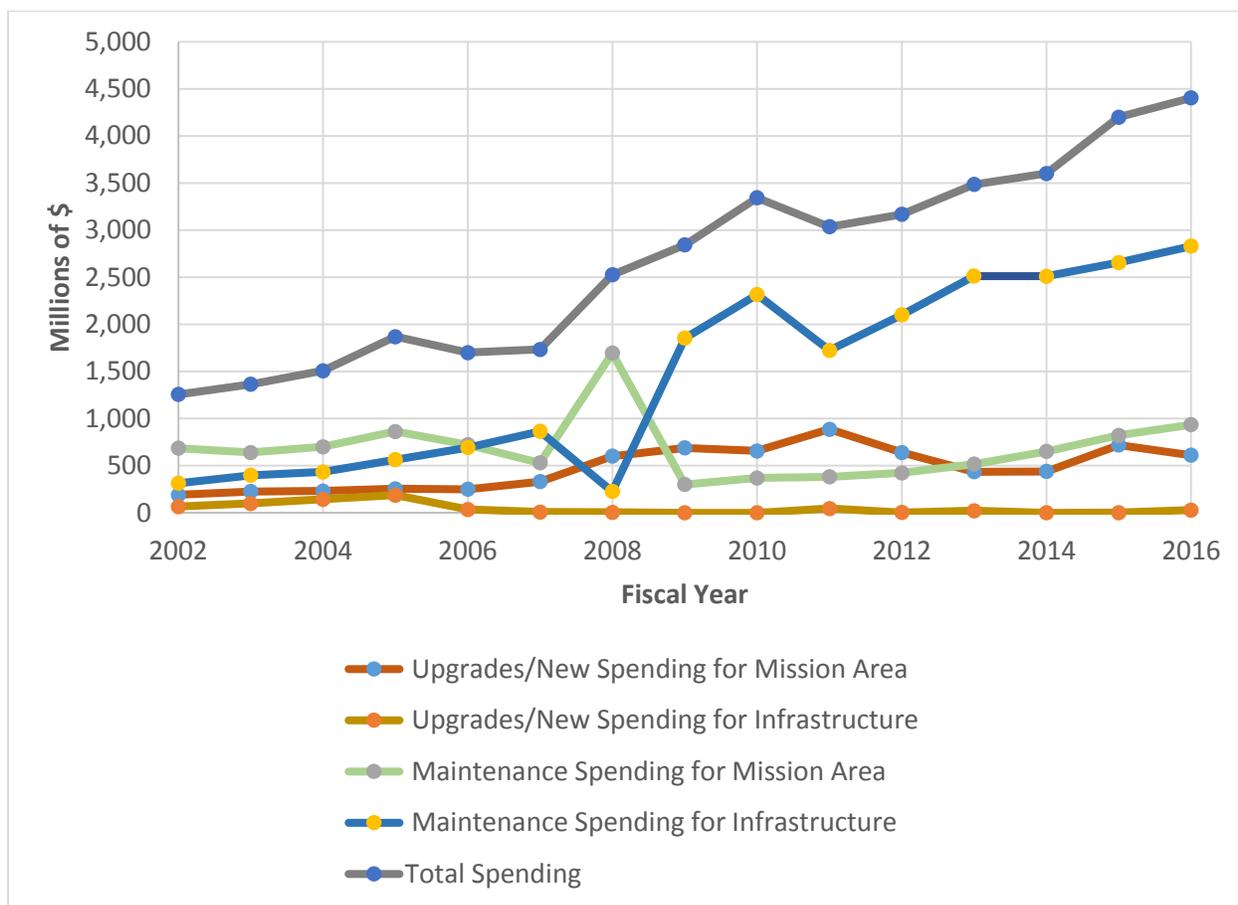
A detailed assessment of VA's enterprise IT infrastructure and itemized annual IT O&M spending were beyond the scope of Assessment H. However, analysis of VA IT spending trends found that maintenance costs have grown almost continually since 2002, as shown in Figure A-7. More troubling, spending on upgrades or new capabilities for the VA mission now represent only 15 percent of the total IT budget. During Assessment H interviews, several stakeholders, including those directly involved with IT investment planning and funding allocations, echoed concerns that O&M funding is "eating up our development, modernization, and enhancement funding." As a result, the growing cost of maintaining the complex infrastructure reduces the availability of funding for new IT capabilities needed to manage and meet health care needs.

Figure A-7. VA IT Spending on Upgrades vs. Maintenance


Source: MITRE graph derived from data collected from the Federal IT Dashboard 2015, https://itdashboard.gov/

OI&T leadership identified these O&M costs as those associated with the sustainment of VA legacy systems, which corroborates our previous finding regarding the high cost associated with the 'accidental complexity' created by the initial development and ongoing evolution of VA software infrastructure.

Figure A-8 illustrates the impact of increasing IT infrastructure costs, which shows increases in total VA IT spending and IT infrastructure maintenance spending during the past five years, but a flat to declining trend in DME spending on mission areas and infrastructure improvements (software development and modernization). Because OI&T provides infrastructure and mission area capabilities for VBA, NCA, and VHA, the proportion of IT spending for health care capabilities and infrastructure are not discernible from this figure. In addition, the negligible spending on infrastructure upgrades compared to infrastructure maintenance raised questions about how OI&T categorized IT spending that could not be resolved prior to publishing of this report.

Figure A-7. VA IT Spending Trends by Year


Source: MITRE rendition of VA data.

The VA IT O&M cost increases have continued *despite* several ongoing IT initiatives that are specifically intended to reduce IT O&M-related costs. These cost-cutting initiatives include the following, which have not demonstrated measurable reduction in costs:

- **Physical consolidation enterprise IT infrastructure assets:** VA has been attempting to consolidate their distributed physical servers (and applications) into four regional data centers since 1998 (GAO, 1998) with planned completion by 2010 (OMB, 2008). As of 2014, this consolidation remains far from complete (VA Enterprise Centers 2014) with the cost for managing these yet-to-be-filled enterprise data centers exceeding $300M per year – the highest line item in the FY15 O&M budget. Furthermore, multiple VAMC CIOs interviewed by the Assessment H team were unaware of these consolidation plans.

- **Logical consolidation of enterprise software infrastructure**: This consolidation can be considered a form of 'logical consolidation,' which is intended to reduce development, integration, and sustainment costs by reducing total complexity, eliminating duplication of functionality (e.g., many different versions of many different software modules). Effective logical consolidation, combined with the VA CIO's explicit focus on 'increasing flexibility' as a non-functional requirement of VA's software infrastructure, should be having

---

measurable impacts on both DME and O&M costs, but the Assessment H study did not find evidence of this impact.

- **Ruthless Reduction Task Force (RRTF**): This was specifically designed to eliminate hardware and software redundancies within the VA enterprise (Miller, 2011). The focus of this group included: consolidation of IT contracts where possible, IT virtualization, elimination of desk side printers, and purchase of more multi-functional devices (e.g., printers with fax capability).

None of the VA stakeholders interviewed by the Assessment H team could identify the specific root cause of these O&M increases or explain why the cost-cutting initiatives listed apparently have no measurable impact on cost cutting. Also, they could not describe an executable mitigation plan for controlling these increasing costs.

Despite increased spending on IT infrastructure, VISN sites expressed dissatisfaction with OI&T response time and overall ability to support local IT infrastructure needs.

VA stakeholders across many VISN clinical environments expressed concerns that may reflect the unintentional consequences of the transition to a centralized IT organization. This transition has moved most of the IT decision making to the regional and national levels, disconnecting the local IT organization from these decisions. The problems expressed by stakeholders at the local VISN sites include the following:

- OI&T is slow to respond to local requests.
- Local IT resources having insufficient resources to support local requirements. This included a variety of requirements, from increased bandwidth to accommodate the increased use of Telehealth to the need for scanners.
- Insufficient local IT staff to support the infrastructure growth required to support emerging health IT trends.
- VISN directors and IT staff have little or no visibility into strategic IT objectives and major IT projects that are in development or how and when these may impact their clinical environments.

A.2.4 Security and Privacy

The size and complexity of VA's enterprise IT infrastructure continues to impact their ability to effectively secure the sensitive data within their information systems; and the increased dependence on telehealth, mobile applications, and information exchange with external providers will increase their challenges with achieving an acceptable cyber security posture.

A detailed, comprehensive assessment of VA's cyber security plan and current posture was beyond the scope of Assessment H. Furthermore, VA OIG already provides annual performance audits of VA's compliance with the Federal Information Security Management Act (FISMA) with the latest report published May 2015 (VA OIG, 2015).

However, the ability to effectively secure Veteran's sensitive information is a critical cross-cutting enterprise IT concern for all aspects of VA IT strategies, especially with respect to the

outcomes impacting Veterans (in this case, the measurable effectiveness of cyber security strategies).

VA is responsible for executing the Federal Cybersecurity Cross-Agency Priority (CAP) Goal and objectives, which the Government established to "*address the long standing challenges of tackling horizontal problems across vertical organizational silos.*" The Cybersecurity CAP Goal strategy starts by requiring compliance with the FISMA requirements.

Chronic Weaknesses and Deficiencies with Cyber Security Posture

With respect to execution of IT strategies for satisfying FISMA requirements, the 2013 audit report "*marks the 16th consecutive year the agency has failed a cyber-security assessment* (Federal News Radio 2014; Washington Free Beacon 2014)." Even more relevant to our previous findings regarding *effective IT execution* is the fact that OIG has <u>repeatedly identified the same weaknesses and deficiencies</u> in VA's information security program in their annual FISMA audit reports (VA OIG, 2011; VA OIG, 2012; VA OIG, 2013; VA OIG, 2014; VA OIG, 2015). That trend has continued in the recent 2014 FISMA audit report published May 2015 (VA OIG, 2015), which states that "*this FISMA audit continued to identify significant deficiencies related to access controls, configuration management controls, continuous monitoring controls, and service continuity practices designed to protect mission-critical systems. […] the VA has not remediated approximately 9,000 outstanding system security risks in its corresponding Plans of Action and Milestones to improve its information security posture.*"

Despite these repeated failures to meet FISMA compliance requirements, the 2015 version of the OMB report to Congress (OMB 2015) on the implementation of FISMA by Federal agencies ranked VA in the middle tier *with respect to aggregate cybersecurity compliance scores* (see Figure A-10). However, this middle-tier ranking only reflects VA's relative ability to meet basic cybersecurity compliance requirements (and may be interpreted as a negative indication of cyber security posture for Federal IT systems rather than a positive indication for VA, but these results prove that VA cannot be singled out as a poor performer in the Federal IT domain).

Critical Assets, Specific Threats, and Vulnerabilities

While Assessment H did not conduct an evaluation of VA cybersecurity posture, the team did assess VA IT strategies with respect to the following critical considerations for effective cybersecurity:

1. **Assets**, in the context of Assessment H, include the Veteran's private, sensitive information (e.g., Social Security numbers, home address, personal health information). The sensitive nature of these data and the specific threats listed below highlight *the potential impact on the Veteran.* The specific vulnerabilities described below highlights the increased *likelihood of this impact.* The inability to execute effective cybersecurity IT strategies to address the specific threats and IT-related vulnerabilities listed below contributes to our concerns expressed in this finding.

Figure A-8. Cybersecurity Assessment Scores in OMB 2015 FISMA Report

Agency	FY 2014 (%)	FY 2013 (%)	FY 2012 (%)
General Services Administration	99	98	99
Department of Justice	99	98	94
Department of Homeland Security	98	99	99
Nuclear Regulatory Commission	96	98	99
Social Security Administration	96	96	98
National Aeronautics and Space Administration	95	91	92

Source: OMB, 2015.

2. **Threats** are *parties with the intention and capabilities to exploit vulnerabilities and gain access to the assets.* The FBI has issued two specific threat warnings that elevate our concerns about VA cyber security:

    - The FBI Cyber Division issued a Private Industry Notification (PIN) that states "*Health Care Systems and Medical Devices at Risk for Increased Cyber Intrusions for Financial Gain*" (FBI Cyber Division,2014). The FBI warns about the "*transition to EHR coupled with more medical devices being connected to the internet will generate a rich new environment for cyber criminals to exploit.*" The FBI report includes a reference to a SANS, Ponemon, and EMC²/RSA that states the following: "*the health care industry is not technically prepared to combat against cyber criminals' basic cyber intrusion tactics, techniques and procedures (TTPs), much less against more advanced persistent threats (APTs). The health care industry is not as resilient to cyber intrusions compared to the financial and retail sectors, therefore the possibility of increased cyber intrusions is likely.*"

The views, opinions, and/or findings contained in this report are those of The MITRE Corporation and should not be construed as an official government position, policy, or decision.

- The FBI and the Department of Homeland Security issued a joint intelligent bulletin with a threat warning regarding ISIS and their call on supporters to scour social media for addresses of their family members – and to "*show up [at their homes] and slaughter them.*" The warning specifically stated this: *"The FBI and DHS recommend that current and former members of the military review their online social media accounts for any information that might serve to attract the attention of ISIL [ISIS] and its supporters."* While this threat warning was not explicitly expressed as a direct threat to the VA enterprise, this should arguably be considered a relevant cyber security threat because: 1) there is a clear focus on using cyber-based tactics to obtain Veteran's personal information; 2) the VA information systems have Veteran's personal information; and 3) the risk has very high impact.

3. **Vulnerabilities** are specific weaknesses and deficiencies in VA's ability to secure their assets against known and unknown, emerging cyber threats (e.g., secure the Veteran's data against the threats listed above). With respect to Assessment H, our specific concerns focused on the identification and mitigation of IT-related vulnerabilities (i.e., not insider threats, etc.) – especially those IT-related vulnerabilities related to the concerns described in our other findings, and concerns regarding the increasing reliance on Telehealth, mobile devices and applications, and information exchange with external providers.

   Assessment H reviews of past FISMA compliance reports described the fact that OIG *has repeatedly identified the same weaknesses and deficiencies in VA's information security program*, which already suggests vulnerabilities with respect to protecting Veterans' data against threats which include those listed above.

The identification of critical assets, threats, and vulnerabilities are essential planning activities for developing effective IT cyber security strategies. However, minimizing or eliminating vulnerabilities requires *effective execution of IT strategies*. As decades of security audits indicate, VA has significant challenges in this area. Many of these challenges stem from the complexity of the IT and software infrastructures described above (e.g., inability to establish accurate inventory of all IT assets).

While VA was ranked middle-tier in comparisons with other Federal IT systems in their aggregate cybersecurity scores, our assessment identified high risk exposure created by specific IT-related KFMs (see Table A-1) related to the Veterans' data and the threats described above.

4. **Ability to Protect, Detect, and Respond** to Cyber-based attacks. While there is clear evidence of the inability to satisfy basic cyber security compliance, with additional evidence suggesting that this is related to IT complexity. The Assessment H team was unable to ascertain the degree of strategic and tactical planning that has been focused on maximizing 'effectiveness' of VA's enterprise-wide cyber security capabilities. 'Compliance' does not ensure cyber security effectiveness, which involves a holistic, continually evolving, risk-based approach incorporating sophisticate analytics, detection, containment, and recovery strategies are on par with the assets, threats, and vulnerabilities outlined.

Table A-1. VA Challenges with CAP Goals and Key FISMA Metrics

Key Performance Area	Description	Avg. Score	VA Score
Automated Asset Management: Detect and Block Unauthorized Software (KFM)	Percentage of applicable assets for which the organization has implemented an automated capability to _detect and block unauthorized software_ from executing or for which no such software exists for the device type. The average is weighted by the total number of the organization's hardware assets connected to the organization's unclassified network(s).	69%	**0%**
Data Protection: Mobile Asset Encryption (KFM)	Percentage of _mobile assets with encryption of data_ on the device. The average is weighted by the total number of mobile assets at the organization.	55%	**5%**
Data Protection: Anti-spoofing (KFM)	Percentage of _email systems_ implementing anti-spoofing technologies when sending messages, and when receiving messages.	Receiving: 87%	Receiving: **0%**
TIC Traffic Consolidation CAP Goal	_Percentage of underlined external network traffic to/from the organization's networks that passes through a Trusted Internet Connection (TIC) / Managed Trusted Internet Protocol Services (MTIPS)._	_95%_	_**57%**_

Source: OMB, 2015.

A.2.5 Summary

The cumulative _combination_ of findings above, along with Assessment H findings related to VA's ability to effective execute IT strategies, will _continue_ to have the following impacts:

- Limit VA's ability to effectively address the new and existing, long-standing IT-related vulnerabilities required to effectively secure their information systems.

- Increase the time and cost of OI&T's perpetual attempts to create an integrated, unified VA enterprise that must effectively and cost-efficiently addresses many cross-cutting IT aspects.

- Limit the ability to develop and incorporate innovative health IT solutions, since these technologies will typically need to be integrated into the enterprise software infrastructure to effectively be leveraged in the centralized IT model.

- Limit OI&T's time and funding to support traditional IT responsibilities, and decrease their software development productivity. This will have a similar impact on O&M costs by increasing the 'time and cost of change.'

- Limit the ability to accurately estimate the total time and cost to translate health care objectives into measurable outcomes.

- Limit their ability to cost-efficiently integrate COTS products that offer innovative or supplemental health IT solutions.

- Limit VA's ability to effectively execute cost-cutting initiatives, which will continue to limit their ability to produce measurable cost-cutting results (and thereby control increasing O&M costs).

A continued trend in increasing O&M costs could create the following impacts:

- Continue to take away time, staff, and funding required for the development of IT infrastructure updates and advancements in health IT for managing and furnishing health care.
- Ultimately lead to the need to incorporate reactive measures, which are typically associated with high-cost consequences (note that a proactive approach requires the identification of root cause followed by the development of an executable plan to control these increases before they become unmanageable).

The inability to satisfy local site IT infrastructure requirements, despite the increasing IT infrastructure funding, suggests underlying problems with VA's approach to centralized IT management that may have the following impact:

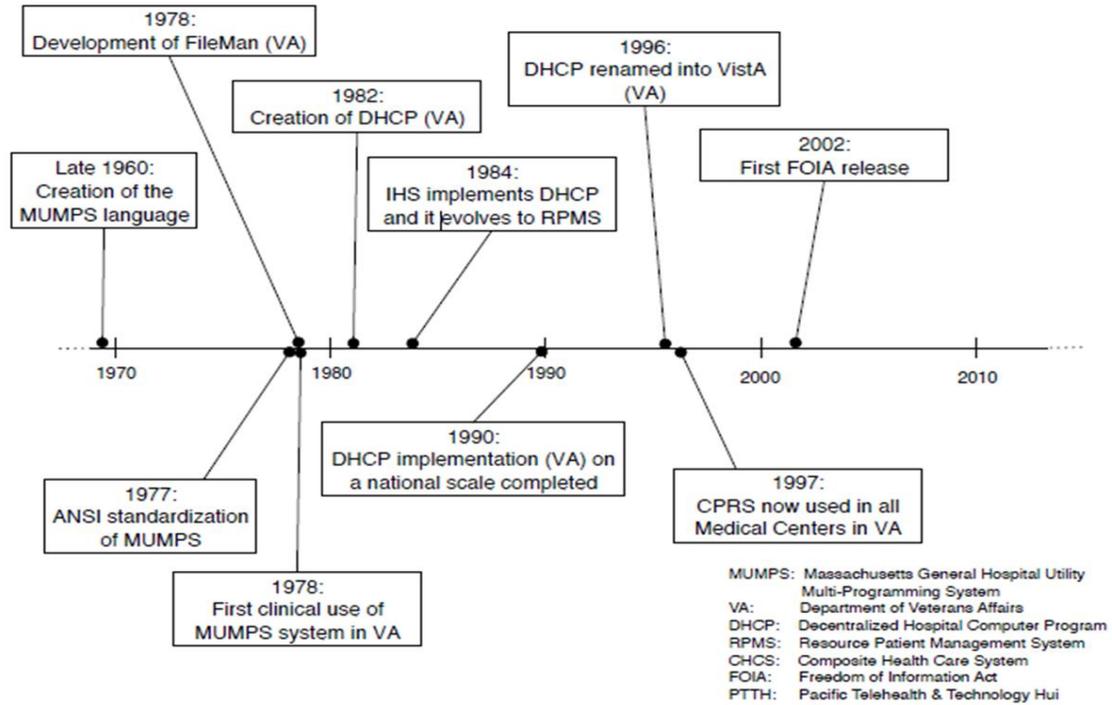
- Limit ability for patient-facing clinical environments to effectively support Veterans health care using emerging technologies such as telehealth and mobile applications (e.g., inability to respond to network capacity limitations and other site-specific IT-related limitations).

A.3   EHR/VistA

A.3.1   Overview

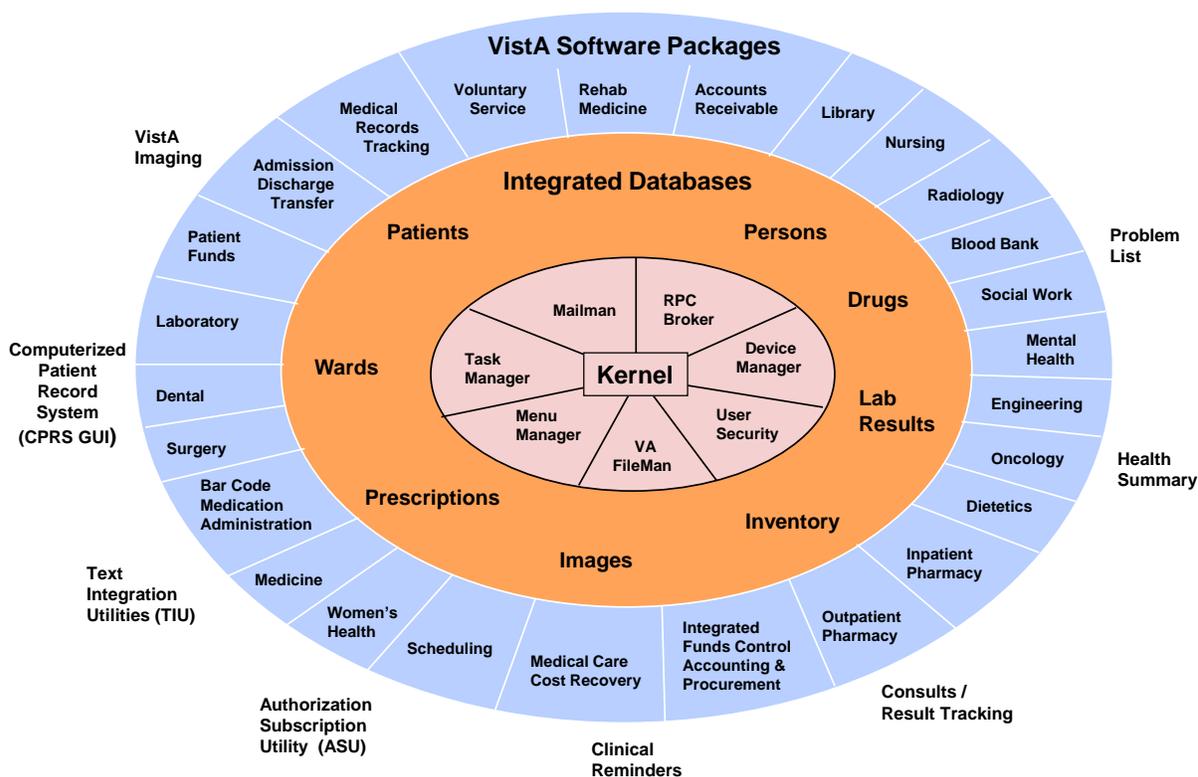
VA's health IT Infrastructure is a large and complex ecosystem comprising several layers of applications, services, databases, and technologies to manage and deliver clinical patient information. The Veterans Health Information Systems and Technology Architecture (VistA) and Computerized Patient Record System (CPRS) applications are the core components of this system. When released in 1997, CPRS was widely acknowledged to be innovative and the best in its class. Nearly 20 years later, it is still considered by many to have functionality on par with commercially available systems.

VA has had automated information systems in its medical facilities since 1981 beginning with the Decentralized Hospital Computer Program (DHCP). DHCP was transformed into VistA in the 1990s. In 1997, CPRS was released to provide an updated graphical user interface (GUI) to complement VistA capabilities. Figure A-9 shows the timeline for implementing VistA and CPRS capabilities.

Figure A-9. VistA/CPRS Development Timeline


Source: VistA/CPRS Timeline - http://worldvista.org/AboutVistA/VistA_History

Figure A-10 shows VistA as an enterprise-wide ("Mega Suite Clinical") information system built around an EHR used throughout VA.

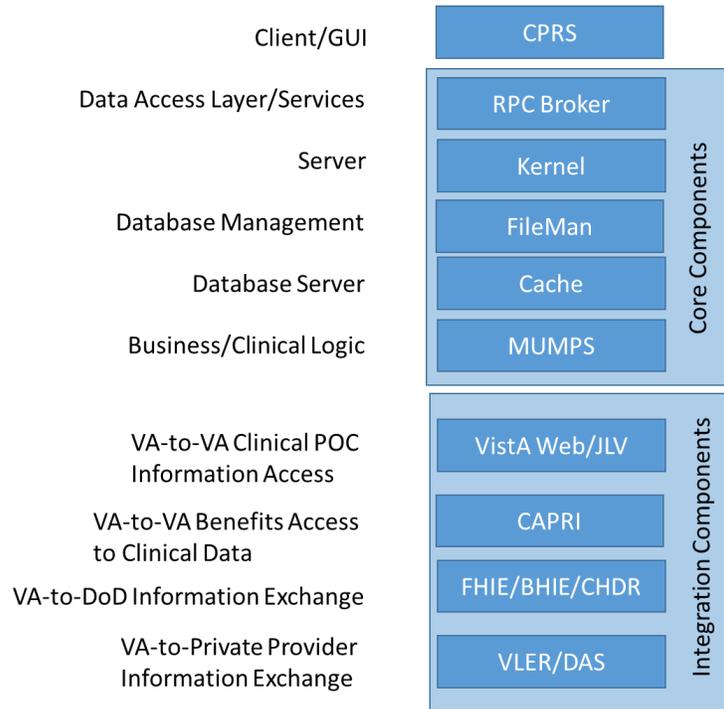
Figure A-10. VistA Technical Architecture


Source MITRE rendition of VistA technical specifications

VistA consists of application packages that share a common data store and common internal services to capture, manage and share patient information at local VA Medical Centers (VAMCs), between VA locations, with the DoD, with private providers, and with Veterans and payers. The data store and VistA kernel are implemented in the MUMPS (or M) computer language and comprise nearly 160 distinct applications/modules, 15,000 routines, and millions of lines of software computer code. VA has approximately 130 separate physical instances of VistA running the "same" version of software on centralized VA servers (in regional data centers) to support all 155 VAMCs and clinics throughout the United States.

In 2012, VA started the "Gold Disk Project" to standardize on a national version of VistA by the end of 2015. The first "gold disk" standardized 60 percent of the modules in VistA that were considered "essential" to clinical care. This instance was deployed and work on the remaining 40 percent of modules continues. The system does allow for local variations, resulting in some data elements being captured in different ways from instance to instance. Data is copied from CPRS as it is recorded and replicated into VA's Corporate Data Warehouse and Regional Data Warehouses. Differential interpretation/transformation of the data, however, sometimes results in reports being different, though the data came from "the same" data source. Figure A-11 shows the EHR/VistA technology stack, which includes kernel and core applications (i.e., Remote Procedure Call (RPC) Broker, FileMan, Device Manager) that provide the essential

functions to capture, manipulate, and exchange patient information with VA's user applications and interoperability solutions. VistA's use of MUMPS technology tightly integrates the clinical information stored in the underlying Intersystem Caché databases with the business logic used to retrieve and manipulate that data.

Figure A-11. EHR/VistA Technology Stack


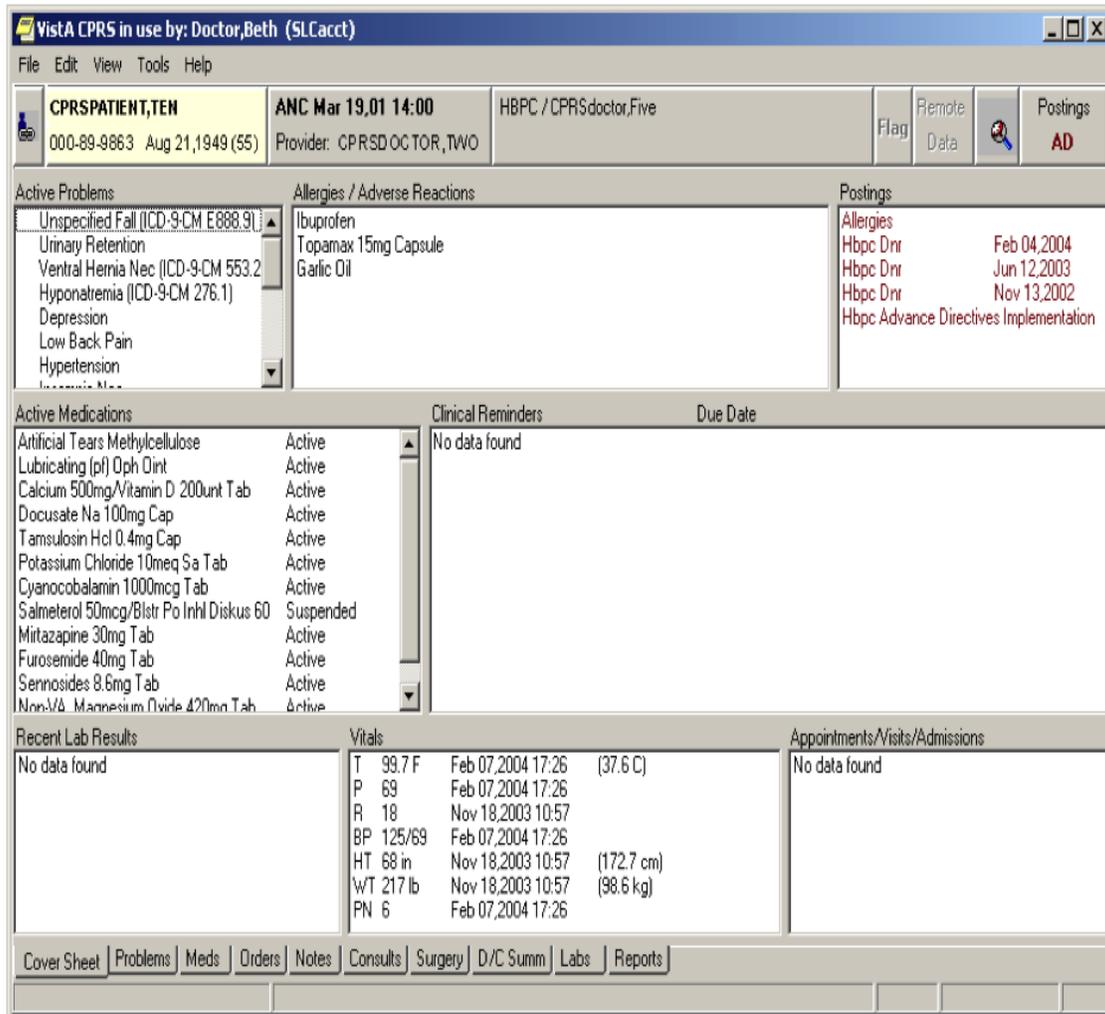
Source: VA OI&T, 2015b.

To simplify data access, VistA employs FileMan as VistA's database management system. The majority of VHA clinical data is stored in VA FileMan files and is retrieved and accessed through VA FileMan user interfaces. FileMan utilities allow the definition of data structures, menus and security, reports, and forms, allowing a person to set up applications without tremendous experience in the MUMPS programming language.

Patient Information is retrieved from the current VistA's InterSystems Cache data store using existing MUMPs procedures (MUMPS RPC interface) based upon business triggers (such as an appointment, admission, Integration, or patient search).

Figure A-12 shows the CPRS user interface. CPRS is a desktop client application (i.e., a "fat" client) that provides VA's health care professionals with a single Windows-style interface for health care providers to review and update any patient information, to place orders, including medications, special procedures, x-rays, patient care nursing orders, diets, and laboratory tests stored and managed in the VistA EHR.

Figure A-12. CPRS User Interface

Source: CPRS User Interface – https://en.wikipedia.org/wiki/VistA#/media/File:VistACPRScover.png


A.3.2   EHR Integration

VistA supports the ability to communicate and interact with other systems at multiple levels: applications may be tightly integrated with VistA code or loosely integrated via application programming interfaces (APIs), medical devices may be connected, and patient data may be shared between providers.

For custom or commercial applications that require tight integration with the VistA database or business logic, the interface of each VistA package is documented, identifying both the code routines and the data fields owned by the package. VistA supports a library of published interfaces that provide access to VistA data and logic for a wide variety of functions through VistA's RPC Broker module. This is the mechanism used by CPRS to call the underlying business logic in VistA. The RPC interface provides separation between the mainline VistA applications and the clinician-facing GUI. Some web-based applications interface with VistA via the RPC

library using newer software architecture that allows for newer software technologies (i.e., JavaScript-based development).

In addition to internal programming interfaces and outward-facing web services interfaces, many VistA applications communicate via standard Health Level 7 International (HL7) messaging protocols. HL7 messages provide for application-to-application communication and enable data exchange with external data repositories. HL7 messaging provides the fundamental mechanism for medical devices to interact with VistA. The Clinical Procedures package provides an interface between medical devices and VistA. Data from the device is saved according to the particular application. VistA supports both a data repository for clinical device data and a report viewer to format the data for clinical review. Numerous devices, from Picture Archiving Communications Systems (PACS) imaging to Intensive Care Unit (ICU) equipment, interface with VistA in this manner.

A.3.3   EHR Interoperability

Assessment H interviews indicated that widespread device integration is limited due to the time required to gain security accreditation and lack of programmer (MUMPS VistA) integration skills within VA. The Assessment H team was unable to identify a medical device strategy or inventory of device interfaces requests and approved interfaces. However, a sample of 20 New Service Requests for "New Device Interfaces" from OI&T's Innovation and Development Request Portal (IDRP) database indicate that only one is complete (submitted 9/8/14), one is under development and test (submitted 12/13/12), three were rejected, and the remaining 15 (75 percent) were "Not Opened - Pending NSR Acceptance" or "Accepted for review."

To be useful the EHR must expose and share information with external providers, administrative applications, and benefits organizations to service Veteran's needs. The four primary paths of information exchange to fulfill these roles are described in Table A-2.

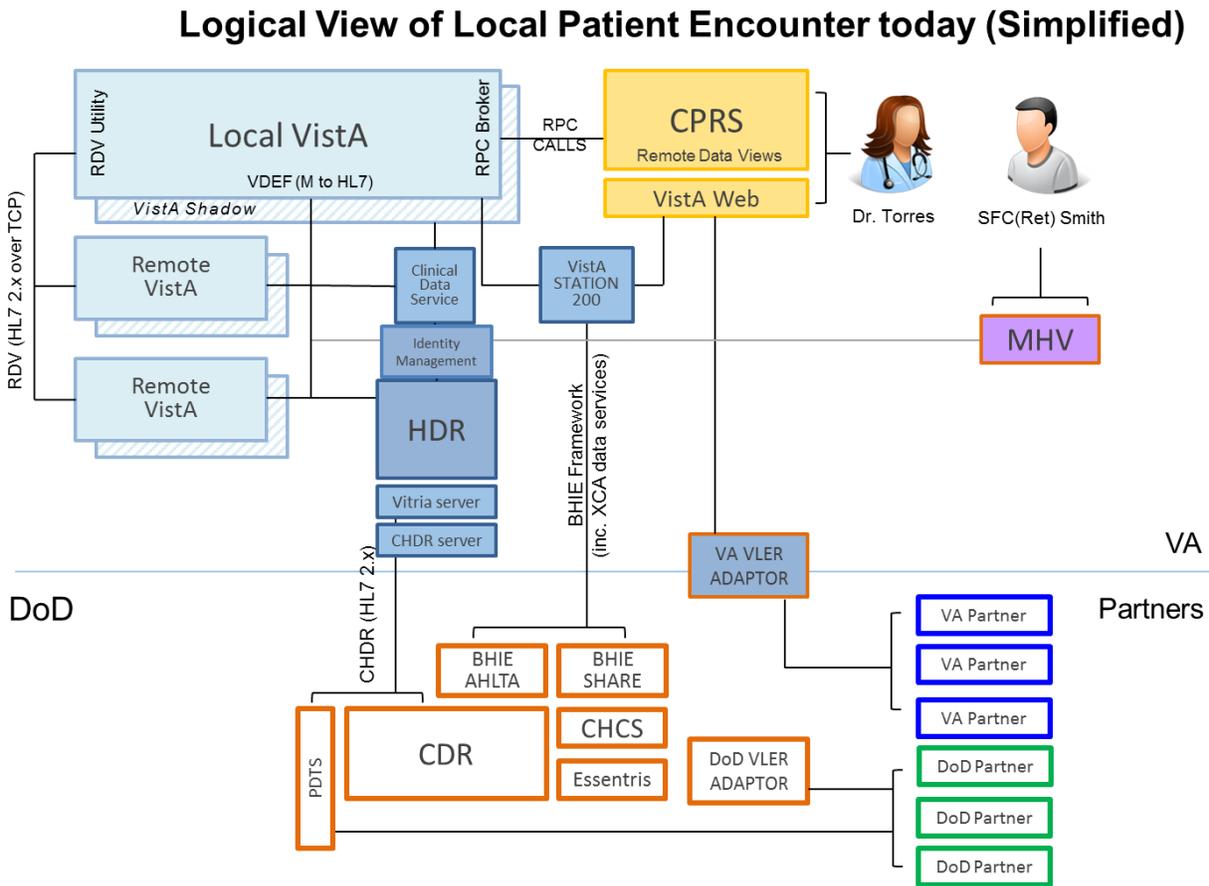
Table A-2. VA Clinical Information Exchanges

Information Exchange Profile	Current Systems	Data Exchanged
VA-VA	VistA Web	Remote patient information found in VistA, the Federal Health Information Exchange (FHIE) system, and the Health Data Repository (HDR) databases
	JLV	Medications, progress and discharge notes.
	CAPRI	Veteran's entire VA health record including progress notes and discharge summaries, Compensation and Pension (C&P) exam requests and results, FHIE data

---

Information Exchange Profile	Current Systems	Data Exchanged
VA-DoD	BHIE	Real-time read-only viewing of DoD and VA patient clinical data (i.e., Consultations, patient history and physical reports, theatre clinical data)
	FHIE	Monthly transfer of discharged Service members' clinical data from DoD to VA (i.e., Pharmacy, radiology, lab results)
	CHDR	Two-way exchange between DoD and VA of actionable outpatient (pharmacy medication, allergy, and allergy reaction) data for beneficiaries that use both DoD and VA health facilities, allowing the information to become part of the patients' permanent medical records.
VA-Private Provider	VLER DAS	Veterans external partner data
	eHealth Exchange	Veterans external partner data (Populated Summary of Care Document (C32), Populated Unstructured Document Component (C62) data domains
VA-Veteran	My HealtheVet	Veteran Web Portal
	BlueButton	Veteran medical records in C32 Continuity of Care document format

Figure A-13 shows a simplified view of a patient's encounter with the current VA and DoD health care systems.

Figure A-13. Current View of Patient Encounter with VA and DoD Health Care Systems


Logical View of Local Patient Encounter today (Simplified)

Source: OI&T ASD, VistA 4 Product Architecture Review Triad Meeting Winter 2015 (briefing), January 27, 2015.

VA-VA Information Exchange

VistA Web and the recently updated Joint Legacy Viewer (JLV) are intranet web applications that clinicians use to review remote patient information found in VistA, the Federal Health Information Exchange (FHIE) system, and the Health Data Repository (HDR) databases. To a large extent, VistA Web mirrors the reports behavior of CPRS. An updated version of the JLV that provides the ability for both VA and DoD user to view health record data to meet the increasing need for seamless interoperability of standards-based health data was released in FY15Q1.

A clinician in Palm Springs, who is looking at a record from a Veteran who received care in Northport, NY, will view that record through VistA Web and also through the JLV. The clinician is not actually able to copy that record in Northport and put it in the Palm Springs instance—they are viewing the record in a web viewer, whose data reside in the Northport instance.

VA-DoD Information Exchange

VA clinicians have been able to access DoD data (i.e., medications, progress, and discharge notes) for many years through VistA Web using the same workflow for accessing data from

other local VA systems. JLV, also allowed Health Information Exchange (HIE), starting in 2013 and was recently updated in FY15Q1 and is the first major phase to modify the viewer capability. JLV provides a read-only interface for patient data aggregated from DoD, VA, and external partners. JLV provides an integrated view of both DoD and VA health information on a single screen for providers of both Departments. It obtains its data from the DoD's newer data services (currently called the DoD Adaptor) and from all of VA's VistA systems (currently via its "VistA Data Services" component).

The following three major backend applications are used to transfer information between DoD and VA to populate VistA and supply data to JVL and VistA Web:

Federal Health Information Exchange (FHIE) has been in use since 2002 and is the oldest and simplest exchange between the DoD and VA. The FHIE architecture is essentially a one-time data transfer of data from the DoD to VA triggered by a Service member's separation from Active Duty. The FHIE Repository (aka BHE Repository) sits within the BHIE Framework within the VA networking enclave.

Bidirectional Health Information Exchange (BHIE) is a middleware hardware and software framework that builds on FHIE. BHIE provides a secure, bidirectional, real-time interagency exchange of clinical Personal Health Information (PHI) data and patient demographics sharing between DoD and VHA. BHIE allows both DoD and VA care providers to view records on shared patients receiving care from both Departments.

Clinical Health Data Repository (CHDR) is a semantically interoperable solution that generates standards-based, bidirectional, real-time computable electronic health data for outpatient pharmacy and drug allergies. CHDR data enable drug/drug and drug/allergy order checks for active ADC Veterans, Service members, and dependents eligible to receive health care services from both agencies.

VA-Private Provider Information Exchange

The purpose of the Virtual Lifetime Electronic Record (VLER) project is to facilitate data exchange between VA and the private sector using national standards. The project has been in development for roughly five years and exchange includes eHealth Exchange[30], Direct Secure Messaging, and exchange through Health Information Handlers (HIH). External partner data are now included in JLV. The eHealth Exchange (formerly known as the Nationwide Health Information Network) was originally launched by DoD and VA Interagency Program Office (IPO) to support the VLER initiative.

Future plans include FHIR and public APIs. VA is currently partnering with 50 external organizations through eHealth Exchange and has several active and planned use cases for secure messaging. VA providers may also be approved to access partners' HIE data through local health exchange organizations that are not currently participating in eHealth Exchange.

---

[30] Formerly known as the Nationwide Health Information Network, the NHIN or NwHIN, is an initiative for the exchange of healthcare information. It is operational and securely exchanging data. It was developed under the auspices of the U.S. Office of the National Coordinator for Health Information Technology (ONC), and now managed by a non-profit industry coalition called HealtheWay.

VA-Veteran Information Exchange

All consented Veterans are able to use the "Blue Button" mechanism through the My HealtheVet portal to download their entire record from My HealtheVet in an electronic format of the C32 Continuity of Care document. VA's Blue Button support is built upon web services that perform the extraction of Blue Button information from VistA, the composition of Continuity of Care Documents, and the system management required to provide on-demand patient access to current Blue Button information.

A.3.4   VistA Evolution Program

VA established the VistA Evolution program in 2014, to oversee modernization of VA's EHR system. VistA Evolution is the third EHR modernization program in 10 years. VistA Evolution is a joint program of VA's OI&T and VHA organizations and will provide interoperability with DoD EHR systems and with other health care partners to promote improved outcomes in quality, safety, efficiency, and satisfaction in health care for Veterans, Service members, and their dependents. The first product version, VistA 4, will use modern software technologies to build a new web-based interface around the existing VistA core.

This approach is also driven by the FY 2014 NDAA (section 713) that requires any enhancements to VistA to result in an EHR that *"...at the point of deployment...must be at a generation 3 level or better for a health information technology system"* as described by Gartner.

A 2011 Gartner report states that while Gartner did not complete a formal Generations Assessment of VistA, the organization estimates that VistA is definitely more than a Generation 1 EHR and may in fact be Generation 2 EHR, but is definitely not a Generation 3 EHR.

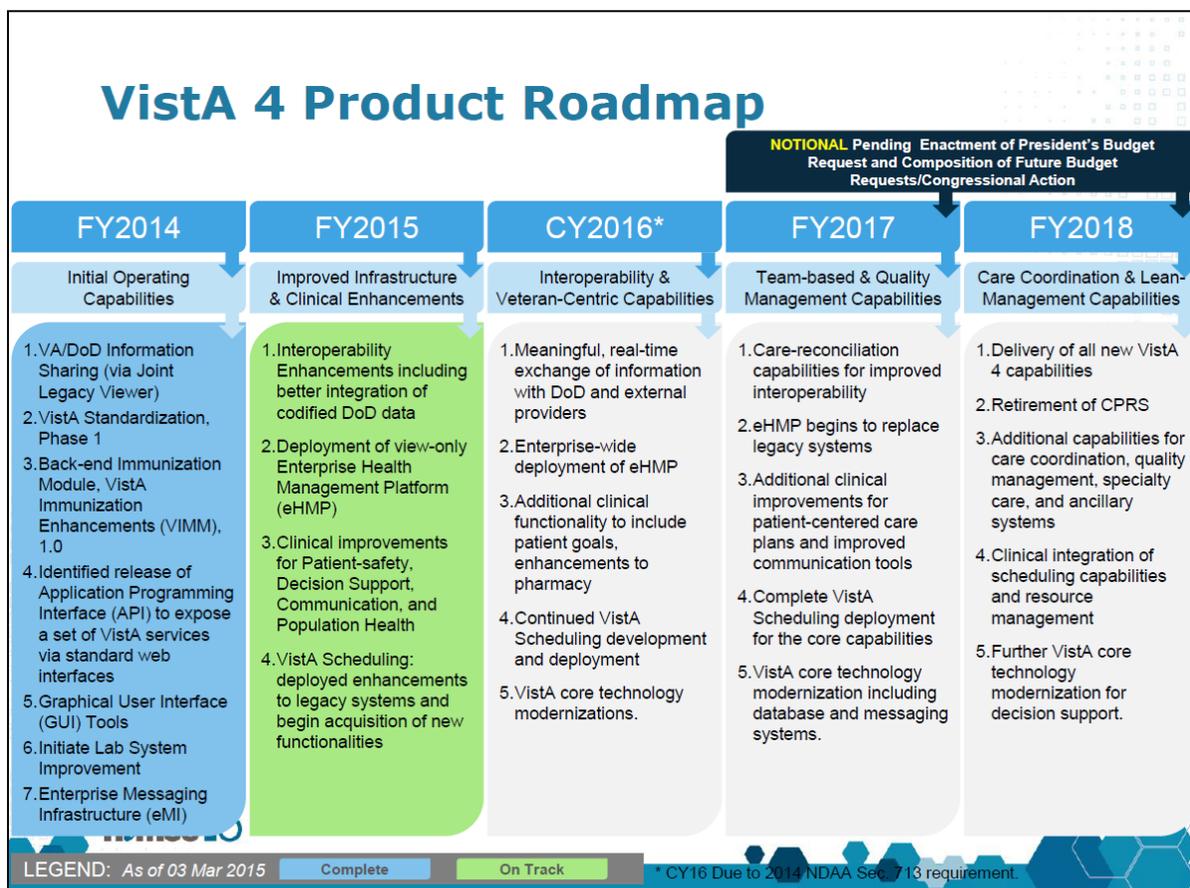
A 2007 Gartner report identifies five generations of CPRS systems as follows:

- Generation 1 systems allow the clinician electronic access of clinical data that may have been scattered across several paper record systems;
- Generation 2 systems build upon on the Generation 1 functionality by offering documentation capabilities;
- Generation 3 systems further help the clinician with basic care management and decision support;
- Generation 4 system incorporates greater decision support capability and intuitive workflow capabilities; and
- Generation 5 systems are envisioned as true 'colleagues' that can assist the clinician in all facets of care.

The VistA Evolution Roadmap shown in Figure A-14 defines a five-year period over which the VistA 4 Product will be delivered as a series of feature sets with Full Operational Capability (FOC) to be delivered in 2018 and it is expected to achieve and exceed Generation 3 capabilities. The roadmap details how VistA Evolution will evolve through time not merely as replacements for VistA/CPRS but as a complex clinical system that provides decision support, capable of not only catching potential errors and alerting clinicians but also of guiding clinicians in the implementation of improved treatment methodologies.

VistA Evolution is responsible for developing an entirely new user interface, clinical workflows and business logic, data access layers, terminology translation services, ancillary services and supporter interfaces to improve interoperability with DoD and private provider networks. The program is supported by the VistA Evolution Triad (described in Section 5 of this Assessment H report) which has oversight to develop several major components (i.e., eHMP, VistA Exchange, VSA, EMI) across 30-40 VA Independent Project Teams and DoD.

The current VistA/CPRS operating environment must be maintained while the VistA Evolution program simultaneously modernizes key components of those legacy systems and integrates them with newly developed software applications across the enterprise. As explained in Figure A-14, VistA Evolution will develop and deploy capabilities in four major feature increments over 5–6 years completing in FY 2018. All the interdependent technical project components must come together to achieve the health outcome described in the *Blueprint for Excellence* EHR objectives. (VA, 2014c)

Figure A-14. VistA Evolution Roadmap


Source: Drew & Nebeker, 2015.

The enterprise Health Management Platform (eHMP) project is the CPRS replacement and is the core of the VistA Evolution program. From a clinical perspective, eHMP will provide the full range of EHR functionality to support ambulatory and inpatient care documentation, including

---

workflow and activities management, clinical orders, encounter documentation, and clinical decision support.

This multi-year effort will develop a modern service-oriented EHR platform around the existing MUMPs and CACHE VistA system internals. The eHMP project provides several new capabilities including:

- New web-based user interface
- Clinical data services that assembles patient clinical data from federated VistA repositories and DoD data sources into an Enterprise Virtual Patient Record (eVPR)
- Synchronization system to handle all of the backend system to system data synchronizations
- Standard APIs, data services and Software Development Kit (SDK) interfaces to support open integration with other enterprise and external applications.

Figure A-15 shows the VistA Evolution program components.

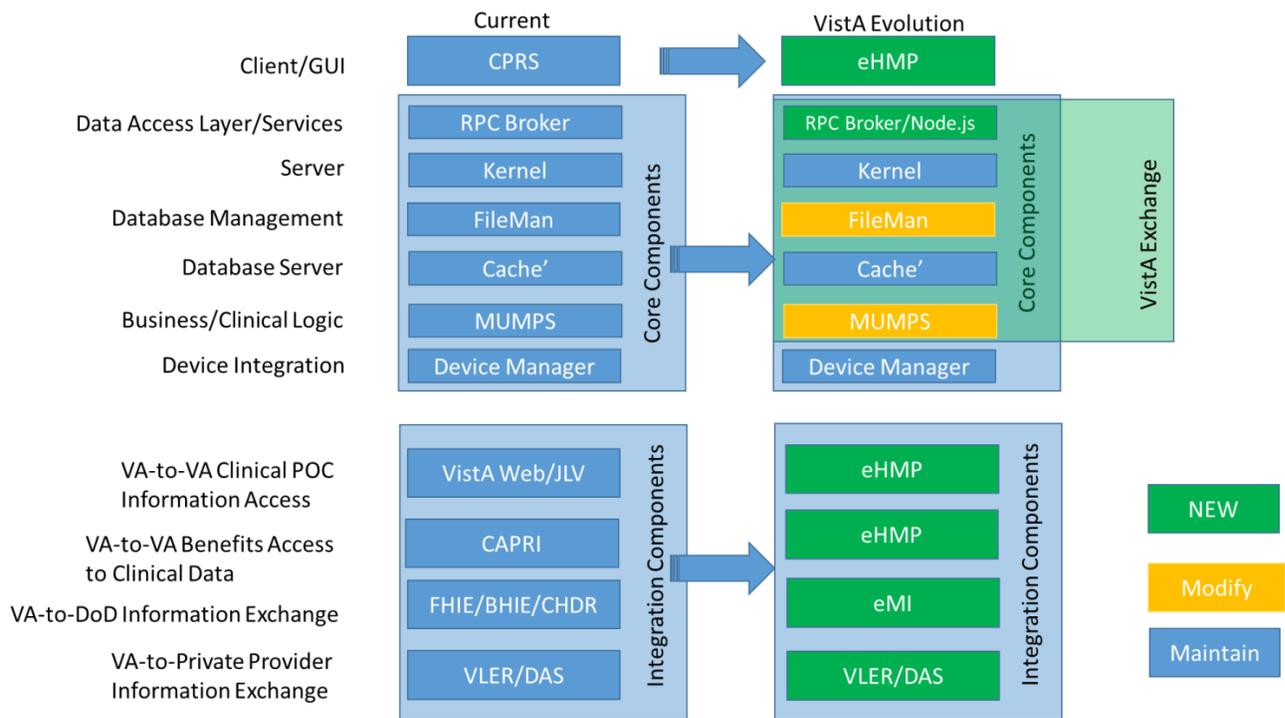
The eHMP web application (i.e., GUI) is being developed from the ground up (Java, JavaScript, and HTML 5) to support a clinician at the point of care and will ultimately perform the functions of CPRS and more. The <u>system is unique in that it will provide a longitudinal view of patient data provided by eHMP's VistA Exchange synchronization engine.</u>

The web application is developed as a single page application with behavior logic contained within the web client, avoiding unnecessary communications across the network to improve performance and the user experience. As of March 2015 human-machine interface details were still being defined. The detailed interface design rules, inputs, outputs, and navigation hierarchy are being developed in accordance with a defined feature schedule but the detailed designs are subject to change as additional customer review cycles are held.

The eHMP web-based GUI is using an iterative design approach starting with functionality existing in the current patient record viewers (i.e., JLV, VistA Web). eHMP must build to the existing viewer features before it can migrate users to the new platform. eHMP V1.1 is the first step to incorporate existing software with read-only capabilities of patient records in the local VistA system. Future versions will evolve the application to become a full read-write application to replace CPRS and provide a view across all patient-centric actions and data sources. eHMP services will include: Clinical Decision Support (based on the openCDS initiative), Context Persistence, Orders Selection Service, Orders Management Service, Data Annotation Service, Clinical Workflow, Documentation and Text Search Services. Figure A-16 depicts the VistA Evolution transition in terms of changes in major system and software components.

Figure A-16. VistA Evolution Transition


Source: MITRE summarization of architecture and design descriptions from VA (2015b), VA (2015i), and OI&T eHMP System Design Document, March 2015, V2.8.

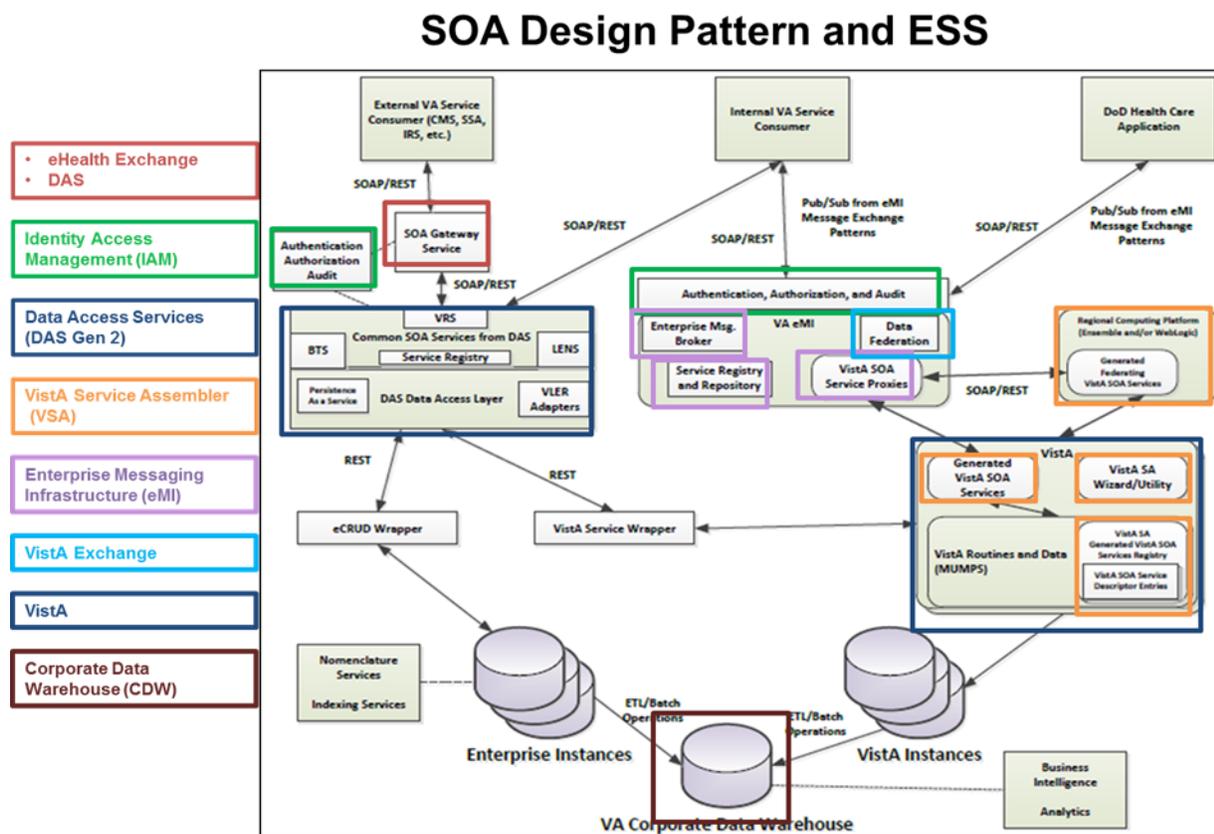
VistA Evolution Access Services

VistA Exchange (VX) is a new software system component being developed that provides eHMP with a patient's longitudinal enterprise record by retrieving and combining data from one or

more of the existing approximately 130 VistA instances. As part of the synchronization services, VX will normalize incoming clinical data to meet VA data standards using standardized terminologies prior to being stored in a VistA Evolutions temporary data store.

VX is not a new data source, it retrieves data from the current VistA InterSystems Cache data store using existing MUMPs procedures (MUMPS RPC interface) based upon business triggers (such as an appointment, admission, or patient search). Additional logic will allow the system to identify other sources of patient data and route requests to those systems for the information through other VA integration systems.

VX is also developing web service APIs to standardize the way applications retrieve a patient record. VistA Evolution will provide both custom and HL7 standards-based FHIR web services and will integrate with a number of enterprise system services. Figure A-17 shows the planned VA service oriented architecture and enterprise system services to be implemented by the VistA Evolution program. The services are expected to provide a valuable way for developers to access the existing M-based data and business logic in VistA and other data sources using mainstream languages. They should also provide a potential pathway for VA and other open source developers to replace M-based implementations, module by module, with identical API functionality using mainstream languages.

Figure A-17. VA SOA Design Patterns and Enterprise System Services


Source: - SOA Design Patterns for VistA Evolution: COTS Applications Office of the Chief Technology Strategist (TS) Architecture, Strategy, and Design (ASD) Office of Information and Technology (OI&T) Version 1.2, Date Issued: 15 April 2014.

The eHMP architecture and designs for patient health record access, user interface, data integration and access, and DoD/VA interoperability are in the process of being assessed and finalized. They must take into account the millions of lines of code and hundreds of VistA M-based modules. Several attempts have been made in the past to convert VistA in its entirety to more mainstream development environments and have failed, both within VA and in the open source community. (GAO, 2008) The tight coupling between M the language and the built-in M database provide unique and difficult challenges when translating M code into other programming languages. To address the data access complexity, VA plans to implement capabilities in four phases:

1. Read only local VistA system - Synchronization process initiates a subscription or checks for published events from VistA. It will connect to local VistA using a direct connection to the existing RPC Broker for a specific patient.
2. Read only local and remote VistA systems - Retrieval of patient data from remote VistA hosts. The subscription process performs a request by invoking a web service which in turn, invokes other VistA instances to retrieve data for that patient.

---

3. <u>Read and write using MUMPS API</u> - VistA Exchange will utilize a direct RPC connection for performing writes. These writes will cover the domains of allergies, vitals, and problems. All of these writes will be to VistA.
4. Under a future release when VistA Service Assembler (VSA) is available, it is expected to <u>migrate the writes from direct RPC Broker connection to utilize VSA.</u>

This architecture requires eHMP data requests to cross several system boundaries and layers to access VistA data (VX to VSA to VistA MUMPS Interfaces) using several different software technologies (Java, JavaScript, MUMPS) and a new standard (VPR, FHIR). This greatly increases the complexity of the solution architecture and forces teams to maintain close integration and configuration management across three disparate projects (MUMPS API, VX, and VSA) without the support of a VistA Evolution lead integrator.

The following two observations provide detailed examples of this complexity and possible impact to performance and scalability.

Stateful session management in eHMP is a concern for system performance and scalability:
An example of a software session is when a clinician connects using their web browser interface to write notes and orders for a patient. In a stateful session the system maintains information on the status of each communications to match the clinician request to the data exchanges with the system. In this manner each subsequent activity (request or reply) relies on the result (i.e., state) of the previous activity. There are several activities that occur during a session to achieve an objective and once that is accomplished, the session is dissolved. Currently, CPRS is the client that creates a stateful connection to VistA that remains open during the entire session. As a Windows-client, CPRS communicates through a proprietary stateful protocol so it is not burdensome to keep the connection open.

Web-based systems have moved away from stateful sessions to resolve scalability problems that result from managing the context across enormous numbers of activities. The *stateless* architecture used by web-based systems has enabled its tremendous scalability. As eHMP moves to a web-based system, it will need to support an unprecedented number of users through mobile, telehealth, and other planned enhancements. Keeping stateful sessions open is expensive and may not scale. eHMP depends on VSA, which uses VistA's RPC Broker, the stateful mechanism used by CPRS to call the underlying business logic in VistA. VSA also provides the common federator logic within services to connect two of the VistA hosts and is another dependency for scalability. Stateful session management may not provide the performance and reliability to meet Veteran needs at scale.

eHMP will initially have a small user set as the transition from CPRS to eHMP begins so stateful sessions will not be an issue at first. However, when eHMP scales to thousands of users (perhaps millions with mobile and telehealth), stateful sessions will become unmanageable and require a significant architectural overhaul with the added complexity of a heavily used production environment.

The VSA team is scheduled to have a product ready to integrate with eHMP around the September 2015 timeframe. eHMP version 1.0 is using RPC Broker and is targeting integration with VSA in version 2.0. eHMP partially addresses the stateful session issue through limited

data write capability. Assessment H interviews and reviews of project risk documentation indicated that the project recognizes this is not a good long-term solution as the ability to create and update patient records is a vital capability.

eHMP is moving to a relatively new technology, Node.js, to mitigate scalability and integration issues: eHMP is using a Node.js-based solution to provide an interface (wrapper) around VistA's MUMPS packages that can potentially provide a mechanism to address the scalability issue raised by the VistA RPC Broker. Additional open source software will be used to integrate Node.js with the underlying database, allowing MUMPS data to be accessed from JavaScript.

Node.js is an open source JavaScript-based web server platform rapidly gaining popularity, based upon Google's V8 JavaScript engine, with an emphasis on non-blocking, event-driven I/O. JavaScript application interface libraries and utilities (i.e., Node) are available to work with VA's InterSystems Global and Caché products that provide VistA's underlying data capabilities.

Assessment H interviews indicated that very little is understood regarding the optimization that will be required to handle the load for a web-based system with data aggregation from multiple systems verses a single instance today. eHMP engineering teams have developed preliminary approaches to conduct end-to-end testing. They are conducting acceptance and integration testing now which includes all integrated tests related to functionality but not performance. eHMP is standing up a performance testing platform, trying to gain access to the enterprise testing center, and promoting development of joint, centrally funded, VistA Evolution test and production test environments. The VistA Evolution program needs to develop an end-to-end approach to address issues related to stateful sessions now before additional design decisions become difficult to address before eHMP adoption increases.

A.3.4.1   Improving Internal and External Sharing of Veteran Records

A key objective of the VistA Evolution Program is to enhance cross-Agency (DoD/VA) interoperability by providing all clinically relevant data at the point of care for Veterans. Improved interoperability will enhance communication among VA health care partners by ensuring that authorized beneficiary and medical data are accessible, usable, shared, secured and sufficient to meet the needs of Veterans and their care team in real-time (VA, 2015h).

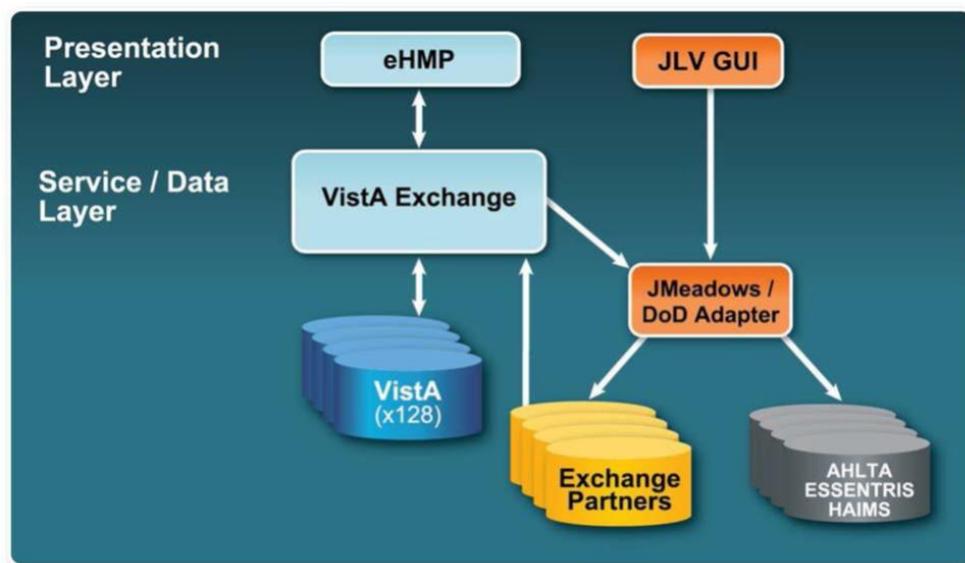
VistA Evolution defines interoperability as "the ability of different EHR systems or software to meaningfully exchange information in real time and provide useful results to one or more systems." Interoperability capabilities will be achieved within the overarching VistA Evolution product delivery schedule. The path to interoperability evolves and builds upon existing progress year by year, with a goal to meet the FY 2014 NDAA directive to provide "seamless electronic sharing of medical health data" between VA and DoD by December 31, 2016. This seamless electronic sharing of data involves the creation of a unified lifetime health record for Veterans and Service members that can be accessed by clinicians at any point in time and regardless of where the information is stored.

The VistA Evolution program will evolve VA from its current forms of health information exchange to a more consolidated, centralized, and integrated design to minimize duplicative

functionality. VistA Evolution integration within VA, is briefly described below and in more detail in Assessment B, which assessed HIE as a capability to improve Veteran access to care.[31]

Current VA-VA Information Exchange

At present, using CPRS, most VA clinicians have access only to patient data that reside at a single VistA location. Figure A-18 shows how VA clinicians will be able to access patient data in other VistA locations.

Figure A-18. VA-VA Information Exchange Architecture


Source: VA, VistA 4 Product Architecture, January 27, 2015 Version 1.0.

Clinical data within each VA system are stored in a unified medical record and easily accessible to any facility within that region, which is similar to other large provider organizations. However, there are approximately 130 separate physical instances running the "same" version of VistA software on centralized servers. Data sharing across regions is currently available through the Remote Data Viewer (RDV), VistA Web, and most recently by the JLV (VA OI&T, 2014g).

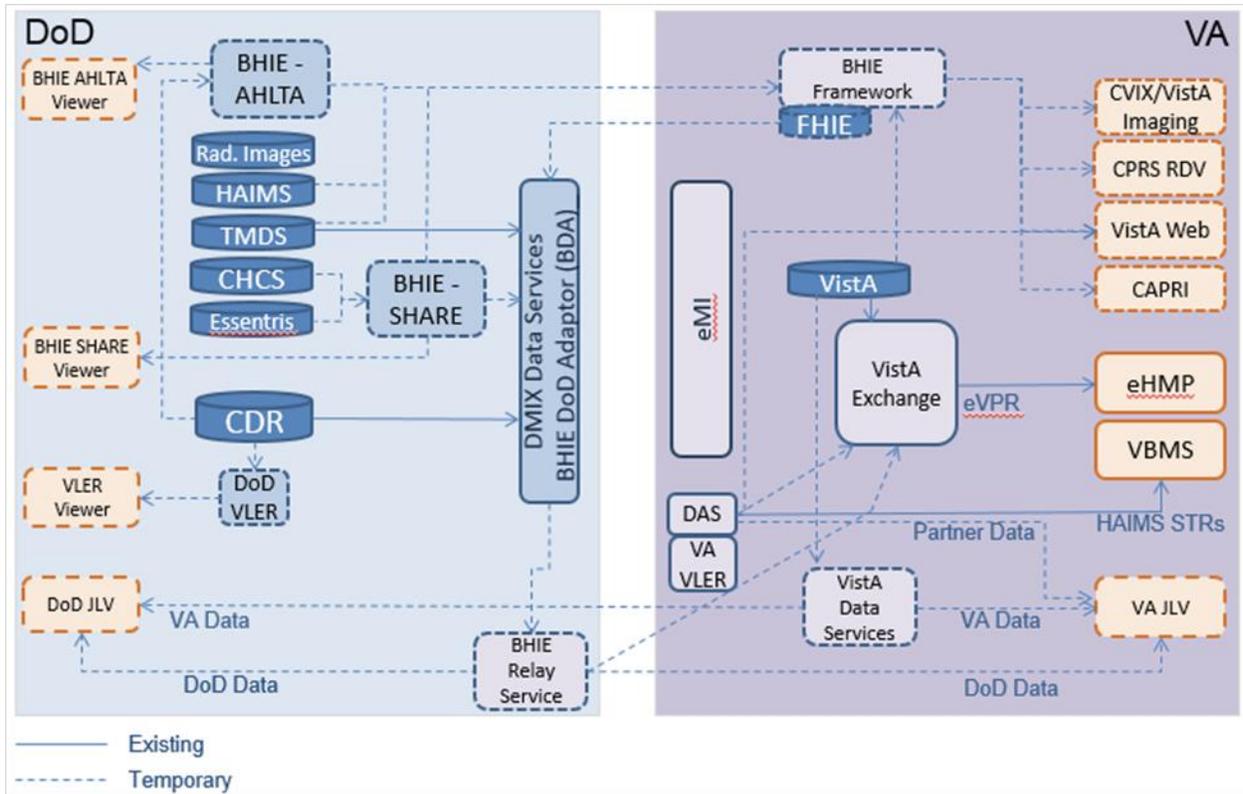
Current VA-DoD Information Exchange

As shown in Figure A-19, VA clinicians have been able to access DoD data for many years through VistA Web and the CPRS portal using the same workflow that accesses data from other local VA systems. The JLV also enables HIE starting in 2013. JLV is a cloud-based medical records system that allows DoD and VA EHR data to be displayed on one screen. The data include medications, progress notes, and discharge notes. The FY15Q1 JLV deployment is the first major

---

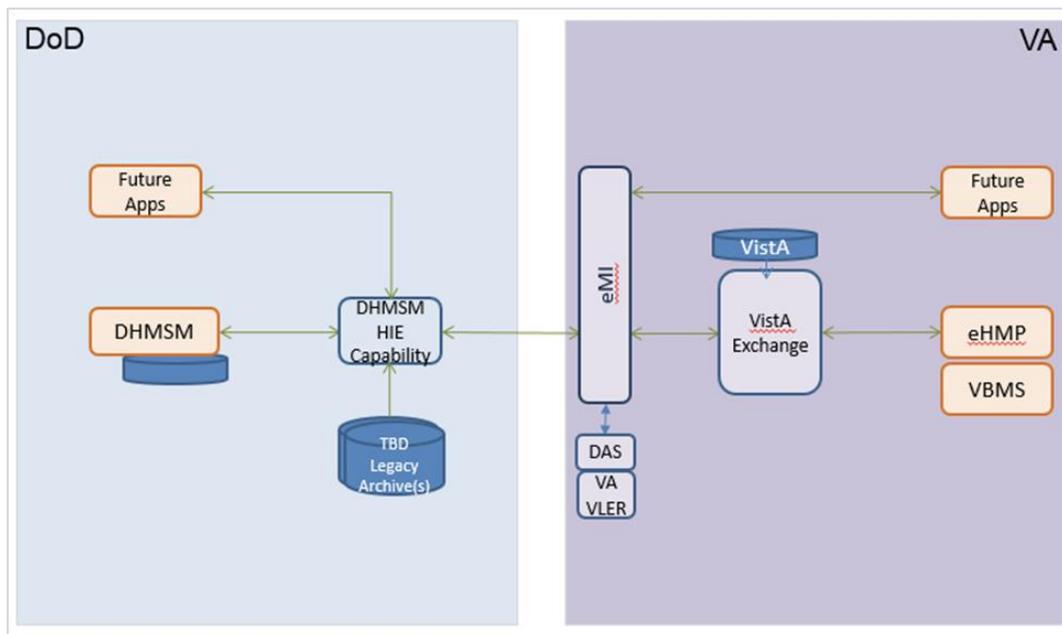
[31] OI&T, 2 Apr 2015. "VistA Evolution – Draft DoD/VA Interoperability Transition Plan (Primary Focus on BHIE)." Working draft, pre-decisional –Internal VA Use Only.

phase to modify the viewer capability. However, usage and usability data have not been captured or published since the application is still in the early stages of deployment and use.

Figure A-19. Current DoD-VA Information Exchange Architecture


Source: VA OI&T, 2014g.

Figure A-20 shows the Future DoD-VA information exchange architecture. The joint goal of the Interoperability Enterprise Plan is to lay out a modernization process that is focused around the now legacy BHIE Framework set of systems. The plan lays out a step-by-step process to fully transition from this legacy BHIE Framework-centered environment to the new interoperability platforms that DoD and VA have established. The plan incorporates existing DoD and VA strategies and plans for DoD-VA interoperability data services and viewers into a single joint plan. Upon completion of the Interoperability Enterprise Transition, the infrastructure is expected to be greatly simplified with full semantic interoperability.

Figure A-20. Future DoD-VA Information Exchange Architecture


Source: VA, 2015e.

Current VA-Private Provider Information Exchange

The purpose of the Virtual Lifetime Electronic Record (VLER) project is to facilitate data exchange between VA and the private sector. The project has been in development for roughly five years, and includes eHealth Exchange,[32] Direct Secure Messaging, and exchange through Health Information Handlers (HIH). Future plans include FHIR and public APIs. VA is currently partnering with 50 external organizations through eHealth Exchange and has several active and planned use cases for secure messaging. VA providers may also be approved to access partners' HIE data through local health exchange organizations that are not currently participating in eHealth Exchange.

The VLER initiative is attempting to become a mature HIE initiative and a national leader in developing interoperability standards and standards-based information exchange. Several articles indicate that it has high user Veteran acceptance and high VA clinician acceptance and experience. (Byrne, 2014) However, It is difficult to evaluate the VLER project based on usage data because of the incomplete state of HIE usage measures, the poor evidence of value brought by HIEs, and the lack of user satisfaction metrics. There are a number of barriers to VA-private sector data exchange through VLER, several of which are discussed in Assessment B.

---

[32] Formerly known as the Nationwide Health Information Network, the NHIN or NwHIN, is an initiative for the exchange of healthcare information. It is operational and securely exchanging data. It was developed under the auspices of the U.S. Office of the National Coordinator for Health Information Technology (ONC), and now managed by a non-profit industry coalition called HealtheWay.

The views, opinions, and/or findings contained in this report are those of The MITRE Corporation and should not be construed as an official government position, policy, or decision.

These include patient consent, time to retrieve documents through eHealth Exchange, and record matching rates needed to exchange information.

Based on inputs from VHA's Office of Informatics and Analytics, Strategic Investment Management Implementation of CCDA, 2011 standards commonly used in health record exchanges today had been delayed and generation and display of a full C-32 (older standard) has also been delayed. The 2011 standard is still not implemented; the older C-32 standard is not correctly implemented; as a result, exchange with private partners is not functioning, which, leads to the following issues:

- Of the 24 current active sites, only three have more than 100 transactions per month, and 13 have fewer than 25 transactions per month. Four of the active sites are at risk of shutting down. This reflects extremely low usage.

- Based on the VLER Health 2014 assessment report (June 2014) page 19, "Of particularly concern was the low frequency of VLER Health usage, approximately 5 retrievals per 1000 veteran encounters." Additionally from the report: "VLER Health program is in a high risk situation, as evidenced by both the average assessment score of 3.8 [out of 10 possible], and the fact that every metric category scored in the high risk range."

Based on Assessment H interviews and reviews of test reports, it is estimated that the VLER Exchange website generates approximately 800 incoming transactions and 3375 disclosures per month. The goal is to onboard 100 new partners at an average of 8.3 partners/month (linear growth assumption). The objective is to generate 1,125 total new transactions/month.

Through interviews, the Assessment H team was able to confirm several existing VLER performance issues originally identified in a May 2015 Capacity and Performance Engineering (CPE) Capacity Evaluation Report. The report observed that known performance issues between the eHealth Exchange and its interfacing systems remain unresolved as a Tiger Team continues to work the problems. The initial issue was outlined in a 30 September 2014 CPE Capacity evaluation report (OI&T/ESE, 2014). The report refers to an email from the Director of VFA/Service Integration Office (08/15/2014) stating that:

> VLER eHealth Exchange has been having infrastructure issues and other issues as they try to 'on-board' and move partners into production. Recently, they had to 'back-out' a brand new partner due to performance problems… We have lost tremendous credibility with our external partners because of these issues.

The report goes on further to state a concern that "The causes of disappointing VLER eHealth Exchange performance are many and complex, from architecture/implementation deficiencies to timeout issues, among other things. But one nagging concern persists: a lack of performance testing to ensure the system functions as designed. For example, since December 2009, we found about 80% of releases had no performance testing."

Unless the VLER project teams address this shortfall, VA could jeopardize its ability to deliver expected capabilities to support Veterans' needs, and significant risks remain that upcoming VLER releases could continue encountering challenges on-boarding external partners.

Summary of Future VA Health Information Exchange

The goals of VistA Evolution are to improve the technical infrastructure for health data interoperability while reducing overall system complexity, converting to standards-based services, formats, protocols and data models, and enabling expanded and improved data exchange with partner providers. The VistA Evolution program has been analyzing alternatives and has developed a draft Interoperability Enterprise Transition Plan that outlines an approach to transition of system components and data exchange services for DoD-VA interoperability through an iterative approach.

In developing the strategy and enterprise architecture for interoperability, VA and the VistA Evolution Program have decided to utilize a SOA, an Enterprise Service Bus (ESB) and RESTful services. This approach entails a significant shift in the current health information exchange architecture. Multiple changes to the overall HIE architecture will occur in rapid sequence over the next five years. The future high-level architecture is defined; however, there are numerous design decision that still need to be developed and agreed upon.

The final solution will retire the current clinical application's user interfaces (CPRS, VistA Web and JLV) and migrate to the eHMP. There are several stages of interoperability enhancements that will occur in VistA Evolution feature sets. VistA 4 feature sets 2 through 4 will incrementally make Interoperability enhancements to the health data information exchanges between VA and DoD, and between VA and external health care partners, improving the speed and accuracy of clinical decision making and ensuring that authorized medical data are accessible, usable, shared and secure. (VA, 2015e)

These enhancements will set the framework for data from all available sources to be integrated so that VA clinicians can easily access a patient's entire medical history. This transition of legacy DoD-VA query/response interoperability systems can be summarized in the following high level steps:

- Move consumers/users to new viewer/applications and data services
- Move unique content and required services off of legacy platforms
- Shut off legacy systems.

Figure A-21 shows a notional sequence of events to replace the current components with newly developed VistA Evolution and enterprise service capabilities.

Appendix B   Assessment H Support Data

B.1   Industry Outreach

B.1.1   Overview

Eighteen technology leaders from both health care and non-health care institutions were interviewed to collect their insights on providing effective information technology services for large organizations. The list of CIOs who were interviewed can be found in Table B-1. These experts were selected because they developed and implemented innovative IT solutions. They provided valuable insights, lessons learned, and best practice IT strategies. Their thoughts provided some of the basis for assessing the Department's IT effectiveness.

Table B-1. Health Care Technology Leaders Interviewed

Organization Name	Interviewee	Title
Beth Israel Deaconess Medical Center	John Halamka, MD	Chief Information Officer
Brigham and Women's Health Care	Cedric Priebe, MD	Chief Information Officer
Citizens Memorial Hospital	Dennis McColm	Chief Information Officer
	Karrie Ingram	HCIS Manager
	Sherry Montieone	Network and Support Manager
Edward-Elmhurst Healthcare	Bobbie Byrne, MD	System Vice President & Chief Information Officer, Vice President, Facilities, Construction & Cancer Center Services
Georgia Regents University and Health System	Charlie Enicks	Vice President and Chief information Officer
Johns Hopkins Health System, the Johns Hopkins University, Johns Hopkins International	Stephanie Reel	Chief Information Officer
Legacy Health	John Jay Kenagy, PhD	Senior Vice President and Chief Information Officer
The MITRE Corporation	Joel Jacobs	Chief Information Officer

Organization Name	Interviewee	Title
Northwestern Memorial Hospital	Jay Anderson	Vice President, Quality and Safety
	Carl Christensen	Chief Information Officer, Northwestern Health System
Oregon Health and Science University	Bridget Barnes	Vice President and Chief Information Office
Partners Healthcare	Jim Noga	Chief Information Officer
Sparrow Health System	Michael H. Zaroukian, MD, PhD	Vice President & Chief Medical Information Officer
Surescripts	Mark Gingrich	Chief Information Officer
University of Iowa Health Care	Lee T. Carmen	Associate VP for Information Technology, Chief Information Officer
Vanderbilt University Medical Center	Thomas (Tom) Fricks	Interim Deputy CIO

The following sections contain the major comments and guidance from these health care technology leaders about effectively running a large health care system.

B.1.2 Planning and Governance

Strategic Planning

For strategic planning, most of these health care organizations develop a three to five year vision, which provides a high level of understanding and coordination for executing an associated one-year tactical plan. Nearly all organizations recognize that the three to five year strategic vision will change significantly in response to rapidly evolving information technologies and new clinical policies and approaches. Even with a rolling three-year strategic plan, the pace of change with technology usually requires changes to the plan after the first 18 months.

Investment Decisions

For the purposes of planning new health IT capabilities, the overwhelming majority of the industry leaders described a repeatable and well-understood process for prioritizing and executing investments. These processes and outcomes were widely communicated throughout their organizations. Further, their organizations provided a clear chain of command for assigning individuals to be responsible for the strategic outcomes, incremental improvements,

and operations. The organization's CIO was frequently in charge of communicating the IT plan throughout the organization.

The investment processes all included some form of requirements collection, and the CIO was typically responsible for developing the final blueprint explaining how the clinical and business requirements would be implemented into the IT systems. The CIO was typically responsible for communicating investments that were rejected and the rationale.

Most organizations allow the submission of requirements for new capabilities from anyone in the organization, not just physicians. Most hospitals included a type of steering committee to review the submissions for new health IT capabilities. The steering committees typically included representatives from across the services areas, such as hospital, ambulatory, long term care, and assisted living. When reviewing and prioritizing the requirements, most organizations prioritized improvements in the patient engagement including, patient relationships, reliability, outcomes, and satisfaction. Most of the health care organizations view their patients as "customers" who may go elsewhere if they are not satisfied with their health care experience.

The investment processes all included a public and repeatable schedule for making and communicating the investment decisions. Most organizations make large capital and initiative investments on an annual basis. Most organizations have a monthly meeting to review investment decisions, measure and manage risk, and potentially modify or terminate initiatives. The CIOs are expected to understand a significant amount of detail about high visibility and large investments to manage risk. For these annual investment processes, the CIO is frequently the final authority on the process to prioritize and sequence current and future projects. These decisions are made in collaboration with other executive leaders, such as the CMIO of the organization. However, the CIO is typically accountable for the final decision and the success of the implementation.

Escalation

Many of the leaders indicated their organizations needed to have a clear escalation process for IT investment requests. Escalation can be requested by anyone at any point in the process, with the organization CEO being the final decision maker. Although projects are rarely escalated to the highest levels of the organization, the existence of a documented, formal process provides a clear understanding regarding the roles and responsibilities of the champions of initiatives and the decision makers.

B.1.3   Electronic Medical Record (EMR) Adoption

When planning for capabilities, the CIOs at two large health systems had achieved "Stage 7" of the Healthcare Information Management Systems Society (HIMSS) Analytics EMR Adoption Model (EMRAM). Only 3.7 percent of U.S. health care organization have achieved this level of a virtually paperless system. One of the core principles of one organization was to use the latest version of the EMR provided by their COTS vendor. Since the COTS vendor releases one major version per year, this principle entails an annual update of the EHR. Because the new EHR version requires testing and validation, the organization usually needs about 6 months to

implement the annual upgrade. During the upgrade period, the IT organization typically implements no major new functionality (except for the features and capabilities inherently included in the new version of the EHR). Once the version is installed in production and stable, the IT organization may implement new features.

COTS EHR

The overwhelming majority of the leading health care hospitals are in the process or have completed a transition to a COTS EHR system. The primary reason provided for this change was to reduce the O&M costs of existing EHR systems, to comply with rapidly advancing federal regulations, to reduce the cost to upgrade infrastructure for future programs and policies, and to enable their IT staff to spend less time maintaining their EHR capabilities and to spend more time developing innovative capabilities. The interviewees indicated the majority of the internal resources used to support homegrown EHR solutions were allocated to support capabilities, which were viewed as neither transformative nor innovative for the organization. For example, the Meaningful Use program and its associated requirements for EHR technologies were widely viewed as an excessive burden for any internal development organization to implement in their EHR. The CIOs also emphasized that a single COTS EHR reduces the challenge of interoperability of health data. Although a COTS EHR does not ensure interoperability across a broad set of heterogeneous set of systems, COTS EHRs tend to greatly improve the exchange of patient data within an organization.

For those organizations that are either moving to or have moved to a COTS EHR, most CIOs say they will adopt commercial technology without customizing it to their needs. It may be tempting to customize the COTS EHR, but maintaining the changes as new versions of the EHR are released can be very expensive. Most COTS EHR vendors understand the need for flexibility and allow clinicians control to configure the user interface and workflow to meet their unique processes and needs. The most successful COTS EHRs accommodate this need as a configuration adjustment capability rather than require the development of software customization for each client. For one large health care organization, the plan to transition to a COTS EHR involved over 5000 clinicians in the configuration and deployment. The vendor selected by this organization introduced a disciplined approach to build an example workflow to a large audience of clinicians.

One organization found that their internally developed EHR system they created consumed all of their development funding just to maintain compliance with the bare minimum requirements for the large "Meaningful Use" program. This organization was unable to implement other needs such as upgrading to the ICD-10 coding system, and they were unable to introduce innovative new clinical capabilities. A COTS EHR vendor was able to demonstrate that the COTS EHR would provide all of the "Meaningful Use" requirements and still allow for organization-specific customization for a specific site's needs. This hospital made the strategic decision to shift their developers to configuring the COTS solution, which was less costly than maintaining their internally developed EHR.

The downside of a COTS approach is that these organizations no longer have direct control of their EHR. The vendors provide a distributed, complex governance process in partnership with other medical centers using the EHR. Currently, requests for most changes and configuration

enhancements can be addressed without long delays. But, change from the prior expectation of local control by the physicians was a rude awakening for some physicians. With an enterprise-wide EHR, some changes simply cannot be implemented if the priorities are not shared by other stakeholders. Under the new governance process, requests for changes enter a queue and this organization fully anticipates a backlog that may grow to months, or even years, to see new capabilities fully addressed. With that understanding, the organization implemented a communication and education program to provide expectation management with the clinicians.

Clinician Burden from New IT Systems

When reviewing IT requirements, one organization attempts to minimize the burden on physicians of new systems. The Meaningful Use program was cited as a burden on physicians because the processes require extra data entry and alter the physician's normal workflow. These changes reduce the physician's time with the patient. As a result, the data entry and workflows are reviewed to maximize data entry by administrative staff and maximize time with patients by physicians.

System response time metrics were also measured for physicians. One hospital discovered that a response time of greater than two seconds for any health IT application was considered unacceptable by physicians working directly with patients.

The CIOs interviewed did not have a consistent approach to measuring user satisfaction. One organization meets monthly with 10 to 20 "power users" that are effective in driving change. Another organization abandoned the collection of feedback from user groups because of an inability to implement the changes requested by the users. Most organizations did collect feedback through the use of surveys. For example, upon the closing of each help desk request, a user may be sent an email requesting feedback on the timing and adequacy of the fix.

Return on Investment (ROI)

Most of the CIOs indicated that measuring the return on investment (ROI) for health IT is very difficult. Some organizations are attempting to measure ROI and may speak of "soft returns" as well as "hard dollar returns" on their IT investment. Cost avoidance is one of the easiest returns to measure if processes can be automated. However, improvements in safety and patient satisfaction were also seen as valuable, albeit difficult to quantify financially.

Analytics

The workload for clinical reporting and analytics is growing for most organizations with the adoption of EHRs and a greater abundance of data to analyze. Because advanced analytics can create a substantial computer processing load and require analysts with advanced skills, one hospital outsources the data processing and report preparation to generate the Clinical Quality Measurement results.

Patient safety metrics was a common consideration that was readily identified by the leaders of almost all our hospitals. Patient safety measure anomalies become the highest priority to resolve. Patient safety and patient risk attributes are incorporated both during project work shaping, prioritization, development, operations, and even de-commissioning.

In particular, the electronic capture of health data allows organizations to become accountable to keep people healthy instead of just treating their health conditions. This is increasingly supported by increased visibility into population health.

Technical Reference Model

Some organizations have enacted rules to limit the technical platforms they use for all health IT systems. For instance one organization has assumed a prescriptive posture to only use web and mobile applications for all their health IT capabilities. This means no thick client applications are supported throughout that organization, allowing the IT to have more latitude in introducing future changes to the computer platforms used within the health care organization. Further, this organization ensures their web applications are browser neutral and always conform to standards. This approach also supports mobility to cloud-based hosting of these systems, again providing more flexibility for the CIO to introduce future change. For future planning of homegrown solutions, engineering guidelines on how to architect systems aligned with capabilities are well understood and accessible throughout most organizations.

Homogeneous health IT systems are always the desired approach by health care organizations, primarily because of inherent integrated capabilities. Heterogeneous systems are almost always a detriment for health IT as well as IT. These organizations consistently plan to move towards a homogenous set of tools that avoid duplication of functionality across the enterprise, to have a less complex IT environment resulting in lower O&M costs.

One hospital in Chicago views better health care data standards as the key to addressing gaps in health care data interoperability. In particular, they believe the FHIR standards from HL7 holds promise. A transport standard that was also cited was the DIRECT protocol for securely sending and receiving health data.

Accountable Care Organizations

Accountable Care Organizations (ACOs) are groups of doctors, hospitals, and other health care providers, who come together voluntarily to give coordinated high quality care to their patients. The goal of coordinated care is to ensure that patients, especially the chronically ill, get the right care at the right time, while avoiding unnecessary duplication of services and preventing medical errors. When an ACO is successful in delivering quality care and spending health care dollars carefully, it will share in the savings it achieves *(CMS,* http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/ACO/index.html).

One of the leading ACOs in the country reiterated how critical it is for health IT systems to support a unified view of quality and risk of individuals and the population. The core of a successful ACO model is a focus on care management, quality of care, and cost of care, through risk modeling and risk adjustment using health IT. This needs to be tracked from the population level to the individual patient view.

This organization does not worry if a patient is part of an ACO, at risk, fee for service or uninsured, "we manage patient to the medical needs of a population" (i.e., the sickest). Health IT provides data to create registries with the information to identify these populations needing continued care.

One hospital cited the primary reason they are consolidating on Epic is to allow them to do full population management analysis and reporting for their ACO contracts.

Another describes IT capabilities necessary to support seven key processes necessary for an organization to function as an ACO:

1. Care Coordination

2. Cohort Management

3. Relationship Management

4. Clinician Engagement

5. Financial Management

6. Reporting

7. Knowledge Management.

This organization may perform a "gap analysis" between their current state IT systems and the capabilities described in *A Health IT Framework for Accountable Care* (CCHIT 2013).

B.1.4 Industry Leader Suggestions for VA

Broader Requirement Sources

When considering users' requirements and whether or not your services are meeting the users' requirements, the organizations interviewed have suggested that VA should consider measuring the user experience of a trusted community so that you can react to the needs and not whims. We have found help desk tickets are a significant source of collecting a wider spectrum of users' feedback.

Restrict Local Customizations

When asked about how much latitude should individual hospitals within VA have to implement their own capabilities, a large federated group of hospitals suggests VA be prescriptive and permit minimal to no latitude here. This federated set of hospitals has a 50 person meeting to aggressively monitor changes. Ticket information is analyzed to look at trends and help drive decisions. Sites are allowed to customize but they must go through a review process and receive explicit approval. This requires a well-defined and strict governance model. It cannot take 30 days to review and approve these types of requests. This organization has found that 95 percent of the requests can be "routinized" and don't need to be "local customizations". An example was provided that, "The infection control team wanted to buy a best of breed system citing its superior capabilities than the COTS vendor. The board asked them to take a hard look at that vendor's solution and determine why it couldn't meet their needs and wouldn't work. The team came back and determined that the vendor's option would be the better choice because of data integration across partners."

Meaningful Use Compliance

One expert commented that it merits some attention that VistA is still not a Meaningful Use certified system, yet there are numerous commercial EHRs supporting the Meaningful Use

program. This leader suggested that VA progress with MU certification is a lot slower than he would have expected, and that VA should understand why it has been difficult to see their health IT systems certified for the Meaningful Use program.

Software Development

At one organization software developers embrace highly tested procedures for everything they do. No software goes into production without meeting these processes and is highly tested. Failures with the internally developed capabilities are very painful, and trump all else with the organization's developer staff. Testing of software capabilities and integration with services is critical to their internal developer shop of 20 engineers.

Another hospital leader asked to highlight to VA that the Core VistA was designed to determine the Veterans eligibility level and optimize scheduling according to that eligibility. He suggests stopping wrapping clinical functionality around this outdated system. In particular, he encourages VA to move towards COTS and standardize where the patient is shared among areas (hospitals and clinics). This would allow better physician collaboration. Further, he feels VA should focus on informatics instead of software development, allowing for innovation in care delivery and then studying the outcomes to do comparative effectiveness and optimization.

Experimentation and Testing

After selecting and deploying COTS solutions, there is often still some level of modification and exploration with these external systems. Some industry leaders see some adoption of the notion of a "sandbox" with anonymous patient data. This sandbox is available to stakeholders with ideas to run a silent implementation and observe it before implementing a function. Several COTS solutions support this to allow for changes in the customization of their product to be explored without impacting the existing clinical workflow. If an idea does demonstrate some utility with this "sandbox," there is a process agreed upon with the COTS contractor to introduce new configurations and customizations to introduce this concept more broadly across the health care organization's enterprise. This ability is clearly defined in the COTS contract prior to selection of a tool by a health care organization.

VA Interoperability and Interaction

One hospital in the Midwest shared difficulty when exchanging data with VA systems. This is particularly difficult when a new VA patient is referred to them for services. Since they do not have the data, they need to re-document the patient status. Moving to data exchange in real time is critical to provide quality care to the Veteran.

When residents rotate thru a VA hospital in Chicago, some residents have gone out of their way to express a liking for the VA user interface with CPRS.

One hospital found the process to be a VA CHOICE Partner to be difficult and lengthy.

Transparency

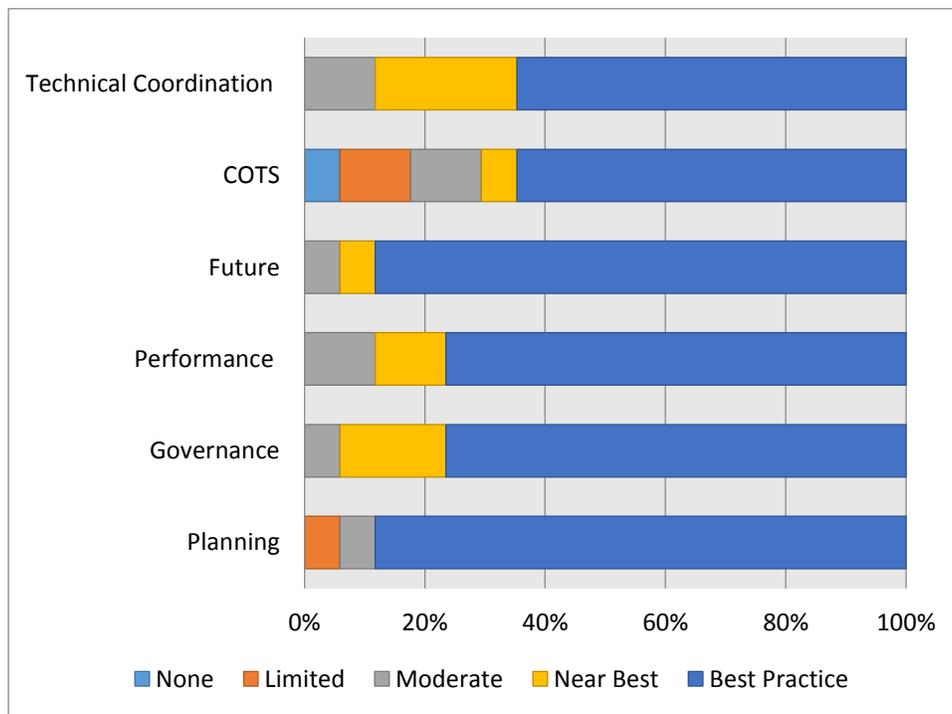
Another hospital believes VA should strive for total transparency on access for patients, where patients can see the schedule and request, like airlines allow you to try to find times and open seats. This type of transparency would help build back trust in the VA community.

Academic Medical Centers

One industry leader felt that VA should consider developing relationships with the Academic Medical Centers so that health care data are more frequently exchanged and interoperability is expanded with non-VA commercial health IT systems. There is only a small window of time when the Veteran is transitioning from active duty that they need to interact with DoD. Academic Medical Centers can provide longer-term collaboration for the Veteran's needs.

B.1.5   Summary

As part of Assessment H evaluation, we reached out to hospitals and high performing health care systems to assess and document how they manage the challenges of providing health IT in their environments. They shared this information in support of VA and Veterans Choice Act Assessments. While we found variations in some practices, almost all reported a tight alignment between the strategic goals of the organization and the funding and priorities of for their health IT plan. Figure B-1 depicts the high level of best practices achieved by these organizations summarized in six IT function areas of planning, governance, performance, future, COTS and technical coordination.

Figure B-1. Industry Outreach: Adoption of Best Practice Measurements


Source: MITRE rendition of industry data.

B.2   Common Failure and Success Factors for Large-Scale EHR Systems

B.2.1   Introduction

Adopting an electronic health record (EHR) is a huge undertaking for a health care provider. It involves more than just installing technology, it requires the practice to transform how it provides care in order to be successful. The Office of the National Coordinator suggests a six-step process for an EHR implementation (HealthIT.gov, 2013):

1. Assess Practice Readiness

2. Plan Your Approach

3. Select/Upgrade Your EHR

4. Conduct Training and Implement EHR

5. Achieve Meaningful Use

6. Continue Quality Improvement.

During each step of the EHR implementation process, there are factors that can lead to success or failure of the project. The goal of this paper is to summarize the main types of failures and success factors to mitigate failures as found in our literature review. We will categorize each of the failure and success factors by stage of the EHR implementation.

B.2.2   Literature Review

To support the Assessment H evaluation of EHR system implementations, we conducted a peer-reviewed literature search for articles related to health IT implementation success and failures. Our search yielded 14 articles which were read for insights on IT project failures and 15 articles that provided insight on successful, large EHR implementations.

B.2.3   Types of Implementation Failures

Our literature review found numerous types of implementation failures. The primary source of failure issues revolves around the planning phase of EHR implementation (Abouzahra, 2011). Failures post implementation are extremely troublesome as they impact patient welfare. (Abouzahra 2011) We removed the last two steps, as there were seen as not applicable to VA.

Table B-2 summarizes types of failures and successes at various stages of EHR system implementation.

Table B-2. Failures and Successes at Stages of EHR Implementation

Implementation Stage	Type of Failure	Type of Success
Assess Practice Readiness	Lack of Executive Support (Standish Group, 1995; Abouzahra, 2011; Glaser, 2005; Gauld, 2007)	Strong Leadership (Jones, 2006; Mooney & Boyle, 2011) Presence of a Champion (Jones, 2006)
Plan Your Approach	Lack of Resources (Standish Group, 1995; Abouzahra, 2011; Glaser, 2005)	Resources to Match Goals (Mooney & Boyle, 2011; Jones, 2006)
	Unrealistic Expectations/Time Frames (Standish Group, 1995)	
	Unclear Objectives (Standish Group, 1995)	Well-Defined Metrics for Success (Jones, 2006)
	Inadequate/Lack of Planning (Standish Group, 1995)	
Select/Upgrade Your EHR	Content Deficiencies/ Lack of User Input/ Technology Incompetence (Standish Group, 1995; Abouzahra, 2011)	Identify Requirements from All Stakeholders (Kaplan & Harris-Salamone, 2009) Clear articulation of desired functionality (Mooney & Boyle, 2011)
	Incomplete/Changing Requirements & Specifications (Standish Group, 1995; Abouzahra, 2011)	Adequate control of scope and changes (Noblin, Cortelyou-Ward & Ton, 2011)
Conduct Training and Implement EHR	Cost Overrun (Standish 1995; Abouzahra, 2011)	Control scope and changes (Noblin, Cortelyou-Ward & Ton, 2011).
	Time Overruns (Standish Group, 1995)	

Implementation Stage	Type of Failure	Type of Success
	Communication issues (Abouzahra, 2011)	Communication of vision and goals (Jones, 2006; Kaplan & Harris-Salamone, 2009)

B.2.4 Assessing Practice Readiness

When assessing practice readiness, a common failure is a lack of executive support (Standish 1995; Abouzahra 2011), which can cause project failures throughout the lifecycle of EHR implementation; it is, therefore, imperative to ensure support early on. Particular to VA, it is important to mitigate the amount of political interference in decision making, as that has been found to be a source of project failure, due to organizational and political complexities (Gauld 2007). In addition, it is important to get clinical support as well to ensure user acceptance of the new technology (Gauld 2007). Finally, project leaders need to avoid invisible progress to ensure executive support throughout the project (Glaser 2005); interim milestones and incremental stages that can showcase progress are crucial to keeping support.

Conversely, strong leadership is a key success factor in large-scale implementations. Leadership plays a key role in ensuring sensitivity to the needs of all stakeholders and ensuring adequate financial resources are dedicated to the implementation (Jones, 2006). Ensuring these resources are committed to the implementation is also key in subsequent steps of implementation. Senior leadership must communicate the goals and vision of the project relative to patient safety, quality, and efficiency. (Jones, 2006) Fully engaged leadership is described as a nonnegotiable during implementation. (Mooney & Boyle, 2011).

B.2.5 Planning the Implementation Approach

During the planning phase, there are four types of failure that need to be addressed. Once project leadership ensures appropriate resources are secured for the project to succeed, it is also important to ensure clear objectives are delineated so that resource planning is as accurate as possible (Standish 1995; Abouzahra 2011; Glaser 2005). Second, realistic expectations and timelines need to be set early in the project (Standish 1995). Third, it is important when setting timelines to anticipate short-term disruptions and incorporate that into your timeframes (Glaser 2005). Finally, as with all planning, it is important to respect uncertainty with your plans, recognizing that many decisions that need to be made are not known when you initial start the project (Glaser 2005).

To overcome the types of failures, success factors in this implementation step include developing well-defined metrics, developing the plan, and ensuring resources meet the metrics. Metrics for success should be defined before implementation begins and feedback on those metrics should be provided on a continuous basis (Jones, 2006). Once leadership identifies what they want to achieve from implementing an EHR, resources should be evaluated to ensure they

are sufficient to achieve success; not that resources needed may vary depending upon the identified metrics (Mooney & Boyle, 2011).

B.2.6   Selecting the EHR System

There are two major categories of failure when it comes to selecting or upgrading the EHR: content deficiencies and incomplete/changing requirements. Content deficiencies can arise from a number of failure factors. A lack of user input is most important in larger settings, such as hospitals, as there are numerous groups that all need to use the technology – such as doctors, nurses, clerks, patients, and visitors – and each has their own needs and requirements (Abouzahra, 2011; Peute, 2010). Frequent communication can help avoid a design-reality gap (Heeks, 2006) between users and designers. EHRs can collect data that are new and may not be directly related to patient care but more for management, so it is important to get clinical approval (Gauld, 2007). Finally, it is important to ensure that the EHR reflects an understanding of the current clinical workflow or that any changes to clinical workflow incorporate adequate redesign and testing (Peute, 2010).

The other major category of EHR selection/upgrade failures is incomplete or changing requirements and specifications (Standish Group, 1995; Abouzahra, 2011). Implementers to be certain that the product is appropriate for the task (Gauld, 2007). They need to define the problem and ascertain if the EHR is best equipped to answer the problem (Cresswell, 2013). It may be possible that new technology is not the answer for the problem, so they need to determine if the EHR can support these strategic goals and whether other approaches may also need to be considered (Cresswell, 2013). Similar to the other main category, if the project objectives and the needs of the users are not well defined, it leads to too much uncertainty or a misspecification of the requirements for the new system and thus a failed implementation (Gauld 2007).

Success factors were also identified to help mitigate failures when selecting and/or upgrading your EHR: identification of requirements from all stakeholders; articulation of desired functionality; and, control of the project scope. When identifying requirements from all stakeholders involved, individuals may not include all the necessary people within an organization, or these individuals may not know how to effectively communicate their desired requirements (Kaplan & Harris-Salamone, 2009). Stakeholders have their own ideal requirements and expectations for a system, so it is important to gather requirements from all stakeholders. Finally, project leadership needs to effectively control the scope based on requirements (Noblin, Cortelyou-Ward, & Ton, 2011).

B.2.7   Conducting Training and Implementing the EHR System

Finally, there are a number of failures possible when implementing the EHR and training users on the EHR. At this point, cost overruns can be a source of failure with an underestimation of the amount of integration needed between systems, especially in larger systems, a main cause of overruns (Standish 1995; Abouzahra 2011). The data may require processing prior to integration and needs to be accounted for; time overruns such as these are also a source of failure at this stage (Standish 1995).

To ensure success in this stage, carefully controlling the scope can help. Human resources are a large share of project costs due to the unique IT needs of implementation. Specialized team members are highly compensated and in high demand; therefore, maximizing their time and expertise is crucial to success (Noblin, Cortelyou-Ward & Ton, 2011). Project managers can control costs by monitoring human resources, investments in additional hardware, and other infrastructure (Noblin, Cortelyou-Ward & Ton, 2011).

B.3 Return on Investment in Health Information Technology

B.3.1 Introduction

In May 2014, the news media reported that a number of Department of Veterans Affairs (VA) Medical Centers were having problems scheduling appointments for Veterans. Other leadership and process issues surfaced in the following months. In August 2014, Congress passed the Veterans Access, Choice, and Accountability Act of 2014 (hereafter, the "Choice Act") to address many of these issues. Section 201 of Title II – Health Care Administrative Matters of the Choice Act calls for 12 assessments, identified as Assessments A through L. Recommendations from these assessments are intended to highlight areas in which services to Veterans can be improved.

Assessment H focuses on the assessment of VA's health IT strategies, including the weaknesses in, and opportunities provided by, the technology used by the Department, especially those related to clinical documentation of hospital care, as well as medical and other health care services, furnished by the Department in VA or non-VA facilities. Under Assessment H, clinical documentation includes images and associated text reports.

In typical assessments of health IT strategies, return on investment (ROI) is often included as an important factor to consider. For Assessment H, ROI in health IT is particularly important given the level of VA's IT expenditures. Thus, the purpose of this paper is to identify health IT financial benchmarks, as well as ROI models and metrics. Health IT benchmarks and ROI metrics identified in this paper can be compared against those which VA uses for its own purposes. Such comparisons can lead to refinements in their benchmarks and metrics and perhaps better measurement of the outcomes of their health IT strategies.

B.3.2 Methods

RTI conducted a search of the professional and grey literature (largely Google searches for the latter). In addition, we searched for relevant materials posted in the knowledge repositories of the American Health Information Management Association (AHIMA), American Medical Informatics Association (AMIA), and the Health Information Management and Systems Society (HIMSS). The search produced different types of artifacts, including comprehensive reviews of the literature; peer-reviewed articles, trade publications, and slide presentations reporting a single organization's costs and benefits of health IT; tool kits; and vendor reports and web pages of professional reviewers describing health system, hospital, or provider IT expenditure benchmarks at an aggregate level.

Though professional articles on ROI in health IT date back to the 1970's, we focused our literature search to cover the years 2000 to the present day. It is in this time period that relevant ROI information can be found for key systems (e.g., electronic health records [EHRs] and computerized physician order entry [CPOE]) and technologies (e.g., mobile health). In addition, though much of the literature we found focused on ROI in EHRs, we made deliberate attempts to gather information on other systems and technologies, so that this report is truly on ROI in *health IT*, not just EHRs.

Many of the artifacts described health IT implementation in a variety of settings, including national programs; health information exchange; as well as health system, large and small hospital, and large and small physician practice, implementations. Admittedly, not all of these settings are comparable to VA. Consequently, the actual figures they report (e.g., dollars or time saved) may not be directly applicable to VA's case. However, in those instances it is not the actual figures, but the metrics they report, that are important here. VA can apply these metrics to various levels of their system (i.e., VISNs, medical centers, or clinics), and are thus appropriate for VA to consider.

Most of the artifacts described individual costs and benefits of health IT in monetary terms, rather than return on investment—i.e., a single numeric figure representing the ROI benefit (numerator) over cost (denominator) ratio (see Figure B-2), or the difference between benefits and cost. Some of the artifacts contained non-monetary benefits, such as time savings. Admittedly, with additional effort, initially reported non-monetary benefits can be translated into dollars. However, in almost every instance the authors of the respective artifacts did not attempt to do so. Where benefits were not translated into monetary terms, we kept them in the category of non-monetary benefits.

The monetary and non-monetary benefits found in the artifacts we reviewed are too numerous to include in a synopsis paper. We selected the more salient metrics and organized them by monetary and non-monetary benefits, and summarized other key metrics in tables in the Supplemental Data section at the end of this article.

B.3.3   Results

ROI Models

Excellent models for calculating ROI, or identifying its components, exist. Each of these models follow the same general principles: (1) determine the goals of the organization and what technology could be implemented to achieve those goals; (2) determine how the organization will measure the impact; (3) determine the source of the data to calculate the estimates, including data needs that may be external to the organization; (4) collect the data; and, (5) compare the pre- and post-implementation data to determine ROI. Each of the models we found are different in format because they accomplish different objectives.

Garrido, et al. (2004), for example, describe a long list of ROI metrics to consider, following item (2) above. At the same time, HIMSS (2013) offers a Health IT Value Suite—essentially, a framework of metrics for Satisfaction, Treatment/Clinical (Care), Electronic Information/Data, Prevention and Patient Education, and Savings (STEPS) (see Table B-3).

Table B-3. HIMSS's Health IT Value Suite

Health IT Value STEPS™ and Subtypes	Documented Examples
S **Satisfaction:** Patient; Provider; Staff; Other	Improved communication with patients; improved patient satisfaction scores; improved internal communication
T **Treatment/Clinical:** Safety; Quality of Care; Efficiency	Improved patient safety; reduction in medical errors; reduced readmissions; improved scheduling
E **Electronic information/Data:** Evidence Based Medicine; Data Sharing and Reporting	Increased use of evidence-based guidelines; increased population health reporting; improved quality measures reporting
P **Prevention and Patient Education:** Prevention; Patient Education	Improved disease surveillance; increased immunizations; longitudinal patient analysis; improved patient compliance
S **Savings:** Financial/Business; Efficiency Savings; Operational Savings	Increased volume; reduction in days in accounts receivable; reduced patient wait times; reduced emergency dept. admissions; improved inventory control

Source: HIMSS, 2013.

Wang and Biedermann (2010) provide formulae to calculate ROI, following item (5) above. Similarly, the formula in the tool from the Health Information Technology Resource Center (HITRC, 2015) concisely accounts for a number of ROI components, as shown in Figure B-2. The HITRC tool calculates cost, as well as monetary (in dollars and percent reductions or gains) and non-monetary benefits depending on the numerator component in the formula.

Figure B-2. ROI Formula from the Health IT Resource Center

$$ROI = \frac{Benefits(Quality + Safety + Efficiency + Profitability + Quality\ of\ Work\ Life)}{Costs(Acquisition + Implementation + Annual)}$$

Source: HITRC, 2015.

In their review of 42 ROI studies, Bassi and Lau (2013) describe in depth the difficulties in comparing results when different assumptions, methods, and metrics are used. As a potential solution, Adler-Milstein, et al. (2014) provide a model that is both visionary, yet practical, in addressing those difficulties. As health care in the United States evolves more and more into a

learning health system (IOM, 2007), Adler-Milstein, et al. (2014) argue that a standard model for assessing ROI in EHRs becomes increasingly important. It is only through a standard model that comparisons of costs and benefits of EHRs and health IT can be made across different institutions, implementations, and technologies.

VA's methods for calculating ROI might be informed by the various models above, particularly the IOM's standard model. For VA's ease of use, we have extracted key ROI metrics found in our literature review and organized them using the IOM's standard model (see the tables in Supplemental Data).

Health IT Financial Benchmarks

Health IT financial benchmarks typically consist of a few key metrics, such as total IT expense and capital budgets as a percent of the institution's total budget. In rare instances, hospitals and health systems will report their ROI or individual cost and benefit metrics. Those which we were able to find are discussed below. Normally, hospitals and health systems do not want their competitors to know their actual figures to these metrics. Therefore, they will only disclose them for aggregate reporting where they can compare their figures against those of a cohort group. Thus, it may be difficult to compare VA's figures in these metrics with *identifiable* health systems of comparable size, such as Kaiser (including Kaiser Permanente, Kaiser Mid-Atlantic, etc.), Tenet Healthcare, and Hospital Corporation of America (HCA).

Aggregate health IT benchmark reports are generally produced as a member benefit by those entities that have access to a number of hospitals or health systems, such as group purchase organizations (GPOs)—including Premier, Inc. and University HealthSystem Consortium (UHC)—and HIMSS. The *2013 Annual Report of the U.S. Hospital IT Market* from HIMSS Analytics (2013) contains the typical health IT benchmarks (see Table B-4).

Table B-4. Health IT Benchmarks

	% of Total IT Operating Expense/Total Hospital Operating Expense-Overall			% of Total IT Budget/Total Hospital Expense–Overall			% IS Capital Expense/Total Hospital Capital Expense–Overall		
	2010	2011	2012	2010	2011	2012	2010	2011	2012
Average	2.40%	2.39%	2.74%	2.77%	4.87%	3.21%	17.32%	17.89%	20.22%
Median	1.93%	2.11%	2.27%	2.26%	3.92%	2.66%	10.27%	12.14%	14.10%
N	471	475	400	469	436	479	211	300	244

Note: The columns are derived from Tables HB1, HB2, and HB3, page 6 of the *2013 Annual Report of the U.S. Hospital IT Market* from HIMSS Analytics (2013).

It should be noted that annual increases in IT budgets is a clear trend. All 2012 IT budgets have increased from 2010. The only exception is Percent Total IT Budget (middle set of columns) where 2011 IT budgets were greater for 2011 than in 2012, yet 2012's budgets are still greater than the budgets for 2010. The spike in 2011 is attributed to the need for hospitals to prepare for Meaningful Use. IS Capital Expenditures (last set of columns) should also be noted. In a Premier survey, 49 percent of hospital executives report that their largest capital investment for 2015 will be in health IT (Gregg, 2014b). Further, whereas the IT Capital Expense as a Total of the Hospital Capital Expense is 20.22 percent for 2012 (see upper right most cell in the table above), a Standard and Poor's executive estimated that current IT capital budgets now range

---

from 25–35 percent (Herman, 2014). In addition, Byrne, et al.(2010) examined similar benchmarks and found that VA's spending levels to be higher than the private sector, with the exception being IT capital spending to total spending. The likely cause is that, at the time of the study, VA was already implementing and maintaining their system whereas the health care industry was still in the early stages of adoption of certified HIT.

The above three metrics are broken down in the HIMSS Analytics (2013) report by three individual factors: bed size, type of hospital (e.g., academic vs. non-academic medical center, rural vs. urban, etc.) and region of the country. However, there are no nested break downs (e.g., bed size by region). These breakdowns are too numerous and lengthy to discuss in a synopsis paper. Nevertheless, VA may find these breakdowns quite useful in comparing its IT spending levels against the private sector bed size, type of hospital, and region benchmarks reported in the survey.

In their review of the state of health IT, Becker (2014b) reports other important findings relevant to VA:

- About half of all health care providers dedicate 3 percent or less of their IT budgets to information security and related systems (HIMSS, 2014).

- IT budgets for non-profit and government-owned hospitals were relatively consistent over the past four years. IT budgets for for-profit hospitals varied widely and increased significantly. The difference is attributed to the notion that for-profit organizations "are more vulnerable to 'disruptive events,' such as the implementation of the health care reform law."

- The total cost of purchasing and installing an EHR varies significantly, from $15,000 to $75,000 per provider, depending on whether an in-office EHR or a cloud-based EHR is installed. Total cost of ownership for cloud-based systems is less than in-office systems after five years (HealthIT.gov, 2015). A hospital review website reported that Duke University Health System reportedly paid $700 million for its EHR system and Kaiser Permanente paid $4 billion (Gregg, 2014a).

ROI Metrics

As previously mentioned, most artifacts report costs and benefits rather than a single ROI figure, perhaps because many organizations find measuring ROI too difficult to attempt (Baldwin, 2009). Below are ROI metrics broken down by monetary vs. non-monetary benefits.

Monetary Benefits

Monetary benefits can accrue to any health care stakeholders, most notably the patient, clinicians, provider organization as a whole, and relevant payers. Examples include:

- Reduced drug costs (Wang, 2003; Girosi, 2003; MedicaLogic, 2015; Fischer, 2009)

- Reduced lost inventory (Ekahau, 2013)

- Improved charge capture (Wang, 2003; Grieger, 2007; MedicaLogic, 2015; Miller, 2005)

- Increased patient volume (Grieger, 2007; Keshavjee, 2001; MedicaLogic, 2015; Miller. 2005; Garrido, 2005)

- Reduced transcription costs (Wang, 2003; Grieger, 2007; Girosi, 2005; MedicaLogic, 2015; Miller, 2005; HIMSS, 2007).

Non-Monetary Benefits

A number of non-monetary benefits were reported in the artifacts we reviewed. As previously mentioned, these benefits can be quantified, and with additional effort, translated into financial benefits (e.g., time savings in terms of dollars saved). However, the feasibility of recouping these benefits depends on how they are realized. For example, time savings may be sufficient to reduce staff and thus payroll. Yet, the time saved as a benefit of health IT implementation may be diverted to other activities that need to be performed within the clinical or office environment. Both the time saved as a result of health IT implementation and the increased productivity from time diverted to other activities would have to be calculated. However, both sides of this metric were not regularly reported in this manner.

Examples of non-monetary benefits include:

- Improved quality of care
    - o Reduction in adverse-drug events (Wang, 2003)
    - o Improved adherence to quality of care measures (MedicaLogic, 2015)
    - o Improved vaccination rates (Jha, 2003; MedicaLogic, 2015)
- Time-Savings
    - o Reduction in chart pulls (Wang, 2003; Grieger, 2007; Keshavjee, 2001; Girosi, 2005, MedicaLogic, 2015)
    - o Reduction in prescription filling time (Grieger 2007, MedicaLogic, 2015)
    - o Reduction in prescription renewal time (Corley, 2003; MedicaLogic, 2015; Keshavjee, 2001)
    - o Reduction in referral generation time (MedicaLogic, 2015)
- Overall Productivity (Alemi, 2011).

Although difficult to measure, other important non-monetary benefits are those realized by patients. As examples, electronic health records (EHRs) and other health IT products provide many benefits that patients appreciate, such as printed medication lists and care plans, improved access to their own health records, and facilitated communications with providers.

Both qualitative and quantitative benefits can be achieved utilizing health IT. Qualitative benefits are typically those that cannot be reduced to a number—e.g., improved patient satisfaction, improved work-life balance, better on-call record availability, better flexibility in chart location, and improved patient education (Baldwin, 2009).

There are also a number of costs that need to be captured for the denominator of the ROI equation. Many studies only include part of the costs, typically the cost of acquiring the system. Those acquisition costs typically include (Williams & Samarth, 2010):

- Hardware (e.g., computers, servers, printers, scanners, internet service, wireless network, maintenance costs)

- Software (e.g., customization, patient portals, annual fees).

However, other costs should be included, such as those associated with the installation of the systems (examples below):

- Initial planning & procurement (Williams & Samarth, 2010)
- Contract negotiation (Williams & Samarth, 2010)
- Staff training costs (Williams & Samarth, 2010)
- Paper records to EMR conversion (Fleming, 2011)
- System migration (Williams & Samarth, 2010)
- Installation (Williams & Samarth, 2010)
- Redesigning workflow to accommodate the EHR (Chaudry, 2006; Fleming, 2011)
- Support for launch (Fleming, 2011)
- Technical deployment (e.g., networking) (Fleming, 2011)
- Project management (Fleming, 2011).

B.3.4   Discussion

Unfortunately, except in rare instances (as reported below), it is difficult to obtain publicly available data on the ROI in health IT achieved by large organizations. Many organizations find measuring ROI to be too difficult to attempt (Baldwin, 2009). Perhaps the most complete study in the past few years was conducted by Adler-Milstein, et al. (2013). They found that the average physician adopting an EHR would lose roughly $44,000 over five years. Further, only 27 percent of the practices achieved a positive return on investment. An additional 14 percent achieved a positive return due to the bonuses from the EHR Incentive program. Practices that focused on using the EHR to improve revenue, primarily through seeing additional patients or improved billing, were the ones that had achieved a positive ROI.

The results from the Adler-Milstein, et al. study, however, should be considered with some circumspection. Their sample represented primarily smaller practices (four or fewer physicians) than what is typical of VA. In addition, the practices were using a range of EHR vendors rather than one system as is the case at VA. Finally, the practices each had their own motivations and intended usage of the system, in particular improved revenue generation that may not be applicable in a closed system like VA. More importantly, Adler-Milstein, et al. did not consider other types of benefits as part of their ROI equation. As Alemi, et al. (2011) stated "[s]elective inclusion leads to contradictory situations, where some costs, e.g., cost of training, is included and other related costs, e.g., cost of employees sitting in training sessions, is ignored. The resulting ROI ratio is a rosy forecast of what might happen."

ROI studies should thus include a wider range of benefits and costs. Byrne, et al. (2010), for example, examined ROI for VA from four different angles: IT spending benchmarks, IT adoption benchmarks, IT quality benchmarks, and cost and benefit estimation. For the IT spending benchmarks, they found that VA's spending levels to be higher than the private sector, except for IT capital spending to total spending. The likely reason for higher VA spending is that, at the

time of the study, VA was already implementing and maintaining their systems, whereas the health care industry was still in the early stages of certified health IT adoption. In support of that argument, the authors found that VA had a much higher level of health IT adoption than the rest of the industry. VA also had higher quality of care when compared to the Medicare HMO plans. Finally, the authors estimated the net value of the health IT for a subset of benefits related to CPRS (particularly CPOE), PACS, bar-code medication administration, and laboratory electronic data interoperability. Their models estimated the benefits to be three times greater than annual costs.

HIMSS (2001, 2004a, 2004b, 2011) provides a wealth of ROI information in their Annual Davies Award manuscripts. Since 2000, several of the awardees have reported the benefits they accrued after implementation of enterprise-level HIT. Such benefits include:

- Reduced duplicative testing and diagnostic procedures
- Avoidance of drug related adverse events
- Allergy checking
- Clinical and financial decision support
- Decreased transcription costs
- Better measurement of care and identification of opportunities for improvement.

The majority of sites reporting benefits have implemented systems from Epic™ Systems Corporation. We report here on a few such sites.

Allina Health

Allina Health is an 11-hospital, 65-clinic system in Wisconsin that began implementing Epic's Enterprise EHR in 2004. It is now used in all of its facilities. Its largest hospital at the time, then known as Evanston-Northwestern, with revenue of $700 million, recorded $24 million in clinical benefits and $31 million in revenue cycle improvements from 2005–2007. Its largest single clinical benefit was a $4.8 million decrease in adverse drug events, and its largest financial benefit was a $15.5 million decrease in denials.

Multicare

Multicare is a four-hospital system in the Tacoma, Washington, area that began its implementation of Epic in 2005. It reported a net benefit of $42.6 million from 2007 to 2009. Reported clinical improvements included a 13-percent decrease in adverse drug events, a 24-percent decrease in the time needed to fill stat orders, and an estimated 108 lives saved among diabetic patients. Financial benefits included $12 million in improved collections and a $5 million reduction in denied claims.

Sentara Health

Sentara is a seven-hospital system in Southeastern Virginia and North Carolina with 1,730 beds that began implementation of Epic at all of its hospitals in 2008 and went live in six of its facilities by the end of 2009. Anticipated (budgeted) benefits in 2009 were $16.6 million. Actual benefits realized totaled $37.3 million. The two largest categories were reduced length of

stay/reduced adverse drug events ($9.4 million) and increased unit efficiency/nursing retention ($9.4 million).

Table B-5 summarizes benefits for these health systems.

Table B-5. Financial Benefits after Implementation of an Epic Enterprise System

Clinical, Operational & Financial Benefits	Epic Enterprise Adopter				
	Allina (2004)	Multi-Care (2005)	Evanston Northwest (2001)	Sentara (2011)	Average
Clinical & Operating Efficiencies (Adverse drug, duplicate testing, drug utilization/cost, documentation workload, order processing HIM					
Clinical Process Improvements	12,400,000	3,721,000		4,900,000	
Reduced Hospital Acquired Conditiond		1,140,000			
Reduced Adverse Drug Events	4,800,000				
Reduced Medical Records/Transcription Cost	6,400,000	310,000	1,274,000	3,600,000	
Reduced IT Maintenance		640,000	1,161,000	3,600,000	
Operational Workflow Improvements	1,200,000		7,287,000	11,400,000	
Duplicate Testing	800,000				
Drug Utilization Cost	600,000			3,000,000	
Sub-Total Expense Reduction	$ 26,200,000	$ 5,811,000	$ 9,722,000	$ 26,500,000	$ 11,700,000
Revenue Cycle Improvement - Reduction in A/R, # FTE's, denial reduction, data quality, time to billing	31,537,000	10,524,000	2,682,000	9,000,000	
Estimated Annual Benefits	$ 57,737,000	$ 16,335,000	$ 12,404,000	$ 35,500,000	$ 121,476,000
Annual Revenues- 2009	$ 2,220,000,000	$ 1,100,000,000	$ 1,530,000,000	$ 2,500,000,000	$ 7,350,000,000
Expense Saving % of Revenue	1.2%	0.5%	0.6%	1.1%	0.7%
Revenue Increase % of Revenue	1.4%	1.0%	0.2%	0.4%	0.9%
Total % Improvement	2.6%	1.5%	0.8%	1.4%	1.6%

Source: HIMSS 2001, 2004a, 2004b, and 2011.

These analyses did not factor in certain costs required to obtain these benefits. Thus, they do not represent a true ROI. Nonetheless, these analyses provide some insight, albeit incomplete, into the types and magnitude of benefits that can be achieved.

Returning to the general case, the discussion is not complete without noting that the reimbursement model utilized has an effect on ROI, and can skew the results. An extreme example would be the following: Imagine an instance where an allergic reaction to a medication is avoided because of information available in the integrated system. Few would argue that avoiding an allergic reaction is not an improvement in care, yet the net impact on the hospital's revenue may be negative. While this is an extreme example, many of the benefits achieved by an integrated electronic health record produce no direct economic benefit in our current fee for service model. This could soon change. With payment reform we may soon be compensated on a more global basis for the quality and cost of the care rendered. In such models, costs avoidance becomes an opportunity for greater net revenue and the improved quality achievable with such systems and a basis for a more direct assessment of ROI.

B.3.5   Conclusion

There are many ways in which a provider can measure the ROI of its health IT investment— quantitative and qualitative, monetary and non-monetary. In addition, there are a number of models that can be used to calculate ROI, each with differing costs that can be included in the

calculations. Despite this, much of the published literature centers on a positive ROI regardless of how it is measured.

Based on the discussion in the Results section above and the Supplemental Data below, numerous individual cost and benefit metrics have been developed. None of the published metrics can be considered benchmarks for health IT as they have not been systematically used for comparison purposes. But that does not belie their usefulness as measures.

Prior research (i.e., Byrne, et al., 2010) found that VA achieved a positive ROI for its health IT. However, as that study was done five years ago, VA can embark on an updated study at the present time. An updated study can encompass the full range of health IT in use throughout VA today. For example, recent implementations such as the Blue Button can be included in ROI calculations. At a minimum, individual cost or benefit metrics can be used.

B.3.6   Supplemental Data

Key ROI metrics found in the documents reviewed for this assessment report are summarized below. The metrics are broken down into quantifiable health IT expenses and benefits. Table B-6 and Table B-7, which describe the metrics, follow the standardized framework put forth by the Institute of Medicine.[33]

Quantifiable Health IT Expenses

Expenses to estimate ROI are identified by category, including productivity loss, staffing and consulting costs, technology costs, maintenance, and training. These expense categories are organized into two types, initial implementation and ongoing, to differentiate between the one-time costs that are incurred upon initial investment, and those that will be ongoing expenses. These expense categories and descriptions are primarily based on EHRs but are applicable to all types of health IT projects.

Table B-6. Expense Types by Category for ROI Estimates

Category	Description (examples primarily based on EHR)
Expense Type: Initial Implementation	
Reduced Productivity	Implementation of the health IT decreases clinician productivity (both in inpatient and outpatient settings) until clinicians are able to "master" the new system, resulting in lost revenue due to lost throughput or increased staffing costs necessary to maintain historical volume during the learning period
Staffing Costs Related to Setting Up	Upfront staff time (both clinical and administrative) spent optimizing the health IT and incorporating it into clinical workflows and administrative

---

[33] Adler-Milstein J, Gregory D, Grossmann C, Mulvany C, Nelson R, Pan E, Rohrbach V, Perlin J. (2014). Return on information: A standard model for assessing institutional return on electronic health records. Institute of Medicine (IOM), Washington, DC.

Category	Description (examples primarily based on EHR)
System Configuration	processes (i.e., billing, decision support). Includes staffing costs for data migration and mappings/remappings.
Consulting Cost	Expense related to consultant assistance during implementation (if not included in hardware/software costs) or if they are an incremental expense related to integrating EHR into clinical workflows and administrative processes
Hardware Cost	Additional servers, routers, cabling, desktops, local area networks, and other items required to implement HIT
Software Cost	Licenses for EHR and other software and associated analytical tools for data extraction, report writing/distribution and integrating with other systems (i.e., registration, billing, scheduling, lab)
IT Staff Cost	Staffing costs associated with health IT implementation, including project management, content development/customization, system interfaces (both internal and external), workflow mapping, building/quality assurance of interfaces, IT help desk and technical deployment
Networking Cost	Initial costs associated with connecting/integrating EHR/HIT with sites of care within a system and other providers within the community
System Design/ Product Evaluation Cost	Upfront costs for articulating the business goals and incorporating them into the system design. This includes both staff and consultant costs, associated research and evaluation of available alternatives, and staff travel and lost productivity related to specifying requirement development/gathering and product selection/design phase of implementing HIT.
Training Cost	Cost of initial staff training during system implementation. Includes salaries of trainers (newly hired or repurposed), opportunity cost for trainee staff time, and costs related to development of training materials.
Transition Cost	Cost of uploading existing medical records into the EHR. Includes non-labor costs for data migration and mappings/re-mappings.
Hardware Cost	Hardware costs associated with specific technologies that complement an EHR or other health IT (i.e., data warehouse environment, patient portal environment, etc.)
Software Cost	Software costs associated with specific technologies that compliment an EHR or other health IT (i.e., data warehouse environment, patient portal environment, business intelligence tools)
Reduced Productivity	Implementation of the health IT reduces revenue cycle productivity until new data and work flows are established. This results in lost revenue due to lost throughput or increased staffing costs necessary to maintain historical productivity during the learning period.

Category	Description (examples primarily based on EHR)
Expense Type: Ongoing	
Physical Plant Cost	Space in the server room and other IT-related square footage required host/support the HIT
IT Cost	Costs associated with disaster recovery plan and "downtime" support
Software Cost	Annual license renewal and/or upgrades for EHR/HIT software and associated analytical tools for data extraction and report writing/distribution and integrating with other systems (i.e., registration, billing, scheduling, lab)
Staff Costs Related to Changing Workflow	Ongoing staff time (both clinical and administrative) spent optimizing the health IT and incorporating it into clinical workflows and administrative processes (i.e., billing, decision support)
IT Staff Cost	Post-implementation IT staff required to support/maintain operations and associated technology investments (BI tools, data warehouse, patient portal)
Hardware Maintenance Costs	Cost for replacement or upgrades of servers, switches, etc.
Networking Cost	Ongoing costs associated with integrating the EHR/HIT with other providers within the community
Training Cost	Ongoing training for new capabilities or new clinical staff. Includes salaries of trainers (newly hired or repurposed), opportunity cost for trainee staff time, and costs related to development of training materials
Staff for Newly Created EHR/HIT Related Functions	Application coordinators, clinical content maintenance, reporting/data extraction
Knowledge Management	Includes costs related to knowledge management for development and maintenance of clinical decision support tools
Staff for Newly Created EHR-Related Functions	Costs associated with "medical scribes" (may even be nurses) replacing transcription
Performance Improvement	Costs associated with newly hired business process improvement teams
Utilities	Increased costs associated with electricity for powering and cooling the server room

Category	Description (examples primarily based on EHR)
Software Cost	Upgrade/replacement/licensing costs associated with specific technologies that complement an health IT (i.e., data warehouse environment, patient portal environment, business intelligence tools)
Hardware Cost	Replacement/upgrade hardware cost associated with specific technologies that compliment a health IT (i.e., data warehouse environment, patient portal environment, etc.)

Source: Health IT benefit strategic goals, types, and descriptions, based on Adler-Milstein et al., 2014

Quantifiable Health IT Benefits

Benefits are categorized by overall core strategic goals, including improved clinical performance, reduced overhead, improved operational performance, reduced inappropriate utilization, and support of clinical trials. These are then categorized by the type of benefit, such as reduction in administrative cost or improved use of disease management strategies. These include some benefits that can be easily attributed as directly to an EHR or other system (e.g., avoiding redundant lab tests), and others for which the EHR works importantly, but less directly, in achieving the improved outcome (e.g., reduced readmissions). It is recognized that the ability to capitalize on these benefits may differ based upon reimbursement type. For example, benefits may accrue to the provider based on reimbursement type, such as per diem or shared savings.

Estimates of ROI are based on adding the total quantifiable costs of the benefits for the specific health IT and comparing it to the total costs to implement, upgrade, or maintain the health IT. In addition, benefits can be reported as measures or metrics, independent of the costs. Examples of these metrics are provided in Table B-7. These measures typically reflect the marginal change due to the health IT, often reflecting reductions in costs associated with efficiencies, workflow improvements, less costly therapies, and avoided health care utilization costs due to the health IT.

Table B-7. Benefit Types by Category and Strategic Goals for ROI Estimates

Benefit Type	Description	Measures/Metrics Examples from Published Studies[34]
Core Strategic Goal: Improved Clinical Performance		
Supply-Chain Management	Health IT such as CDSS facilitates identification of less-expensive pharmaceutical alternatives	• Pharmaceutical costs, overall, per patient (e.g., due to increase in generic drugs prescribed) • Costs per new or refilled prescription

---

[34] Common metrics for costs are per episode, discharge, covered life, enrollee, patient, and by setting.

Benefit Type	Description	Measures/Metrics Examples from Published Studies[34]
Improved Workflow—Staffing	EHR and other health IT can decrease clinician time spent on workflow such as documentation, allowing more patients to be seen in a day	• Time spent on documentation, improved efficiency • Calls for test results by patients (due to access to EHR data) • Average pharmacy department costs per patient due to CPOE
Improved Clinical Outcomes	Improved effectiveness of quality improvement projects that result from improved data gleaned from EHRs	• Estimated change in inpatient costs for preventable adverse drug events caused by inpatient medication administration errors • Average LOS
Patient Safety Initiatives	EHR/HIT can facilitate process improvements that reduce "never events" (i.e., medication errors, patient falls, pressure ulcers, wrong site of surgery) that typically aren't reimbursed and substantially increase episode costs and reduce cost to remediate harm	• Number of medication errors prevented • Inpatient costs for preventable ADEs caused by outpatient medications. • Estimated savings due to averted ADE-related utilization

Core Strategic Goal: Reduce Inappropriate Utilization		
Appropriate Site of Care or Therapeutic Pathway	• HIT such as CDSS facilitates ability to suggest therapeutic alternatives (i.e., watchful waiting for lower-back pain vs. immediate surgery) • EHR enables the use of phone and e-mail visits to address relatively minor issues that otherwise would have required an office visit • Data from a health system's EHR can identify	Costs associate with changes in utilization by: • Rates of ED visits • Rates of primary care visits • Rates of specialist visits Measures below are by number of visits/enrolled patients • Rates of red blood cell transfusions (overall or in settings such as pediatric ICU)

The views, opinions, and/or findings contained in this report are those of The MITRE Corporation and should not be construed as an official government position, policy, or decision.

	the highest-value (lowest cost for a given level of quality) setting to provide care for patients with certain conditions. Patients can then be routed to the most appropriate care setting.	• Costs as a result of increased use of alternative therapeutic approaches • Costs related to antibiotics prescribed, hospital antimicrobial costs
Reduce Duplicative Services	EHR and HIE info available on previous tests reduces laboratory and radiology costs for redundant and unnecessary tests	Costs associated with change in medical tests: • Rate of lab tests • Rate of diagnostic tests • Rate of radiology tests • Tests per patient over unit of time (e.g., tests per patient- day)
Disease/ Population Management Strategies	• HIT allows for development and management of clinical registries to improve care delivery and coordination • EHR facilitates automated reminders and alerts identifying those with chronic disease(s) and enables optimal care of these patients based on predefined protocols	• Average costs per patient (e.g., frequent ED user, nursing home resident with specific condition) • Rates of ambulatory sensitive ED visits and admissions per enrollees/patients
Core Strategic Goal: Overhead Reduction		
Offsetting	If health IT replaces existing systems that performed similar functions, the health IT ongoing maintenance costs should be offset by the legacy system maintenance costs	Change in IT maintenance costs
Core Strategic Goal: Improved Operational Performance		
Supply-Chain Management	EHR/HIT enables decision-support tools to identify less-expensive/ more-effective supply alternatives, reducing supply costs	Reduced supply costs

Supply-Chain Management	EHR/HIT can enable auto restocking/ ordering to support pre-defined par levels	Average supply costs per admission, discharge, visit, etc.
Reduced Capital Expenditures	EHR could reduce demand for imaging and lab services to a point that it reduces the need for new/replacement capital assets (CT machines, X-ray machine, lab equipment)	Capital costs avoided by reallocating space previously used for radiology, labs, MR, CT to other uses that would have otherwise required new space to either be built or leased
Reduced Operating Costs	EHR reduces need for printing X-rays and related radiological film supply costs	Costs in x-ray and radiology film supply costs with radiology system
Improved Workflow— Reduced Capital Expenditure	Clinical protocols/ pathways embedded in the EHR can enable reduced variability in care delivery in all settings, allowing facility to make greater use of fixed capacity (i.e., available beds through decreased average length of stay (ALOS), magnetic resonance imaging (MRI) machines, and surgery suites)	• Average inpatient LOS • Charges per discharge • ED LOS
Improved Workflow— Staffing	Clinical protocols/pathways embedded in health IT such as EHR, CPOE can enable reduced variability in care delivery in all settings allowing the facility to make greater use of step-fixed staffing resources (i.e., free-up floor staff through decreased ALOS, MRIs, surgery suites)	• Changes in patient flow such as admit to bed assignment, bed assign to ED exit, total ED boarder cycle time (LOS in minutes) • Rates of ED patients leaving without treatment • Inpatient transfer cycle • Average time from medication order written to med administration • Staff time to prescribe medication with health IT vs. no HIT • Change in time to make referral
Payer Management	Allows for decreased administrative costs related to payer prior authorization and utilization management/review activities	• Charges per discharge, covered life, encounter, patient • Average inpatient costs • Appropriate billed charges per patient, covered life, encounter, discharge • Claims denials

Reduce Repeat Hospitalizations	EHR can facilitate improved discharge process and improve care coordination across providers, reducing unnecessary readmissions	• Readmission ratio (actual/expected readmission rates) • Associated costs from avoided admissions attributable to HIT, avoided admissions times average cost per admission
Core Strategic Goal: Network Management		
Increased Labor Efficiency	Enables de-skilling strategies allowing organizations to take advantage of clinicians performing at the "top of their license"	Labor costs (per episode, patient, enrollee covered life visit, admission, etc.)
Improved Clinical Outcomes	EHR allows for provider profiling	Accurate and sensitive provider profiles

Core Strategic Goal: Overhead Reduction		
Reduced Capital Expenditures	Reductions in need for space with EHR/HIT and electronic information	Floor space related to radiology film library and medical records/chart rooms
Reduced Operating Costs	EHR reduces operating costs required to manage information that is not electronically stored	Film-processor and related maintenance costs due to reduced radiology tests
Improved Workflow—Staffing	EHR reduces need for staffing for pulling charts, transcription, laboratory order processing by technicians, as examples	• Time spent pulling charts, reduced transcription costs, time spent on laboratory order processing by lab techs • Inpatient nursing time
Administrative Costs	HIT-enabled quality-improvement efforts decrease medication errors and other "never events," leading to a reduction in malpractice premiums	Malpractice premiums (reduction)
Core Strategic Goal: Improved Quality Metric Reporting		
Metric Development/ Management	EHR allows for automation of quality reporting, reducing the need for manual chart abstraction	Chart abstraction (reduction)
Core Strategic Goal: Opportunity Costs		
Service Line Management	Data from a health system's EHR/HIT can better identify underperforming service lines and determine whether the quality/cost point can be improved or the organization should discontinue the service and pursue other opportunities with its resources	Changes in operating margin resulting from a reallocation of resources
Core Strategic Goal: Support Clinical Trials		
Revenue Opportunity/ Halo Effect	More easily provides data to support clinical trials conducted at the organization	• Changes in efficiency of clinical studies • Staff time to recruit participants

	or increases the opportunities for organizations to participate in clinical trials

Appendix C   Assessment H Sites Visited

The Assessment H team visited five VISNs, nine VAMCS, and two CBOCs. At a high-level, the objectives were to understand the impact of the health IT strategies and systems on Veteran access to care, quality of care, and satisfaction with their care.

C.1   Objectives

The team's detailed objectives were to understand the site's views on:

- The effectiveness of health IT (HIT) strategies and systems in supporting Veteran access to care, quality of care, and satisfaction in their care to the clinical end users.
- The effectiveness of HIT strategies, systems and processes in supporting clinical documentation improvement (CDI).
- To what extent site users and planners are engaged in the design and development of new systems
- The most critical HIT requirements to meet local and strategic health objectives.
- How their critical HIT requirements are solicited and addressed.
- How the design, development, and deployment of IT systems could be improved.

C.2   Sites

We visited sites in rural areas in addition to urban areas and covered different regions of the country.

- VISNs
  - 1
  - 4
  - 11
  - 18
  - 19
  - 22.
- VAMCs
  - Boston/West Roxbury, Massachusetts
  - Carl T. Hayden – Phoenix, Arizona
  - Eastern Colorado – Denver, Colorado
  - Erie, Pennsylvania
  - John D. Dingwell – Detroit, Michigan
  - Lexington-Cooper, Kentucky
  - Long Beach, California
  - Togus-Augusta, Maine

---

      o Oscar G. Johnson - Iron Mountain

      o Palo Alto, California

      o Pittsburgh, Pennsylvania.

- CBOCs.
  - o Menominee, Michigan
  - o San Jose, California

Note: Site visits to VISN 4, and VAMCs at Erie and Pittsburgh were primarily for the review of processes utilized by this site enabling them to be among the top performers at VHA and not as part of the Assessment H site visits.

C.3 Approach

Interviews were conducted with key personnel who could represent the various stakeholders impacted by health IT strategies and systems in accordance with the methodology and research questions outlined in Section 2 of this Assessment H report. Each interview lasted between 30 and 60 minutes. Interviews were requested and held with staff in the following roles:

- Director
- Associate Director
- Medical Chief of Staff
- Chief of Nursing
- Chief of Biomedical Engineering
- Lead for Clinical Engineering
- Chief/Director of Health Information Management
- Chief Health Information Officer (CHIO)
- Chief Information Officer (CIO)
- Chief Nursing Informatics Officer
- Department Chief (e.g., Chief Hospitalist, Chief of surgery, Chief of mental health)
- Representative group of providers (e.g., medical, surgery, cardiology, internal medicine, radiology)
- Representative group of nurses (e.g., ED, ICU, medical/surgical)
- HIM staff (e.g., medical records administrators, medical coding, documentation specialists)
- Quality managers, finance managers, and researchers using clinical data
- Clinical Applications Coordinator
- Telehealth Coordinator

Interviews were not conducted with this complete list of staff at each site because they were unavailable or the role did not exist at the VISN-level or CBOC-level. .

Sample interview questions were:

- What are the highest priority, measurable health care objectives? How do the current systems help you achieve these outcomes?
- What specific new health care capabilities have been deployed (at enterprise scale) in the past 5 years, and what was the measurable impact on the ability to manage and furnish health care?
- What are the major advantages/limitations of the current clinical systems?
- What are your top clinical system requirements?
- What and where is the 1-year, 2-year, and 3-year future states for IT defined, and what are the specific measures of effectiveness defined for verifying a measurable improvement to Access to Care and Quality of Care?
- How are "Users" engaged to identify and develop IT requirements to address gaps and for managing and furnishing health care?
- From an operational (clinical) perspective, has there been sufficient allocation of resources and sufficient planning associated with the incremental deployments (e.g., training)?

Additional data and documentation requested from the sites included:

- Clinical documentation improvement reports
- Help desk tickets for the health IT systems
- Strategic Plans.

U.S. Department of Veterans Affairs

At the Request of:
Veterans Access, Choice and Accountability Act of 2014
Section 201: Independent Assessment of the Health Care Delivery
Systems and Management Processes of the Department of Veterans
Affairs

Assessment I (Business Processes)

September 1, 2015

Prepared for CAMH under:

Prime Contract No. HHS-M500-2012-00008I

Prime Task Order No. VA118A14F0373

This page intentionally left blank.

Preface

Congress enacted and President Obama signed into law the Veterans Access, Choice, and Accountability Act of 2014 (Public Law 113-146) ("Veterans Choice Act"), as amended by the Department of Veterans Affairs (VA) Expiring Authorities Act of 2014 (Public Law 113-175), to improve access to timely, high-quality health care for Veterans. Under "Title II – Health Care Administrative Matters," Section 201 calls for an Independent Assessment of 12 areas of VA's health care delivery systems and management processes.

VA engaged the Institute of Medicine of the National Academies to prepare an assessment of access standards and engaged the Centers for Medicare & Medicaid Services (CMS) Alliance to Modernize Healthcare (CAMH)[1] to serve as the program integrator and as primary developer of the remaining 11 Veterans Choice Act independent assessments. CAMH subcontracted with Grant Thornton, McKinsey & Company, and the RAND Corporation to conduct 10 independent assessments as specified in Section 201, with MITRE conducting the 11th assessment. Drawing on the results of the 12 assessments, CAMH also produced the Integrated Report in this volume, which contains key findings and recommendations. CAMH is furnishing the complete set of reports to the Secretary of Veterans Affairs, the Committee on Veterans' Affairs of the Senate, the Committee on Veterans' Affairs of the House of Representatives, and the Commission on Care.

The research addressed in this report was conducted by Grant Thornton LLP, under a subcontract with The MITRE Corporation. Grant Thornton also subcontracted with Navigant Consulting to support the assessment.

---

[1] The CMS Alliance to Modernize Healthcare (CAMH), sponsored by the Centers for Medicare & Medicaid Services (CMS), is a federally funded research and development center (FFRDC) operated by The MITRE Corporation, a not-for-profit company chartered to work in the public interest. For additional information, see the CMS Alliance to Modernize Healthcare (CAMH) website (http://www.mitre.org/centers/cms-alliances-to-modernize-healthcare/who-we-are/the-camh-difference).

Executive Summary

Introduction

Assessment I of Section 201, Title II – Health Care Administrative Matters of the Choice Act, or "Veterans Choice Act," requires an independent assessment of the business processes of the Veterans Health Administration (VHA). Business processes refer to the revenue for direct "**VA Care**" (herein referred to as "VHA Revenue") and payment for private-sector **"Non-VA Care"** services. Per the legislation, this includes processes relating to furnishing non-department health care, insurance identification, third-party revenue collection, and vendor reimbursement, including mechanisms to avoid penalties, increase collections, and increase accuracy and timeliness to external providers and vendors. The business processes used to manage these functions are critical because they affect access, quality of care, and the overall patient experience for our Veterans and their families.

As the largest health care delivery system in the United States, VHA provides and pays for Veteran medical care. The cost of health care, similar to industry, continues to rise. The number of Veterans receiving care from VA has almost doubled since 1997.[2] In fiscal year (FY) 2014, VHA had over $156 billion in obligations and delivered direct VA Care to over 6.4 million unique Veterans. Direct VA Care alone cannot meet all Veterans' health needs; therefore, VHA outsources and pays for external providers, essentially acting as an "insurer" for medically necessary Non-VA Care that is unavailable at VHA facilities (Non-VA Care, in this report). In 2014, Non-VA Care treated approximately 1.2 million unique Veterans with more than 14 million claims valued at $5.5 billion (claims paid). This represents a 400 percent increase over the last ten years and, due to the Veterans Choice Act, the amount is expected to grow.

Financial health is critical for the long-term viability of the Veterans' health care system. To help offset the growing cost of care funded through congressional appropriations, legislation gives VHA authority as a provider to seek reimbursement from insurance companies for non-service connected treatment. Likewise, VHA has authority to seek out-of-pocket patient expenses for non-service connected care. In 2014, VHA billed approximately $6 billion for VA Care and collected almost $3.2 billion from third-party reimbursements. In 2014, VHA billed approximately $106 million and collected $85 million from Veteran (first-party) co-payments.

VHA's health care delivery system is unlike any other health system. VHA has a multitude of challenges driven by its unique combination of scale and scope, geographical dispersion, demographics served, funding model, regulation, benefit structure, and oversight. Nevertheless, the effective provision and payment of direct care and Non-VA Care services, and the business processes used to manage these functions, are critical because they affect access, quality of care, and the overall patient experience for Veterans and their families.

VHA business processes have evolved over the past several years to support VA's mission through operational improvements. VHA has historically addressed business process challenges

---

[2] VERA Veterans Equitable Resource Allocation 2014, VA Under Secretary for Health, May 2104, Pg. 48.

through technology initiatives, changes in structure, and process standardization with many success stories on improving delivery of VA's mission through business processes. While improvements have been realized in recent years, additional work remains. Reports from the VA Office of Inspector General (OIG) and the Government Accountability Office (GAO) have identified weaknesses in VA's control and oversight of payments made to Non-VA entities, and have identified areas for improvement in revenue collection from third parties.

Methodology

The Assessment I team conducted interviews and discussions with executive leadership from the Chief Business Office (CBO)—which comprises both VHA Revenue Operations and Purchased Care, VHA Health Information Management Services (HIMS), and Patient Centered Community Care (PC3) vendors (Health Net Federal Services and TriWest). Additionally, we interviewed 107 VHA staff and conducted 30 process walkthroughs in the course of our site visits to the Health Administration Center (HAC), three Consolidated Patient Account Centers (CPACs), and eight VA Medical Centers (VAMCs). We analyzed 776 documents and datasets, including VHA policy documents; organization charts; financial reports; standard operating procedures; previous OIG, GAO, and internal VA Oversight reports; and other studies for insight into issues, best practices, and process improvements. Our data findings are based on available VHA data for the years 2012 to 2014. We analyzed and compared VHA performance against relevant industry benchmarks and high-performing practices to substantiate evidence-based conclusions and recommendations for improvements to VHA business financial management processes as outlined in the Choice Act. The following table lists the processes we assessed.

Table ES-1. Processes Assessed by Assessment I Team

VA Care (addresses Section 201, I, ii, and iii):	Non-VA Care (addresses Section 201, I, i, and iv):
▪ Scheduling, Pre-registration, and Registration	▪ Consults and Authorization for Care
▪ Clinical Documentation and Coding	▪ Claims Adjudication
▪ Patient Accounting	▪ Payment Processing

This assessment was conducted during a period of significant change in organizational responsibility for Non-VA Care. Section 106 of the Veterans Choice Act "[transferred] the authority to pay for hospital care, medical services, and other health care furnished through non-Department of Veterans Affairs providers from the VISN and medical centers of the Department of Veterans Affairs, to the CBO of the Veterans Health Administration of the Department of Veterans Affairs."[3]

The implementation resulted in the consolidation of claims processing staff, provided CBO with the authority to standardize processes and procedures to pay Non-VA claims, and enforce

---

[3] Veterans Access, Choice, and Accountability Act of 2014

related rules and regulations across VAMCs nationally. The transfer of authority and responsibility to CBO occurred on October 1, 2015. As the timing of our assessment coincided with this transition, we encountered business processes that were in varying stages of consolidation, redesign, and standardization. We also note that due to timing, most of the data we collected and analyzed related to Non-VA Care was for claims paid before CBO accepted operational responsibility as provided by the Choice Act.

Summary of Findings

VHA Revenue—VHA is Not Optimizing Revenue Due to Ineffective Veteran Insurance Identification, Clinical Documentation and Coding, and Cultural Barriers.

Ineffective Veteran-facing (front-end) VAMC processes for insurance identification, and clinical documentation, and outpatient coding issues result in CPAC staff members having to address issues "after-the-fact." The issues correspond to $581 million in denials from insurance companies in 2014.

For first-party (Veteran) co-payments, VAMC staff members are not collecting the co-payments at the point-of-service and CPACs must collect the co-payments weeks to months after the date of service. Further, based on feedback from VAMC leadership, Veterans do not always understand the need to provide insurance information and VHA staff can be reluctant to ask for it.

Revenue processes span across VAMCs and CPACs; however, only the CPACs are accountable for revenue collection and the associated performance outcomes. VAMC commitment is required to monitor and correct issues early in the process to reduce collections delays and denials.

Non-VA Care Payments—VHA Does Not Have Adequate Infrastructure and Streamlined Processes to Pay Non-VA Care Claims Timely and Accurately.

VHA's complex and disparate processes for paying Non-VA Care claims are confusing to Non-VA providers and VHA staff, resulting in inconsistencies in authorization and payment practices. VHA's mechanisms to pay Non-VA claims timely and avoid delinquent payments, particularly at select VISNs. However, inadequate data analytics indicate the issues could be more widespread. VHA mechanisms to avoid delinquent payments to external providers are inadequate putting VHA at risk for significant interest penalties.[4]

Inadequate claims submission guidance discourages widespread use of electronic claims submission. VHA receives only a small percentage of non-VA claims electronically, which increases workload, manual processing, and the likelihood for payment errors. Low staff retention and a 20 percent vacancy rate further exacerbate delays and errors in claims payments.

---

[4] There is an ongoing VA Office of General Counsel review of the universe of payments to which the Prompt Payment Act applies.

VHA established Patient Centered Community Care (PC3) to expand Non-VA care access by entering into national contracts with Healthnet and TriWest to provide Veteran health care on a fee for service basis. Feedback from VA employees interviewed indicate that PC3 is experiencing challenges due to gaps in the non-VA provider network.

Information Technology—Lack of Automation and Integration Prevent VHA from Optimizing Performance in both Collections and Payments.

VHA will not be able to make necessary improvements in their billing and collection processes without modern, automated technology. Antiquated systems used to support the revenue collection processes for third-party reimbursements and first-party (Veteran) co-payments do not provide needed functionality. These systems require significant manual intervention and processing that creates an environment prone to human error and delayed claims payments from insurers.

VHA software tools and functions do not interoperate across clinical and revenue management systems and their limited interoperability with other internal and external systems inhibits VHA's ability to bill and collect revenue accurately and rapidly.

Few Non-VA providers submit their claims to VHA electronically, relying instead on paper claims, which reduces payment timeliness and accuracy. In addition, staff members process claims manually compared to private-sector benchmarks of 79 percent automation.

Oversight and Metrics—VHA Lacks Certain Performance Reporting to Provide Effective Oversight and Proactive Process Improvements for Collections and Payments.

VHA lacks standard national reporting of key performance metrics for timely insurance identification and verification across VHA, inhibiting visibility into VAMC insurance capture performance of VAMCs. In addition, VHA cannot establish effective productivity standards and monitor Non-VA Care staff performance because processes are inconsistent across VAMCs and VISNs. Current decision support capabilities are not sufficient to provide oversight and management of Non-VA Care claims processing and payment. Proactive and retrospective processes are in place to find inaccurate payments, but these practices are highly manual.

Summary of Recommendations

Below is a summary of high-level recommendations, accompanied by duration estimates for completion.

Recommendation 1—VHA: Develop a long-term comprehensive plan for provision of and payment for non-VA health care services (180 days).

The expansion of Non-VA Care over the last decade has resulted in a combination of programs that lack sufficient infrastructure to successfully perform the business functions today or meet the demands of the future. The demand for Non-VA Care will be determined, in large part, by the decisions made regarding VHA care and, in turn, by VHA's capacity to meet demand for services. For example, decisions about VHA facilities and workforce will affect demand for Non-

VA Care, as will changes in the demographics and clinical needs of Veterans. VHA should adjust the plan as necessary depending on ongoing studies regarding VHA's capacity.

Recommendation 2—VHA: Establish a formal governance model that allows CBO and VISN leadership to converge, aligning interests and accountability (90 days).

The growth of both VHA and Non-VA Care requires an increased focus on business processes to sustain care for an increasing Veteran population. An organizational structure that balances central management with local autonomy is vital to VHA. VHA must align accountability and interests at the leadership level of CBO and the VISNs. Under the current alignment, CBO is dependent upon the VAMCs and VISNs to execute core business functions. With CBO and VISNs reporting separately to the VHA Office of the Under Secretary, VAMC priorities do not always align with CBO's. Placing both organizations under a single governance structure will promote convergence of interests, accountability, cooperation, and coordination.

Recommendation 3—VHA: Standardize policies and procedures for execution of Non-VA Care, particularly the Choice Act, and communicate those policies and procedures to Veterans, VHA staff, VHA providers, and Non-VA providers (90 days).

Examination of the claims processing protocols and operations revealed opportunities to standardize the manner in which VHA implements Non-VA Care and the Veterans Choice Act across the organization. Standardization will enable VHA to communicate processes and benefits effectively to both patients and Non-VA providers.

Recommendation 4—VHA: Employ industry standard automated solutions to bill claims for VHA medical care (revenue) and pay claims for Non-VA Care (payment) to increase collections, to improve payment timeliness and accuracy (2 years).

The growth of both VHA and Non-VA Care over the last decade has produced a combination of programs that lack sufficient technology to support the execution of routine business functions. In large part, these deficiencies result in a high degree of manual intervention required to bill and pay claims. The focus on automation should expand to include integration with front-end processes such as scheduling, insurance identification and verification, medical records, and coding.

Recommendation 5—VHA: Consider and further evaluate aligning the Patient Intake and Health Information Management Service (to include Coding) functions under CBO (180 days).

An emerging practice in private-sector health care is to align all components of the revenue cycle under the Chief Financial Officer (CFO) linking job responsibilities to financial performance. VHA's revenue cycle activities currently owned by the VAMC/VISN are Scheduling, Pre-Registration, Registration and Coding—all primary functions for identifying and verifying insurance, and ensuring accurate and timely first- and third-party collections. The private sector has recognized that aligning these functions under a single organization improves accountability and revenue cycle performance. Our findings indicate that the separation between business process and organizational structure within the VHA revenue cycle processes has resulted in a lack of coordination and consistency in these functional areas. Given the size

and complexity of VHA compared to the private sector, any realignment needs to be carefully considered. Added to this, the VHA CBO recently completed a very large organizational consolidation of Non-VA Care employees and adding significantly more responsibility to the CBO at this time may be difficult for the CBO to absorb in the near-term.

Recommendation 6—VHA: Align performance measures to those used by industry, giving VHA leadership meaningful comparisons of performance to the private sector (6 months).

VHA should continue its progress toward implementation and management reporting of common industry performance measures. Once these practices are in place, VHA should identify performance standards that balance meeting VHA requirements with achievable, incremental performance improvements. This approach would immediately allow VHA to leverage common industry measures and benchmarks to conduct analysis, make informed decisions, and help to bring VHA performance into congruence with private-sector benchmarks.

Recommendation 7—VHA: Simplify the rules, policies, and regulations governing revenue, Non-VA Care, eligibility, priority groups, and service connections, educate all stakeholders, and institute effective change management (2 years).

Simplifying the rules, policies, and regulations will allow VHA to execute business processes uniformly, and to communicate clearly with all stakeholders.

Recommendation 8—VHA: Identify, share and institutionalize best practices across the agency (6 months).

There are numerous examples of business practices in VHA (as described in section 4 of this report) that produce results that significantly exceed VHA averages. VHA should develop a recurring process to examine these peer organizations' "positive deviants" and determine where successful practices apply to VHA business processes. Doing so will enable VHA to not only standardize, but also improve upon current best practices.

Moving Forward

Our recommendations reflect our independent assessment of the effectiveness of ongoing operations, and opportunities to improve financial management of payments, reimbursements, and collections for VA and Non-VA Care. We believe these recommendations provide the next steps in building business operations that support VHA's overall health care delivery mission, and improve the relationship with business partners and Veterans alike.

Assessment I Report Organization

This report includes ten chapters and seven appendices.

Chapters 1 through 3 provide an introduction, an overview of our study methodology, and a summary of the VHA organizations that we examined during our assessment.

Chapter 4 identifies some of the best practices we encountered during our site visits and provides recommendations that can assist in spreading these best practices across VHA.

Chapter 5 summarizes the overarching findings, key sub-findings, and associated recommendations that are the core of our assessment report. This chapter also includes some additional considerations for the longer term.

Chapters 6 through 9 provides details of our analysis, including topical background information to enhance reader understanding, explicit references to the data-driven evidence, interview results, and findings and conclusions from our financial analyses. We also identify strategic and actionable, tactical-level recommendations and actions that VHA can take to improve their processes and outcomes.

- Chapter 6 covers VA Revenue—Billings and Collections.
- Chapter 7 covers Non-VA Care—Payments.
- Chapter 8 addresses Information Technology.
- Chapter 9 discusses Oversight and Metrics.
- Chapter 10 concludes the report.
- Appendices A through F provide additional details for further review and information.

1 Introduction

Assessment I of Section 201, Title II – Health Care Administrative Matters of the Choice Act, or "Veterans Choice Act," requires an independent assessment of the business processes of the Veterans Health Administration (VHA). Business processes refer to the revenue for **VA Care** ("VHA Revenue") and payment for private-sector **"Non-VA Care"** services. The business processes used to manage these functions are critical because they affect access, quality of care, and the overall patient experience for our Veterans and their families. This report assesses VHA's business processes.

VHA, a separate administration with the Department of Veterans Affairs, or "VA," seeks to achieve key outcomes from this assessment such as improved patient health and well-being, increased patient satisfaction, and increased cost-effectiveness. To do this, VHA must modernize business processes by making improvements in people management, processes, and technological advances.

Health care costs for Veterans are increasing just as health care costs are rising across the industry. The number of Veterans receiving care from VHA has almost doubled since 1997.[5] In Fiscal Year (FY) 2014, VHA had over $156 billion in obligations and approximately 325,000 full-time equivalent (FTE). VHA maintains the largest integrated health care delivery system in the United States and provides Veterans with direct care provided by VHA clinicians in a VHA facility (VA Care in this report). In FY 2014, VHA delivered direct VA Care to over 6.4 million unique Veterans, including 600,000 inpatients nationwide at 152 VA Medical Centers (VAMCs), 820 Community Based Outpatient Clinics (CBOC), and several other clinics/centers (VSSC, 2014).[6,7]

Direct VA Care alone cannot meet all Veterans' health needs; therefore, VHA outsources and pays for external providers, essentially acting as an "insurer," for this medically necessary care that is unavailable at VHA facilities (herein referred to as "Non-VA Care"). In 2014, there were approximately 1.2 million unique Veterans treated through Non-VA Care with over 14 million claims valued at $5.5 billion. According to VA's CBO, this is a 400 percent increase over the last ten years in Non-VA Care claims. Per the interviews we conducted, Non-VA Care is expected to grow, particularly due to the Veterans Choice Act.

Financial health is critical for the long-term viability of the Veterans' health care system. To help offset the growing cost of care funded through congressional appropriations; United States Code (USC) 1729, Title 38 provides VHA authority as a provider to seek reimbursement for direct VA Care from third-party payers (e.g., Blue Cross, Aetna, and other insurance companies) for non-service connected treatment. VHA also has the authority to collect co-payments for VA Care from Veterans for non-service-connected[8] disability medical care. In 2014, VHA billed

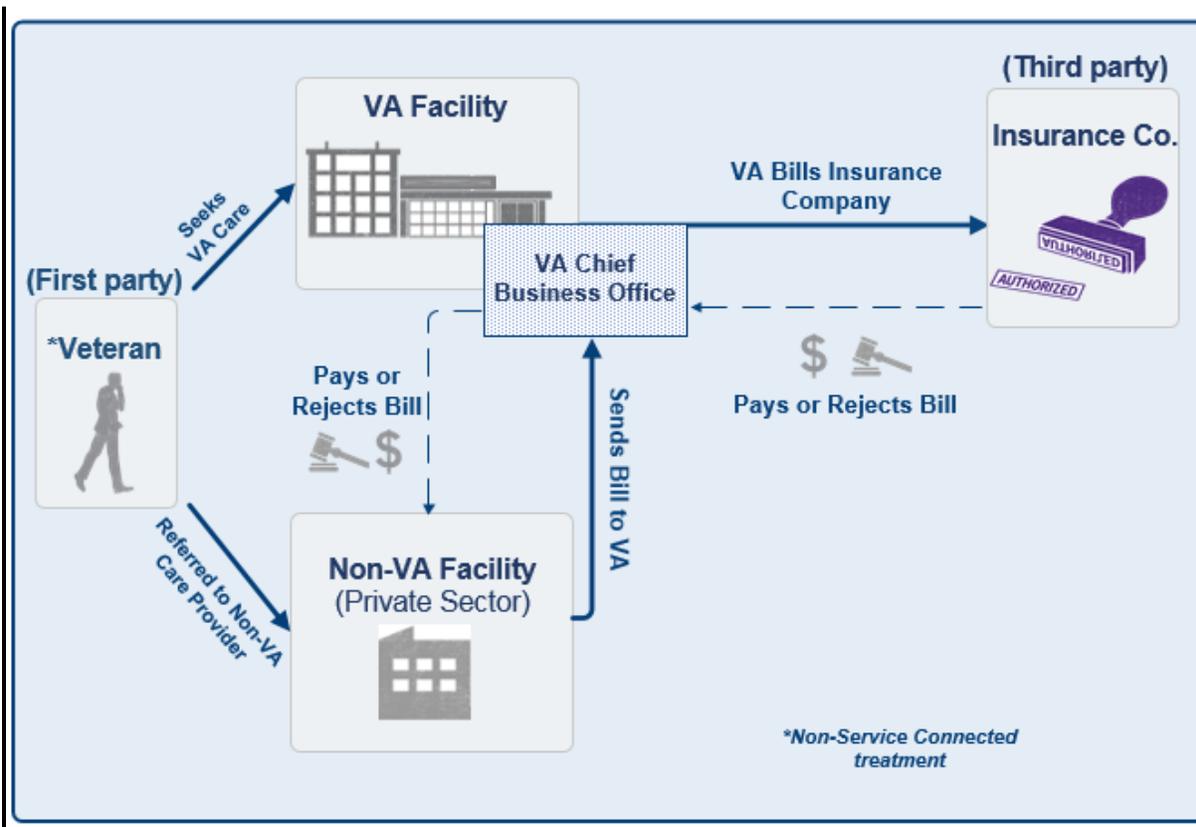
[8]Note: Non-service connected disability medical care refers to care for a Veteran discharged from active military duty without a VA-adjudicated illness or injury incurred in or aggravated by military service.

The views, opinions, and/or findings contained in this report are those of Grant Thornton should not be construed as an official government position, policy, or decision.

approximately $6 billion for VA Care and collected almost $3.2 billion from third-party reimbursements in accordance with USC 1729, Title 38. In 2014, VHA collected an additional $85 million from Veteran (first-party) co-payments. Figure 1-1 illustrates the business process flow for both VA and Non-VA Care.

Figure 1-1. First- and Third-Party Interaction across the Revenue Cycle[9]


Source: Grant Thornton's rendition of VHA's Business process flow

As the largest integrated health care delivery system in the country, VHA has a multitude of challenges driven by the organization's size, magnitude of care and services, and geographical dispersion. To compare with a private-sector provider considered one of industry's best in class, Kaiser Permanente is responsible for millions of "lives," similar to VHA. In contrast with VHA, Kaiser's responsibilities are concentrated in a few distinct areas, while VHA's responsibilities are geographically dispersed across the country, in Puerto Rico, the Philippines, and other locations where Veterans live abroad. This assessment provides insight into VHA financial management by focusing on business process challenges and identifying opportunities to increase revenue reimbursement collection for direct VA Care and to minimize payment issues to external Non-VA Care providers.

---

[9]Note: Under the Veterans Choice Act, the Non-VA Provider also bills Third Party Insurance.

The views, opinions, and/or findings contained in this report are those of Grant Thornton should not be construed as an official government position, policy, or decision.

1.1 Scope

As defined in Paragraph (I), Section 201, Title II – Health Care Administrative Matters of the Choice Act legislation, *Business processes of VHA includes processes relating to furnishing non-Department health care, insurance identification, third-party revenue collection, and vendor reimbursement, including an identification of mechanisms as follows:*

i. *To avoid the payment of penalties to vendors*

ii. *To increase the collection of amounts owed to the Department for hospital care, medical services, or other health care provided by the Department for which reimbursement from a third party is authorized and to ensure that such amounts collected are accurate*

iii. *To increase the collection of any other amounts owed to the Department with respect to hospital care, medical services, and other health care and to ensure that such amounts collected are accurate*

iv. *To increase the accuracy and timeliness of Department payments to vendors and providers*

To meet the legislation, Assessment I (Business Processes) established goals and identified questions to determine the effectiveness of and identify improvement opportunities for VHA financial management of payments, reimbursements, and collections for VA and Non-VA Care processes.

Note: Throughout this report, the term "providers" refers to physicians, and "clinicians" is the broader reference to physicians, nurses, therapists, and medical professionals.

1.2 Assessment I Relationships to Other Assessments

Assessment I (Business Processes) has relationships with other assessment areas due to overlapping processes and tools that required cross-assessment coordination and collaboration. As appropriate, we refer to the following assessment reports for further analysis and additional details.

- **Assessment C—Care Authorities:** Assessed the legislative mandates and VA/VHA directives that drive many of the required processes for revenue collection and claims payments. We coordinated with C to address relevant Non-VA Care drivers and constraints.
- **Assessment E—Workflow – Scheduling:** Assessed the processes for scheduling appointments at each medical facility. Scheduling, part of the Patient Intake process, directly affects the collection of Veterans' insurance and other information needed to collect the Veteran co-payments and third-party reimbursements in Assessment I's scope.
- **Assessment F—Workflow – Clinical:** Assessed the workflow processes and tools for inpatient medical services and care. Clinical coding and documentation workflow processes and tools affect third-party reimbursement collections for VA Care under Assessment I (Business Processes).

- **Assessment H—Health Information Technology:** Assessed the IT strategies that support clinical documentation and enterprise-wide applications for management of care and business operations. IT and automation support are essential for I's business processes.

1.3 Limitations

This assessment has several important limitations including that we conducted the assessment under an abbreviated timeframe, conducted a small sample of site visits, and were limited to the data available from VHA. We interviewed stakeholders at all levels of the agency across both the Chief Business Office (CBO) and VHA. While this approach offered tremendous insight, we recognize that the perspectives are limited to the sample of stakeholders.

As described in Chapter 7, this assessment was conducted during a period of significant change in organizational responsibility for Non-VA Care. Section 106 of the Veterans Choice Act "[transferred] the authority to pay for hospital care, medical services, and other health care furnished through non-Department of Veterans Affairs providers from the VISN and medical centers of the Department of Veterans Affairs, to the CBO of the Veterans Health Administration of the Department of Veterans Affairs."[10] The implementation resulted in the consolidation of Non-VA Care claims processing staff, provides the CBO with the authority to standardize processes and procedures to pay Non-VA Care claims, and enforce related rules and regulations across VAMCs nationally. As the timing of our assessment coincided with this transition, we encountered business processes that were in varying stages of centralization, redesign, and standardization. Our approach was to assess the current state of business processes, while providing perspectives into VHA's planned and ongoing transition activities. We also note that due to timing, most of our data analysis did not contain substantive data on business processes as impacted by the Choice Act. Our data largely reflects the legacy structure and responsibilities for Non-VA Care.

---

[10]Veterans Access, Choice, and Accountability Act of 2014

2 Methodology

Our methodology includes analytical principles supported by sound evaluation, process assessment, and qualitative data collection practices that led to evidence-based findings. We conducted discovery and analysis activities, generated findings and developed unbiased, data-driven conclusions, and made recommendations to improve VA's business processes. Our methodology has three phases: Planning and Discovery, Site Visit and Data Analysis, and Findings and Recommendations.

2.1 Phase 1: Planning and Discovery

Design Assessment: We conducted a broad-based examination of the business processes and identified areas of potential risk and opportunities for improvement. Key activities include:

- Analyzed legislation requirements and identified key study areas.
- Defined the baseline environment of current processes and IT infrastructure and identified anticipated, future needs driven by process and technical improvements.
- Identified qualitative and quantitative assessment effects on engagement, revenue billing, clinical data exchange, experience of providers, and relevant Veteran experience.

We also conducted an analysis that focused on the assessment activities, prioritized our efforts, and validated all activities. Key activities include:

- Designed site survey assessments to highlight commonalities and gaps, and on-site assessments to develop a first-hand understanding and the ability to answer questions and conduct interviews.
- Identified commercial benchmarks that most closely align to VHA business processes and analyzed gaps between VHA and commercial processes.
- Coordinated with VHA to provide input and validate our assessment design and process. Revised the design to meet the people, technology, and process objectives.

Discovery and Data Collection: We identified data sources and information required to conduct the assessment, including necessary policies, procedures, organizational information, prior assessments, audit reports, operational information, key performance indicators, and other required information. Our data findings are based on available VHA data for the years 2012 to 2014. In coordination with VHA stakeholders, and thanks to their proactive and responsive efforts, we obtained about 90 percent of the data we requested. The remaining datasets we requested either were not fully available or did not exist. Refer to Appendix C for more background on our data requests. We also conducted a VAMC-wide data call for insurance capture buffer exceptions to assess advance insurance verification for scheduled patients and pre-registration rates to measure progress in collecting required patient information at time of check in. We were very successful with the data call and received an 88.5 percent response.

Despite the magnitude of recent analyses and reports previously completed for VHA, we carefully reviewed the data and information we collected related to VHA's business processes. Refer to Appendix E for the listing of VA Care and Non-VA Care reports that we reviewed.

During this phase, we established criteria and selected the sites, as summarized in Table 2-1, to visit for our assessment. The condensed timeframe of this assessment required that we use a sampling approach based on our selection criteria. Refer to Appendix B for additional details.

Table 2-1. Site Selection Criteria

Team	Criteria
VA Care	**Consolidated Patient Account Center (CPAC)** • 1 Small, 1 Medium, and 1 Large based on claims volume **VA Medical Center (VAMC)** • 4 VAMCs supported by CPACs above and/or a range of performance on VHA metrics
Non-VA Care	1 Health Administration Center (HAC) VAMC—1 High Performing (High Volume of Claims, Exceptional Timeliness Metrics) VAMC—2 Average Performing (both accuracy and timeliness) VAMC—1 Low Performing VAMC (High Interest Rates, Poor Timeliness)

2.2 Phase 2: Site Visit and Data Analysis

Our team evaluated the people, process, and technology aspects of VHA Revenue and Non-VA Care Payment business processes. As part of each assessment, we conducted document reviews, data analyses, site visits, interviews, and process walkthroughs.

Site Visits: We conducted site visits at the seven VAMCs, three CPACs, and HAC, and examined key functions for both VA Care and Non-VA Care processes as shown in Table 2-2. As part of the site visits, our team conducted interviews with process performers, clinicians, and business managers. We developed our interview questionnaires for our site visits based on industry standards, protocols, and best practices.

Table 2-2. Site Visits Performed and Processes Evaluated

Process	Sites	Key Functions
VA Care	3 CPACs	Billing and Collections
VA Care	4 VAMCs	Scheduling, Registration, Insurance Capture, Documentation, and Coding
Non-VA Care	1 HAC	Non-VA Care Guidance, Policy and Procedures, Training, and Data Analytics
Non-VA Care	4 VAMCs	Non-VA Care Authorization, Receipt of Claim, Processing (e.g., Edit checks, Pricing), and Payment

Data Analysis: In addition to the site visits, we conducted a series of expert stakeholder interviews, reviewed VA materials such as policy documents, organization charts, and standard operating procedures, analyzed and compared VHA performance against relevant industry

benchmarks, and reviewed and analyzed previous studies and reports for additional insight into issues, best practices, and potential process improvements.

We tracked, collected and analyzed 77 documents and datasets from our VHA stakeholders, and collected another 645 documents from our own search efforts. We also reviewed and analyzed 54 documents and datasets that we collected through joint requests with other teams. Through these efforts, we obtained Performance and Operations Web-Enabled Reports (POWER) and Informatics reports with volumes of performance and financial data, which we analyzed and compared against the benchmarks and VHA standards. We also analyzed the insurance capture and verification data we received from the VAMC-wide data call. Table 2-3 summarizes the activities we conducted for this assessment. Refer to Appendix D for more detail on standards and benchmarks.

Table 2-3. Interviews, Benchmarks, and Prior Studies

Interviews and Site Visits Conducted	**Executive Leadership**	• Chief Business Office, including Revenue Operations and Purchased Care • Health Net Federal Services and TriWest • Health Information Management Service (HIMS)
	Site Visits	• Visited 3 CPACs, 1 HAC, and 8 VAMCs • Interview 63 staff members for VA Care • Interviewed 44 staff members for Non-VA Care • Conducted 30 process walkthroughs
Analysis of Industry Benchmarks	**VA Care**	• Healthcare Financial Management Association (HFMA)
	Non-VA Care	• American Health Insurance Plans (AHIP) • American Medical Association (AMA) • RSM McGladrey • Medicare/Medicaid
Analysis of Previous Studies	**VA/Non-VA Care**	• Office of Inspector General (OIG) Reports • Government Accountability Office (GAO) Reports • Internal VA Oversight Reports (e.g., Internal Controls, Improper Payments) • Industry White Papers (e.g., National Academy of Public Administration)

Benchmarks and VHA Standards: For VA Care revenue collection processes, we used the private-sector Healthcare Financial Management Association's (HFMA) benchmarks and best commercial practices for evaluating VHA performance, to the extent possible. For example, we used payment denial rates as a benchmark in our evaluation. If required, and possible, we adjusted the data in order to conduct an "apples-to-apples" comparison. For VHA data/metrics that could not align to commercial metrics, we used VHA standards of performance for our analysis. For example, VHA metrics for coder productivity did not fit the HFMA benchmark, so we used VHA's standard for coding turnaround time for our evaluation criteria. For more detail, refer to Appendix D.

For Non-VA Care, we used the private-sector American Health Insurance Plan (AHIP), American Medical Association (AMA), RSM McGladrey, Medicare and Medicaid benchmarks to the extent

possible. For payer-related benchmarks, we sought to include Sherlock data[11] in our assessment, but were unable to obtain the necessary licensing rights. We adjusted VHA's data for a good comparison against the industry benchmarks, as needed. We used VHA's standards when we could not make an adequate comparison. We examined process metrics including payments, accuracy, timeliness, interest payments, and mode of claims submissions. Refer to Appendix D for more detail on standards and benchmarks.

2.3   Phase 3: Findings and Recommendations

In this phase, we analyzed the collected data, comparing VHA data against previous studies and industry benchmarks, and evaluated the interviews and site visits results to identify findings and potential recommendations. We synthesized our findings to highlight those that are most important and developed strategic and tactical recommendations. We based these recommendations on best practices and industry standard practices used by other providers to improve their processes and outcomes.

We reviewed and analyzed several GAO, VA OIG, and prior studies and investigations conducted to evaluate VHA revenue collection and claims payment processes. Several findings in our report reflect historical issues as identified in previous reports. We conducted specific root-cause analyses of these findings and went beyond strategic, high policy-level guidelines typically found in prior reports and identified tactical-level, actionable recommendations that assist with near-term, incremental improvements.

We also considered input from an independent Blue Ribbon Panel, comprised of executive-level health care industry leaders, who provided expert opinion and input throughout the assessment activities. The panel members possessed a thorough understanding of health care industry best practices and provided advice and feedback on the emerging findings and recommendations.

The results address performance across VHA business processes to improve revenue and payment with key recommendations to help achieve critical outcomes of improving the Veteran experience, decreasing Veteran medical costs, and ensuring the long-term viability and success of VHA's Veteran health care program.

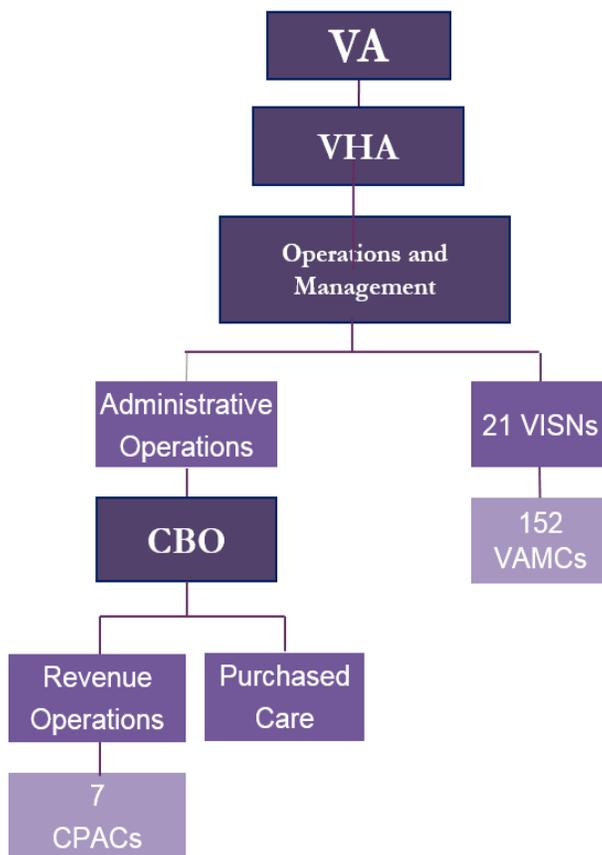
---

[11] Note: Sherlock is a well-known, industry standard used by large insurance plans, Medicare and others for benchmarking, staffing and budgeting.

3 Key Organizations and Stakeholders Examined

Several key VHA organizations have major roles and responsibilities to execute and oversee the business processes related to collections for VA Care and claims payments for Non-VA Care. This section identifies and explains the key organizations that influence VHA's business processes related to revenue and payment.

Figure 3-1 illustrates the key VHA organizations and the following paragraphs describe their related roles in more detail.[12] VHA is a separate administration under VA. Within VHA, the Office of the Deputy Under Secretary for Health for Operations and Management (DUSHOM) leads VHA operations and operates VHA health care systems, VAMCs, systems of clinics, and outpatient clinics. The Assistant DUSH for Administrative Operations manages 12 components that provide administrative and operational support services for the VHA health care system, with the CBO being most relevant for this assessment.

Figure 3-1. Key VHA Organizations Assessed Relevant to Revenue Collection and Claims Payments


Source: Grant Thornton's rendition of key VHA organizations that are relevant to revenue collection and claims.

---

[12] Note: VA 2014 Functional Organizational Manual—v2.0a, Description of Organization Structure, Missions, Functions, Tasks and Authorities, is the primary source for the summarized information in this section.

The views, opinions, and/or findings contained in this report are those of Grant Thornton should not be construed as an official government position, policy, or decision.

3.1 Chief Business Office (CBO)

Located in Washington, D.C., the CBO is responsible for all VHA Business Operations, including Purchased Care and Revenue Operations. The CBO develops policies, procedures, and training for VAMCs and provides overall direction and guidance for advancing business practices that support patient care and health benefits delivery. This group is responsible for compliance with business standards and requirements, including implementing appropriate internal controls and performance measures. The CBO manages three business lines: Revenue Operations, Purchased Care, and Member Services with the first two relevant to this assessment.

3.1.1 CBO Revenue Operations

The CBO Revenue Operations business line manages the following responsibilities:

- Administering first- and third-party collections
- Developing and providing overall direction, guidance, procedures, and training for the CPACs
- Standardizing processes and providing technical expertise in revenue processes
- Conducting metric-based, operational analysis.

Revenue Operations is also responsible for eBusiness Solutions and Business Information, not shown above. The Office of eBusiness Solutions develops and implements leading electronic Data interchange applications throughout VHA. The Business Information Office provides data and analysis to support VHA's legislative and process-improvement initiatives.

Consolidated Patient Account Centers (CPAC) – The CPACs standardize and coordinate activities related to billing and collections for all health care services furnished to Veterans for non-service-connected medical conditions. The CPACs are chartered to apply commercial industry standards for measures of access, timeliness, and performance metrics with respect to revenue enhancement of the Department.[13] The CPACs generate bills from VAMC-coded non-service connected disability health care admissions and encounters, send them to third-party insurance carriers, then collect and process payments. To improve coordination and communication between the VAMCs and the CPACs, staffs are located in the facilities as well as each regional CPAC. CPACs perform back-end revenue processes while each of the VAMCs maintain ownership of key Veteran-facing revenue functions.[14]

> *CPACs perform back-end revenue accounting processes, while VAMCs own key front-end Veteran-facing functions.*

There are seven CPACs assigned to cover different regions throughout the country. The CPAC locations are: Asheville, NC (Mid-Atlantic—MACPAC); Middleton, WI (North Central—NCCPAC); Smyrna, TN (Mid-South—MSCPAC); Lebanon, PA (North East—NECPAC); Orlando, FL (Florida &

---

[13] Public Law 110-387, Section 406.

[14] VA 2014 Functional Organizational Manual—v2.0a, Description of Organization Structure, Missions, Functions, Tasks and Authorities, Pg 133.

Caribbean—FCCPAC); Leavenworth, KS (Central Plains—CPCPAC); and Las Vegas, NV (West—WCPAC). Additional background and history of the CPAC is located in Section 6.

3.1.2   CBO Purchased Care (CBOPC)

Located in Denver, CO, CBOPC is the center of external Non-VA Care and associated claims payment processes. CBOPC is responsible for the delivery of health care benefits through enterprise program management and oversight of Purchased Care functions. This includes overall management of Health Care Payer Programs, including development, implementation and oversight of legislative, regulatory, and policy standards for the program areas. CBOPC oversees the Non-VA Medical Care (Fee) Program and manages business and systems support for the program areas.

- CBOPC is responsible for the development of administrative processes, policy, regulations and directives associated with the delivery of the Non-VA Care program. Section 106 of the Veterans Choice Act directed VHA to transfer the authority to pay for hospital care, medical services, and other health care furnished through Non-VA providers from the VISN and VAMCs to the CBO. CBO is now responsible for all claims processing and payment operations and staff. Supervisors and claims clerks manage and conduct the day-to-day activities of the Non-VA Care program. These activities include scanning claims, reviewing administrative eligibility, processing claims for payment, answering Non-VA provider inquiries.

CBOPC manages offices responsible for the following activities:

- Administering VistA Fee, Central Fee, Fee Payment Processing System, and Fee Basis Claims Systems (FBCS)
- Developing and maintaining contractual relationships with Non-VA (private-sector) providers, including Patient-Centered Community Care (PC3) relationships
- Processing claims and payments, and adjudicating benefits.

3.2   Veterans Integrated Service Networks (VISN)

VHA designed VISNs to be the basic budgetary and planning unit of the VHA. There are 21 VISN offices organized by geographic regions throughout the country, with each VISN providing a shared system of care to provide Veterans better and greater access to care. Each VISN delivers medical care through a network of VAMCs, CBOCs, and related facilities located within their geographic region. Each VISN has budget and administrative responsibilities, including contract services, long-term care, sharing-agreements, and operational oversight for associated facilities.

3.2.1 Department of Veterans Affairs Medical Center (VAMC)

There are 152 VAMCs functioning as the primary care delivery operations within VA's structure.[15] Each VAMC is associated with a VISN in its geographical region and supported by a regional CPAC. As it relates to revenue collection, VAMCs are responsible for the patient registration, scheduling, clinical documentation, and coding.

- When VAMCs are unable to provide the needed care, VAMCs refer Veterans to private-sector providers, often referred to as "Non-VA providers." VAMC clinicians generate the referrals for Non-VA Care. VAMC authorization staff members are responsible for reviewing these referrals, creating authorizations, and scheduling appointments for Veterans in the community.

---

[15] U.S. Department of Veterans Affairs. (2015, May 11). Where do I get the care I need? [Veterans Health Administration] Retrieved from http://www.va.gov/health/findcare.asp

4 Best Practices

VHA has seen significant opportunities for improvements across business processes. Our site visits and interviews revealed several best practices across VHA. We conducted root cause analyses for sites where performance results significantly exceeded VHA averages. VHA should examine these peer organizations' best practices to determine applicability across other sites. This section summarizes some of the proven ideas and initiatives that could help VHA achieve some needed process improvements throughout the organization. This section also includes recommendations that can help "institutionalize" these improvements throughout VHA.

4.1 Identified Best Practices

1. **Nation-wide implementation of CPAC structure following successful MACPAC pilot: VHA opened the first Consolidated Patient Account Center (CPAC) in October 2009 as a successful pilot facility.**

   - Following successful implementation of the MACPAC, all VAMCs transitioned their Patient Accounting operations to one of seven CPACs. The transition to the CPAC structure is industry-modeled to centralize and enhance billing and collection activities. The consolidation of traditional revenue program functions into regionalized centers closely aligns VHA billing and collections activities with industry best practices. The CPAC consolidation enabled VHA to structure and standardize key billing and collection functions.

2. **Non-VA Care claims timeliness improved due to new workload distribution approach.**

   - Sixty days after implementing the Fee Basis Claims System (FCBS), the Minneapolis VAMC within VISN 23 had a backlog of claims exceeding 30 days as the FBCS process required claims distributed alphabetically to each processor. By changing the process and giving the supervisor control over the flow and distribution of claims, the unit optimized productivity as the supervisor assigned claims to processors based on workload.

3. **Although manual, pre-authorization and pre-payment reviews reduced Non-VA Care error rates.**

   - To ensure accuracy of claims payment, the Minneapolis VAMC developed a workaround to conduct pre-authorization and pre-payment reviews of each claim. In the absence of an ideal automated solution, the workaround resulted in an FY2014 error rate of less than one percent.[16] When the pre-authorization and pre-payment reviews identify errors, a supervisor works with the clerk to provide corrective training and ensure finalization of the payment. This process, although manual, is beneficial until automation of the claims payment process is achieved. The end state best practice is for an automated review with the appropriate analytics followed by a manual review of a sample of claims to achieve an error rate of less than one percent. Note that these claims reviews require subject matter expertise on the Non-VA Care program.

---

[16] Note: The error rate of less than one percent was identified by using raw data from the 2014 IPERIA report.

---

4. **High and Accurate VAMC Insurance Capture Rates Improved Associated CPAC Revenue Collection.**
   - Through an evaluation of our site visits and compiled data, we noted three CPACs and their supported VAMCs were using specific leading practices regarding VMAC insurance capture processes to enable better revenue collection performance. The MACPAC in Asheville, NC, the NCCPAC in Middleton, WI, and the FCCPAC in Orlando, FL, had the lowest error rates in insurance capture (based on a VAMC-wide data call) and, as a result, are leading performers in revenue collection. Insurance identification errors are missed opportunities for VAMC Patient Intake clerks to capture Veteran's insurance information.
     - *Centralized check-in and VAMC leadership support improves insurance identification:* The Asheville VAMC conducts insurance identification through a centralized check-in station allowing patients to register in one location. The Asheville VAMC Director requires all patient intake clerks to ask for third-party insurance cards at the central check-in station. In reviewing Asheville's collections-to-billings indicator, they are performing at 52.2 percent, which significantly exceeds other VAMC's 35–45 percent performance range. The use of centralized check-in and the VAMC Director's support of insurance capture requirement contribute to high collections-to-billing performance at the associated CPAC and is consistent with industry practice.
     - *CPAC and VAMC insurance identification monitoring improves performance:* VISN 8 in North Florida/South Georgia developed an insurance identification report that monitors insurance capture by VAMC department and patient intake clerk.[17] VAMC management monitors this report to identify and correct low insurance identification performers and resolve the insurance capture challenges. In reviewing performance indicators, the FCCPAC is the third best CPAC in insurance capture performance and collections as a percent of billings performance metrics. The regular VAMC use of insurance identification tools positively affects CPAC performance in billings and collections.
     - *CPAC and VISN teaming streamlines Accounts Management workflow processes to improve revenue collection:* The NCCPAC Accounts Management team teamed with VISN 10, 11, and 12 to create a structure that assigns Accounts Management clerks to specific VISNs within the CPAC. This allowed CPAC staff to improve communication and coordination with VAMC Patient Intake staff. CPAC Accounts Management staff achieved a better understanding of the specifics for a particular VISN (e.g., facility revenue, payers and specific denials) and, as a result, addressed issues better and more quickly. The Accounts Management team also generates site-specific data reports to identify tactical challenges. The streamlined workflow processes are a best practice that contributes to NCCPAC's performance as second of all CPACs at insurance capture and the best at collections to billings.

---

[17] Note: Most VAMCs do not monitor insurance capture by department or patient intake clerk; VAMCs typically monitor insurance capture by site.

4.2 Recommendations for Expanding Best Practices

As described in Section 4.1, our site visits and interviews revealed several best practices for VAMCs, CPACs, and VISNs; however, the national adoption of these best practices is inconsistent. We recommend that VHA develop mechanisms for regular examination of best practices to determine where successful practices apply and implement these practices across similar VHA business functions. For example, VHA and CBO should leverage existing PMO meetings across both Purchased Care and Revenue Operations to include an action item to identify, share, and institutionalize best practices across VHA. Sharing and institutionalizing best practices will allow VHA to improve upon them as business processes continue to evolve.

5 Overarching Findings and Recommendations

5.1 VHA Revenue: VHA is Not Optimizing Revenue Due to Ineffective Veteran Insurance Identification, Clinical Documentation and Coding, and Culture Barriers.

This finding relates to the billing and collection processes associated with the direct medical care VHA provides in its facilities (VA Care). Commonly referred to in industry as the "revenue cycle," the requisite processes are - *Patient Accounting* (Billing and Accounts Management), that are highly dependent on activities that include *Patient Intake* (Scheduling, Pre-registration, and Registration), and *Clinical Administration* (Clinical Documentation and Coding). At VHA, the VAMCs are responsible for the Patient Intake and Clinical Administration activities while the CPACs own and execute the Patient Accounting activities. From beginning to end, all parts of the revenue cycle must be coordinated to effectively and properly bill and collect revenue from insurance companies (third party) and co-payments from Veterans (first party) for non-service connected medical treatment.

As the cost of Veteran care continues to rise, increased emphasis on collections is integral to ensure long-term financial viability for the Veterans' health care program. VHA opportunities to increase collections offers a stark contrast between a disciplined and coordinated private-sector revenue cycle and the revenue cycle that VHA employs.

Major Sub-Findings

The following points summarize the root causes and major sub-findings that contribute to this overarching finding. Chapter 6, VHA Revenue, includes the detailed analyses, evidence, and data sources required for a more complete understanding.

- **Ineffective Insurance Identification and Verification:** The current process is for VAMC Patient Intake staff to ask for insurance information from the patient. Once insurance is identified, the CPAC insurance verification teams verify insurance coverage (patient dates of eligibility, service coverage, and pre-certification/authorization requirements). When insurance is not identified appropriately, this results in CPAC staff collecting and verifying the patient's insurance "after-the-fact." Ineffective insurance identification and verification of insurance during the Patient Intake results in delayed insurance verification by CPAC staff and denials from insurers. Accurate Veteran insurance identification is a key predecessor to bill and collect payments from third-party insurers. This current process has led to significant collection delays and denials. For example, in 2014, 54.6 percent of denials were related to the Patient Intake function, with non-covered charges representing the largest (35.8 percent) portion.

- **Delays in Coding and Clinical Documentation:** Delays in VAMC clinical documentation and outpatient coding impede timely revenue collection. Clinical documentation and coding drive the services and amounts necessary to bill and collect from insurers. Delays in clinical

documentation across VHA, coupled with a lack of certified coders, reduce collections. In 2014, clinical documentation and coding issues were associated with $14.2 million in denials. VHA has not mandated participation in the national Clinical Documentation Improvement (CDI) program to improve documentation practices and fewer than half of VAMCs have a CDI program. Inadequate documentation forces VHA Coders to exhaust energy and resources rectifying gaps in documentation. This results in coding backlogs. VHA is also at risk for ICD-10 readiness if clinicians are not trained on documentation requirements, and coders are too busy to keep up.

- **Longstanding Cultural Barriers:** According to interviews with VAMC leadership, Veterans and VHA staff do not consistently understand Veterans' financial obligations, resulting in inconsistent insurance identification and co-payment collections. Congress gave VHA authority to collect reimbursements for direct VA Care from third party payers and to collect co-payments for non-service connected care. Many Veterans believe they are entitled to "free care for life," some VHA staff are uncomfortable asking for insurance or do not believe it is appropriate to bill insurance for Veteran care. Based on feedback from VAMC leadership, culture barriers prevent VHA from maximizing collections due to Veterans not always understanding the need to provide insurance information and reluctance from VHA staff to ask for it.

- **Organizational Challenges:** Separate lines of accountability for revenue processes across VAMCs and CPACs negatively affects collections. VHA executes Patient Intake, Clinical Administration, and Patient Accounting business processes across the VAMC and CPAC. However, only the CPACs are accountable for revenue collection and the associated performance outcomes.

- **Ineffective First-Party Collections:** Lack of one-on-one interaction with the Veteran during registration/check-in processes to offer financial education inhibits VHA's ability to increase first-party collections. Veterans who do not understand why and how much they owe for non-service connected treatment are less likely to pay owed amounts.

Major Recommendations

The following recommendations are key actions and process improvements that VHA should take to address the long-standing, systemic issues with revenue cycle processes to achieve enhanced, overall performance, increase revenues, and, ultimately, increase Veteran satisfaction.

- **Identify Insurance Information at VAMCs:** VHA should immediately mandate and incentivize all VAMCs to identify insurance and obtain signed release of information as necessary during the Patient Intake process. VHA should document best-practice insurance capture guidelines and incorporate them into standardized procedures. CPACs should assign and co-locate a Facility Revenue Technician (FRT) with the VAMC Patient Intake clerks to assist with insurance questions and financial questions. VAMCs and CPACs should monitor

the best practice reports to identify progress and proactively work issues. For the longer term, VHA should enhance kiosk functionality to identify and verify insurance.

- **Enforce Clinical Documentation Requirements:** VAMCs should enforce the existing policy that directs 24-hour turnaround for all clinical documentation and encounter closeouts. VAMCs should use performance pay agreements to assist with enforcing and rewarding clinician compliance. VHA should also standardize the CDI program and mandate use across all VAMCs. VHA should provide designated CDI specialist funding to VAMCs to enable use of this essential role. VHA should also use the CDI program to enhance ICD-10 readiness and implementation.

- **Minimize Cultural Barriers:** Near-term actions include increasing communication to Veterans and VHA staff through an immediate push using VAMC Town Hall meetings, website resources, and existing staff and Veteran training as mechanisms to emphasize the insurance collection requirement. Include this education in mandatory, periodic refresher training for all VHA staff. To address the larger cultural barriers, VHA should incorporate education of Veterans, their families/caretakers, all levels of VHA staff, key stakeholders (including Congress and state/local government agencies, Veterans' groups), and the public into their Strategic Communications Plan. The education should focus on the legislative requirements for third-party insurance identification and collection to support the long-term financial viability of VHA's health care program.

- **Assign Revenue Accountability to VAMC/VISNs:** VHA should assign VAMCs shared responsibility with the CPAC for revenue outcomes and include specific goals in management/staff performance plans as a near-term improvement. Longer term, an emerging practice in private-sector health care is to align all components of the revenue cycle under the Chief Financial Officer (CFO) linking job responsibilities to financial performance. VHA's revenue cycle activities currently owned by the VAMC/VISN are Scheduling, Pre-Registration, Registration and Coding—all primary functions for identifying and verifying insurance, and ensuring accurate and timely first- and third-party collections. The private sector has recognized that aligning these functions under a single organization improves accountability and revenue cycle performance. Our findings indicate that the separation between business process and organizational structure within the VHA revenue cycle processes has resulted in a lack of coordination and consistency in these functional areas. Given the size and complexity of VHA compared to the private sector, any realignment needs to be carefully considered. Added to this, the VHA CBO recently completed a very large organizational consolidation of Non-VA Care employees and adding significantly more responsibility to the CBO at this time may be difficult for the CBO to absorb in the near-term.

- **Reduce Complexity of Rules:** Congress and VHA should undertake a complete review of the Veteran eligibility, service connection, non-service connection and benefits rules and

categories in order to develop a single, comprehensive, easy-to-understand set of guidelines that align with industry standards (where possible). VHA should support automated business rules and enforce simplified rules that are understandable and implementable by staff at all levels. In addition, we believe that the complex billing processes require higher graded staff levels for billers than the GS5 level currently employed.

- **Automate and Integrate Technology:** VHA must recognize and allocate sufficient funding to acquire and implement the automated technology needed to address the significant manual-process issues that plague and prevent VHA from achieving the needed improvements in revenue collection. The technology needs to integrate dependent functions (front, middle, and back end) to execute routine business processes seamlessly across functional areas.

5.2 Non-VA Care: Payments—VHA Does Not Have Adequate Infrastructure and Streamlined Processes to Pay Non-VA Care Claims Timely and Accurately.

This finding relates to VHA payments for private-sector (Non-VA) care when required care is not available in VHA facilities. Infrastructure, in this finding, includes the lack of documented guidelines and procedures, inadequate technology and tools, insufficiently trained staff, and an inadequate number of staff. Private-sector providers (herein referred to as Non-VA Care providers) submit claims to VHA for the authorized care they provide to Veterans and VHA is required to process and pay those claims. Non-VA Care claims processes are complicated significantly by the number of multiple parties, complex procedures, and manual tasks required. Inadequate technology has a major effect on the outcome of these processes due to the volume and manual nature of work required. In 2014, VHA processed 14 million claims, which could rise to 19 million claims in 2015 if the trend continues.

The effective execution of Non-VA Care activities, both from timeliness and accuracy perspectives, is essential to maintaining the network of providers necessary to keep America's health care promise to our Veterans.

5.2.1 Major Sub-Findings

The following list summarizes root causes and major sub-findings that contribute to this overarching finding. Timeliness, accuracy, and penalties are addressed first, followed by the infrastructure and related challenges. Chapter 7, Non-VA Care, includes the detailed discussion, evidence, and data sources required for a more complete understanding.

- **Accuracy and Timeliness Issues:** VHA has widespread, significant issues with payment accuracy. Only six of 21 VISNs met VHA's standard and industry benchmark for payment accuracy. Since 2009, VHA improvements have increased accuracy rates from 83 percent to 91 percent in 2014; however, that is still lower than the VHA standard of 98.5 percent. Two

VISNs, different than the VISNs with timeliness issues, are well below the average rates at 78 and 83 percent accuracy rates. The same underlying issues with infrastructure, technology and process complexities discussed above also apply.

Issues exist with paying Non-VA Care claims timely. The backlogs, as detailed in Chapter 7, reflect this. Additionally, the manner in which VHA tracks payment timeliness is not entirely reliable. For example, there are indications that due to the claims backlog, claims are not date-stamped timely. Consequently, this affects the ability to assess timeliness performance accurately. According to VHA-provided data, 16 percent of claims (approximately 239,000) are 31-60 days late and 1 percent (approximately 12,000) are more than 180 days late, causing significant financial effect to select providers.

- **Penalties Assessed:** VHA mechanisms to avoid penalty payments to vendors are inadequate. Currently, VHA's interest penalties are minimal; in 2014, VHA incurred $292,217 in interest penalties on $5,580,590,777 of paid claims, however, VHA's payment practices are under review by VA's Office of General Counsel (OGC). If OGC finds that VHA must pay back interest, then it will be significant based on conducted interviews. VHA tracks interest penalties at the national level and does not consistently communicate interest penalties down to the CBO staff at the VAMCs. Improvements are necessary in payment timeliness and accuracy to avoid penalties that will accrue for late and inaccurate payments.
- **Inadequate Non-VA Provider Guidelines:** Inadequate Non-VA Care claims submission guidance prohibits widespread use of electronic claims submission and increases workload and payment errors. Non-VA Care providers only submitted 28.6 percent of their claims electronically for fiscal year 2014, significantly less than the 94 percent of electronic claims for commercial payers. High levels of paper claims affect accuracy and timeliness. Non-VA providers lack access to VHA's detailed billing, authorization, and clinical documentation requirements, leading to increased workload for VHA and Non-VA staff, and inadvertent duplicate billing and payment. Lack of provider education increases the risk of erroneously billed claims, affecting claims backlogs as the Non-VA providers resubmit for unpaid services.
- **Complex Policies:** High risk of improper payments due to complex rules and Non-VA Care claims submission requirements causes confusion, inefficiencies, and increases errors. Complex rules and disparate processes result in inconsistencies in authorization and payment practices. Without common, standardized processes and procedures, claims clerks conduct claim assessments inconsistently across VAMCs, potentially leading to inaccurate payment. Unclear authorizations lead to confusion among Non-VA providers and potential risk of improper payment for services not authorized.

- **Staff Vacancies and Poor Retention:** High staff vacancy rates and poor retention contribute to delays and errors in claims payment.[18] During the implementation of the Veterans Choice Act in October 2014, CBO leadership reported there were 295 vacant positions (out of 1,982 authorized positions) for Non-VA Care claims clerks, supervisor, and support positions, such as clinical staff and budget technicians.[19] Since the implementation of the Veterans Choice Act, CBO has indicated some progress reducing the number of staff vacancies; however, during our site visit interviews, we found staffing retention and vacancy rates to be a significant and widespread challenge facing local Non-VA Care operations.[20] Vacancy rates and staffing shortages lead to higher overtime costs, inexperienced staff, and a constant focus on employee recruitment, training and retention, which negatively affect the timeliness and accuracy of claims payments.

- **Patient Centered Community Care (PC3) Challenges:** PC3, comprised of HealthNet and TriWest, is a recently implemented network that VHA uses to supplement access to Non-VA Care. PC3 experiences challenges due to inadequate provider enrollment and stringent clinical documentation requirements. According to the OIG, PC3 has not met the PC3 contract requirements for full implementation of the networks in six provider regions by April 2014 (OIG, 2015). Existing local VAMC contracts that frequently pay higher rates with less administrative burden further challenges PC3. Additionally, PC3 does not consistently return contractually required medical documentation in a timely manner. We note that the PC3 contract requirement to collect medical records for every claim prior to payment is burdensome in comparison to industry best practices.

5.2.2 Major Recommendations

The following recommendations are key actions and process improvements that VHA should take to address the significant issues existing with the Non-VA Care payment processes to enhance payment timeliness and accuracy, avoid penalties, and develop positive relationships with network providers. VHA must address the underlying issues and take action on these recommendations to ensure Veterans have the needed access to the Non-VA care network of providers.

- **Establish Single Set of Guidance:** Adopt a single set of practices and guidance for authorizing and paying Non-VA claims. Review and evaluate the existing authorization and claims processing procedures at high performing facilities and interview industry experts to determine best practices. Increase electronic claims submission rates by creating

---

[18] CBO Purchased Care Operations Directorate indicated that they began tracking staff turnover rates; however, they only began tracking this data in October 2014, limiting our ability to draw comprehensive conclusions. In addition, CBO tracks and reports turnover data on a pay period basis.

[19] Per CBOPC OPS FTEE by VISN.xlsx prepared by CBO Purchased Care Operations Directorate

[20] As of August 2015, there are currently 83 vacancies within Non-VA Care; however, over that same time, CBO transferred a number of positions to other departments, reducing the total number of authorized positions in Non-VA Care to 1,871. The CBO provided the updated number of staff vacancies and authorized positions but the data was not independently validated.

---

provider manuals, known in the industry as 837 companion guides, to give Non-VA Care providers the information needed to submit electronic claims successfully. Also, encourage, through contract provisions and preferential contacting approaches, Non-VA Care providers to submit electronic rather than paper claims. Standardize the Non-VA Care claims processing methods and train claims clerks accordingly.

- **Reduce Complexity:** Similar to VHA Revenue, Congress and VHA should undertake a complete review of the Veteran eligibility, service-connected, non-service connected and many benefits rules and categories and develop a single, comprehensive, easy-to-understand set of guidelines that align as much as possible to industry standards.

- **Establish Common Reimbursement Structure and Methodology:** Develop and implement a common reimbursement structure and process for Non-VA Providers that eliminates the multitude of individual and different contracts with providers and that simplifies the entire process. Revise contracts with HealthNet, TriWest, and other Non-VA providers to incorporate a common reimbursement methodology.

- **Establish Transparent Reporting of Interest:** Accountability at the facility level is necessary to ensure process improvements to payment processes to eliminate or reduce interest payments. Stronger coordination between Corporate Office and VAMC level management over interest penalties will provide the ability to analyze and identify root causes of interest penalties on an ongoing basis, and proactively develop corrective actions.

5.3 Information Technology—Lack of Automation and Integration Prevent VHA from Optimizing Performance in both Collections and Payments.

This finding relates to the information technology (IT) tools and applications that VHA uses to support the various processes involved with the VA Care revenue cycle and the Non-VA Care claims payments. We address VA Care and Non-VA Care processes and associated tools separately due to their magnitude and significant differences.

It is important to note for our technology review that VA established the Office of Information Technology (OIT), under the Chief Information Office (CIO) to centralize the development, delivery, operation, and management of IT capabilities across the Department. In the past, while VHA worked with OIT to prioritize IT needs, OIT ultimately set the funding priorities.[21]

Information technology, automation of manual processes and other applications and tools are essential in effectively and accurately processing and meeting the substantial requirements for revenue collection and claims payments. The current state of automation within VHA presents many opportunities for improvements.

---

[21] Assessment H provides a more detailed discussion on the OI&T centralization.

The following sections summarize the root causes and major sub-findings that contribute to this overarching finding. Chapter 8, Information Technology, includes the detailed discussion, evidence, and data sources required for a more complete understanding.

5.3.1 Major Sub-Findings—Information Technology: VHA Revenue

- **Inadequate Technology:** Systems for revenue collection require significant manual intervention, causing errors and delays. VHA will not be able to make the needed improvement in their billing and collection processes without integrated, automated technology. Antiquated systems used to support revenue collection for third-party reimbursements and first-party (Veteran) co-payments require increased spot checks and manual intervention. For example, VHA executes the coding and billing functions on separate platforms inhibiting synchronization of information. The lack of system integration also prohibits sharing of information across clinical and revenue management systems. Additionally, VHA's clinical systems do not automate clinical documentation and coding functions as efficiently as private-sector systems.

  - The systems require significant manual intervention and processing that creates an environment prone to human error and delays billing**.** For example, CPAC billing staff members manually review 100 percent of bills to third-party insurance (also referred to as claims), subsequent to automated edits. In the private sector, clerks manually review only 10 to 20 percent of claims, subsequent to automated edit and correction. In addition, manual processes are required to verify that Veteran care bills are compliant with the third-party insurance contracts.

5.3.2 Major Recommendations—Information Technology: VA Care Revenue

- **Fund and Implement an Integrated Patient Accounting System:** VHA should continue efforts they have initiated to begin planning for an integrated and automated billing system.[22] VHA, in coordination with VA OIT, should prioritize funding and accelerate efforts to implement an integrated patient accounting system that supports synchronization of information, minimal work processes, and automated decision-making. VHA should prioritize the integration of tools (and functions) across patient intake, clinical administration, and billing systems. In particular, we recommend VHA to integrate medical records, coding, and billing systems under one login to facilitate expedited claims generation and payment. One integrated system will allow billers and coders to access the information they need from one site rather than multiple sites, reducing human error, and time needed to complete tasks. Once a new integrated solution is developed and put into place, VHA should revaluate staffing levels to account for the change in workload and reallocate personnel accordingly.

  - Evaluate technology that will allow Patient Intake staff to access patient's out-of-pocket responsibilities real time. Invest in technology that allows for generation of enhanced

---

[22] Based on interview with the Deputy Director of Revenue Systems Management.

itemized statements for patients including information related to third-party payers billed, detail of charges (description, quantity, and amount), payments and adjustments, and contact information for billing and other questions. Evaluate a solution for calculating the optimum payment plan for each Veteran based on the patient's ability to pay and the organization's payment plan guidelines.

5.3.3   Major Sub-Findings—Information Technology: Non-VA Care Payments

- **Inadequate Technology:** Manual payment process for Non-VA Care providers negatively affects timeliness and accuracy. The high rate of manual intervention is in contrast to the private sector, where payer systems typically carry an edit status or disposition. An additional systems complication is that Non-VA Care claim processing system is not able to process all types of Non-VA Care claims. For example, VHA cannot process dental and contract nursing home claims through the current Non-VA Care claims processing system (FBCS). These claims require a much higher level of manual effort.

- **Missing Claims Status:** VHA lacks an online resource for Non-VA Care providers to check claims status. Modern workflow tools routinely provide a capability for online status; such as, checks of orders, payments, shipping. Most major payers provide claims status updates online, which is quickly becoming an industry standard that increases provider satisfaction. Providing online claim inquiry will also eliminate duplicate claims submitted by Non-VA Care providers with a subsequent reduction in manual claims processing.

- **Decentralized Claims Processing:** The Non-VA Care claims processing system is not centralized, leading to inconsistencies in claims processing across VAMCs. Consequently, there are discrepancies among deployed technical processes and local instances of the FBCS. These differences have also limited VHA's ability to create keystroke-level training and desk-level procedures, which affects both timeliness and accuracy.

- **High Staffing Levels:** The process to pay Non-VA providers requires higher staffing levels relative to other payers. VHA's Non-VA Care claims processing system is heavily reliant on manual processes when compared to health plans. Currently, the Non-VA Care claims processing system auto-adjudicates zero percent of claims compared to private-sector payer benchmark of 79 percent.

5.3.4   Major Recommendations—Information Technology: Non-VA Care Payments

- **Strategic Planning:** Develop and implement both a short-term and a long-term plan to reduce the degree of manual intervention in claims adjudication and other manual processes related to Non-VA Care business processes. Automation will lead to provider satisfaction and reduce the burden on the Non-VA Care claims staff, which will increase claims payment timeliness.
- **Claims Status:** Create a provider portal so that providers can routinely check the status of submitted claims, and a centralized call center with dedicated staff to answer Non-VA provider questions.

- **Funding:** VHA and CIO/OIT should work in close, coordinated partnership and within required regulation guidelines to address IT challenges for improving both collection and payment processes and, ultimately ensure funding to help secure the long-term viability of the Veterans' health program. Short-term fixes do not do justice for VHA staff or the Veterans they serve.

5.4 Oversight and Metrics—VHA Lacks Certain Performance Reporting to Provide Effective Oversight and Proactive Process Improvements for Collections and Payments.

The processes to effectively monitor and oversee collections and payments are essential to sustain process improvements across VHA. The findings and recommendations in this section address opportunities to benefit from stronger national reporting, leveraging private-sector benchmarks, more insightful decision support, common productivity standards, and management over timely payments. The findings also address program integrity tools, through which CBO is realizing results and should continue using to identify systemic issues. Chapter 9 includes the detailed discussion, evidence, and data sources required for a more complete understanding.

5.4.1 Major Sub-Findings—Oversight and Metrics: VHA Revenue

- **Lack of Insurance Capture Reporting:** VHA lacks standard national reporting of key performance metrics for timely insurance identification and verification across VHA, inhibiting visibility into insurance capture across VAMCs. Insufficient national reporting on Patient Intake key performance metrics hinders visibility into the Patient Intake functions of VAMCs and contributes to lack of accountability by all responsible parties.

- **Inconsistent Performance Measures:** Reporting in the current patient accounting system (VistA) is not comparable to private sector, inhibiting the identification of areas for improvement. For example, Days to Bill, GDRO, and contractual adjustments are all calculated and reported differently in the private sector.

- **Lack of Oversight of Regional Contracts:** Regional contracts with payers lack the necessary support from VHA's Revenue Operations Payer Relations Office. Local CPAC Payer Relations staff manages VHA's regional contracts with minimal oversight from the Revenue Operations Payer Relations Office. This arrangement limits the opportunity for local regional contracts to reap the benefits and negotiating strengths of the Revenue Operations Payer Relations Office. Without effective payer contracting and oversight in place at the regional level, mechanisms to ensure payment accuracy is diminished. Further, loss of revenue may occur, directly affecting the collection of amounts owed to VHA for care provided.

5.4.2 Major Recommendations—Oversight and Metrics: VHA Revenue

- **Elevate Reporting:** Evaluate the current reporting capabilities of the patient accounting system and perform a gap analysis with equitable private-sector reports. This would

further enhance VHA's ability to identify the root causes for process improvement areas and knowledge from which to develop and act on resolution plans. VHA should align performance measures to those used by industry, giving VHA leadership meaningful comparisons of performance to the private sector.

- **Perform Realignment:** CPAC Payer Relations staff should report to the Revenue Operations Payer Relations Office. This will allow VHA to optimize reimbursement rates leveraging economies of scale. A standardized approach should allow for flexibility at the CPAC/regional level, while addressing issues promptly with national advantage, particularly payer negotiations. Payer Relations staff should remain co-located at the CPAC to better understand regional influences and maintain a local presence.

5.4.3 Major Sub-Findings—Oversight and Metrics: Non-VA Care Payments

- **Lack of Productivity Standards:** As of April 1, 2015, VHA cannot establish effective productivity standards and monitor employee performance because its processes are not consistent across VAMCs and VISNs.[23] For example, at some VAMCs claims clerks work closely with the authorization personnel and are involved in care coordination, while others do not.

- **Inadequate Decision Support:** Current decision support capabilities are not sufficient to support oversight and management of Non-VA Care claims processing and payment. The analytical deficiencies across claims processing and payment prevent VHA from effectively assessing the performance and management of the processing system. Due to this deficiency, VHA is unable to analyze enterprise-wide denials.

- **Labor Intensive Oversight:** Proactive and retrospective processes are in place to find inaccurate payments, but some practices are manual. Reviews and audits to monitor improper payments are largely retrospective in nature; therefore, for any overpayments identified through these reviews and audits, VHA must invest time and money to recoup overpayments to Non-VA providers.

- **Lack of Oversight of Interest Penalties:** Currently, VHA's oversight of interest penalties is limited to VHA Corporate Office and not locally at VAMCs. As a result, VHA inconsistently communicates interest penalties down to the CBO staff at the VAMCs. Lack of accountability at the local level prevents needed improvements in payment timeliness.

5.4.4 Major Recommendations—Oversight and Metrics: Non-VA Care Payments

- **Establish Standardized Productivity Standards:** Establish standardized Non-VA Care productivity standards for staff across VAMCs and VISNs. VHA should employ these standards to project staffing needs and evaluate staff performance to assure sufficient staff

---

[23] Since the time of our review, the CBO indicates that they have made significant improvements to implement these standards. The timing of this information was out of the scope of our review; therefore, the Assessment I team could not validate this statement.

to support the claims processing process. As Non-VA Care continues to evolve, continually assessing VHA staffing levels is critical in leveraging human resources necessary to improve the accuracy and timeliness of claims processing.

- **Improve Review and Oversight:** Build upon and improve current pre- and post-payment review and oversight practices, so that VHA is using the most effective and highly automated tools and practices with emphasis on automated pre-payment edit techniques.

- **Establish Transparent Reporting of Interest:** Accountability at the facility level is necessary to ensure process improvements to payment processes to eliminate or reduce interest payments. Stronger coordination between VHA Corporate Office and VAMC level management over interest penalties will provide the ability to analyze and identify root causes of interest penalties on an ongoing basis, and proactively develop corrective actions.

5.5 Additional Considerations

While conducting research for this study, we gained many insights regarding VHA Revenue and Non-VA Care. We provide below some additional considerations for VHA's business processes.

5.5.1 Holistic, Long-term Planning

VHA should develop a long-term holistic plan for provision of and payment for health care services (180 days).

Rationale: The growth of Non-VA Care over the last decade has resulted in a combination of programs that, as evidenced by our report, do not have sufficient infrastructure to successfully perform the business functions today nor meet the demands of the future. The demand for Non-VA Care will be determined, in large part, by the decisions made regarding VA Care and, in turn, VA's capacity to meet demand for services. For example, decisions about VHA facilities and workforce will affect demand for Non-VA Care, as could changes in the demographics and clinical needs of Veterans. VHA should supplement the plan with the results of VHA's ongoing capacity and other ongoing studies. This will also allow VHA to evaluate whether areas that are suffering from under capacity are using PC3 more than other areas. Furthermore, Non-VA Care or other approaches to outsourcing could present opportunities for VHA to adopt best and emerging practices in health program administration, care management, preferred or tiered provider networks, provider payment and other areas.

To be successful, the long-term plan should account for the factors discussed above and allow for adoption of best practices from the private sector and other government sectors (e.g., the Medicare program, related to pricing, contracting, privatization, value-based purchasing, management, and oversight). Plans should also allow for adaptation at the local and regional levels, to reflect regional and local differences in provider supply, Veteran needs, and marketplace characteristics, among other factors.

VHA should establish formal governance model that allows CBO and VISN leadership to converge, aligning interests, and accountability (90 days).

Rationale: An organization structure that balances central management with local autonomy is vital to VA. In order to do so effectively, accountability and interests should align at the leadership level. Concerning business processes, the execution of core CBO functions is often dependent on coordination with VAMC and VISN actions. Under VA's current organization, since CBO and VISNs report separately to the VHA Office of the Under Secretary, VAMC priorities do not always align with CBO's. The significance of both VA and Non-VA Care requires an increased focus on business processes to sustain care for the Veteran population. Aligning both organizations under a single governance structure will converge interests and accountability resulting in the necessary cooperation and alignment to enable success.

5.5.2   Choice Act Implementation

VHA should standardize policies and procedures for execution of the Choice Act and communicate those policies and procedures to Veterans, VHA providers and staff and Non-VA providers (180 days).

Rationale: Our study was limited in scope to Non-VA Care claims payment timeliness and accuracy and interest penalties; however, examination of the claims processing protocols and operations revealed apparent opportunities to standardize the manner in which the Choice Act is implemented across VAMCs and VISNs and to improve VHA communications about Choice Act-related developments. Standardization will enable VHA staff members to communicate processes and benefits effectively to both patients and Non-VA providers. For the PC3 program, there appears to be tremendous confusion for both the providers of care (VA and Non-VA providers) as well as VHA staff, providers, and patients regarding authorization requirements, networks, out of pocket responsibilities, etc. VHA should determine outreach efforts that best optimize the message (e.g., newsletters, town hall meetings to help internal and external stakeholders understand the policies and processes related to PC3 and The Choice Act).

5.5.3   Non-VA Care Contracting and Oversight

VHA should identify opportunities to align payment and incentives among Non-VA Care programs and contracts and to strengthen the terms and oversight of those contracts, and VHA should centralize and inventory local contracts with Non-VA providers across all VAMCs (1 year).

Rationale: Our study was limited in scope to Non-VA Care claims payment timeliness and accuracy and interest penalties; however, examination of the claims processing protocols and operations revealed apparent opportunities for VHA to improve many aspects of its Non-VA Care contracting. Under the current model, VHA processes claims twice—once by the PC3 vendor and a second time by VHA to determine payment amounts. This is not reflective of typical Third Party Administrator arrangements and result in additional costs.

It appears that PC3 contracts and the oversight of those contracts, as well as VAMC contracts with providers, could strengthen through increased alignment, adoption of best practices in private sector and government health care contracting, and coordinated and rigorous management and oversight of those contracts. Private-sector and other government payers are increasingly adopting performance incentives, value-based purchasing, tiered or narrow

networks, transparency, and data analytics to drive provider and member behavior change through outreach and education. We also noted inconsistencies regarding the number and types of contracts established at the local (VAMC) level.

With more insight into the breadth and depth of contracted services, the negotiated requisite fees, and the performance of the contracted entities, VHA will be better positioned to make more informed contracting decisions such as, but not limited to:

- Restructuring contracts if rates are not competitive with other payers and are affecting PC3 contractors' leverage in the marketplace
- Mandating that VAMCs use PC3 vendors for particular costly medical services
- Revisiting performance requirements for Non-VA providers.

6 Analysis of VHA Revenue

6.1 VHA Revenue—Introduction

Congressional appropriations fund the care and treatment provided to Veterans. Congress provided VHA with the authority to bill Veterans and health insurance companies for Veterans' non-service connected care to help defray the cost of delivering medical services.[24] VHA considers a Veteran's health care "billable" if the care provided is non-service connected and if the Veteran's third-party health insurance policy covers the treatment. The Omnibus Budget Reconciliation Act of 1990 established standard out of pocket co-payments for billable treatment.

Many Veterans qualify for free health care and/or prescriptions based on service-connected conditions, special eligibility factors, and specific services exempt from inpatient and outpatient co-payments (e.g., counseling). All remaining Veterans with private-sector insurance coverage pay co-payments to help offset the cost of care.[25] VHA's non-service connected co-payment amount is limited to a single charge per visit regardless of the number of health care providers seen in a single day. VHA bases the co-payment amount on the Veteran's income and highest-level clinical service received on the date of service.[26]Note, if the insurance company pays VHA an amount that exceeds the co-pay, VHA reimburses the co-pay amount back to the Veteran. VHA uses this process to incentivize Veterans to provide insurance information.[27]

The Balanced Budget Act of 1997 stipulates that VHA must deposit all payments from health insurance companies and Veterans into the Medical Care Collections Fund (MCCF) to offset the cost of care funded through congressional appropriations. VHA considers services that are billable to the Veteran as "first party" (i.e., co-payments) and those that are billable to an insurance company as "third party." MCCF funds return to the VHA health care facility that provides the care for the Veteran. Table 6-1 outlines the first- and third-party collections and estimates for FY2011–FY2015.

---

[24] Note: The Consolidated Omnibus Budget Reconciliation Act of 1985 (P.L. 99-272), enacted into law in 1986 established means testing for Veterans seeking care for non-service-connected conditions.

[25] Note: Under the Choice Act, insured Veterans are explicitly required to provide insurance.

Table 6-1. Total First and Third-party Collections, FY2011-2015 ($ in thousands)[28]

	FY2011 Actual	FY2012 Actual	FY2013 Actual	FY2014 Actual	FY2015 Estimate[29]
First-party co-payments[30]	956,461	970,180	923,508	885,228	939,762
Third-party insurance Collections	1,754,875	1,770,911	1,940,014	2,169,932	2,424,677

6.1.1 VHA Revenue—History

VAMCs initially performed all revenue cycle functions, including billing and collections. While this approach achieved momentum in supplementing congressional appropriations, it lacked coordination and standardization, which hindered VHA's ability to maximize revenue. Multiple OIG and GAO reports have documented performance issues, as discussed in the past findings and recommendations section of this report. In 2008, Public Law 110-387 passed, requiring VHA to consolidate business office operations so VHA patient accounting activities, billing and collections, are aligned with health care industry best practices. As a result, VHA opened the first Consolidated Patient Account Center (CPAC) in October 2009, as a pilot facility in Asheville, NC. Table 6-2 shows the growth in MCCF collections from fiscal year 2006 to 2012.

Table 6-2. Total MCCF Collections, FY2006-2012 ($ in thousands)[31]

	FY2006	FY2007	FY2008	FY2009*	FY2010*	FY2011*	FY2012*
MCCF Collections –FYTD[32]	1,958,759	2,176,625	2,419,157	2,734,950	2,773,968	2,711,336	2,741,091

*In 2009, VHA first consolidated patient accounting functions at the Mid-Atlantic CPAC in Asheville, NC. Six remaining CPACs followed, with the final CPAC operationalizing on September 24, 2012. VHA placed the CPACs under the Central Business Office (CBO). Figure 6-1. CPAC & VISN Regional Alignment depicts the CPACs, dates operationalized, and associated regions.

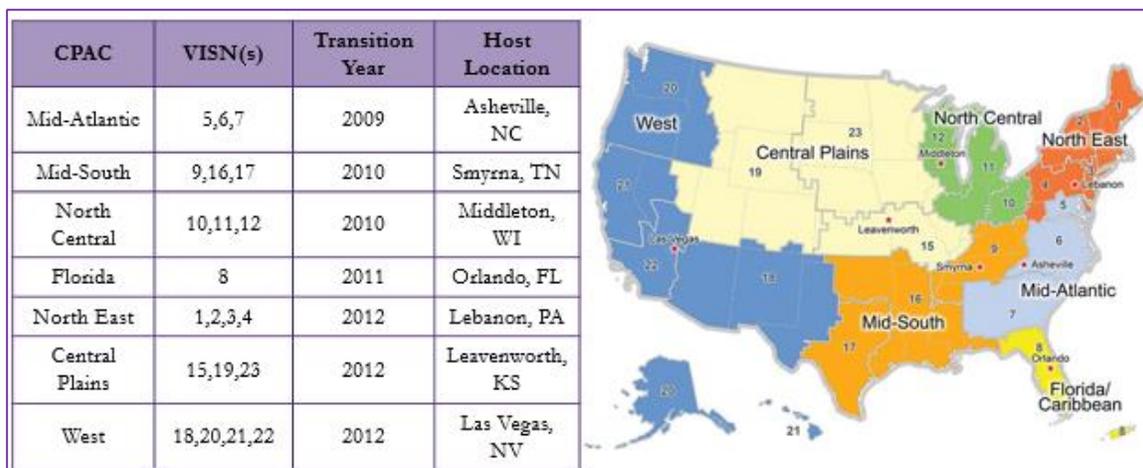
North East	1,2,3,4	2012	Lebanon, PA
Central Plains	15,19,23	2012	Leavenworth, KS
West	18,20,21,22	2012	Las Vegas, NV


Source: Grant Thornton rendition based on CBO feedback. Note: VISNs 13 and 14 do not appear on this figure because they were combined into VISN 23.

Each VAMC is located in a VISN, and all VISNs are assigned to one of seven regional CPACs. CPAC staff members are located both at the regional CPAC and at each VAMC to improve coordination and communication between the two entities. Chapter 3 describes the roles of VISNs, VAMCs, and CPACs in revenue cycle operations in more detail.

This industry-modeled, CPAC implementation:

- Centralized and enhanced billing and collections activities across VHA, which maximized economies of scale, and provided continuity and standardization
- Consolidated traditional revenue program operations into regionalized centers, closely aligning VHA billing and collections activities with industry best practices
- Placed ownership of revenue cycle processes deemed to be patient-facing at the VAMC level (front end)
- Transferred billing and collection activities to the CPACs (back end).

6.1.2   VHA Revenue—Current State

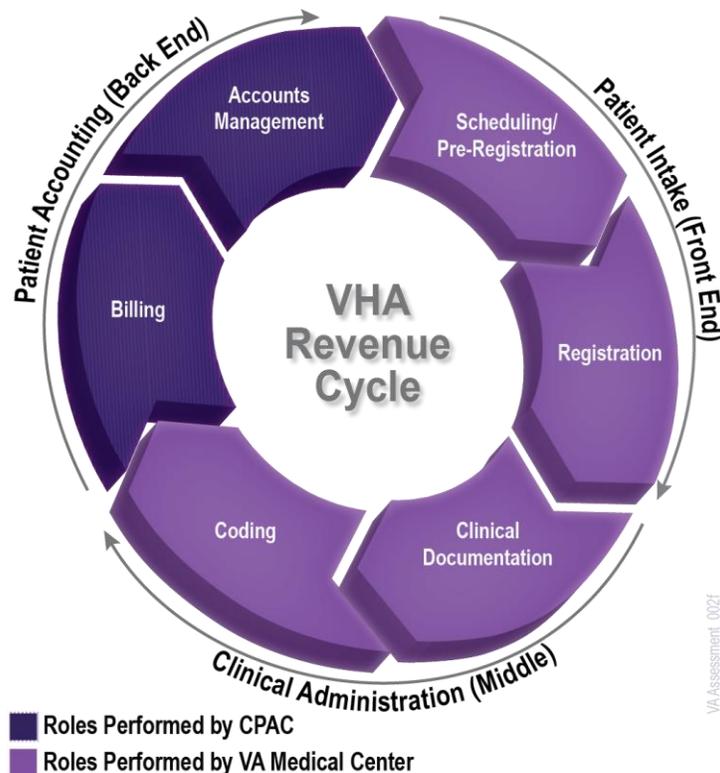
The transition to the CPAC structure drove standardization and coordination across Patient Accounting functions. Since the completion of the national CPAC implementation, national collections have increased by 14 percent to $3.1 billion for calendar year 2014, while the related national billings increased by 17 percent.[33]

Today, VAMCs continue to execute the "front end" and "middle" (Patient Intake and Clinical Administration) operations, and the CPACs, perform "back end" (billing and accounts management) operations. Together, these operations comprise VHA's revenue cycle. Figure 6-2

---

[33] CBO. (2015). *Total Collections to Billings, Calendar Year 2012-2014*. Retrieved from POWER.

illustrates VHA's revenue cycle responsibilities and aligns the responsibilities to the CPAC or VAMC.

Figure 6-2. Process Areas and Key Components


Source: Grant Thornton's rendition of the VHA Revenue Cycle

- *Patient Intake*: Patient Intake activities occur at the beginning of a Veteran's interaction with a VHA provider. These activities typically include scheduling, pre-registration, registration, point-of-service collections, insurance identification and verification, and financial counseling. At VHA, the Patient Intake functions reside at the VAMCs, referred to as Patient Administration Services (PAS), Hospital Administration Services (HAS), or Medical Administration Service (MAS)—the name varies depending on the VAMC visited. Currently, VAMCs are responsible for identifying insurance, while the CPAC is responsible for verifying insurance. The CPAC cannot verify insurance if it is not identified and communicated by the VAMC.

- *Clinical Administration*: Clinical Administration activities occur after a VHA clinician has treated a Veteran. During this phase, the clinician completes all clinical documentation and signs off on the encounter. Subsequently, VHA coders review the encounter's clinical documentation, assign appropriate codes, and submit the validated and coded encounter to billing for submission to third-party payers. Clinical Administration functions reside at the VAMCs and are performed by both clinicians and coders (also referred to as Health Information Management Services [HIMS]).

- *Patient Accounting*: At VHA, CPACs oversee all Patient Accounting functions, which include billing, accounts receivable (AR) management, follow up, denials management, first-party follow up, cash applications and adjustments, regional payer relations, and customer service.

6.2 VHA Revenue Assessment Approach

6.2.1 Data Sources and Analysis

As described in the methodology of this report (Chapter 2), our approach comprised of information collection, analysis, interviews and process walkthroughs. We collected a variety of qualitative and quantitative data that directed our findings and recommendations. This data includes: (1) billing and collection performance data (2) coding turnaround time/backlog data, (3) clinical documentation latency data, and (4) a VAMC-wide data call for insurance identification and pre-registration data. Additional data sources include interviews with more than 63 VHA revenue staff members as well as several executive interviews with VHA leadership. Our data collection and analysis focused on assessing the key components of VHA's revenue cycle. Table 6-3 outlines the key components, examined by our assessment, and the VHA functions that perform each component.

Table 6-3. Key Components of VHA Revenue Cycle

Process Area	Key Components	Performed By

Patient Intake	▪ Scheduling/Preregistration/Registration
	   ○ Insurance identification
	   ○ Veteran eligibility
	   ○ Demographics
		VAMC

Clinical Administration	▪ Clinical Documentation
	   ○ Timeliness and accuracy
	   ○ Response to physician queries
	▪ Coding
	   ○ Receipt of clinical documentation
	   ○ Coding all inpatient and billable outpatient encounters
	   ○ Health Information Management Services (HIMS)
		VAMC

Process Area	Key Components	Performed By

Patient Accounting	▪ Insurance Verification
	▪ Revenue Utilization Review
	▪ Billing
	   ○ First and third-party billing
	   ○ Bill editor/edit checks
	   ○ Submission to payer
	▪ Accounts Management
	   ○ Payment Posting
	   ○ Cash Collection
	   ○ Payer Relations (payment compliance)
	   ○ Follow up and denials management
		CPAC

We used leading private-sector HFMA benchmarks and best commercial practices to evaluate VHA performance. For example, we used HFMA benchmarks to analyze VHA performance in denial management, pre-registration, and first party collections (HFMA, 2012). For VHA data/metrics that did not align to commercial metrics, we used VHA standards of performance for our analysis. For a summary of the data and benchmarking used for this assessment, refer to Appendix D.

6.2.2 Past Findings and Recommendations

A key part of our approach was the review of findings and recommendations outlined in prior assessment reports. Since 2002, VHA has received several assessments on insurance identification and third-party revenue collection performance. These assessments have identified several challenges, including difficulties with identifying patients with third-party insurance (OIG, 2012),[34] clinical documentation limitations (OIG, 2012),[35] and ineffective billing and accounts management processes (GAO, 2008). Our team outlined a sample of key findings from these assessments in Table 6-4. The assessments are included in the References provided in Appendix E. Note that these examples illustrate the type of factors identified in recent years, and are not intended to be a comprehensive listing.

---

[34] Department of Veterans Affairs Office of Inspector General. (2012). Audit of VHA's Medical Care Collections Fund Billing of VA-Provided Care. Report No. 11-00333-254. Retrieved from http://www.va.gov/oig/pubs/VAOIG-11-00333-254.pdf

[35] Ibid.

Table 6-4. Previous VHA Care Report Findings

Process Area	Cited Findings	2002	2005	2007	2008	2012
Patient Intake	Lack of timely third-party insurance identification	OIG				OIG
	Pre-registration functions are not being performed	OIG				
	Patients are not educated on the value of third-party insurance collection	OIG				OIG
	Limitations in insurance identification training for clinical administration staff	OIG				OIG
Clinical Administration	Clinical documentation practices are inconsistent	OIG			GAO	OIG
	Residents and attending physicians are not appropriately documenting encounters			OIG		
Patient Accounting	Failure to develop and use metrics to track timely and accurate billing performance		GAO		GAO	
	Accounts management follow-up processes are not following VHA standards	OIG	GAO		GAO	
	Non-billable encounters are not being reviewed to maximize billing opportunities				GAO	OIG

VHA's revenue cycle functions have not received the same level of evaluation as other direct patient care areas of VHA, however, VHA has received feedback on methods to improve insurance identification and third-party collections. These past assessments have tended to provide broad compliance oriented recommendations. In contrast, our assessment tries to take an end-to-end view of the challenges in VHA's revenue operations and identify recommendations that would specifically address each challenge.

In reviewing the recommendations presented in past reports, the majority focused on the following recommendations:

- Providing additional guidance on insurance identification to clinical administrative staff and implementing methods to monitor their compliance

- Promoting the importance of insurance identification to Veterans and staff by demonstrating how third-party collections benefit VHA's ability to provide medical services to Veterans

- Improving clinical documentation practices to ensure appropriate coding and billing of encounters

- Ensuring adequate documentation of resident-provided care and timely submission of attending notes for appropriate billing

- Evaluating encounters determined to be non-billable to ensure that VHA maximizes billing opportunities for VHA-provided care

- Requiring the development and use of management reports on the accuracy and timeliness of billing performance

- Ensuring that AR staff members perform the first follow-up on unpaid claims within 30 days of the billing date and establishing procedures for monitoring compliance.

6.2.3 Revenue Operations Strategic Plan

We reviewed the CBO Revenue Operations Way Forward Strategic Plan (2014–2016) and noted a number of initiatives to maintain and improve upon collections exist in support of their strategic goals to:

1. Realize a "Best in Business" revenue program—increasing collections and achieving industry performance standards.
2. Streamline revenue operations and enhance supporting technology—reducing the Cost to Collect.

The initiatives associated with these goals pertinent to our findings and recommendations are:

Table 6-5. Key Intersections with Way Forward Strategic Plan

Initiative	Strategic Target
Implement a Customer Relationship Management system to track Veteran interactions and provide seamless customer service	FY 2015/Q1
Support the implementation of International Classification of Diseases version 10 (ICD-10) to ensure continuity of operations and minimize revenue loss during transition	FY 2015/Q1
Identify, support and promote opportunities to improve clinical documentation	FY 2015/Q4
Establish process improvement task forces and enhanced procedures for insurance identification, clinic setup and non-MCCF revenue functions	FY 2015/Q4
Maintain commitment to "Gold Standard" Quality Assurance and Internal Control Programs	FY 2016/Q4
Implement an automated billing system (ABS) that will result in a "touch-by-exception" environment	FY 2016/Q4

Initiative	Strategic Target
Increase process automation through Enterprise Workflow Management Engine (EWME)	FY 2014/Q4
Deploy VistA Remote Access Management (VRAM) software to provide access to multiple VistA systems using a single set of credentials	FY 2014/Q2
Integrate HIM reporting with revenue workflow tools	FY 2014/Q4
Expand guidebooks to include standard operating procedures, detailed process models and quality standards for all revenue functions	FY 2014/Q3
Conduct outpatient consolidated coding feasibility study	FY 2016/Q4
Implement a comprehensive individual development program (IDP) that targets advancement against established competency models	FY 2015/Q2
Implement an interactive Knowledge Management System (KMS)—providing on-demand access to business information, training materials and operational support documents via self-service	FY 2016/Q4
Deploy a national revenue training and education delivery system to support virtual and self-paced instruction	FY 2014/Q2

The purpose of our assessment is to evaluate the status of current operations. We reviewed relevant plans and previous studies; however, an evaluation of the adequacy and status of these initiatives was beyond our scope. Please contact CBO or Revenue Operations for the status of completed, in process, or future initiatives listed in this plan.

6.3 VHA is Not Optimizing Revenue Due to Ineffective Veteran Insurance Identification, Clinical Documentation and Coding, and Culture Barriers.

6.3.1 Insurance Identification—Ineffective and Inconsistent VAMC Processes for Identification of Veteran Insurance Negatively Impacts Third-Party Collections.

Third-party collections involve the collection of amounts owed from insurance companies for care Veterans received from VHA. Key enablers of third-party collections include insurance capture and coverage determinations during Scheduling, Pre-registration, and/or Registration processes (collectively referred to as "Patient Intake"). Visibility into these key components allows for the assessment of performance in insurance identification and the associated collection of amounts due from third parties. This section addresses VHA's performance across the key Patient Intake functions in identifying and verifying insurance.

6.3.1.1 Scheduling

The separate Veterans' Choice Act Assessment E (Workflow – Scheduling) provides a complete, detailed analysis of the scheduling function at VHA. Our team reviewed the scheduling function

as it relates to insurance identification, verification, and pre-authorization. During our site visits, we conducted structured interviews with the PAS, HAS, or MAS departments that were responsible for scheduling patients' appointments. Additional assessment activities included viewing the systems and tools used by VA scheduling staff and reviewing VHA policies and guidebooks that were specific to scheduling.

Table 6-6. Scheduling

Scheduling Defined:
Point of entry for non-emergency care is through the scheduling of an appointment (for both inpatient and outpatient services).
Impact:
Effective scheduling allows for accurate and timely insurance identification, verification, and pre-authorization. Each of these components are key drivers to maximize third-party collections.
Industry Best Practices:
Schedule all non-emergent patients in advance to ensure the timely and accurate collection of demographic and insurance information. Centralized and standardized scheduling processes and procedures enable insurance identification and eligibility verification, prior to scheduled services. By using online technology tools, VHA can further facilitate verification of coverage prior to service.
VHA Key Finding:
1. VHA lacks standard scheduling practices and the requirement to identify insurance at the time of scheduling, inhibiting timely insurance capture.

Finding 1

1. **VHA lacks standard scheduling practices and the requirement to identify insurance at the time of scheduling, inhibiting timely insurance capture.**

   • The scheduling function is inconsistent and highly decentralized at each VAMC responsible for scheduling patients. Even within the same VAMC, scheduling practices are further decentralized and the practices vary across departments (i.e., Surgery versus Internal Medicine).

   • We noted a lack of consistent insurance identification during the scheduling process, which is attributable to limited standard policies, procedures, and scripts.[36] Scripts should have a set of common questions for clerks to ask, including those related to the existence of third-party insurance coverage.

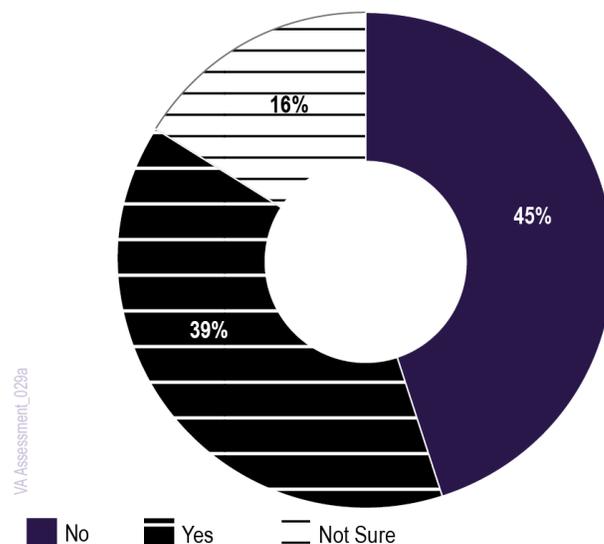
---

[36] Qualitative interviews at three VAMCs indicated that this was an issue.

- Assessment E surveyed the patient registration staff at VAMCs and the results were as follows:[37]

  o As shown in Figure 6-3, out of 325 patient registration staff surveyed, 61.2 percent responded "No" or they were "Unsure" if insurance information was collected when patient visits are scheduled.[38]

Figure 6-3. Patient Registration Staff Survey

Is insurance information collected at the time when patient visits are scheduled?


Source: Patient Registration Assessment E Survey Results

  o Another 61.1 percent (approximately two-thirds of surveyed VAMCs) responded "No" or they were "Unsure" when asked if they were aware of policy, procedure or other guidance regarding insurance capture that guided the scheduling process.

- We also learned that not all VAMCs are consistently using the VistA scheduling packages.[39] This has a significant impact on revenue, as CPAC Revenue Utilization Revenue (RUR) nurses cannot obtain the necessary preauthorization for scheduled inpatient and outpatient services if patients are not scheduled using the VistA scheduling package.

- VHA's scheduling function primarily focuses on obtaining demographic information and ensuring that the patient is enrolled for VHA benefits. Interviewees noted that when staff members do not capture insurance during scheduling, they cannot always bill third party insurance in a timely manner, or there can be delays to obtaining the necessary pre-authorization medical procedures (if at all).[40] Reimbursements may be lost as the CPAC is

---

[37] Assessment E Data Call. (2015). Survey of VAMC Patient Registration Staff. Unpublished raw data.

[38] Note: Survey of Patient Registration staff at VAMCs was a not a random or representative sample survey. Survey respondents were wholly self-selected.

[39] Qualitative interviews at one CPAC indicated that this was an issue and consistent with Assessment E.

[40] Qualitative interviews at three CPACs indicated that this was an issue.

---

unaware of the insurance company to bill, missing a timely billing statute when staff members identify the insurance late, or not obtaining required pre-authorization for services.

Recommendations

- **CBO/VAMC Task Force**: Update VHA Directives to require the identification of third-party payer coverage at the point of scheduling. Specifically, when schedulers establish or confirm appointments with the patient. Develop detailed scripts for VAMC schedulers to follow. These scripts will also be valuable for use in training sessions for Patient Intake staff.

- **VHA/VAMC**: Add insurance identification to scheduling staff performance plans.

- **CBO/CPACs**: Develop and implement a reminder tool/feature to give the scheduler a notice to ask for insurance information.

- **VAMC**: Verify all identified insurance using the electronic Insurance Verification (eIV) tool prior to the patient's appointment date. Coordinate with insurance verification teams at the CPACs to resolve discrepancies.

- **VHA/VAMC**: Develop and enforce same requirements for insurance identification and verification for non-scheduled patient walk-ins and patients arriving in the Emergency Department. This should occur as early as is practical for the situation (i.e., before, during, or immediately after the encounter, if possible), without unnecessarily interfering with the provision of care.

- **VAMC**: For recurring patient care (i.e., therapy patients, chemotherapy patients, etc.), re-verify (using the eIV tool) the Veteran's insurance every 30 days. Patient Intake staff should confirm insurance has not changed each time a Veteran checks in.

6.3.1.2   Pre-Registration and Registration

We assessed pre-registration and registration activities through a review of VAMC policies and procedures, VHA directives, structured interviews, and viewing tools used during patient check-in with staff from PAS, HAS or MAS (Patient Intake staff) and the CPAC (insurance verification).

Table 6-7. Pre-registration and Registration

Pre-registration and Registration Defined: Pre-registration of scheduled patients is the second contact, where the patient provides insurance and demographics information. Prior to the patient's appointment, insurance information is verified and any necessary pre-authorizations are obtained. Registration activities follow when the patient checks-in for their scheduled appointment. At this time, staff verify insurance information and demographics if the patient was not pre-registered or presents in the Emergency Department.

> **Impact:**
>
> Effective pre-registration allows for accurate and timely insurance verification and pre-authorizations, which increases cash collections and net revenue and reduces third-party denials.

> **Industry Best Practices:**
>
> All patients are pre-registered one to three days in advance of their scheduled appointment. Staff verify insurance benefits and pre-authorizations 72 hours prior to the patient's appointment using online technology tools. Registration should occur during appointment check-in to verify the patient's insurance and demographics information if they were not pre-registered.

> **VHA Key Findings:**
>
> 1. Limited and ineffective pre-registration processes before the date of service across VAMCs, resulting in potential inaccuracies and timeliness issues for capturing demographic and insurance information.
> 2. Training on Patient Intake procedures vary across VAMCs, and within VAMCs, inhibiting timely insurance identification.
> 3. VHA relies on costly back-end processes and outside contractors to identify insurance

Finding 1

1. **Limited and ineffective pre-registration processes before the date of service across VAMCs, resulting in potential inaccuracies and timeliness issues for capturing demographic and insurance information.**

- We noted a lack of national standardized processes related to pre-registration and the capturing of demographic and insurance information in Patient Intake.[41] These activities are essential to insurance capture, in addition to obtaining pre-authorization from the insurance carrier prior to date of service, as is typically required. For scheduled patients with insurance on file, CPAC RUR nurses (located at VAMCs) will obtain authorization for episodes of care per insurance policy requirements to prevent payment denials. CPAC RUR staff cannot effectively obtain timely authorizations if VAMC's do no consistently pre-register the Veteran (prior to date of service).

- A VHA Pre-Registration Directive issued in February of 2007 mandated the use of pre-registration processes and systems to "achieve maximum collection potential." However, the directive expired on February 28, 2012.[42] Based on interviews, we understand that some VAMCs implemented the 2007 Pre-Registration Directive to varying degrees of success. Our research revealed that a Patient Information Collection Management directive was issued on January 2011, which rescinded the 2007 Pre-Registration Directive

---

[41] Qualitative interviews at four VAMCs indicated that this was an issue.
[42] VHA Directive 2007-007 (February 2007). Pre-Registration Directive.

---

and provided pre-registration policy and procedures to VAMCs.[43]It appears based on discussions with VAMC staff; they are unaware of this updated directive or do not find it specific enough to drive processes.

- VHA does not calculate standard pre-registration rates consistently across VAMCs.[44] HFMA's best practice pre-registration rate is defined as the number of patient encounter's pre-registered (demographic and insurance information obtained and verified) divided by the number of scheduled patient encounters. The HFMA pre-registration rate is greater than or equal to 98 percent (HFMA, 2012)

- Since 'pre-registration rates are not available nationally, we requested and obtained this information as part of a national VAMC data call.[45] We learned that certain VAMCs calculate the pre-registration rate using the collection of information at check-in (not in advance of check-in). For this reason, we are not able to compare VHA's pre-registration rate with the industry benchmark.

Recommendations

- **VAMC**: Implement and enforce a standard pre-registration policy and process for all VAMCs to follow. The process should be coordinated between the scheduling functions at VAMCs and the insurance verification teams at the CPACs to ensure the identification and verification of insurance and demographic information.

- **VAMC**: Establish and enforce a national pre-registration rate as a standard key performance metric. Report the metric nationally and hold Patient Intake staff and VAMC leadership accountable for achieving it. Standard performance metrics must be aligned across VISNs, VAMCs, and CPACs and support an overarching metric of total collections. We understand that each CPAC has collections goals communicated to the respective VAMC leadership. Performance against collection goals should be communicated to both VAMC and CPAC staff, and aligned to individual performance. This is particularly important for Patient Intake staff to understand to improve performance in this area.

Finding 2

2. **Training on Patient Intake procedures vary across VAMCs, and within VAMCs, inhibiting timely insurance identification.**

- Interviews with VAMC staff revealed a shortage of national training on standard Patient Intake policies and procedures.[46] This lack of standard training has created variability in

---

[43]VHA Directive 2011-003 (January 2011). Patient Information Collection Management Processes (PICM).

[44]Qualitative interviews with two VAMCs indicated that this was an issue.

[45]Source: For calendar year 2014, a pre-registration rate was obtained via a VAMC-wide data call. 123 VAMCs responded and provided data on the "Number of Unique Outpatients Pre-Registered" and the "Total Number of Unique Patients Treated During Scheduled Visit." We analyzed this VAMC data at the CPAC level to obtain an average pre-registration rate for calendar year 2014.

[46]Qualitative interviews at four VAMCs indicated that this was an issue.

the methods Patient Intake clerks use to obtain demographic and third party insurance information.

- While Patient Intake staff at VAMCs complete training sessions to learn about updates to systems and policies, this training is not standardized and differs in content and complexity across VAMCs. For example, some VAMCs reported that Patient Intake staff were required to attend detailed training sessions led by PAS, HAS, or MAS leadership, while other VAMCs reported that training for Patient Intake is primarily focused on shadowing more experienced employees.

Recommendations

- **VAMC and CPAC**: Develop a formal training program managed by Patient Intake and Revenue Operations leadership. As part of this training program, Patient Intake staff should complete standard, recurring training sessions to learn about updates to systems and policies. This recommendation includes the following:
    - o Create a national training program for the Patient Intake function and provide updated national policy and procedure guidebooks for all Patient Intake staff.
    - o Develop detailed scripts to accompany standard policies and procedures for use during training sessions.
    - o Require that new hires complete a comprehensive training program that includes insurance identification training, point of service collection training, financial counseling training, computer and systems training, and on-the-job training.

Finding 3

3. **VHA relies on costly back-end processes and outside contractors.**

- VHA relies on a contracted vendor to perform insurance identification and verification for missing insurance at a cost of $14.75 for each billable policy identified and verified as in effect for the applicable date of service. This service resulted in identifying 254,672 billable insurance policies for calendar year 2014 at a cost of $3.7 million to VHA.[47] Collections associated with these activities was not readily available. The vendor finds the patient's billable insurance and uploads it to VistA on the first day of every month.

- The reliance on back-end (CPAC) insurance verification, coupled with insufficient insurance identification and verification processes in Patient Intake, creates situations where insurance verification is being performed post the visit and too late, payers are not being billed, and payments are reduced or denied.

---

[47]CBO (2015). *HMS Monthly Uploads Costs by CPAC, CY2014*. Data was received by CPAC (and associated VAMC) and included month/year, total billable policies, and invoice amount. National totals for Calendar year 2014 total were calculated by adding totals across all CPACs.

Recommendations

- **CBO**: Conduct cost benefit analysis for use of contracted vendor for insurance identification and verification compared to an in-house solution.
- **CBO**: Continue current efforts to upgrade and further develop the eIV tool that allows for insurance verification prior to the date of service. Doing so generates additional benefits not only for meeting precertification requirements, but also by eliminating third-party contractor service costs for missing insurance capture.
- **VAMC**: Standardize and enforce use of eIV tool for all non-service connected treatment in Patient Intake.

6.3.2 Coding and Clinical Documentation—Delays in VAMC Clinical Documentation and Outpatient Coding Backlog Prevent Timely Collections.

Clinical documentation and coding, categorized as "Clinical Administration" occur subsequent to Registration. After treating a patient, the clinician completes all clinical documentation and signs off on the encounter. Coders review the clinical documentation, assign appropriate codes, and submit the validated and coded encounter to billing for submission to third-party payers. To make sound coding decisions, leading practices are for coders to be certified.[48] Clinicians and coders should receive ongoing training to promote accurate and timely clinical documentation and coding as well as training on any major systems or coding changes. More details regarding VHA's clinical documentation and coding processes for inpatient care are located in the Assessment F (Clinical Workflow) Report.

For the purposes of our assessment, we reviewed clinical documentation and coding processes for billable inpatient and outpatient encounters. We did not conduct an independent audit of the appropriateness of coding assignments and documented diagnoses and services. We examined industry leading practices in clinician and coder coordination and training, as well as, the tools and systems used to support correct code assignment.

Table 6-8. Clinical Administration

Clinical Administration Defined:
After providing medical services, a clinician completes and signs clinical documentation, indicating that the patient encounter is "closed." Coding staff review and validate the completeness and accuracy of the encounter's clinical documentation and assign requisite codes related to the patient diagnosis and procedures performed.
Impact:
Clinical documentation and coding is essential to the accurate assignment of clinical and billing codes enabling accurate third-party reimbursement.

---

[48]Note: The American Health Information Management Association (AHIMA) is one of the major coding credentialing entity. Certified Coding Specialist (CCS). http://www.ahima.org/certification/CCS.

> **Industry Best Practices:**
>
> Clinicians typically complete clinical documentation within 24 hours. Clinicians should enter charges, assign codes, and close encounters in less than four days for inpatient encounters and six days for outpatient encounters. Clinicians should then submit coded patient accounts to billing so that claims are ready to submit to third-party payers.[49]
>
> **VHA Key Findings:**
>
> 1. Delays in clinical documentation turnaround time are inhibiting timely coding, billing and third-party revenue collection.
> 2. VHA is not consistently implementing and enforcing the national initiative around improving clinical documentation practices.
> 3. VHA is unable to code outpatient encounters promptly, resulting in outpatient coding backlog across VHA and preventing accelerated billing and collections.

Finding 1

1. **Delays in clinical documentation turnaround time are inhibiting timely coding, billing, and third-party collections.**

- Three factors contributing to this finding are (1) clinicians are not completing clinical notes and closing patient files on time, (2) clinical documentation issues are requiring significant coder follow-up, and (3) residents are not getting their attending physicians to cosign their encounters. Interviews with VAMC leadership indicated that were was a lack of clinician accountability for completing their clinical notes and patient files within VHA's targets and standards.[50]

- Figure 6-4 outlines VHA's documentation and coding processes for all billable encounters. VHA coders review and code all billable and non-billable inpatient admissions and inpatient surgeries as well as all billable inpatient professional services.[51]For billable outpatient encounters, VHA coders validate the accuracy of the clinician assigned code(s) by reviewing the encounter's clinical documentation. If the clinician's code(s) do not match the encounter's documentation, then VHA coders will adjust per the documentation. CPAC staff assigns patient encounters flagged as being billable to third-party insurance to VAMC coders for coding. When staff identifies billable insurance after the patient's encounter, the encounter assigns to the coder as a "new insurance late check-out" and is coded and sent to the CPAC for billing.

[49]Per Grant Thornton industry subject matter expertise.

[50]Qualitative interviews at four VAMCs indicated that this was an issue.

[51]Discussion with HIM leadership.

Figure 6-4. VHA's Documentation and Coding Process Map for Billable Encounters

Source: Grant Thornton's rendition of the VHA Documentation and Coding processes.

- VHA clinical documentation targets are for clinicians to complete patient a history and physical note within 24 hours of admission and to sign and close the patient's medical record within seven days of discharge or outpatient visit.[52] In the private sector, leading practices include clinicians completing clinical documentation within 24 hours, entering charges and codes, and closing the encounter in less than four days for inpatient encounters and six days for outpatient encounters.

- Table 6-9 summarizes clinical documentation delays from November 2014 to March 2015 for all billable outpatient encounters. The data revealed a delay in approximately 13 percent of billable outpatient encounters due to issues with clinical documentation (i.e., missing documentation, documentation with errors, or open outpatient encounters). This data supports interview findings.[53]

- Interviewees consistently reported challenges with clinical documentation, specifically that clinicians were late in closing out their encounters and were submitting missing or incomplete documentation.[54] One site noted that many clinicians work part time at VAMCs, which significantly delays documentation turnaround when clinicians do not have remote access capacity to complete patient files or to answer coder's questions.[55] Table 6-9 shows documentation latency percentages for outpatient encounters.

Table 6-9. Clinical Documentation Latency[56]

Clinical Documentation Latency as % of Insured Outpatient Encounters (November 2014 – March 2015) is Impacting Collections						
	Nov '14 (%)	Dec '14 (%)	Jan '15 (%)	Feb '15 (%)	Mar '15 (%)	5 Month Avg*
Outpatient Encounters Requiring Clinical Action *(Not Including Closing Out)	3.79%	3.78%	4.55%	5.06%	4.41%	4.32%

---

[52]Note: Per VHA Directive 2011-025, workload closeout for all monthly updates to VHA corporate patient data files must be accepted by AITC no later than 7 days from the date of the Patient Treatment File (PTF) discharge and the inpatient or outpatient encounter.

Total Billable Outpatient Documentation Latency	15.13%	12.66%	13.14%	14.03%	11.19%	13.23%

Source: CBO. (2015). Clinical Documentation Latency in Insured Outpatient Encounters, November 2014-March 2015. Data and percentages were obtained from CBO. Five-month average was calculate by averaging November-March.

- When CPAC staff members submit late and incomplete encounters, this requires coders to spend significant time following up with clinicians to finalize an encounter's documentation. For example, coders review physician query reports to identify encounters requiring clinician action (e.g., coder questions, documentation with errors). These activities delay coding turnaround time and the submission of coded encounters for billing to third-party payers.

- HIMS tracks inpatient and outpatient coding turnaround time. In reviewing the national HIMS inpatient metrics for calendar year 2014, VHA is performing above standard and in line with leading practices by coding billable and non-billable inpatient encounters within four days, ahead of VHA's seven-day standard.[57]

> Inpatient Coding: VAMC coders are consistently outperforming VHA standards for inpatient coding turnaround time by an average three days.

- However, VHA is performing approximately nine days below its own standard for the HIMS outpatient turnaround time metric for Calendar Year 2014. VHA is completing the turnaround time for outpatient encounters within an average of approximately 23 days as compared to the 14-day VHA target.[58] Since VHA coders are only reviewing and coding billable outpatient encounters while industry standard is to bill all encounters, this turnaround time delay and failure to meet national HIMS targets is notable. Interviewees at all visited VAMCs noted the timeliness of receiving clinical documentation as a root cause of the turnaround time delay.[59] VHA understands the importance of timely coding and the impact on the revenue cycle. The

[58]HIMS. (2015). *Calendar Year 2014 Outpatient Coding Turnaround Time.* Monthly VHA averages were received from HIMS and a national VHA average was calculated for calendar year 2014 based on the monthly VHA average.

[59]Qualitative interviews at four VAMCs indicated that this was an issue.

The views, opinions, and/or findings contained in this report are those of Grant Thornton should not be construed as an official government position, policy, or decision.

CBO Strategic Plan identified that VHA will conduct an outpatient consolidated coding feasibility study in Q4 of FY 2016.[60] The study will include the development of a work group to focus on current coding processes, workforce, costs, governance, and organizational alignment.

- During site visits to two of four visited VAMCs, interviewees reported challenges with resident physicians appropriately documenting encounters and getting their attending physicians to provide the required counter signatures. Interviewees reported that it was common for residents to treat patients and complete their rotation without ensuring the completion of a patient's treatment file or counter signing by an attending physician. VHA's internal policies and agreements with third-party payers state that they cannot bill a third party without an attending physician cosigning an encounter's documentation for resident-provided care. The 2007 OIG Report identified challenges with enforcing resident documentation compliance and third-party revenue losses (OIG, 2007). OIG recommended that VAMCs ensure resident and attending clinician compliance with the existing VHA Handbook for Resident Supervision.[61]

- VAMC personnel we interviewed during a site visit noted success with including incentives for clinical documentation performance in clinician's performance pay agreements.[62]

- The issues in clinical documentation and coding illustrate that the mechanisms to ensure the accuracy of third party collections is inadequate.

Recommendations

- **VAMC Leadership**: Enforce existing national targets for clinicians to complete notes within 24 hours of admission and to sign and close the patient's medical record within seven days of discharge or outpatient visit. VHA should apply and enforce these requirements for all clinicians, full time and part time, as well as residents and their attending physicians and include them in performance plans.

- **VAMC Leadership**: Use performance pay agreements to assist with enforcing clinician compliance. Tie turnaround time compliance with performance ratings for VISN and VAMC Directors and Medical Directors. Inconsistent provider compliance with clinical documentation requirements could be resolved with appropriate penalties, such as reduced performance pay. Investigate increasing the weight placed on administrative elements in clinician's performance pay agreements, such as clinical documentation timeliness and accuracy.

- **VAMC**: Provide standard clinical documentation training to all clinicians. A CDI specialist should deliver this training and highlight the importance of clinical documentation in accurate and timely coding.

---

[60]CBO. The Way Forward (February 2014). Revenue Operations Strategic Plan. February 2014. Pg 52.
[61]VHA Handbook 1400.01. Resident Supervision. Page 1-31.
[62]Qualitative interviews at one VAMC indicated that this was a successful approach to address clinical documentation challenges.

- **VAMC**: Provide clinicians with remote access to VHA email/systems so that they can make updates to clinical documentation and respond to coder queries when offsite.

Finding 2

2. **VHA is not consistently implementing and enforcing the national initiative around improving clinical documentation practices.**

- VHA coders are spending excessive time querying clinicians to make corrections or updates to their clinical documentation, rather than providing corrective training. Some VAMCs use CDI programs to address challenges in clinician's documentation (Advisory Board, 2014). Dedicated CDI specialists are staff members that implement CDI programs, review patient charts, and train clinicians to improve their documentation practices.[63] VHA HIMS is providing national level guidance to VAMCs implementing CDI programs.[64] However, despite the availability of guidance, CDI programs are not mandated and only 46 percent of VAMCs reported having a CDI program.[65]

- The inconsistent use of CDI programs and lack of national initiative around improving VHA documentation may be a contributor to the number of controllable medical necessity denials initially received. During calendar year 2014, there was $14.2 million dollars of medical necessity denials initially received (or 1.3 percent of all denials initially received).[66] The submission of timely and accurate clinical documentation is required to bill an encounter and without an enforced national initiative around improving clinical documentation practices, VHA risks the collection of amounts owed from third parties.

- Lack of standardized clinical documentation practices poses a risk for VHA's ICD-10 readiness. The nationally mandated change in coding requirements from ICD-9 to ICD-10 is significant. It requires both clinicians and HIMS to adjust the way encounters are documented and coded, which will result in revenue that is more accurate. In October 2015, all providers will be required to be compliant with the new coding guidelines as mandated by CMS.[67] If clinicians do not document per new specificity guidelines, the appropriate code cannot be applied which will result in lost revenue from third-party payers. During site visits, we learned that there are national level ICD-10 preparation activities occurring and that VHA coders have started dual coding in ICD-10. In the private sector, leading ICD-10 preparation activities have included using CDI programs to train and educate coders and clinicians, streamlining ICD-10 communications, and optimizing the use of available clinical documentation and coding tools. HFMA has estimated that providers could see a 100-200 percent increase in denials and a 20–40 percent increase in

---

[63]Note: CDI specialist role is focused on promoting clinical documentation improvement through ongoing measurement and provider education. Specialists will review medical records for incomplete or conflicting information and provide follow-up training. Previous coders or nurses with coding knowledge often fill these positions.

[64]CBO. The Way Forward (2014). Revenue Operations Strategic Plan. pg 35 & VHA CDI Program Guide

The views, opinions, and/or findings contained in this report are those of Grant Thornton should not be construed as an official government position, policy, or decision.

days in AR concurrent with ICD-10 implementation (HFMA, 2013). VHA's denials will likely increase significantly after ICD-10 implementation, which may negatively affect MCCF collections.

Recommendations

- **VAMC/HIMS Leadership**: Standardize the CDI program and mandate use across all VAMCs. VHA should provide designated CDI specialist funding to VAMCs to promote use of this essential role. These actions would improve the quality of clinical documentation, meet industry standards, and increase VHA's ability to collect appropriate third-party reimbursement. A standardized CDI role will also allow VAMCs to manage their controllable medical necessity denials and to provide corrective training to clinicians to improve their documentation.

- **VAMC/HIMS Leadership**: Perform tests of readiness using a national steering committee to ensure that VHA mitigates risk ICD-10 implementation. We understand VHA has taken steps to ensure ICD-10 technology and training is available to staff members. VAMCs should continue their local preparation activities and use a CDI program to train clinicians on ICD-10's more stringent clinical documentation requirements.

Finding 3

3. **VHA is unable to code outpatient encounters promptly, resulting in outpatient coding backlog across VHA and preventing accelerated billing and collections.**

- We identified an outpatient coding backlog at all VAMC site visits, which is significant considering that VHA coders only validate the accuracy of clinician assigned code(s) and apply correct codes as necessary for *billable* outpatient encounters, while the private sector codes and validates every patient encounter.[68] Figure 6-5 depicts the average monthly outpatient backlog at each visited VAMC for calendar year 2014, as reported by HIMS.[69] We estimated the average days' worth of backlog using the daily coder productivity standard of 70 outpatient records per coder found in VHA Directive 1907.03 (2012). In reviewing backlog data, we found that VAMCs are keeping up with their inpatient coding volume but have significant outpatient coding backlogs.

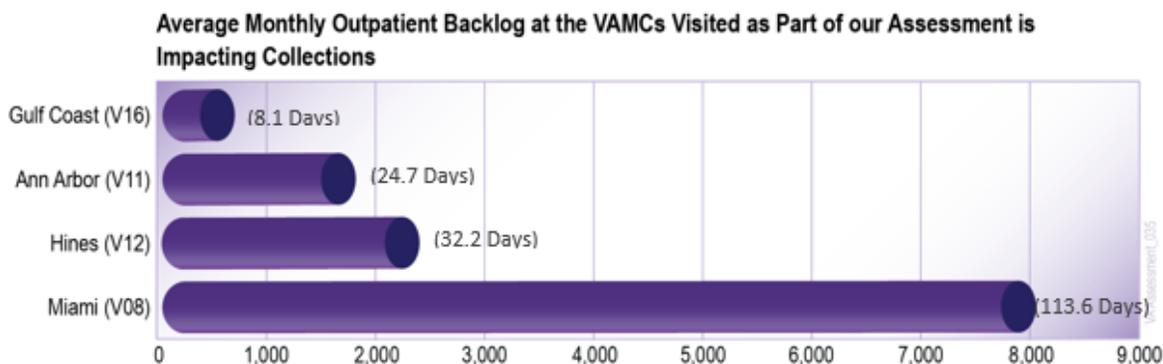
---

[68]Note: The assessment requested national level backlog data. However, this data was not readily available and backlog data from each visited VAMC for calendar year 2014 was used instead.

[69]Note: Interviews with Miami HIMS and Compliance staff revealed a significant outpatient backlog during part of Calendar Year 2014 due to high turnover among coding staff. The backlog was resolved with contracted coders and new coders have since been hired.

Figure 6-5. CY 2014 Average Monthly Outpatient Coding Backlog[70,71]

Average Monthly Outpatient Backlog at the VAMCs Visited as Part of our Assessment is Impacting Collections

Gulf Coast (V16) — (8.1 Days)
Ann Arbor (V11) — (24.7 Days)
Hines (V12) — (32.2 Days)
Miami (V08) — (113.6 Days)


Source: HIMS (2015). Calendar Year 2014 Outpatient Coding Backlog at Miami, Ann Arbor, Biloxi, and Hines. VSSC data. The HIMS backlog data contained monthly totals for calendar year 2014 that was separated by VAMC site. A twelve-month average was calculated by the assessment and excluded months where backlog data was not reported by the site.

Note: Interviews with Miami HIMS and Compliance staff revealed a significant outpatient backlog during part of Calendar Year 2014 due to high turnover among coding staff. The backlog was resolved with contracted coders and new coders have since been hired.

- To reduce their outpatient backlog, VAMCs often resort to using coding contractors. [72,73] We found three factors contributing VHA's outpatient coding backlog: (1) There is a national shortage of certified coders, (2) VHA coders are responsible for more administrative duties than private-sectors coders, and (3) VHA coder training is insufficient.

- There is currently a national shortage of certified coders and VHA struggles to compete with their private-sector peers to attract and retain high performing coders (Heubusch, 2008). VHA's 2015 Workforce Report identified an increase in the loss rate for coders (identified as Medical Records Technicians) from 6.8 percent in FY 2012 to 8.5 percent in FY 2013.[74] Interviews identified high turnover among existing coding staff and VHA's Workforce Report reported an increase in quit rates among coders from 2.6 percent in FY 2009 to 3.4 percent in FY 2014.[75] VHA's clinical coding procedures do not require the

---

hiring of credentialed coders, which departs from private sector leading practices.[76] Non-certified coders require additional training and supervision and may present an ongoing risk of compliance to VHA with the implementation of ICD-10. Qualitative interviews also revealed that VHA loses top coding candidates to the private sector because of slow hiring processes, increased responsibilities at VA, and a lack of competitive compensation.

- We also noted that VHA requires coders to perform administrative activities not required of private-sector coders. For example, since VHA providers do not routinely check VistA email, coders are forced to use various time consuming methods (phone calls, drop-ins, notes on charts) to obtain responses to documentation requests. Since coders are already coding much more than their private-sector counterparts (due to VHA's antiquated charge master system as explained in Section 8), VHA coders' additional administrative duties are significant and prevent them from working outpatient-coding backlogs.[77] Interviews revealed that coders are required to review open encounters and to follow up with clinicians to clarify or update their documentation (e.g., to identify or correct diagnosis and treatment information).[78] Coders are often responsible for providing ad hoc training to clinicians when they identify errors or inconsistencies in their documentation practices.

- VHA's HIMS coding procedures states that a qualified coder should review clinician-assigned codes and that the clinicians who are maintaining an acceptable accuracy rate only require random compliance reviews.[79] We found that VHA coders were reviewing all evaluation and management (E&M) codes, rather than conducting sample reviews for compliance. This approach deviates from private-sector leading practices, which are for certified coders to conduct a coding review of a sample of E&M codes per month by provider. Private-sector providers are trained on proper E&M assignment and use robust coding tools such as Computer Assisted Coding (CAC) devices to ensure codes are correct. Lack of adequate clinician training and CAC tools available nationally at VHA cause additional administrative burden for coders and contributes to the outpatient-coding backlog and high coder turnover.[80]

- Interviews with coding supervisors and new coding employees revealed an over reliance on informal training practices, such as shadowing experienced employees.[81] We found that the reliance on informal training for coding staff places a heavy burden on more experienced staff who are required to train new employees as well as meet their ongoing performance metrics. The ineffective coder training and inconsistent hiring of certified coders contributes to the number of controllable wrong procedure code denials received.

---

[76]VHA Handbook 1907.03. *Health Information Management Clinical Coding Program Procedures.* (2012, September). Page 2.

[77]Qualitative interviews with HIM and CBO staff revealed that this was an issue.

[78]Qualitative interviews at four VAMCs indicated that this was an issue.

[79]VHA Procedures. Health information Management Services (HIMS) Clinical Coding Program Procedures. Pg 4.

[80]Qualitative interview findings with three VAMCs indicated that this was an issue.

[81]Qualitative interviews at two VAMCs indicated that this was an issue.

During calendar year 2014, there was $33.6 million dollars' worth of wrong procedure code denials initially received (or 3.2 percent of all denials initially received).[82]

- This outpatient coding backlog delays the billing of a third party and risks denials for untimely submission, which directly affects the collection of amounts owed to VHA. More details regarding VHA's inpatient coder workload and productivity are located in the Assessment F (Workflow – Clinical) Report.

Recommendations

- **VA/VHA Leadership**: Collaborate with the Office of Personnel Management (OPM) to streamline the process for sourcing, interviewing, and hiring new certified coders to compete with the private sector. VHA could favorably influence their wrong procedure code denials by requiring VAMCs to hire only certified coders and by standardizing national coder training. These efforts may require VHA to engage with unions on new coder certification requirements.

- **VAMC**: In recent years, VHA has made significant advancements in virtual and self-paced training and education programs delivered via online platforms. VAMCs should leverage these platforms to train coders but consider virtual training as supplemental to formal in-person trainings. Experienced subject matter experts (SMEs) should deliver the formal in-person coding training.

- **VAMC**: Hire administrative staff members well versed in medical terminology to support coders by performing non-coding functions. Administrative staff could review open encounter reports and follow up with providers to meet documentation needs. This will allow VHA's coders to focus on coding and managing any coding backlog so that VA can avoid using coding contractors to resolve their backlog. Continue to explore the use of contracted coding staff based on demand.

- **VAMC**: Reduce coding data validation reviews for clinicians maintaining VHA's acceptable accuracy standard of 95 percent.[83] Coding should move toward conducting a sampling of a number of clinician-coded encounters to promote continued accuracy and compliance. Prior to initiating the coding data validation review, VHA should confirm the proper training, availability of education materials, and instruction of clinicians on clinical documentation requirements. If there are ongoing issues with compliance and a lack of confidence in the providers' documentation and coding, VHA should use CDI specialists to provide training to noncompliant clinicians.

---

6.3.3 Cultural Barriers—Veterans and VHA Staff Members Do Not Consistently Understand Veteran Financial Obligations, Resulting in Inconsistent Insurance Identification and Collections.

Based on interviews with VAMC leadership, cultural barriers have a significant role in the identification of Veteran's insurance information by VAMC Patient Access staff. VHA must have a culture of synchronized organizational functions for both VAMC Patient Intake and CPAC Patient Accounting that work toward a common goal of caring for Veterans and supporting the appropriate collection of first- and third-party revenue as outlined by Congress. A lack of shared goals contributes to weak culture and inhibits collaboration, resulting in poor outcomes. While VHA has improved its efforts to obtain insurance information from the patient, cultural barriers remain. The follow section outlines VHA's current cultural barriers in insurance identification among Veterans and VHA staff.

Table 6-10. Cultural Barriers

Cultural Barriers Defined:
Informal values, norms, and beliefs that prevent an organization from achieving its mission.
Impact:
A strong (organizational) culture is necessary to synchronize all business processes and work toward a common goal. Lack of shared goals contributes to weak culture and inhibits collaboration, resulting in poor outcomes.
Industry Best Practices:
Strong cultures are adaptable to change, build loyalty and commitment, effectively communicate with customers, and tie operational tasks to mission accomplishment. In leading hospitals, all business processes across departments are coordinated, enabling better collections.
VHA Key Findings:
1. Cultural barriers, coupled with administrative challenges, prevent VHA from maximizing collections. Veterans do not understand the need to provide insurance information, and some VHA employees do not agree with VHA's authority to bill insurance companies for non-service connected health care.

Findings

1. **Cultural barriers, coupled with administrative challenges, prevent VHA from maximizing collections. Veterans do not understand the need to provide insurance information, and some VHA employees do not agree with VHA's authority to bill insurance companies for non-service connected health care.**

Fifty-four point six percent of denials from insurers in 2014 were related to the Patient Intake functions, where issues with insurance verification and authorization are prevalent. Notably, non-covered charges represented the largest (35.8 percent) portion of those denials (additional

detail located in Section 6.3.5 Denials).[84] When VHA does not identify or verify insurance prior to providing scheduled services, VHA is unable to properly bill third-party insurance and perform necessary pre-authorization services, which results in denied or delayed payment for services. While VHA has improved its efforts to obtain insurance information from the Veteran, cultural barriers remain. In interviewing Patient Intake staff members, we learned two key issues that prevent timely insurance capture. These are as follows:

   a. Many Veterans do not understand why insurance information is required (many recall being promised 'free care for life') and refuse to provide insurance information. Other Veterans do not understand their out-of-pocket responsibilities, the CPAC refund process, or are afraid of being charged by their insurance co-payments.[85] Veterans do not understand that providing third-party insurance information and paying amounts due allows VHA to provide medical care and services to other Veterans. Interviewees reported that many Veterans are reluctant to provide insurance information or pay co-payments.[86]

   b. Registration clerks do not feel comfortable asking for insurance and engaging the Veterans in this sensitive discussion. Further, some VHA staff members do not ask for insurance information because they do not believe it is appropriate to bill insurance companies for Veteran care.[87] Due to staff members not understanding the reasons to ask for insurance, lack of enforcement or Veterans unwillingness to provide this information, they do not capture insurance consistently for each Veteran.

The VAMCs run an insurance capture buffer exceptions report that indicates each time they were unable to obtain updated insurance information from a Veteran. An exception occurs when a Veteran's health insurance requires updating and Patient Intake staff did not obtain the information from the Veteran. As depicted by Figure 6-6, VAMCs are struggling to meet VHA's national insurance capture metric, implying an opportunity to increase performance.[88]

---

[84] Source: National Initial Denials Received from CBO, CY2014.

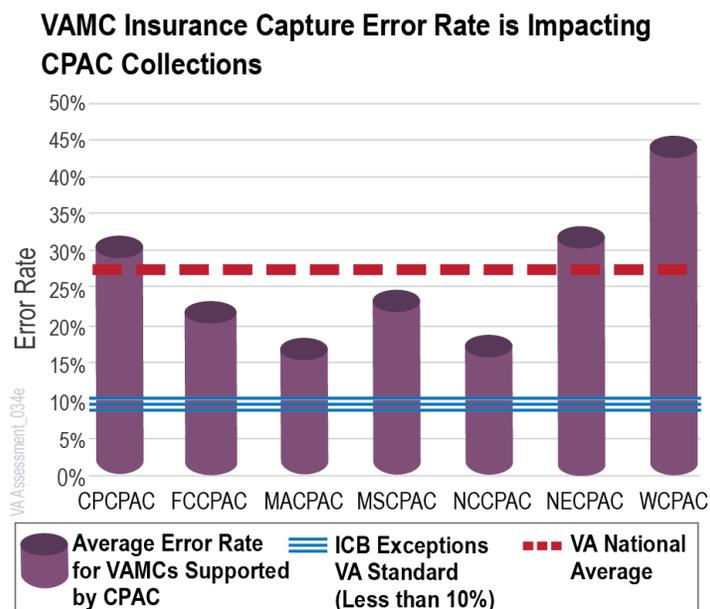
[85] Qualitative interviews at two CPACs and three VAMCs indicated that this was an issue.

[86] Qualitative interviews at two CPACs and one VAMC indicated that this was an issue.

[87] Qualitative interviews at one CPAC and one VAMC indicated that this was an issue.

[88] Assessment I Data Call. (2015). *Insurance Capture Error Rate Survey of 123 of 139 VAMCs*. Unpublished raw data.

Figure 6-6. Insurance Capture Error Rate

VAMC Insurance Capture Error Rate is Impacting CPAC Collections


Source: VAMC Insurance Capture Error Rate Data Call Results. ICB exception rate data for Calendar Year 2014 was obtained via a VAMC-wide data call. There were 123 VAMC respondents that provided their error rate. An average error rate for VAMCs support by CPAC was calculated at the CPAC level.

- Our finding is consistent with a 2012 OIG Report, which found that VHA needed to improve their processes for identifying Veterans with third-party insurance (OIG, 2012). Per the 2012 OIG Report: [89]

  o "VA medical facility revenue staff did not bill approximately 400,000 or three percent of over 16 million unbilled episodes of care because Veterans or their spouses' insurance policies were not identified at the time of treatment or within the insurance billing time frame."

- OIG recommended that VHA implement mechanisms to monitor insurance identification and to train clinical administrative staff on third-party insurance identification policies and procedures. In reviewing VHA's insurance capture data and interviews with CPAC and Patient Intake staff, it appears that the OIG's 2012 recommendations were not implemented effectively.

Recommendations

- **VHA**: Near-term actions include increasing communication to Veterans and VHA staff using VAMC Town Hall meetings, website resources, and existing staff and Veteran

---

[89] Department of Veterans Affairs Office of Inspector General. (2012). Audit of VHA's Medical Care Collections Fund Billing of VA-Provided Care. Report No. 11-00333-254. Retrieved from http://www.va.gov/oig/pubs/VAOIG-11-00333-254.pdf

training as mechanisms to emphasize the insurance collection requirement. Include this education in mandatory, periodic refresher training for all VHA staff.

- **VHA**: Institute and mandate a process to identify third-party payer coverage at or near the point of scheduling, or at a minimum within 72 hours of the scheduled service. Doing so will reduce the risk of not capturing insurance until later in the process (e.g., Patient Intake).

- **VHA**: To address the larger cultural barriers, VHA should incorporate education of Veterans, their families/caretakers, all levels of VHA staff, key stakeholders (including Congress and state/local government agencies, Veterans' groups), and the public, into their Strategic Communications Plan. The education should focus on the legislative requirements for third-party insurance identification and collection, and the importance for Veterans to ensure the long-term viability of the VHA health care program.

- **VAMC**: Consistently communicate the benefits of insurance identification and verification to both Veterans and VHA staff. Patient Intake and Scheduling staff need to understand how important insurance information is to their own VA Medical Center's financial standing, and that allows it them to better serve Veterans. It is important for any communication efforts to help Veterans understand how insurance works at VHA, how co-payments are collected and reimbursed, and how funds are used to provide additional services for Veterans. Veteran training should include financial responsibilities in the benefits information sent to each Veteran, potentially through issuance of a card (that details co-payment amounts).

- **VAMC**: Invest in recurring training program to reinforce to Patient Intake staff the benefits to the VAMC of collecting third-party insurance information. For example, help new clerks understand the amounts collected are ultimately returned back to the VAMC. Better-informed clerks will enable the confidence required to inquiring about and obtaining Veteran insurance information, leading to improved collections for VHA.

6.3.4 Patient Accounting—Opportunities to Increase Collections Exist.

At VHA, the CPACs oversee all billing, accounts management, claims follow up, denials management, first-party follow up, cash applications and adjustments, customer service, vendor management, insurance verification, utilization review, and payer relations.[90] We evaluated VHA's key performance metrics for comparison to the private sector, the performance between the CPACs and the performance against the VHA standard. We evaluated the collections to billings and GDRO metrics for Patient Accounting. Appendix D, Standards and Benchmarks, provides our summary of key private-sector benchmarks compared to related VHA measures. Additionally, we attempted to evaluate days to bill as a key performance indicator; however, we did not evaluate this metric due to lack of comparability to the private-sector benchmark.

---

[90]Note: Regional payer relations is covered in Chapter 9.

Table 6-11. Patient Accounting

Patient Accounting Defined:
Patient Accounting is comprised of Billing, Accounts Management, and Payer Relations. VHA refers to the submission of claims to the first-party (Veteran) and third-party (insurance company) as billing. Accounts Management activities occur after billing and focus on timely follow-up and payment of unpaid amounts (aged AR) from payers. Payer Relations is the provider function responsible for establishing contracts with third-party payers, negotiating payment rates, and ensuring the accuracy and compliance of third-party payments in accordance with negotiated contracts.
Impact:
Billing the correct amount and ensuring amounts billed are collected promptly are key drivers to overall financial performance of the revenue cycle. Additionally, Payer Relations negotiates reimbursement terms with contracted payers and supports enforcing third-party payer adherence to agreed-upon terms (including payment terms).
Industry Best Practices:
Claims are billed with automated tools that support ensuring accuracy and appropriateness of billed amounts. Accounts management teams, organized by large and small balance units, follow-up with payers on unpaid bills and ensure timely payment.
Payer Relations negotiate contracts to create uniform agreements that allow for standardization and automation of patient accounting functions. An integrated billing and payer contracting system exists to systematically verify bills comply with payer contracts.
VHA Key Findings:
1. VHA collections, as a percent of billings, has decreased over the last three years despite the growing maturity of the CPACs (the last CPAC was operationalized in 2012).
2. While the CPACs have improved standardization of billing and collection processes, process inefficiencies and talent management issues were evident.

Finding 1

1. VHA collections, as a percent of billings, has decreased over the last three years despite the growing maturity of the CPACs (the last CPAC was established in 2012).

- The CPAC model has improved performance across key revenue cycle functions as it matured over time. However, a key metric, the percent of third-party collections to billings decreased from 39.2 percent to 36.5 percent over the three-year period from January 2012 to December 2014.[91,92] As the amount of billings rose by nearly $200 million during that time, we would typically anticipate that collections would trend in a similar

---

[91]CBO. (2015). *National Third Party Collections as a Percent of Billings, CY2012-CY2014*. [Data file and code book]. Retrieved from POWER.

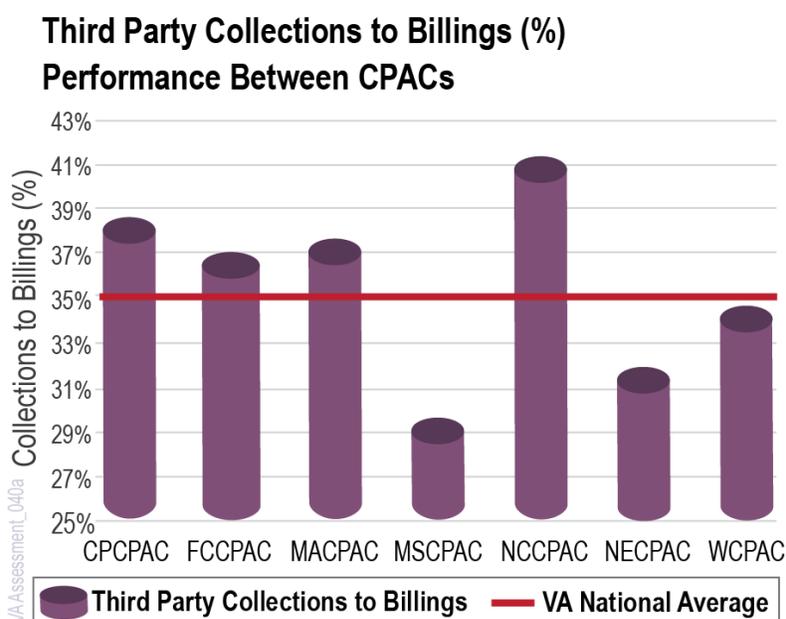
[92]Note: Based on private sector calculation (Collections to Billings percent = Total Collections/ Total Billings) for a given time period.

The views, opinions, and/or findings contained in this report are those of Grant Thornton should not be construed as an official government position, policy, or decision.

manner. We understand additional variables affect this trending, such as price increases, changes in reimbursement terms, new payer contracts, changes in payer mix and/or changes in the volume and types of services provided. Evaluating the effect of these variables was not within the scope of this assessment.

- The 2014 third-party national collection to billings percentage was down to 34.8 percent from 35.7 percent in 2013; however, it slightly improved from the 2012 performance of 34.3 percent.[93]

- Figure 6-8 represents the CPAC's performance of collections as a percent of billings for calendar year 2014. The North Central CPAC with a collection rate of 40.8 percent has the highest collection rate in relation to the other CPACs.

Figure 6-7. Collections Related to Billings – CY2014[94,95]


Source: CPAC Third Party Collections to Billings from CBO, CY2014

- VHA measures collections to billings as a key performance indicator in their revenue cycle reporting tool; however, due to calculation variations from industry standard, we could not effectively analyze this metric. CBO tracks third-party collections to billings by comparing collections to the bills to which they directly correlate. VHA excludes uncollected bills from the calculation. This is not consistent with the industry standard

---

[93]CBO. (2015). *National Third Party Collections as a Percent of Billings, CY2012-CY2014*. [Data file and code book]. Retrieved from POWER.

[94]CBO. (2015). CPAC Third Party Collections to Billings, CY2014. [Data file and code book]. Retrieved from POWER.

[95]Note: Billings and Collections data based on calendar year 2014. National average of 34.8 percent calculated using data from same timeframe. San Juan is excluded from FCCPAC analysis due to unique payers not on electronic billing.

---

calculation that includes total billings in a given timeframe and not just collected billings. By calculating the metric using the industry standard, the third-party collections to billings ratio for calendar year 2014 was approximately four percent lower than when calculated using the VHA method. This percentage difference is accounted by billings that are unpaid and in AR or potentially adjusted/written-off.

Recommendations

- **CBO/VHA/CPAC/VAMC**: If VHA addresses and standardizes the issues and recommendations listed in this report, it will improve the CPAC's collections as a percent of billings.[96]

- **VHA/CBO**: Calculate and report collections to billings using traditional industry approaches.

Finding 2

2. **Patient accounting experiences process inefficiencies and talent management issues.**

- A common theme across our interviews was that billers could not keep up with their productivity goals and accounts management requires a significant amount of rework.[97] Billing staff turnover is an issue due to the low pay grade of the positions. Interviewees noted that many billers view their positon as a stepping-stone to another role with a higher pay grade, leading to high turnover and a constant need to train new staff. VHA billing technicians are currently a GS5 on the federal pay scale, which is a lower rating than other CPAC departments and in turn leads to employee turnover. Billers move into other departments as opportunities arise.

- Another process inefficiency that negatively affects the time to collect is the division of work within accounts management follow up, where the distributed workload does not follow designated dollar thresholds.[98] The accounts management "follow up" team is currently split in two teams: (1) the "follow up" team whose designated dollar threshold to work billed claims with accounts receivable balances between $251 and $4,999, and (2) the denial management team whose designated dollar threshold is to work billed claims with accounts receivable balances greater than $5,000. Routed work load does not follow these designated thresholds as low dollar issues are routed to the high dollar denial management team work queue (e.g., underpayments, providers, and coding issues are primarily low dollar issues < $1,500 that are funneled to the high dollar denial management team work queue).

---

[96]Note: Similar to the private sector, collections as a percent of billings are also influenced by trends such as price increases, changes in reimbursement terms, new payer contracts, changes in payer mix, and/or changes in the volume and types of services. CBO should consider these factors as it evaluates collections as a percent of billing at each CPAC going forward.

[97]Qualitative interviews at three CPACs VAMCs indicated that this was an issue.

[98]Qualitative interviews at three CPACs VAMCs indicated that this was an issue.

- In addition to distribution of work duties, we would not expect to see as many billing FTEs as compared to the accounts management follow up FTEs. This is partially explained by the high number of biller FTEs that are required due to manual nature of generating bills. For example, at the time of our site visit, the North Central CPAC had 64 billing FTEs (not including 10 vacancies), 24 "follow up" FTEs working balances between $251 and $4,999, and eight denial FTEs working balances greater than $5,000. As a result of the division of labor, more FTEs are billing claims and focused on low dollar claim follow up versus high dollar account balances.[99]

Recommendations

- **VHA**: Reevaluate the appropriate GS level to perform the billing function and collaborate with the Office of Personnel Management (OPM) to change the requisite pay grade level.

- **CPAC**: Reorganize the accounts management team so that the large balance unit is proactively working and resolving approximately 80 percent of the AR dollar balance. The small balance unit should reactively work and resolve 20 percent of the dollar balance of AR (typically comprised of 80 percent of account volumes), as is the industry standard. The number of accounts assigned to large balance and small balance should reflect private industry standards whereby large balance personnel are assigned lower volumes of accounts than small balance personnel. If resources exist, consider further organizing the large balance unit and small balance unit by payer to develop rapport and expertise with a payer that accelerates resolution of outstanding claims.

- **CPAC**: Continue to explore and evaluate contracting out routine follow up functions.

6.3.5 Denials

The CPAC is responsible for tracking and responding to denials from third party insurers. Third-party denial rates depict bills for medical services provided which a payer (the insurer) has rejected. Denials result in decreased collections and occur for myriad reasons. CPAC staff assigns each denial a rejection code, and typically aligns the denial to a function within the providers' revenue cycle. As such, third-party denials provide a strong indication on the effectiveness of an organization's business operations and the health of a revenue cycle program. A denied claim has the potential to represent lost or delayed collections from a third-party insurer and illustrates the accuracy and efficiency of VHA's revenue cycle.

The Accounts Management team at the CPACs receive denials from third-party insurers and conduct root cause analyses to understand and resolve the denial. A Denials Management Specialist in the quality department at the CPACs performs root cause analyses of denials and works with the business functions (both at the CPAC and VAMCs) to remediate and prevent denials from recurring. Coordination between business functions is necessary to resolve most denials.

---

[99]Qualitative interviews at three CPACs VAMCs indicated that this was an issue.

Table 6-12. Denials

Denials Defined:
Denials occur when a third-party payer initially refuses to pay a claim due to a provider not adhering to specific policies/procedures or the payer requests additional information.
Impact:
Analyzing and correcting claims from the denial resolution process represents opportunities to increase collections, and prevent mistakes from recurring.
Industry Best Practices:
Seamless coordination across Patient Access, Clinical Administration, and Patient Accounting functions prevent a majority of denials. Effective denials management practices include regular reviews of denials by a denial management committee of key revenue cycle and administrative stakeholders, standardizing recovery processes, efficient third-party contacts management, and developing approaches to resolve frequently recurring denials proactively. These activities are key to improving financial performance.
VHA Key Findings:
1. Third-party collections delayed or denied by insurers due to ineffective insurance identification in Patient Intake.
2. Third-party collections are delayed or denied by insurers due to issues that arise from a lack of coordination across VHA's revenue cycle.
3. Patient Intake, Coding, and Patient Accounting functions are not integrated resulting in disparate processes and lack of coordination across the revenue cycle.

Table 6-13 depicts a summary of the total denials for calendar year 2014 received by all seven CPACs.[100] The table includes a comparison of VHA's initial denial received rate of 22.9 percent versus the Healthcare Financial Management Association's (HFMA) leading practice metric of 4 percent.[101] This large variation highlights a significant opportunity for improvement within VHA's revenue cycle processes.

Table 6-13. Total Initial Denials Received – CY2014[102]

CY 2014 Total	$/%
Total Billed ($)	$5,992,545,661
Total Initial Denials Received ($)	$1,371,836,531

[102]For CY 2014 $3,176,041,415 was received in collections. Denials presented are denials initially received versus denials posted

---

CY 2014 Total	$/%
Total Initial Denials Received (%)	22.9%
HFMA Initial Denial Rate (%)	4.0%
Variance from Best Practice (%)	18.9%
Variance from Best Practice ($)	$1,132,134,705

Source: Total Initial Denials Received from CBO, CY2014

Figure 6-8 depicts a summary of the calendar year 2014 denials received by all seven CPACs and includes the dollar and percentage of the top 80 percent denials received. A large proportion of VHA's denials is controllable and could be resolved through enhanced upfront insurance identification and verification. The lack of accurate and timely insurance identification and verification results in non-payment due to issues with pre-authorization, coordination of benefits, patient insurance coverage period termed, non-covered charges, and patient not eligible or covered by insurance at date of service.[103] Refer to Appendix A-1 for a summary of denial categories, the definition, the corrective action and our recommendations to correct the business processes surrounding the denial category.

---

[103]Note: Note all denials are attributable to VHA. Denials for maximum benefit reached and non-covered charges may not be reimbursed. These denial categories may be due to the patient's insurance plan, charge description master issues, payer contracting issues, and other categories.

Figure 6-8. Reasons for VHA Payment Denials (CY 2014)

Approximately 54.6%, or $580.9M of $1.06B, in denials received are primarily attributable to Patient Intake processes in the revenue cycle

Provider-Based Eligibility | $39,747,605 | 3.7%

Information Requested | $173,728,353 | 16.3%

File Limit Expired | $5,495,794 | 0.5%

Duplicate | $216,000,485 | 20.3%

Wrong Procedure Code | $33,596,895 | 3.2%

Medical Necessity | $14,239,431 | 1.3%

Authorization Issue | $50,122,775 | 4.7%

Coordination of Benefits | $66,158,136 | 6.2%

Coverage Period Termed | $67,845,178 | 6.4%

Maximum Benefit | $8,889,433 | 0.8%

Non-Covered Charge | $381,043,005 | 35.8%

Patient Eligibility | $6,849,616 | 0.6%

Source: Author Rendition based on National Initial Denials CY2014 data provided by CBO

Figure 6-8 displays the distribution of the top 80 percent, based on dollar amount, of VHA denials received nationwide for calendar year 2014. VHA received a total of $1.372B worth of denials in 2014, the top 80 percent of these denials totaled $1.063B. VistA tracks all transactions with an insurer on a claim. When a line item or specific charge denial is received from an insurer the total balance of the claim is counted as a denial; therefore, denial amounts may be artificially inflated.

Finding 1

1. **Third-party collections are delayed or denied by insurers due to ineffective insurance identification, verification, and preauthorization in Patient Intake.**

- VHA's third-party denials initially identified as primarily attributable to Patient Intake/VAMC processes make up $508.9 million or 54.6 percent of the top 80 percent of denials received in calendar year 2014.[104]

- In reviewing VHA's denial category data, we found that high denial rates are occurring because Patient Intake staff did not obtain and identify patients' information (demographic and insurance).

- When Patient Intake staff members do not identify and update insurance information, billing errors result in third-party payment denials. Such denials require additional efforts to resolve and may result in lost revenue.

- Patient Intake staff members, as is customary in private sector, do not complete preauthorization prior to a Veterans appointment. Furthermore, due to late insurance identification, the CPAC Utilization Review Nurse does not routinely obtain pre-authorization *before* treatment is rendered, resulting in payment denials.

Recommendations

- **VAMC** Leadership: Require the identification of third-party insurance at scheduling and pre-registration by VAMC Patient Intake staff. Electronically verify all insurance prior to date of service to allow CPAC nurses to obtain necessary preauthorization timely.

- **CPAC**: Perform a regular root cause analysis of non-covered charges related to Patient Intake issues. This analysis should include identification of charges not covered that relate to only a portion of services provide, charge not covered due to charge description master issues, payer contracting issues, and other categories. The results of this would be to identify common trends in non-covered charge denials and develop preventive work plans to prioritize correctly.

- **VAMC**: Enhance the patient self-service kiosks with technical capabilities to scan insurance cards and to include system rules that prevent the patient from completing the registration process if the insurance information on file is missing or expired.

6.3.6 Organizational Alignment – Separate lines of accountability for Revenue Processes across VAMCs and CPACs negatively affects collections.

The revenue processes span across VAMC and CPAC responsibilities and processes; however, only the CPACs are responsible for revenue collection and the associated performance outcomes.

Finding 1

1. **Third-party collections are delayed or denied by insurers due to issues that arise from a lack of coordination across VHA's revenue cycle.**

---

[104]CBO. (2015).*Total Initial Denials Received, CY2014*. Retrieved from POWER. Reported in POWER by CPAC and totaled to report Total Initial Denials Received for calendar year 2014.

- We learned through interviews that Billing, Accounts Management/follow up, and insurance verification units, which are located at the CPACs, do not communicate and coordinate enough with Patient Intake and Coding at the VAMCs.[105]While we understand communication has improved in recent years, the lack of accountability across these key revenue cycle functions inhibits optimal collaboration on systemic issues.

Recommendation

- **VAMC and CPAC**: Create a cross-functional denial management committee at each VAMC to increase collaboration between the professionals in Patient Intake, Coding, and Billing. Consistent with private-sector best practices, the committee should meet monthly at a minimum and comprise of the key stakeholders in Patient Intake, Clinical Administration and Patient Accounting.

Finding 2

2. **Patient Intake, Coding, and Patient Accounting functions are not integrated resulting in disparate processes and lack of coordination across the revenue cycle.**

- The VAMC/VISN currently owns Patient Intake and Coding activities. VHA's national Health Information Management Service, comprised of Coding leaders do not have authority over coders. Coders report locally, to VAMC leadership. Patient Accounting is an activity within the revenue cycle that is dependent on successful execution of Patient Intake and Coding functions. Patient Accounting reports to CBO, unlike Patient Intake and Coding. Driven by the separation between business process and structure within the revenue cycle, there is a lack of coordination across the revenue cycle continuum.[106]

Recommendations

- **VHA**: Assign shared responsibility between Patient Intake and Clinical Administration (e.g., coding) with Patient Accounting for revenue collection outcomes and include specific goals in management/staff performance plans as a near-term improvement.

- **VHA**: In the longer term, consider and evaluate the benefits of aligning patient intake and coding functions under CBO. Evaluation should consider the benefit of aligning coding under VHA's national HIMS and subsequently, HIMS under CBO. Organizationally aligned business functions provide greater opportunity for successful performance management and establishment of organizational accountability. Private-sector leading practices are to align all components of the revenue cycle under the CFO linking job responsibilities to financial performance.

---

[105]Qualitative interviews at three CPACs and two VAMCs.
[106]Qualitative interviews at three CPACs and four VAMCs.

The views, opinions, and/or findings contained in this report are those of Grant Thornton should not be construed as an official government position, policy, or decision.

6.3.7 First Party Collections – VHA Could Increase First Party Collections through Financial Education and Point of Service Collections.

First Party collections refers to co-payment amounts due from the patient. Effective financial counseling is a significant component of Patient Intake, directly influencing Veteran satisfaction and first-party collections. Industry leading practices are to train Patient Intake personnel to appropriately identify and communicate out of pocket responsibilities and alternatives for covering expenses to patients. Patients are instructed to be prepared to meet financial obligations *prior* to or on the day of the scheduled appointment.

Table 6-14. First Party Definition

First Party Defined: First party refers to the patient/Veteran
Impact: Patients need to understand their roles and responsibilities in regards to benefits and out of pocket expenses. Educating Veterans will increase collections to the provider of non-service connected care if the Veteran has other health insurance. Without financial education to help the patient understand his/her insurance coverage and financial responsibility for health care services, loss of revenue may occur, directly affecting the collection of amounts owed to VHA for non-service connected care.
Industry Best Practices: Out of pocket amounts due should be collected on the date of service. VHA should provide financial counseling prior to services performed to assist patients in understanding costs and alternatives for covering such expenses.
VHA Key Findings: 1. VHA provides inconsistent education on financial responsibilities to Veterans at point of service, inhibiting understanding of their financial obligations at VAMCs upon check-in and negatively affecting first party collections. 2. Collections are not maximized due to VHA's inability to collect release of information forms (ROI) from Veterans at the point-of-service.

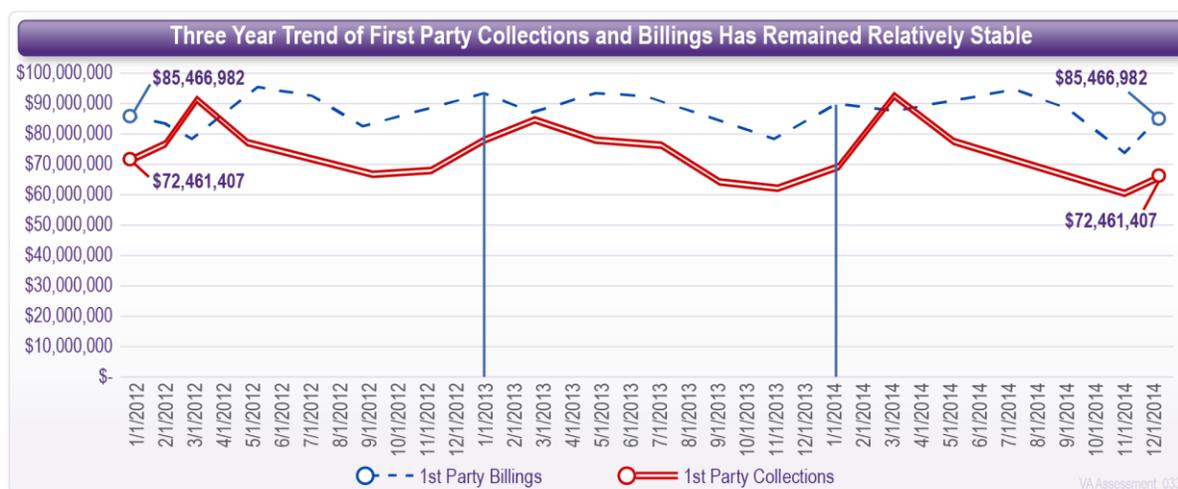
VHA begins first-party collections at the CPAC after encounters are complete. If the patient care is not service connected and out-of-pocket expenses are owed, a patient bill is automatically generated 90 days after services are rendered (the 90 day period was established to allow time to identify third-party insurance) and sent to the patient.[107] Following the initial 90-day period, VHA provides the Veteran with three statements over a 90-day period. Each statement reflects total amounts due and directs the Veteran to where they can get help with questions.

---

[107] Note: VHA does not bill a Veteran before the date of their service.

Additional detail regarding co-payments and eligibility is located in Appendix 10A.2.5.2 Eligibility and Coordination of Benefits.

Figure 6-9 depicts the national collection rate of first-party payments compared to first-party billings for the period January 1, 2012 to December 31, 2014.[108] On average, VHA collects first-party payments between 30-60 days after VHA releases the initial bill. VHA's collection performance has remained relatively stable over the past three years. The annual rise of collections during the month of March corresponds to increased collections from Veteran's upon filing federal and state taxes, and setting up repayment plans with the CPACs. After approximately 90 days, VHA sends any nonpaid Veteran bills to VHA's Debt Management Center (DMC) for collection. If collection efforts remain unsuccessful, DMC transfers the bills to the Treasury Offset Program (TOP). Both programs contribute to VHA's first-party collection performance.

Figure 6-9. National First Party Billings and Collections[109,110]


Source: National First Party Billings and Collections from CBO, CY2012-2014

Figure 6-9 reflects the total first-party collections as a percent of billings for calendar year 2014 by CPAC and as a national average. In Figure 6-9, CPCPAC (Central Plains) is reflected as the top performer amongst the CPACs in 2014 in comparison to VHA's national average. The MACPAC had the lowest performance of the seven national CPACs. Performance may vary between the CPACs given the population of Veteran's, the Veteran's ability to pay, Veteran education and influence of other factors (e.g., local economy).

---

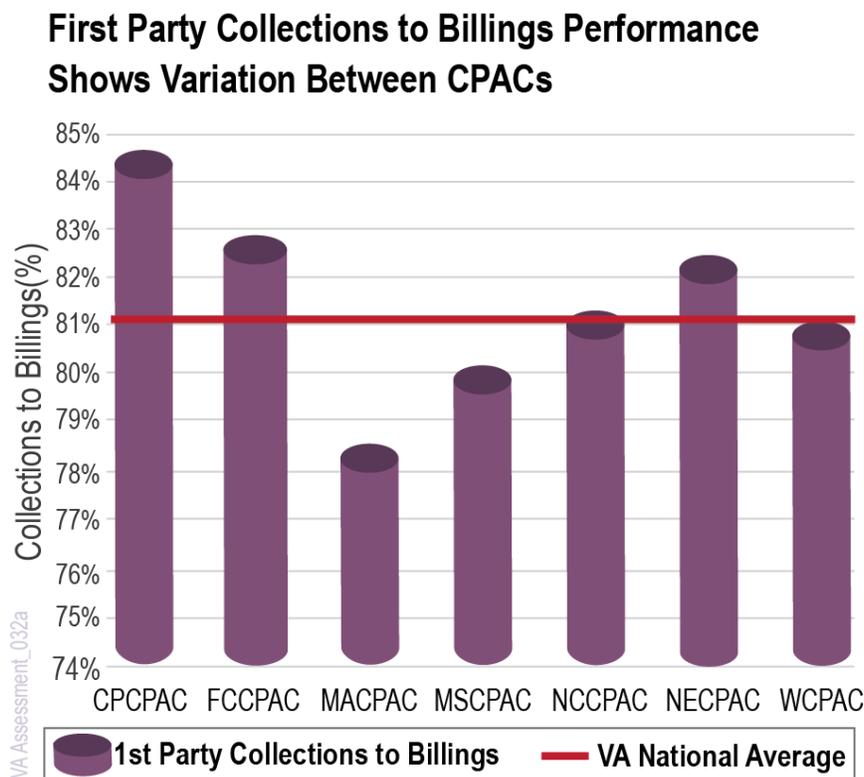
[108] CBO. (2015). *National First Party Collections and Billings, CY2012-CY2014*. [Data file and code book]. Retrieved from POWER. Reported in POWER by CPAC and totaled to report National First Party Billings and Collections for calendar year 2014.

[109]CBO. (2015). *National First Party Collections and Billings, CY2012-CY2014*. [Data file and code book]. Retrieved from POWER.

[110]Note: First party billings and collections include inpatient, outpatient, pharmacy, and long term care co-payments.

Per HFMA, private-sector hospitals should strive to collect 65 percent of patient pay (or first-party) balances prior to inpatient discharge and 75 percent of patient pay balances prior to outpatient service (HFMA, 2012). The private-sector metric is not an appropriate baseline for VHA's First-party process for three reasons: (1) VHA collects well after the service is provided, (2) VHA waives co-payments for Veterans with insufficient financial means, and (3) VHA waives the co-payment for Veterans within Priority Groups (see Appendix 10A.2.5.2 Eligibility and Coordination of Benefits).

Figure 6-10. First-party Collections as a Percent of Billings for CY2014[111]

First Party Collections to Billings Performance Shows Variation Between CPACs


Source: CPAC First Party Collections to Billings from CBO, CY2014

Finding 1

1. **VHA provides inconsistent education on financial responsibilities to Veterans at point of service, inhibiting understanding of their financial obligations at VAMCs upon check-in and negatively affecting first party collections.**

- Due to differences in Veteran's co-pay amounts based on service connectedness and priority groups, Veterans have varying co-payment obligations when seeking care at VHA. This can become confusing for Veterans and VHA staff. During interviews, we noted some VHA staff lack a full understanding of patient obligations due to inadequate training and

---

[111]CBO. (2015). *CPAC Collections and Percent of Billings, CY2014*. [Data file and code book]. Retrieved from POWER. Data was reported by CPAC.

inconsistent communication from VHA. Further, staff members do not always ask correct follow-up questions when speaking with a Veteran (OIG, 2012).

- VHA bills patients for VHA co-payments 90 days after their date of service. Co-payments are not collected at point-of-service, as is customary in private sector.[112] We understand this is due in part to service connected determinations, late insurance identification and outdated income verification (VHA refers to as "means test").

- Based on sites visited, we also found that VAMCs provide insufficient financial counseling to non-service connected patients. Financial counseling is an in person, one-on-one interaction with the Veteran to explain out of pocket responsibilities. There are CPAC staff members (Facility Revenue Technicians) stationed at each VAMC to counsel patients if they have a question or complaint regarding a bill, but the Facility Revenue Technicians (FRT) are separated from the registration desk/area and do not provide proactive financial counseling to all patients. Similarly, the OIG identified missed First-party collection opportunities during point-of-service encounters due to inadequate staff training and Veterans not understanding their financial obligations. The OIG reported that registration clerks were not educating patients on their financial responsibilities (OIG, 2012).

- Two of the VAMCs we visited offer patients the one-time opportunity upon enrollment to participate in an optional educational class at the VAMC to receive financial counseling. In the private sector, readily available one-on-one counseling is customary.

Recommendations

- **VHA/CBO**: Upon implementation of related recommendations in this report (i.e., Culture, Simplification of Rules, Organizational Alignment), CBO should ultimately plan to collect co-payments at point of service, prior to treatment. Develop and implement a standard point-of-service collections policy directing VHA staff members to identify and request co-payments at each appointment prior to the patient leaving the facility.

- **CBO**: Standardize policies to ensure that if late insurance is identified, collection efforts on First-party obligations begin with written communication no later than 30 days after date of service. Communication should occur over routinely a 90 to 120 day period.

- **CBO**: Invest in online tools for pre-registration and registration that allow for real time explanation of Veteran out-of-pocket expenses. Technological solutions should account for Veteran's service connected status, priority group and diagnosis when relaying out-of-pocket expenses. The technological solution should be coupled with the issuance of a card to each Veteran with individual co-payment information encoded.

- **VHA Leadership**: Reexamine VHA's co-pay policy and structure within the Veteran Priority Groups to determine if simplification is feasible (refer to Appendix A Background VHA Care Revenue-First-party Collections) as well as improve the tracking and monitoring payments to VHA co-payment guidelines. For instance, we understand VHA has mandated

---

[112]Qualitative interviews at three CPACs provided this process overview. Private-sector co-payment collection standard is based on feedback from industry subject matter experts.

that all co-payments to be refunded to Veterans once insurance companies pay billed amounts exceeding the co-payment. The intent is to incentivize Veterans to provide insurance information for non-service connected treatment. Upon implementation of culture and organizational recommendations, we suggest VHA explore avenues to cease the manual and cumbersome co-payment refund process (additional detail in the IT section). Further, a streamlined approach to service connected determinations, means testing, and financial counseling will result in increased first party collections.

- **CPAC**: Evaluate staffing requirements for FRTs at each VAMC, evaluate FRT's workload, and prioritize responsibilities amongst the FRTs and their managers. Make available a FRT at Patient Intake of each VAMC to provide direct, one-on-one financial counseling for non-service connected treatment in an effort to enhance Veterans' understanding of their financial responsibilities.

- **VAMC**: Standardizing Patient Intake staff training materials, including scripts that highlight out-of-pocket obligations for all VHA staff that interact with Veterans. This will allow all Veterans to receive a uniform response regardless of the VHA staff with whom they speak.

- **VAMC**: Leverage existing Veteran outreach and education programs, as well as collaborate with outside Veteran Service organizations (e.g., VFW), to publish financial responsibilities regarding out-of-pocket expenses and CPAC financial assistance policies. This information should also be readily available on VHA's web site with a 1-800 telephone number for Veteran questions, in addition to printed material at Veteran Service organizations and VAMCs. Consider consolidating all Veteran education material in a pocket-sized format, which would allow Veterans to have all pertinent information in an easy to access guide.

- **VAMC/CPAC**: Standardize the one-time Veteran education class. The material should cover Veteran co-payment requirements and rates, overview of Veteran health benefits and eligibility, as well as financial distress programs to assist Veterans pay co-payment requirements.

Finding 2

2. **Collections are not maximized due to VHA's inability to collect Release of Information forms (ROI) from Veterans at the point-of-service.**

- 38 USC §7332 and implementing regulations (sections 1.460- 1.499) requires VHA to obtain a patient release of information for all care related to drug abuse, alcoholism or alcohol abuse, infection with the human immunodeficiency virus, or sickle cell anemia. ROI forms (VA Form 3288) are created by VHA to authorize the release of the Veteran's information to third-party insurance carriers. Veterans complete the ROI forms post care and currently they are not being completed promptly.

- VHA cannot submit a claim to the third-party payer until after receiving a signed ROI form. When a Veteran does not sign it, this results in lost revenue for VHA. VHA does not currently have the ability to report the amount of lost revenue from missing ROI forms, but interviews at the CPAC indicate it is substantial.

Recommendations

- **VAMC**: Conduct mass mailing of VA Form 3288 (ROI form) to all Veterans currently enrolled to obtain Release of Information signatures. Implement process for Veteran to sign one all-inclusive ROI that is attached to the 10-10EZ (Application for Health Benefits). Veteran would be required to sign this during initial VHA enrollment, and is all - encompassing., and upload forms to VistA where scheduling and registration staff can verify and change. Additionally, develop and implement a standard registration/check-in procedure directing VAMC Patient Intake staff to collect a completed ROI form for those who have not previously signed it.[113]

- **VHA/CBO Leadership**: Make ROI forms available online and build all-inclusive ROI functionality into the check-in kiosk system. Patients should be prompted to complete and authorize the form, but not be required to, when using the kiosks prior to being seen by a provider. This added functionality would support further automation of key VHA systems and improve administrative efficiencies for VHA staff.

- **VHA/CBO**: If ROI issues persist after implementing these recommendations, align ROI completion compliance to performance standards for patient intake and VAMC leadership staff to drive accountability.

6.4   Summary of Findings and Recommendations

The following table summarizes the findings and recommendations presented in this chapter, providing further detail to identify each finding's significance and each associated recommendation's timeline and effect.

Table 6-15. Summary of Findings and Recommendations

FINDINGS	RECOMMENDATIONS	SIGNIFICANCE	TIMELINE	IMPACT
Cultural barriers, coupled with administrative challenges, prevent VHA from maximizing collections.	Increase communication to Veterans and VHA staff. Institute and mandate a process to identify third-party payer coverage at or near the point of scheduling.	Tier 1	Short	Process, People, Technology
Third-party collections delayed or denied by insurers due to ineffective insurance	Require the identification of insurance at scheduling and pre-registration by	Tier 1	Short	Process, Technology

---

[113]Note: VA staff referred us to Title 38, Section 1.576, stating that it prevents them from proactively collecting ROIs prior to services. However, our review of the legislation did not confirm this.

FINDINGS	RECOMMENDATIONS	SIGNIFICANCE	TIMELINE	IMPACT
identification in Patient Intake.	VAMC Patient Intake staff.			
VHA lacks standard scheduling practices and the requirement to identify insurance at the time of scheduling, inhibiting timely insurance capture.	Update VHA Directives to require the identification of third-party payer coverage at or near the point of scheduling.	Tier 1	Short	People, Process, Technology
Delays in clinical documentation turnaround time are inhibiting timely coding, billing, and third-party revenue collection.	Enforce national targets for clinicians to complete notes within 24 hours and medical records within seven days, and use performance pay agreements to assist with enforcement.	Tier 1	Short	People, Process, Technology
VHA is not consistently implementing and enforcing the national initiative around improving clinical documentation practices.	Standardize the CDI program and mandate use across all VAMCs by providing designated CDI specialist funding.	Tier 1	Short	Process, Technology
Third-party collections are delayed or denied by insurers due to issues that arise from a lack of coordination across VHA's revenue cycle	Assign shared responsibility between Patient Intake and Clinical Administration (i.e., coding) with Patient Accounting for revenue collection outcomes and include specific goals in management/staff performance plans as a near-term improvement	Tier 1	Medium	People, Process

7 Analysis of Non-VA Care Payments

7.1 Non-VA Care Introduction

The introduction section contains a description of the background of Non-VA Medical Care, hereafter referred to as "Non-VA Care," legislative authorities, payment processes, and disbursement details and key findings related to Non-VA Care claim timeliness, accuracy, and interest payments. Additional detail regarding processes and detailed descriptions are included in the appendices following the main body of this report.

7.1.1 Non-VA Care – History

Non-VA Care, referred to as 'Non Departmental' care in the Veterans Choice Act, provides an option for eligible Veterans to seek care outside of VHA facilities. There are two broad categories of Non-VA Care: preauthorized care and emergent care. VHA approves preauthorized care prior to the Non-VA provider delivering care. VHA can approve preauthorized care for the following reasons:[114]

- VHA cannot provide the care
- VHA facility is not geographically accessible
- VHA facility cannot provide the service in a timely manner
- The Veteran cannot safely travel to VHA facility

Due to its nature, VHA conducts retrospective clinical and administrative reviews for emergent care to ensure it meets the requirements of the authority to purchase care outside of VHA facilities. Table 7-1, Types of Non-VA Care, outlines the types of Non-VA Care and eligibility requirements under the related care authority. Additional detail is located in Appendix 10A.2.2 Overview of Care Authorities. A separate assessment (Assessment C) examines Care Authorities in depth.

Table 7-1. Types of Non-VA Care

Type of care	Description and relevant payment authority	FY 2014 Spending Breakout[115]
Preauthorized Care	Services with prior VHA authorization meeting criteria under 38 U.S.C. § 1703 (e.g., cancer treatment, mammography)	$4,974,209,147

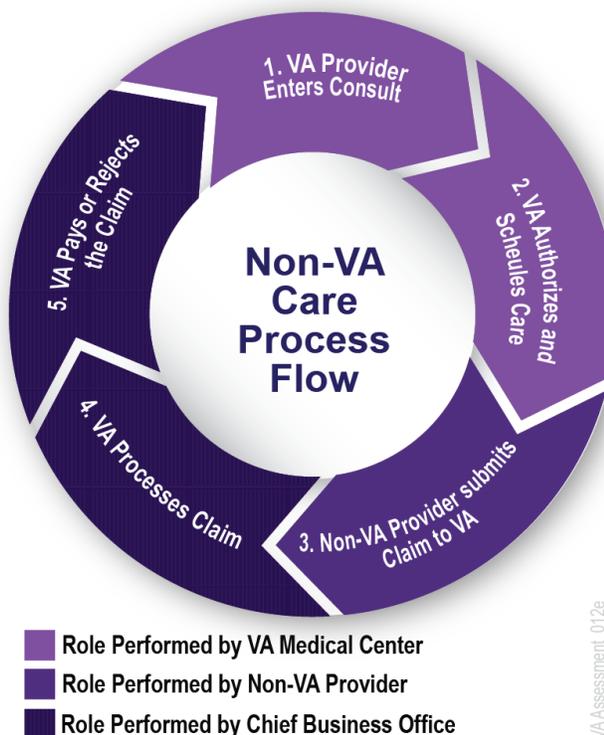
[114] 38 Code of Federal Regulations (CFR) Section 17.53 – Limitations on use of public or private hospitals

[115] Per Paid Data and Timeliness FY12-14 v2.xlsx prepared by CBO Department of Informatics; excludes Manila and VAMCs with less than 1000 claim lines

Type of care	Description and relevant payment authority	FY 2014 Spending Breakout[115]
Emergency care	Services without VHA preauthorization (e.g., heart attack care, treatment of injuries from a motor vehicle crash). Includes emergency care for service-connected disabilities (38 USC 1728 – Unauthorized Care) and non-service connected care (38 USC 1725 – Mill Bill). Refer to Chapter 0 for more information regarding Veteran eligibility.	$554,617,762

The process for authorizing care requires numerous steps by the local VAMC. Figure 7-1 illustrates the Non-VA Care Process.

Figure 7-1. Rendition of Non-VA Care Process Flow


Source: Grant Thornton rendition of Non-VA Care Process Flow based on CBO feedback.

1. Non-VA Care initiates when a VHA provider determines the Veteran requires or requests care outside of VHA. The VHA provider sends a request for a consult or referral to the VAMC authorization department. An authorization clerk reviews the request for Veteran eligibility, as defined in the care authorities in Table 7-1. Upon verifying the Veteran's eligibility, the clerk generates an authorization and sends it forward for approval.

2. Either the chief of staff or the designated service line chief approves the request for care, after which the authorization clerk creates an official authorization guaranteeing payment for specific services and schedules an appointment a Non-VA Care provider.

3. The Non-VA Care provider sends an electronic or paper claim to VHA for processing and payment after rendering services.

4. Upon receipt, a VAMC claims clerk (CBO staff located at the VAMC) puts the claim through automated system and manual edits. Edits include, but are not limited to determination if the claim corresponds to the authorized services, or in the case of emergent services, eligibility and a host of other requirements outlined in detail in Assessment C. Emergent service claims also require documentation, which VHA clinicians review for medical necessity. Documentation is not required for review and payment of authorized care. Once the edits and reviews are complete, and the clinician determines everything is appropriate, they apply correct reimbursement rate and approves the claim for payment.

5. If the claim does not meet all requirements, the claim clerk denies payment, and a remittance is sent to the provider informing them of the reason for the denial.

Note, for extended emergent care the Non-VA Emergency Department is to notify VHA within 72 hours of patient admission so the VAMC may authorize retroactively and monitor treatment.

7.1.2 Non-VA Care—Current State

Non-VA Care experienced significant growth during the last decade. It has grown from a small, seldom-used alternative method of care to a multi-billion dollar program that supplements care provided at VHA facilities. CBO reports Non-VA Care claims have increased over 400 percent over the past 10 years and expenditures have increased from $1.37 billion in FY 2004 to $5.5 billion in FY 2014. Refer to Figure 7-2 for the spending trend lines. Over the same time, the number of unique Veterans treated through Non-VA Care increased 250 percent from 501,258 to 1,250,698.[116] In 2014, this program processed over 14 million claims using FBCS. Because of the increase in need and legislative changes, VHA actions have been reactive, not proactive. Consequently, VHA has implemented short-term solutions for Non-VA Care processes, staffing, training, and technology.

Over the past year, efforts to improve Veteran access to care have increased the utilization of Non-VA Care. In March 2014, 1.1 million claims were received; for the same month in 2015 the claim volume was approximately 1.6 million, a 45 percent increase.[117] Initiatives to accelerate access to care through Non-VA care is forcing VHA to manage resources retroactively.[118]

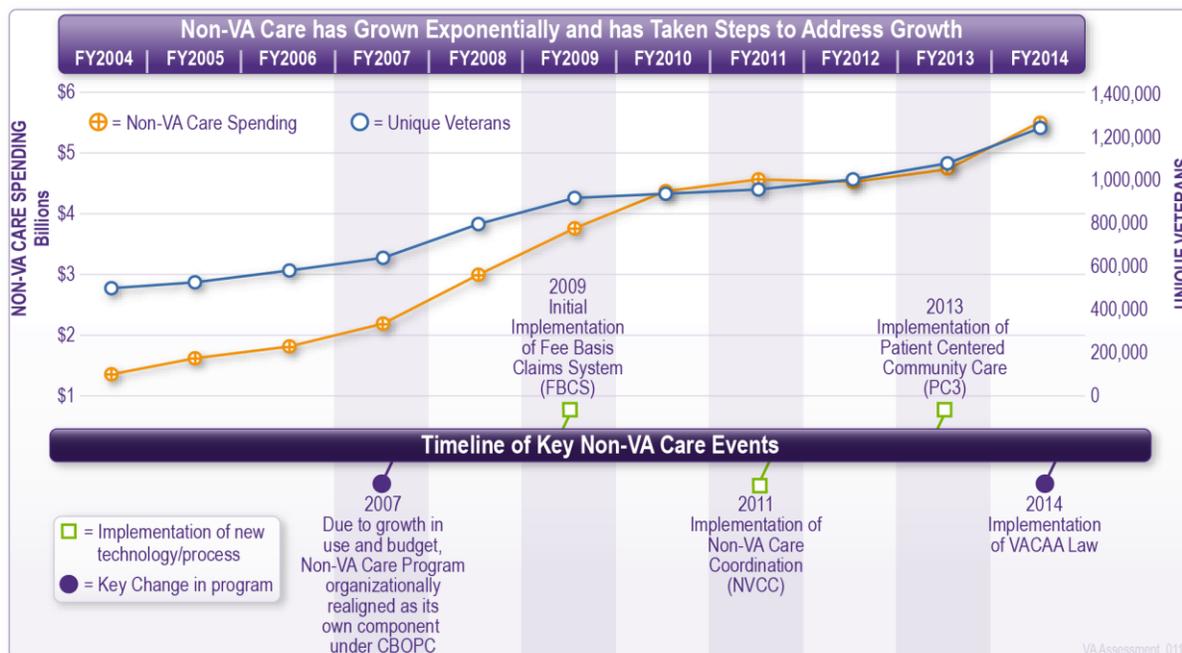
[117] Per Paid Data and Timeliness FY12-14 v2.xlsx prepared by CBO Department of Informatics; excludes Manila and VAMCs with less than 1000 claim lines

[118] Note: At the time of this report, VA had not prepared future projections of Non-VA Care spending.

Figure 7-2 Unique Veterans Served Compared to Total Non-VA Care Spending and Timelines of Key Non-VA Care Events[119]


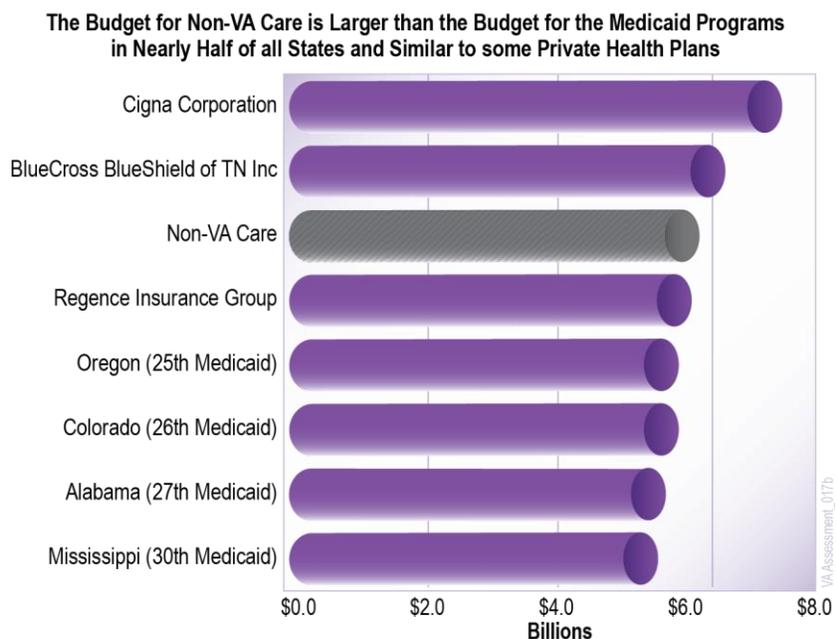
Source: Paid and Timeliness FY12-FY14 Data

At approximately $5.5 billion in annual payments, Non-VA Care is comparable to a number of sizable commercial and federal health insurance programs and is larger than 23 of the 50 states' Medicaid programs. In comparison, Medicare (excluding Part D) processes about $365 billion annually through Medicare Administrative Contractors (MACs) using a decentralized, but highly standardized process. Figure 7-3 shows the Non-VA Care spending comparison.

---

[119] Per Paid Data and Timeliness FY12–14 v2.xlsx prepared by CBO Department of Informatics; excludes Manila and VAMCs with less than 1000 claim lines.

The views, opinions, and/or findings contained in this report are those of Grant Thornton should not be construed as an official government position, policy, or decision.

Figure 7-3. Non-VA Care Spending Comparison[120,121]


The Budget for Non-VA Care is Larger than the Budget for the Medicaid Programs in Nearly Half of all States and Similar to some Private Health Plans

The following sections provide an overview of new initiatives relevant to Non-VA Care. For more details on each program, refer to Assessment C.

Patient Centered Community Care (PC3)

Launched in 2013, Patient-Centered Community Care (PC3) contracts with vendors to develop a network of health care providers to deliver care to Veterans. Coverage includes primary, inpatient, outpatient, mental health, emergency (limited), newborn (limited in duration and female Veterans following delivery), and skilled home health care as well as home infusion therapy. Care is available through PC3 when local VHA Medical Centers cannot readily provide services, when demand exceeds capacity, geographic inaccessibility or other limiting factors.[122]

To improve access to care, VHA contracted with HealthNet Federal Services ("HealthNet") and TriWest Healthcare Alliance ("TriWest") to expand their Nov-VA provider network and administer the program. These PC3 vendors develop and manage their network of providers,

coordinate care for the Veteran, and reimburse providers for care. 10A.2.7 and Assessment C provide additional background on PC3.

Effects of Veterans Access Choice and Accountability Act (VACAA) Legislation on Non-VA Care

Choice Program and Related Eligibility

Title I, Section 101 of the Veteran's Choice Act authorized the expansion of medical care through agreements with Non-VA entities.[123] The Choice Program allows Veterans to seek care in the community if the Veteran:

- Was unable to schedule any appointment with VHA for hospital care or medical services within VHA's "wait-time goals."

- Resides more than 40 miles from any VHA medical facility.

- Resides more than 20 miles from any VHA medical facility if his or her state of residency lacks a VHA medical facility providing hospital care, emergency services, or inpatient surgical care.

- Resides 40 miles or less from any VHA medical facility but either is required to travel by air or water to all VHA medical facilities within the 40-mile limit or is faced by an "unusual or excessive burden" in accessing those facilities due to "geographic challenges" as defined by VA (Sec. 101[b][2]).[124]Residing 40 miles or less from any VHA medical facility but is either required to travel by air or water to all VHA medical facilities within the 40-mile limit, or is faced by an "unusual or excessive burden" in accessing those facilities due to "geographic challenges" as defined by VA (Sec. 101[b][2]).

In addition, the law includes a $10 billion fund for Non-VA Care as part of the Choice Program. The Choice Program is expected to operate for a period of three years or until allocated funds are exhausted. VHA expanded the scope of their contracts with HealthNet and TriWest to help administer the Choice Program.

VHA mailed Veterans thought to be potentially eligible for the Choice Program cards and a letter explaining the program; however, this lead to confusion, as all Veterans were not immediately eligible.

Policies regarding third-party coverage also cause confusion for both providers and Veterans. Rules regarding primary and secondary payers and Veteran co-payments vary depending upon the basis of the Veteran's coverage (Choice versus Non-VA Care). Understanding the basis of eligibility (such as service connectedness) adds additional complexity. Assessment C, Authorities and Mechanisms for Purchased Care at the Department of Veterans Affairs, describes the

---

[123] Note: Eligible Veterans must have been enrolled in VA health care on or before August 1, 2014 and/or eligible to enroll as recently discharged combat Veteran within 5 years of separation in addition to meeting the standards described below.

[124] Assessment C, Authorities and Mechanisms for Purchased Care at the Department of Veterans Affairs.

---

ongoing changes to VA's authorities and mechanisms for purchasing care. Assessment C's team points out that the full landscape of VHA purchase care is complicated, and they highlight the drawbacks of a piecemeal approach absent a guiding orientation and strategy for VHA.[125]

Transfer of Non-VA Care Payment Authority from VAMCs and VISNs to CBO

CBO Purchased Care manages the Non-VA Care Program, in addition to care for Veterans' dependents, Veterans overseas, and Veterans of Indian or Alaskan heritage. Prior to the Veterans Choice Act CBO did not have formal authority over operations at the VAMC. While CBO provided overall guidance to the field, each VAMC held responsibility for administering the Non-VA program. Section 106 of the Veterans Choice Act "[transferred] the authority to pay for hospital care, medical services, and other health care furnished through non-Department of Veterans Affairs providers from the VISN and medical centers of the Department of Veterans Affairs, to the CBO of the Veterans Health Administration of the Department of Veterans Affairs."[126]

The implementation resulted in the consolidation of claims processing staff, and VHA initiated an assessment of roles and responsibilities to determine re-organization under CBO. This consolidation provides CBO with the authority to standardize processes and procedures to pay Non-VA claims, and enforce related rules and regulations across VAMCs nationally. The transfer of authority to CBO was a significant challenge due to a compressed schedule, and CBO continues to work through the transition.

Special Purpose Funding[127]

In addition to consolidation of staffs, CBO now manages the Non-VA Care funds. Congress classifies these as 'special purpose' funds, meaning they cannot be used for other purposes. CBO obligates the funds and the VAMC records the obligation and accounts for the funding.

Prior to the implementation of the Veterans Choice Act, Non-VA Care funds were general purpose and included in the VAMCs' operating budget.[128] The VAMCs flexibility to shift funds is limited as a result of the special purpose funding. For example, if Non-VA Care authorizations decrease the VAMC no longer has the ability to direct funds towards other patient care initiatives.[129]

VAMCs continue to be the primary source of Veteran care. When VAMC care is not feasible or accessible VHA providers are required to seek care at other government medical facilities prior to seeking care to the private sector. As shown in Figure 7-4, VA has defined a hierarchy for care.

---

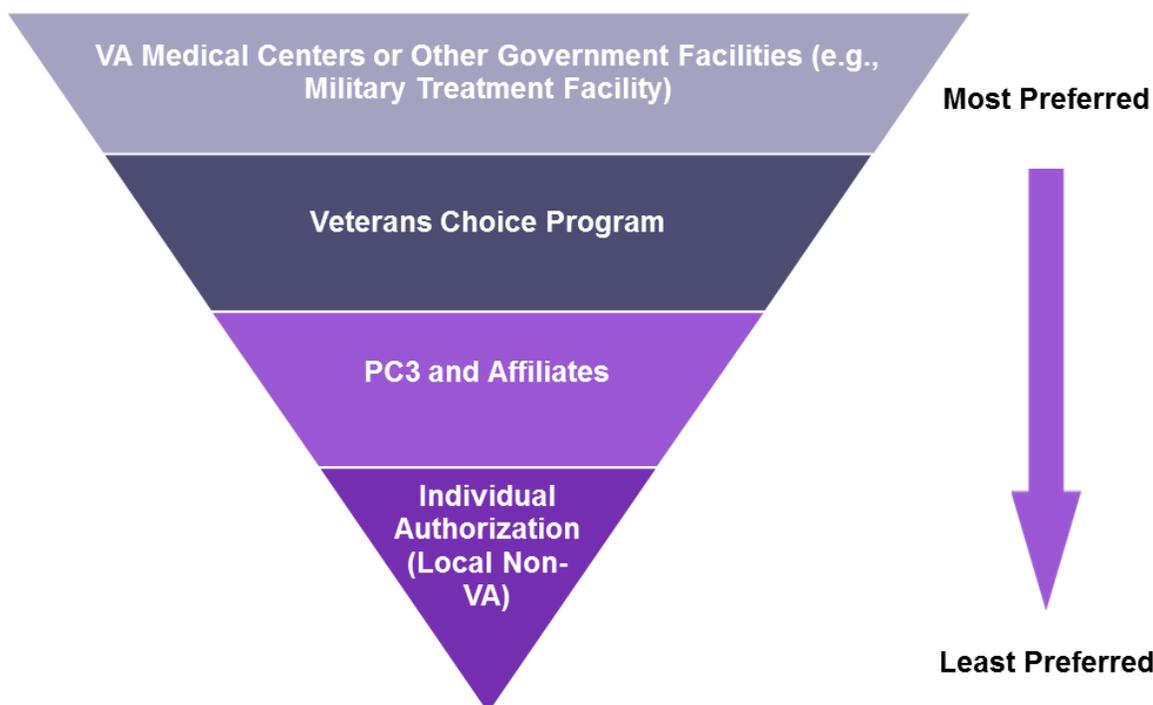
[125] Assessment C, Authorities and Mechanisms for Purchased Care at the Department of Veterans Affairs.

[126] Veterans Access, Choice, and Accountability Act of 2014

[127] Note: Further analysis of the Non-VA Care funding mechanisms was out of scope of this assessment.

[128] Qualitative Interviews with four VAMCs (Salt Lake City, Philadelphia, San Francisco, and San Antonio)

[129] Qualitative Interview with one VAMC (Salt Lake City)

Figure 7-4. Designated Sequence Order for Obtaining Care through VHA[130]


Source: Grant Thornton's rendition of VHA's designated sequence order for care based on qualitative interview

VHA has a long-standing collaborative relationship with the U.S. Department of Defense (DoD) to provide health care services to Veterans. Under a resource sharing arrangement between VA and DoD, Veterans may receive purchased care services at a DoD facility. In their report, Assessment C states in FY 2013 DoD purchased $152 million in services from VHA; and DoD provided $119 million in medical resources to VHA. While referrals to DoD facilities and providers are preferred, the location and security requirements of DoD installations limit the ability to refer Veterans to them. (See Assessment C for a detailed description of the VHA's arrangement with DoD and other government agencies.)

PC3 is the preferred method of contracting for care in the private sector. VHA centralized contract administration of the PC3 program with the intent to replace their local provider contracts. VISN and VAMC leadership is encouraged not to renew or establish local provider contracts outside of PC3. Each VAMC uses this hierarchy of care to prioritize treatment options.

7.2   Non-VA Care Assessment Approach

7.2.1   Data Sources and Analysis

As described in the methodology of this report (Chapter 2), our approach consisted of information collection and analysis. We collected a variety of qualitative and quantitative data that directed our findings and recommendations. This data includes: (1) payment timeliness

---

[130] Qualitative Interview with CBO Purchased Care Leadership in Denver, CO.

and accuracy data, (2) interest penalties data, (3) staffing and productivity data, and (4) IT systems data. Additional data sources include interviews with more than 44 Non-VA Care staff members as well as several executive interviews with VHA leadership.

7.2.2 Past Findings and Recommendations

A key part of our approach was the review of the findings and recommendations outlined in prior assessment reports. Previous reports, including VA OIG, White Papers, and Improper Payment Elimination and Recovery Improvement Act Reports, have identified weaknesses in VA's control and oversight of payments made to Non-VA entities. Our team has outlined a sample of key findings from these assessments in Table 7-2. Note that these examples illustrate the type of factors identified in recent years, and are not intended to be a comprehensive listing.

Table 7-2. Previous Non-VA Care Report Findings

Process Area	Cited Findings	2009	2010	2011	2012	2013	2014	2015
Technology	Little automation of systems affect efficiency and accuracy			White Paper				
	A centralized claims processing system will improve payment accuracy and processing timeliness						VA	
	Inefficiencies due to the fee program's decentralized structure and labor intensive payment system		OIG					
	Inefficient fee program leading to error rates than benchmarked organizations		OIG					

Process Area	Cited Findings	2009	2010	2011	2012	2013	2014	2015

7.3 VHA Does Not Have Adequate Infrastructure and Streamlined Processes to Pay Non-VA Care Claims Timely and Accurately.

As mandated in Section 201 of the Veterans Choice Act, our review focused on the timeliness, accuracy, and associated interest penalties of payments to Non-VA Care providers. The following sections describe high-level findings related to these processes.

7.3.1 Timeliness – Issues with Paying Claims Timely Exists throughout VHA

The inability to pay Non-VA Care claims timely results in a multitude of issues. Paying claims in a timely fashion is essential to attracting and retaining the community-based providers necessary to augment VA Care.

Prompt claim payment is also essential to the coordination and quality management of Veterans' health care. Most Veterans accessing Non-VA Care also receive care at VHA facilities; thus, a Veteran gets better care if VHA providers are knowledgeable about the Non-VA services the Veteran received. As Non-VA providers generally submit medical documentation with or as follow-up to their claims, this information is generally available.

Late claims payment creates liability for VHA. With Non-VA Care growing as a percentage of the total VHA budget, tracking Non-VA Care claims liabilities, including interest payments, will be increasingly important.

According to VHA policy, "90 percent of all Non-VA health care claims are processed within 30 days of the date the claim is received by the facility."[133] Our analysis shows VHA is processing approximately 70 percent of claims within 30 days, 20 percent below VHA claims payment timeliness standards. Further examination of claims payment timeliness reveals on average VHA is paying claims within 34.2 days; however, this statistic does not reflect the underlying significant variation in claims payment timeliness. With VHA's high claim volume, even a small percentage of late claims payment translates to hundreds of thousands of claims at any given point in time. Not only does this create interest penalties, it also stresses relations with the provider community, and draws negative attention that overshadows overall performance. For example, in recent testimony by Vince Leist, a representative for the American Hospital Association, before the House Subcommittee on Health for Veterans Affairs on June 3, 2015,

---

[133] VHA Directive 2010-005 – Timeliness Standards for Processing Non-VA Provider Claims.

Mr. Leist described that VHA has yet to pay an Arkansas medical center for 215 claims totaling more than $750,000 and dating back to 2011.[134]

As revealed by Table 7-3, in FY 2014, VHA paid 20.7 percent of claims 35 days or more after receipt.[135]

Table 7-3. Percent of Claims Line Items Paid by Number of Days After Receipt, FY2012 through FY2014[136]

Fiscal Year	Days										
	5	**10**	**15**	**20**	**25**	**30**	**35**	**40**	**45**	**60**	**90**
FY12	0.6%	1.3%	2.2%	2.9%	33.7%	67.1%	73.4%	77.8%	81.5%	88.1%	93.9%
FY13	1.0%	1.4%	2.8%	3.8%	34.6%	69.4%	77.0%	81.6%	85.8%	92.3%	97.3%
FY14	0.7%	1.1%	2.5%	3.7%	35.9%	70.3%	79.3%	84.0%	87.3%	92.5%	96.8%

Source: Paid and Timeliness FY12-FY14 Data

When evaluating Non-VA Care claims payment timeliness, several factors must be considered:

- VA money management policy slows claims payment and affects VHA's timeliness metrics. According to CBO, VHA holds payment of processed claims 25 days from date of receipt.[137] Table 7-3 identifies the percentage of claim lines paid by number of days for FY 2012 through FY 2014 and illustrates that VHA pays very few claim lines within 20 days of receipt.

- VHA date stamp policy results in miscalculation of processing timeframes for Non-VA Care claims. VHA policy states, "All claims should be date stamped with the date the claim is received at the facility and in those instances when the date of claim is unknown, the postmark date or date of invoice, whichever is later, should be used as the receipt date."[138] Effectively, when counting days to process a claim, the date of receipt "starts the clock" and the date the claim is approved for payment or returned to the Non-VA provider "stops the clock." When VHA returns the claim to the Non-VA provider for additional information or corrections, the clock resets to zero.

- According to interviews, due to inadequate staff and increased claims volume, VHA has experienced backlogs in scanning paper claims into FBCS. This creates the risk of an

[137] Qualitative Interview with VA's Financial Services Center (FSC). The FSC is responsible for finalizing and releasing payment to Treasury.

[138] VHA Directive 2010-005, Timeliness Standard for processing Non-VA provider claims

---

inaccurate receipt date, or possibly losing the claim. If a claim is not date stamped or scanned when received, VHA will not capture the true date of receipt with a subsequent inaccurate calculation of claims timeliness. To mitigate some of these risks, CBO implemented a daily certification in late 2014 that requires VAMCs to acknowledge having scanned all claims received that day into FBCS.

- Non-VA Care's timeliness standard for "clean" claim payment is not comparable to industry practice.[139] Per CMS, a "clean" claim is one that does not require the carrier to investigate or develop external to their Medicare operation on a prepayment basis." We note that the industry timeliness benchmark is for clean claims. Since VHA measures timeliness for all claims and not for clean claims,[140] the industry benchmark is not directly relatable to VHA; however, we have included it in Appendix D-1 as a point of reference.[141]

To better understand the variation in claims payment timeliness, we analyzed the status of in-process[142] claims (i.e., claims that VHA has received and entered into the claims processing system but has not yet finished processing) as of February 27, 2015. Our analysis measured the number and percentage of claims and days outstanding; claim value was not available. This examination revealed nearly 70 percent of claims entered the system within 30 days of receipt and had potential to be paid timely. Notably, we presume the remaining claims will be paid late.

As illustrated in Table 7-4, approximately:

- 16 percent of claims were 31-60 days old.
- 13 percent of claims were 61-180 days old.
- 1 percent of claims were more than 180 days old.

Notably, approximately 25 percent of claims are delinquent 31 to 120 days and require targeted focus.

---

[139] Medicare Claims Processing Manual Chapter 1 - General Billing Requirements, section 80.2 http://www.cms.gov/Regulations-and-Guidance/Guidance/Manuals/Downloads/clm104c01.pdf.

- "[Clean claims] have all basic information necessary to adjudicate the claim, and all required supporting documentation"

- Clean claims do "not require external development (i.e., are investigated within the claims, medical review, or payment office without the need to contact the provider, the beneficiary, or other outside source)"

[140] Qualitative Interview with CBO Purchased Care Operations Directorate

[141] Note: The calculation of claims timeliness rates: Most commercial benchmarks use in the denominator a count of clean claims only; they do not count in the denominator claims that were incomplete or submitted with invalid values, known as "dirty" claims. VA, in contrast, may not distinguish between clean and "dirty" claims when counting claims for the denominator. Counting clean and "dirty" claims in the denominator inflates the denominator and could explain in part why VA's claims processing timeliness rates are low relative to commercial benchmarks.

[142] Note: Non-VA Care refers to these claims as "Pending Claims." Industry uses the term "pending claims" to refer to claims that have been suspended due to the need for additional information from an external source such as the health care provider, facility or the member.

The skewed distribution of this claims aging report shows how over 30 percent of providers experience delays in payment and VHA is well below its claims payment timeliness performance standard of paying 90 percent of claims within 30 days.

Table 7-4. Number and Distribution of Non-VA Care Claims In-Process as of February 27, 2015[143],[144]

Days Since Receipt of Claim	Number of Claims	Percent of Claims
0-30 days	1,045,044	69.94%
31-60 days	239,740	16.04%
61-90 days	106,284	7.11%
91 to 120 days	52,340	3.50%
121 to 150 days	26,876	1.80%
151 to 180 days	10,944	0.73%
181 to 210 days	5,967	0.40%
211 to 240 days	2,516	0.17%
241 to 270 days	1,544	0.10%
271 to 300 days	620	0.04%
301 to 330 days	540	0.04%
331 to 365 days	382	0.03%
More than 365 days	1,376	0.09%
All Claims In Process	1,494,173	100.00%

VHA must consider timeliness in the context of payment accuracy, discussed further in the next section. Unless the underlying infrastructure, technology and process complexities issues are addressed, risks are high that the timeliness and accuracy issues will grow and become even more widespread. Additional analysis related to VHA timeliness of non-VA Care payments is located in the Appendix, Section A.2.3.

---

[143] Per Paid Data and Timeliness FY12-14 v2.xlsx prepared by CBO Department of Informatics; excludes Manila and VAMCs with less than 1000 claim lines

[144] Note: CBO could not readily provide the dollar values associated with these claims. CBO indicated they could provide the billed amount, but this is not reflective of amount VA pays to the Non-VA provider. As previously stated the high dollar amount would demonstrate the point above – while the percent is low, the number [and value] of the claims is high.

Table 7-5. VHA Timeliness: Percentage of Claims Processed within 30 days

	VHA Performance: Timeliness[145] All Claims	VHA Performance Standard[146] All Claims	Commercial or Other Payer Benchmark[147] "Clean" Claims
2012	66.9%	90%	96%
2013	69.3%	90%	96%
2014	70.2%	90%	96%
Note: The commercial benchmark uses "clean claims," (i.e., claims that do not require additional documentation from the Non-VA provider. VHA's benchmark uses all claims and VHA cannot track clean claims; therefore, VHA is unable to generate claims payment timeliness statistics in the same manner as industry).			

7.3.2 Accuracy – VHA Payment Accuracy is Lower than Private-Sector Benchmarks.

Only six of 21 VISNs met VHA standard and the industry standard benchmark for payment accuracy. Since 2009, VHA improvements have increased accuracy rates from 83 percent to 91 percent in 2014; however, that is still lower than the VHA standard of 98.5 percent.[148]

Paying claims accurately is essential to VHA's financial management, in addition to disciplined stewardship of taxpayer dollars. Overpayments result in unnecessary expenditures; whereas underpayments could result in unanticipated claims liabilities and higher administrative costs associated with payment adjustments.

In addition, inaccurate payments further hinder relationships with Non-VA providers, requiring the provider to spend, for example, time on the phone with provider services staff tracking claims status and correcting and resubmitting claims. Frustrated community-based providers may not be willing to treat Veterans if issues persist.

Accuracy rates were calculated as part of the Improper Payment Elimination and Recovery Improvement Act (IPERIA) reports based upon the rate of inaccurate payments on a statistically valid sample.[149] Our team compared the accuracy of Non-VA Care claims payment to commercial health care industry standards and practices and to IPERIA performance standards. We summarize VHA's performance in claims payment accuracy in Table 7-6.

---

[145] "Timeliness" rate derived from Informatics team email: "RE: Data Request and discussion regarding denial data" on 3/4/2015: Accuracy as % of paid = "Claims < 30 days" /"Total claims"

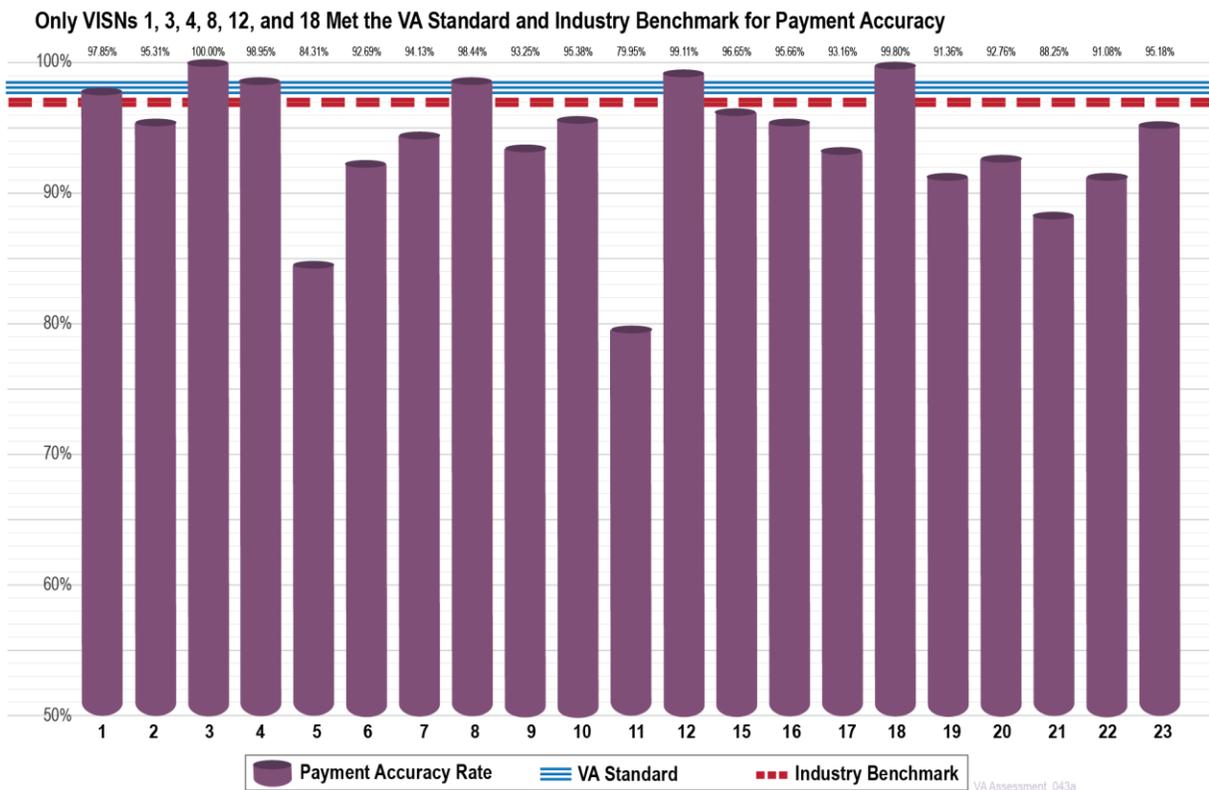
[148] FY 2009 VA Performance and Accountability Report (PAR): http://www.va.gov/budget/report/

[149] FY 2014 Improper Payment Elimination and Recovery Improvement Act Report identifies a listing of events categorized as inaccuracies.

Table 7-6. VHA Accuracy of Payment

FY	VHA Payment Accuracy[150]	VHA Performance Standard	Commercial or Other Payer Benchmark[151]
2012	88.0%	98.5%	97%
2013	90.35%	98.5%	97%
2014	90.76%	98.5%	97%

Figure 7-5. Payment Accuracy Rate by VISN[152]


Source: FY2014 IPERIA Data

VHA's low rate of payment accuracy is attributable to the high degree of manual intervention required to process a claim. Currently, VHA does not have the capability to "auto-adjudicate" a claim, meaning VHA staff make are required to make complex decisions regarding eligibility and

---

[150] Accuracy (IPERA Reports 2012-2014) claims payment processing compliance with established VA pricing and payment methodologies, policies, handbooks, and regulations.

[151] RSM McGladrey 2013 Report of Lead Regulators, UnitedHealthcare

[152] Per Request-Accuracy.xlsx. This workbook includes FY2014 IPERIA data for each sample reviewed. To arrive at these figures from the raw IPERIA testing data, the team divided the sum of the improper payment amount by the sum of the amount sampled/paid for each VISN.

The views, opinions, and/or findings contained in this report are those of Grant Thornton should not be construed as an official government position, policy, or decision.

pricing. Furthermore, VHA staff members make these decisions without comprehensive and standardized procedures guides.[153] Refer to sections 7.6 and 8.4 for more information regarding the root-causes of payment errors.

To ensure accuracy of claims payment, one VAMC within VISN 8 conducts extensive pre-authorization and pre-payment reviews of each claim, resulting in an FY2014 error rate of less than one percent.[154] While this is a best practice, these reviews require Non-VA Care program subject matter expertise and they may not be repeatable at all VAMCs. A comprehensive training program for supervisors would increase the likelihood of successful implementation at other VAMCs.

On March 2, 2015, VA's Inspector General reported as of August 2014, VHA had spent $73.8 million of the $92.8 million required to develop and implement a new processing system to correct many of these issues. Work ceased upon discovery that incorrect funding appropriations were allocated for this procurement. The report indicates VHA established a target date of June 30, 2015 for correcting the appropriations issue.[155] The outcome of this was not available at the time of publishing.

7.3.3 Findings and Recommendations for Timeliness and Accuracy

The processes and effective execution of key activities, both from timeliness and accuracy perspectives, are essential to maintaining the network of providers necessary to keep America's health care promise to our Veterans. The infrastructure part of this finding includes the lack of documented guidelines and procedures, inadequate technology and tools, and insufficiently trained and inadequate number of staff coupled with the highly complex, and inconsistent rules spread across VHA and outlined in Assessment C.

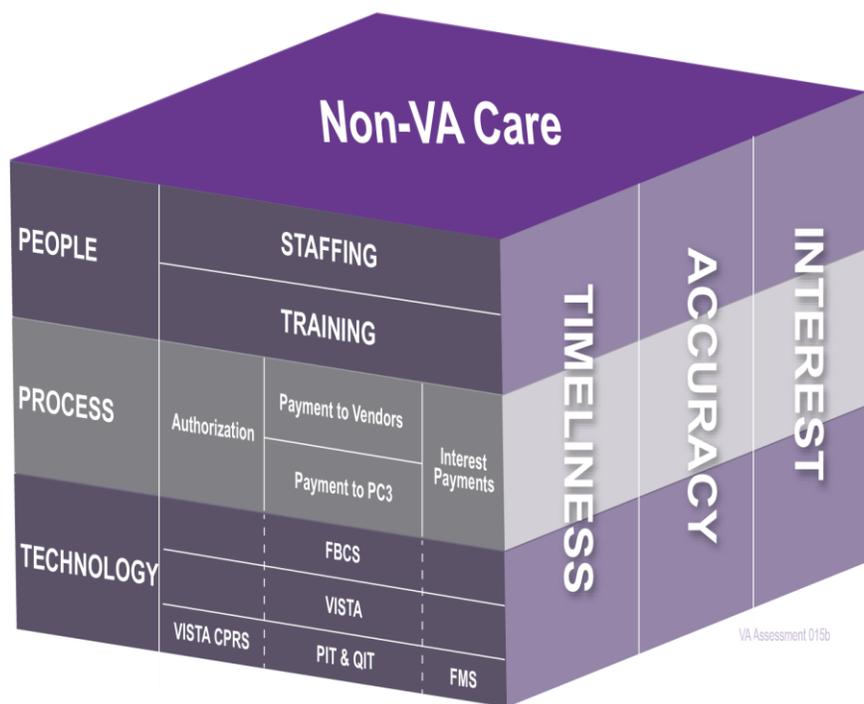
The following section discusses root causes and major sub-findings that contribute to this overarching finding, as well as our recommendations for improvement to timeliness, accuracy, and penalties discussed above. The drivers of Non-VA claims payment performance on timeliness, accuracy, and interest payments are people, process, and technology, as illustrated in Figure 7-6. The following section discusses people and process findings and recommendations. Chapter 8 discusses Non-VA Care technology.

---

[153] FY 2014 Improper Payment Elimination and Recovery Improvement Act Report identifies a listing of events categorized as inaccuracies. Per Interviews with CBO Business Systems Management Directorate and four VAMCs.

[154] Ibid.

[155] OIG Report 14-00730-126, Reviewed of Alleged Misuse of VA Funds to Develop the Health Care Claims Processing System, March 2015

Figure 7-6. People, Process, and Technology Tied to Timeliness, Accuracy, and Interest Payments


Source: Grant Thornton's rendition of VHA's people, process, and technology component for Non-VA Care

Non-VA Care procedures for processing claims are complex, often confusing, and lead to the inaccurate and untimely claims payments. Assessment C provides detailed information on the complexities of care authorities. Unlike the insurance industry Non-VA claims processing staff must manually determine eligibility, interpret authorities (benefits), apply the correct payment rate, and interpret system edits. The authorities governing Non-VA Care and service connected disability determination require careful interpretation and are difficult to translate from requirements to operations. We organize our findings and recommendations for timeliness and accuracy into the sections below:

- 7.3.4 Claims Submission Requirements
- 7.3.5 Process for Authorizing Non-VA Care
- 7.3.6 Patient Centered Community Care (PC3)
- 7.3.7 Preventing Inaccurate Payments.

7.3.4   Claims Submission Requirements

In the typical provider and a payer transaction, payers are responsible for furnishing guidance on claims submission requirements. This includes specialized instructions for unique rules relevant to the payer. Private-sector payers typically develop a Provider Manual (often referred to in the industry as an 837 companion guide) to describe detailed instructions on how to submit claims for reimbursement. These manuals are often hundreds of pages, available online

with search capabilities, and address comprehensive and detailed requirements and billing scenarios. [156]

Findings

1. **Inadequate Non-VA Care Claims Submission Guidance Contributes to Increased Workload and Payment Errors.**

- Non-VA providers lack access to VHA's detailed billing, authorization and clinical documentation requirements, leading to increased workload for VHA staff and Non-VA staff, and inadvertent duplicate billing and payment. Lack of provider education increases the risk of erroneously billed claims and affects claims backlogs as the Non-VA providers resubmit for unpaid services. VHA does not publish a provider or a billing manual. If a provider inquires about instructions to bill VHA staff typically recommend following Medicare guidance, which is not completely applicable to Non-VA Care. CBO understands the need to create a provider and billing manual, however a manual is not in development and we were unable to determine a date for publishing one.

- Non-VA providers are directed to CBO's website which includes a link to the VHA Provider Guide, an overview of how to work with VHA.[157] While the VHA Provider Guide documents high-level instructions to bill VHA, it does not provide billing instructions related to the multitude of scenarios and requirements facing Non-VA providers. We asked Non-VA Care supervisors for the guidance given to providers, and they referenced the VHA Provider Guide. The Provider Guide instructs providers to bill based on Medicare requirements; however, there are some critical differences between VHA and Medicare, specifically regarding eligibility and documentation requirements.

Table 7-7. Examples of Billing Differences between VHA and Medicare

Type of Claim	Medicare Policy	VHA Policy
Dental Claims	"Medicare doesn't cover most dental care, dental procedures, or supplies, like cleanings, fillings, tooth extractions, dentures, dental plates, or other dental devices. Medicare Part A (Hospital Insurance) will pay for certain dental services that you get when you are in a hospital. Part A can pay for inpatient hospital care if you need to have emergency or complicated dental procedures, even though the dental care is not covered."[158]	VHA pays service-connected dental claims.

---

[156] Peter Kongstvedt "Essentials of Managed Care" Fifth Edition, 2007 Pg 393.

[157] Working with Veterans Health Administration: A Guide for Providers - http://www.va.gov/PURCHASEDCARE/docs/pubfiles/programguides/NVC_Providers_Guide.pdf

[158] Medicare Dental Information http://www.medicare.gov/coverage/dental-services.html

Type of Claim	Medicare Policy	VHA Policy
Maternity Claims	Most people on Medicare are age 65 and older so the program is not usually associated with childbearing. As a result, Medicare guidance for maternity related claims is minimal.	VHA will reimburse for maternity care.

- Lack of provider education increases the risk of erroneously billed claims, resulting in claims backlogs as the Non-VA providers resubmit for unpaid services. Multiple VAMCs indicated that some Non-VA providers periodically resubmit the claims until VHA pays.[159] This adds to the backlog of claims, increases processing time, and the risk of paying for the same services twice. According to paid and denial data provided by CBO, VHA paid 54.1 percent of submitted claims in calendar year 2014, meaning 45.9 percent of claims were returned to Non-VHA providers to correct an error on the claim.[160] One Non-VA provider's billing staff indicated that VHA denies 58 percent of that Non-VA provider's claims.[161] Figure 7-7 shows the percentage of submitted Non-VA Care claims paid by each VISN.

---

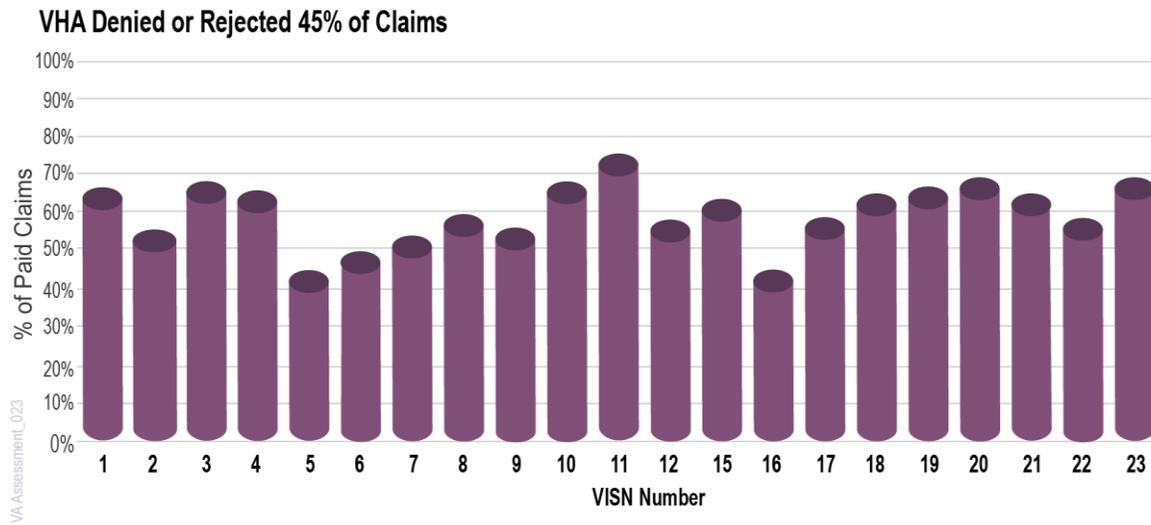
[159] Note: VHA currently does not have a standard for the percentage of claims (or claim lines) that should pay. The commercial benchmark cited here is for professional claim (i.e., CMS-1500 claims submitted by medical practitioners) lines, whereas VHA's performance is based on all claims (i.e., professional, facility, dental and pharmacy claims). We could not directly compare VA's performance to the commercial benchmark because of limitation in the data available.

[160] Per CBO File "Paid Denied or Rejected data thru 4-30-15.xlsx". See previous discussion on performance compared to commercial benchmark.

[161] Qualitative Interview with Non-VA provider billing staff in Salt Lake City, Utah

---

Figure 7-7. CY 2014 Percentage of Submitted Claims Paid[162,163]

VHA Denied or Rejected 45% of Claims


Source: CY14 Paid, Denied, or Rejected Data

- Policies regarding third-party coverage have also caused confusion for both providers and Veterans.[164] Rules regarding primary and secondary payers and co-payments vary depending upon the basis of the Veteran's coverage (Choice versus Non-VA Care, for example) and understanding the basis of eligibility (such as service connectedness) adds further confusion.

- Duplicate claims unnecessarily increase volume and workload for Non-VA Care staff and exacerbate VHA claims payment timeliness issues. Non-VA Care providers submit duplicate claims because they:[165]

  o Cannot determine the status of a claim

  o Are not paid on time

  o Are instructed to submit the claim to the VAMC closest to the Veteran's home Zip Code regardless of which VAMC is responsible for processing that claim

  o Resend claims when they submit medical record documentation to support the original claim.

2. **Policy complexity for Staff and Non-VA Providers Results in a High Risk of Improper Payments and Causes Confusion, Inefficiencies, and Errors in a Manual Environment.**

---

[162] Per CBO File "Paid Denied or Rejected data thru 4-30-15.xlsx". See previous discussion on performance compared to commercial benchmark.

[163] Note: Paid, denied, and rejected claims were not tracked for the entirety of FY 2014; therefore, CY 2014 was the only full year of data available.

[164] Per Interviews with four VAMCs and two Non-VA provider billing staffs

[165] Ibid.

- Complex rules and disparate processes result in inconsistencies in authorization and payment practices. Without standardized processes and procedures claims clerks conduct complex assessments inconsistently across VAMCs, potentially leading to inaccurate payment. Unclear authorizations lead to confusion among Non-VA providers and potential payment for unauthorized services.

- According to the 2014 IPERIA report, 27.2 percent of all improper Non-VA Care payments were the result of claims clerks selecting the wrong payment schedule. The second highest cause of improper payment was incorrect assessments regarding Veteran eligibility) 10.7 percent). The third highest case of improper payment was selection of the wrong care authority at 7.8 percent.[166] In addition, claims clerks have to interpret, and in many cases override, complex system edits without any point of reference, such as a procedure guide due to system limitations. One site developed a local "cheat sheet" to help guide the claims clerk through these scenarios.

- A 2009 OIG report on VHA's patient fee care program states "VHA does not have a centralized source of comprehensive, clearly written, current policies and procedures for the [Non-VA Care Program]. Instead, Non-VA Care supervisors and staff rely on an assortment of resources that contain some policy, technical guides for the VistA Fee system, training materials, and informal guidance, such as conference call minutes."[167] Since the 2009 OIG audit, VHA reported all recommendations and proposed actions were completed. However, we observed VHA continues to struggle with these challenges, indicating lack of sustainability in changes implemented. The recent transfer of responsibility to CBO under the Veterans Choice Act provides an excellent opportunity for VHA to develop and successfully implement standardized processes and procedures.

- The lack of standardized processes and procedures prohibits VHA from developing consistent keystroke-level training on a national scale. While there is general, high-level training and guidance to help the claims clerk understand Non-VA Care, there is no detailed training to instruct the claims clerk on how to process and pay claims. Every location, whether a local VAMC or consolidated VISN payment center, processes claims with slight variations; therefore, every location has unique training needs. The best practice is to have detailed and standardized internal processes and procedures.[168]

- VHA cannot establish productivity standards and monitor employee performance because its processes are not consistent across VAMCs and VISNs. For example, some VAMCs appear to have the claims clerks work closely with the authorization personnel and involved in care coordination, while others do not. Some claims clerks are more involved in "provider relations" activities than others. Additionally, claims clerks work on all types

---

[166] FY 2014 IPERA Report (Final) Pg. 6

[167] OIG Audit of Veteran's Health Administration's Non-VA Care Outpatient Fee Program, Report No. 08-02901-185, August 3, 2009

[168] Essentials of Managed Health Care, Fifth Edition By Peter Reid Kongstvedt Page 413 "Discreet policies and procedures are required for all claims capability tasks…They should be thorough in that they account for every single step in a process. Thoroughly reviewing and documenting processes helps to reveal inconsistencies or gaps in claims processes that compromise quality and/or efficiency"

---

of claims that require varying levels of effort. Some claims clerks process only authorized claims while others work both authorized and unauthorized. In some cases, even outpatient and inpatient claims are divided among claims staff.

- Inconsistencies extend beyond processes and procedures to department naming conventions. From facility to facility, departments with the same operational responsibilities often have varying names and position descriptions, leading to Non-VA provider confusion. For example, four VAMCs referred to the authorization and scheduling department for Non-VA Care by four different names: Patient Administration Services (PAS), Health Administration Services (HAS), Business Service, and Non-VA Care Coordination.

- Adding to the complexities that characterize traditional Non-VA Care, VHA staff now struggle to understand new Patient Centered Community Care (PC3) and Choice Program requirements. Although the same vendors operate PC3 and Choice, the procedures and related legislative requirements are inconsistent across these two programs. For example, VHA creates the authorization for PC3-related care, whereas HealthNet or TriWest creates the authorization for Veterans Choice Program-related care. These nuances create confusion for VHA staff, vendors and Non-VA providers, leading to risk of untimely and/or inaccurate payment.

- VHA has not updated official Non-VA Care employee handbooks since 2008, and the best practice is to update the official handbooks continuously.[169] CBO officials indicated they are in the process of creating standardized processes and procedures, but the extensive vetting process of draft guidance (e.g., reviews by General Counsel, CBO, and Program Offices delays the issuance of any guidance). To mitigate the lack of updated handbooks, CBO developed operational plans and procedures, which do not require the same degree of vetting; however, CBO does not enforce these plans and procedures. Ultimately, the lack of clear direction, at a national level, leaves individual facilities to develop their own, individualized processes.

Recommendations

To address these findings, CBO should:

- Develop a comprehensive online Provider Guide (that includes an 837 companion guide and billing manual) to offer Non-VA Care providers detailed instructions about how to bill VHA. Doing so will reduce duplicates, rejections, inquiries, administrative burden on Non-VHA providers, and increase timeliness and accuracy of payment. When a claim is submitted correctly the first time, the claims clerk can spend more time processing payments instead of following up with Non-VA Care providers. Non-VA Care provider billing manuals will ultimately lead to better relations with Non-VA providers.

---

[169] Peter Kongstvedt "Essentials of Managed Care" Fifth Edition, 2007 Pg 413 "One cannot overstate the value of thorough, well-written, cross-functional, current, and accessible policies and procedures"

- Create a provider portal so that providers can routinely check the status of submitted claims.

- Create a centralized call center with dedicated staff to answer Non-VA provider questions. The frequency and purpose of the calls, as well as the call notes and outcomes, should be available across VHA so that claims clerks, supervisors, and authorization staff can access that information if they need to. Creating a centralized call center will allow claims clerks to focus more time on the processing and payment of claims, leading to improved timeliness and accuracy.[170]

- Leverage existing Veteran education programs, using multiple media and mediums to reach Veterans. Several changes affecting Non-VA Care processes have occurred since implementation of the Choice Act, such as the consolidation of staff under CBO and the implementation of the Choice Program and its related business processes.

- Adopt a single set of practices and guidance for authorizing and paying Non-VA claims (including PC3 and Choice Program requirements). Review and evaluate the existing authorization and claims processing procedures at high performing facilities and interview industry experts to determine best practices. Develop sustainable keystroke-level training to reinforce practices and guidance.

- Conduct ongoing compliance reviews to ensure effective implementation of the processes and procedures.

- Apply consistent naming standards across departments responsible for authorization and payment.

- Explore alternative business models to address administrative portions of Non-VA Care claims processing.

7.3.5 Process for Authorizing Non-VA Care

Finding

1. **Authorization requirements for Non-VA Care are unclear and inconsistent among VAMCs.**

- The authorization directs the Non-VA provider to render the treatment the Veteran requires and approved by VHA.[171] Authorizations should be clear and concise to ensure there is no misunderstanding between VHA and the Non-VA provider. Considerable claims do not reflect care authorized, leading to risk of improper payment. Unclear

---

[170] Peter Kongstvedt in Essentials of Managed Care cites, "The advantage of a centralized call center is that the customer service representatives are trained to respond to all sorts of issues, not just claims-related problems, and a disadvantage is that additional extensive training on how claims are adjudicated may be needed to fully prepare customer service representatives to respond to claims inquiries. Furthermore, care must be taken to segregate claims adjudication production task from call center task to ensure appropriate focus."

[171] VHA requires 100 percent authorization, whereas industry best practice does not. Other organizations of similar size authorize a very small percentage of care.

---

authorizations lead to confusion among Non-VA providers and potential risk of improper payment for unauthorized services. CPT codes are the most widely used medical nomenclature used to document medical procedures and services.[172] Currently, authorizations include a brief, qualitative description of the authorized services, whereas industry best practice is to include the applicable Current Procedural Terminology (CPT) code or range of CPT codes. The CPT codes will allow the Non-VA provider some flexibility in treating the patient, but will eliminate any questions with regard to the care authorized.

- The use of vague language in authorizations can lead to misinterpretation by the provider delivering the care and VHA staff paying the claim. When Non-VA providers deliver and bill for services outside of the care authorized by VHA, improper payments result in use of resources that otherwise would be available to provide Authorized Care to Veterans. Over-payment recovery increases VHA's administrative overhead.

Recommendations

To address these findings, CBO should:

- Incorporate applicable CPT codes or ranges of CPT codes on the authorization to provide more clear and concise direction to the Non-VA provider. Adopting this industry best practice will enable VHA to reduce potential misinterpretation and risk of paying for services not authorized.

- Analyze and routinely report the reasons for referrals for Non-VA Care nationally. There is a standardized list of categories for authorizations for Non-VA Care. Analyses of these referral reasons will help VHA assess the need for Non-VA Care by clinical category, VAMC, and VISN. These analytics will also help inform VHA about clinical shortages, the demand for Non-VA Care, the need to expand the PC3 networks, and anticipate increases in Non-VA Care claims volume, staffing requirements and resource allocation.

7.3.6 Patient Centered Community Care (PC3)

Since PC3 is an evolving program, we assessed relevant business processes. We supplemented results of our site visits and data analysis with insight from both PC3 vendors, TriWest and HealthNet. The following are related findings and recommendations.

Finding

2. **Patient Centered Community Care (PC3) is experiencing challenges in scheduling appointments and meeting administrative requirements of the PC3 vendor contracts.**

- VHA created PC3 to expand care to Veterans, especially in rural areas, and facilitate collection of medical documentation. We found the PC3 vendors experience challenges

---

[172] Per American Medical Association. (2015). About CPT. Retrieved from http://www.ama-assn.org/ama/pub/physician-resources/solutions-managing-your-practice/coding-billing-insurance/cpt/about-cpt.page?

similar to those of traditional Non-VA Care—difficulty in arranging Non-VA Care for Veterans and retrieving medical documentation related to care provided outside of VHA facilities.

- HealthNet and TriWest have yet to establish adequate networks in to handle the volume or type of authorizations from VHA, resulting in an increased administrative burden and delayed access to care.[173] For example, of the 156 referrals one rural VAMC sent to the PC3 vendor, approximately half returned without action as the vendor's network of providers was unable to accommodate to the appointment. The 2015 OIG report on PC3 supports this point:

   "Neither PC3 contractor had established adequate provider networks. The PC3 contracts required full implementation of the networks in all six provider regions by April 2014. However, the PC3 Contracting Officer issued corrective action letters faulting the respective contractors for inadequate provider networks in February, May, and September 2014." The report continues, "At one VHA medical facility, staff stated they only authorized non-urgent care such as ophthalmology under PC3 because they could not rely on the PC3 contractor to schedule appointments for other medical services due to a shortage in network providers."[174]

Three of four VAMCs visited indicated many providers are reluctant to join the PC3 network because of low reimbursement rates.[175] Assessment C indicates the PC3 vendors reimbursement rates are below Medicare.[176]

- When HealthNet or TriWest are unable to schedule an appointment, they return the authorization to VHA. VHA is ultimately responsible for providing the care or using alternative Non-VA Care means. This adds to VHA's administrative burden and delays the Veteran's access to care while the PC3 vendor determines whether it has an available provider.

- HealthNet representatives indicated challenges building a network because it has to compete with already established local contracts with VHA facilities. These contracts often pay a higher percentage of Medicare reimbursement and have fewer administrative requirements than PC3.[177,178] To mitigate this issue, CBO directed local VAMCs not to enter into any new agreements with local Non-VA providers. This will reduce competition among VHA's Non-VA Care programs once the local contracts expire.

---

[173] Note: The evaluation of the adequacy of the PC3 agreements was beyond the scope of this assessment.

[174] VA OIG Review of VA's Patient-Centered Community Care (PC3) Contracts' Estimated Cost Savings Report – April 28, 2015

[175] Per interviews with three VAMCs

[176] Assessment C, Table 1-1

[177] Qualitative Interviews with HealthNet and TriWest Leadership

[178] Note: VHA pays Medicare rates for services unless they have a pre-established contract with a provider.

- HealthNet and TriWest do not return medical documentation to VHA in a timely manner, leading to payments that are inconsistent with the terms of the PC3 contract. The PC3 contract stipulates, "For [medical services] claims to be considered for payment they must include required medical documentation."[179] The contract goes on to stipulate, "All submitted claims must have sufficient medical documentation to support the payment of the claim."[180] According to the Return of Medical Documentation audit, the vendors provided only 79 percent of the documentation in accordance with the contract.[181] They submitted 19 percent late and did not submit 2 percent of the required documentation. Failure of the PC3 vendor to provide medical documentation prevents VHA physicians from having up-to-date clinical information. In addition to the contract compliance issues lack of medical documentation can affect coordination of care and future clinical services.[182]

- One PC3 vendor reported challenges administering the PC3 program due to inconsistencies in business process across VAMCs. For example, the vendor reported authorizations differ from one location to another and, as a result, the same documentation issued by two different VAMCs can reflect two different intents. Thus, the vendor faces challenges interpreting the authorizations and applying standardized business processes nationwide.

- Assessment C provides a detailed overview of the challenges associated with administering the Non-VA care programs.

---

[179] Per VHA Contract with HealthNet - B.3 PWS Section 2. Healthcare Resource Network i. Return of Medical Documentation

[180] Per VA's contract with HealthNet, page 21 and PC3 Contract page 45 which states, "Medical documentation recording an authorized episode of outpatient care (see section 2.h.iii Quality Assurance and Surveillance Plan) shall be submitted to VA within 14 calendar days after completion of the initial appointment. If additional appointments are conducted, medical documentation shall be submitted to VA within 14 calendar days upon completion of the episode of care. Medical documentation recording an authorized episode of inpatient care shall be submitted to VA within 30 days after discharge. Critical findings have sooner report requirements as described in section 2.g.iii.1 of this PWS. The authorization may request medical documentation be returned sooner than 14 calendar days based on clinical need. Communication of information by telephone may be required when results or clinical findings necessitate an urgent response. This shall be followed up by submission of complete medical documentation within 14 calendar days. Contractors shall not bill VA until they have submitted medical documentation for both inpatient and outpatient care to VA. VA will consider exceptions for highly unusual circumstances. This process will be audited on a regular basis. Contractors may request access to VA's Computerized Record System (CPRS)". See Section B.4 for IT contract security requirements.

[181] CBO Departments of Audits and Internal Controls (DAIC) Patient Centered Community Care Review of PC3 for Return of Medical Documentation, September 4, 2014

[182] Per VA contract with HealthNet, VA did not provide a copy of Attachment A, which details Implementation Plan and Performance Based Payment Milestone Schedule, so we are unable to assess the degree to which these claims processing performance issues might affect incentive payments paid or performance penalties were assessed by VA to PC3 vendors.

Recommendations

To address these findings, CBO should:

- Review the terms of VHA's contracts with HealthNet and TriWest to verify documentation of network adequacy and medical documentation requirements, and VHA has the ability to hold them accountable. If so, VHA should enforce the terms governing network adequacy, billing and the provision of documentation. For example, VHA should hold PC3 payment until it has received the medical documentation corresponding to the claim at hand. If VHA's PC3 vendor contracts do not contain network adequacy and medical documentation performance standards and penalties, they should be amended to include them.

- Work with VAMCs to ensure standardization and centralization of provider contracting. Assessment C notes the need to assign responsibilities to organizations at the appropriate level of VHA's administrative hierarchy, and argues for central management of contracts (such as those under Choice and PC3).[183]

- Allow PC3 vendors to enter electronic medical documentation received from Non-VA Care providers directly into the VHA system. Doing so would eliminate the additional processes of printing, scanning, and uploading these documents by the Non-VA Care staff.

- Assess alternatives for increasing utilization of Medicare's network of providers, expanding the network of physicians and potentially reducing the expense of developing a separate network for different sets of government beneficiaries.

7.3.7 Preventing Inaccurate Payments

Driven by its manual claims adjudication process, VHA is at risk for making improper payments. To mitigate those risks, VHA has implemented a number of oversight and quality assurance practices such as internal reviews and sophisticated claims scrubbers. To understand the breadth of processes in place to reduce improper payments we requested all post payment audits and reviews conducted by VHA oversight groups for the last three fiscal years.

Findings

1. **Proactive and retrospective processes are in place to find inaccurate payments, but these practices are highly manual and there is little evidence to show how effective some mechanisms are.**

- VHA generates routine reports on claims accuracy. Internal audit teams routinely review processes and procedures to further reduce and prevent fraud, waste and abuse, and improve payment accuracy. The audit teams follow up with the VAMCs understand the root cause of errors and assist in the implementation of corrective actions. These reviews and audits monitor improper payments they are retrospective in nature; therefore, VHA

[183] Assessment C.

must invest time and money to recoup overpayments to Non-VA providers identified through these reviews and audits.

- There are a number of edit checks and quality reviews prior to payment, such as those performed with the Quality Inspector Tool (QIT) and Program Integrity Tool (PIT). These tools represent positive steps toward improving program integrity and accuracy, but they are labor intensive and can distract from claims processing, leading to an increase in the backlog. According to one VAMC, the QIT tool requires manual retrieval of two separate reports from FBCS that can take as long as four hours per day. One VAMC indicated that it has dedicated a full FTE with the sole responsibility of running the QIT tool. Another VAMC questioned whether the QIT tool identified the full spectrum of errors. This particular VAMC implemented a more robust pre-payment review process and as a result had an improper payment rate of less than one percent for FY2014.[184] This performance is a best practice among VAMCs; however, the processes are reliant on Non-VA Care subject matter experts and may not be repeatable among all sites.

- While there are a number of pre- and post-payment review and oversight practices in place, they are the result of the manual process for adjudicating claims. With a more automated approach, edits are performed automatically in the system; thereby, reducing manual intervention and risk of improper payment.

Recommendations

To address these findings, CBO should:

- Improve current pre- and post-payment review and oversight practices so VHA is using the most effective technological tools and practices with emphasis on automated pre-payment edit techniques.

7.4   Penalties – VHA is at Risk for Penalty Payments to Vendors Due to Timeliness Issues.

Federal and state laws mandate health insurers pay provider claims promptly. The Prompt Payment Act requires federal agencies to pay vendors in a timely manner and stipulates interest penalties be applied to late payments. When VHA enters into a contractual agreement with a Non-VA provider, it is subject to the Prompt Payment Act. If VHA does not reimburse the contracted provider within 30 days of submitting a <u>clean</u> claim, VHA must pay the state mandated interest rate for each day the payment is delinquent.[185]

The contract between the insurer, in this case, VHA, and the provider submitting the claim may contain provisions regarding claims payment timeliness and penalties for late payments. Driven

[185] Note: Interest payments are calculated automatically in FMS based on Prompt Payment Act requirements. Interest rates may vary every six months.

by these prompt payment requirements, interest penalty payments are another indicator of an insurer's timeliness of claims payment.

Minimizing interest penalty payments is important in effectively managing the finances of VHA. These penalties are expenditures that otherwise could be used for patient care. Commercial payers typically monitor interest payments very closely to ensure minimal costs and effective financial management. VHA does not track or monitor interest payments at the VAMC level. CBO staff at the VAMCs should be aware of the claims that are subject to interest.

VHA measures interest penalty payments in terms of dollars and as a percent of claim payments. VHA's current standard with regard to interest is $300 per $1 million, or .03 percent, in paid claims. We compared Non-VA Care interest payments to commercial health care industry standards and to other government payers. Table 7-8 also shows interest payments as a percent of total claim payment during the past three fiscal years. Interest payments have decreased in the last three years from $425,704 in FY12 to $292,217 in FY14. In 2014, VA incurred $292,217 in interest penalties on $5,580,590,777 of paid claims.

Table 7-8. Interest Penalties on Late Payments

FY	VHA Performance: Interest Percentage[186]	VHA Performance Standard	Commercial or Other Payer Benchmark[187]
2012	.009%	.03%	0.8%
2013	.004%	.03%	0.8%
2014	.005%	.03%	0.8%
