CVT could also be leveraged to address inequities in access across geographical regions. For example, in VISNs such as VISN 3, 5, 10, and 17, where projected growth in demand is expected to be greater than the growth in supply (that is, workforce), telehealth might be used to redistribute that demand to other VISNs where supply might less of an access constraint, such as VISNs 8, 21, and 22. However, currently, 96 percent of all clinical video telehealth encounters occur within the same VISN (VA, 2015e). Increased use of CVT might be further targeted toward certain specialties within those VISNs that face significant capacity issues and are suitable for telehealth care, such as rheumatology, otolaryngology, and dermatology.

Clinical video telehealth might also indirectly improve access to care over the long term: As new users who previously lacked access to care realize better health outcomes and require fewer services over the long term, resources could then be reallocated to other parts of the system with greater needs. In previous studies of VA comparing telehealth to routine care, telehealth has been shown to reduce hospital, nursing home, and emergency/urgent care utilization (Begg et al., 1998), as well as primary care and outpatient need-based visits (Barnett et al., 2006b; Chumbler et al., 2005).

Fiscal impact. The costs of securing additional exam space, hiring staff, and purchasing the necessary equipment to expand telehealth in VA are likely to be significant. VA might be able to repurpose existing clinic and administrative spaces for telehealth but may still be constrained by the overall lack of space and persistent difficulties in hiring and training providers. However, if the capital investment were made, it is possible that cost savings would be realized over time (LeRouge & Garfield, 2013). A growing body of evidence highlights the cost-effectiveness of telehealth interventions related to decreased utilization of in-person care, including inpatient and outpatient care, pharmacy, and diagnostic tests (Baker et al., 2011; Cryer et al., 2012; Rojas & Gagnon, 2008; Rosenberg et al., 2012). In addition, telehealth has the potential to significantly reduce Veterans' costs pertaining to travel time, waiting time, and time off work (Field, 1996); telehealth initiatives from VA Office of Rural Health saved Veterans almost 8 million miles in travel in FY 2014, or approximately 38 miles per telehealth encounter.

Stakeholder acceptability. Patients and providers have been generally supportive of telemedicine as a cost-effective approach to increasing access to care. Patient satisfaction has consistently been high (Abrams & Geier, 2006; Allen & Hayes, 1995; Gustke et al., 2000; Hunkeler et al., 2000; Janca, 2000), indicating that public support of this relatively new technology is likely growing. Although further research is needed, some studies have also described provider satisfaction with health care delivery through telemedicine modalities (Kavanaugh, 1995; Weinstock, Nguyen, & Risica, 2002; Richards, 2005; Guillen, 2002; Larcher,

2002). This level of support suggests that the option to expand virtual access via telehealth would be politically feasible.

Operational feasibility. Expanding clinical video telehealth will likely involve several challenges, which Assessment H addresses. Expansion would likely require hiring additional staff, including clinicians who are trained in providing telehealth care, clinical support staff to collect medical data or administer certain procedures, and trained technicians to help set up the appointment and equipment (for example, an EKG for TeleCardiology) and provide technical support. Concrete steps are needed to address the problems with the transmission and assimilation of information (discussed in Subsection 3.5.4.2), as well as the exchange of data among providers, settings, and facilities (discussed in Subsection 3.5.5). Each telehealth site will need the necessary space in an environment where securing adequate exam and office space is already a significant challenge. Moreover, those spaces require audiovisual equipment, secure wireless Internet capabilities, and related diagnostic equipment. Finally, the administrative feasibility of this option is limited by the ability of VA's data network to respond to increased demands (Darkins et al., 2008). The organization will likely need to allocate dedicated network capacity to its telehealth program going forward and to be responsive to issues as they arise to ensure efficient workflow and provider productivity. In one study, clinicians reported spending considerable time responding to technical and connectivity problems instead of providing care (Hopp et al., 2006). In addition, interviewees noted that telehealth expansion requires new and additional scheduling processes that can put a strain on the host facility, and that, taken together with the need to operate new technology and manage technical issues, can consume more time than a traditional face-to-face visit. Consistent use of telehealth and the implementation of relevant protocols may minimize such administrative challenges over the longer term.

Summary statement. Expanding VA's telehealth program will require an upfront financial and administrative investment. However, the impact of telehealth on access through workload and workforce redistribution, the potential for cost savings, and strong stakeholder support suggest that expanding virtual access to care via clinical video telehealth is a highly promising avenue for improving VA's ability to provide timely and accessible care.

6.4.1.3   Other Options to Modify the Amount and/or Type of Resources

Other options that we considered but did not select for evaluation include increasing the number of support staff, increasing physical space for health care delivery, and integrating with the DoD military health system.

Increase the number of support staff. This option would focus on hiring more support staff to increase the productivity of health care providers including nurses, health technicians, medical assistants, clerks, schedulers, and administrative assistants. Although 22 percent of respondents (11 of 51 sites reporting delays in patients obtaining a new primary care appointment) on our Survey of VA Resources and Capabilities identified increasing other personnel as critically important to reducing delays in care, our key informants infrequently raised this option as a way to improve timely access to care. Instead, they more frequently advocated for more licensed independent practitioners (also reported by 43 percent of survey

respondents as critically important to reducing delays in care) to provide direct care. The impact of this policy option on access is highly dependent on (1) the extent to which support staff time is maximized for facilitating clinic workflow and (2) the availability of independent practitioners whose productivity might be improved through increases in support staffing.

Increase physical space for health care delivery. This option would entail purchasing or leasing new physical infrastructure, or repurposing existing physical spaces to be used for providing health care (for example, exam rooms, office space, medical equipment space). This option would face significant constraints in its implementation as well as its expected impact on access. First, the purchase or leasing of new space (assuming it is available in areas where it was needed) would require significant additional funding and would entail burdensome and lengthy procurement or contracting processes; the process would consume enough time that the initial need would likely far surpass actual capacity by the time the space is secured. Second, the impact on access would be wholly dependent on both the availability of physical space for purchase or lease in areas where it is needed as well as the availability of health care providers and support staff to utilize the additional space. The latter requirement underscores the need to ensure adequate health care workforce within VA as an antecedent to any consideration of acquiring new space for health care delivery. The likely fiscal impact and administrative complexity of this option, together with an impact on access that is highly dependent on other major variables, makes this option a less feasible approach to improving timely and accessible care in VA than others.

Integrate with DoD military health system. This option, in its most fully realized form, would entail integrating VA and DoD workforce and physical infrastructure to provide joint health care to Veterans and active-duty personnel and their families. It would likely require both a single governance structure to oversee joint operations as well as a single electronic health record system. Improvements in access to care under this option are highly dependent on the capacity that is created through such a merger. It is possible that additional capacity constraints might be created, particularly given the administrative hurdles and related "growing pains" of a newly created organization of this size. The financial and administrative complexity of integrating the two systems will be significant, likely detracting from any long-term potential cost savings, efficiency gains, or access improvements. Moreover, this option may not have strong stakeholder support as it could result in lost jobs, culture clashes, and the loss of a "Veteran-only" health care system. In a less ambitious form, this option might involve developing an interoperable electronic health record system so Veterans could access care at military treatment facilities if needed; however, VA's history of unsuccessful attempts to build an interoperable electronic health record system point to a low likelihood of success in the near term.

6.4.2   Policy Options to Increase Productivity of Existing Resources

There are numerous options for improving the use of existing resources and making them more productive. Below, we describe and evaluate three options that were frequently raised in our interviews and in the published literature: (1) formalize full nursing practice authority throughout VA, (2) formalize task assignment in outpatient clinics, and (3) standardize return visit intervals for common conditions. Other options that we considered but did not select for

evaluation include eliminating inappropriate care, expanding care management programs for complex chronic conditions, and expanding working hours.

6.4.2.1 Formalize Full Nursing Practice Authority throughout VA

6.4.2.1.1 Overview

This option would formally grant full practice authority for all advanced practice nurses (APNs) (that is, nurse practitioners, clinical nurse specialists, nurse anesthetists, and nurse midwives) across VA, superseding individual state laws governing scope of practice where applicable. This would include authority to, for example, evaluate and diagnose conditions, order and interpret tests, and admit patients without physician oversight. VA is currently considering changes to a VA Nursing Handbook that would expand the breadth of VA nurses' authority. In addition, H.R. 1247, the "Improving Veterans Access to Care Act of 2015," currently under consideration in the House Committee on Veterans Affairs, would give APNs in VA full practice authority.

6.4.2.1.2 Rationale

Allowing full nursing practice authority is often raised as a key approach to addressing physician workforce shortages and access problems in non-VA contexts, particularly in primary care (Carrier, Yee, & Stark, 2011; Wilson, 2008). A 2011 Institute of Medicine report, "The Future of Nursing: Leading Change, Advancing Health," suggests that removing scope of practice barriers and allowing APNs to practice independently could increase clinical productivity; substituting APNs for physicians across a wider range of health care services frees up physician time to handle more complex cases (Institute of Medicine, 2011). Results from the Chief of Staff module of our 2015 Survey of VA Resources and Capabilities show that 68 percent of respondents (76 out of 111 sites) identified providers performing clinical activities that could be performed by individuals with less training as a key issue negatively impacting provider and system efficiency.

VA is the largest employer of APNs in the nation (VA, 2010a; Domine et al., 1998; Faris et al., 2010). Data from our workforce analyses show that in FY 2014, VA utilized 3,626 nurse practitioners, 396 clinical nurse specialists, and 598 certified registered nurse anesthetists. Currently, the ability of APNs to practice independently varies widely across VA, with nursing scope of practice established at the facility level (VA Directive 2008-049: Establishing medication prescribing authority for APNs). To our knowledge, there is no systematic analysis of VA compared with non-VA use of APNs and scope of practice.

Interviewees noted that although some VA facilities formally grant full practice authority to APNs, many facilities implicitly defer to state laws (despite VA federal supremacy) that require nurses to collaborate with physicians or may even require formal physician supervision (Cassidy, 2012; Institute of Medicine, 2011; Pearson, 2012). Interviewees also revealed that full nursing practice authority can vary within facilities even at the department or team level, whereby APNs with more experience or established relationships with their physician partners are granted more leeway. Although some observers have described VA as being at the vanguard in the use of APNs with respect to both numbers employed and relative autonomy in

clinical care (Huang et al., 2004; Robinson & Petzel, 2010), the variation in how they are utilized and the extent to which they are allowed to practice independently has been highlighted as a critical barrier to achieving optimal use of VA resources and capabilities (Kizer & Norby, 1998).

6.4.2.1.3 Implementing Steps

The cornerstone of this option is standardizing full practice authority for APNs across the VA system. A first step to implementing this option could be to endorse and implement proposed changes to VA's nursing handbook that would recognize APNs as independent practitioners authorized to provide patient care without physician supervision. The revised handbook would standardize processes and formally recognize the expanded scope of practice throughout the system (VA, 2011b). Subsequently, new scope of practice protocols would be required to clearly specify the expanded scope of nursing practice (Mohler et al., 1998), similar to the national templates previously proposed by former Undersecretary of Health Kenneth Kizer (Kizer & Norby, 1998). This might require forming an expert consensus panel to determine relevant qualifications and minimum standards for allowing expanded scope of practice. For example, recent legislation in New York State enacted in January 2015 allows nurse practitioners with over 3,600 hours (approximately two years) of clinical practice to practice independently (that is, without a written collaborative agreement with a physician) but does not change scope of practice rules for nurse practitioners with under 3,600 hours of practice (New York State Assembly, 2013). Nurse providers would have to engage in additional training and certification to meet standards for full practice authority, and undergo routine performance evaluations according to a prespecified schedule. Continuing medical education programs would have to be developed to sustain nursing skills relevant to full practice authority. Existing nursing oversight bodies may need to be restructured to address new regulations under an expanded scope of practice; Dr. Kizer had previously recommended funding an Advanced Practice Nursing Council to be responsible for licensure, role, and scope of practice protocols, as well as education and training opportunities (VHA, 1997). In addition, the establishment of professional standards boards for APNs at the local or network level to provide consistency in the development and interpretation of relevant rules and regulations will be needed.

6.4.2.1.4 Evaluation

Impact on access. An option to formalize full practice authority might impact access in two ways: (1) It could allow APNs to spend less time on tasks such as reviewing clinical decisions with a supervising physician and more time providing direct patient care, and (2) it could allow physicians to spend less time supervising APNs and more time caring for patients. Quantitative data on the effect of full practice authority on access as a result of additional time for patient care are limited and mixed. Although it is clear that following scope of practice regulations is time-consuming for both the nurse and the physician, it is unclear how much of that time could and would be redirected to patient care. One study found that APNs in states allowing full practice authority worked 11 percent more hours per year than APNs in states with scope of practice restrictions—but that physicians worked 6 percent fewer hours, presumably because independently practicing APNs were picking up the patient care duties (Kleiner et al., 2014). In contrast, another study found that physicians increased their direct patient care hours by 8

percent, given that they spent less time supervising APNs (Traczynski & Udalova, 2013). There are some data to suggest that granting full nursing practice authority could increase the supply of APNs due to either more entrants to nursing programs or nurses relocating to states with expanded scope of practice laws (Kalist & Spurr, 2004). Under an expanded scope of nursing practice, VA may be able to attract more APNs from the private sector in states that have scope of practice restrictions, which is particularly salient for states with large rural areas where VA might be struggling to ensure an adequate provider workforce.

Finally, some data suggest that the total amount of care provided to patients might increase with full nursing practice authority. One study found a 2-percent increase in number of office visits when state scope of practice was expanded, and the percentage of patients receiving preventive care and reporting timely and accessible care increased by as much as 10 percent on some measures (Traczynski & Udalova, 2013).

Indirect evidence also supports the positive potential impact on access that formalizing independent nursing might have, particularly through better use of APNs in clinical practice. For example, APNs in the private sector see twice as many patients per day as a VA APN, suggesting considerable room for improvement in VA's use of APNs as clinical providers (Mohler et al., 1998), which might be achieved via relaxed scope of practice regulations. Data also suggest that APNs can function effectively as physician substitutes in VA primary care given similarities in the patterns of patient encounter characteristics across provider types (Morgan et al., 2012). In addition, a substantial body of literature shows that important health outcomes—including disease-specific physiologic measures, reduction of symptomatology, mortality, hospitalization and other utilization measures, and patient satisfaction—are comparable between patients served by APNs and those served by physicians (Grumbach et al., 2003; Horrocks, Anderson, & Salisbury, 2002; Laurant et al., 2009; Laurant et al., 2005; Mundinger et al., 2000; Naylor & Kurtzman, 2010; Wilson et al., 2005).

This option could impact access in both primary and specialty care settings. Nurse practitioners are a core member of VA's primary care Patient Aligned Care Team model and are widely used in chronic conditions management, which can involve specialty services (for example, endocrinology for diabetes management, cardiology for heart failure management) (Newhouse et al., 2011). APNs have also been increasingly used in geriatrics, with the launching of an adult-gerontology clinical nurse specialist board certification in 2013. Finally, under this option clinical nurse anesthetists might be more widely used in inpatient and surgical settings.

Fiscal impact. Evidence regarding the possible fiscal impact of this option is also mixed but suggests the potential for cost savings. APNs are a less expensive alternative to physicians for providing direct patient care. Prior research in non-VA settings demonstrates that substituting some APNs for physicians (for example, five APNs and three physicians versus eight physicians) in a collaborative practice model results in significant cost savings over time (Bosque, 2015) given salary differences. More efficient use of APN time in clinical practice might also decrease costs; one study found that when APNs in retail clinics were allowed to practice independently, the clinics' cost savings were greater than when they could not practice independently because of state scope of practice regulations (Spetz et al., 2013). Although cost calculations may be

different between VA and non-VA—particularly in fee-for-service settings—these findings point to the potential savings that might be realized through more efficient use of APNs in practice.

On the other hand, if granting full practice authority increases access to care, the total amount of services provided might escalate, increasing overall costs. One study found that total spending on office visits (that is, all office-based settings for physician and APN care) was 4.3 percent higher in states with full practice authority than in states with scope of practice restrictions (Stange, 2014). However, increases in spending related to greater access to primary and preventive care could be offset by savings from reduced utilization in more intensive settings; for example, one study found reductions in ambulatory-sensitive emergency department visits (Traczynski & Udalova, 2013). Some have argued that APNs might contribute to costs because they tend to order more diagnostic tests than physicians do (Jauhar, 2014; Medical Society of the State of New York, 2015), presumably to compensate for differences in training and knowledge; however, this assertion is often based on a study published in 1999 that did not directly estimate the effect of expanding nursing practice authority on costs but simply compared nursing to physician practices.

The estimated implementation costs of this option are relatively low, and the option may reduce costs over time. There will likely be costs associated with developing new and expanded scopes of practice and standardizing them across VA, communicating and educating providers and staff about the expanded nursing authorities, and training and credentialing to appropriately reflect the expanded scope. These costs may be at the individual facility level or structured through VA Nursing Academy Partnership, which provides training at 18 academic nursing partnership sites across VA.

Stakeholder acceptability. This option could face strong political opposition from physician advocates within and outside VA. Allowing full nursing practice authority has historically been a controversial topic, and physician reluctance to accept the expanding role of nonphysician practitioners remains a persistent cultural barrier that will require sustained and intensive attention by VA leadership and beyond to overcome (Kizer & Norby, 1998). Physician organizations including the American Medical Association have been vocal in their ongoing opposition to allowing full nursing practice authority particularly in response to the recently proposed scope of practice changes to VA's nursing handbook (Beck, 2014). A recent JAMA commentary by three VA physicians (Bakaeen, Blaustein, & Kibbe, 2014) recommended that VA hire more physicians, nurses, and support staff to care for the increased number of VA enrollees, but warned against hiring nurse practitioners and physician assistants to replace primary care physicians, stating that "This is not the time to test unproven and controversial solutions" (p. 481). Physician organizations often state that substituting APNs for physicians may put patients at risk for poorer outcomes despite a lack of evidence to support this claim. Stakeholder acceptability might be fostered by emphasizing evidence supporting the ability of APNs to provide care that is as safe as the care provided by physicians (Fairman, 2008; Groth, Norsen, & Kitzman, 2010; Hatem et al., 2008; Hogan, 2010; Horrocks et al., 2002; Hughes, 2010; Laurant et al., 2004; Dulisse & Cromwell, 2010; Newhouse et al., 2011; Laurant et al., 2009; Jackson et al., 2011; Ohman-Strickland et al., 2008; Lenz et al., 2004). Establishing a consensus-based minimum standard for clinical experience before an APN is granted full practice

authority, as New York State has done, will likely be critical to facilitating stakeholder acceptability.

Strong physician opposition may also stoke patient and Veteran reluctance to support this policy option, although evidence regarding patient preferences for physicians versus APNs remains mixed. As an example, one survey commissioned by the American Academy of Family Physicians found that patients preferred and trusted physicians over nurse practitioners (Porter, 2013), while another study using survey data from the AHRQ found that patients reported better experiences with care from APNs compared with physicians (Creech, 2011).

Due to persistent physician workforce shortages and concerns related to health insurance expansion, state legislatures are increasingly receptive to expanding scopes of practice for nurses, which could contribute to this option's successful implementation in VA. To date, 20 states and the District of Columbia have given APNs practice autonomy, and several other states are considering it (Phillips, 2014). The Institute of Medicine's first recommendation in its *Future of Nursing* report was to "remove scope of practice barriers." This growing political support for full nursing practice authority in the broader context of access delays, increasing demand for primary care, and workforce shortages may soon offset the political challenges historically raised by physician advocacy groups.

Operational feasibility. Once endorsed, this option would likely require time to fully implement as new scopes of practice are drafted and care protocols developed. It would require coordination and partnership among several different VA offices, including but not limited to the Office of Nursing Service, Office of Patient Care Services, several Clinical Operations offices (for example, Primary Care Operations, Mental Health Operations, Geriatrics and Extended Care Operations), and network and facility directorship, to ensure that APNs begin to practice independently in a consistent and guideline-concordant manner. The Central Office-level policy change would have to be appropriately communicated through the regions down to the facility level, and monitored and evaluated for an initial implementation period, with feedback processes built in. Nursing leadership—both at VA Central Office and the facility level—may need to provide additional oversight and develop evaluation processes to incorporate expanded scopes. Additionally, new training and continuing education protocols would have to be developed and implemented to support expanded nursing scope of practice.

Summary statement. Formalizing full practice authority for APNs would likely be a cost-effective approach to increasing the productivity of VA's existing workforce. However, entrenched political barriers to enactment may limit uptake and challenge full implementation in practice, making this a longer-term solution rather than an immediate fix.

6.4.2.2 Formalize Task Assignment in Outpatient Clinics

6.4.2.2.1 Overview

This option would formally assign clinic tasks according to job function, with a focus on maximizing the use of clerical and clinical support staff to make physicians more productive and optimize clinic workflow. Our interviews revealed a prevailing perception that staff performs clinic tasks on an "as available" basis rather than being assigned tasks that match their skills and

training. Interviewees noted that this was in large part due to available clerical and clinical support staff not taking on relevant tasks or not completing them in a timely manner, and in smaller part due to inadequate staffing. They also cited confusion about which tasks could be assigned to clerical and clinical support staff rather than providers. Explicitly assigning tasks based on skill level and training could ensure that specialized personnel such as physicians spend their time on direct patient care activities rather than paperwork.

6.4.2.2.2   Rationale

Interviewees at VA medical centers and CBOCs regularly raised the concern that clinic workflow was inefficient due to lack of clear expectations regarding task responsibilities as well as a lack of accountability among administrative and clerical staff for task completion. Physicians we interviewed reported spending a significant amount of time completing what were described as "below-license" tasks such as bringing patients from the waiting room to the exam room, collecting vital signs, and completing pre-visit paperwork. In addition, they often noted that they were increasingly tasked with addressing pre-visit screening and prevention protocols that are often performed by lower-level staff in the private sector. Sometimes these challenges were ascribed to "cultural issues" among VA support staff (for example, a reluctance to take on more work), and other times they were attributed to restrictive VA policies and protocols. These are described in greater detail as capacity constraints in Subsection 3.2.4. These issues are not limited to physicians; VA nurse practitioners have reported spending an increasing amount of time on administrative tasks over clinical tasks and not fully utilizing their training and expertise (Fletcher et al., 2007). Results from the Chief of Staff module of our 2015 Survey of VA Resources and Capabilities show that 84 percent of respondents (94 out of 111 sites) identified providers performing administrative activities that could be performed by others as a key issue negatively impacting provider and system efficiency. This issue ranked second among factors impacting provider and system efficiency. ("Too many administrative requirements" was first with 96 out of 110 sites reporting it as an issue.)

Research evidence echoes our interview findings regarding how tasks are currently performed. A functional job analysis conducted in VA primary care found that staff at all job titles (clerks, health technicians, licensed vocational nurses, registered nurses, APNs, and physicians) were performing tasks of all kinds, rather than only those related directly to their job function (for example, all clerical tasks to clerical personnel and all clinical duties to clinical personnel). This included clerks performing service delivery tasks such as patient education and coordination, and physicians performing administrative tasks such as completing paperwork or maintaining patient records (Hysong, Best, & Moore, 2007). The most consequential implication for efficiency is that higher-trained VA personnel are performing tasks that do not require their level of training. A related VA study identified significant task overlap among occupational groups; for example, physicians reported performing 69 percent of the tasks also being performed by health technicians, 45 percent of the tasks also being performed by clerks, and 64 percent of tasks also being performed by licensed vocational nurses (Best et al., 2006). Clerks reported the lowest percentage of task overlap with other occupational groups, executing 13–14 percent of tasks also performed by physicians and nurse practitioners, 24 percent of tasks also performed by registered nurses, 26 percent of tasks also performed by licensed vocational

nurses, and 50 percent of tasks also performed by health technicians. This indicates that it would be possible to reallocate certain tasks across occupational groups to increase productivity, particularly shifting low-complexity tasks from advanced practitioners to clerks and health technicians.

6.4.2.2.3   Implementing Steps

Implementing this policy option would require the systematic identification of all clinic-related tasks in VA through a functional job analysis (Fine & Cronshaw, 1999), building on previous research done in VA (Best et al., 2006; Hysong, Best, & Moore, 2007; Pugh, 2001) and in other settings (Burgel et al., 1997; Mbambo, 2003; Salazar et al., 2002; Soh, 1998). Developing a task database is likely to be useful for cataloging identified tasks according to job function, skill level, and training (Best et al., 2006). After clinic tasks are identified and catalogued, expert input and consensus on the assignment (or reassignment) of these tasks by job title and function would be necessary. Prior work has shown that using standardized guidelines, protocols, or checklists can aid the transfer and assignment of clinical tasks between physicians and nurses, for example (Macdonald et al., 2013; Thomas et al., 1999); a similar approach might be useful in assigning tasks across all clinic staff. Task assignment might be a function of who is best suited to do the work based on skills and training as well as the impact of task assignment on patient safety (that is, the most consequential tasks would be assigned to workers with the greatest skill and training). Ideally, a template for the formal assignment of tasks could be created, with built-in flexibility for making actual assignment decisions at the facility level that consider contextual factors such as staffing levels, clinic layout, and primary care team relationships.

6.4.2.2.4   Evaluation

Impact on access. There is no direct evidence of the impact of formal task assignment on access to care, but it has been suggested that task assignment is critical because it minimizes constraints in clinic flow and improves patient throughput (Best et al., 2006). For example, a health care provider who spends time checking a patient into a room and completing paperwork instead of delivering hands-on care has less time to spend with subsequent patients, resulting in a backlog that impacts future appointment availability. Relieving higher-trained personnel of responsibility for low-complexity tasks would allow more time for patient care and make better use of their skills and training. Assuming that improvements in task assignment contribute to provider productivity and thus greater access to care, implementing this option system-wide could help to address inequities in access across facilities and regions. Facilities where providers are performing clerical tasks and clerical staff are not optimally utilized would likely see significant improvements in productivity and access on par with access at higher-performing facilities where clinic tasks are already assigned and completed efficiently.

Fiscal impact. There is a lack of economic data available to estimate the fiscal consequences of task assignment, although a systematic collection of relevant economic measures has been proposed (Dierick-van Daele et al., 2008) and may contribute to future estimations. To the extent that task assignment leads to task shifting from more expensive personnel, this option is likely to realize some savings over time. For example, in a VA study of primary care task overlap, the authors found that registered nurses performed 97 percent of the same tasks that licensed

---

vocational nurses performed. Implementing this option may require funding to ensure that clinics have the right mix of personnel for the optimal assignment of tasks. While our interviewees underscored gaps in the productivity of existing support staff, they also highlighted workforce shortages. Understaffed clinics may not have enough staff to perform all clinic-related tasks efficiently regardless of how they are assigned, and it may be the case that higher-trained personnel have no choice but to perform lower-complexity tasks. However, this option, if fully implemented, is likely to realize cost savings over time, given the costs associated with using highly trained providers to perform low-complexity tasks. Our interviewees frequently commented that using physician time to perform clerical tasks in the absence of any guidelines regarding task mapping or assignment was a particularly expensive solution.

Stakeholder acceptability. Staff members' resistance to additional tasks or reassignment of tasks could be a barrier to successfully implementing this option. While some staff will face additional workload, others may be reluctant to relinquish certain responsibilities. Unions may or may not support this option based on how the shifting workload is perceived. Physicians' concerns about scope of practice may make them reluctant to cede clinical tasks to lower-level providers. There may be concerns about lack of customization in clinic workflow, so flexibility in task assignments should be clearly delineated to allow tailoring of work assignments as clinic needs dictate. Staff buy-in and, where relevant, union support, will be critical through the task identification and assignment phases.

Operational feasibility. Ensuring that assigned tasks are completed will be a critical component of this policy option. This may require changes in contracts and union involvement in drafting these changes. In addition, establishing standardized protocols describing task assignments, guidelines, and checklists to ensure adherence to assignments creates an additional layer of bureaucracy that will require systems and processes for oversight and enforcement. With the proposed option, section heads and service chiefs will need greater authority to enforce and evaluate task assignment, including the ability to penalize underperformance. This option will take time to fully implement, particularly as new processes are formalized and staff is trained in these processes.

Summary statement. Formalizing task assignment is one approach to improving health care providers' productivity by ensuring task completion according to skills and job function, with an indirect impact on access. This option would require implementation of new administrative processes and changes to existing reporting and accountability structures that may prove challenging to enact over the short term.

6.4.2.3 Standardize Evidence-Based Follow-up Visit Intervals for Common Chronic Conditions

6.4.2.3.1 Overview

This option would standardize times for VA follow-up visits for common chronic conditions based on scientific evidence. A substantial portion of outpatient clinic visits are follow-up visits: 56 percent of the 1 billion office visits nationally in 2009 (including but not limited to VA) were follow-up or preventive care visits, while 42 percent were evaluations of a new problem or the

exacerbation of a chronic condition (Centers for Disease Control, 2010). In both VA and non-VA health care, follow-up visit intervals vary widely, with little evidence-based guidance for determining optimal intervals. Setting intervals based on scientific evidence may allow certain follow-up times to be extended, which would reduce the overall number of clinic visits per capita in a given time period and increase appointment availability for other patients or for emergent issues. As an example, if two providers with the same number of appointment slots each week have different follow-up visit intervals, on average—for example, the first mean interval is four weeks and the second is eight weeks—the second provider could see twice as many patients as the first provider in a defined time period. In some cases, shortening follow-up visit intervals (where supported by evidence) might initially increase the number of face-to-face visits and create additional access challenges, but may lead to lower utilization overall as patients are managed more appropriately.

6.4.2.3.2   Rationale

Current VA practices for determining follow-up intervals vary widely across providers (Welch et al., 1999), from as short as one week to as long as 12 months (Schwartz et al., 1999). This variation is explained only in part by the actual medical needs of the patient (DeSalvo et al., 2000; Kravitz et al., 1992; Welch et al., 1999); other important factors include whether the initial visit occurred on a "hectic" day (Schwartz et al., 1999) and how far the patient would have to travel to the clinic (Welch et al., 1999), with distant patients assigned longer intervals for follow-up visits. Follow-up intervals also vary with individual physician characteristics such as gender; one study found that female providers assign shorter intervals than male providers, independent of other factors such as patient stability (DeSalvo et al., 2000).[71] Provider training is an important factor as well. Providers are often taught to routinely schedule their patients with chronic conditions every three or four months regardless of disease severity (Schectman et al., 2005). Follow-up intervals are therefore likely influenced by the styles and preferences of individual clinicians and the educators to whom they are exposed.

In some cases, providers may assign follow-up times based on a perception that frequent contact is necessary to achieve therapeutic goals (Schectman et al., 2005), despite evidence to the contrary. For example, patients who are being managed for hypertension are typically seen every six months, although data from a randomized clinical trial demonstrated that a six-month interval was too short to accurately measure clinically significant changes in hypertension due to treatment (Keenan et al., 2009). In some cases, more frequent contact may even result in negative consequences, although this needs further investigation. In a randomized study of an intervention to increase contact with primary care providers following hospitalization among Veterans with diabetes, chronic obstructive pulmonary disease, or congestive heart failure, the

---

[71] More recent data on follow-up interval practices were not identified through our literature review. The growing use of electronic medical record platforms for managing patient information over the last decade may have facilitated interval assignment based on clinical need or other relevant patient factors, and additional research to evaluate this is warranted.

---

increased contact was actually associated with increased readmission rates and more days of rehospitalizations compared with usual care, with no difference in patient-reported quality of life (Weinberger, Oddone, & Henderson, 1996).

As part of our wait-time analysis (Subsection 4.2), interviewees routinely indicated that they preferred to define appropriate times between visits for a given condition or population of patients (and consequently appropriate wait times for appointments) based on clinical and scientific evidence. However, there is little scientific evidence regarding the optimal follow-up interval for conditions commonly seen and managed in primary care. A few older studies (Gordon & Webb, 1984; Dittus & Tierney 1987; Stern et al., 1991; Tobacman, Zeitler, Cilursu, & Mori, 1992) have focused on identifying factors and variability associated with follow-up visit intervals rather than on modeling optimal intervals. The wide variation in follow-up visit intervals in VA and the fact that intervals are predominantly determined by factors other than scientific evidence or clinical need underscores the salience of evaluating and standardizing optimal timing of follow-up visits.

6.4.2.3.3 Implementing Steps

Determining the appropriate intervals based on their impact on patient outcomes is critical. Implementing this policy option depends on building the evidence base regarding follow-up intervals for conditions common in VA's patient population. VA's well-established research and development infrastructure might lead such an effort. Initial work could focus on chronic conditions that require regular follow-up for primary care management and on those that account for the greatest number of outpatient visits such as hypertension, arthritis, chronic obstructive pulmonary disease, back problems, and mental disorders (Agency for Healthcare Research and Quality, 2012). In addition, provider retraining will be critical to assuring that follow-up visit intervals are appropriately modified. Provider retraining is an important change concept already recommended to increase access (Kilo et al., 1999; Murray & Berwick, 2003; Murray et al., 2003), and at least one study suggests that provider decision-making regarding the follow-up visit interval can be significantly modified by education and feedback to extend intervals without compromising patient outcomes (Schectman et al., 2005). VA's IT infrastructure could help support these shifts by building evidence-based follow-up appointment timing into scheduling systems that a provider could override if appropriate.

6.4.2.3.4 Evaluation

Impact on access. The impact of standardizing follow-up visit intervals is highly dependent on the number of appointment slots that could be created, which depends on whether existing intervals are extended or shortened. There is little evidence to indicate what direction the effects might take or what their magnitude might be, but one study at a large VAMC found that extending follow-up intervals in primary care reduced primary care visits by 27 percent and specialty care visits by 14 percent with no adverse impact on patient outcomes (Schectman et al., 2005).

Fiscal impact. The main direct fiscal impact would be funding to examine return visit intervals and retrain providers, which might be achieved through VA's current research budget. This

option could also lead to changes in utilization, although the direction and magnitude of this effect are difficult to predict. One study found that extending follow-up visits for hypertension by one month could lead to a 15 percent decrease in the number of visits in one year and savings of approximately $682 million annually. Extending the interval by three months could lead to an estimated 34 percent decrease in the number of visits in a year and a potential cost savings of $1.5 billion (Javorsky, Robinson, & Boer, 2014).

Stakeholder acceptability. Some patient and Veteran advocacy groups may misperceive extending return visit intervals as delaying or withholding care and thus potentially harming patients. Establishing and communicating evidence will be critical to assuaging any concerns and supporting evidence-based service delivery. Staged implementation to match and advance the evidence-building process (for example, extending intervals for a single condition at a time) could also help address any unintended consequences of implementing this option.

Operational feasibility. A primary barrier is the time required to build an adequate evidence base around return visit intervals to guide standardization of follow-up times, as well as the time it could take to train providers, collect data on implementation progress, monitor implementation and impact, and provide feedback to providers to support ongoing training. Designing and implementing studies that identify optimal follow-up visit intervals is technically challenging. In addition, clinic support staff may need to be trained to manage an increased volume of telephone contact, triage patient complaints, and address minor issues to the extent that these activities replace face-to-face visits. Expanding the registered nurse role might be a cost-effective approach for between-visit monitoring and might include nurse-run disease management programs (Herbert et al., 2008), which could be telephone-based (Dunagan et al., 2005), or nurse triage and consultation by phone (Campbell et al., 2015). Use of a patient portal (for example, MyHealtheVet) for secure messaging with providers might also be utilized to support extended follow-up visit intervals.

Summary statement. Standardizing return visit intervals based on scientific evidence would help to optimize the use of VA health care resources. It could improve access through gains in capacity achieved by prolonging visit intervals or by improving patient outcomes through better disease management over shortened visit intervals. This option depends on gathering adequate evidence on optimal intervals.

6.4.2.4 Other Options to Increase Productivity of Existing Resources

Other options that we considered but did not select for evaluation include eliminating inappropriate care, expanding care management programs for complex chronic conditions, and expanding working hours.

Eliminate inappropriate care. This option would use performance improvement strategies to eliminate services where the potential health benefit to the patient is less than the potential harm. Although this would improve the quality of patient care and some evidence suggests that reducing inappropriate care could result in cost savings over time, the impact of this option on access is highly uncertain and at best, indirect and long-term. For example, it is possible that over the long-term, any cost savings realized by the elimination of inappropriate care could be reallocated toward increased delivery of appropriate and necessary care, but this is highly

speculative. In addition, this option would require significant administrative oversight and enforcement to implement, including processes for identifying and quantifying inappropriate care, and approaches for communicating improvement strategies to Veterans and their family members. Any option aimed at reducing the overall care provided to Veterans is likely to be met with significant opposition, greatly diminishing stakeholder support. The highly uncertain impact on access of this option, as well as the significant operational and political barriers to adoption and implementation indicate that this is likely to be an infeasible approach to improving timely and accessible care in VA.

Expand care management programs for complex chronic conditions. This option would provide additional resources for care management programs focused on high-need, high-cost patients (that is, those with complex chronic conditions and/or multimorbidity) to support improvements in care coordination across settings, overall quality of care provided, and patient outcomes. Implementation might include a range of strategies such as greater use of group appointments to address self-management and collect basic clinical measurements, increased hiring of nurse care managers, increased use of telephonic support services to address minor concerns between appointments, informatics-based disease monitoring programs or remote monitoring, nurse home visits, and care transitions support. VA has an established foundation in this area, including the Patient Aligned Care Team primary care medical home model, as well as a growing use of group visits and nurse care managers. This option would simply dedicate additional resources to expanding current efforts. The impact on access would be highly indirect and grounded in the assumption that improved management would lead to better patient outcomes, which would consequently translate into decreased utilization, at least of resource-intensive care. This freed-up capacity could then be reallocated to other patients; however, this potential pathway toward increased access has yet to be conclusively demonstrated. In addition, this option requires considerable fiscal investment and could be an administrative burden depending on the strategies chosen for implementation. Despite potential stakeholder acceptability, these considerations suggest this option is likely not the most direct or feasible approach to improving VA's ability to provide timely and accessible care.

Expand working hours. This option would expand normal clinic operating hours at VAMCs to evenings (for example, 4:30 pm to 6:30 pm) and weekends (for example, Saturday 8:00 am to 1:00 pm) to increase access to care in a manner that is responsive to Veteran needs. For example, Veterans who hold traditional, full-time jobs or who are primary caregivers for a dependent child or parent may benefit from such an option to expand access to care. However, the impact on access of this option is uncertain and highly dependent on the availability of providers and support staff to work extended hours, which may detract from stakeholder support of this option. Unions in particular may be reluctant to support extending working hours without adequate compensation—including overtime—and protection. There may be significant costs associated with this option, in terms of both compensating personnel for working extended hours and keeping facilities and equipment operating over longer periods.

6.4.3 Subsection Summary

Policy options to modify the amount and/or type of resources available for VA care. Adding more physicians to VA's workforce is a potentially effective approach to improving access, but

its short-term impact is significantly constrained by the high cost of hiring more physicians, the lack of infrastructure to support an expanded workforce, and the bureaucratic challenges related to hiring in VA. Expanding VA's telehealth program will also require a financial and administrative investment. However, its potential impact on workload and workforce redistribution, the potential for cost savings, and strong stakeholder support suggest that this is a highly promising avenue for improving VA's ability to provide timely and accessible care.

Policy options to increase productivity of existing resources. Formalizing full practice authority for APNs would likely be a cost-effective approach to increasing the productivity of VA's existing workforce. However, political barriers to enactment may limit uptake and challenge full implementation in practice, making this a longer-term solution rather than an immediate fix. Formalizing task assignment can improve providers' productivity by ensuring task completion according to skills and job function, with an indirect impact on access. This option would require new administrative processes and changes to existing reporting and accountability structures that may prove challenging over the short term. Standardizing return visit intervals based on scientific evidence would help to optimize the use of VA health care resources by prolonging visit intervals or by improving patient outcomes through better disease management over shortened visit intervals, but more evidence is needed on potential impact.

6.5 Selected Policy Options to Enhance Access Outside VA

VA has the authority to purchase care from the private sector when needed. This has usually been exercised in cases where necessary care is geographically or temporally distant, and determined through a combination of physician evaluation of clinical necessity and patient preference. In this section, we evaluate options for (1) improving the productivity of existing resources by consolidating existing purchased care programs and (2) increasing the amount of resources for enhancing timely access to care outside VA.

6.5.1 Policy Options to Modify the Amount and/or Type of Resources

This group of policy options would modify the type and quantity of external resources that are purchased by VA. These options are qualitatively different from the other options discussed in this report because they would represent a significant strategic shift for VA. There are options along the continuum from the status quo (contract out some services for enrollees with limited access) to purchasing all Veterans' health care from non-VA providers. Selecting which services should be delivered by non-VA providers involves both strategic and technical questions, and is beyond the scope of this assessment. In this subsection, we describe several examples only to illustrate the option, and we discuss considerations in developing this type of policy option. The examples we discuss represent two distinct points along the continuum of possibilities for significantly increasing the use of purchased care: (1) outsourcing certain services and (2) outsourcing all Veteran care so that VA functions as a payer rather than provider of health care services.

6.5.1.1 Increase Purchased Care Use by Outsourcing Certain Services

VA could identify certain services that would no longer be provided within VA and instead be purchased from non-VA providers based on issues of scale, resources available, cost, and patient outcomes. This would have the dual objective of reserving available resources within VA for the organization's "core business" and facilitating timely access to other care for Veterans via non-VA providers. In contrast to VA's current approach to outsourcing, which is based on individual patient need and access, this option would seek to strategically identify and outsource entire service lines based on an overarching strategy or guiding principle, which could include timely access, patient outcomes, and/or costs expected to be favorable in non-VA settings. This decision might vary across geographic regions depending on supply and demand within VA and the private sector.

As a hypothetical example, VA might identify some surgical services that are provided at low volumes at VA facilities and high volumes at nearby non-VA facilities. Evidence from health services research has indicated a relationship between higher procedure volume and better outcomes (Bach et al., 2001; Begg et al., 1998; Birkmeyer et al., 2002; Birkmeyer et al., 2003; Carey et al., 2005; Ho et al., 2006; Luft, Bunker, & Enthoven, 1979; Wen et al., 2006), and conversely between low-volume care and poor outcomes, including higher mortality rates (Sternberg & Dougherty, 2015). This option could also potentially allow VA to reduce the fixed cost of maintaining capabilities for selected surgical services, such as specially trained support staff and high-tech equipment. VA might leverage its existing partnerships with academic medical centers that have higher demonstrated procedure volume, although even academic centers have been recently challenged to identify and limit many lower-volume surgeries (Sternberg, 2015).

A more extreme approach would be for VA to focus its direct care delivery on certain core services. The definition of core services would need to be developed, but one possibility would be to identify the services for which VA has the greatest advantages as an integrated delivery system and direct provider of care—for example, services for which care coordination is critical or in which VA holds specialized expertise. Candidates for core services include primary care, mental health care, and care pertaining to certain service-related disabilities and illness (for example, spinal cord injury, TBI, vision loss, and prosthetics and rehabilitation).

6.5.1.1.1 Evaluation

Impact on access. The impact of this option is highly uncertain. It would depend on the volume of services provided by non-VA providers and the relative accessibility of non-VA and VA provision of those services. The volume and accessibility of services would depend on VA strategic decisions as well as the capacity of non-VA providers.

Fiscal impact. The fiscal impact of outsourcing low-volume surgical services is uncertain and dependent on both the amount of services shifting from VA to non-VA providers and the relative cost of VA versus non-VA services. As discussed in Subsection 3.1, existing data do not allow for comparisons of VA versus non-VA costs of health services. If large amounts of care are outsourced, some Veterans may shift from using private insurance to using VA purchased services, increasing total VA costs.

Stakeholder acceptability. Several important stakeholder groups, including Veterans and VA providers, could be opposed to shifting care from VA to non-VA providers. As identified in our interviews, many Veterans prefer to receive their care from VA and are concerned that outsourcing care is a "slippery slope" that will lead to reduced health care coverage over the long term. VA providers are likely to be concerned about potential job loss if large portions of care are outsourced. In addition, there may be concerns about how decisions are made for outsourcing certain services over others. A clear rationale for outsourcing care (beyond the current wait-time and 40-mile criteria) would need to be established and agreed upon. A recent move by VA to outsource Hepatitis C care to non-VA providers due to a depletion of internal funds for antiviral treatment has been met with strong stakeholder criticism in large part because it appears that a priority system based on patient characteristics (for example, limited life expectancy or vegetative state) is being used to make the outsourcing determination, raising questions about the ethics of the process (Wagner, 2015). Stakeholder buy-in will be critical to the success of any option aimed at increasing VA's use of purchased care. Importantly, purchasing selected services could allow VA to continue to directly provide most care to Veterans and minimize these impacts.

Operational feasibility. Administration of this option would face significant barriers. At a minimum, the option would require new contracts or other partnership agreements, which would be challenging given the significant administrative burdens associated with VA contracting as reported by many of our interviewees. Another barrier is the logistical task of coordinating care between VA and non-VA providers. VA has considerable experience with care coordination within its system. Eliminating large portions of its current care delivery would detract from advantages VA's system derives from its integration. If acute and specialty care were provided in the private sector, VA primary care would need to serve as a coordinating point, but medical information would need to be shared across multiple providers and organizations.

Summary statement. The effect of increasing purchased care use by outsourcing certain services is highly uncertain and would depend on the volume of services provided by non-VA providers and the relative accessibility of non-VA and VA provision of those services as well as VA strategic decisions. This option might face opposition from important stakeholder groups, including Veterans and VA providers, as well as administrative barriers, including the need for new contracts or other partnership agreements, which would pose a significant administrative burden.

6.5.1.2   Redefine the Role of VA as Payer Versus Provider

This option would entail a radical shift in VA's mission and structure. It would outsource all Veteran care to the private sector, making VA a payer instead of direct provider of health care services. Some observers have questioned whether a separate health care delivery system is a necessary and efficient approach to caring for the nation's Veterans (Concerned Veterans For America, 2014). This option represents a major and complex reform that requires evaluation beyond the scope of this assessment; here we present a few key elements of such an option.

The general approach of this option would be to provide Veterans with health insurance coverage rather than eligibility for VA care. For example, VA could offer premium (and other cost-sharing) support for Veterans to purchase private insurance coverage. Another approach might be modeled after certain elements of the Federal Employees Health Benefits Program; this would also be similar to a drastically expanded PC3 program. VA would provide health insurance benefits for Veterans to access purchased care.

Regardless of which approach is undertaken, certain considerations must be noted in this option's implementation. VA's physical infrastructure would have to be drastically reduced or even eliminated altogether. This would likely entail complex sales to private-sector health care organizations; for example, hospital buildings might be sold to hospital ownership entities, clinics sold to medical groups, and, in some cases, entire medical centers (that is, hospital and clinics) might be sold to integrated health care delivery systems. It could also entail sales to non–health care organizations and demolishing buildings that are unusable or otherwise unable to be sold. Similarly, health care equipment (for example, beds, X-ray machines) might be sold to other health care entities.

In addition, VA's workforce would change significantly, shifting from providers to administrative personnel who oversee the program. While some of the workforce might be redirected to the private sector (for example, a health care delivery organization purchasing VA resources in a given area might choose to hire VA staff), the loss of thousands of federal jobs would be a drastic and unattractive measure to many communities and individuals. Incorporating a systematic plan for job repatriation would protect VA's workforce and potentially increase political viability of this option. As an example, part of this policy option might require VA Centers of Excellence providing specialized services to be purchased by private-sector organizations without changes in space, equipment, or staffing, so as to retain expertise and capabilities in those areas that may be lacking in the private sector. However, this is highly dependent on the willingness of the private sector in a given area to absorb these resources.

VA's current medical education and research programs would also need to be significantly reduced or dismantled and transferred to the private sector. VA manages the largest medical education and health professional training program in the United States; approximately 81,000 health professionals are trained annually in VAMCs across the nation, and roughly 60 percent of all medical residents obtain a portion of their training at VA hospitals. VA is also a research leader, playing a critical function in understanding the needs of Veterans and developing innovative approaches to meet them through established programs in health services, biomedical, and clinical research. Both these functions would be significantly compromised under this option.

This option would require that the Veteran health benefit be defined similarly to Medicare or TRICARE. In addition, current eligibility rules for accessing VA care may need to be modified to implement this option to limit increases in outlays. Currently, many Veterans eligible for VA benefits do not enroll, and many enrollees have other sources of insurance coverage. If VA provided insurance coverage, Veterans currently using private insurance or Medicare might instead switch to VA coverage under this option to receive the same private-sector care, particularly if VA offered relatively favorable benefits and cost-sharing requirements.

6.5.1.2.1 Evaluation

Impact on access. This option would entail a drastic shift in VA health care, with a highly uncertain impact on access. The impact would depend on design and implementation of features, including insurance benefits, provider network adequacy, and beneficiary cost sharing. Broadly speaking, the impact on access would be defined in part by the private sector's ability to provide timely and accessible care. Some data suggest that private-sector wait times could be worse than VA wait times. For example, VA reports that, on average, Veterans seeking new patient appointments wait approximately eight days from their preferred date for primary care and seven days from their preferred date for specialty care. Meanwhile, prior studies of private-sector wait times reported average wait times of 19.5 days between an initial call and the appointment date for new primary care appointments (Merritt Hawkins, 2014) and 22–37 days for specialty appointments (Massachusetts Medical Society, 2013). In addition, our geographic analyses indicates that the majority of enrollees who live more than 40 miles from a VA facility live more than 40 miles from any provider in that specialty and are much less likely to have access to academic and teaching hospitals, or to specialized services such as oncology, cardiac surgery, and cardiac catheterization. This suggests that directing Veterans to the private sector may not necessarily improve timely access to care.

Fiscal impact. This option would likely generate substantial implementation costs associated with the transition from provider to purchaser. The long-run costs would depend on enrollment in VA health insurance, the generosity of coverage, and the prices of purchased care. Critical components would be defining the benefit and reconsidering Veteran eligibility for health care. Many Veterans do not use VA for health care, opting for other sources of insurance coverage for private-sector care instead. If the benefit were based on the current promise of a comprehensive benefit with limited out-of-pocket costs, many of these Veterans might find VA insurance more attractive than their current coverage, leading to increased federal outlays.

Stakeholder acceptability. This option has been previously suggested by some observers but has generated significant controversy. Although the success of TRICARE suggests the potential acceptability of an option to similarly restructure VHA as a purchaser of health care, the option calls into question the very nature of VA's mission to care for Veterans.

Operational feasibility. There are significant administrative challenges to implementing this option. Implementation would be a lengthy process with changes gradually phased in. Changes would also have to be clearly communicated to Veterans; experience with disseminating information regarding the Veterans Choice Program to Veterans suggests that this is likely to be a challenging task with successful implementation highly uncertain. Starting with pilot programs to test various elements of such a program would be critical to its successful implementation.

VA would also need to create and oversee processes for administrative and payer functions such as monitoring the quality of care provided in the private sector, measuring Veteran satisfaction with private-sector care and contractor services, measuring access to care, and handling claims appeals. VA might consider adapting or piggybacking onto existing approaches utilized by Medicare and some larger employers, or outsourcing this function. Regardless of the selected approach, this option would likely require implementation of new processes as well as additional staff training.

Finally, attention to dually eligible Veterans would be warranted, and coordination between programs such as Medicare and Medicaid required. For example, it might be that VA would serve as the secondary payer to Medicare, perhaps providing supplemental benefits or cost-sharing reductions for those dually eligible.

Summary statement. Redefining the role of VA as payer rather than provider would entail a radical shift in VA's mission and structure, with a highly uncertain impact on access. This option has been previously suggested by some observers but has generated significant controversy. If deemed feasible, there would be significant administrative challenges to implementing this option.

6.5.2 Policy Options to Improve Productivity of Existing Resources

Veterans currently face many barriers in accessing care from non-VA providers; minimizing these barriers could allow Veterans to better access private-sector providers. Below, we describe the single option that was consistently raised in our interviews: Consolidate existing purchased care programs.

6.5.2.1 Consolidate Existing Purchased Care Programs

This option would consolidate salient features of VA's existing purchased care programs—the traditional program, the PC3 program, the Access Received Closer to Home (Project ARCH) pilot, and the newly created Veterans Choice Program—into a single system-wide program that replaces all other approaches to purchasing care in VA, including local facility contracts and individual provider authorizations. Assessment C reviews the possible approaches to consolidation and the implications for VA's authorities to purchase care. Accordingly, we do not describe the details of how this option would be implemented. We focus on the implications of the option for access to care.

Several general approaches could be followed. A simple approach might be to combine programmatic oversight of the programs under a single administrative umbrella. A mid-range approach might be to standardize key elements of existing programs (for example, reimbursement rates, medical record return and documentation rules). A more ambitious approach would be to create a single program that facilities would be mandated to use for all purchased care.

Our interviews indicated that considerable duplication and variation exist in VA processes for authorizing and purchasing care, which results in confusion among VA and non-VA providers regarding contractual requirements (for example, medical record return and documentation, provider credentialing), reimbursement rates, authorization processes, and patient eligibility. This can contribute to delays in care. Recent congressional testimony before the Senate Committee on Veterans Affairs indicates that many VA facilities continue to use the traditional program to purchase care directly from non-VA providers instead of using one of the contracting vehicles such as PC3 or the Veterans Choice Program, despite the money and time put into those programs (McIntyre, 2015). Moreover, many of these non-VA providers are also network providers under PC3 and the Veterans Choice Program, exacerbating confusion by non-VA providers about which program (and therefore which rules and rates) applies to a

Veteran's care. Non-VA provider confusion regarding how, what, and when they might be reimbursed as a result of multiple programs surfaced consistently in stakeholder interviews. Some non-VA providers may decline participation altogether because of the administrative burden and complexity of navigating the VA purchased care system. Assessment C explores these issues in more detail.

Consolidating existing purchased care programs could potentially mitigate these challenges. VA has already begun an effort to standardize its approach to purchasing care, largely by focusing on replacing local facility contracts (contracts that individual facilities set up with local providers) and individual provider authorizations with the PC3 or Veterans Choice Program (Robinson, 2014). In addition, Section 106 of the Veterans Choice Act consolidates and centralizes the back-end processes (for example, claims processing) for purchased care under VA's Central Business Office. Implementation of the proposed option would involve additional steps to advance this consolidation and standardization process.

6.5.2.1.1 Evaluation

Impact on access. No direct evidence exists to support an estimate of this option's impact on access. However, to the extent the option addresses barriers to the use of current purchased care programs, it could potentially increase the ease and timeliness with which Veterans can access care, enable VA to develop a larger network of non-VA providers, and create administrative efficiencies. Reducing confusion regarding VA's purchased care programs, particularly around reimbursement rates and contractual requirements such as credentialing or medical record documentation, might make it more attractive to non-VA providers who might previously have been reluctant to engage. It should be noted that increasing access to purchased care may not ultimately increase access to care overall, particularly if the availability of purchased care is constrained in the same regions where demand relative to supply in VA is imbalanced. In addition, to the extent that this option increases access either by streamlining processes and/or facilitating expansions to non-VA provider networks, it may engender new access constraints over the long term as more Veterans are encouraged to enroll.

Reducing confusion regarding VA's purchased care initiatives by creating a single program might improve VA provider knowledge of how to access purchased care and induce providers to refer patients to purchased care more often, although there is no direct evidence available to estimate this impact. Minimizing Veteran confusion regarding eligibility rules might also help Veterans to seek out purchased care. Interviewees reported that many Veterans are relatively unfamiliar with PC3 and even more confused about their eligibility for the Veterans Choice Act.

The impact of a single purchased care program on access is highly dependent on several factors, the most important of which is the ability of private-sector providers to provide additional care to Veterans. This is constrained by market forces, which affect the ability for VA to offer payment rates that are attractive enough to induce provider participation. Our interviews revealed that many VAMCs rely on local contracts because they reimburse at higher rates than PC3. The impact is also dependent on non-VA providers' willingness to engage in a contractual relationship.

Fiscal impact. This option may require additional investment to further support streamlining and consolidating current purchased care programs, but any administrative efficiency achieved could reduce costs over time.

Stakeholder acceptability. This option is not expected to face significant stakeholder opposition because it does not significantly change the structure or delivery of services. This option continues to provide a private-sector avenue for timely and accessible care, but maintains VA's role as a provider of health care services.

Operational feasibility. Although many of the structures and processes necessary for implementing this option are in place in VA, the operational feasibility of this option will depend on the organization's ability to streamline and consolidate its existing processes. This will entail identifying all processes related to purchased care, identifying opportunities and methods for consolidation, and then implementing those methods in a systematic and consistent manner. Currently, several offices within VA hold some responsibility for the different existing purchased care programs; this option would require coordination among offices and potentially downsizing through the consolidation process. There is likely to be some confusion on the part of Veterans and both VA and non-VA providers as processes are communicated and implemented, and a potentially extended ramp-up period is possible as provider networks are built and policies and procedures established.

Summary statement. This option could potentially increase the ease and timeliness with which Veterans can access purchased care, enable VA to develop a larger network of non-VA providers, and create administrative efficiencies but may require additional investment in the near term. Administrative efficiencies achieved could reduce costs over time, while the operational feasibility of this option will depend on the organization's ability to streamline and consolidate its existing processes.

6.5.3 Subsection Summary

Policy options to modify the amount and/or type of resources. The effect of increasing purchased care use by outsourcing certain services is highly uncertain and would depend on the volume of services provided by non-VA providers and the relative accessibility of non-VA and VA provision of those services as well as VA strategic decisions. This option might face opposition from important stakeholder groups, including Veterans and VA providers, as well as administrative barriers, including the need for new contracts or other partnership agreements. On the one hand, increased collaboration and reliance on academic medical centers and other private-sector health care organizations could enhance VA capacity to provide timely access to care to Veterans. On the other hand, these organizations could face the same capacity constraints in providing timely access to care as VA, particularly with increased demand from a new population with unique needs. Redefining the role of VA as payer rather than provider would entail a radical shift in VA's mission and structure with a highly uncertain impact on access. This option has been suggested previously but has generated significant controversy, and implementation would require significant administrative challenges to be addressed.

Policy options to improve productivity of existing resources. Consolidation of existing purchased care programs could potentially increase Veteran access to purchased care, enable

VA to develop a larger network of non-VA providers, and create administrative efficiencies. This option may require additional investment to support streamlining and consolidation of current purchased care programs, but any administrative efficiency achieved could reduce costs over time. Operational feasibility would depend on the organization's ability to streamline and consolidate its existing processes.

6.6   Comparison of Policy Options

In this subsection, we briefly summarize and compare the policy options and discuss tradeoffs between options.

Based on the projections presented in Subsection 6.1, unless VA demand projections are inaccurate or other changes occur, it will not likely get easier for VA to provide adequate access to care. In the status quo scenario, demand for VA health care services will increase more rapidly than VA capabilities to provide those services. However, policy options that would substantially increase the productivity of VA health care resources, increase the amount of those resources, or both would allow VA production of health care services to keep up with or even exceed demand. While this would not guarantee access to care, it would make accessible care more feasible.

None of the policy options we considered dominates the others on all criteria. Similarly, no option can be eliminated because it is inferior on all criteria. However, comparing the options through the policy lens of increasing access within the VA system, the three options with the highest estimated impact on access are formalizing full nursing practice authority, increasing the number of VA physicians, and expanding virtual access to care. None of these options is mutually exclusive; they could be combined in a number of different ways. Each option has different potential barriers that present tradeoffs. The primary barrier to formalizing full nursing practice authority is political (key stakeholder opposition); the barriers to hiring physicians are related to cost and administrative challenges associated with the hiring process; and the primary barrier to expanding virtual access to care is cost.

Policy options for increasing access outside VA's system have considerable uncertain impacts on access. One option, consolidating existing purchased care programs, has the most certain impact. The current system of overlapping programs was widely cited as problematic and lacks any clear benefits. This option is discussed in greater detail in Assessment C.

There is greater uncertainty around the potential impact of policy options aimed at increasing non-VA resources available for Veterans' health care. The impact and feasibility would be highly dependent on the scope of the change. Shifting certain types of services from VA to purchased care could potentially improve both access and quality of care, though this could increase challenges in care coordination. Shifting a greater share of services from VA to purchased care would require more fundamental changes to VA. Our analyses indicate that many Veterans without access to VA health care also face obstacles to accessing purchased care, including distance and cultural barriers. Thus, transforming VA from a provider to a purchaser of health care would not necessarily have a significant positive impact on access.

These policy options are summarized in Table 6-5.

Table 6-5. Summary Evaluation of Selected Policy Options

Option	Summary
Improve productivity of existing resources internal to VA	
Formalize full nursing practice authority throughout VA	Allowing full nursing practice authority would be a cost-effective approach to increasing the productivity of VA's existing physician workforce, thereby increasing access to care. However, stakeholder opposition may challenge adoption and uptake of this option, and full implementation may take considerable time and coordination.
Formalize task assignment in outpatient clinics	Formalizing task assignments in outpatient clinics could improve clinic workflow and provider efficiencies at low cost with a modest impact on access. This option will likely require many new administrative processes and changes to existing reporting and accountability structures. There may be some stakeholder resistance based on perceptions of new workload.
Standardize return visit intervals for common conditions	Standardizing return visit intervals could increase access over time by freeing up appointment slots as a result of either extending intervals or improved patient outcomes from shortened intervals. The feasibility and impact of this option is highly dependent on developing a solid evidence base to set optimal intervals, which will take time and research funding. There may be some challenges to stakeholder acceptability that could be mitigated by a transparent communication plan.
Modify amount of resources internal to VA	
Increase the number of physicians	Increasing the number of physicians in VA will require significant financial resources and the ability to overcome pervasive administrative barriers within the organization. The impact of this option on access is highly dependent on the availability of other, potentially costly resources such as space, equipment, and support staff.
Expand virtual access to care through use of telehealth	Expanding the use of telehealth could significantly improve access through workload and workforce redistribution across the system but will require significant up-front fiscal investment and attention to various administrative issues. This option is likely to have strong stakeholder support and may realize cost savings over time.

Option	Summary
Improve productivity of existing resources external to VA	
Consolidate existing purchased care programs	The impact of this option on access is highly dependent on private-sector capacity and the development of an adequate provider network. It may be difficult to implement this option as it requires VA to streamline many of its existing administrative processes; however, there may be some administrative efficiency to be achieved over time through the use of a single purchased care program. Stakeholder acceptability is expected to be high.
Modify amount of resources external to VA	
Expand purchased care use	The impact of expanding purchased care on access is uncertain and highly dependent on private-sector capacity. The cost is also uncertain and dependent on the balance between VA and non-VA provision of services. Implementation would be challenging, and the option may face some opposition from stakeholder groups reluctant to shift care away from VA.
Shift VA role from provider to purchaser of health care services	This is likely to be a controversial and costly option with a highly uncertain impact on access and significant administrative challenges.

6.7   Section Conclusion

We compared a number of policy options for increasing access for Veterans within the VA system, finding that, of the options considered, the three with highest estimated impact on access are formalizing full nursing practice authority, increasing the number of VA physicians, and expanding virtual access to care. None of these options is mutually exclusive; they could be combined in a number of different ways. However, each of the options has different potential barriers that present tradeoffs. The primary barrier to formalizing full nursing practice authority is political (key stakeholder opposition); the barriers to hiring physicians are related to cost and administrative and administrative challenges associated with the hiring process; and the primary barrier to expanding virtual access to care is cost.

The impact and feasibility of increasing non-VA resources available for Veterans' health care would be highly dependent on the scope of the change. Shifting a greater share of services from VA to purchased care would require more fundamental changes to VA. We did not find evidence of a current system-wide crisis in access to VA care that would indicate that such a change is necessary, but it is possible that such a reorientation would improve access. Coordination of care is challenging even within the VA system, but is more challenging when

coordination includes non-VA providers with separate information systems. Our assessment found that many Veterans without access to VA health care also face obstacles to accessing purchased care, including distance and cultural barriers. While non-VA providers may provide superior levels of access for certain Veterans and certain conditions, this will not be true for all Veterans and all conditions.

7 Conclusions and Recommendations

7.1 Summary of Assessment Findings

Access to timely and high-quality health care is a central part of our nation's commitment to Veterans, but concerns have been raised about how effectively this commitment is being fulfilled. In this report, we assessed VA's current and projected resources and capabilities, the level and nature of access to VA care, and barriers and facilitators to access. We then explored how selected policies could affect Veterans' access to high-quality care and considered how various policy options might enhance VA's resources and capabilities for treating Veterans in the future. Our assessment is based on a broad range of evidence from qualitative and quantitative analyses.

The assessment highlights many opportunities to improve VA capabilities to provide timely and accessible care. We identified a large number of barriers to effective use of VA resources. We also found widespread variation in performance across VA facilities. We did not find evidence of a system-wide crisis in current access to VA care. However, our projections indicate that, without changes, it will be increasingly difficult for VA to provide good access to care for our nation's Veterans.

We found that VA operates a unique health care system with broad and deep resources and capabilities. This system often, but not always, provides timely and accessible care to Veterans. For example, the vast majority of appointments were completed within 14 days of the provider-recommended or Veteran's preferred date for the appointment, as recorded by VA. At top-performing facilities, nearly all appointments meet VA's wait-time standards. At the same time, across the VA system, there were some facilities with much higher rates of long waits for appointments than others. Though small as a percentage of all appointments, there is still a large absolute number of Veterans' appointments that do not meet VA's own wait-time standard of within 30 days of the preferred date. Furthermore, even VA facilities performing well on the VA wait-time standard have opportunities for improvement: At facilities with the shortest wait times, many Veterans report that they do not always get an appointment as soon as needed. This suggests that even facilities that achieve VA's wait-time standards do not meet many Veterans' expectations for timely appointments.

VA's wait-time standards are based on the notion of a preferred date and do not reflect the absolute time between appointments. The preferred date has also been found to be subject to manipulation by VA employees in some well-publicized cases. Therefore, many have questioned whether the VA data and standard provide a valid reference for timeliness of appointments. While it was outside the scope of this assessment to validate these data, we examined whether alternative standards for timeliness could be applied. Alternative standards, such as those that assess availability rather than completion of appointments, may be less subject to gaming and more comparable to private-sector standards. It is unclear how many VA facilities or non-VA providers meet these alternative standards. We found limited data available with which to compare VA and non-VA waits for care, but VA wait times do not seem to be substantially worse than non-VA waits, based on the limited available evidence.

Geographic access is another challenge for VA. Veterans are highly dispersed geographically throughout the United States, and ensuring nearby access to needed services for this population is difficult. Overall, we found that many Veterans have geographic access to VA care by a general standard of less than 40 miles distance from any facility, not considering the services available at that facility; this is true regardless of whether distance is measured using a straight line or using driving distance. VA enrollees live an average of 52 minutes driving time from the nearest VAMC and 23 minutes driving time from the nearest VA medical facility of any type. On average and in most VISNs, these driving times are less than enrollees' reported willingness to travel and Medicare beneficiaries' average observed travel times. Geographic access is worse when using different types of access standards. Veterans who must rely on public transportation, for example, have much lower levels of access than other Veterans. Geographic access to specialized facilities and providers is also lower. Veterans often live far from a VA facility offering the services they need. This is also true of purchased care, however: Veterans who live far from VA medical facilities typically have access to non-VA community hospitals and primary care physicians, but are also likely to live farther than 40 miles from the nearest non-VA specialist and academic medical center.

When Veterans do access VA care, it is important that the care be of high quality. The assessment showed that VA health care quality was better on many measures and domains compared with non-VA comparators, while similar or worse on other measures. However, as with access to care, quality performance was uneven across facilities, with many opportunities for improvement.

Based on these observations and the data available to us, we conclude that VA does not currently face an overall crisis in access to care. However, there is variation in access and quality across the VA system, with poor performance for some VA facilities and Veteran subgroups. Examples of substantial variation in performance across VA facilities include:

- At the best-performing VA facilities,[72] the average wait time for new primary care patients was less than one day from the preferred date. At the worst-performing facility, the average wait time for these patients was more than 40 days from the preferred date.
- At the best-performing VA facilities, 61 percent of Veterans reported that they "always got urgent care appointments as soon as needed" in FY 2014. At the worst-performing VA facility, this rate was 21 percent.
- At the best-performing VA facilities, 68 percent of Veterans reported that their primary care providers always seem up to date about care received from specialists in FY 2014. At the worst-performing facility, this rate was 46 percent.
- At the best-performing VA facilities, 80 percent of patients with cardiovascular conditions had LDL-C levels below recommended thresholds in FY 2014. At the worst-performing facility, this rate was 50 percent.

---

[72] The "best-performing VA facilities" are defined as the top 10 percent of VA facilities.

This level of variation in performance across VA facilities suggests that significant opportunities exist to improve access to care in VA through systematic performance improvement. Some variation in performance across regions and VA facilities may be inevitable because of differences in patient characteristics. In addition, some localized strategies for improvement may not scale up well because of contextual factors. However, the assessment suggests that there are significant opportunities to improve performance by identifying and scaling up proven best practices within VA that could increase access to care for Veterans.

7.1.1   Barriers to Effective Use of Resources and Capabilities

VA faces many barriers to using resources in the most effective way to support Veterans; these barriers will need to be addressed to improve performance. These barriers present a formidable, but not insurmountable, problem regarding the level of VA resources and capabilities. Some of these barriers are specific to VA, while some affect the U.S. health care system more broadly. Below, we summarize the main barriers we found related to each type of resource examined. Other assessments also analyzed barriers in some of these areas in more detail.

Fiscal resources. We identified concerns about the data used for VA's budget planning and inflexibility in budgeting stemming from the congressional appropriation processes. The appropriation for VHA is divided into accounts for medical care, medical support and compliance, and some nonrecurring maintenance. The money is not fungible across categories because of appropriations law. The inability to shift money between the major allocation line items, such as maintenance and medical services, makes it difficult to adequately manage the budget over the course of the year. Congressional priorities can affect VA's appropriation, and the impact of increases in purchased care on the budget in future years is currently unknown. The process used to allocate funds to VISNs for medical services is equitable, though the process is based on data that are several years behind the current allocation year. This can leave facilities that are experiencing change in patient volume or case mix over- or underfunded in the current year, and creates incentives for facilities to treat more of certain types of patients in order to increase funding in future years.

Workforce and human resources. VA faces shortages of physicians in some geographic areas and of certain physician specialists more generally. VA's ability to hire and retain new physicians is influenced by a number of key factors, including relatively low salaries, a slow credentialing process, and infrastructure constraints. We identified several challenges associated with the VA workforce planning and assessment processes. These include a lack of guidance about what methods should be used for these processes, a lack of external productivity benchmarks, inaccurate or incomplete data inputs, and the inability of the productivity benchmarking data system to adequately account for certain types of providers and patient visits.

Physical infrastructure. VA is also constrained by its physical space. Interviewees reported that it was difficult to update the physical space in older buildings to accommodate new medical technology and equipment. They also noted that the need for additional space or more

effective use of existing space was often a key limiting factor in improving access to care for Veterans.

Interorganizational relationships. VA provides access to purchased care through several programs and various types of payment or contractual arrangements, but managing these overlapping programs has been a challenge. For example, as VA was attempting to address some of the administrative challenges associated with arranging, coordinating, and reimbursing purchased care through the implementation of the PC3 program, the addition of the Veterans Choice Program further complicated these challenges and resulted in confusion among Veterans, VA employees, and non-VA providers. VA and members of Congress have expressed a desire to more effectively utilize interorganizational relationships.

Informational resources. VA's role as an innovator and leader in health IT has been challenged by issues related to the management and planning of its IT systems. Among every IT capability we studied, we found clear barriers to further taking advantage of what IT can offer, including inadequate infrastructure, lack of facility leadership and provider buy-in, and administrative burden. Our findings also confirm the results of previous studies concerning strengths and weaknesses in VA's current electronic health record (VistA/CPRS) technology, which suffers from an aging architecture and 10 years of limited development. However, interviews across the spectrum of VA personnel—from management and IT thought-leaders to end-users— suggest strong support for renewed investment in a modern, home-grown product rather than transitioning to a commercial off-the-shelf alternative. The tradeoffs of homegrown versus commercial electronic health records software are discussed in Assessment H.

Addressing these barriers will require a mix of short- and long-term initiatives. Our projections indicate that, if no substantial changes are made, it could be more difficult in 2019 for VA to provide accessible and timely care for Veterans than it was in 2014. However, available policy options could likely ensure that there are sufficient resources and capabilities to provide access without a fundamental change in the objective and orientation of VA. Among the options we considered, which comprise a prominent but not exhaustive set of options, no single policy option for increasing resources and capabilities was clearly superior to the others on all the criteria we considered.

7.1.2   Moving Forward

VA has the potential to be a national leader in health care innovation that improves access, quality, and the value of care. In certain areas, such as health IT and quality improvement, VA has historically been a leader and innovator. However, in some cases, such as IT, that position has eroded over time. There is widespread innovation and experimentation in new models of health care delivery that are occurring in federal and private-sector programs. VA should be at the forefront of these efforts.

Options with a policy objective of increasing Veterans' access to care outside the VA system have considerable uncertainty related to their potential impact on overall access. Purchased care provided to Veterans through relations with non-VA entities already represents a substantial and growing resource for VA. Care is provided to VA enrollees by non-VA entities through several programs and various types of payment or contractual arrangements that VA

has negotiated with its partners. The assessment highlighted several important barriers to increasing access through these programs. First, as described above, the existence of multiple programs has led to confusion and administrative complexity. Second, the geographic access standards used to identify Veterans eligible for purchased care are not very sensitive to differences in access experienced by subgroups of Veterans. In particular, the standards do not consider the availability of specific types of services, or regional differences such as traffic patterns. Third, VA's effort to increase Veterans Choice Program utilization could be better targeted at areas with lower rates of geographic access to needed care; such an assessment would consider area population totals and urbanicity, as well as VA facility complexity and service offerings.

VA could more fundamentally change its approach to providing access to non-VA providers in order to increase access for Veterans. There is a wide range of possible approaches, from providing Veterans access to certain defined services from non-VA providers to changing VA's role to that of a payer like TRICARE or Medicare.

There are several important areas of uncertainty that make it difficult to assess the projected impact of such changes. First, it is unclear to what extent non-VA providers would provide a superior level of access to care for Veterans. Our assessment found that many Veterans without access to VA health care also face obstacles in accessing purchased care, including long travel distances in the same rural areas where VA care is less available, and cultural barriers, particularly for complex and specialized services. Second, increased use of non-VA providers would increase challenges related to VA care coordination. Coordination of care is challenging in any single system, but is more challenging when coordination includes providers working across distinct systems of care with separate information systems and cultures. Third, fundamental changes in VA's role would have an uncertain effect on enrollment and use of care by Veterans. Many Veterans eligible for VA care are not currently enrolled, and many current enrollees do not use VA for all of their care. If VA were to transform to the TRICARE or Medicare model, for example, it is possible that demand for care would increase substantially, creating new challenges for VA capabilities to provide timely access. Thus, transforming VA from a provider to a purchaser of health care would not necessarily have a significant positive impact on access.

7.2   Limitations of the Assessment

This assessment has several important limitations, a number of which stem from the fact that the assessment was conducted over a very short time frame. This limited the scope of what could be included and to some extent the depth of analysis, particularly in cases where the process for obtaining VA data was protracted relative to the project timeline.

The lack of direct input from Veterans is a key limitation of this assessment. Veteran input would have provided valuable information about how Veterans perceive VA resources and capabilities and the barriers they face in accessing VA care. We were unable to conduct

interviews or focus groups with Veterans because doing so would require U.S. Office of Management and Budget approval under the Paperwork Reduction Act.[73] The application and approval process can take many months and was not feasible within the assessment time frame. To address this limitation, we conducted several analyses of secondary data sources that included Veterans' perspectives. For example, we analyzed VA patient experience measures and Yelp reviews of VA facilities and conducted interviews with representatives of Veterans Service Organizations.

Another limitation is that the projections of future resources are based solely on provider and productivity data (that is, FTEs and RVUs). The projections do not directly include changes in other key resources, such as physical space, equipment, and IT. They do include these resources indirectly through the productivity measure, since increased productivity could come through improved use of these resources. A projection model that included all resources and the interactions between them (for example, system dynamics) would be useful, but was beyond the scope of this assessment.

Moreover, the projections analysis is static in that it does not account for changes in demand that might occur if supply, and thus access, were increased. For example, if VA increased the productivity of its resources and improved access, current users might increase their reliance on VA, and more Veterans might choose to use the VA system. The VA demand projections we rely on do not account for this demand response, and thus the comparisons between projected supply and demand may understate a future gap if VA takes actions to improve access.

To put VA measures in context and assess adequacy, it would be useful to compare VA with non-VA health care organizations on measures of resources and capabilities. This would provide an objective benchmark against which we could assess VA measures. Differences between VA and other health care organizations, in terms of the organization of the delivery system and the patient population, however, limit the value of such comparisons. Therefore, in most cases, we use qualitative data from interviews and literature reviews to assess the adequacy of VA's resources and capabilities. Only for selected analyses did we identify and include useful non-VA comparators.

Several of our data sources and methods used have limitations that could have biased our analyses. Data from interviews may not be widely generalizable because our interviewees may not have been representative of all possible respondents, and the results may have been subject to biases in interviews and interpretation of results. Many data analyses relied on VA data sources, and we were not able to assess the validity of the source data. Survey results may have been subject to nonresponse bias.

Despite these limitations, this assessment provides valuable information about VA resources and capabilities to provide timely, accessible care.

---

[73] In accordance with the Paperwork Reduction Act, an approval from OMB must be obtained prior to collecting federally sponsored data from 10 or more respondents within a 12-month period using standardized questions.

7.3 Recommendations

Based on the findings of Assessment B, we make several recommendations to improve access to care for Veterans.

VA should use a systematic, continuous performance improvement process to improve access to care. Many VA facilities achieve very high levels of performance on key access and quality measures. At the same time, there is a great deal of variation across the system, and some Veterans are not receiving timely access to care. A systematic effort is needed to identify unwarranted variation, identify and develop best practices to improve performance, and embed these practices into use across the VA system at other sites where they could be successful. However, attempts to standardize high-quality performance should also be sensitive to the need for some solutions designed to support local needs and contexts. Solutions should be designed to be responsive to Veterans' preferences, needs, and values.

VA should consider alternative standards of timely access to care. Although VA provides timely and accessible care to most Veterans, there are still many Veterans who do not get an appointment as soon as needed. Timeliness standards should be reexamined and should consider use of metrics that reflect the *availability* of appointments, rather than when they are completed. VA should examine the utility of existing alternative benchmarks such as same-day availability of the third next available appointment. Access standards for other dimensions, such as cultural access, should also be developed and used in performance monitoring and improvement. VA should develop methods to routinely compare timeliness of VA care with non-VA benchmarks and publish these comparisons to give Veterans a better understanding of facility performance. Currently, good non-VA benchmarks do not exist. The evidence base for appropriate visit intervals is also very underdeveloped. VA has an opportunity to be a leader in the U.S. health care system in developing evidence-based methods for measuring and improving the timeliness of care.

VA and Congress should develop and implement more sensitive standards of geographic access to care. Although most Veterans have geographic access to VA care by a general standard of less than 40 miles distance from any facility, geographic access is worse when using different types of access standards. VA should compare the "one-size-fits-all" approach of driving distance with alternative standards that are more sensitive to differences between Veteran subgroups, clinical populations, geographic regions, and individual facilities. This assessment highlighted the importance of time spent driving, mode of transportation, traffic, and availability of needed services as key considerations in assessing whether Veterans have geographic access to care.

VA should focus efforts to increase Veterans Choice Program utilization in areas with the lowest rates of geographic access to VA facilities. These areas can be identified in geographic assessments that consider locations of facilities relative to enrollee populations, along with estimates of access to more complex and specialized service offerings in VA facilities.

VA should continue moving toward using a smaller number of quality metrics in quality measurement and improvement activities. VA has historically been on the forefront of quality measurement and improvement in the United States. As a result, VA currently maintains an

extensive set of quality measures. Although use of these measures has led to improvements in care, the proliferation of measures creates burdens on staff and resources and can lead to an emphasis on the measures rather than improvement in areas of care that are more likely to improve outcomes for Veterans. VA has already moved toward reporting systems that rely on a smaller number of measures, such as Strategic Analytics for Improvement and Learning (SAIL)[74], and should continue to advance in this direction.

VA should take significant steps to improve access to VA care. Our projections indicate that increases in resources and the productivity of resources will be necessary to meet increases in Veterans' demand for health care over the next five years. The options we considered that have the highest estimated potential impact are formalizing full nursing practice authority, increasing physician hiring, and increasing the use of virtual care. These are commonly proposed options for improving VA care. In addition, new models of health care delivery are emerging rapidly in the U.S. health care system that could improve access to care. VA should seek to be an early adopter of these new models and should build a strategy that enables and supports such innovation.

VA should establish itself as a leader and innovator in health care redesign. Our assessment found that VA has historically been on the leading edge in several important areas, such as development and use of health IT. It is also on the forefront of many other innovative delivery methods, such as team-based primary care. As a large integrated delivery system, VA has some favorable conditions in which to innovate compared with many other U.S. health care delivery systems. However, VA also faces certain constraints (hiring processes, salaries, budgeting, etc.) that private-sector entities do not. VA should endeavor to maximize its opportunities to innovate, and should also endeavor to learn from current leaders in areas where its leadership position has eroded, particularly in health IT, and seek to reestablish its leading position.

VA should streamline its programs for providing access to purchased care and use them strategically to maximize access. Currently available programs are overlapping and confusing to Veterans, VA employees, and non-VA providers. VA should clearly identify the objectives of purchased care access and streamline programs to meet those objectives.

VA should systematically identify opportunities to improve access to high-quality care through use of purchased care. Some types of care may be more effectively and efficiently delivered by non-VA providers. Identification of these types of care and the impact of shifting Veteran's care to non-VA providers requires an in-depth systematic analysis that was beyond the scope of this assessment.

7.4   Conclusions

These recommendations would help VA improve access to care for Veterans across the VA system and ensure that future demands for VA care can be met. Although this assessment did

---

[74] Although SAIL uses fewer measures to simplify reporting, they are composite measures which still incorporate numerous individual performance measures.

---

not find a system-wide crisis in access to VA care, it did identify a high degree of variability in performance across VA facilities, a number of barriers to effective use of VA resources and capabilities, and likely future challenges. These recommendations should be implemented and progress regularly evaluated to ensure continuous improvement in performance. Such improvement in performance will be needed to ensure that we meet our nation's commitment to care for Veterans.

Appendix A   Methods

This appendix provides additional information on the methodologies used in Assessment B. It is intended to supplement Section 2, Methods Overview. The appendix contains material related to the following subsections in Section 2:

A.1: Illustrative Clinical Populations
A.2: Interviews
A.3: VA Resources and Capabilities
A.4: Access to VA Care
A.5: Quality of VA Care
A.6: Developing Policy Options
A.7: Projecting Future VA Resources and Capabilities

Appendix A.1 Illustrative Clinical Populations

As described in Section 2, we selected seven illustrative clinical populations that were used to provide a more detailed understanding of VA capabilities, resources, and accessibility in selected subpopulations of Veterans. We defined a clinical population as a group of individuals with a need for specific health care resources.

We selected clinical populations by applying "screening criteria" that were applied to each candidate population (importance, measurability) as well as "breadth criteria" that were applied to a subset of populations that met the screening criteria (type of care, acuity, care setting, workforce, population diversity). The breadth criteria were applied as a group to ensure that the portfolio was diverse on important characteristics. While each individual clinical population cannot meet all the breadth criteria, the group of clinical populations as a whole was required to cover the range of options specified by these criteria.

We applied the screening criteria using a two-step process. First, to identify "important" and "measureable" clinical populations, we selected the 37 conditions identified by the VA-DoD Reporting & Analysis Datamart Technical Advisory Group as a "High Interest Group." We used prevalence data provided by the VA Healthcare Analysis and Information Group to select the 10 most prevalent medical high interest groups, the five most prevalent behavioral health high interest groups, and all conditions that were primarily attributable to military service. The result was the 20 populations listed in Table A-1. This list was subsequently revised, using the method described in Subsection 2.2.

Table A-1. Breadth Criteria Characteristics of the 20 Candidate Clinical Populations Meeting the Screening Criteria

	No. Unique Patients at VHA Facilities with Primary Diagnosis, FY 2014	Population Diversity	Acuity	Care Setting	Workforce
Medical					
Circulatory System	2,046,220	Older	Broad category which ranges from chronic (for example, asymptomatic coronary disease to acute (acute coronary syndromes)	Inpatient hospital with coronary care capability; cardiac catheterization laboratory; interventional radiology; emergency department; outpatient primary care and specialty clinics	Primary care, emergency medicine, cardiology, cardiothoracic surgery, vascular surgery; interventional radiology; rehabilitation
Pain	1,594,560	All ages	Chronic more common than acute	Primarily outpatient	Primary care, pain management
Vision Loss, Visual	1,177,707	Older	Chronic	Outpatient	Primary care, optometry
Diabetes	1,115,700	Middle age, older	Chronic; can be acutely exacerbated	Primarily outpatient. Occasionally inpatient hospital for uncontrolled diabetes	Primary care, endocrinology; ancillary services like nutrition counseling, podiatry, ophthalmology; team-based care
Hearing Loss	694,409	All ages	Chronic	Outpatient	Primary care, audiology
Hyperlipidemia	630,265	All ages	Chronic	Outpatient	Primary care

	No. Unique Patients at VHA Facilities with Primary Diagnosis, FY 2014	Population Diversity	Acuity	Care Setting	Workforce
Chronic Obstructive Pulmonary Disease	369,050	Older	Chronic with acute exacerbations	Outpatient primary care clinics, outpatient specialty clinics, inpatient hospital for acute exacerbations	Primary care, pulmonology, respiratory therapy
Arthritis & Arthropathy	367,151	Older	Chronic with acute exacerbations	Primarily outpatient. Rarely inpatient hospital	Primary care, rheumatology
Malignancy	203,096	All ages	Sub-acute; the course of the illness generally occurs over a discrete time interval (with exceptions). Timeliness of care is particularly important	Outpatient primary care, outpatient specialty care such as advanced imaging, chemotherapy and radiation therapy	Primary care for screening and diagnosis; Specialty care (for example, oncology, surgery, radiation treatment) is typically most important for treatment
Obesity	183,972	All ages	Chronic	Outpatient	Primary Care
TBI	59,394	Younger	Chronic	Outpatient specialty clinics, rehab	Primary Care, neurology, psychiatry, rehab med
Spinal Cord Injury	24,634	Younger	Chronic	Outpatient specialty clinics, rehab	Primary care, rehab med
Burns	5,595	Younger	Chronic in the context of the VA	Outpatient, surgical suites (if acute burn care not provided)	Primary care, plastic surgery

	No. Unique Patients at VHA Facilities with Primary Diagnosis, FY 2014	Population Diversity	Acuity	Care Setting	Workforce
Behavioral Health					
Depression	646,640	All ages	Chronic with acute exacerbations	Outpatient, inpatient for severe exacerbations	Psychiatry, primary care, psychology, social work
PTSD	582,565	All ages	Chronic, with acute exacerbations	Outpatient primary care and specialty mental health; some specialized PTSD residential programs	Psychiatry, primary care, psychology, social work, peer counselors
Anxiety	313,792	All ages	Chronic, acute	Outpatient primary care and specialty mental health;	Primary care, psychiatry, psychology
Substance Abuse	245,312	All ages	Chronic with acute exacerbations	Outpatient primary care, specialty mental health and specialty substance abuse clinics, emergency department, residential rehabilitation centers, outpatient rehabilitation centers; domiciliary	Primary care, emergency medicine, substance abuse specialists, psychiatry, psychology, social work, peer counselors
Other Mental Health	196,537	Unknown	Chronic, acute	Outpatient, inpatient for severe exacerbations	Primary care, psychiatry

	No. Unique Patients at VHA Facilities with Primary Diagnosis, FY 2014	Population Diversity	Acuity	Care Setting	Workforce
Adjustment Reaction	155,203	Unknown	Chronic, acute	Outpatient, primarily primary care	Primary care, psychiatry
Brain Injury Mental Disorder	2,745	Younger	Chronic	Outpatient	Primary care, psychiatry, neurology, rehab

Sources: VA Healthcare Analysis and Information Group provided a list of 37 "High Interest Group" conditions, along with associated prevalence data. Population Diversity, Acuity, Care Setting, and Workforce columns are based upon clinical expertise. For Population Diversity, "Older" is indicated when the condition is more common among Veterans age 50 or older; "Younger" is indicated when the condition is more common among Veterans age 40 or younger.

Appendix A.2 Interviews

As part of our methodology for identifying personnel to interview (see Subsection 2.4), we drew a purposive sample of VAMCs. The sample of facilities was selected to include a variety of facilities that, while not technically representative of the universe of VAMCs, would provide variation on key characteristics. As explained in Section 2, we created six VAMC groups based on three characteristics: capacity, complexity, and metropolitan context.

We provide additional information about how we defined these characteristics here:

Capacity: Capacity refers to the size of the facility, which was measured in terms of the number of patients served. At the time that facilities needed to be selected (in order to begin interviews in a timely fashion), the best machine-readable measure of capacity to which we had access was the 2012 Hospital Quality Report Card (VA, undated). Data tables were publicly available. While this report contains several measures of capacity, we reviewed three: number of Acute Inpatient (Medical/Surgical) Facility Unique Patients, Number of Primary Care Outpatient Visits, and Number of Specialty Care Outpatient Visits. Dividing the VAMCs into groups using each of these metrics resulted in fairly similar results, so we ultimately used the inpatient numbers to assign each VAMC a size category of small (under 40,000 visits), medium (40,000 to 60,000 visits), and large (over 60,000 visits).

Complexity: Complexity refers to the level of the VAMC's ability to treat a large number of conditions (as opposed to offering a limited suite of services). Complexity was drawn from the Veterans Affairs Site Tracking System dataset (extract from September 30, 2014). Each VAMC is assigned a complexity score of 1 through 3 (1a, 1b, and 1c—High Complexity; 2—Medium Complexity, 3—Low Complexity). VAMCs were classified as complex (1) or less complex (2 and 3). The VHA's 2011 Facility Complexity Model classification is based on seven standardized criteria: volume and patient case mix, clinical services provided, patient risk calculated from VA patient diagnosis, total resident slots, an index of multiple residency programs at a single facility, total amount of research dollars, and the number of specialized clinical services.

Metropolitan context: Metropolitan context is the size of the urban area served. In Veterans Affairs Site Tracking data, all VAMCs are designated as Urban, Rural, or Highly Rural based on the Rural-Urban Commuting Areas system, which is based on the Census Bureau's urbanized areas and the percentage of the rural population commuting to urbanized clusters. We created three categories of VAMCs: Rural, Small/Medium Metro, and Large Metro. The "Rural" category included one VAMC that was classified as "Highly Rural" by the VA and 19 that were classified as "Rural." VAMCs designated as "Urban" were subdivided into two categories: Small/Medium Metro and Large Metro, by the size of the urbanized areas, on the grounds that the size of the metropolitan area may limit or enable access to non-VA care and therefore be an important dimension to consider in constructing the purposive sample of VAMCs. Size of the metropolitan area was obtained from the American Community Survey 2013 estimates of population for Core-Based Statistical Areas, which comprise micropolitan and metropolitan areas. These statistical areas are co-terminus with county boundaries, so it was possible to link the county location given for each facility in the Veterans Affairs Site Tracking System extract to its

associated Core-Based Statistical Area population. A threshold of 4 million in population was used to distinguish Small/Medium Metro areas from Large Metro areas.

Appendix A.3 VA Resources and Capabilities

As part of our assessment of physical infrastructure capabilities and resources, we identified and defined clinical care services that are definitive for one or more of the seven illustrative clinical populations described in Section 2, Table 2-1. Table A-2 provides a full list of 27 such services and their definitions, grouped by clinical population.

Table A-2. Definitions of Condition-Specific Services

Clinical Population and Service #	Services	Definition
Acute Coronary Syndromes		
1	Emergency department	Hospital facilities for the provision of unscheduled, outpatient services to patients whose conditions require immediate care.
2	Coronary care unit	A hospital unit with specialty services to care for patients with heart attacks, unstable angina, cardiac dysrhythmia, and other cardiac conditions.
3	Telemetry (If CCU/ICU not available)	Electronic monitoring of heart rate and rhythm.
4	Non-invasive cardiology services	Evaluation of heart disease using external tests such as echocardiograms and stress tests.
5	Diagnostic cardiac catheterization	This technique assists in diagnosing complex heart conditions. cardiac angiography Involves the insertion of a tiny catheter into the artery in the groin then carefully threading the catheter up into the aorta where the coronary arteries originate. Once the catheter is in place, a dye is injected which allows the cardiologist to see the size, shape, and distribution of the coronary arteries. These images are used to diagnose heart disease and to determine, among other things, whether or not surgery is indicated.

Clinical Population and Service #	Services	Definition
6	Interventional Cardiology	Nonsurgical procedure that utilizes the same basic principles as diagnostic catheterization and then uses advanced techniques to improve the heart's function. It can be a less-invasive alternative to heart surgery.
7	Cardiac Surgery	Includes minimally invasive procedures that Include surgery done with only a small incision or no incision at all, such as through a laparoscope or an endoscope, as well as more invasive major surgical procedures that include open chest and open heart surgery.
Colon Cancer		
8*	Primary Care Clinic	A unit or clinic within the hospital that provides primary care services (for example, general pediatric care, general internal medicine, family practice, gynecology) through hospital-salaried medical and/or nursing staff, focusing on evaluating and diagnosing medical problems and providing medical treatment on an outpatient basis.
9	Colonoscopy	An examination of the interior of the colon using a long, flexible, lighted tube with a small built-in camera.
10	Computerized Tomography Scan	Computed tomographic scanner for head or whole body scans.
11	Surgical Services	Inpatient and outpatient services for patients requiring surgery.
12	Oncology Services	Inpatient and outpatient services for patients with cancer, including comprehensive care, support and guidance In addition to patient education and prevention, chemotherapy, counseling and other treatment methods.

Clinical Population and Service #	Services	Definition
TBI		
13	Polytrauma Support Clinic Team	An interdisciplinary team of health care providers who provide and coordinate rehabilitation services for patients with traumatically induced structural injury and/or physiological disruption of brain function as a result of an external force. Polytrauma Support Clinical Teams also conduct comprehensive evaluations of patients with positive TBI screens, and develop and implement rehabilitation and community reintegration plans.
14	Polytrauma Network Site	Sites that provides inpatient and outpatient rehabilitation care and coordinate polytrauma and TBI services throughout the VISN, generally with less comprehensive services than Polytrauma Rehabilitation Centers. (VA-specific term)
15	Polytrauma Rehabilitation Center (Program)	Regional referral centers for the comprehensive acute rehabilitation for Veterans with complex and severe polytrauma. Polytrauma Rehabilitation Centers maintain a full staff of dedicated rehabilitation professionals and consultants from other medical specialties to address the complex medical and psychosocial needs of patients with polytrauma. The Polytrauma Rehabilitation Centers serve as a resource for educational programs and best practice models for other facilities. (VA-specific term)
16	TBI Specialty Care	Specialty services designed for evaluation and treatment for patients with TBI.
Type 2 Diabetes Mellitus		
8*	Primary care clinic	(defined above)
17	Diabetes specialty or endocrinology clinic	Clinic that provides specialty care for patients with diabetes, including diagnosis, testing of glucose levels, and education about self-care and self-monitoring.
18	Podiatry clinic	Clinic that provides specialty care to diagnose and treat diseases affecting the feet and ankles.

Clinical Population and Service #	Services	Definition
19	Ophthalmology clinic	Physician-staffed clinic that provides specialty care to diagnose and treat diseases of the eye.
PTSD		
20	Domiciliary Residential Rehabilitative Treatment Program	A DRRTP provides a residential level of care for Veteran populations including medical, psychiatric, SUD, PTSD, and homelessness. DRRTPs provide a 24-hours-per-day, 7 days-per-week (24/7) structured and supportive residential environment as a part of the rehabilitative treatment regime. DRRTPs are larger residential programs with multiple units serving various patient populations. (VA-specific term)
21**	Mental Health Services	A broad variety of health care services to diagnose and treat mental illness.
22	PTSD psychotherapy	Psychotherapy (talk therapy) services specially designed to alleviate symptoms for patients with PTSD, including behavioral techniques.
SUD		
23	Residential SUD treatment	Diagnosis and therapeutic services to patients with alcoholism or other drug dependencies as part of inpatient/residential treatment for patients whose course of treatment involves more intensive care than provided in an outpatient setting or where patient requires supervised withdrawal.
24	Methadone	Outpatient clinic that dispenses the drug methadone to patients with drug addiction to avoid symptoms of narcotic withdrawal.
25	Outpatient specialty SUD care	Diagnosis and therapeutic services to patients with alcoholism or other drug dependencies.
26	Inpatient detoxification	Inpatient unit to manage the narcotic withdrawal process for patients with drug withdrawal symptoms.
21**	Mental health services	(defined above)

Clinical Population and Service #	Services	A-11 Definition
Conditions Requiring Gynecological Surgery		
27	Gynecological surgery services	Facility that provides care to patients requiring surgery on either an inpatient or outpatient basis.

SOURCES: Definitions 1, 5-10, 12, 23, 25, and 26 adapted from the American Hospital Association Annual Survey Reporting Instructions, 2008. Definitions 13-15 adapted from the VHA Handbook 1172.01, March 20, 2013. Definition 20 adapted from the VHA Handbook 1162.02, December 22, 2010. **Service 21, mental health services, appears twice and retains the same number in this table

Appendix A.4 Access to VA Care

This subsection provides additional information on the methods used for two components of our assessment of access to VA care:

Measures of access (Subsection A.4.1)
Systematic literature review (Subsection A.4.2).

Appendix A.4.1 Measures of Access

We characterized access to VA care and, where possible, compared access in the VA versus non-VA settings, by analyzing performance measure data from VA and non-VA data sources. Table A-3 provides a list of access measures used in this assessment, organized by the five dimensions of access.

Table A-3. VA Access Measures and Questions By Domain (Timeliness, Geographical, Financial, Digital, and Cultural)

Domain of Access	Access Measure or Survey Question	VA Data Source(s)	Non-VA Data Source(s)
Timeliness	▪ Percentage of primary care appointments completed in less than or equal to 30 days from preferred date for: ▪ New patients ▪ Established patients ▪ Percentage of specialty care appointments completed in less than or equal to 30 days from preferred date for: ▪ New patients ▪ Established patients ▪ Percentage of mental health appointments completed in less than or equal to 30 days from preferred date for: ▪ New patients ▪ Established patients	VHA Support Service Center (VSSC)	Not available for a representative sample of health care providers or plans

Timeliness	• Outpatient access composite case-mix adjusted (%) • Get an urgent care appointment as soon as needed case-mix adjusted (%) • Get a routine care appointment as soon as needed case-mix adjusted (%) • Got answer to phone question during regular office hours on same day • Got answer to phone question after hours as soon as needed • Saw provider within 15 minutes of appointment time • Got needed care during evenings, weekends, or holidays	VA Survey of Healthcare Experiences of Patients (SHEP): Patient-Centered Medical Home (PCMH) survey	AHRQ CAHPS Database[75]
Timeliness	• Veterans like me can get in and out of an appointment at VA in a reasonable time • When Veterans like me go to VA for an appointment, they do not wait a long time to see the doctor	VA Survey of Enrollees	Not available
Geographical	• It is easy to get to my local VA facility • There is a VA provider in my area that offers all of the health care services that Veterans like me need • It is easy for Veterans like me to get around in the VA health care facility	VA Survey of Enrollees	Not available

---

[75] National scores are available for the CAHPS Health Plan Survey and Medicare CAHPS surveys; however, the measures on these surveys are not the same as those on the SHEP PCMH.

The views, opinions, and/or findings contained in this report are those of RAND Corporation and should not be construed as an official government position, policy, or decision.

Financial	▪ If the cost of health care to me increases, I will use VA more ▪ Veterans who can afford to use other sources of health care should leave the VA to those who really need it ▪ VA offers Veterans like me the best value for our health care dollar ▪ VA is the most cost-effective health care provider for Veterans like me ▪ My use of VA will decrease if my financial resources improve	VA Survey of Enrollees	Not available
Digital	▪ Access to the Internet	VA Survey of Enrollees	Not available
Cultural	▪ Veterans like me like going to VA because you can talk to other Veterans ▪ VA health care providers treat their patients with respect	VA Survey of Enrollees	Not available

To identify measures of access for analysis, we conducted an environmental scan of access measures in VA performance measure reporting systems and publications, including the Strategic Analytics for Improvement and Learning (SAIL) (VA, 2014h), VA Hospital Compare ASPIRE (VA, 2014d), Linking Knowledge & Systems (LinKS) (VA, 2014c), and the Facility Quality and Safety Report (VA, 2013d).

Fifteen access measures or survey questions relate to the timeliness domain of access (Table A-3), including six related to appointment completions (wait-time measures), one composite measure, and six individual questions regarding access to care from an annual survey of Veterans who have used VA outpatient care (SHEP PCMH), and two items from an annual survey of Veterans who are enrolled in the VA health care system (VHA Survey of Veteran Enrollees' Health and Reliance upon VA, known as the Survey of Enrollees). We also analyzed measures related to the digital (one question), financial (five questions), geographical (three questions), and cultural aspects of access to VA care (two questions) from the Survey of Enrollees.

Appendix A.4.2 Methods for Systematic Literature Review on Access to Care for Veterans

To summarize the peer-reviewed literature, we conducted a systematic review on access to VHA care for Veterans. Figure A-1 illustrates our review process.

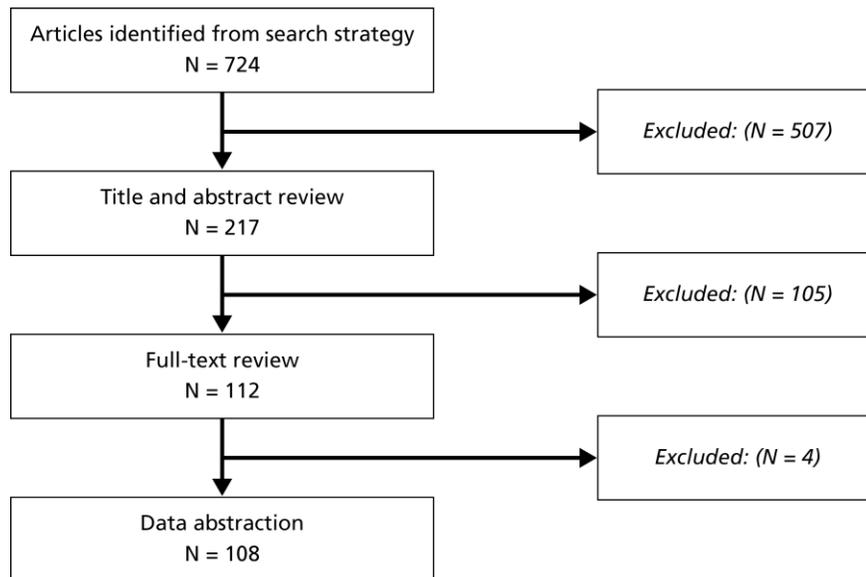
Search Strategy. We built our search terms based on three major areas of interest that include (1) articles that focus on Veterans and VA health care facilities, (2) search terms around access

(defined as the availability of services), and (3) search terms around utilization (defined as the use of services). The search identified 724 articles of potential interest. The start date for the PubMed search was January 1, 2005, and the end date was April 10, 2015. A Stage 1 form was developed in DistillerSR with inclusion and exclusion criteria, and two researchers screened each title and abstract produced by the search. An article was selected for full-text screening when both researchers agreed it should be included. When disagreement about the initial assessment (inclusion or not) occurred, the specific articles were discussed with at least one other senior member of the review team. A total of 217 articles were carried through to the following stage.

Study Selection. Full-text articles selected for screening were reviewed by two trained researchers using a Stage 2 form in DistillerSR. To be included in the review, the article was required to evaluate access to care and/or the relationship between access to care and the utilization of services at VA facilities. Additionally, the Stage 2 screening form collected basic information about the articles to confirm that it should be carried forward to the final stage of review: outcome(s) related to access and/or access and utilization; type of access based on the outcomes (check all that apply). A total of 112 articles were carried through to the following stage.

Data Abstraction. Data were abstracted by one reviewer using a Stage 3 form in DistillerSR. Once the forms were completed, a senior member of the review team reviewed all the data. The following data were abstracted from all studies: author names, publication year, type of data, type of study design, sample size and unit of measurement, study health care setting, location, insurance status of study participants, outcome related to access and/or access and utilization (up to five could be reported), results related to access and/or access and utilization (up to five could be reported). A total of 108 articles were reviewed at this final stage.

Data Synthesis. We classified articles according to the dimensions of access outlined in Section 1. All articles that had been classified as "other" also overlapped with a specific domain of access (geographic, timely, financial, digital, and cultural) and results were reported in those respective dimensions. Within each dimension, studies were sufficiently heterogeneous to preclude meta-analysis. Consequently, our syntheses are narrative.

Figure A-1. Literature Flow for Access Review


MS4675B-A.1

Appendix A.5 Quality of VA Care

This subsection provides additional information on the methods used for three components of our assessment of the quality of VA care:

- Measures of quality (Subsection A.5.1)
- Comparing quality in VA and non-VA inpatient settings (Subsection A.5.2)
- Systematic literature review (Subsection A.5.3).

Appendix A.5.1 Analysis of VA Performance Measures

We used performance measures tracked by VA and evidence from peer-reviewed literature to measure quality of care in the VA, compare across VA facilities, compare across subgroups of Veterans, and compare with non-VA benchmarks. We selected a subset of performance measures for analysis from the more than 500 measures of quality available for use in the VA system. We analyzed measures for this report for which there were data available for VA patients; data for non-VA comparison groups was also analyzed when available. We prioritized quality measures that reflect national standards and are reported by national performance measurement programs, as follows:

The HEDIS measures, which were developed by the National Committee for Quality Assurance (National Committee for Quality Assurance, 2014). HEDIS measures included in this report relate to screening, prevention, and wellness, as well as management of chronic medical conditions, such as diabetes, hypertension, cardiovascular disease, and depression. HEDIS outpatient quality measures of effectiveness reported by VA and the National Committee for Quality Assurance are shown in Table A-4.

Table A-4. HEDIS Outpatient Quality Measures of Effectiveness Reported by VA and the National Committee for Quality Assurance

Measure Title*
Screening, Prevention, and Wellness
Tobacco Use: Advising Smokers and Tobacco Users to Quit
Breast Cancer Screening (50-74)
Colorectal Cancer Screening (50-75)
Chronic Condition Management
Persistence of Beta-Blocker Treatment After a Heart Attack
Comprehensive Diabetes Care
Blood Pressure Control (diagnosis of DM and hypertension, 18-85 years, and <140/90 mm Hg)
Eye Exams
HbA1c Screening
Poor Glycemic Control (HbA1c >9%)—Lower rates signify better performance
LDL-C Screening
LDL-C Control (<100 mg/dL)
Medical Attention for Nephropathy
Hypertension
Controlling High Blood Pressure (Diagnosis of hypertension, 18-85 years and <140/90)
Cholesterol Management for Patients With Cardiovascular Conditions
LDL-C Screening
LDL-C Control (<100 mg/dL)
Antidepressant Medication Management
Acute Phase
Continuation Phase
*VA facility-level data for HEDIS outpatient quality measures were obtained from the VA Office of Performance Measurement. National data for HEDIS outpatient quality measures for non-VA patients in health plans (commercial HMO, Medicare HMO, and Medicaid HMO) were obtained from the following report: National Committee for Quality Assurance. 2014. *The State of Health Care Quality 2014.* Available as of March 20, 2015 at www.ncqa.org.

The patient experience measures for health care received in the outpatient and inpatient settings adapted from the CAHPS (AHRQ, 2015) and HCAHPS (CMS, 2015) measure sets, respectively. For patients receiving care in non-VA hospitals, we used HCAHPS data that are reported on the CMS Hospital Compare website (CMS, 2015). Patient experience measures reported by VA are shown in Table A-5.

Table A-5. Patient Experience Measures for Outpatient and Inpatient Settings Reported by VA and Non-VA Facilities

Measure Title
Outpatient Setting*
Communication (How Well Providers Communicate with Patients)
Office Staff (Helpful, Courteous, and Respectful Office Staff)
Comprehensiveness (Providers Pay Attention to Your Mental or Emotional Health)
Self-Management Support (Providers Support You in Taking Care of Your Own Health)
Providers Discuss Medication Decisions
Patients' Rating of the Provider
Follow-up on Test Results
Provider was informed and up-to-date on care received from specialist
Talked about prescription medicines at each visit
Provider's office gave information on what to do if care needed on evenings, weekends, or holidays
Got reminders from provider's office between visits
Inpatient Setting**
Communication with Nurses
Communication with Doctors
Communication about Medicine
Responsiveness of Hospital Staff
Discharge Information
Pain Management
Care Transition
Cleanliness of the Hospital Environment
Quietness of the Hospital Environment
Overall Rating of Hospital

*VA facility-level data for outpatient patient experience measures (Survey of Healthcare Experiences of Patients) were obtained from the VA Office of Performance Measurement. **VA facility-level data for inpatient patient experience measures (Survey of Healthcare Experiences of Patients) were obtained from the VA Office of Performance Measurement. Non-VA facility-level data for inpatient patient experience measures were obtained from the CMS Hospital Compare website.

The ORYX measures (also known as the National Hospital Quality Measures) developed by the Joint Commission for hospital quality improvement and used in its hospital accreditation

process (Joint Commission, 2015). We used data for VA and non-VA hospitals that are reported on the CMS Hospital Compare website (CMS, 2015). The ORYX measures included in this report relate to acute myocardial infarction, heart failure, pneumonia, and surgical care. Inpatient hospital quality measures reported by VA and non-VA hospitals are shown in Table A-6.

Table A-6. Inpatient Hospital Quality Measures Reported by VA and Non-VA Hospitals

Measure Title
Acute Myocardial Infarction*
Timing of receipt of primary percutaneous coronary intervention (PCI)
Aspirin prescribed at discharge
Statin prescribed at discharge
Heart Failure*
Discharge instructions
Evaluation of left ventricular systolic function
ACEI or ARB for left ventricular systolic dysfunction
Pneumonia*
Initial antibiotic for community-acquired pneumonia (CAP) in immunocompetent patient
Surgical Care*
Prophylactic antibiotic received within one hour prior to surgical incision
Prophylactic antibiotics discontinued within 24 hours after surgery end time
Surgery patients who received appropriate venous thromboembolism prophylaxis within 24 hours prior to surgery to 24 hours after surgery
Surgery patients on beta-blocker therapy prior to arrival who received a beta-blocker during the perioperative period
Prophylactic antibiotic selection for surgical patients
Cardiac surgery patients with controlled 6 a.m. postoperative blood glucose
Urinary catheter removed on postoperative day 1 (POD 1) or postoperative day 2 (POD 2) with day of surgery being day zero
Surgery patients with perioperative temperature management
Patient Safety**
Complication/patient safety for selected indicators (composite) (observed: expected)
Death rate (per 1,000) among surgical inpatients with serious treatable complications
Iatrogenic pneumothorax (per 1,000)
Postoperative pulmonary embolism or deep vein thrombosis rate (per 1,000)
Postoperative wound dehiscence (per 1,000)

Measure Title
Accidental puncture or laceration (per 1,000)
Outcome
Readmission*
Acute myocardial infarction (AMI) 30-day all-cause risk-standardized readmission rate
Heart failure (HF) 30-day all-cause risk-standardized readmission rate
Pneumonia (PN) 30-day all-cause risk-standardized readmission rate
Mortality*
Acute myocardial infarction (AMI) 30-day all-cause risk-standardized mortality rate
Heart failure (HF) 30-day all-cause risk-standardized mortality rate
Pneumonia (PN) 30-day all-cause risk-standardized mortality rate

*VA and non-VA facility-level data for these inpatient hospital measures were obtained from the CMS Hospital Compare website.
**VA facility-level data for the patient safety indicator measures were obtained from the VA Inpatient Evaluation Center (IPEC). Non-VA facility-level data for the patient safety indicator measures were obtained from the CMS Hospital Compare website.

The Patient Safety Indicators (PSIs) developed by the AHRQ to provide information about adverse events and complications of care that may occur in the hospital (AHRQ, 2015). The PSIs in this report include two composite measures on overall inpatient safety and surgical safety, and four specific complications (Table A-6). We used data for VA and non-VA hospitals that are reported on the CMS Hospital Compare website (CMS, 2015).

The 30-day all-cause risk-standardized mortality and readmission measures developed by the CMS in conjunction with the Hospital Quality Alliance (CMS, 2014). We used data for VA and non-VA hospitals that are reported on the CMS Hospital Compare website (CMS, 2015). The mortality and readmission measures in this report include those for acute myocardial infarction, heart failure, and pneumonia (Table A-6).

The number of VA and non-VA hospitals that report data to CMS Hospital Compare varies across measures for several reasons. Different numbers of hospitals meet the CMS Hospital Compare criteria for reporting the various measures. The criteria include: the number of cases/patients must meet the required minimum number for public reporting (for example, 25 cases for the AMI measures); and the number of cases/patients must be large enough to reliably tell how well a hospital is performing and protect personal health information. Other reasons include the hospital did not have data to report for a measure, or a hospital did not have any patients meet the inclusion criteria for a measure.

Appendix A.5.2 Comparing Quality in VA and Non-VA Inpatient Settings

In this subsection, we describe our method for comparing quality in VA and non-VA settings and, in particular, for propensity score matching. For inpatient quality measures, we compared

VA performance rates based on data provided by VA with data for non-VA hospitals on CMS Hospital Compare. To ensure optimum comparability between VA and non-VA facilities in our analysis, we identified a subset of non-VA facilities with similar characteristics. For this, we used a file of American Hospital Association data (American Hospital Association, 2014), which include facility-level characteristics for 135 VA facilities[76] and 6,332 non-VA facilities. We used the American Hospital Association data for propensity score matching based on the predicted likelihood that a non-VA facility could be a VA facility given certain characteristics (covariates). For matching, we selected four facility characteristics most likely to differ between VA and non-VA hospitals, and shown to be predictive of performance on Hospital Compare measures. The facility-level characteristics used for matching were:

- Bed size (<100 beds, 100–199 beds, and 200+ beds)
- U.S. Census division (East North Central, East South Central, Mid-Atlantic, Mountain, New England, Other, Pacific, South Atlantic, West North Central, and West South Central)
- Location (urban, rural)[77]
- Teaching status (teaching facility, non-teaching facility).[78]

We performed a t-test comparing all VA facilities and all non-VA facilities on the four baseline characteristics before building the propensity score model. There were significant differences between the VA and non-VA facilities for almost every characteristic. Therefore, the goal was to minimize these differences using our propensity score matching method. Next, we ran a logistic regression model to compute a propensity score for each facility. In our case, the propensity score is the predicted probability of the facility being a VA facility. We matched non-VA facilities to VA facilities based on these probabilities. We chose to match three non-VA facilities to each VA facility with a maximum allowable absolute difference between propensity scores of 0.0009. Non-VA facility matches were identified for all VA facilities. We ran t-tests again comparing the baseline characteristics of VA facilities and the matched set of non-VA facilities. There were no significant differences between the VA and the matched non-VA facilities for any characteristic in the model, indicating that the two sets of facilities are well-matched. When we estimated the measure results for the VA and non-VA comparison groups, if a VA hospital had a missing value

---

[76] Seven of 135 facilities flagged as "VA" in the American Hospital Association file could not be matched to the CMS Hospital Compare file, and therefore, were excluded from the propensity score matching. Of the seven excluded VA facilities, three facilities had measure data for Fiscal Year 2014 Q4 CMS Hospital Compare, and four facilities had Patient Safety Indicator and SHEP data from the VA's datasets. Based on a comparison of the measure performance between the included and excluded hospitals, we concluded there were no meaningful differences between the two groups.

[77] Facilities are categorized as urban or rural based on the AHA definition: "A rural hospital is located outside a Metropolitan Statistical Area (MSA), as designated by the U.S. Office of Management and Budget (OMB), effective June 6, 2003. Urban hospitals are inside Metropolitan Statistical Areas."

[78] Teaching facilities are defined to include all major and minor teaching hospitals, with a major teaching hospital being those with a Council of Teaching Hospitals (COTH) designation and a minor teaching hospital being those with another teaching hospital designation. Facilities without a teaching hospital designation were classified as non-teaching facilities.

---

for a measure, we excluded the non-VA hospitals matched to that hospital from the analysis of that measure. In addition, if one of the matched non-VA hospitals had a missing value for a measure, the remaining two hospitals were "up-weighted" by a factor of 3/2 or 1.5, and if two of the matched non-VA hospitals had a missing value for a measure, the remaining hospital was "up-weighted" by a factor of 3. Results are presented for comparisons of VA facilities and non-VA hospitals overall.

Appendix A.5.3 Methods for Systematic Literature Review Comparing Quality of Care for Veterans in VA and Non-VA Settings

We conducted a systematic review of evidence on the quality of care provided by the VA compared with non-VA health care facilities and systems based on studies published in the peer-reviewed literature.

Search Strategy. We defined quality of care broadly using the Institute of Medicine's definition, which is "the degree to which health services for individuals and populations increase the likelihood of desired health outcomes and are consistent with current professional knowledge" (IOM, 2001). The Institute of Medicine further proposed six characteristics of high-quality care: safe, timely, equitable, effective, efficient, and patient-centered. Timeliness as it relates solely to access is addressed by a separate literature review.

Given the existence of a recent systematic review on the quality of health care delivered in VA versus non-VA settings performed on this topic by RAND investigators, we chose to explicitly build upon this work (Asch et al., 2010). We built our search strategy using terms from this review.

The start date for the search was January 1, 2005, and the end date was January 1, 2015. We chose a cut-off of 10 years to ensure that we captured the most recent literature. Because of the focus on U.S. health care, we searched Medline only. Titles and abstracts identified by our literature search were then screened by two researchers trained in the critical analysis of literature. Articles that both agreed should be included were then selected for full-text screening. When differences in the initial assessment (inclusion versus not) occurred, the specific articles were then discussed with the senior member of the review team.

Study Selection. Full-text articles selected for screening were reviewed using a two-page screening form. Each article was again reviewed by two trained researchers. To be included in our report, the article had to present a comparison of quality of health care in VA and U.S. non-VA settings. Full inclusion and exclusion criteria were developed and applied consistently.

The screening form also collected basic information about the articles: whether the data for the comparison were sufficiently contemporaneous (within one to two years of each other); how VA and non-VA data were assembled; from what geographical area(s) VA and non-VA data were collected and analyzed; what conditions were covered in the quality assessment; what features of quality were measured (structure, process, and/or outcomes); which dimensions of quality were covered; and how similar the specifications were for quality assessments comparing VA and non-VA samples. Articles that had been previously included in the systematic review by

Asch et al. were reviewed at the full-screening stage only to identify which dimensions of quality they covered as this had not been included in the original review.

Data Abstraction. Data were independently abstracted by two reviewers using a one-page abstraction form. Once the forms were completed, differences in the data were reconciled by the two reviewers, and the evidence grade was reviewed by the senior member of the review team. The following data were abstracted from included studies: sample size for both VA and non-VA sources, years of data collection covered for both VA and non-VA sources, control variables, primary outcomes, and secondary or associated findings. Articles abstracted by Asch et al. in the previous review from 2005 to 2009 were not abstracted again, but are included as part of our results to present a complete picture from 2005 to 2015.

Assessment of Study Quality. Each article was given an overall assessment, which was based on the following criteria: time frames, samples (both VA and non-VA), quality measurements, outcomes, importance of measures, and statistical methods. Each of these factors was assigned a grade (A, B, or C) based on the data abstraction grading guidelines developed. The overall assessment was predicated on the global assessment of the article, considering the individual components, but was not an average. Thus an article that had, for example, a critical flaw in methodology would be a "C," even if other issues were satisfactory. During this phase, or during the initial assessment or data abstraction phases, disagreements or questions about the articles or information were discussed with at least the senior member of the team in order to reach consensus. The specific definitions used in the quality assessment are provided here:

Time frames

- Contemporaneous time frames
- All studies with time frames between A and C
- Non-contemporaneous

Samples (both VA and non-VA)

- Representative or national samples (both VA and non-VA)
- All studies with samples between A and C
- Small, limited, unequal or non-representative samples

Quality measurements

- Specified and identical measures with a similar assessment format for those measures
- All studies with quality measurement between A and C
- Dissimilar measures and/or dissimilar assessment methods

Outcomes

- Outcomes are either well established clinical endpoints or processes strongly associated with well-established clinical endpoints
- All studies with outcomes between A and C
- Outcomes are structures, processes or clinical endpoints that are not well-established or are indirect measures of quality

Importance of measures (for example, number of clinically relevant indicators, potential impact of indicators)

- High

- Medium

- Low

Statistical methods

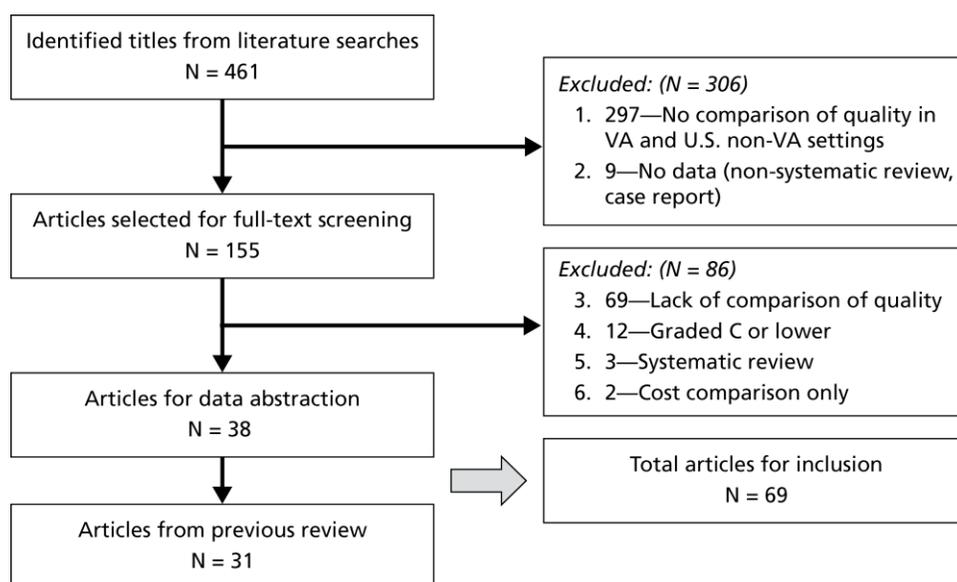
- Sufficient sample size and/or methods appropriate to address hypothesis(ses)

- All studies with statistical methods between A and C

- Insufficient sample size and/or methods questionable to address hypothesis(ses)

Data Synthesis. We classified articles along the dimensions of quality outlined by the Institute of Medicine. Within these categories, studies were sufficiently heterogeneous to preclude meta-analysis. Consequently, our synthesis is narrative.

In total, 461 articles from 2005 to 2015 were returned by the literature search (Figure A-2). Of the 306 articles that did not go on for full-text screening, most were due to a lack of comparison of quality between VA and non-VA settings (N = 297). We conducted full-text screening for the remaining 155 articles, of which 86 were excluded (69 because of a lack of comparison of quality, 12 because they were graded "C" or lower, 3 because they were systematic reviews, and 2 because they looked exclusively at cost comparisons). We abstracted new details (related to dimensions of quality) for 31 articles from 2005 to 2009 previously reviewed by Asch et al. Ultimately, an additional 38 new articles underwent full data abstraction, which left us with a total of 69 articles for inclusion in the review.

Figure A-2. Literature Flow for Systematic Review of Quality


MS4675B-A.2

Strengths and Limitations of Review. Our review has several strengths, including using systematic methods and using only adjusted results, which more fairly accounts for differences in patient characteristics between VA and non-VA care. Limitations of our review include the possibility of publication bias, in which studies that fail to show a statistically significant difference in a comparison are not submitted or accepted for publication. However, as Asch et al. (2010) point out, it is not clear which directionality of a comparison of quality of care between VA and non-VA facilities would lead to a study not being published. Although we used systematic review methods, it is possible that the patient populations are sufficiently different to make a comparison of results, even though adjusted for differences, subject to bias. Another limitation is almost all of the studies were supported by VA research funding or had VA investigators performing the work, which may have introduced some bias.

Appendix A.6 Developing Policy Options

This subsection contains additional information regarding the methods used to identify and describe potential policy options for improving VA's ability to provide timely and accessible care to Veterans. There are two parts to this appendix:

Methods to establish criteria for evaluating policy options (Subsection A.6.1)
Systematic literature review (Subsection A.6.2).

Appendix A.6.1 Methods to Establish Evaluation Criteria for Policy Options

We began with a standard set of evaluation criteria commonly used to evaluate the value and feasibility of health policy options (Rossell, 1993):

- Economic feasibility, including costs and benefits

- Equity, which refers to the social distribution of costs and benefits
- Effectiveness, which is the extent to which the policy would achieve the stated policy objectives
- Operational feasibility, including both legal authority and ease of implementation
- Stakeholder acceptability, which refers to both political and social acceptability.

In an iterative process utilizing data from our interviews and literature review and input from our in-house experts, we further refined this list to better suit the unique context of VA and the issue of timely access to care. Our final set of evaluative criteria included:

- Impact on access: the extent to which the stated policy option is likely to achieve improvements in timely and accessible care.
- Fiscal impact: direct costs and potential savings (that is, fiscal benefits to be realized) associated with implementing the policy option
- Stakeholder acceptability: the likelihood that the policy option will have sufficient stakeholder support to be politically feasible to legislate or to implement by VA under its existing authority
- Operational feasibility: the ease of implementing the policy option into practice.

We excluded "equity" as a separate criterion because social justice and social distribution are issues impacting social acceptability and, as such, would include the stakeholder acceptability criterion. We also excluded the issue of legal authority from our definition of administrative feasibility, as this is separately covered in detail by Assessment C.

Appendix A.6.2 Systematic Literature Review

Once an initial list of possible policy options was drafted, we conducted a more exhaustive review of the peer-reviewed and gray literature for options and approaches to improve VA's ability to provide timely and accessible care (see Figure A-3). Data from the literature review were used to identify new policy options and to modify the initial list, as well as to collect evidence pertaining to the evaluation criteria in order to compare and contrast a final set of policy options.

Figure A-3. Flow Chart of Peer-Reviewed and Grey Literature

| PubMed Main Search: **548 articles** | PubMed Supplemental Search: **792 articles** | Grey Literature Search **75 documents** |

Number of records for screening (duplicates removed): **1,243 articles**

Number of records excluded: **1,035 articles**

Number of records excluded: **38 articles**

Number of records after title/abstract screening: **208 articles**

Number of records excluded: **55 articles**

Number of records after full-text screening: **153 articles for abstraction**

Number of records after title/abstract/full-text screening: **37 articles for abstraction**

MS4675B-A.3

Peer-Reviewed Literature: We first searched PubMed for all English-language articles published from 1995 to the present using a broad search strategy that combined terms representing VA resources and capabilities and each of the dimensions of access (see Table A-7). We also conducted separate targeted searches on potential policy options that were mentioned during the key informant interviews and not fully captured in the main literature search, and on topics that were most frequently raised during the interviews, such as contracted care, DoD care, waitlists and scheduling, physician recruitment, and hiring and overall access to care (Table A-8).

Review and Abstraction Process: Two researchers independently screened first titles, then abstracts, and finally the full texts of the identified articles, applying a consensus-based set of inclusion criteria at each stage. Briefly, we included articles of any type or study design that analyzed, made recommendations, and/or discussed barriers and facilitators to providing timely and accessible care within VA. Three researchers then independently reviewed the full texts of then-accepted articles and abstracted the following information into an Excel spreadsheet: author, title, manuscript type, objective, primary domain, secondary domain, and key findings. Based on the key domains in the conceptual framework, the domains were community care, workforce, physical infrastructure, information technology, interorganizational relationships other than community care, and care management. We also included wait time as a domain to capture articles related to scheduling and timeliness of appointments.

Grey Literature Search: We searched think tank, research institute, and foundation websites (for example, RAND, Commonwealth Fund, Brookings Institute, Cato Institute, Kaiser Family Foundation, Robert Wood Johnson Foundation, National Bureau of Economic Research) for research and policy reports pertaining to timely and accessible care in VA. We also searched multiple government websites, including VA, DoD, Congressional Budget Office, GAO, Congressional Research Service, and VA Office of Inspector General and Defense Technical Information Center, for relevant reports and data pertaining to VA's ability to provide timely and accessible care. Additionally, we reviewed congressional testimony before the House Veterans Affairs Committee and Senate Veterans Affairs Committee to better understand congressional priorities and potential challenges to policy development, adoption, and implementation, and to capture the perspectives of key stakeholders. Finally, we searched gray literature sites such as the New York Academy of Medicine Grey Literature Report, GreyNet International, Google Scholar, and Google for any additional data or research and policy reports. We searched for reports published between 2005 and the present and, where relevant, used a combination of search terms representing VA capabilities and resources, access to care, and each of the dimensions of access. We restricted the date range for our search of congressional testimony to the past two years to identify the most recent policy priorities in the context of the current wait-time issues facing VA. Two researchers independently reviewed the titles, abstracts, and full-texts of the articles and abstracted the following information into an Excel spreadsheet: author, title, primary domain, and key findings.

Appendix A.7 Projecting Future VA Capabilities and Resources

This subsection covers additional methods used in projecting future VA capabilities and resources to provide timely, accessible care. There are two topics covered in this subsection:

- Data sources, input preparation, and data validation (Subsection A.7.1)
- Analytical methods (Subsection A.7.2).

Appendix A.7.1 Data Sources, Input Preparation, and Data Validation

This subsection details the data sources and model input preparation necessary to implement the projection models. Specifically, this subsection details the VA EHCPM demand RVU forecasts and the VA staffing data obtained from the VA Productivity Cube. The EHCPM initially forecasts RVU demand by VA Sector (geographic area) and by EHCPM Healthcare Service Category. The EHCPM then translates the forecasts from VA Sector-Healthcare Service Categories to VA specialties and administrative parents. Our analysis uses the results of these EHCPM translations, but we independently verified the quality of the mapping. This subsection also presents an independent comparison of the data used for quantifying how historical FTE data from the VA Productivity Cube and EHCPM RVU forecasts differ from observed FY14 FTE and RVU data provided by VA and compiled by Assessment G. The data received from Assessment G data are used in Section 3 on workforce and human resources.

VA Staffing Data. The VA staffing data used in the projection models are taken from the VA Productivity Cube and contain the number of physician clinical FTEs from 2009 through 2015 for each administrative parent and specialty. The VA staffing data are mostly complete, but there are some specialties and specialty-administrative parent combinations that do not contain enough historical data to build an FTE projection model. We exclude any specialty-administrative parent combinations with less than six years of data from the projection model.

Demand Forecast Data. The EHCPM forecasts made available to Assessment B are based on historical data through FY13 with forecasts for RVUs for FY14 through FY23. The EHCPM 10-year annual forecast of demand is measured in RVUs and provided by VA specialty and VA administrative parent. To generate this, the EHCPM projects Healthcare Service Categories by repackaging Current Procedural Terminology codes based on Milliman's proprietary model. The EHCPM projects Veteran enrollment and utilization for 83 Healthcare Service Categories for each of 425 VA geographic sectors that are areas defined by the residential locations of Veterans. The model determines the number of Veterans enrolled in the VA for each forecasted year and then estimates the portion of care that the enrollees will demand from the VA (that is, reliance) (Milliman Inc., 2014). The EHCPM then translates the forecasted RVUs by VA sector and Healthcare Service Category into forecasted RVU by VA specialty and administrative parent by matching the sectors to administrative parents and Healthcare Service Categories to the appropriate physician specialties.

Independent Evaluation of Converting EHCPM Data Forecasts from Healthcare Service Category and VA Sector to VA Specialty and Administrative Parent. We independently assessed this conversion by performing our own basic RVU mapping of Healthcare Service Categories to physician specialties and VA sectors to administrative parent. Three RAND researchers, one a physician (MD) and subject matter expert, reviewed the Healthcare Service Category descriptions and attributed them to the VA physician specialties.

We reallocated Veteran statistics from VA sector to administrative parent catchment area by using 2014 Veteran population at the U.S. Census block group level as a proxy for Veteran statistics in general. We pulled Veteran estimates by block group from the American Community Survey five-year estimates for 2014 along with the associated spatial block group GIS files. Because VA sectors are composed of collections of whole counties, we were able to

code these block groups unambiguously by VA sector. We then calculated the total number of Veterans (as measured by the American Community Survey) for each VA sector by summing the Veteran population for each of the block groups in each sector. We then calculated the fraction of the Veteran population from each sector residing in each block group by dividing the population of that block group by the Veteran population of the sector in which it is contained. We then coded block groups by 40-mile drive radius (which is very similar to the one-hour drive time radius) to approximate the prime catchment area for each administrative parent. With this coding in place, we were able to calculate the percentage of the Veterans from each sector falling into the prime catchment area of each administrative parent. These fractions could then be used to translate any projection about Veteran populations stated at the VA sector level to the administrative parent level.

We then summed the pertinent Healthcare Service Category for each specialty and used the proportion of demand from each sector that applied to each administrative parent. We compared the resultant projected summed Healthcare Service Category by specialty-administrative parent with the projected RVU by specialty-administrative parent performed by Milliman on behalf of VA.

In general, RAND's conversion of Veteran conditions and residences to VA physician specialties at facilities matched quite well to the same conversion as performed for EHCPM. The Assessment B team independently converted the data for 14 specialties at 118 administrative parents. Of the 1,652 possible specialty-administrative parent combinations, 85 percent showed correlations of Assessment B and EHCPM conversions greater than 0.9. The low correlations were clustered within three specialties: nephrology (37 of 118 administrative parents with correlation <0.9), psychology (50 of 118 administrative parents with correlation <0.9), and obstetrics and gynecology (81 of 118 administrative parents with correlation <0.9). Other specialties exhibited correlations less than 0.9 in 15 percent or fewer of the administrative parents. This likely indicates differences in the conversion logic used by Assessment B and the EHCPM to match Healthcare Service Categories to physician specialties. The overall conclusion is that an independent look at the conversion process appears to validate this aspect of the demand projection used in workforce planning by VA.

Differences Between the EHCPM Projected Demand RVUs and Observed RVUs in FY 2014. We obtained projected demand from the EHCPM for FY 2014 through FY 2019. We also obtained observed RVUs from Assessment G for FY 2014. Assessment G obtained the observed RVU data from the VISTA New Person File, the VISTA Patient Care Encounter File, and the Monthly Program Cost Report. Comparing across the projected and actual data for FY 2014, we found that the FY 2014 EHCPM projected demand estimates are close to the observed data provided by Assessment G though not identical. Nationally, the EHCPM forecasted RVUs were between five percent and 15 percent larger than the observed RVUs for most specialties. The discrepancies did not appear to be administrative parent-specific and it is unclear what the causes are aside from the fact that EHCPM RVUs are projections from FY 2013 and the data from Assessment G are observed actuals from FY 2104.

Differences Between Data from VA Productivity Cube and from Assessment G on FTEs in FY 2014. The FTE data used in the projection models is taken from the VA Productivity Cube and

contains the number of physician clinical FTEs from 2009 through 2015 for each administrative parent and specialty. We also obtained FY 2014 FTE data from Assessment G. Assessment G obtained their FTE data from the VISTA New Person File, the VISTA Patient Care Encounter File, and the Monthly Program Cost Report and generated FTE counts by administrative parents and specialty. Comparing across the two sources of FTE data, we found only very small differences, typically less than 5 percent for most specialties. It is unclear what is generating the small differences between Productivity Cube FTE data and the FTE data compiled and provided by Assessment G. We use the FTE data provided by Assessment G for our assessment of VA's workforce and human resources in Subsection 3.2 so that it is consistent with Assessment G. We use the FTE data from the Productivity Cube for the projection model since it was the only source that provided historical data that could be used to model trends.

Appendix A.7.2 Description of Analytic Methods

In this subsection, we describe the analytic method used in the forecasts. This subsection builds upon the discussion presented in Subsection 2.8.2.

Increasing the Number of Resources. The purpose of this projection, supply scenario one, is to assess how well projected supply (as measured by physician clinical FTEs) aligns with projected demand (measured in RVUs) overall, by provider specialty, by administrative parent, and by VISN. The provider forecasts at the administrative parent level project supply that would be produced if historical hiring trends persist. The supply projection is modeled as a linear regression model where the response is the number of physician FTE for a given specialty-administrative parent pair and the regressor is the year. The equation below shows the structure of the provider administrative parent-level regression model:

$$y = \beta_0 + \beta_1 * year + \varepsilon$$

Where y is the number of provider FTEs for a given specialty, β_0 is the intercept, "year" is the regressor and the specified year to forecast, β_1 is the coefficient for the year regressor, and ε is an error term representing the unexplained variation in the data. The model uses at least six but up to seven years of VA staffing data to fit the regression and forecast FTEs for FY 2015 through FY 2019 by administrative parent and VA specialty. In general, the fitted regression models had highly variable quality of fits. Seventy-five percent of the administrative parent specialties had an R^2 greater than 0.15, 50 percent had an R^2 greater than 0.43, 25 percent had an R^2 greater than 0.72, and 10 percent had an R^2 greater than 0.87. The analysis team decided to use these models for forecasts despite the highly variable fit quality because the intent is to capture overall trends over the seven years of historical data; some VA administrative parent-specialty combinations added provider FTEs and then removed them over the course of the seven years, which decreased the quality of fit for the model. Because for some models there are quality of fit concerns and because provider FTE trends found in the seven years of data may not continue for the several years in the future, the analysis limits the provider FTE forecasts to a maximum of a 30-percent change from the mean FTEs in FY 2014.

Having conducted our own projection of FTEs and having validated the projections of demand provided measured in RVUs by the EHCPM, the analysis team took the difference between these projections to identify in which administrative parent and specialty combinations where

projected growth in demand was expected to exceed projected growth in supply. The difference between EHCPM forecasted percent change in RVU (Demand) to the FTE (Supply) forecasted percent change from FY14 to FY19:

$$\text{FTE} - \text{RVU Difference} = (\text{Forecasted \% change in FTE from FY14 to FY19})$$
$$- (\text{Forecasted \% change in RVU from FY14 to FY19})$$

The analysis focuses on five-year projections in the report because these projections are more reliable than are 10-year projections, which would be highly unpredictable if any systemic changes occurred, such as new legislation or executive policies.

Improving Provider Productivity. The purpose of this projection, supply scenario two, is to quantify how increased provider productivity can increase capacity to manage demand increases in the future. The policy options that improve efficiency of internal resources have the potential to enable providers to be more productive. RVU per FTE from EHCPM is used in this analysis as the measure of productivity.

This projection targets administrative parents with low RVU/FTE ratios and increases their productivity to a specified level within a specialty. The specified levels are then varied in three ways:

- **Productivity Level 1**: All administrative parents operate at least at the FY 2014 25th RVU/FTE percentile within each specialty nationally.

- **Productivity Level 2**: All administrative parents operate at least at the FY 2014 50th RVU/FTE percentile within each specialty nationally.

- **Productivity Level 3**: All administrative parents operate at least at the FY 2014 75th RVU/FTE percentile within each specialty nationally.

For example, if administrative parent A is operating at the 16th RVU/FTE percentile nationally within cardiology, the first bullet analysis would raise their productivity to the 25th percentile nationally within cardiology. The productivity of the administrative parents that operate above the specified level is left unchanged. Increasing the administrative parent productivity will increase the number of RVUs that can be seen per provider FTE.

This analysis quantifies how many RVUs would be gained for each specialty if all administrative parents were performing at the three productivity levels for each specialty. Then the analysis compares the gain in RVU with the projected increased demand of RVU from FY 2014 to FY 2019 from the EHCPM. In addition, for supply scenario three, we project the RVU gains if both the FTE forecasts and productivity gains were realized. The analysis also quantifies the percentage of RVU demand that would have to be redistributed if provider productivity increased.

Appendix B   Survey

1.1 Appendix B.1 Overview

The 2015 Survey of VA Resources and Capabilities, part of Assessment B, was designed to identify clinically meaningful delays for Veterans in access to care for seven illustrative clinical conditions: PTSD, SUD, TBI, acute coronary syndromes, colon cancer, diabetes mellitus (type 2), and conditions requiring gynecologic surgery. The conditions were chosen based on their importance to VA (for example, high prevalence, congressional focus, service connection) and were selected to represent diversity across care settings, acuity, type of care, workforce, and population characteristics (for example, sex, age, era of military service).

To develop the survey, the team specified clinical care trajectories for each of the seven conditions, based on existing VA and DoD clinical practice guidelines (where available) and on interviews with VA and non-VA subject matter experts. The care trajectories map out the different care paths that a patient with one of the clinical conditions might take, depending on the severity of the condition and the resources available. The survey asked respondents to report how often there were clinically meaningful delays at various junctures in each care trajectory. Where delays were identified, respondents were asked to indicate which of the solution components listed might be important in reducing the delay. The survey also contained questions related to workforce in order to evaluate the difficulties VA may be facing in recruiting, hiring, and retaining the clinical personnel necessary to provide care to Veterans in these clinical populations.

In addition to condition-specific data, the survey sought to gather information at the facility level about issues that negatively impacted provider and system efficiency, about use of purchased care, and about the availability and use of information technology.

Reflecting these goals, the survey had eight modules—a general module focused on facility-level issues, and one module for each of the seven conditions. The survey was sent to the Chief of Staff at the parent facility of each local VA system, nationwide. The Chief of Staff was asked to complete the "general module," which focused on primary care and topics not specific to the care of one of the illustrative populations, and to send the other modules to the clinical chiefs (or other leadership) best able to speak about care for the clinical condition of interest (for example, chief of cardiology for acute coronary syndromes; chief of gastroenterology for colon cancer).

By virtue of the respondents' leadership positions and the fact that parallel questions were asked across disciplines and across facilities nationwide, the results offer a unique opportunity to understand common concerns and how those varied, both across clinical specialties and between VA facilities. In addition to questions about specific services, respondents had an opportunity to amplify their answers and to offer general observations about the functioning of the VA health care system and the access to care it provides for Veterans.

Our discussion of the survey results is organized as follows. We begin by describing our methods, including development, piloting, and administration of the survey. We then report

the survey results for the eight modules, beginning with the general module for which the Chief of Staff was the intended respondent. We conclude with some general observations about issues and solution components that figure prominently in the survey results. Tables in Appendix I report the raw data from each survey module. Additional tables referenced in this text are also in Appendix I.

1.2 Appendix B.2 Methods

1.2.1 Appendix B.2.1 Questionnaire Development

We developed survey questions targeted to the Chief of Staff at each parent facility. We also developed questions designed to be answered by the service chiefs most appropriate for each of the seven clinical care trajectories. These questions were designed to identify potential bottlenecks in care at key junctures in each of the clinical care trajectories. The survey questions first elicit respondents' perceptions about the existence of *clinically meaningful* delays. Specifically, respondents were asked to "*Consider delays which might put a patient at risk for adverse outcomes, slow resolution of symptoms, or which are not compliant with VA/DoD guidelines.*" We use the term *clinically meaningful* in our discussion as shorthand for this more precise definition. Here is an example survey question from the colon cancer module.

> Consider the use of colonoscopy for patients with the following indications. In the PAST 12 MONTHS, how often were there delays in colonoscopy for patients with the following indications: Screening for average-risk patients; Screening for high-risk patients (for example, strong family history of colon cancer or personal history of inflammatory bowel disease.)

Respondents indicate the proportion of patients with clinically meaningful delays on a five-point scale ranging from "No delay" to "51 percent or more of patients experience a clinically meaningful delay."

Respondents who indicated that delays sometimes exist were asked to formulate a solution for reducing delays and to then rate the importance of various components to that solution (using a four-point scale ranging from "critically important" to "unimportant").

> Based on your knowledge and experience, think of the most effective way to reduce delays for colonoscopy. How important are each of the following elements in your solution: Less use of colonoscopy for screening; Discourage inappropriate colonoscopy (for example, surveillance for adenomas earlier than recommended by guidelines); Better scheduling mechanism to avoid no-shows; Hire more gastroenterologists; Build more procedure rooms; Increase weekend and evening availability of colonoscopy; Allow patients more access to colonoscopy outside VA system (purchased care)?

Each module also contained a question that asked respondents to identify issues that affect provider and system efficiency, and to rate the degree to which each of the following had a negative impact:

- Providers performing clinical activities that could be performed by individuals with less training

- Providers performing administrative activities that could be performed by others
- Residency training/teaching requirements
- Insufficient clinical/administrative support staff
- Inadequate scheduling system and policies (for example, hard to cancel or reschedule, coordinate)
- Unnecessary documentation requirements or inefficient CPRS interface
- Patient no-show rates
- Poor patient flow management (room/bed turnover, appointments)
- Too many administrative requirements (Initiatives/Policies/Programs).

There were two questions about workforce recruitment and retention: We asked respondents whether they had difficulty recruiting and retaining clinicians with expertise in the clinical condition of interest. The chiefs of staff were asked about staff categories that spanned multiple conditions. For those facilities reporting difficulties in recruiting or retaining staff in a given category, respondents were asked to identify barriers to recruitment and retention. Suggested barriers were the same for the Chief of Staff and all disease-specific modules. Possible barriers to recruitment included the following:

1. Senior management does not agree to post new position
2. Non-competitive wages
3. Work schedule (for example, call requirements)
4. Benefits (for example, health insurance, leave, continuing education, travel)
5. Equipment/resources/office space
6. Facility condition
7. Case types/complexity
8. VA reputation
9. No academic affiliation/lack of protected time for early career investigator
10. Geographic location of facility
11. HR process (for example, time to advertise; length of time from job offer to start date)
12. Lack of qualified applicants

We were also interested in understanding why there might be problems in retaining the same staff categories. Possible barrier options were as follows:

1. Lack of opportunity for professional growth/promotion
2. Dissatisfaction with supervision/management support
3. Dissatisfaction with support staff
4. Dissatisfaction with physical demands of the job

---

5. Lack of frozen pathology or gynecology backup

6. Lack of trained operating room support or lack of post-operating room nursing support

7. Dissatisfaction with workload

8. Lack of incentives or "management levers" to encourage productivity (that is, no accountability)

9. Organizational culture that does not prioritize/encourage productivity

10. Administrative/program demands

11. Lack of professional autonomy

12. Dissatisfaction with pay

13. Work schedule

The categories for barriers to recruitment and retention were developed from existing VA survey questions, retention and recruitment issues raised in the literature, and in consultation with VA. All survey questions were reviewed by a range of VA and non-VA survey, data, and clinical experts and then revised.

1.2.2 **Appendix B.2.2 Pilot Test**

Each survey module was pilot-tested by a sample of two to five additional VA subject matter experts identified by RAND and VA staff. Pilot study respondents were asked to provide feedback on the survey instructions, questions, and time required to complete each module. The survey was revised based on feedback from the pilot testing. To the extent possible, question formats were consistent across modules.

1.2.3 **Appendix B.2.3 Sample Frame**

The survey sample frame included all of VA's 141 administrative parents (for example, local health care systems with at least one hospital and its affiliated clinics). The administrative parent within VA is defined as:

> A collection of all the points of service that a leadership group (Medical Facility Director, Deputy Medical Facility Director, Chief of Staff, Associate or Assistant Director, and Nurse Executive) manages. The points of service can include any institution where health care is delivered. All of the data that originate from these points of service roll up to a single station number representing the administrative parent for management and programmatic activities.

The administrative parents are distributed across the United States and the territories, including the Philippines and Puerto Rico (see Table B-1).

Table B-1. VA Administrative Parents, by VISN

VISN	Station Number	Name	City, State
1	402	Maine VA Medical Center	Augusta, Maine
	405	White River Junction VA Medical Center	White River Junction, Vermont
	518	Edith Nourse Rogers Memorial VA Medical Center-Bedford	Bedford, Massachusetts
	523	Boston VA Medical Center-Jamaica Plain	Boston, Massachusetts
	608	Manchester VA Medical Center	Manchester, New Hampshire
	631	Central Western Massachusetts VA Medical Center-Leeds	Leeds, Massachusetts
	650	Providence VA Medical Center	Providence, Rhode Island
	689	Connecticut VA Medical Center-West Haven	West Haven, Connecticut
2	528	Western New York VA Medical Center-Buffalo	Buffalo, New York
	528A5	Canandaigua VA Medical Center	Canandaigua, New York
	528A6	Bath VA Medical Center	Bath, New York
	528A7	Syracuse VA Medical Center	Syracuse, New York
	528A8	Samuel S. Stratton VA Medical Center-Albany	Albany, New York
3	526	James J. Peters VA Medical Center-Bronx	Bronx, New York
	561	New Jersey VA Medical Center-East Orange	East Orange, New Jersey
	620	Franklin Delano Roosevelt VA Medical Center-Montrose	Montrose, New York
	630	New York Harbor VA Medical Center-Manhattan	New York, New York
	632	Northport VA Medical Center	Northport, New York
4	460	Wilmington VA Medical Center	Wilmington, Delaware
	503	James E. Van Zandt VA Medical Center-Altoona	Altoona, Pennsylvania
	529	Butler VA Medical Center	Butler, Pennsylvania

1.2.4 Appendix B.2.4 Survey Administration

The invitation to participate in the survey was sent via email directly to the Chief of Staff at each administrative parent. The email included instructions, links to the survey modules, and a signed letter from the Under Secretary for Health for the Department of Veterans Affairs encouraging VA employees to assist in the assessments of the Veterans Choice, Access and Accountability Act. The survey was web-based, and each of the eight modules could be completed independently. Survey instructions described suggested respondents, based on job title, for each of the modules. (Please see Table B-3 for the "Targeted Point of Contact" for each module). The Chief of Staff was responsible for completing the general module, identifying the most appropriate individual to complete each of the clinical condition modules, and overseeing the completion and return of all survey modules.

The survey was in the field for approximately two and a half weeks from Thursday, May 7, 2015, through Tuesday, May 26, 2015. During the survey fielding, the Chiefs of Staff were sent reminders via email and phone. Three question-and-answer phone sessions were held during the survey period, and respondents could also ask questions by phone or email.

1.2.5 **Appendix B.2.5 Response Rates**

Overall, the survey response rate was high, ranging from 83 percent for the general module to 94 percent for the PTSD module. These high response rates are reassuring in terms of the potential for bias due to non-response. Table B-2 shows variability in response rates across three key confounders: (1) region, (2) rural or urban designation, and (3) facility complexity as categorized by VA according to seven characteristics (for example, volume and patient case mix, total residency slots).

The general module (for Chiefs of Staff) had the most variability across potential confounders. We estimated a non-response weight using a logistic regression model that included all three confounders. Based on this model, we estimated the probability of response, and weighted estimates based on their inverse probability of response. This approach gives greater weight to facilities with lower response probabilities.

The condition-specific modules all had response rates greater than 90 percent. For these outcomes, we estimated response weights using a restricted model that included only rural/urban location. An evaluation of the weights and response rates suggested that the weights were not necessary; thus we present only unweighted results.

Table B-2. Response Rates

	N	General	PTSD	SUD	TBI	Acute Coronary Syndromes	Colon cancer	Diabetes Mellitus	Gynecologic surgery
N		117	117	114	107	100	109	111	107
Overall	141	0.83	0.94	0.91	0.91	0.91	0.93	0.91	0.93
Northeast	26	0.81	0.90	0.90	0.80	0.81	0.94	0.90	0.94
Midwest	34	0.85	0.90	0.90	0.86	0.90	0.83	0.82	0.92
South	50	0.86	1.00	0.98	0.98	1.00	1.00	1.00	0.95
West	29	0.79	0.92	0.81	0.90	0.81	0.88	0.85	0.88
Rural	21	0.76	0.88	0.88	0.79	0.86	0.82	0.88	0.85
Urban	119	0.85	0.95	0.92	0.92	0.91	0.94	0.91	0.94
Complexity 1a	32	0.84	1.00	0.93	0.96	0.93	1.00	1.00	0.93
Complexity 1b	16	0.94	1.00	0.93	0.93	0.93	1.00	1.00	1.00
Complexity 1c	26	0.89	0.92	0.92	0.92	0.88	0.92	0.92	0.96
Complexity 2	32	0.88	0.96	0.93	0.88	0.90	0.88	0.89	0.91

	N	General	PTSD	SUD	TBI	Acute Coronary Syndromes	Colon cancer	Diabetes Mellitus	Gynecologic surgery
Complexity 3	32	0.70	0.85	0.86	0.83	0.89	0.81	0.79	0.84

Note: Response rates are based on responses to each module and indication by the Chief of Staff that the module-specific service is offered within the administrative parent.

1.2.6 Appendix B.2.6 Survey Respondents

The recommended staff and selection of job titles for actual respondents are listed in Table B-3.

Table B-3. Typical Titles of Respondents by Module

Module	Topic	Targeted Point of Contact	Sample Job Titles for Respondents
1	General Facility Questions	Chief of Staff; Associate Director for Patient Care Services; Head of Primary Care	Chief of Staff, Acting Chief of Staff, Deputy Chief of Staff, Interim Chief of Staff, MD, Medicine Service Line Manager, Secretary to Chief of Staff, Special Assistant to Chief of Staff
2	PTSD	Associate Chief of Staff for Mental Health; Administrative Officer for Mental Health; Chief of PTSD Services	Chief of Staff, Chief of Behavioral Health, Chief of Mental Health, Chief of Psychology, Director of PTSD Division, Coordinator of PTSD program, Lead Psychologist, Staff Psychiatrist
3	SUD	Associate Chief of Staff for Mental Health; Administrative Officer for Substance Abuse Services; Chief of Substance Abuse Treatment Services	Chief of Mental Health Service, Chief of Substance Abuse Treatment Program, Attending Psychiatrist, Director of Addiction Recovery Treatment Services, Program Manager, Staff Psychiatrist, RN, Acting Chief of Staff
4	TBI	Chief of Staff; Chief of Physical Medicine and Rehabilitation (PM&R); Chief of Neurology; Administrative Officer for TBI, PM&R or Neurology; POC for TBI services	Chief (PMR), MD, Polytrauma/TBI Coordinator, Chief of Staff, Chief of Mental Health, Neurologist, Rehab MD, Staff Psychologist

Module	Topic	Targeted Point of Contact	Sample Job Titles for Respondents
5	Acute Coronary Syndromes	Chief of Cardiology; Administrative Officer for Cardiac Services; Chief of Cardiothoracic Surgery; Chief of Internal Medicine	Chief of Cardiology, MD, Chief of Medicine, Chief of Surgery, ACOS Primary Care, Medicine Service Line Manager
6	Colon Cancer	Gastroenterology Point of Contact; Oncology Point of Contact; Oncology Surgery Point of Contact; Laboratory Services Point of Contact	Chief of Medicine, Chief of Gastroenterology, Gastroenterologist, MD, Chief of Staff, Chief of Surgery, Chief of Oncology, Cancer Coordinator
7	Type 2 Diabetes	Chief of Staff; Administrative Officer for Primary Care; Associate Director for Patient Care Services; Head of Primary Care	Chief of Endocrinology, Endocrinologist, MD, Chief of Primary Care, Chief of Staff, Clinical Director of Primary Care, Nurse Practitioner and Diabetes Educator
8	Gynecologic Conditions	Women's Health Point of Contact; Administrative Officer for Women's Health	Chief of Surgery, Gynecologist, Women Veterans Program Manager, Women's Health Medical Director, MD, ACOS (ambulatory care)

1.2.7 Appendix B. 2.7 Data Analyses and Presentation

Data were analyzed at the level of each administrative parent (N = 141) and aggregated to national estimates. Stata (version 13) and SAS (version 9.3) were used for data analyses. In reporting these data, we summarize quantitative survey results for each of the eight modules. With regard to delays, we focus on items where respondents report that more than 10 percent of patients experienced a delay in the service in question. We refer to delays experienced by more than 10 percent of patients as "frequent." We also present findings on workforce issues, use and availability of health IT, and efficiency issues.

Where respondents identified problems, we asked them to formulate a solution and rate the importance of each of various elements of the solution (for example, increase clinical staff, increase space for patient care).

Tables in the second half of this report present aggregated raw survey results in the basic format in which questions were asked. We reference the relevant table(s) in discussing our findings.

A note about the "NA" response. For all Likert-type questions, an NA response was allowed. In the raw survey results, we present NA as a response category, and include it in the denominator wherever percentages are given. In the narrative description and interpretation of

the results, we exclude NAs from the denominator. We do this because, in most cases, the meaning of "NA" is apparent from the context (for example, bariatric surgery, interventional cardiology, and residency training programs are examples of services that are known not to exist at many institutions), and the interpretation is more intuitive with the exclusion. The one exception is the presentation of the "solutions element" and efficiency questions. For these types of questions, the meaning of "NA" is less clear, and the NA response is infrequent. Therefore, to keep the descriptions of these results numerically consistent with the large number of tables, we do not exclude NA from the denominator here. We do not expect that the results would change meaningfully if we did otherwise.

1.3 Appendix B.3 Results

1.3.1 Appendix B.3.1 General Module: Chief of Staff as Main Respondent

Background

The general module was designed to identify clinically meaningful delays in primary care and to assess other centrally managed factors related to patient care, including recruiting and retaining primary care staff, use of purchased care, and IT.

Survey Results

The overall response rate to the general module was 83 percent (N = 117). Below we report survey responses regarding delays in care, issues affecting provider and system efficiency, workforce issues, experiences with purchased care, and the availability and use of information technology.

Delays

Respondents were asked about delays at two care junctures: (1) obtaining a "new patient" appointment in primary care, and (2) obtaining a follow-up appointment in primary care. Specifically, we asked respondents to "*Consider delays which might put a patient at risk for adverse outcomes, slow resolution of symptoms, or which are not compliant with VA/DoD guidelines.*" Respondents who reported delays were asked to formulate a solution and to rate the importance of 11 potential components (for example, creating additional space, increasing the number of licensed independent practitioners) of their solutions.

Juncture 1: Obtaining a "new patient" appointment in primary care

Reported delays are detailed in Table I-4. Survey respondents (N = 114) were asked what percentage of patients experienced frequent delays in obtaining a primary care appointment as a new patient. Those who indicated frequent delays were asked to rate the importance of a range of potential solutions (for example, create additional space for patient care) on a four-point scale ranging from "critically important" to "unimportant."

Slightly more than half of respondents indicated that within the previous 90 days, no patients had experienced a clinically meaningful delay trying to obtain a new primary care appointment within their local health care system. Frequent delays (that is, experienced by more than 10 percent of patients seeking appointments) were reported by 5 percent of respondents.

Respondents (n = 49) who reported delays also answered the question on the most effective ways to reduce such delays (Table I-5). The following solution components were most frequently identified as "critically" or "very important":

Increase the number of licensed independent practitioners	94%
Increase the number of other personnel	80%
Improve information technology	77%
Change "central office policies" that affect workflow and efficiency	73%
Create additional space for patient care	71%
Improve personnel supervision, management, or incentives	67%
Implement or increase the availability of telehealth services	45%
Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community	45%
Some other solution(s)	33%
Increase weekend and evening availability of services	31%
Acquire and/or improve availability of equipment	24%

Juncture 2: Obtaining a follow-up appointment in primary care

A question about delays in obtaining a follow-up (rather than initial) primary care appointment produced similar responses (Tables I-6 and I-7).

Issues Affecting Provider and System Efficiency

A total of 112 respondents reported how provider and system efficiency were affected by a number of issues, including providers performing administrative tasks or tasks that could be performed by individuals with less training (Table I-8). The following issues were most frequently identified as "a fair amount" or "a lot":

Too many administrative requirements	86%
Providers performing administrative activities that could be performed by others	84%
Inadequate scheduling system and policies (for example, hard to cancel or reschedule, coordinate)	81%
Unnecessary documentation requirements or inefficient CPRS interface	81%
Insufficient clinical/administrative support staff	74%

Providers performing clinical activities that could be performed by individuals with less training	68%
Poor patient flow management (room/bed turnover, appointments)	52%
Patient no-show rates	48%
Residency training/teaching requirements	20%

Recruitment and Retention

We asked about recruitment and retention for a range of core clinical personnel (for example, radiologists, hospitalists) not covered in the other condition-specific modules of this survey. Table I-9 shows responses to the question "did your local health care system have problems recruiting and hiring." Three-quarters of respondents reported difficulty hiring primary care providers. About 60 percent said recruiting specialized staff such as laboratory or imaging technicians was also a challenge; about half reported difficulties recruiting registered nurses, licensed practical nurses, and clinical nurse specialists. About 20 percent reported that inpatient support staff, social workers, telehealth technicians, and radiologists were difficult to recruit. Respondents who reported recruiting difficulties were asked to suggest the cause (Table I-10). In the case of primary care providers, slightly fewer than one-half cited the geographic location of the facility and non-competitive wages as the main barriers. In the case of specialized support staff, about half of respondents cited lack of qualified applicants as a key barrier, but nearly three-quarters said the wages were non-competitive.

Tables I-11 and I-12 show results for analogous questions regarding personnel retention rather than recruitment. Retention was generally less of a problem: For most service lines, one-third to one-half as many respondents indicated problems with retention. Notable exceptions were primary care providers, nursing, technicians, and administrative support staff; for those categories, respondents thought retention appeared to be as much of a problem as recruitment.

The two most frequently reported reasons for problems in retaining primary care staff problems were dissatisfaction with supervision and management support as well as dissatisfaction with workload. The top two retention problems for administrative support staff were dissatisfaction with management and dissatisfaction with salaries.

Purchased Care Experiences (Assessment C)

The survey included seven survey questions in this module intended to provide information for Assessment C – Authority, Benefits, and Outside Contracting. Questions were designed to assess the frequency of, and reasons for, referrals to purchased care; and to capture respondents' experiences with episodes of care, electronic record sharing, priority ratings, and the Non-VA Care Coordination program (Tables I-13 to I-19).

There is a range of purchased care mechanisms, each with different rules for eligibility. To gauge the basis for purchased care use, we asked a series of questions about referral processes. Respondents were asked how often, and why, they refer Veterans out for purchased care. Frequency of referrals varied substantially: 16 percent of respondents refer patients out 1

percent of the time or less; referral rates for other respondents ranged about evenly from 2 percent to 100 percent of the time. More than three-quarters of respondents indicated that a lack of clinical services at VA was the most important reason for referring patients to non-VA care; far fewer respondents mentioned either travel distance or wait time as primary reasons.

Respondents were also asked about data collection and sharing of health records. In response to a question about how often the VA facility collects data about wait times with non-VA providers, one quarter of respondents said they never collect such data; only 14 percent of respondents do it all of the time; and the remaining respondents answered some or most of the time. Respondents were also asked about whether, and how often, they share electronic health records with non-VA providers. About one-half said that they never share such data, and only 5 percent said they always do; the rest reported that they share such records some or most of the time.

Internal processes for scheduling appointments are also important because they help convey how VAMC staff interpret the legal authorities for purchased care. We asked about various internal processes. Almost all respondents indicated that they have implemented the Non-VA Care Coordination program. We were also interested in the role of priority ratings, which are intended to ensure that certain Veterans are enrolled in the health care program before others. About 40 percent of respondents answered that they consider Veteran priority ratings and the service-connection of the injury or disease when scheduling appointments. However, only a few respondents said that they bump Veterans from scheduled appointments to accommodate the appointment needs of a Veteran from a higher priority group.

In an effort to determine whether only one referral is needed for visits to a single specialist over various periods of time, respondents were also asked several questions about episodes of care. Respondents were first asked about situations where referrals are for care that requires more than one visit. Eight percent of respondents said that they would need a separate referral for each visit. The rest of the respondents were about equally split between reporting that one referral would cover all related visits to the specialist within a 60-day timeframe, and indicating that some other method applied.

Asked about situations where the care would span a period longer than 60 days, about 20 percent indicated that the Veteran would need a separate referral for each visit. The remainder were about evenly split between stating that one referral would still cover all related visits regardless of timeframe, and believing that another method was used.

Information Technology
Information technology questions for the Chief of Staff focused on the availability of wireless internet access and on the use of Telehealth (Tables I-20 to I-30).

Internet access. Wireless Internet (wifi) access enables use of mobile technology, such as iPads, both for patients and for providers. According to our respondents, patients and guests can expect wifi to be reliably available everywhere at only 21 percent of VAMCs, and they will find no wifi at all in almost 40 percent of VAMCs. Staff had higher rates of extensive reliable access, but nearly 40 percent of them also have no access at VAMCs. Wifi access is even lower at CBOCs: 72 percent provide no wifi for patients, and 64 percent do not have it for staff.

<u>Telehealth</u>. Telehealth at VA is divided into three categories. Store-and-forward Telehealth is used to transfer images in a non-synchronous manner. A major use of this tool is for radiology reading, which is done offsite. About one-third of respondents report using remote reading as a constant service; 56 percent say they use the service only at night. When reading is done offsite, facilities tend to select interpretation services for their store-and-forward data from providers that are outside either their administrative parent (58 percent) or entirely outside VA (47 percent).

Two other IT tools are clinical video telehealth in which providers and patients communicate by synchronous video, and home telehealth, which allows providers to monitor patient clinical measures like glucose levels or blood pressures while patients remain at home. According to respondents, among the seven conditions analyzed for this survey (PTSD, SUD, TBI, colon cancer, type 2 diabetes, acute coronary syndromes, and gynecologic conditions), clinical video telehealth between provider and patient was the most widely used telehealth modality. Store-and-forward telehealth was the technology least likely to be used for this purpose. About two-third of facilities confirmed that none of these technologies was available for use with colon cancer patients.

Clinical video telehealth can be conducted between VAMCs, from a VAMC to a CBOC, or even from the facility to a patient's home. We found that telehealth providers were usually (77 percent) at VAMCs, and patients were usually at CBOCS, particularly small to medium sized CBOCs, although occasionally the converse is true.

<u>Home telehealth monitoring</u>. Respondents were asked how long the average patient spends in a home monitoring program. About half said four to six months or less; one in five said more than 12 months. Nearly half of respondents said that the primary reason patients stop participating in home telehealth is that their health improves.

Asked about the size of their home telehealth programs, about half of the respondents reported that between 100 and 500 patients were enrolled at their local VA system; about one-third said that more than 500 patients were enrolled.

Finally, we asked where the home telehealth providers are located relative to the patients (more than one response was allowed). About one-half said that providers are sometimes located at the patient's primary CBOC and about one-third said they were sometimes at a different VA facility within the same local system. No respondent said that outside vendors provided home telehealth offsite.

Free-text comments

Comments that respondents offered augment the detailed survey results regarding clinically meaningful delays in care, hiring and retention of staff, IT, and use of purchased care.

Policies and mandates of the VA Central Office were a reoccurring theme in respondent comments. For example, "Policies get pushed down from Central Office that are often more mandates than guidelines and recommendations without field input or sufficient consideration for clinical repercussions." Respondents indicated that many policies and standards are based on a "one-size fits all" approach and that there is a "disconnect between Central Office and the

facilities providing the care."

Several respondents felt that VA Central Office policies and programs are implemented "without thought of the impact on the field or the needs of the Veterans." Others noted that VA polices are bureaucratic and politically motivated. For example: "VA has been overrun with bureaucratic policies and oversight that often lays in direct contrast to access and quality care for our Veterans. The idea that 'if a little is good, much more must be better' is the standard operating procedure of VA" and "Central Office seems solely politically driven and is not using best medical evidence to drive decisions on access and focuses on process not outcome measures."

Many respondents viewed the scheduling software as inefficient, antiquated, and inflexible. Respondents also note a lack of support staff to facilitate scheduling. The disconnect between the Central Office and the field with respect to scheduling policies was also noted. For example: "[VA Central Office] imposes reporting criteria that make it difficult to schedule, but facilitate their reporting of our scheduling." Many respondents also noted the inefficiencies of CPRS including "inordinate amount of clinical reminders, view alerts, suspense, metrics require large amounts of administrative time that could be better used to see patients" and "documentation requirements [are] for regulatory and not medical reasons."

Inadequate staffing, for both clinical and support responsibilities, figured prominently in respondent comments. Many reported that due to insufficient support staff, burdensome administrative mandates, new training requirements, ineffective staffing modules, and an "overwhelming" number of "clinically insignificant" electronic health record prompts, clinicians were required to perform tasks well below their levels of training.

In addition, respondents noted clinician shortages in primary care, urology, psychiatry, surgery, and orthopedics. Multiple respondents noted that VA salaries were not competitive and felt that inefficient human resources processes, including "lag time" in the hiring process, make it difficult to recruit into VA. One Chief of Staff summarized the situation as follows: "Ability to recruit and retain physicians is a huge problem. VA pay for providers has not kept track with what has been available in our area. Additionally, once we get good providers in place, an unending bureaucracy, difficulty dealing with non-productive clerical staff, and burdensome clinical reminders leads them to consider other jobs. Too many of our provider hires consider VA a "temporary" job until something better comes along or they can move to another area. For the most part, we have the appropriate number of support personnel, but maintaining those with a good work ethic is difficult and getting rid of those who are unproductive is even more difficult. Equipment procurement and contracting are extremely difficult to navigate, making new purchases a challenge. Central Office's requirements, while noble, fail to take into account the current status of non-VA health care systems across the country. Mandating 30-day evaluations for VA when most clinicians in our area can't accommodate similar requests is unreasonable. Patients that we send out via Choice are rarely seen any sooner than we could see them in our facility."

Several respondents noted that limited space and lack of exam rooms pose barriers to efficient patient care. Respondents indicated that primary care providers are frequently limited to a single exam room and that "2 exam rooms per provider would greatly facilitate workload." The

"cumbersome contracting" and leasing process were noted as barriers in obtaining required space.

Some respondents indicated that they use purchased care when necessary for specialty care and in rural areas; however, other respondents noted that purchased care is "not Veteran-centric" and "is to be avoided if possible since the model of delivery that is a hallmark of VHA quality cannot be assured under these circumstances." Respondents also indicated that using purchased care presents many challenges, for example, "The difficulties in trying to assure coordination of care through NVCC [Non-VA Care Coordination] and the Choice program is creating substantial additional workload on clinicians that diminishes efficiency."

Conclusion

This module of the survey was completed by the Chief of Staff of the parent facility of 117 local VHA systems nationwide, and focused on topics best answered by the person in charge of all clinical departments across the local system. The items included questions on access to primary care, on system efficiency and workforce hiring and retention, on purchased care, and on certain aspects of IT infrastructure.

Chiefs of Staff reported few problems with access to primary care, either for "new patient appointments" or follow-up appointments. Very few (about one in 20) reported frequent delays in access to primary care. This is remarkable in light of the fact that nearly three in four respondents described difficulties recruiting and retaining primary care personnel, and that there were many reports of inefficiencies, inadequate staffing, and provider dissatisfaction.

Those who did report delays overwhelmingly reported that more primary care providers were needed. Nearly as many said that other types of personnel were also needed.

Problems recruiting and retaining primary care providers were reported more often than for any other clinical specialty although there were widespread reports of problems across personnel types. Such comparisons across personnel types must be interpreted with caution, however, since hiring and retention problems might be more apparent for specialties with more personnel.

Below-market wages appeared to be less of a perceived problem for hiring primary care workers than for many other specialists, likely because the wage gap between the private sector and VA is lower for primary care than for other specialties or other types of personnel.

A high proportion of Chiefs of Staff perceive substantial inefficiencies in clinical operations, mostly revolving around burdensome administrative requirements, inadequate IT tools, and inflexible Central Office policies. In aggregate, comments suggest that these problems have had a substantially negative impact on employee morale, and possibly on patient care.

1.3.2 **Appendix B.3.2 Post-Traumatic Stress Disorder**

Clinical Background

Post-traumatic Stress Disorder (PTSD) affects hundreds of thousands of Veterans and service members (Institute of Medicine, 2014). An estimated 7–20 percent of service members who have served in Iraq or Afghanistan report having PTSD (Vasterling et al., 2010; Tanielian &

Jaycox, 2008; Smith et al., 2008; Seal et al., 2007; Hoge et al., 2004). Individuals with PTSD have been exposed to a traumatic event and experience symptoms such as intrusive thoughts and nightmares and alternations in arousal and reactivity; they avoid associations with the traumatic event and experience negative alterations in cognitions and also mood (American Psychiatric Association, 2013).

Research suggests that Veterans exposed to combat are more likely to develop PTSD than those who have not experienced combat. For instance, in one study, the odds of screening positive for PTSD were more than four times higher for Operation Iraqi Freedom Veterans who experienced combat compared with those who did not (Hoge et al., 2006). Individuals with PTSD are also more likely to have a second or third co-occurring mental health disorder. For example, in one study, 70 percent of National Guard soldiers returning from Iraq who were diagnosed with PTSD were also diagnosed with depressive disorders (Kehle et al., 2011). In another study, 41 percent of Veterans with a substance use disorder who served in the Vietnam era or later had comorbid PTSD (Petrakis et al., 2011).

RAND reviewed VA/DoD clinical practice guidelines for post-traumatic stress (VA, Management of Post-Traumatic Stress Working Group, 2010) and interviewed key informants within VA to better understand the course of clinical care for Veterans with PTSD. Within VA, there are typically three stages of treatment: assessment and diagnosis, acute treatment, and relapse prevention/care coordination. Veterans can be initially screened and assessed for PTSD in any of several clinics including primary care, mental health, and specialty PTSD clinics. Female military personnel can also be screened in women's health and at specific women's PTSD clinics at some facilities.

Women Veterans are also screened for military sexual trauma, which can also result in PTSD. All VA primary care and mental health providers are required to complete training on military sexual trauma. VA offers a number of other resources, including national training calls, web-based information, and an annual conference to provide further training (VA, 2015f).

Veterans with PTSD seeking treatment may access psychotherapy or pharmacotherapy treatment within the VAMC and CBOC; the level and number of services available depends on the size and location of these facilities. Patients with severe or refractory PTSD can also be transferred to residential treatment programs, which are available in some VISNs.

Clinical practice guidelines detail evidence-based psychotherapy and pharmacotherapy approaches that are recommended for PTSD treatment (VA, Management of Post-Traumatic Stress Working Group, 2010). Treatment may be provided in primary care or specialty PTSD or mental health clinics (for example, pharmacotherapy) by a variety of professionals, including nurse practitioners, primary care physicians, and psychiatrists. Psychotherapy may be provided in specialty PTSD care or mental health clinics (for example, cognitive processing therapy) by clinical psychologists, licensed social workers, and other licensed mental health professionals. While treatment is typically provided in-person at a VA facility, telemental health can allow a Veteran at a CBOC to receive care from a mental health professional at a remote site. Once symptoms have decreased, the frequency and intensity of treatment can be adjusted, and ongoing relapse prevention or care coordination can be provided through primary care or the specialty clinics at VAMCs or CBOCs.

Survey Results

A total of 117 respondents answered one or more questions in this module, which contained questions about the frequency of delays and proposed solutions for addressing them. Questions also touched on factors impacting provider and system efficiency, and workforce recruitment and retention.

Delays

Respondents were asked about delays at two care junctures: (1) PTSD diagnosis and assessment and (2) PTSD treatment. Both of these categories were further subdivided (as discussed below). Specifically, we asked respondents to "*Consider delays which might put a patient at risk for adverse outcomes, slow resolution of symptoms, or which are not compliant with VA/DoD guidelines.*"

Respondents who reported delays were asked to formulate a solution and to rate the importance of 11 potential components (for example, creating additional space, increasing the number of licensed independent practitioners) of their solutions.

Juncture 1: Diagnosis and assessment

Reported delays are detailed in Table I-31. We asked about delays in the following services related to PTSD diagnosis and assessment: in general mental health clinic; evaluation by the PTSD clinical team; evaluation using telehealth in CBOCs; evaluation for mental health services in CBOCs; and self-referred appointment in general mental health clinic. Most respondents said that delays for PTSD Diagnosis and assessment services were infrequent. About half said that no patient experienced delays; 70–90 percent reported that delays that were infrequent. The proportion of respondents indicating frequent delays, by service are presented below:

Evaluation in general mental health within your local health care system	10%
Evaluation by the PTSD clinical team	17%
Evaluation using telehealth in CBOCs (all sizes)	20%
Evaluation for mental health services in CBOCs (all sizes)	30%
Getting appointments when patients are self-referred for an evaluation in general mental health	10%

Respondents who identified delays in particular services were asked to think about a solution, and to rate the importance of various "elements of the proposed solution." Tables I-32 to I-36 describe the responses in detail. The responses (N = 36) for "Evaluation in general mental health within your local health care system" are typical (percentages are given as the proportion of respondents who rated the element "critically important" or "very important").

Increase the number of licensed independent practitioners	83%
Create additional space for patient care	69%
Increase the number of other personnel	69%

Improve information technology	64%
Change "central office policies" that affect workflow and efficiency	61%
Improve personnel supervision, management, or incentives	61%
Implement or increase the availability of telehealth services	33%
Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community	28%
Acquire and/or improve availability of equipment	22%
Increase weekend and evening availability of services	19%

Juncture 2: PTSD treatment

Reported delays are detailed in Table I-37. We asked about delays in the following services related to PTSD treatment: Pharmacotherapy in general mental health, pharmacotherapy in CBOCs, pharmacotherapy using telemental health in CBOCs (all sizes), group or individual psychotherapy in general mental health, group or individual psychotherapy in CBOCs, group or individual psychotherapy using telemental health in CBOCs, group or individual psychotherapy with a provider trained in evidence-based psychotherapy for PTSD, group or individual psychotherapy with a provider trained in evidence-based psychotherapy for PTSD in CBOCs, group or individual psychotherapy provided by telemental health with a provider trained in evidence-based psychotherapy for PTSD, a PTSD specialty bed in mental health residential rehabilitative treatment programs, and intake with the SUD/PTSD treatment program.

Reports of widespread delays were more frequent for PTSD treatment as compared with diagnosis and assessment. Between 20 percent and 40 percent of respondents reported delays in the various services that comprise PTSD treatment. Delays were most often reported in receipt of group or individual psychotherapy in CBOCs (39 percent), receipt of group or individual psychotherapy with a provider trained in evidence-based psychotherapy for PTSD (38 percent), and mental health residential rehabilitation beds (35 percent). The proportion of respondents who said that there were frequent delays at their institutions are shown:

Pharmacotherapy in general mental health	20%
Pharmacotherapy in CBOCs (all sizes)	29%
Pharmacotherapy using telemental health in CBOCs (all sizes)	22%
Group or individual psychotherapy in general mental health	24%
Group or individual psychotherapy in CBOCs (all sizes)	39%

Group or individual psychotherapy using telemental health in CBOCs (all sizes)	24%
Group or individual psychotherapy with a provider trained in evidence-based psychotherapy for PTSD	23%
Group or individual psychotherapy with a provider trained in evidence-based psychotherapy for PTSD in CBOCs (all sizes)	38%
Group or individual psychotherapy provided by telemental health with a provider trained in evidence-based psychotherapy for PTSD in CBOCs (all sizes)	24%
A PTSD specialty bed in Mental Health Residential Rehabilitative Treatment Programs	35%
Intake with the SUD/PTSD treatment program	14%

Tables I-38 to I-46 describe the responses for "elements of a proposed solution" in detail. Responses shown here (N = 37) for "Group or individual psychotherapy in CBOCs" were typical (percentages are given as the proportion of respondents who rated the element "critically important" or "very important").

Increase the number of licensed independent practitioners	83%
Create additional space for patient care	79%
Improve information technology	50%
Increase the number of other personnel	45%
Improve personnel supervision, management, or incentives	45%
Change "central office policies" that affect workflow and efficiency	38%
Implement or increase the availability of telehealth services	36%
Some other solution(s)	24%
Increase weekend and evening availability of services	17%
Acquire and/or improve availability of equipment	14%
Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community	14%

Issues Affecting Provider and System Efficiency

Respondents were asked to describe the degree to which various issues affected provider and system efficiency. Table I-47 describes the results. The proportion of respondents who said that there were frequent delays at their institutions are shown:

Inadequate scheduling system and policies	74%
Insufficient clinical/administrative support staff	72%
Providers performing administrative activities that could be performed by others	72%
Too many administrative requirements	63%
Unnecessary documentation requirements or inefficient CPRS	62%
Patient no-show rates	56%
Providers performing clinical activities that could be performed by individuals with less training	45%
Poor patient flow management	30%
Residency training/teaching requirements	15%

Recruitment and Retention

The facility survey also contained questions that focused on retention and hiring issues. Tables I-48 to I-51 describe the results. Several staff categories are central to treating PTSD, including psychiatrists, psychologists, and support staff such as nurses or physician assistants. Counselors and mental health social workers were also included. About 115 facilities responded to questions about problems recruiting/retaining the given staff position.

More than 80 percent of survey respondents reported problems recruiting psychiatrists and more than half reported problems recruiting psychologists for PTSD treatment. The top two reasons cited for recruitment problems for psychiatrists were non-competitive pay and the geographic location of the facility. About half of respondents reported that the human resources process took too long in hiring psychologists. Geographic location of the facilities was also identified as a barrier to recruiting psychologists.

About half the respondents also reported that psychiatrists and psychologists were the mental health specialties most difficult to retain, once hired. The most commonly cited reasons for problems retaining psychiatrists were dissatisfaction with workload and dissatisfaction with pay. About one-third of respondents also identified burnout as a retention problem. Indeed, 40 percent reported that burnout was the top reason for retention problems with psychologists. A second reason cited was lack of opportunity for professional growth or promotion.

Free-text comments

The free-text comments that respondents provided echo the numerical results.

Many respondents commented heavily on shortages of clinicians, on space for patient care, and the interplay between the two:

We are in dire need of more space and more providers. If both were increased, the access issue would be resolved.

We do not have the space to add more clinicians.

Many viewed the VistA scheduling system as a barrier to timely and efficient care:

The scheduling system is archaic, cumbersome, and does not meet the needs of modern health care systems. It needs not a set of "fixes" but replacement.

Rather than having a real time calendar that demonstrates all clinic slots available for booking, in general there are specific slots assigned to a given program (that is, Thursdays from 2-3 pm). If that slot does not work for the patient(s) then it may go un-utilized, whereas other services may be able to utilize that slot.

Comments suggest some support for the finding that delays are greater with regard to ongoing PTSD care than with diagnosis and assessment:

Limited providers in the outpatient clinic have resulted in large panel sizes for providers that limit frequency of sessions.

Current staff are insufficient for the demand; cannot get patients back for weekly psychotherapy when necessary.

Comments on telehealth were mixed. Several respondents expressed a desire for more telehealth resources, while others questioned the value or applicability of telehealth:

Better Tele-equipment would be helpful, as well as more available units.

Veterans have not, in our experience, enjoyed attempts to participate in groups via telehealth with a group of Veterans at our parent facility (even our staff who use telehealth equipment to be involved in team discussions feel removed and thus it is more difficult to engage).

There is a general lack of interest in telemental health in the patient population who can travel easily to the medical center.

Several comments highlighted a perception that requirements from VA Central Office and other bureaucracy have a negative impact on efficiency and morale:

Clinicians spend far too much time on nonclinical duties. We have a ridiculous amount of irrelevant trainings TMS [online coursework for staff], for instance.

[We should] focus on clinical care not political care; eliminate government roadblocks and bureaucracy, eliminate irrelevant and unsuccessful measures unrelated to providing good clinical care.

We have to pull clinicians away from clinical care to keep up with the growing amount of time devoted to complete administrative requirements, training, completion of reports, etc. The efficiency of providing care is being greatly reduced.

Policies really need to be made with better vertical as well as horizontal transmission for optimal understanding of local impact.

The documentation requirements and paternalistic rules for managing patients are so overwhelming that it over-tasks the providers and causes huge morale issues.

> Regarding personnel supervision and management: We need to be able to FIRE people who cannot or do not do their jobs. Right now that is nearly impossible.

> The environment in VHA currently is punitive in many cases, rather than offering rewards for excellent ideas, policies, and procedures.

Respondent comments surfaced several other ideas:

> We have a large volume of referrals to contracted providers (about 20 percent) but many Vets insist on being seen at VA.

> The evidenced based psychotherapies are a tough sell with the Veterans as whole. It is not easy to get them engaged in a therapy process that requires more active participation—but this is true in the civilian sector as well. I think the national expectation for the adoption of these therapies and their clinical penetration was unrealistically hopeful.

Conclusions

While a majority of respondents indicate that clinically meaningful delays in the care of PTSD patients occur infrequently at their local VA system, it is clear that at many institutions, the demand for some PTSD services such as regularly scheduled evidence-based therapy exceeds supply. Access problems appear to be more common with regard to ongoing treatment than with assessment and diagnosis. Respondents suggest several explanations: ongoing therapy is inherently resource-intensive, patient volume has been increasing, and facilities are substantially constrained by lack of both clinical personnel and physical space.

Respondents also noted a number of inefficiencies, chief among them those created by an outdated scheduling system and by what are viewed by some to be onerous regulations and mandated activities that detract from time available for clinical care.

Respondent comments highlighted the need for more clinical personnel and for more space in which to provide patient care.

Views on telehealth were mixed. Some respondents viewed it as potentially helpful, if more resources could be devoted to it; others questioned whether Veterans would find it useful, especially if they were able to travel easily to the VA medical center.

1.3.3 **Appendix B.3.3 Substance Use Disorder**

Clinical Background

Between 7 and 20 percent of Operation Enduring Freedom/Operation Iraqi Freedom Veterans and service members report heavy alcohol use, 12 percent report illicit drug use (including prescription drug misuse), and 2 percent report illicit drug use (excluding prescription drug misuse) in the past 30 days (Bray et al., 2009). Individuals with SUD can experience a continuum of problems that range in severity from mild to severe. These problems may include cravings and urges to use the substance, development of withdrawal symptoms, and social and occupational impairment (American Psychiatric Association 2013). According to Bray et al., 11 percent of active duty service members in 2008 self-reported the misuse of prescription medications, up from just 2 percent in 2002 (Bray et al., 2009). Within the active-duty military population, those members in possession of prescriptions for pain medications were nearly 3

times more likely to self-report misuse as compared with those without a prescription (Substance Abuse and Mental Health Services Administration, 2002).

RAND reviewed VA/DoD's clinical practice guidelines for SUD (Management of Substance Use Disorders Working Group. 2009) and interviewed key informants within VA to better understand the course of clinical care for Veterans with SUD. Treatment begins with a comprehensive assessment leading to a treatment plan, followed by either medication management of withdrawal symptoms, a brief intervention for someone with less severe alcohol abuse or specialty treatment for individuals with more severe alcohol or other drug use disorders. Medication-assisted withdrawal management can occur in either the inpatient or outpatient setting; treatment can include outpatient or residential psychosocial treatment and/or pharmacotherapy for either alcohol or opiate disorders, which can occur in primary care, specialty mental health, or specialty SUD care. Telemental health can also be used to provide outpatient psychosocial treatment. Frequently there are transitions in care, as when a Veteran is transferred from primary to specialty SUD care, from the emergency department to inpatient detoxification for withdrawal management, or from outpatient to residential treatment.

Opioid disorders should be mentioned specifically, as pharmacotherapy for opioid addiction requires additional resources. Veterans can receive office-based opiate treatment or be treated in Opioid Addiction Treatment Programs, which are more commonly located in specialty SUD clinics. Several requirements are needed to administer pharmacotherapy, including X-waivers for physicians to administer buprenorphine in either primary or specialty care or a licensed methadone program for methadone maintenance. As a result, pharmacotherapy such as methadone may only be available at larger facilities. Treatment for SUD may be complemented with other services including adjunctive treatment from the Pain Clinic, Sleep Clinic, and Specialty Mental Health care.

Survey Results

A total of 114 respondents answered one or more questions in this module, which contained questions about the frequency of delays and proposed solutions for addressing them. Questions also addressed reasons impacting provider and system efficiency, and workforce recruitment and retention.

Delays

Survey respondents were asked what percentage of patients experienced clinically meaningful delays in the following categories: (1) Comprehensive evaluation for SUD, (2) SUD treatment, and (3) SUD care transitions (that is, transitioning from one service or program to another). We further subdivided the three categories into subcategories: Evaluation had eight subcategories (for example, referral to SUD specialty care, referral to methadone clinic), Treatment had 12 subcategories (for example, medication-assisted withdrawal management, SUD psychosocial treatment, methadone maintenance), and Care Transitions had six subcategories.

Once participants reported the percentage of patients experiencing delays, they were asked to think about ways to reduce the number of these delays. For the services with the greatest frequency of delay (that is, the highest percentage of patients experiencing a delay),

participants were asked to formulate a solution that could reduce the number of these delays and to report the importance of 11 potential components (for example, creating additional space, increasing the number of licensed independent practitioners) to their solutions, using a four-point scale (1 = critically important to 4=unimportant). We report only on those solution components identified as important by more than 10 respondents.

Juncture 1: Comprehensive evaluation for SUD

There were about 112 respondents for each of the possible eight delay subcategories. The subcategories for which delay was reported the most frequently were those that involved access to care outside of the respondent's local health care system—that is, referral to residential treatment at another administrative parent (44 percent) and referral to fee-basis or contracted SUD care (29 percent) (Table I-52). The proportion of respondents who said that there were frequent delays at their institutions are shown:

Referral to general mental health	7%
Referral to SUD specialty care	8%
Referral to telemental health	11%
Referral to SUD services located in CBOCs (all sizes)	16%
Referral to methadone clinic	20%
Patients who are self-referred for a SUD evaluation in general mental health	5%
Referral to SUD services from the administrative parent to fee-basis or contracted care	29%
Referral to residential treatment at another administrative parent	44%

Respondents who identified delays in particular services were asked to think about a solution, and to rate the importance of various "components of the proposed solution." Tables I-53 to I-60 describe the responses in detail. Responses shown here (N = 58) for "referral to residential treatment at another administrative parent" were typical. The most frequently cited as "critically important" or "very important" were as follows:

Create additional space for patient care	64%
Increase the number of licensed independent practitioners	52%
Increase the number of other personnel	48%
Improve personnel supervision, management, or incentives	38%
Change "central office policies" that affect workflow and efficiency (for example, rules governing documentation or how quickly certain services must be provided)	33%

Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community	31%
Improve information technology	22%
Some other solution(s)	21%
Implement or increase the availability of telehealth services	17%
Acquire and/or improve availability of equipment	9%
Increase weekend and evening availability of services	7%

We note for both of these SUD comprehensive evaluation services for which respondents reported significant access delays, the most commonly suggested components of solutions were to increase the number of independent licensed practitioners and to create additional space for patient care.

Juncture 2: SUD treatment or follow-up to the initial evaluation

One hundred thirteen respondents answered the delay questions about the 12 treatment subcategories (Table I-61). The SUD treatments with the most commonly reported clinically significant delays were opiate dependence treatment, when it was provided through purchased or contracted care (33 percent for buprenorphine and 31 percent for methadone maintenance). Other important delays in care reported included psychosocial treatment within residential SUD care (30 percent), and, in CBOCs, pharmacotherapy for alcoholism (all sizes) (20 percent), and psychosocial treatment (19 percent). The proportion of respondents who said that there were frequent delays at their institutions are shown:

Medication-assisted Withdrawal Management for Alcoholism provided as an inpatient within your local health care system	8%
Medication-assisted Withdrawal Management for Alcoholism provided as an inpatient through fee-basis or contracted care	14%
Medication-assisted Withdrawal Management for Alcoholism provided as an outpatient within your local health care system	11%
Medication-assisted Withdrawal Management for Opiate Dependence provided as an inpatient within your local health care system	5%
Medication-assisted Withdrawal Management for Opiate Dependence provided as an inpatient through fee-basis or contracted care	17%

Medication-assisted Withdrawal Management for Opiate Dependence provided as an outpatient within your local health care system	15%
Outpatient SUD Psychosocial Treatment (either group or individual) within your local health care system	8%
Psychosocial Treatment (either group or individual) within Residential SUD care	30%
SUD Psychosocial Treatment in CBOCs (all sizes)	19%
SUD Psychosocial Treatment (either group or individual) using tele-mental health in CBOCs (all sizes)	17%
Pharmacotherapy for Alcoholism provided in specialty mental health clinics within your local health care system	11%
Pharmacotherapy for Alcoholism provided in specialty SUD clinics within your local health care system	6%
Pharmacotherapy for Alcoholism provided in CBOCs (all sizes)	20%
Maintenance Pharmacotherapy for Opiate Dependence: Buprenorphine within your local health care system	15%
Maintenance Pharmacotherapy for Opiate Dependence: Buprenorphine provided through fee-basis or contracted care	33%
Methadone Maintenance within your local health care system	24%
Methadone Maintenance provided through fee-basis or contracted care	31%

Respondents who identified delays in particular services were asked to think about a solution, and to rate the importance of various "components of the proposed solution." Tables I-61 to I-71 describe the responses in detail. Responses shown here (N = 58) for "psychosocial treatment within residential SUD care" were typical: The most frequently cited as "critically important" or "very important" were as follows:

Create additional space for patient care	81%
Increase the number of licensed independent practitioners	66%

Increase the number of other personnel	59%
Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community	47%
Improve personnel supervision, management, or incentives	41%
Some other solution(s)	36%
Change "central office policies" that affect workflow and efficiency	31%
Improve information technology	28%
Increase weekend and evening availability of services	25%
Acquire and/or improve availability of equipment	22%
Implement or increase the availability of telehealth services	22%

We note that for both of these SUD treatments, the most commonly suggested solution components were increasing the number of licensed independent practitioners and creating additional space.

Juncture 3: SUD care transitions

A total of 112 respondents reported on delays for the six subcategories on SUD care transitions (Table I-72). Delays in transitioning patients to residential treatment were endorsed much more frequently than any other transition in care. The proportion of respondents who said that there were frequent delays at their institutions are shown:

From primary care (excluding CBOCs) to outpatient specialty SUD care	4%
From general mental health to residential SUD care	31%
From Emergency Department to outpatient specialty SUD care	3%
From Emergency Department to inpatient detox	5%
From ambulatory detox to residential SUD treatment	37%
From CBOCs (all sizes) to specialty residential SUD care at your local health care system	31%

Respondents who identified delays in particular services were asked to think about a solution, and to rate the importance of various "components of the proposed solution." Tables I-73 to I-78 describe the responses in detail. Responses shown here (N = 52) for "transitioning patients from general mental health to residential SUD care" were typical: The most frequently cited as "critically important" or "very important" were as follows:

Create additional space for patient care	67%
Increase the number of licensed independent practitioners	63%
Increase the number of other personnel	56%
Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community	38%
Improve personnel supervision, management, or incentives	31%
Some other solution(s)	27%
Improve information technology	21%
Change "central office policies" that affect workflow and efficiency	21%
Implement or increase the availability of telehealth services	19%
Increase weekend and evening availability of services	19%

We note that for all three of these SUD care transitions, creating additional space, increasing the number of licensed independent practitioners, and increasing the number of other personnel were the most commonly suggested solution components.

Issues Affecting Provider and System Efficiency

A total of 113 respondents reported on the negative impact of a number of issues, ranging from providers performing clinical duties that could be performed by individuals with less training to administrative requirements, on provider and system efficiency (Table I-79). The following issues were most frequently identified as "a fair amount" or "a lot":

Patient no-show rates	66%
Insufficient clinical/administrative support staff	65%
Providers performing administrative activities that could be performed by others	65%
Too many administrative requirements	57%
Inadequate scheduling system and policies	51%
Unnecessary documentation requirements or inefficient CPRS interface	50%
Providers performing clinical activities that could be performed by individuals with less training	36%
Poor patient flow management (room/bed turnover, appointments)	26%

Residency training/teaching requirements   12%

Recruitment and Retention

The SUD staff categories are similar to those of PTSD, with the addition of providers specializing in opioid disorder treatment (buprenorphine), social workers and psychologists. Also important for continuity of care in this population are schedulers.

One hundred and thirteen respondents reported problems recruiting or retaining a given staff position. The percentage of respondents reporting barriers for the given staff category are calculated from the subset answering 'yes' to problems recruiting/retaining.

Prescribing mental health professionals (76 percent) and prescribing providers with X-waivers for office-based buprenorphine treatment (58 percent) were the most commonly reported staff categories for which respondents reported difficulty recruiting or hiring (Table I-80). Psychologists and nurses or physician assistants with specializations in mental health were close behind with 47 percent and 49 percent reporting difficulties in hiring/recruiting these staff positions. For both of these positions, the top recruitment barrier reported was non-competitive wages (57 and 55, respectively) (Table I-81). The second most common reason for both staff categories was lack of qualified applicants (35 and 44 percent, respectively).

Prescribing mental health providers were the main staff category that respondents reported problems in retaining, with 52 percent reporting difficulties (Table I-82). Less than 35 percent of respondents reported having difficulty retaining the rest of the mental health professionals. The top barriers to retaining the prescribing mental health providers were dissatisfaction with pay (51 percent) and dissatisfaction with workload (29 percent) (Table I-83).

Free-text comments

Respondents offered comments/suggestions on issues affecting delays in access to SUD care and on matters related to provider and system efficiency.

First, respondents reported that they did not have enough clinical staff and support staff to efficiently serve Veterans. In particular, they noted the need for more psychiatrists and support staff to work with the psychiatrists. "[I] simply need additional psychiatrists; numbers are critically low with [my] two suboxone-qualified psychiatrists on deployment or indefinite leave. A primary care provider will appropriately have three support staff[;] a psychiatrist is expected to work with a fraction of a nurse and a fraction of a scheduler." "[We] require an addiction psychiatrist and another nurse practitioner who could do the physical screening."

The lack of providers able to prescribe burprenorphine/Suboxone was frequently mentioned: "[We need] a new addiction psychiatrist to see Suboxone patients." "We need to pay Suboxone providers more." "We have limited Suboxone providers on staff." "We need buprenorphine providers." Other providers were also needed. As one respondent noted "I do not have enough providers to offer this service without fatiguing my existing providers." Another respondent mentioned "Staffing at CBOCs is a particular problem."

The lack of residential treatment was identified frequently as a concern.

> There is no available VA residential care in [name of state]. Often there are lengthy application processes and complicated travel arrangements. There is no centralized way to know about wait times.
>
> The process of referring to SUD residential care at other facilities remains problematic.
>
> We need an increase in [residential] beds. We have 20 beds with a waitlist that fluctuates between 2-3 months.
>
> Our beds are full on a consistent basis . . . there is no healthy environment during the wait time to residential.
>
> There are long waits to transfer Veterans [to residential treatment.] Sometimes we are told that our Veterans cannot access the desired programs because they have too long of a waiting time for their own residents.
>
> Referrals can take months.

Respondents also reported needing additional support staff to schedule patients who were waiting for appointments and to help make reminder calls, potentially preventing common no-shows for appointments in this population. Respondents felt that having support staff available to provide such services would free clinical staff from these administrative burdens.

> The SUD clinician handles scheduling…there aren't enough administrative staff.
>
> Understaffing is the biggest problem.

Ancillary staff were also viewed as essential. "Specify staffing models for different levels of care based on ASAM [American Society of Addiction Medicine] criteria to include designated staffing for ancillary/support services such as gym, recreation therapy, occupational therapy, vocational rehab. Ancillary services are critical to reconditional the limbic system/ leisure time activity and reduce relapse risks."

Telehealth had the potential to enhance access:

> Telehealth from home would improve PT [patient] access and outcomes but VA would need to supply iPad and needed equipment. Standardized biofeedback equipment such as apps and finder monitors which are used on personal cell phones [would need to] be funded and made available to Veterans for mood regulation.

Respondents also identified lack of space as a significant issue: "Space is a critical need at all CBOCs." Another observed that due to the lack of space, they have "created offices on what used to be porch space just to make room for more providers." And "…group space is important for ability to do additional group therapies."

Respondents also commented on their experiences in referring patients to purchased care in the community or to other VISNS. Many respondents thought the current referral processes, which they saw as long and cumbersome, could be made more efficient: "Fee-basis approval can be a slow process as there is limited staff to process consults and limited programs in the community that offer this service."

Quality of purchased care was also a concern. A few respondents reported the need to find ways to offer Veterans services within the facility or a nearby VISN because of their concerns with the quality of care at community-based organizations and the lack of VA staff time and

resources to coordinate and follow care of a Veteran in purchased care. One respondent said "I have concerns about the standard of care at local methadone clinics and some ambiguity about how responsible VA staff are for care at outsourced private clinic." "I have been disappointed with the quality of care in the community, yet I am responsible." Another felt that Veterans wanted "improvement to occur in VA and not contracted to some programs that have poor environment for recovery."

Several respondents reported that community-based organizations needed more incentives to treat Veterans and that they needed to be paid in a more timely manner. One respondent said "our payment rate is low to these fee-basis providers such that they are not eager for our business." Lack of financial incentives may be a barrier to needed treatment: "Community Fee-Base programs feel that VAs are not paying enough vs Medicaid rates." Supply of community-based providers was also highlighted as a potential barrier to access: "VA needs to market and recruit more Non-VA Care agencies in some areas (for example, Methadone/Suboxone) as there is far more need and not enough services available."

The final issue respondents most frequently commented on was the need to have an updated scheduling software program. Respondents characterized the current system as "antiquated," "archaic," "ancient," and "arduous." They observed that "at many CBOC sites, CPRS bandwidth is severely limited and [there is] very slow computer responsiveness." The system was seen as inefficient and error-prone. CPRS documenting was reported as cumbersome and time-consuming.

Conclusion

While delays in accessing outpatient SUD treatment services within the respondent's local health care system were reported infrequently, many more respondents reported delays when trying to access either residential treatment, treatment at another administrative parent, or fee-basis or contracted care. Access to residential treatment or medication-assisted treatment for opioid dependence, whether for buprenorphine or methadone, was noted as a particular problem; residential treatment because of the lack of beds and space, and medication assisted treatment because of the lack of providers. By contrast, apart from within CBOCs, delays in access to pharmacotherapy for alcoholism were not reported by many respondents. The most commonly cited staff recruitment and retention problem were for prescribing mental health providers.

1.3.4 Appendix B.3.4 Traumatic Brain Injury

Clinical Background

While many Veterans with who carry a TBI diagnosis sustained their injuries during deployment, a substantial number relate to other trauma such as motor vehicle accidents. TBI services at VA are referred to as "Polytrauma" in recognition of the fact that severe traumatic brain injuries rarely occur in isolation (they are commonly associated with extremity injuries, lung injuries, etc.). VA's organizational structure for the care of Polytrauma patients is outlined in the Polytrauma System of Care handbook [VHA Handbook 1172.01].

VA defines several levels of Polytrauma services. Nationwide, there are five Polytrauma Rehabilitation Centers which focus on treating patients with severe TBI in the immediate aftermath of the injury. The next level is the Polytrauma Network Site which serves as the regional TBI referral center; there is at least one Polytrauma Network Site per VISN (VISN 8 and 17 each have two). Finally, the Polytrauma support clinic team at most large VAMCs organizes local TBI care and helps facilitate the comprehensive TBI evaluation for patients who screen positive (discussed below).

TBI can be categorized as mild or severe, recent or chronic. Patients with severe and recent TBI often enter the system (either via the DoD health system if the injury is service-related, or otherwise) at a Polytrauma Rehabilitation Center, and then are referred to the Polytrauma Network Site closest to home for ongoing care. Mild TBI, on the other hand, is often diagnosed long after the injury. Screening for TBI is mandatory for all new VA enrollees who separated from service after September 11, 2001, and takes place via a "clinical reminder" during their first clinical encounter. Patients who "screen positive" are referred for an extensive "comprehensive TBI evaluation." Depending upon the results of that evaluation, patients may be referred for further studies (for example, sleep studies, neuropsychiatric testing). Depending upon the results of the initial comprehensive TBI evaluation and those tests, a care plan is developed and implemented locally or at a regional center as necessary.

TBI and PTSD are closely intertwined conditions as to some extent they share a common etiology, and as neuropsychiatric symptoms are common to both. One unique feature of TBI is that the disease itself can interfere with treatment for it: Patients with cognitive disabilities are more likely to be no-shows to appointments, for example.

Survey Results

There were between 107 respondents for questions regarding TBI. Rates of "not applicable" responses varied substantially across sub-questions. Please see Table I-2 for details of responses and response rates.

Delays

Respondents were asked about delays at three care junctures after screening: (1) Comprehensive TBI evaluation, (2) Additional assessments after the comprehensive TBI evaluation, (3) Ongoing TBI care. Categories were further subdivided into specific services.

Those who reported delays were asked to formulate a solution and to rate the importance of 11 potential components (for example, creating additional space, increasing the number of licensed independent practitioners) of their solutions.

Juncture 1: Comprehensive TBI evaluation after a positive screening test

Respondents were asked where patients who screened positive for possible TBI symptoms were typically sent for a comprehensive TBI evaluation (Table I-84). The most common venues were reported to be as follows: Interdisciplinary TBI clinic within local health care system, physical medicine & rehabilitation clinic, and neurology clinic. As indicated in the comments section, several respondents noted that the interdisciplinary TBI clinic exists within the physical medicine & rehabilitation clinic at their institution. One respondent reported that the

comprehensive TBI evaluation occurs at CBOCs via telemedicine led by an interdisciplinary TBI team. Approximately 20 percent of respondents reported frequent delays (Table I-85).

Components of a solution to delays in obtaining comprehensive TBI evaluation that were most frequently cited as critically important or very important were as follows (Table I-86):

Increase the number of licensed independent practitioners	52%
Increase the number of licensed independent practitioners	52%
Improve information technology	48%
Increase the number of other personnel	39%
Change "central office policies" that affect workflow and efficiency	38%
Implement or increase the availability of telehealth services	34%
Some other solution(s)	29%
Improve personnel supervision, management, or incentives	27%
Create additional space for patient care	25%
Increase weekend and evening availability of services	13%
Acquire and/or improve availability of equipment	11%
Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community	11%

Juncture 2: Delays in obtaining additional assessments after the comprehensive TBI evaluation

Table I-87 describes reported delays in the following services used in the next stage of assessment after the comprehensive TBI evaluation: Magnetic resonance imaging, comprehensive sleep evaluation, neuropsychiatry evaluation, case management services, mental health evaluation, neuro-optometry/ophthalmology testing, hearing assessment, balance and vestibular testing, physical therapy evaluation, and occupational therapy evaluation. Comprehensive sleep evaluation and neuropsychiatric evaluation had the most reports of frequent delays. The proportions of respondents who reported frequent delays are as follows:

Magnetic resonance imaging	20%
Comprehensive sleep evaluation	35%
Neuropsych evaluation	27%

Case management services	8%
Mental health evaluation	16%
Neuro-optometry/ ophthalmology testing	18%
Hearing assessment	14%
Balance and vestibular testing	11%
Physical therapy evaluation	13%
Occupational therapy evaluation	9%

Respondents who identified delays in particular services were asked to think about a solution, and to rate the importance of various "components of the proposed solution." Tables I-88 to I-96 describe the responses in detail. Responses shown here for "Comprehensive sleep evaluation" were typical (proportions of respondents who answered either "critically important" or "very important" are shown):

Create additional space for patient care	45%
Increase the number of licensed independent practitioners	59%
Increase the number of other personnel	44%
Acquire and/or improve availability of equipment	39%
Implement or increase the availability of telehealth services	15%
Improve information technology	15%
Change "central office policies" that affect workflow and efficiency	10%
Improve personnel supervision, management, or incentives	10%
Increase weekend and evening availability of services	18%
Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community	29%
Some other solution(s).	28%

Juncture 3: Ongoing TBI care

Approximately 30 percent of respondents reported that their local system was a Polytrauma Network Site. Of the 73 who said that they were not, 12 percent said that most TBI patients were referred out to the regional Polytrauma Network Site, while 88 percent said that most TBI care occurred at their own facility. (Table I-98)

We asked about the following services for ongoing TBI care: Ongoing care by a TBI specialist at your facility, ongoing care at a regional Polytrauma Network Site, neuropsychiatric therapy, other mental health therapy, pain clinic for refractory symptoms, sleep clinic follow-up for refractory symptoms, physical therapy, occupational therapy, speech therapy, and vocational rehabilitation. Reports of frequent delays were somewhat more common for care at this juncture as compared with assessment after the comprehensive TBI evaluation. The services with the most respondents reporting delays were pain clinic and sleep clinic (about one third of respondents for each said that there were frequent delays). Notably, only 20 percent said that there were frequent delays in ongoing neuropsychiatric therapy, and only 16 percent identified frequent delays in other mental health therapy. It is not clear whether respondents took this question to refer to the initial appointment for ongoing therapy, or to access to ongoing care at regular intervals. The proportions of respondents who reported frequent delays are as follows:

Ongoing care by a TBI specialist at your facility	14%
Ongoing care at a regional Polytrauma Network Site	11%
Neuropsych therapy	20%
Other mental health therapy	16%
Pain clinic for refractory symptoms	34%
Sleep clinic follow-up for refractory symptoms	34%
Physical therapy	12%
Occupational therapy	7%
Speech therapy	11%
Vocational rehabilitation	15%

Respondents who identified delays in particular services were asked to think about a solution, and to rate the importance of various "components of the proposed solution." Tables I-100 to I-107 describe the responses in detail. Responses shown here for "Treatment from a pain clinic for refractory symptoms" were typical (proportions of respondents who answered either "critically important" or "very important" are shown):

Increase the number of licensed independent practitioners	84%
Create additional space for patient care	62%
Increase the number of other personnel	56%
Improve information technology	38%
Improve personnel supervision, management, or incentives	29%
Acquire and/or improve availability of equipment	28%
Change "central office policies" that affect workflow and efficiency	26%

Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community	25%
Increase weekend and evening availability of services	23%
Some other solution(s)	18%
Implement or increase the availability of telehealth services.	17%

Issues Affecting Provider and System Efficiency

A total of 106 respondents reported the negative impact on provider and system efficiency from issues such as providers performing clinical duties that could be performed by individuals with less training or from administrative requirements, (Table I-108). The following issues were most frequently identified as "a fair amount" or "a lot":

Patient no-show rates	71%
Inadequate scheduling system and policies	63%
Insufficient clinical/administrative support staff	59%
Unnecessary documentation requirements or inefficient CPRS interface	58%
Providers performing administrative activities that could be performed by others	57%
Too many administrative requirements	56%
Inadequate physical space (for example, exam rooms) or equipment	38%
Providers performing clinical activities that could be performed by individuals with less training	29%
Poor patient flow management (room/bed turnover, appointments)	22%
Residency training/teaching requirements	5%

Recruitment and Retention

We asked about recruitment (Tables I-109 and I-110) and retention (Tables I-111 and I-112) of a variety of physician specialists, mental health professionals, and therapists involved in the care of TBI patients.

In most cases, about one-half of respondents reported problems with recruitment; substantially fewer reported problems with retention. Excluding those who answered "NA," about one-half reported problems recruiting most personnel types. Less than one-third reported problems with personnel retention.

Noncompetitive wages and dissatisfaction with pay were far more frequently cited than other reasons for problems with recruitment and retention, respectively.

Free-text comments

Respondents offered additional observations about delays, staffing, efficiency, and Central Office policies, among other issues.

Respondents felt that some delays were caused by Veterans themselves

> Veterans frequently cancel or no-show and when the appointments are re-scheduled per the Veterans request it often gives the appearance of delay on the part of the facility.

> There is a high no-show rate (traditionally almost 50 percent, improved to 33 percent d/t overbooks, not because patients are showing up more frequently!!)

Shortages of clinical and support staff was a prominent concern as was concern about insufficient space for existing staff to provide care.

> Our facility receives approximately 100 consults a months with only 1.5 FTE provider(s) to see those requiring a CTBIE [comprehensive TBI evaluation]

> We are dealing with a shortage of providers, both physicians and mid -level providers. There is a shortage of nursing personnel, both RN [registered nurse] and LPN [licensed practical nurse]. We have a critical shortage of physical space, not enough exam rooms to the point of inhibiting productivity. Telemedicine has increased our ability to reach rural areas, and this should be expanded. Providers other than neurologists and physiatrists are capable of performing the CTBIE [comprehensive TBI evaluation]. We are currently doing this; otherwise we would not be capable of keeping up with the demand.

> Lots of funding for Polytrauma site- those funds need to be shared with Polytrauma Support Clinic Sites as that is where the bulk of follow up and long term care resides.

Respondents had varied perspectives on the accessibility and utility of information in a Veteran's medical record.

> The lack of medical records from DoD does not delay or providing the Second Level TBI Evaluation. We always provide the evaluation regardless of records from DoD.

> This is a trick question. Remote data allows you to access DoD records from CPRS. However, those records are rarely relevant to the evaluation. They are often VA records that have been transferred into the DoD database, and almost never contain information about injures that happened in theatre or that involved medical care while on Active Duty that is associated with the reported TBI.

> I never see the inpatient records from Walter Reed, Landstuhl or Iraq or Afghanistan. I sometimes see the outpatient records from remote facilities in Iraq or Afghanistan, but they are few and far between. I *never* have access to things like sleep studies or the images from studies such as CT or MRI and usually have to re-image anything that I want to look at.

Respondents did report frequent delays but thought measuring delay in obtaining a new visit did not capture true access to mental health care, for which effectiveness would be a more appropriate measure.

> We are capacity constrained in mental health due to the number of providers we have and the demands for services. We can see patients quickly, but then they may have a long wait to be seen again. We might be able to be more effective if we see the same patient more often, but that results in delays in seeing others. As delay is what is being measured, not effectiveness (a tough measure), we end up with many patients being seen, but not very effectively.

> At this juncture, this level 1A hospital has two 0.5 psychologists who treat PTSD. This is far less than prior to 911. This is beyond unacceptable.

> Delays in neuropsychiatric assessment sometimes as long as 4 months

Many respondents voiced frustration with the CPRS tool for the comprehensive TBI evaluation, and for Central Office policies they viewed as not focused on patient care.

> Many CO [Central Office] directives do not address the real need of having the ability to schedule and contact Veterans more efficiently. Wait times are arbitrary and rarely reflect clinical need or community standards.

> Many Veterans that are screened for TBI are many years past the initial incident. It is important to address their clinical needs but the required templates are not necessary for many of the evaluations.

> VA is run, to quote a director, so as "to control the doctors." You cannot run a health care system against the doctors. All the problems mentioned above derive fundamentally from the desire to by CO [Central Office] to control the system not let professionals do their job.

> We have a doctor and nurse doing a great deal of clerical work and much of the documentation requirements do not feel meaningful to the actual care of the patient.

> Delay due to staffing issue and lack of leadership support to address this issue in hiring appropriate personnel.

> The TBI second level screening tool in CPRS is difficult to use, frequently does not work and is very slow. While it may allow [VA Central Office] to collect data, it adds nothing to clinical care for the Veteran.

> The TBI screening program is flawed and has resulted in too many Veterans being diagnosed with TBI based on limited info. The need to complete Mayo-Portland evaluations for mild TBI patients is not helpful.

> No show rates, clerical staff, and the ridiculous CPRS/VISTA interface are interconnected problems.

Conclusion

VA has a well-developed system of care in place for patients with TBI. Except for the military, it is likely unrivaled in the depth of expertise available system-wide, or in the immediate care of the most severely injured patients. Access to care for those with less severe or less recent injuries is somewhat less clear.

Numerical survey results tell a somewhat different story than do the accompanying comments. The former suggests that at a majority of facilities, delays experienced by TBI patients at any care juncture are relatively uncommon. Moreover, it is suggested that many apparent delays are actually precipitated by patient no-shows for care (presumably in part related to cognitive deficits related to injury).

The comments suggest greater problems with access, and particularly that the system is responding to the access measures that are being audited, such that true problems may be understated. Neuropsychiatric evaluations and ongoing mental health care of any kind appear particularly problematic. It is possible that the comments give disproportionate voice to an unrepresentative sample of respondents. It is also possible that survey questions regarding "delays in ongoing care" were interpreted according to the letter of our instructions (for example, if no adverse outcome, and in keeping with VA/DoD guidelines, then no delay was reported).

Transfer of information between the DoD health care system and a VA Polytrauma Rehabilitation Center is generally done via "warm handoff" whereby pertinent medical history is discussed between providers at the two institutions. For less acute or less serious cases, survey evidence suggests that DoD records are often not deemed particularly relevant, nor are they routinely available (as they relate to the injury in questions or care for it); in short, there does not appear to be a perceived problem with regard to information transfer.

Comments also reflect widespread dissatisfaction with CPRS screening and evaluation tools for TBI, and with VA Central Office policy that is seen by some as focused on data collection at the expense of patient care.

1.3.5 Appendix B.3.5 Acute Coronary Syndromes

Clinical Background

The term "acute coronary syndromes" describes a constellation of signs and symptoms of myocardial ischemia or infarction. Acute coronary syndromes is a spectrum of disease ranging from "unstable angina" to "non-ST elevation myocardial infarction" to ST elevation myocardial infarction (STEMI). Patients seen in the emergency department for symptoms (typically chest pain) that might or might not be caused by acute coronary syndromes are commonly included in discussions of acute coronary syndromes care, and we do so here.

Acute coronary syndromes is an emergent condition where outcome depends upon timely diagnosis and treatment. Therefore, patients with compatible symptoms are told to call 911, and ambulance protocols usually suggest transport to the emergency department of the nearest appropriately equipped hospital. In some 911 systems, ambulances are equipped to perform 12-lead EKGs and will divert STEMI ("heart attack") patients to regional centers equipped to perform emergent coronary interventions. A substantial proportion of acute coronary syndromes patients arrives via "self-transport" and do not come by ambulance.

STEMI

In the emergency department, if the EKG suggests STEMI, then a strategy to re-open the obstructed coronary artery must be undertaken immediately. Reperfusion can be achieved in two ways: via a percutaneous coronary intervention or via a "clot-dissolving" thrombolytic drug such as Tissue Plasminogen Activator. Outcomes are better with the percutaneous coronary intervention strategy; thrombolytics are only used if transport time to a percutaneous coronary intervention capable hospital would be prohibitive. However treated, STEMI patients are admitted to a coronary care unit, where they are treated and monitored for life-threatening complications.

Acute coronary syndromes other than STEMI

If STEMI is excluded then patients are typically admitted either to a short-stay observation unit or an inpatient telemetry unit, depending on the probability that symptoms are caused by myocardial ischemia and on the risk of life-threatening complications. Acute coronary syndromes are diagnosed or excluded on the basis of EKGs, laboratory tests, and sometimes "non-invasive" evaluation of the coronary arteries. If acute coronary syndromes are diagnosed (or if it is felt to be probable), then the next step is diagnostic cardiac catheterization (also called coronary angiography). Patients found on catheterization to have an unstable coronary artery lesion usually will go on to an interventional procedure (that is, the placement of an intra-coronary stent).

Post-acute care (all acute coronary syndromes patients)

Patients found to have other coronary artery lesions (besides the one that caused acute coronary syndromes) may be referred for elective PCI or coronary artery bypass graft surgery. Whether or not that occurs, they are then typically followed at regular intervals in an outpatient cardiology clinic. Follow-up focuses on monitoring for symptoms of complications, medications to prevent blood clots in the coronary arteries, and on lowering the risk (through medications and behavioral interventions) of future acute coronary syndromes episodes. Once symptoms stabilize, a patient may be referred back to primary care for ongoing care.

Survey Results

A total of 98 respondents answered one or more questions in this module, which contained questions about the frequency of delays, proposed solutions for improving delays, factors impacting provider and system efficiency, and questions about workforce recruitment and retention.

Delays

Respondents were asked about delays at five care junctures: (1) Emergency department assessment of patients with "possible acute coronary syndromes," (2) Inpatient assessment of patients with "possible acute coronary syndromes," (3) Patients with STEMI, (4) Revascularization for inpatients who are symptomatically stable but who have acute coronary lesions, and (5) Post-discharge care. Categories were further subdivided into specific services (for example, cardiology consultation, echocardiography). Specifically, we asked respondents to *"Consider delays which might put a patient at risk for adverse outcomes, slow resolution of symptoms, or which are not compliant with VA/DoD guidelines."*

For the services with the greatest frequency of delay (that is, the highest percentage of patients experiencing a delay), participants were asked to think of the most effective way to reduce the number of delays, and to rate the importance of various elements of a solution (for example, create additional space, increase the number of licensed independent practitioners).

Juncture 1: Emergency department assessment

The first set of questions focused on the emergency department assessment of patients with symptoms that might suggest acute coronary syndromes. Responses are detailed in Table I-113. We asked about delays in the following services or transitions: Completing the emergency department evaluation, transferring from the emergency department to a short-stay observation unit, to a telemetry unit, or to a CCU bed.

For each step in the emergency department assessment, most respondents said that delays were infrequent. Transfer from the emergency department to telemetry was the step for which the most respondents (22 percent) reported that delays occurred in more than 10 percent of patients. The proportions of respondents who reported frequent delays are as follows:

Completing the emergency department evaluation	6%
Transfer from the emergency department to a short-stay observation unit (that is, "chest pain unit")	10%
Transfer from the emergency department to a telemetry bed	22%
Transfer from the emergency department to a CCU or ICU bed	12%

Respondents who identified delays in a particular service were asked to think about a solution, and to rank the importance of various "components of the proposed solution." Tables I-114 to I-117 describe the responses in detail. Responses (N = 36) to "Transfer from the emergency department to a telemetry bed" are typical:

Create additional space for patient care	86%
Increase the number of other personnel	57%
Increase the number of licensed independent practitioners	43%
Increase weekend and evening availability of services	38%
Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community	38%
Improve personnel supervision, management, or incentives	31%
Change "central office policies" that affect workflow and efficiency	26%

Acquire and/or improve availability of equipment	24%
Implement or increase the availability of telehealth services	6%

Juncture 2: Inpatients admitted to rule out acute coronary syndromes

Regarding stable inpatients admitted to "rule out" acute coronary syndromes, we asked about delays in the following: Cardiology consultation, Echocardiography, Non-invasive coronary evaluation (for example, nuclear stress testing), On-site coronary angiography, Transfer to another VA health care system for coronary angiography, and Transfer to non-VA facility for coronary angiography (fee-basis or contracted care).

Delays in cardiology consultation and on-site coronary angiography were reported to be uncommon. A slightly larger number of respondents reported delays in transfer to an outside (non-VA) facility for coronary angiography, and for echocardiography, and non-invasive coronary testing. Transfer to a different VA facility appear to be a less common event (half reported "NA") but more than one-third who answered said that frequent delays occurred. The proportions of respondents who reported frequent delays are as follows:

Cardiology consultation	6%
Echocardiography	13%
Non-invasive coronary evaluation (for example, nuclear stress testing)	19%
On-site coronary angiography	5%
Transfer to another VA health care system for coronary angiography	36%
Transfer to non-VA facility for coronary angiography (fee-basis or contracted care)	10%

Respondents who identified delays in a particular service were asked to think about a solution, and to rank the importance of various "components of the proposed solution." Tables I-119 to I-124 describe the responses in detail. Responses (N = 35) for echocardiography were typical: The most frequently cited as "critically important" or "very important" were as follows:

Increase the number of other personnel	70%
Acquire and/or improve availability of equipment	46%
Create additional space for patient care	43%
Change "central office policies" that affect workflow and efficiency	41%
Increase the number of licensed independent practitioners	37%
Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer	37%

to care in the community

Increase weekend and evening availability of services	29%
Improve personnel supervision, management, or incentives	23%
Implement or increase the availability of telehealth services	9%

Juncture 3: *Patients with ST-Segment Elevation MI*

Delays in caring for patients with STEMI are of particular concern because there is a well-documented inverse relationship between time-to-treatment and chance of death or heart damage. With regard to management of STEMI, we asked about the following: Emergency department activation of STEMI protocol, Primary PCI at an on-site catheterization laboratory, Primary percutaneous coronary intervention at a different VA facility (via transfer), Primary percutaneous coronary intervention at a non-VA facility (via transfer), and Thrombolytic therapy.

For these services, one-half to three-quarters of respondents reported that there are no delays for any patients, and 80–90 percent said that delays occurred for 10 percent of patients or fewer. Of note, a majority responded "NA" with regard to "Primary percutaneous coronary intervention at a different VA facility," and "Thrombolytic therapy," suggesting that use of these services may not be widespread. The proportions of respondents who reported frequent delays are as follows:

Emergency department activation of STEMI protocol	12%
Emergency department activation of STEMI protocol	12%
Primary percutaneous coronary intervention at an on-site catheterization laboratory	12%
Primary percutaneous coronary intervention at a different VA facility (via transfer)	19%
Primary percutaneous coronary intervention at a non-VA facility (via transfer)	13%
Thrombolytic therapy	0%

Respondents who identified delays were asked to think about a solution, and to rank the importance of various "components of the proposed solution." Tables I-125–I-129 describe the responses in detail. Responses (N = 34) for "Emergency Department Activation of STEMI protocol" were typical: The most frequently cited as "critically important" or "very important" were as follows:

Increase the number of other personnel (for example, nursing, technicians, pharmacists, clerical staff)	48%
Increase the number of other personnel (for example,	48%

---

nursing, technicians, pharmacists, clerical staff)

Increase the number of licensed independent practitioners (for example, physicians, nurse practitioners, psychologists)	44%
Create additional space for patient care (for example, more exam rooms, procedure rooms, inpatient beds)	38%
Some other solution(s)	35%
Improve personnel supervision, management, or incentives	33%
Increase weekend and evening availability of services	32%
Change "central office policies" that affect workflow and efficiency (for example, rules governing documentation or how quickly certain services must be provided)	26%
Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community	26%
Acquire and/or improve availability of equipment	18%
Implement or increase the availability of telehealth services	6%

Juncture 4: Revascularization for inpatients who are symptomatically stable but who have acute coronary lesions

We asked about delays in obtaining: On-site percutaneous coronary intervention, Transfer to another VA facility for percutaneous coronary intervention, Transfer to a non-VA facility for percutaneous coronary intervention, On-site coronary artery bypass graft surgery, Transfer to another VA facility for coronary artery bypass graft surgery, and Transfer to a non-VA facility for coronary artery bypass graft surgery.

While more than half of respondents reported infrequent delays in each of these services, a substantial minority (35–45 percent) reported more frequent delays in transfer to another VAMC for percutaneous coronary intervention, in on-site coronary artery bypass graft surgery, and transfer to another VAMC facility for coronary artery bypass graft surgery.

Reports of delays in transfer to non-VA facilities for non-emergent percutaneous coronary intervention were notably uncommon (3 percent of respondents reported that delays occur more than 10 percent of the time). The proportions of respondents who reported frequent delays are as follows:

On-site percutaneous coronary intervention	6%
Transfer to another VA facility for percutaneous coronary intervention	26%
Transfer to a non-VA facility for percutaneous coronary	3%

intervention

On-site coronary artery bypass graft surgery	48%
Transfer to another VA facility for coronary artery bypass graft surgery	46%
Transfer to a non-VA facility for coronary artery bypass graft surgery	9%

Respondents who identified delays were asked to think about a solution, and to rate the importance of various "components of the proposed solution." Tables I-131–I-136 describe the responses in detail. Notably, the number of responses for many of these steps was low, reflecting, probably the relatively small number of patients who need these services (and likely their uneven distribution throughout the VA system). Responses shown here for "coronary artery bypass graft surgery on-site" were typical: The most frequently cited as "critically important" or "very important" were as follows:

Increase the number of licensed independent practitioners	81%
Increase the number of other personnel	71%
Create additional space for patient care	43%
Increase weekend and evening availability of services	33%
Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community	33%
Acquire and/or improve availability of equipment	29%
Improve personnel supervision, management, or incentives	24%
Change "central office policies" that affect workflow and efficiency	19%
Implement or increase the availability of telehealth services	19%

Juncture 5: Transfer of acute coronary syndromes patients from an outside hospital to a VAMC

Here we asked about transfers of (symptomatically stable) Veterans either from other VAMCs without required acute coronary syndromes services, or from non-VA hospitals (Table I-137). One quarter of respondents answered "not applicable," expected since many VA systems would be transferring patients out, not in (since they lack services). Those who answered the question said that more than half of all patients who needed to be transferred to their facility experienced delays.

Transferring patients from an outside hospital to your hospital for further evaluation	44%

Respondents who identified delays were asked to think about a solution, and to rate the importance of various "components of the proposed solution." Responses were as follows (see also Table I-138). Of note, free-text comments suggest that "additional space" refers to inpatient beds, and that "some other solution" may relates to changes in organizational culture or incentive structure to encourage the acceptance of transfers. The most frequently cited as "critically important" or "very important" were as follows:

Create additional space for patient care (for example, more exam rooms, procedure rooms, inpatient beds)	87%
Increase the number of other personnel (for example, nursing, technicians, pharmacists, clerical staff)	56%
Some other solution(s)	53%
Increase the number of licensed independent practitioners (for example, physicians, nurse practitioners, psychologists)	49%
Improve personnel supervision, management, or incentives	37%
Increase weekend and evening availability of services	35%
Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community	34%
Acquire and/or improve availability of equipment	30%
Improve information technology (for example, scheduling system, electronic health record)	24%
Change "central office policies" that affect workflow and efficiency (for example, rules governing documentation or how quickly certain services must be provided)	24%

Juncture 6: Post-discharge care

With regard to care of acute coronary syndromes patients after hospital discharge, we asked about delays in the following: Follow-up cardiology clinic appointments (percutaneous coronary intervention), Non-invasive coronary evaluation (for example, nuclear stress testing) as outpatients, Initial cardiothoracic surgery appointment for patients referred for possible elective coronary artery bypass graft surgery, Pre-operative testing (for example, carotid ultrasound) for patients under consideration for elective coronary artery bypass graft surgery, Elective coronary artery bypass graft surgery, Elective (or otherwise non-emergent) angiography or percutaneous coronary intervention (Table I-139).

While a majority of respondents cited infrequent delays for each of these steps, 32 percent reported more frequent delays in elective coronary artery bypass graft surgery, 17 percent in non-invasive coronary evaluation, and 16 percent in obtaining follow-up cardiology clinic

appointments. The proportion of respondents who said that there were frequent delays at their institutions are shown:

Follow-up cardiology clinic appointments (percutaneous coronary intervention)	16%
Non-invasive coronary evaluation (for example, nuclear stress testing) as outpatients	17%
Initial cardiothoracic surgery appointment for patients referred for possible elective coronary artery bypass graft surgery	24%
Pre-operative testing (for example, carotid ultrasound) for patients under consideration for elective coronary artery bypass graft surgery	9%
Elective coronary artery bypass graft surgery	32%
Elective (or otherwise non-emergent) angiography or percutaneous coronary intervention	5%

Respondents who identified delays in services for post-discharge care were asked to think about a solution, and to rate the importance of various "components of the proposed solution." Responses are given in tables I-140 to I-145. Responses for "follow-up cardiology clinic appointment" were typical and are given below: The most frequently cited as "critically important" or "very important" were as follows:

Increase the number of licensed independent practitioners	46%
Create additional space for patient care	39%
Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community	36%
Improve personnel supervision, management, or incentives	32%
Increase the number of other personnel	32%
Increase weekend and evening availability of services	32%
Change "central office policies" that affect workflow and efficiency	25%
Acquire and/or improve availability of equipment	21%
Implement or increase the availability of telehealth services	14%

Issues Affecting Provider and System Efficiency

Respondents for the module (N = 98) were asked to describe the degree to which various issues affected provider and system efficiency. Table I-146 describes the results. The most frequently cited as "critically important" or "very important" were as follows:

Insufficient clinical/administrative support staff	66%
Providers performing administrative activities that could be performed by others	61%
Too many administrative requirements	58%
Inadequate scheduling system and policies	53%
Inadequate number of staffed inpatient beds	48%
Unnecessary documentation requirements or inefficient CPRS interface	47%
Poor patient flow management (for example, bed turnover)	34%
Providers performing clinical activities that could be performed by others	33%
Inefficient processes related to outmoded or suboptimal physical infrastructure	32%
Patient no-show rates (for outpatient follow-up)	30%
Residency training/teaching requirements	21%
Delays in obtaining specialized supplies or devices	21%

Recruitment and Retention

We asked about recruitment (Tables I-147 and I-148) and retention (Tables I-149 and I-150) for emergency physicians, cardiologists (various subspecialties), cardiothoracic surgeons, technicians, and specialized support staff. Ninety-eight percent of respondents answered the questions about recruiting and retaining staff, although a large proportion of responses were "not applicable," presumably reflecting the fact that many local systems do not have the relevant service, and possibly also that because the number of staff is small at most facilities that do have them, turnover is infrequent.

For most workforce categories, about half of the respondents (excluding "NA") said that there were recruitment difficulties. Notably, this proportion was somewhat lower for interventional cardiologists (approximately one third of respondents said that there were recruitment problems).

Substantially fewer respondents identified problems with workforce retention, as compared with recruitment. The specialist most frequently identified as having problems with both recruitment and retention were emergency physicians. It should be noted that the cardiology chief would not normally be involved in their recruiting or hiring (this is true for other personnel

types such as cardiothoracic surgeons), so the source of these perceptions might be questioned.

Non-competitive wages/ dissatisfaction with pay were by far the most common reasons cited for problems with recruitment and retention, respectively.

Free-text comments

Timeliness of STEMI care was mentioned by several respondents. At least one comment was congruent with the survey result that STEMI delays were rare, while others were not:

> We usually get our STEMIs out in time and there are no issues with local acceptance.

> If we have an STEMI after hours it will require transfer from VA to university which will take a minimum of one hour, usually more, to work out. We cannot staff a cath lab 24h, 7d a week.

> This facility provides primary PCI [percutaneous coronary intervention] only during business hours if (single) cath lab is available. Delays in inter-hospital transfer night/weekends related to recognition and facile activation of STEMI system for transfer or thrombolytics + transfer. Need to work with community to permit transmission of first-contact ECGs and administrative authority to directly route patient to closest PCI center for optimal STEMI care without cost to patient.

Timeliness of elective coronary artery bypass graft surgery and transfer of a Veteran into VA from an outside VA (or non-VA) facility were discussed. Some of these touched on organizational culture as being part of the problem.

> Delays in getting outpatient CABG [coronary artery bypass graft surgery] for patients after ACS [acute coronary syndromes] happen often, partially because the referral center surgeons insist on multiple consults by other services before seeing the patients. Also, I assume because of lack of OR [operating room]. Often patients wait for months to get outpatient CABG in the referral VA. Better communication between cardiologists at our VA and surgeons in referral VAs may help, and we can work on this on our own. VISN level cardiovascular meetings where the Chiefs of Cardiology or even all cardiologists/CT [cardiothoracic] surgeons get together to discuss pressing issues, would help A LOT.

> If Central Office could incentivize our tertiary hospitals to take our patients, incorporate customer service reviews perhaps this could change. Our community hospitals are more accepting and easier to deal with.

> Unlike the private sector there is not a "service mentality" in the transfer office. The transfer process is "unfriendly" to referring hospitals, typically they have to leave a message and get a call back, rather than having a transfer clerk consistently available to answer the phone directly. This is a problem both for referring physicians and in-house physicians trying to get a patient admitted.

Some comments alluded to a "domino effect" whereby bottlenecks at one hospital location or with one service can cause downstream problems with timely care:

> We have enough medical provider staff- we could use a LMSW [Licensed Master Social Worker] to help us move people more quickly out of the UCC [urgent care center] so we

---

can care for our ACS [acute coronary syndromes] and other urgent patients more quickly.

Our single biggest deficiency is in availability of inpatient beds. Most often, but not always, the actual shortfall is in bed staffing (that is, nursing) and not in physical beds. This results in delays in transfer of patients from the emergency department to the floor, and creates further bottlenecks for the procedure areas. For example, in the Cardiac Cath lab patients often must be held in the Recovery area for additional hours due to lack of available telemetry beds, which pulls cath lab staff from other duties and affects procedure throughput.

Radiology needs additional personnel for staffing on nights and weekends when there is often only one X-ray tech for the entire building and services the ED [emergency department], ICU, and OR [operating room] simultaneously.

Comments regarding physical space primarily focused on the availability of ICU and telemetry beds. While some respondents made the distinction between the availability of physical beds versus staffed beds, others did not.

We have physical beds but not enough nurses to take care of patients; hence the wait time for inpatient beds. We cannot transfer ACS [acute coronary syndromes] patients (to our VA for cardiac cath) easily from outside hospitals or other VAs because of the bed situation

No physical beds.

One noted that problems with bed capacity are seasonal:

Our facility has too few inpatient beds for busy months of the year, for example, flu season.

Several comments suggested that VA may not be well-suited to care for many enrollees with acute, time-sensitive conditions, by virtue of the fact that non-VA resources are often much closer:

Our options for ACS [acute coronary syndromes] are to transfer patients locally (we have a local contract with a community medical center) or to send ~200 miles to [redacted]. The patients have to wait on average 2–3 days or longer for beds at those outside facilities. The VA preference is that we send within VA rather than the community for financial reasons. However, it is inappropriate for ACS [acute coronary syndromes] patients (even stable patients, chest pain free, with mild or no troponins) to wait 48 hrs.

Patients with chest pain should be evaluated in local ER and service should be provided (paid for) by VA. If patient requires admission, cath, etc., stabilize and transfer to VA. Currently services outside VA are not paid for unless patient is service connected. This means many patients attempted to drive long distances (hours) to a VAMC for ACS [acute coronary syndromes]. The result is substantial delay in treatment of ACS.

Depending on the urgency of the situation as determined by the Urgent Care physician, the patient is transferred to a local non-VA facility or (if very stable) to a VA hospital which is 90 to 120 miles away. Because VA must pay Medicare rates if admitted to a non-VA facility, there is emphasis on trying to admit to a VA facility if deemed safe. If

our clinic could work out a financial arrangement with a local inpatient facility, it would alleviate the need to transport long distances patients with potential unstable cardiac conditions.

Would be nice to have CABG [coronary artery bypass graft] surgery done locally rather than traveling to another state to get to a VA offering this service.

One respondent suggested at least for certain facets of cardiovascular care, Veterans prefer to stay within VA:

The vast majority of Veterans do not want to take advantage of fee-basis opportunities or the Veterans Choice Act. If the services can be offered at VA, they seem committed to staying within VA. So, it would be helpful to provide the infrastructure to help them do so.

Some comments on coronary artery bypass graft surgery alluded to perceived problems with training or quality. The need for trained emergency physicians rather than primary care providers to staff ERs was also mentioned.

The department of CT [cardiothoracic] surgery requires a substantial overall. Employ energetic, eager to work, and, most importantly, competent cardiac surgeons

Retire cardiac surgeons who are no longer able to provide state of the art operations and real on-call coverage

Several comments mentioned that low salaries caused hiring difficulties; others discussed the HR process.

VA is not competitive (salary) in hiring echo technicians. This results in delays in getting inpatient echocardiograms.

In Cardiology we have a shortfall in technologist positions -- primarily cath lab techs and echo techs. Technologist pay scales fall far below market in high cost of living areas, and we have continual problems attracting and retaining these critical personnel.

Pay for interventional or other cardiologists are much lower than market pay ranges

When hiring new staff for technical positions, such as echocardiography technician, it is important to test the technical skills of the people applying. With current HR [human resources] rules, it is difficult to do (if there are no local Veterans applying, then you have to consider Veteran applicants from across the country but nobody pays them to fly out for an in-person interview.

VA has become increasingly bureaucratic and inefficient in terms of hiring; this is affecting patient safety and care, and is also very expensive as increasing numbers of patients are sent out to community.

Conclusion

This module reflects the opinions of the heads of cardiology at 98 local VA systems. They were asked about acute coronary syndromes, broadly defined, including the spectrum of illness ranging from symptoms that might be caused by myocardial ischemia to acute STEMI, and about the phases of care ranging from the initial emergency department presentation to post-hospitalization follow-up. Of the eight modules in the survey, this is the only one that focused on either an emergent condition or inpatient care.

One striking finding was that inadequate clinical (provider) personnel were rarely mentioned as a cause of inpatient delays. Problems reported were most frequently attributed to bed shortages and to organizational problems.

Delays in initial emergency department evaluation and STEMI care, the most time-sensitive and high-risk scenario covered here, were reported to be infrequent. Delays in admission of stable patients to inpatient beds were more common, attributed primarily to problems of bed capacity (whether physical beds or beds empty but unstaffed).

Remarkably, about half of respondents (excluding "NA" responses), when asked about transfers of (symptomatically stable) acute coronary syndromes patients into their facilities, said that more than 50 percent of such patients experienced clinically meaningful delays. These delays were attributed both to bed capacity problems and to a lack of incentive and a "lack of a service mentality" among certain administrators at the receiving facilities.

For the most part, these survey questions only addressed the care of those Veterans who made it to a VAMC for acute coronary syndromes care. As some respondents alluded to, however, many patients with emergent conditions such as this cannot or should not travel the extra distance to a VAMC if there is an appropriately equipped non-VA hospital that is closer. To the extent that some Veterans spend extra travel time when they should not, or are not covered when they are admitted to non-VA hospitals, problems with access to care for this patient population might not be fully reflected in this survey.

1.3.6 Appendix B.3.6 Colon Cancer

Clinical Background

Colon cancer is a leading cause of cancer and cancer-related deaths in the United States and among Veterans. It is one of the few cancers for which there is strong evidence that screening and timely follow-up to screening saves lives. Because of this, timely and appropriate screening, follow-up to screening, and treatment of patients who are diagnosed with colon cancer are areas of intense interest to VA. Moreover, the logistics of ensuring that a massive population (for example, every Veteran over 50) is screened without fail, and that a mechanism exists to enforce a zero tolerance policy for failure to follow-up on a positive screening test, would challenge even the most sophisticated health care organization. Colon cancer is therefore an ideal condition with which to illustrate the strengths and weaknesses of a variety of VA systems.

Clinical guidelines have evolved over time, and there are currently a number of screening mechanisms viewed by many to be equally effective, although they vary substantially in cost and patient convenience. Three screening mechanisms currently predominate: (1) An annual test for small amounts of blood in the stool, "fecal occult blood test," (2) A flexible sigmoidoscopy examination every five years, and (3) a screening colonoscopy examination every 10 years. Colonoscopy has the advantage of being definitive—either a cancer or precancerous lesion is seen or it is not. Fecal testing is reliable if done correctly and tests are done annually, but a substantial number of patients who do not actually have colon cancer will have a positive test and will need to go on to colonoscopy anyway. Until recently fecal occult

blood testing was done via the "guaiac test," which has been used for decades. More recently, an immunochemical test for fecal occult blood has been advocated by some as more effective, but it is more expensive.

Patients who go on to colonoscopy (either primarily or after a positive occult blood test) are biopsied if there are suspicious lesions. If a cancer diagnosis is made, then a variety of ancillary tests are performed and depending upon the stage and location, definitive treatment can include surgical excision (usually hemi-colectomy), and adjuvant chemotherapy or radiation therapy.

Survey Results

There were 109 respondents for the colon cancer module. Please see Table I-2 for details of responses and response rates.

Survey respondents were asked about three junctures in the care pathway: (1) Screening of asymptomatic patients, (2) Colonoscopy, whether for screening or other indications, and (3) Care for biopsy-proven colon cancer. Categories were further subdivided into specific services.

Juncture 1: Screening

We asked respondents to identify the screening methods were commonly used at their facilities. More than one response was allowed. In decreasing order of frequency, responses were: colonoscopy every 10 years (92 percent), fecal immunochemical testing (70 percent), standard stool guaiac (36 percent), flexible sigmoidoscopy every five years (17 percent), double contrast barium enema every five years (4 percent) (Table I-151).

Regarding availability of the fecal immunochemical test at their facility, 73 percent said that this was available at all locations, 10 percent at some but not all locations, and 17 percent said that fecal immunochemical testing was not available at their institution (Table I-152).

Respondents were asked whether CPRS clinical reminders for colon cancer are implemented. All respondents (100 percent) answering the question said that they were (Table I-153). Regarding CPRS "view alerts" for a positive fecal occult blood test: 45 percent of respondents said that a fecal occult blood test generates an alert which requires some sort of acknowledgement by the clinician, 32 percent said that it generates an alert which may be easily overlooked, and 22 percent said that positive fecal occult blood tests are automatically routed to gastroenterology (Table I-154).

Juncture 2: Colonoscopy (for screening and other indications)

Respondents were asked to estimate the average colonoscopy wait times at their facilities, for various indications. The median response was 30 days for colonoscopy for high risk patients or those with symptoms, iron deficiency anemia, or a positive fecal occult blood test, and 55 days for a screening colonoscopy for average-risk patients (Table I-155).

Delays in colonoscopy varied somewhat with the clinical indication. Frequent delays were most often reported for screening in average-risk patients (20 percent of respondents), and least often for routine follow-up to positive fecal occult blood test (Table I-156). The proportions of respondents who reported frequent delays are as follows:

Colonoscopy screening for average-risk patients	21%
Colonoscopy screening for high-risk patients (for example, strong family of colon cancer or personal history of inflammatory bowel disease)	13%
Colonoscopy for patients with positive fecal occult blood test	8%
Colonoscopy for patients with iron deficiency anemia	11%
Colonoscopy for patients with other symptoms or indications	13%

Respondents who identified delays in particular services were asked to think about a solution, and to rate the importance of various "components of the proposed solution." Table I-157 describes the responses in detail. Proportion of respondents indicting the solution to delays in colonoscopy is "critically" or "very important" are shown below for the 64 respondents:

Increase the number of licensed independent practitioners	78%
Increase the number of other personnel	67%
Create additional space for patient care	52%
Improve information technology	50%
Change "central office policies" that affect workflow and efficiency	48%
Some other solution(s)	45%
Acquire and/or improve availability of equipment	33%
Improve personnel supervision, management, or incentives	33%
Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community	25%
Increase weekend and evening availability of services	9%
Implement or increase the availability of telehealth services	3%

Juncture 3: Management of biopsy-proven colon cancer

We asked about the following services for patients already diagnosed with colon cancer: Initial evaluation by a surgeon, computerized tomography scan for staging, partial colectomy, chemotherapy, and radiation therapy (Table I-158). For each of these services, fewer than 10 respondents reported frequent delays. Possible solutions to reducing delays are therefore not discussed (Tables I-159–I-164).

Issues Affecting Provider and System Efficiency

A total of 107 respondents reported on the negative impact of a number of issues, ranging from providers performing clinical duties that could be performed by individuals with less training to administrative requirements, on provider and system efficiency (Table I-165). The following issues were most frequently identified as "a fair amount" or "a lot":

Insufficient clinical/administrative support staff	72%
Providers performing administrative activities that could be performed by others	71%
Inadequate scheduling system and policies (for example, hard to cancel or reschedule, coordinate)	65%
Patient no-show rates	64%
Unnecessary documentation requirements or inefficient CPRS interface	58%
Too many administrative requirements	56%
Providers performing clinical activities that could be performed by individuals with less training	50%
Poor patient flow management	39%
Residency training/teaching requirements	13%

Recruitment and Retention

The colon cancer section asked about specialties associated with colon cancer care such as gastroenterologists, surgeons and oncologists, as well as support staff trained in oncology. One hundred six respondents answered the recruitment and retention questions. Two-thirds reported difficulties in hiring gastroenterologists. More than 90 percent of respondents said that non-competitive wages were the major barrier (Table I-167). A distant second was burdensome human resources process to actually hire someone (26 percent).

Nearly 38 percent of respondents reported problems retaining gastroenterologists, once they were hired (Table I-168). About two-thirds said this was due to dissatisfaction with pay (Table I-169). Of those facilities reporting problems in retaining gastroenterologists, 30 percent of respondents reported dissatisfaction with management support as the next most common barrier to retention.

Free-text comments

Many respondents reported high demand for gastrointestinal services, exceeding the supply that their facility was capable of providing. In particular, the high rate of no-shows was highlighted as wasting physician time. As one respondent observed: "…physicians especially procedural physicians need nurses to follow up with patient labs, etc. and to remind and educate patients regarding their upcoming procedure appointments otherwise we have an increase in no show and cancellation rates." According to another respondent, the "biggest problem is no shows and [appointments] cancelled by patient too late to move someone in."

Some respondents mentioned the clinical reminders in VistA/CPRS to prompt physicians to order screening colonoscopies for their patients. However, several respondents felt that the documentation requirements associated with colorectal cancer screening and care were onerous and represented a significant barrier to access to care, as the workflow for a colonoscopy was similar to the workflow for surgery. They thought that physicians spent an excessive amount of time on documentation and paperwork: "A lot of time is spent by providers in administrative work, triaging consults etc. No training is given to providers to capture work load properly."

One respondent observed that the burden of paperwork was a barrier to using new purchased-care programs effectively: "The non VA care department is overwhelmed by the demand created by the various new programs. As in all cases, every effort should be made to streamline paperwork." "It takes longer to do the paper work than perform the procedure and MOST of the paper work is not value added." Others felt that the electronic health record system was too clunky and should be streamlined for optimal care, adding that the potential for "pop-up fatigue" limits the effectiveness of reminders and alerts.

Staffing was a major concern. As one respondent telegraphed: "Desperately needed—GI physicians [gastroenterologists] and endoscopy nursing personnel; badly needed—more endoscopy rooms." Multiple respondents suggested that the salaries offered by VA are too low to attract providers, who have the potential to make much more money in other care systems. "…The salary range for GI physicians [gastroenterologists] is still far lower than in the private sector. In addition, despite the increase recently in the salary caps, these increases will only be given to new hires. . . . This will mean that the seasoned staff including the department chiefs will be paid less than the freshman. "

Many respondents felt that more nurses and support staff, such as techs, were needed. "We are understaffed with respect to GI providers [gastroenterologists] and nurse/techs to run the rooms. We do not have sufficient Facilitators to schedule procedures, and we do not have enough Nurse Care Coordinators to manage the complex patients we do see." Low salaries were also cited as a barrier to adequate staffing in these areas: "Nurse hiring and retention [are] problematic due to noncompetitive grades/salaries and long HR [human resources] delays."

Respondents viewed increasing support staff as essential to increasing more physician services. The understaffing of VA administration and support personnel was seen as "a pervasive and longstanding VA problem." Several respondents also decried a shortage of providers from other specialties, such as anesthesiology, radiology, and surgical oncology. The need for more space was also frequently mentioned. "Limited number of endo [endoscopy] rooms, lack of nursing support and delays in replacing equipment are major causes for delays."

But multiple respondents commented on how the disconnect between one-size-fits-all requirements for obtaining appointments and clinical realities affected VA abilities to provide the right care at the right time. Several respondents observed that screening policies and metrics used to monitor quality of colorectal cancer care were not designed with input from clinicians and therefore do not reflect the most current evidence. As one articulated: "The central office policies need to be revised because obviously non-clinicians are making decisions

as to how quickly patients need to undergo procedures. The doubling time in the colon is ~5 years, therefore the average patient does not need to have a procedure performed within 30 days or even 60 days."

Given these clinical facts, one respondent observed that a metric rewarding providers based on how many of their patients receive a colon cancer screening within 30 days creates unnecessary pressure to get low-risk patients in quickly for screening, diverting patient and provider attention from problems that actually require urgent attention. As one respondent commented, "a patient referred for routine screening colonoscopy because it has been 10 years since his last one should have ONE YEAR--365 days--to get his procedure done sometime in that calendar year." In addition, the guidelines should be applied that "stop screening at age 75, so that 82 year-olds stop being referred for routine endoscopy and clogging the system."

Respondents did not perceive purchased care as a necessarily promising option for expanding access and had concerns about the quality of care Veterans would receive outside VA: "To me [non-VA care] is the worst of all possible solutions. Our experience has been that we end up repeating studies due to poor quality of procedures performed resulting in waste of resources and what is worst delay in diagnosis and treatment. Furthermore, community resources are limited and waiting times are even longer that at VA. While we devote to high quality procedures; we end up offering substandard care in the community due to lack of capacity to cope with the demand."

At least one respondent felt that more efficient processes within VA would have the effect of expanding access. "Space and personnel are key, but we could do many more procedures with existing structural resources if our processes were more efficient/streamlined. There are major organizational and regulatory (VA-specific) impediments to efficient care. Examples: (1) misaligned incentives between nurses/techs and physicians; (2) high nurse turnover; (3) high regulatory burden (that is, excessive time out requirements, lack of ability for non-physician consents, etc.); (4) antiquated scheduling system; (5) lack of operational data to guide process improvement. This being said, the patients in VA are MUCH more complicated than your normal community screening patient, and so non-VA benchmarks don't apply."

Conclusion

Colon cancer screening is an excellent example of the degree to which practices vary across the VA system, even for something that would seem highly amenable to a standard nationwide protocol. Variation is not necessarily a problem—there is no universal consensus regarding the best screening method—and VA probably mirrors non-VA systems in this regard. However, insofar as colonoscopy demand appears to outstrip supply at many local VA systems, an argument might be made for a system-wide shift away from screening colonoscopy for average risk patients, as some respondents have indicated that their institutions have already done.

Questions about VA mechanisms to ensure that colon cancer screening takes place and that abnormal results receive timely follow-up touch upon two functions of the CPRS clinical information system that have been identified elsewhere in this survey and in other parts of the Assessment B report as widespread sources of provider dissatisfaction: "Clinical reminders" and "View alerts." Clinical reminders were developed for tasks such as this—automatically notifying

providers when it is time (that is, calendar date) to take a specific action such as ensure colon cancer screening. But reminders have evolved into what is perceived by many to be primarily a tool for measuring compliance regarding clinical and administrative processes, detracting from rather than enhancing clinical care. Survey results demonstrate that the colon-cancer screening reminder is implemented throughout the VA system (although, interviews described in Section 3 suggest that there is variability across institutions in whether or not clinicians actually use the reminder to ensure timely screening).

We instructed respondents to consider delays with actual health impact or delays that would render care not compliant with VA/DoD guidelines. In the context of screening, a delay measured in weeks to months could not plausibly be expected to cause adverse clinical consequences. This is even true with regard to follow-up to abnormal screening tests. Survey comments indicate that many consider current VA guidelines mandating colonoscopy within a specific short time interval (and require referral to outside care if they are not met) to be without a solid clinical rationale, and an unnecessary constraint to optimal deployment of colonoscopy resources to those who need them most urgently.

Moreover, respondents pointed out that community standards for colonoscopy appointments are not better, that Veterans generally do not like to go outside the system for colonoscopies, and that colonoscopies done outside are often suboptimal in quality or pose challenges in terms of the timely availability of clinical reports that are usable within the VA system. Respondents also thought that clinicians and patients faced substantial paperwork to arrange for purchased care.

At most facilities, barriers to increasing the number of colonoscopies performed include lack of physical space, lack of support staff, and lack of physicians trained in performing them. The greatest barrier to hiring more gastroenterologists appears to be pay that is well below national standards. Policy-related inefficiencies were also mentioned: For example, a mandate that colonoscopy patients must be fully dressed when consenting for the procedure undoubtedly has well-intentioned, patient-centric origins, but in fact it causes significant disruptions to the normal workflow, and insofar as it seems like a solution in search of a problem might be an example of the kind of ponderous "mandate from above" that is damaging to employee morale.

1.3.7 Appendix B.3.7 Diabetes Mellitus (Type 2)

Clinical Background

Type 2 diabetes mellitus is a chronic disease of relative insulin deficiency resulting in abnormal blood sugar regulation and associated symptoms and sequelae. Obesity and a family history of diabetes are substantial risk factors for this disease. Type 1 diabetes mellitus is a distinct and less common disease and will not be considered further in this report. Hereafter we refer to type 2 diabetes mellitus as "diabetes."

Care setting

Diabetes is often diagnosed in a primary care setting, after routine blood work shows an elevated blood glucose level in an asymptomatic patient. It may also come to attention after a

patient complains of symptoms of high blood sugar (commonly visual or urinary changes). Once diagnosed, treatment involves education about the disease, diet modification, weight loss, and, usually, one or more medications. Primary care physicians are well-qualified to care for most diabetes patients; however, diabetes is particularly well-suited to an interdisciplinary approach (either in a diabetes specialty clinic or a team-based primary care setting). Patients with diabetes that is difficult to control or who have complications may be referred to a diabetes specialist (typically an endocrinologist).

Complications

Poorly-controlled diabetes can result in both acute and chronic sequelae. Acutely, high blood sugar can cause symptoms severe enough to necessitate hospitalization. Overmedication can result in abnormally low blood sugar, which can also lead to hospitalization. High blood sugar over a longer timeframe can lead to a variety of end-organ damage, most notably to the kidneys, the eyes, the peripheral nerves, and the cardiovascular system. Foot problems are also common, due to both peripheral vascular disease (which delays healing) and to neuropathy (which prevent patients from sensing and protecting injuries). Diabetes, not combat-related injuries, is the leading cause of amputations in the VA population (VHA Handbook 1172.03, Amputation System of Care, August 2012).

Monitoring

Patients are asked to use glucometers to frequently check blood sugar and help guide therapy. Successful blood sugar regulation over time is measured by a blood test known as "Hemoglobin A1C." Patients are screened in primary care for many complications, and often in ophthalmology for periodic retinal examinations, and podiatry for foot care.

Survey Results

There were 110 respondents for the diabetes module. Please see Table I-2 for details of responses and response rates.

Delays

Survey respondents were asked what percentage of patients experienced clinically meaningful delays in receiving (1) services to treat/manage diabetes itself, and (2) services to manage complications. For the services with the greatest frequency of delay (that is, the highest percentage of patients experiencing a delay), participants were asked to formulate a solution that could to reduce the number of these delays and to report the importance of 11 potential components (for example, creating additional space, increasing the number of licensed independent practitioners) to their solutions. We report only those solution components identified as important by more than 10 respondents.

Juncture 1: Diabetes management

We asked about delays in obtaining the following services: primary care clinic appointment for issues related to glycemic control (for example, symptoms or glucometer reading), consult with endocrinologist/diabetes specialist, nutritionist, podiatry clinic for preventative care, retinopathy screening services, retinopathy treatment services, bariatric surgery (in patients

deemed to be good candidates), and dispensing diabetes-related personal equipment such as glucometers or special footwear.

With the exception of bariatric surgery, for each service, a majority of respondents reported that 10 percent or fewer patients experienced delays. For bariatric surgery, 50 of the 110 respondents reported "not applicable," and more frequent delays were reported by half of the others (30 of 60). Of note, the interpretation of "Not Applicable" survey responses is unclear; such a response could indicate Veterans' lack of need for a service, or conversely, complete absence of the service at the facility, despite need. In the case of bariatric surgery, we believe that "not applicable" responses are more likely to represent unmet need, rather than complete lack of demand for this service.

The services most commonly cited as associated with frequent delays were as follows: consult with endocrinologist/diabetes specialist (for example, or poor glycemic control, or for patients at high risk for complications) (27 percent), podiatry clinic (27 percent), and in-person endocrinology for poor glycemic control, or for patients at high risk for complications (21 percent) (Table I-170). The proportions of respondents who reported frequent delays are as follows:

Primary care clinic appointment for issues related to glycemic control (for example, symptoms or glucometer reading)	20%
Consult with endocrinologist/diabetes specialist (for example, or poor glycemic control, or for patients at high risk for complications)	27%
In-person care at endocrinology, for poor glycemic control, or for patients at high risk for complications	21%
Nutritionist	13%
Podiatry clinic for preventative care	27%
Retinopathy screening services	12%
Retinopathy treatment services	11%
Bariatric surgery (in patients deemed to be good candidates)	50%
Dispensing diabetes-related personal equipment such as glucometers or special footwear	6%

Respondents who identified delays in particular services were asked to think about a solution, and to rate the importance of various "components of the proposed solution." Tables I-171 to I-178 describe the responses in detail. Responses shown here (N = 44) for "consult with endocrinologist/diabetes specialist (for example, or poor glycemic control, or for patients at high risk for complications)" were typical: The most frequently cited as "critically important" or "very important" were as follows:

Acquire and/or improve availability of equipment	9%
Increase weekend and evening availability of services	14%
Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community	20%
Implement or increase the availability of tele-health services	23%
Some other solution(s)	28%
Improve personnel supervision, management, or incentives	39%
Improve information technology	43%
Change "central office policies" that affect workflow and efficiency	45%
Create additional space for patient care	48%
Increase the number of other personnel	57%
Increase the number of licensed independent practitioners (for example, physicians, nurse practitioners, psychologists)	59%

Juncture 2. Services to manage complications of diabetes

We asked about delays in services to manage the complications of diabetes. For each, a majority of respondents reported that 10 percent or fewer patients experienced delays (Table I-179). The top three services with delays of more than 10 percent of patients were as follows: evaluation and treatment by vascular surgery for non-acute limb ischemia (19 percent); evaluation and treatment by cardiology for new symptoms or refractory hyperlipidemia (18 percent); and evaluation and treatment by cardiology for new symptoms or refractory hyperlipidemia (17 percent) (Table I-179). The proportion of respondents who reported frequent delays for these services are as follows:

Evaluation and treatment by vascular surgery for non-acute limb ischemia	19%
Evaluation and treatment by podiatry for new foot lesions	12%
Evaluation and treatment by nephrology for worsening renal function	18%
Evaluation and treatment by cardiology for new symptoms or refractory hyperlipidemia	14%
Evaluation and treatment by podiatry for new foot lesions	17%

Respondents who identified delays in particular services were asked to think about a solution, and to rate the importance of various "components of the proposed solution." Tables I-180 to I-184 describe the responses in detail. Responses shown here (N = 36) for "evaluation and treatment by vascular surgery for non-acute limb ischemia" were typical:

Increase the number of licensed independent practitioners	75%
Increase the number of other personnel	58%
Create additional space for patient care	42%
Acquire and/or improve availability of equipment	39%
Improve information technology	34%
Improve personnel supervision, management, or incentives	33%
Change "central office policies" that affect workflow and efficiency	31%
Some other solution(s)	31%
Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community	26%
Implement or increase the availability of telehealth services	17%
Increase weekend and evening availability of services	14%

Issues Affecting Provider and System Efficiency

Respondents for the diabetes module (N = 110) were asked to rate the importance of nine potential negative impacts to efficiency. Responses were given on a four-point Likert scale (none, a little, a fair amount, a lot; also "not applicable"). We ranked the items according to the number of respondents who said that they had "a fair amount" or "a lot" of impact (Table I-185):

Providers performing administrative activities that could be performed by others	80%
Too many administrative requirements	76%
Inadequate scheduling system and policies	73%
Insufficient clinical/administrative support staff	70%
Unnecessary documentation requirements or inefficient CPRS interface	65%
Providers performing clinical activities that could be performed by individuals with less training	62%
Patient no-show rates	45%

Poor patient flow management	43%
Residency training/teaching requirements	14%

Recruitment and Retention

Specialties examined in this module included primary care staff involved in coordinating care, as well as specialties particular to diabetes, endocrinology, podiatry, nutrition counseling and ophthalmology. 110 of the facilities answered the questions relating to whether there were problems recruiting or retaining these staff categories. Only those facilities responding "yes" to a given category were asked about barriers to retention or recruitment.

Similar to the general (Chief of Staff) module, a high proportion of facilities reported difficulty in recruiting primary care physicians (72 percent) (Table I-186). Non-physician primary care staff categories were also problematic with 43 percent reporting difficulties. While nearly a third of facilities reported trouble hiring endocrinologists, 35 percent of facilities reported this position as not applicable. Non-competitive wages were the most commonly cited reason for recruitment problems for both primary care and the non-physician primary care staff (60 and 70 percent, respectively) (Table I-187). The second most common reason for both was the human resources process at 43 and 47 percent, respectively.

Nearly two thirds of facilities also reported difficulties in retaining primary care physicians, followed closely by 31 percent of facilities reporting problems retaining non-physicians primary care providers (Table I-188). For primary care physician and non-physician staff, the most common retention problem was the dissatisfaction with workload (45 and 41 percent, respectively), followed closely by burnout (49 and 38, respectively) (Table I-189).

Free-text comments

Comments from respondents augment the detailed survey results regarding delays in diabetes care.

Multiple respondents reported that the inability to prioritize patients led to delays in care, relative to when it was truly needed, for patients with relatively urgent problems. For example, mandated limits on time from appointment request to delivery of care prevented VA staff from exercising clinical judgment, paradoxically worsening delays for patients with truly urgent needs because patients with less urgent conditions were scheduled first, to stay within the rigid benchmark: "Blanket mandates for timing between consultation request placement and delivery of care cause inefficient utilization of limited resources."

Many respondents viewed the scheduling software as antiquated, inflexible, and error prone, exacerbating delays; they believed that inadequately trained scheduling staff precluded intelligent patient scheduling based on true clinical urgency. Policies penalizing canceled and rescheduled appointments further impeded priority-driven scheduling. For example, one respondent commented: "…clinic staff have to spend additional time working around scrubbing of bookings to protect access." In another example, podiatry clinics were judged to have lower standards for urgent access, forcing patients with urgent podiatric problems to receive care elsewhere.

Inadequate staffing, for both clinical and support responsibilities, figured prominently in

---

respondent comments. Many reported that due to insufficient support staff, burdensome administrative mandates, and a flood of EHR prompts, clinicians were required to perform tasks well below their levels of training. For example, "Many clinical reminders can and should be done by ancillary staff, yet are left to providers to complete and this takes time away from patient care responsibilities." Insufficient support staff made it difficult to offload work such as chronic disease management from clinicians.

In addition, respondents noted clinician shortages in endocrinology, podiatry, nephrology, ophthalmology, wound and vascular care, and nutrition and bariatric services. Multiple respondents noted that VA salaries in these specialties were lower than non-VA salaries, making it difficult to recruit into VA. Cumbersome hiring rules and regulations were thought to worsen the problem.

Telehealth was cited as a potential way to expand clinical resources. For example: "If teleretinal imaging could be done as screening every year, it might free up time of the eye providers to see those that truly need an exam." "Additional access to tele-endocrinology services could be made possible with the addition of 1-2 tele-endocrinologists." No-shows were noted by multiple respondents as a barrier to access since these consumed appointment slots. But respondents thought "Telehealth services will certainly improve no show rates and is excellent for diabetes follow-up appointments."

Some respondents observed that even when it was available, purchased care was not necessarily an adequate substitute for within-VA care because poor communication between VA and non-VA providers hampered care coordination. For example, "Out-sourcing endocrine care tends to fragment care, since communication is less good." Some respondents suggested telehealth as a way to make care transitions seamless.

Finally, and very interestingly, a small number of respondents reported that quality measures resulted in delays. For example, licensed practical nurses checking blood pressure multiple times to meet a quality performance measure created delays within the primary care clinic and tied up staff who could otherwise be assisting more patients.

Many individuals summarized a range of frustrations and the multifactorial nature of problems:

> Primary Care panel sizes are too large, operating at 100 percent of capacity, which increases risk of burnout and leads to lapses in care… There needs to be stronger link between what program offices require and the funding to the field. Currently the requirements of program offices are often unfunded mandates. Program offices need to understand that incremental change ultimately requires re-thinking staffing models or the field dies a death of a thousand cuts. In our location night and weekend hours are not desired by our patients and requiring continuing these activities is wasteful. Some of the changes coming in the IT and EHR [electronic health record] world like active notes could be game changer. Tele health has been oversold as a potential solution. Smaller panel sizes and more PACT [Patient Aligned Care Teams] imply more space. The current space planning process is so lengthy that space is often too small by the time it is opened.

> Safe and quality diabetes care CANNOT be delivered to all Veterans who need it in the current care delivery paradigm. We have strong data that system based diabetes case

management models work well but facilities must provide sufficient qualified personnel (diabetes case managers) AND support medical directors (e.g., MD, DO) to oversee these programs. The type of effort involved in effective/safe diabetes care that is well established to be time-intensive MUST be able to be captured and recognized as effort (beyond current RVU based methods) . the number of Primary care MDs are also currently insufficient to provide diabetes care to patients who are not high-risk (that diabetes case management and endocrinologist see).

I am taking this survey at 6AM on a Sunday. We don't need more supervision and incentives…Just remove some barriers to efficiency, provide the type of support mentioned (space for one on one teaching and for groups, excellent diabetes educators, and a facile EHR) FYI it take roughly 30 percent of the time allotted for office visit to document, place orders etc. there's room for improvement when our highest paid personnel are doing this....

Conclusions

Diabetes is a common but serious chronic illness that is managed primarily by primary care providers, but which can benefit from an interdisciplinary approach to care. It is itself a leading cause of morbidity and mortality among Veterans and therefore access to high quality and timely care is of paramount importance.

The survey suggests that frequent delays in obtaining a primary care clinic appointment for glycemic control problems occur at approximately one in five local VA systems. This is a higher number than that obtained from a similar question posed to the chiefs of staff regarding access to primary care follow-up in general (only 7 percent of those respondents noted frequent delays). The discrepancy might be explained because the observers are different or because there is some imprecision in how the question might be interpreted.

Conceptually, there is not a clear definition of what constitutes optimal access to care for a diabetes patient, and therefore what a delay really is. We know it primarily when we do not see it—as stated in one comment, "planned 6 month appointments with the PCP [primary care physician] is not adequate for good control of diabetes mellitus." But what is? Arguably, the measure might have something to do with whether a provider is able to schedule follow-up appointments as frequently as he/she deems necessary. The survey does not tell us whether this is so. An alternative to a timeliness-focused process measure might be to consider objective measures such as hemoglobin A1C as a marker of whether access to quality care was truly adequate.

Reported delays in access to endocrinologists or other diabetes specialists were slightly more widespread, as were delays to podiatry appointments. Bariatric surgery was a notable outlier. Half the respondents marked "NA" and half of those who didn't reported frequent delays.

With the caveat that free-text comments come from a selected sample of respondents, in aggregate they paint a striking picture of frustration—partly because resources are inadequate, but perhaps more strikingly, it appears that many of these chiefs of service (and presumably those under them) appear to believe that they are doing battle against the institution they work for, rather than working with them, to offer Veterans the care they believe they need.

1.3.8 Appendix B.3.8 Gynecologic Surgery

Clinical Background

Women are a rapidly increasing and important component of the U.S. armed services. While female Veterans make up approximately 8 percent (1.8 million) of the current Veteran population, their numbers are expected to grow, as the number of women entering the active duty military force and the National Guard and Reserves continues to increase. The number of women Veterans who use services provided by the VHA has doubled in the past 10 years, growing from 160,000 in 2000 to more than 337,000 in 2011; their median age of 48 years is significantly younger than their male counterparts (median age 63 years).

With their growing numbers has come an increased emphasis on the provision of female-specific health care. Female Veterans have unique and complex health care needs, ranging from care for obstetric and gynecologic conditions to mental health and chronic pain/musculoskeletal conditions. In this subsection, we focus on access to care for conditions requiring gynecologic surgery, such as gynecologic cancers, fibroids, endometriosis, ectopic pregnancies, and stress urinary incontinence. While some of these conditions could be handled by a general surgeon, the intent was to focus on conditions for which the standard of care would include surgical treatment by a gynecologist, whether in the inpatient or outpatient setting. In the survey, we focus on access to an initial surgical evaluation by a gynecologist, and then access to the surgery itself, regardless of whether it was inpatient or outpatient surgery.

Survey Results

A total of 107 respondents answered one or more questions in this module, which contained questions about the frequency of delays and proposed solutions for addressing them. Questions also touched on factors impacting provider and system efficiency, and workforce recruitment and retention.

Delays

Respondents were asked about delays at two care junctures: (1) Scheduling an initial surgical evaluation with a gynecologist, and (2) Receiving the surgical procedure.

Respondents who reported delays were asked to formulate a solution to the delay, and to rate the importance of 11 potential components (for example, creating additional space, increasing the number of licensed independent practitioners) of their solutions.

Juncture 1: Initial surgical evaluation

Reported delays related to scheduling an initial surgical evaluation with a gynecologist are detailed in Table I-190. Most respondents said that delays for this service were infrequent, and about half said that no patient experienced delays, regardless of the setting. The most notable reported delays (20 percent) were when a patient needed to be referred to a gynecologist outside the respondent's local health care system for an initial surgical evaluation (specific services and proportion of respondents who mentioned frequent delays in that service are given below):

VA Gynecologist located at this administrative parent (local health care system)	9%
VA Gynecologist located at another VA health care system	20%
Community Gynecologist (fee-basis or contracted care)	17%

Respondents who identified that there were clinically meaningful delays in scheduling patients for an initial surgical evaluation (N = 22) were asked to think about a solution, and to rate the importance of various components of the proposed solution. Tables I-191–I-193 describe the responses in detail. Responses shown here for "VA gynecologist located at this administrative parent (local health care system) were typical, and show that increasing the number of providers/personnel and space for patient care were the most commonly suggested components of the solution to the delay problems (percentages are given as the proportion of respondents who rated the element "critically important" or "very important").

Increase the number of licensed independent practitioners	73%
Increase the number of other personnel	73%
Create additional space for patient care	59%
Acquire and/or improve availability of equipment. Describe the type(s) of equipment needed in the comments box below	55%
Improve personnel supervision, management, or incentives	50%
Change "central office policies" that affect workflow and efficiency	45%
Improve information technology	41%
Some other solution(s)	41%
Implement or increase the availability of telehealth services	27%
Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community	27%
Increase weekend and evening availability of services	5%

Juncture 2: Surgical procedure

The survey asked separately about delays in undergoing the surgical procedure. Responses to this question produced similar patterns (Tables I-194 to I-197). The proportions of respondents who said that there were frequent delays at their institutions are shown:

At this local VA health care system	12%

At another local VA health care system	23%
In the community using fee-basis or contracted care	15%

Issues Affecting Provider and System Efficiency

Respondents were asked to describe the degree to which various issues affected provider and system efficiency. Table I-198 describes the results. The most frequently cited issues were as follows:

Insufficient clinical/administrative support staff	45%
Providers performing administrative activities that could be performed by others	43%
Patient no-show rates	43%
Inadequate scheduling system and policies (for example, hard to cancel or reschedule, coordinate)	40%
Unnecessary documentation requirements or inefficient CPRS interface	39%
Too many administrative requirements (Initiatives/Policies/Programs)	39%
Providers performing clinical activities that could be performed by individuals with less training	29%
Poor patient flow management (room/bed turnover, appointments)	20%
Residency training/teaching requirements	12%

Recruitment and Retention

The facility survey also contained questions that focused on issues related to hiring and retaining gynecologists. There were 106 facilities responded to questions about problems recruiting/retaining gynecologists. Approximately 28 percent reported problems recruiting gynecologists. The top two recruiting barriers were non-competitive wages and the length of the human resources process (83 percent for both).

Only 12 percent of respondents reported problems retaining gynecologists. Among the few facilities reporting difficulties, the main reasons cited were dissatisfaction with pay and inadequate equipment/resources/space (62 percent, both) (Table I-199 to I-202).

Free-text comments

Respondents for the gynecologic surgery module represent a service that is in much lower demand than many of the other conditions we surveyed, even though demand is growing in some areas of the country. As a result, the gynecology programs rely more heavily on non-VA or purchased care compared with other programs. In-house gynecology services are often only provided for a few days per week or month. The limited offering of clinic time has obvious

ramifications for Veteran access, which many of the respondents noted in the free text citations.

Barriers such as not enough provider time or space for existing staff to work in were frequently mentioned. Several respondents mentioned limited access to the operating room as a key barrier: "Because GYN [gynecology] is a small clinical service competing for [operating room] time with much larger and more politically powerful services this is not always seen as important (though I must add that immediate supervisors and Surgery admin staff are very responsive and try their best)." Burdensome administrative requirements and a lack of adequately trained support staff were also often mentioned in the free-text responses. For example, one respondent noted: "Administratively, too often we are assigned duties without adequate data reports, and without staff well versed in how to generate that data. So we spend gobs of time figuring out how to get the data we need."

Many respondents noted difficulties in referring patients to gynecologic surgery services in the community, which also hampers Veteran access. Several respondents noted that, at best, the processes to refer Veterans out to the community, pay claims, and then receive the medical records back in-house are inefficient: "Our business office cannot process our non-VA care requests fast enough and do a miserable job at bill paying. Female [Veterans] need to fend off collection agencies and fight damaged credit due to non-payment of maternity care bills." Many respondents noted that TriWest and Health Net do not schedule appointments quickly enough. (TriWest and Health Net are the two contractors operating the provider network system for some of the non-VA care requests.) Respondents also noted that the staff within these organizations may not be sufficiently trained to provide the community facilities with enough background on the Veteran so the community facility may not schedule them in an appropriate time frame for the given medical problem.

Conclusion

Although the absolute number of female Veterans who require surgical treatment by a gynecologist is low, demand is likely to increase as more women are discharged from military service and seek care at VA. Our results suggest that when gynecologic surgery services are available at a local VA health care system, fewer than 10 percent of respondents report clinically meaningful delays in patient access to an initial surgical evaluation. However, when patients need to go outside the local health care system, either to the community or to another administrative parent, the frequency of reported delays rises to 17 percent and 20 percent respectively. Similar results are seen for access to surgical treatment. The lack of administrative support staff, which results in providers needing to do administrative tasks, was seen by nearly half of the respondents as an important cause of provider and system inefficiency. Low wages were the most frequent response for problems in both hiring and retaining gynecologists on VA staff.

1.4 Appendix B.4 Discussion

The 2015 Survey of VA Resources and Capabilities provides a unique and comprehensive, though subjective, assessment of VA's capacity to provide timely and accessible care to

Veterans. The survey provides VA employee perspectives on the strengths and weaknesses of their organization. Survey respondents—VA chiefs of staff and clinical chiefs of service—generally have considerable experience working in the VA system and managing VA medical facilities and health care employees. Thus, their assessments, though by their nature subjective, are informed by direct and diverse experiences in providing health care to Veterans.

The survey's eight modules were distributed to eight different clinical leaders at each institution. Therefore, an additional strength of the results viewed in aggregate is that many of the same questions (with slight context-specific modification) were answered independently by different people in charge of different clinical domains. Therefore, to the extent that common themes emerge, this is likely to reflect broader experiences and not those specific to a single clinical department.

A primary feature of the survey was asking respondents to estimate the proportion of patients who were delayed in receiving services or undergoing care transitions. We specified that we were interested in "clinically meaningful delays," and at each point such a question appeared, we specified the following: "Consider delays which might put a patient at risk for adverse outcomes, slow resolution of symptoms, or which are not compliant with VA/DoD guidelines." Several respondents noted that where delays did occur, they did not believe they had any adverse clinical consequences. However, respondents may have different perspectives on when delays lead to adverse clinical consequences or are not compliant with guidelines. As noted in Section 6, in many clinical areas, there is a thin evidence base on the association between wait times and adverse outcomes.

A strong common theme in responses across modules was that VA guidelines are overly prescriptive, enforcing timeliness standards that are not met in the private sector, that do not have an evidence-based rationale, and that constrain providers in a way that diminishes their capacity to divert resources to the patients who need them most urgently. Moreover, the essence of many comments, remarkably consistent across disciplines, is that such constraints, and more generally the feeling that inefficiencies are imposed from a VA Central Office lacking real-world clinical sensibilities, are demoralizing. Demoralized clinicians might be expected to contribute to broader problems with organizational culture that are described in each set of responses.

It is also possible that diverting the focus of a clinical encounter away from patient-driven concerns and toward overly prescriptive VA guidelines may have an adverse impact on patient care. Likewise, insofar as resources are limited, diverting resources away from clinical activities and toward clerical duties, mandatory online trainings, elaborate screening questionnaires, and even questionnaires such as the 2015 Survey of VA Resources and Capabilities (as one respondent ironically pointed out) could limit the total amount of care that can be provided and thereby diminish access in one way or another. Similar concerns have been raised in private-sector health care delivery organizations.

When assessing delays in access to care, it is easy to focus on delays in receiving a discrete one-time service or an initial appointment to a clinic, if for no other reason than it is measurable as the elapsed time between when care is requested by a patient or provider and the time when the service occurs. But an unintended consequence of such a focus—highlighted in responses

---

to both PTSD and TBI with regard to mental health professionals and particularly mental health subspecialists (for example, cognitive behavioral therapists and neuropsychiatrists)—is to create a focus on initial assessment rather than ongoing treatment. For mental health conditions, some PTSD and TBI module respondents reported that they lack the ability to schedule repeated follow-up visits on a sufficiently regular basis to develop a therapeutic relationship.

Our respondents were ambivalent about the contributions of telehealth. Some saw it as increasing the reach of VA providers in circumstances when patients could not readily come to the VA health center. But others questioned its acceptance by patients and expressed skepticism regarding potential productivity gains.

When asked about purchased care, respondents generally reflected some degree of support for increased use of it in certain situations. However, many respondents also expressed concern about the quality of care for VA patients using purchased care. Multiple respondents felt that some Veterans, whether being treated for service-connected disabilities or not, feel that VA is their medical home. In addition, respondents viewed it as likely that some VA patients have had bad experiences with unexpected bills generated outside the VA system.

Respondents reported concern that purchased care currently presents a substantial challenge for information transfer. For some conditions (for example, coronary artery bypass graft surgery) there may be fewer points of coordination between VA and non-VA providers. However, if a VA patient uses purchased care for an ultrasound or a colonoscopy and the results are not available, then the value of that service is diminished if the results are not as quickly or completely accessible as they would be in-house, if the quality is not as good, or if, as is reportedly sometimes true, the service takes longer to get outside the system than it would within it. Furthermore, some respondents (for TBI in particular) indicated that in-house capacity constraints are often paralleled by non-VA capacity constraints in the same region for the same services.

Coronary artery bypass graft surgery was one service where delays were reported to be frequent and where several respondents made a strong case for increased use of purchased care. The rationale is that there are problems with access not only in terms of time, but also in terms of geography. Several respondents noted that because regionalization is a necessity (since cardiothoracic surgeons must do a minimum number of annual cases to maintain proficiency), some patients must travel long distances for this operation. There was also a suggestion (by more than one respondent) that some cardiothoracic surgeons performing coronary artery bypass graft surgery at VA did not meet acceptable proficiency and training standards. One of the respondents therefore posed the following question: Should a patient travel 200 miles away from home to have major open heart surgery performed by a surgeon that may not have state-of-the art skills, when closer alternatives will allow a recovery closer to home and family and possibly offer a better chance at a good outcome?

In a related vein, responses to the acute coronary syndromes module, unique in that it covered inpatient care and treatment for an emergent condition, raised similar questions about how access should be defined. For acute inpatient care, it is tempting to consider timeliness from the time that a patient hits the door of the emergency department, but in fact, the biggest

problems with access might be seen in patients who never receive care at all. Nor is it clear that they should, since the "standard of care" in terms of instructing patients with acute coronary syndromes-type symptoms is to go to the nearest emergency department. But if the nearest emergency department is not at a VA facility, then a patient will either end up outside the system with a bill that might not be covered by VA, or may have taken an unnecessary risk by travelling too far. This conundrum was discussed by at least two respondents. Moreover, while a middle-ground solution might be that a patient should go to the nearest emergency department and then transfer to a VAMC when stable, the greatest delays described, among all questions in the survey, were in regard to transfer of stable acute coronary syndromes patients in to VA for further management. This, respondents described, is a function both of limited bed availability, and an institutional culture that lacks a "service mentality."

One service chief posed a provocative alternative that seems consistent with the views of many other respondents: "Space and personnel are key, but we could do many more procedures with existing structural resources if our processes were more efficient/streamlined. There are major organizational and regulatory (VA-specific) impediments to efficient care."

Assessment B (Health Care Capabilities) Appendices E-I

September 1, 2015

This page intentionally left blank.

Preface

Congress enacted and President Obama signed into law the Veterans Access, Choice, and Accountability Act of 2014 (Public Law 113-146) ("Veterans Choice Act"), as amended by the Department of Veterans Affairs (VA) Expiring Authorities Act of 2014 (Public Law 113-175), to improve access to timely, high-quality health care for Veterans. Under "Title II – Health Care Administrative Matters," Section 201 calls for an Independent Assessment of 12 areas of VA's health care delivery systems and management processes.

VA engaged the Institute of Medicine of the National Academies to prepare an assessment of access standards and engaged the Centers for Medicare & Medicaid Services (CMS) Alliance to Modernize Healthcare (CAMH)[1] to serve as the program integrator and as primary developer of the remaining 11 Veterans Choice Act independent assessments. CAMH subcontracted with Grant Thornton, McKinsey & Company, and the RAND Corporation to conduct 10 independent assessments as specified in Section 201, with MITRE conducting the 11th assessment. Drawing on the results of the 12 assessments, CAMH also produced the Integrated Report in this volume, which contains key findings and recommendations. CAMH is furnishing the complete set of reports to the Secretary of Veterans Affairs, the Committee on Veterans' Affairs of the Senate, the Committee on Veterans' Affairs of the House of Representatives, and the Commission on Care.

The research addressed in this report was conducted by the RAND Corporation, under a subcontract with The MITRE Corporation.

Appendix E Summary of Qualitative Interview Results

This appendix provides a descriptive summary of the results from the expert and facility-level interviews conducted as part of Assessment B. The methods used are described in Chapter Two and Appendix A. Below, we present a descriptive summary of the qualitative interview data for the following domains:

Fiscal and economic resources
Workforce and human resources
Physical infrastructure resources
Information resources
Access/quality
Policy options

Appendix E.1 Results by Domain

Appendix E.1.1 Fiscal and Economic Resources

In 11 qualitative interviews with VAMC leadership (Directors and Associate Directors), the questions for the fiscal and economic resources domain focused on the effects of decentralization on the ability to allocate resources at the facility level, potential drivers of costs, and perspectives on the process for contracting to outside providers. Table E-2 at the end of this section provides the code counts by interview for each fiscal and economic resources domain code.

Budget and Budget Process

VAMC administrators were asked whether there were disconnects between the projection model, which helps develop the budget submitted to Congress, and the VERA model, which allocates money from the VISN to facilities. Most respondents indicated that the VERA distribution model worked well at efficiently allocating resources from the VISN to the VAMC based on workload and population factors at the facility level. However, respondents noted different issues with the process, including time lags in the data used in the VERA model or delays in receiving the allocation itself (four facilities) and the need to document and code accurately to reflect actual workload (two facilities). Several respondents noted that after being initially underfunded through the VERA allocation process the VISN was able to supplement their budget to bridge the gap.

> …there's actually a two-year lag between what data that methodology looks at, so there can be some significant population and/or workload shifts that take place. [F-005]

> In as far back as I can remember, we haven't gotten a budget allocation for several months into the fiscal year. Sometimes we've gone till six months into the fiscal year before we have a budget, so that's sort of a very difficult question to respond to when we're dealing with such a vacuum of information.[F-064]

> Probably about five years ago we started looking at a lot of the things that impact VERA to make sure that we were maximizing…or we were documenting correctly, we were coding correctly, we were getting everything completed within the amount of time to capture the appropriate workload. [F-061]

Respondents at five facilities also commented on whether the reallocation process was flexible enough to allow for redistribution based on changes in the patient population with some indicating the VISN had

flexibility (four facilities) while others described constraints on the ability to redistribute funds (two facilities).

> ….so, again, you may have a base allocation that's provided, but then as things change during the year there's enough flexibility in that the funds both to the facility and then within the facility can be redistributed or reallocated without really going into a VA cost accounting. [F-005]

> If the VISN holds a reserve, which they do, you're halfway through the year and you see a big shift, then some money can shift with it out of the reserve. The problem is that, again, we have created rules that all of your reserve needs to be out—all of your projects need to be obligated in the first six months of the year, all of your equipment has to be purchased in the first six months of the year, which doesn't leave you any room to have emergencies or make shifts as the environment shifts. [F-044]

Administrators at all facilities described different challenges to using allocated funds, including the time it takes to acquire new space (three facilities), mandates that have to be funded out of the allocation (three facilities), the inability to move funds between categories at the facility level (two facilities), and the burden of maintaining physical infrastructure no longer used for patient care (one facility).

Time to acquire new space

> … that we are in a huge space crunch and so right now I'm being told that you've got to bring 150-some mental health staff onboard. And in order to do that we're putting up modular buildings until once the space is available. Then we can start bringing the people onboard. But you can't recruit until you have that space to accommodate that staff. So it works great when the money comes at the beginning of the fiscal year. You have time to plan well and you've got the space. But when it comes at a very restricted time or the timeline is very short it makes it a challenge. [F-084]

Mandates and special programs

> I think it's a lot of the mandates or all of the sudden something new comes from a program office that then it's thrown back at you and you have to then fund it with the money that you've been allocated from the beginning. And then it becomes a challenge. [F-084]

Inability to move funds between categories

> If we're spending more than it was originally budgeted in a certain category, we would need to go to our network to try to get approval to move money from one account to another. Generally we're not allowed to do that. [F-064]

> In addition is all the special funding that comes out of central office. So they decide what your needs are, they decide that you need 15 mental health providers and say, "Here you go. You can only spend this money on this." And then at the end of the year if you didn't necessarily need that, you can't use the money for different operations somewhere else. You would have to return that money to central office. [F-041]

Need to maintain physical infrastructure

> The problem is that for this facility here, it's a pretty significant bill that we pay every year that the funding methodology does not compensate for, to maintain these buildings and the grounds that are really no longer needed for healthcare. So that has

---

an impact on our budget, a direct impact on our budget, because we still have to manage these buildings and maintain them and the infrastructure to support them, but it generates no revenue for us in workload or anything else. And so that puts us—is a handicap right away in our budget methodology. [F-024]

Respondents at most facilities offered suggestions for improving the allocation process, including using a long-term budgeting process, allowing flexibility to move funds between categories at the facility level, and developing a performance-based model that goes beyond assessing prior workload.

VA has been attempting to go more toward a planning-based or performance-based model that would, again, truly based on—and this would be more at the local or the market level—based on needs of the specific, unique population of the area and based on the capacity, not only in the VA but the capacity in the community resources, that those kind of be reconciled, to make sure that optimal treatment is given and services provided based on what is available in the budget. [F-005]

In terms of overall adequacy of the budget allocated through the VERA process, there was variation across facilities, with some starting out positively while others begin the fiscal year in a deficit. One administrator noted that the overall budget was constrained by centralized programs that required a lot of resources, while another commented that these centralized programs did not appear to be coordinated by the central office.

Currently and for the last several years has been a positive VERA in terms of—that our allocation is, at the onset, sufficient to take care of our operational needs. That is not the case with all of the medical centers in our network. Some of them start with a projected deficit with regard to what they've been allocated. [F-064]

Of course, we never have enough to go around everywhere. Actually this year we faced a pretty substantial projected budget deficit. So we had to take some steps locally to deal with that and delayed some funding of programs, that type of thing, to make sure we were going to close the year out—and we'll do fine now. [F-024]

For instance, a lot of money comes out of the budget to support centralized programs both at the big VA level and at the VHA level and there's been tremendous growth in those programs that take money – there's only a fixed pot of money – that take money out – well, so there's less to be distributed to the field to provide the care to the Veterans. [F-044]

then you have a lot of mandates, either…and from different program offices, that I believe in the sense throughout the organization is that a lot of these mandates that come from the different program offices are not coordinated through the leadership at central office. [F-084]

Hiring

Administrators at four facilities noted that there was discretion at the facility level to hire physicians, nurses, and other clinical staff as necessary to meet local demand.

We do have to ability to do that locally. That's a local decision. Again, it is based on funding availability. And so the way we do it here, we have a physician management committee that looks at all new positions and recurring positions that have come open. And they go through the process of looking at that and looking at our budget projections

and our supportable FTE levels, and then make recommendations to the director on which positions to fill or not fill. [F-024]

Purchasing

Respondents were asked about purchasing drugs and medical supplies. Generally, facilities had fairly good processes in place to meet their needs. One respondent, however, in describing the purchasing process in more detail, emphasized the layers of tasks and processes that needed to be accomplished despite centralized contracting.

> We have the national contracts and the idea was originally that [those] would streamline the process, but since they don't negotiate best pricing, that still has to be done at the regional or local level which then adds a substantial amount of lead time to the average procurement. So anything over $3,000, over the micropurchase threshold, still has to go through a fairly labor intensive and time consuming procurement process to validate [that] we're getting best value. That has a major impact on your efficient supply distribution methodologies because then you have to build that procurement process or that best value analysis process into your lead time. And so when you're trying to go to a just-in-time model of supply support at your facilities so you're efficiently using space and people and everything else, that is counter to that. That causes major, major problems. [F-024]

Contracting to External Providers

Respondents were asked about how they developed budgets for and made the decision to refer to non-VA care. Several themes emerged about the infrastructure and processes for non-VA care.

Developing budgets for non-VA care

Respondents described budgeting for non-VA care as part of the annual budgeting process. Like other parts of the budget, services or segments of the facility are asked to estimate needs for the coming year and provide justification. Given the somewhat unpredictable nature of demand for non-VA services, and the variability in staffing and other resources that might affect the site's ability to provide care in-house, respondents freely admitted that budgeting was only an "educated guess" at what they might need. When demand for non-VA care outstrips the budget, as was commonly true in one site, facilities need to go back to the VISN for more funds.

> We do our budget call, each individual service, medical service, or surgery, or whatever else, they would analyze what they feel they need for fee or non-VA care, so that would be part of the annual budget call. They would try to project what that requirement would be and then of course adjustments are made throughout the year based on actual patient needs. But that is part of the budget call that we do annually with all the services. And it's an educated guess, as things shift. [F-024]

> [To determine the budget for non-VA care] You look at what you did last year.... I say [that] kind of tongue in cheek, but really a lot of it is based upon previous experience. [F-081]

> It's a yearly cycle of being allocated a certain amount and knowing going in that you've executed more money the year before than you started out with the current year—you know you're going to have to go back in for more money. So that's the situation we face. [F-104]

Making referrals to purchased care

Respondents discussed the reasons that purchased care would be used. They emphasized that use of purchased care is based first on clinical need and what is best for the patient, not on cost.

> Those decisions are primarily based on clinical need and we try to keep it that way, that we don't—we try not to bias, if you will, the clinical decision due to funding. So if the need is there, the clinical need is there, we don't have the specialty in-house, then yeah, they are free to fee that out. That is what drives that decision, not the money. [F-024]

> You go through the third party administrator and, to be patient-friendly, you want to get that care as close to the Veteran's home as you can. For instance, if they need PT three times a week for some rehab, you don't want them coming all the way into [central city] for that. Then you'd just bring them to the medical center. You want to do that close to where they live. [F-044]

> Here at the facility level, we can take individuals on an individual basis and kind of do some research on their particular situation and make an exception to that rule [of when to refer to non-VA care]. There is a clause written for the geographical burden; however, the parameters of that decision-making process can be left for very vague interpretation. So our philosophy here is to err on the side of the Veteran and that's taking into account all the geographical barriers, the weather, the road conditions, all these factors that preclude them from being eligible and making an informed decision on that, and so that's kind of given that population of Veterans some hope. [F-005]

Respondents also described the tension between the benefits of providing care through VA and the cases in which non-VA care makes more sense for Veterans. VAMC leadership were attentive to the need to analyze the business case for either model of care, and the importance of periodically re-evaluating to identify the best solution.

> We would always prefer to have people working for us because we feel that provides better continuity of care, continuity of services, when somebody works for you, as opposed to a contract. However, sometimes a contract is better because we don't do enough of that work in-house here to justify having our own staff to do it. Case in point, mammographies. We don't have enough workload to justify the equipment and the personnel to run that equipment on a full-time basis, so we contract for that. And we have sufficient resources in the area to do that. [F-064]

> I feel like we have the authority to look into the demand for health services, and for example, one of the initiatives we're looking at now is, we don't have magnetic resonance imaging or an MRI machine. In the past, they've had contracted services for a service provider could bring a tractor trailer that has the MRI for certain days a week or a certain number of days per month, and so pay a contract fee for imaging onsite. A couple of years ago, it was decided that that was no longer what management wanted to do—instead, they were going to fee out or purchase the MRI services in the local communities. So as we take a fresh look at it, it appears that there's probably a blended approach that's more financially advantageous, so we're working on a contract to bring an MRI vehicle back to our central facility [F-104]

> When we are looking to staff or send something out on contract or bring in a fee provider or somebody on an intermittent basis, we need to look at the workload, we need to make sure that we're doing a make [or] buy analysis and do the best for the

---

facility. So if we have the space and we're bringing people in, that's great. If we've got mammography and we know that we can't take care of that and that that's over at [academic partner]; great. But that workload has to be there. That data has to be there and that analysis is done appropriately. [F-041]

Use of contracts

Respondents commented on the challenges of using established third-party administrators (TPA) to refer patients to purchased care. Some facilities described the workflow required to interface with the TPA is duplicative and onerous. Respondents also complained about the limited networks of the TPA, how this affects patients, and how it creates more work for the sites, who must find an out-of-network fee provider when the TPA "fails."

> I can no longer just fee something to the dermatologist across the street unless it's an affiliate, and we have all these other issues we have to jump through. We created this third party administrator that's going to get all the providers for us and you know it sounds great on paper except they can't perform, so I send people out on fee and I can't get the work done because unless we go through this third party administrator. They fail and then I can send it out and get the care done, but I have to prove that the third party administrator can't perform the service first and that is not good patient care and it certainly is not good for patient satisfaction. [F-044]

Choice Cards – Utilization and Challenges

Respondents reported generally low utilization of the Choice Act option for obtaining purchased care. When asked about low demand, respondents surmised that many patients preferred receiving care within VA, and that wait times for community facilities were similar or worse than at VA.

> [The low utilization of the Choice Act is] for multiple different reasons. We could actually have an appointment that's earlier than they can find in the community—which happens a lot. Most of our veterans really love the VA here. We have an inner city population, we've got a high homeless population, and they connect with the VA. They want to be here. They don't want to go outside. … In addition, … for Choice the VA has also contracted with HealthNet. So the veterans just can't go to anybody that they want to go to. They have to go to the HealthNet providers. And if they don't have a good provider network, why are they going to go on the outside? [F-041]

> I've been asking for hard numbers and I haven't been able to get much information, much data yet. So I can only give you anecdotal data that yeah, we're not seeing much use of the Choice Card. And anecdotally, we're getting, again, from patients that, you know, even though they may have to wait a little longer, they'd rather just stay with their VA provider. [F-024]

Respondents also commented on the importance of education around the Choice Act for patients and providers outside VA. Several facilities were making efforts to engage their patients and communities to raise awareness about what the Choice Act does—and does *not*—provide.

> We have had some success where community providers have reached out to us and we've provided them with the literature and the information and the mechanisms to apply for the program and so we've seen some success with that. On the flip side of that, we've also seen where the providers read the details and has opted not to become partnered under that program, so that's one thing that the Veteran has to take and

---

account for, too, is that the card in itself isn't a key to that access. It relies heavily on the community partnership, on educating both the Veteran and the provider about the Choice program, so we're doing that on a daily basis.
[F-005]

Finally, respondents discussed administrative challenges with Choice, including the 40 mile "as the crow flies" distance (which was since been changed) and the paperwork overhead for facilities.

Another piece pertaining to that 40-mile radius is that a lot of these folks live in mountainous terrain or there's a canyon separating them or big conservation reservations that they can't cross, and so under that law, "as the crow flies," and whether we agree or disagree with that, it is misleading in the fact that when a Veteran has to drive 90 miles around something, but yet if they were to be able to fly across the mountain they'd be there in 12 minutes, so those are issues that, again, are being taken up with the congressional channels to kind of rewrite that law and take into account the geographic burdens that the Veterans face in the rural communities and, again, we're not any different than other rural communities, but we are subject to quite a mountainous terrain here. [F-005]

It is a tremendous amount of work for our front line people who do scheduling to make the appointment for the Veteran within our own system, which we know he's going to keep and do this work to put him on the Choice Act, and then we have to go in and the [staff who handle fee service referrals] have to upload all of this information when it's not going to be used. [F-044]

Comments on VA bureaucracy

Throughout the discussion of the budget and contracting processes for non-VA care, respondents emphasized the challenges of contracting within VA. Whether contracting for space, supplies, services, or providers, respondents complained that the contracting process was time-consuming and non-responsive.

We have some contract CBOCs. So actually we contract for service and we do have some of our CBOCs that are VA run that are in leased space. So yes, that is a very viable program although again that is a very lengthy approval process, to go through that whole lease process as well.
[F-024]

The ability to [experience saving by purchasing non-VA care] is dependent on your ability to do the analysis, to navigate and negotiate the contracting world to actually accomplish what it is you're trying to set out, and there are sometimes obstacles, certainly in the contracting environment, that delay those kinds of projects for many months. [F-104]

There is an entire process for contracting which is extremely challenging for the medical center. We don't do it. Somebody else does it for us. And it's become—and this is a general comment from my part—it has become so convoluted and so complex over the last couple of years that it is a constant problem for us. It takes too long to be able to accomplish anything with regard to—I'm not using hyperbole—it is just an exasperating process to do anything by contracting. So that's another reason why we would rather do it in-house because we don't want to get involved with contracting. It's the way the government is. [F-064]

Respondents suggested reasons that the VA contracting process might be as bad as they thought it was. They believed that a remoteness from the day-to-day responsibility of patient care kept them removed from the mission of VA, and that the reporting structure—in that contracting reports to Central Office—was not conducive to engaging contracting staff in the goals of a given facility. Other respondents explained the burdensome requirements by acknowledging that VA was part of the federal government, and therefore held to a higher standard for rules and procedures, regardless of the effect on efficiency.

> Our contracting staff are in [another regional city]. I've been there. They sit in a little office park and sometimes they're there, sometimes they're not there. And there's no real incentive for them to hurry the process up…. I should not need to get on the phone or go up there and go through every single thing and say "Why is this not done? Why are you not meeting your deadline on this? Why do you not need this?" If they were under my supervision, fine, because I am generally a tough manager, I'm going to make sure that you meet your deadlines and I want you to understand the whole picture, and by delaying the process, how it's affecting patient care. But since I have no control over those individuals, I sit there and I have my hands tied behind my back a lot of the time. [F-041]

> We are part of the federal government and there are a lot of bureaucratic processes that we're bound by law and regulation to follow. The simpler the process can be made to be, the better our veterans will benefit. So as we go to pay bills, as we enter into contracts, the magnitude of things we have to do to expend that money on behalf of our veterans sometimes slows the process and gets in the way. But we understand we're a public entity with a trust and that we have to do our due diligence to ensure that we're following the law, but that comes at an expense of the speed and volume of care we're able to translate that budget into execution, if that makes sense. [F-104]

> [Contracting is] one of those centralized programs that's beefed up its staffing by about three times, yet the service has gone through the basement, and it's all because one or two people make stupid purchasing decisions so we overreact and create this monster organization, train people – and I'm not exaggerating – one month out of the year, so they're not providing the service and then you centralize them so they are not connected to the mission or to the organization, and you just paralyze. [F-044]

Appendix E.1.2 Workforce and Human Resources

Twenty-six qualitative interviews with VAMC leadership (Associate Directors and Chiefs of Staff) and VAMC and CBOC clinical staff (providers) included questions for the workforce and human resources domain focused on capacity constraints related to the number of providers and provider productivity. Table E-3 at the end of this section provides the code counts by interview for each workforce and human resources domain code.

Provider numbers and staffing

Findings from qualitative interviews at six facilities indicate that staffing shortages are common across VA. Representatives from all facilities could identify at least two areas in which they experience shortages. (Five facilities [83 percent] are short-staffed in primary care and all facilities [100 percent] are short-staffed in at least one specialty). Shortages by specialty are largely idiosyncratic, though a few specialties were identified by multiple respondents: mental health (10), urology (5), orthopedic surgery (3), physical therapy (4), and hospitalists (3) were among the most often mentioned.

Respondents attribute struggles with staffing shortages to non-competitive salaries relative to the private sector (five facilities; 83 percent), national shortages in certain specialties (four facilities; 67 percent), geographic isolation (five facilities; 83 percent), insufficient funds to hire and provide support resources for new providers (four facilities; 67 percent), and insufficient space to add staff (e.g., exam rooms, ORs) (five facilities; 83 percent).

National shortage:

> it's not easy when now, across the board a variety of positions are being recruited by VA when, frankly, nationally we don't have enough providers for the population in this country. [F-063]

> I'd say we're not replacing physicians who leave patient care at the rate at which we need them, considering the demand has increased, both within VA and nationally with the Affordable Care Act, so that's a challenge that we will have [F-063]

Geography:

> It's also very difficult to get specialists into small clinics because they prefer to live in the city where they have potential for income and their families want to live, etc. [F-032]

> In the case of the eye care in the northern clinics, they're relatively rural areas, where we've had two instances of people accepting the position, driving out there with their spouse and then going, "Aw, no, I don't want to move there." [F-021]

> The barrier chiefly for us, aside from being an extremely rural location is that though it's extremely rural, they have an oil boom in our area. So when you have an oil boom, the price of things, everything just went up, it shot, skyrocket. So the people that are coming in for oil, which is one of the major factors that's driving the veterans in as well, because of the job opportunity in the oil field. It's making housing very expensive. So people are not able to afford it and just the cost of living's gone way high and then the amount of accommodations that you have, the demand and supply, so it's not catching up with the level of influx of people. So that is the major factor for us. [F-115]

Salary:

> When you're talking about physicians, the pay scale. You've probably heard this from other people, but when you get into dermatology, neurosurgery, those kinds of things, the top of our top our pay scale is sometimes at best half of what they would make in the private sector.

Insufficient funds to hire:

> We are constrained by budget, I guess I should say. And the ability to… If you have an increase in your demand coming in…demand for services, you have to also be able to increase your full-time equivalent to be able to address that demand. For us for several years we've been under an FTE cap which has prevented us from being able to bring in and grow the number of people that we need to grow. [F-081]

> When you talk about expanding providers, and talking about extra space, then you're also talking about hiring additional environmental management staff, you're talking about extra burden on pharmacy, lab, pathology, radiology. All of those other services also have an impact. And when we do things like our VACAA funding and so forth it's basically just considered the primary care staff, or specialty care staff. It didn't talk about the extra workload that would be generated for lab, radiology, environmental management with a new space, SCS with demand in surgeons, dental. I mean, all of these areas have an impact outside of their small area that they work. [F-094]

Insufficient space:

> Certainly just not having enough space in general is an issue. We are bringing on several new positions and providers and support staff through the VACAA funding, and I have a small group that looks at our physical space and we're doing our very best to utilize every inch that we have and we still don't have enough space to provide everything that we need to provide and to house everyone we need to house, so we're looking at leasing space.
> [F-002]

> We need to hire our providers and I can tell you right now in mental health … I have a meeting later today actually on this very issue. They're holding off on hiring a couple of RN positions and provider – I can't remember if it's a psychologist or a psychiatrist position, some of those, because they don't have the space and I'm saying, no, you need to move forward with the recruiting and we'll figure this out. [F-002]

> The last analysis that we did about six months ago show that easily they need at least two and a half to three providers in that facility. But a concern we have in their facility is that there's nowhere to expand, there's nowhere to put a third provider. And we can't move out because there's no other thing in town that we can put. [F-115]

Respondents named a few sources of benchmarks for determining staffing levels including top-down mandates from program offices, panel sizes (for primary care), and comparison to similar facilities.

> A big chunk of that really came in through mandates from our program offices. And I'm sorry, at that level I don't know the exact models that they use. But they did use some

types of algorithms or models to look at our demand, look at our volume and predict the number of providers that we needed. [F-081]

Primary care is formulaic in that we now determine capacity based on panel size and your number of providers. So we know for a nurse practitioner, they get x amount of patients. A primary care physician gets y amount of patients. [F-023]

Because we use our sister facility, XXXX, as a benchmark and we had something like 40-some FTE and radiology and they had 88. Now they see a few more patients than we do, but not that many more. So we do a business case analysis when we look at these things. [F-043]

Some respondents (50 percent) described difficulties with assessing requisite staffing, including challenges with complexity in treatment modalities (especially in mental health), a lack of ideal or recommended panel sizes in many specialties, and challenges presented by utilizing contract providers.

In terms of capacity, mental health capacity is extremely difficult to figure out. It's not like primary care, where it's by panel. Mental health capacities are many, many different models and the issue with mental health is, unlike primary care which gives you a single therapeutic modality that pretty much everybody agrees with… Mental health has many therapies that are incorporated as part of mental health, including behavioral cognitive therapy, individual psychotherapy and other mental health modalities that you are never going to have enough staff to do. [F-023]

It's not so clear in specialty care. There is no set ratio, so service chiefs for surgery, medicine, PM&R [physical medicine and rehabilitation, etc., have a combination of things that they have to use to determine the number of staff at your site and workload is one, productivity is another. [F-032]

I kind of got in trouble because I was told I had too many providers. But when we did the analysis for medicine, which is our largest service, I asked my chief of medicine to find chiefs of medicine at other 1B facilities and see how many they had, and it turns out they were doing contracts and things like that, which doesn't count in the end number. So we actually had fewer when we did it on a per thousand patients. We had fewer FTE than the other facilities that were like us had because they were doing contracts. [F-043]

As a result, staffing models only account for part of the equation, and about half of respondents (50 percent) indicated that they used additional metrics to determine if changes in staffing were necessary. Access and quality metrics (e.g.,. SPARQ and SAIL data) were used to determine if patients were waiting or quality was slipping; at that point, facilities would devise ways to acquire additional FTE.

Basically we look at all the quality data. We look at SAIL, we look at the 30, 60, 90 days, we also look at panel sizes and try to project. We look at vacancy rates that are coming up and try to make sure that we have those announcements out so that a provider will come in within a reasonable period of time. [F-041]

Well, decisions about adding would be if we're struggling to get patients seen then we're looking at all of the possibilities, are there things we can do to make them more efficient, is there a way to schedule additional clinics using either fee or part-time. [F-083]

Respondents discussed a variety of approaches to acquiring and maintaining FTE at their facilities, including hiring and retaining full time employees, using contract employees, and fee-basis and intermittent staff. All respondents (100 percent of facilities) mentioned that they were actively recruiting for vacancies at their facilities. Hiring decisions were made using a business case analysis, in many cases, and respondents from one facility (17 percent) indicated that they had established a committee to make and execute hiring decisions. For the most part, respondents indicated that they preferred to try to fill vacancies by hiring, especially in primary care where full time providers are virtually required, and that full-time employees tended to be more accountable than contractors.

> So if they do a cost benefit analysis, they've got the workload there and they show the labor mapping of where that physician is actually a map to, you know, whether they're mapped to research and actually doing research, we can find some more capacity within the system so we require them to do an analysis when they go to submit for a position. [F-041]

> Generally speaking if we've identified a demand our preference would almost always be to hire. If then we've been recruiting for a period of time and we can't fill the position we would start looking at fee providers, part-time providers, contracts with the community. We do use a business case planning model that goes through our resource board where if we've identified and people feel reasonable that this is a need that we have, then we begin our recruiting efforts. But we look at workload data, wait times, all of those kinds of things. [F-061]

> The way we do it here, we have a physician management committee that looks at all new positions and recurring positions that have come open. And they go through the process of looking at that and looking at our budget projections and our supportable FTE levels, and then make recommendations to the director on which positions to fill or not fill. And of course they make that decision based on our strategic goals, our issues with access, that type of thing. So all that is in a committee structure, is vetted, analyzed, and then the recommendations are then sent forward to the director. [F-024]

> I just think that we are considering [hiring] more in primary care because primary care here is normally going to be a full position, except with the residents coming over. So again, with the specialty care, we're sharing physicians with the different affiliates, so again, if we need a .2 or a .3, they're going to be able to find someone on their staff and send them over. [F-041]

> Even though you can put items in a contract that you hold people accountable to, they're not as accountable as people who actually work for you and are long term and are devoted to XXXX and its veterans. [F-043]

Barriers to hiring were common (six facilities; 100 percent) and were similar to the reasons for provider shortages described above, but also included a long HR process, and other VA regulations related to the approval process (privileging, credentialing, salary approval, etc.).

> Every time I have an open position I'm amazed by the number and the quality of the applicants that I get. But the HR process is in a state of utter paralysis. They can't move the ball down the field. [F-150]

The VA is trying to address [shortages] to try to hire, but seems like our HR department is not very efficient and so between the selecting the candidates to getting on board it takes between three to six months. [F-251]

Probably the biggest barrier [to hiring] is that our senior leadership understandably watches everyone that's hired and looks at the numbers, and looks at why do we need to hire this person. Why do we need to replace this social worker who just left? And so, this also drags out the process of hiring new staff. And this may actually be one of the major barriers actually, is the attempts by a senior leadership to make absolutely sure that we can justify all of the people that we're hiring, even if these are positions that previously had a demonstrable workload and functioning within the organization. [F-182]

It depends on the specialty, but there are specialties which require approval at the facility level, above the facility, at the VISN level and above the facility at central office level. [F-004]

Other barriers included challenges presented by the culture of the VA (especially among support staff and facility-level administrators) and VA regulations that limit facilities' ability to expand service hours:

Culture of VA:

We have no trouble finding highly trained, highly motivated professional staff. It's just that the efficiency of the place is undermined by not having administrative support commensurate with the professional effort being made. And just a tolerance of, I won't even say mediocrity, worse than mediocrity, in things like HR, contracting. [F-150]

VA regulations

We need more providers. But if we hire the providers and we have nowhere to put them then it's a waste of resources. And we can't just hire providers to work evening hours without their support staff. We can't get past the labor partners to have support staff work those hours. [F-094]

Our full-time docs, they're paid on a 40 hour week but there's no way to pay them for working extra. And while there may be some that would be willing to work extra hours or take a weekend a month, there's no way to pay them for that, other than to rearrange their work week so that they're off other days. But that doesn't give you any net increase. [F-083]

In order to address some of these barriers, respondents at all facilities (100 percent) described a number of strategies utilized to recruit providers, including raising salaries as much as possible within designated tiers, promoting other VA employee benefits, relocation packages, promoting affiliations with universities and other medical centers, utilizing recruiters, attending job fairs, advertising, and promoting unique aspects of practicing in a VA setting (e.g., slower pace at smaller clinics, lack of paperwork and payment processing that comes with private practice). Some respondents also indicate that these strategies could be utilized more effectively.

Pay: Now that's not entirely fair because our pay table recently was raised from just around $200[,000]—maybe a little higher—up to $240[,000] as the top of the pay table, so we are more competitive. What I don't think that we promote as strongly as we could

is that that $240[,000], if we give the top of the pay table—and I have to justify that—if we give that $240[,000] that comes along with other benefits that you don't necessarily get in the private sector like a pension plan, the matching components on the 401k equivalent and lots of various other benefits that the government and civil service provide. So that $240[,000] and equivalent value is probably higher, but to the applicant that's not always clear. [F-004]

Affiliations: In XXXX we are very heavily integrated with the XXXX and XXXX medical schools, particularly XXXX. And so there are a lot of docs that have part-time appointments at VA and at XXXX. And that's actually been an enormously helpful recruiting tool for some of the scarce and more highly paid specialties. [F-083]

Traditional: HR has gone out the last year or so on a regular basis doing job fairs in the different universities around us and different clinics and attending public…like big city of XXXX job fair and stuff like that, just to announce to us for recruitment. No one told me update on that. We've gone into the journals, you know, placed advertisement in the journals, in the local newspapers, especially the weekends so that people are able to read it. [F-115]

Intensity: The other advantage that we offer is that when you work at either of these other two [non-VA] facilities, you are at a much higher level of intensity when you are working. Our facility is small, our facility has a lower average daily census and a lower level of acuity, so the demands placed on the provider are less and sometimes providers are looking for a less intense position.
[F-004]

Comparison to private practice:

I saw an Air Force ad not long ago that I think embodies a really excellent recruitment tool. And the ad basically said, "If you come and work for us you'll take care of patients, we'll take care of the administrative work." And to the degree that that can be realized, that is an area where the VA could be really attractive, particularly to the docs in practice who have gotten tired of interfacing with insurance companies that require preapproval for everything, and more and more forms to fill out, and delays in getting things paid for, and the hassles of running an office and all of that. I think that is a recruiting tool that is probably…not probably, has been grossly underutilized. [F-083]

And we've asked the staff that are currently student that are rotating with us to, even word of mouth, anybody they know. They may know a doctor that is saying okay he's tired because of all these changes in the healthcare outside in non-VA community, that he may want to just transition to the VA. [F-115]

Retention challenges were also common among facilities, with respondents from only one facility (17%) explicitly stating that they had no issues with retention. (The other 5 facilities (83%) did experience provider turn-over). The most common area in which retention was discussed was primary care: While provider turn-over in primary care was often mentioned, recruitment of primary care providers was not a challenge for most facilities.

I think we are in primary care. The only issue is that we do have an influx and outflux of physicians. It's turnover, so making sure that those physicians are adequately

compensated for what they're doing would help with that. But overall, I think primary care is running well. [F-041]

Respondents described struggles with retention due to a number of factors that relate to pay and provider burn-out.

Pay:

The second a provider or someone else like a mental health professional walks on board in XXXX, they're immediately looking for their next job down south where they can increase their pay and automatically get that higher geographic adjustment down in the XXXX area, so we have extremely high turnover in areas where the geographic pay is not matched out in the rest of the system. [F-032]

XXXX is right across the street; seriously, literally across the main XXXX. XXXX is across the street, and I think that there are instances where people will go across the street to XXXX because the pay is better. [F-021]

Technology-based challenges: "why is that, what is it that we're seeing, why is it we're not bringing more patients in, what is this, why does it take 30 minutes for one of these appointments," and a lot of it I'm being told it's the complexities of the CPRS tool and managing and getting through it today. It's also the mandates from all the various program offices that it can take you up to 12 minutes to just get through all of the health factor screenings and all the different questions to get through that; which is also something that has been a problem with maintaining physicians and keeping them onboard, because it's a big drag on them to have to do all of those. [F-081]

Issues with VA culture and process:

And most docs and clinical people really want to provide excellent care and they just get frustrated when they can't do it, when something is getting in the way of it. And it's also I guess part of the sense of, can we trust clinical people or do the clinical people have to be regulated and managed in the sense that, we will give you this and only this, and we're going to expect you to achieve with only what resources we give you. And it's almost like on the administrative side we don't trust that the clinical folks will do the right thing. And again, that seems like an engrained institutional impediment to success. [F-083]

The other problem is that you're working in a VA system and in the VA, there's a lot of frustrations. There's your team. It takes forever to replace when a team member leaves. Computers are clunky. Our beautiful medical records system is no longer state of the art. We kind of lag on that now. And there's provider burnout, particularly in primary care. In mental health, I assume it's the same issues. [F-023]

Just as facilities struggle with keeping providers on payroll, they also implement strategies to enhance retention. Representatives of all facilities (100 percent) identified specific retention strategies. These strategies were primarily financial: increasing salaries, improving debt reduction benefits, and offering pay-for-performance.

> The only issue is that we do have an influx and outflux of physicians. It's turnover, so making sure that those physicians are adequately compensated for what they're doing would help with that. [F-041]

> We're looking at the new EDRP. I've got to try to fund that out of my budget, so right now central office gave us some resources for EDRP if we found certain positions either that we wanted to recruit or retain… So right now we are looking at funding that out of our budget with, again, I mean I have a very, very tight budget to begin with but I'm seeing what I can piece together to try to influence these individuals to stay. [F-041]

> We do as much as we can with recognition awards and retention incentives. On the front end we're using recruitment incentives wherever we can. In rare circumstances if we're looking into a physician from out of the area we may offer a move package. Also, when you're talking the physician providers, we have pay-for-performance, so they have an opportunity to maximize their earnings there. [F-061]

Respondents also described the importance of the "mission" of the VA and maintaining transparency when it comes to retaining providers

> However, the flip side of that is that there are providers who stay because (a) they resonate with the mission or (b) VA is not profit-driven as it were, so some people have left XXXX and come to us because that drive for the almighty dollar is different here. Yes, we have productivity standards, but that concept of the more surgeries you do, the more money you get is a little bit – it's not the same, you know what I mean? [F-021]

> I meet them once a week during journal club just so we are sure to update them on where we are at, what, if anything's in the pipeline, how many interviews have been done so they know that the administration is just not saying okay…they don't think administration is just saying, yeah, we are 50 percent or so providers shorted, so the rest of you get on with it. When they work we appreciate what you're doing. This is what administration is doing. We're very transparent so that they know where we're at and what constraints. Once we get providers that accept we let them know, too, and then the same backpedaling because they can't get any accommodations. You know what I mean? So we let them know that, too. So that way they're in the know and once they know that we're continuously trying they—so far at least—they've been very understanding. And they've really got together and rallied together to help to assist. [F-115]

As described above, respondents indicated that their facilities used a variety of methods to maintain and increase FTE. Contract arrangements were common, with all facilities (100 percent) reporting that they used contract providers in-house, or that they contracted out certain complex or specialized procedures to affiliate facilities. Among the provider positions filled by contractors were difficult-to-recruit specialties (e.g., stroke neurology) or critical specialties (e.g., emergency department providers, hospitalists). Among the procedures that were mentioned as contracted out were mammography, complex surgeries, labor and delivery, and bariatric treatments.

> We've done other creative avenues to increase access. We're currently a standard level complexity facility and we've contracted with our local community hospital to use their OR, for our general surgeons to do intermediate complexity surgery in their facility, so we do creative things and we definitely use contracts. We use fee for service on a

regular basis and we do contract for our, like I had said before, for our overnight hospitalists. [F-002]

We're in an active partnership that's close to being consummated with a DOD facility that in many ways is a mirror image of us. They have multiple specialty physicians who are relatively underutilized because of a relatively healthy population and a medical facility that's relatively underutilized. And so we're in the final stages of completing a sharing agreement that will allow us to refer patients there, as well as even put some VA care teams in that site to take care of VA patients. That's one that we are utilizing. [F-083]

As for sending care out, we would normally do that for things that we could not take care of and it wouldn't be necessarily something that comes up all the time like mammography. [F-041]

Among the reasons cited to use contracts were that they were often cost-effective solutions to access problems, they could quickly begin filling staffing holes more quickly than new-hires, and they improve access, particularly in rural areas.

We use contracts, we use fee basis, we even use intermittent staff, depending on the gaps that we actually have is how we choose to do that and when we're looking or a contract, a make buy analysis is really going to have to be completed and we definitely do that, say, for mammography. We've decided here that it is better for our patients' continuity of care as well as from a financial perspective to send that care to one of our affiliates here at University of XXXX. [F-041]

So the one contract I have was one FTE, is now a .5. I said I was willing to do it if it was cost neutral. So that's a cost neutral contract. It would have been the same if I was paying a .5 stroke neurologist and just had one. [F-043]

We've been very successful with locus tenens because we stay in really close contact with the folks. It tends to be more paperwork that slows it down, waiting for signatures, but from the national office perspective, the office that runs this, we've had a very good relationship… They're already pre-credentialed, they already have everything ready to go and we get our paperwork, and once it gets out of our own site, they tend to move very quickly the locus tenens procedure. We're very pleased at the support we get there. [F-032]

It's actually a contract that we've done with the community hospital… what it allows us to do is, like I said, our facility is a standard complexity and so we can do our intermediate complexity level procedures at that facility, which is beneficial. It gives our surgeons the ability to keep up on some of those skills and it gives access to our patients who otherwise would have to drive at least 250 miles or be transported to another VA. That's how far they would have to go and so it's been a very positive thing that we've done, and we have a good relationship with the local community hospital. [F-002]

On the other hand, two facilities (33 percent) indicated that they did not use contract providers, and many used fee-based or intermittent providers (five facilities; 83 percent). Reasons cited for using fee-based providers were often presented in contrast to using contract providers, including relative time to begin work, relative cost, relative administrative burden, and provider accountability. Provider

productivity among fee-based providers was also seen as a benefit. Much like contract providers, fee-based providers were often used to fill vacancies in difficult to hire, or rarely utilized specialties.

> **Time to begin work:** Fee is much quicker. Contracts are difficult, often taking months to get through the contracting process. That's a theme that you've probably heard before, and which relates to a lot of the support services. One thing that you… And I guess with fee you can turn it on and off quickly, if needed. [F-083]

Relative cost:

> We have quite a few of those, particularly in surgery because we can pay them higher and they're intermittent, and it doesn't make sense to hire a full time person. [F-023]

> The provider can get paid more than if they were part-time and it makes more sense for intermittent roles. And if I'm going to have 400… well, we can't pay 400. We can pay 380,000 is our top salary. If I have some surgeon that's worth 380, but they're only doing 1 surgery a month, I think I probably want to hire him or her intermittently, fee-basis employed, and have them come from XXXX and do the one-a-month surgery here. [F-023]

> It's also usually more expensive to do a contract. So the one contract I have was one FTE, is now a .5. [F-043]

Productivity:

> Fee is more of a productivity model. So folks tend to be productive if they're working in a fee arrangement versus a salaried arrangement. [F-083]

Accountability:

> There's a lot of issues with contracts in that they require monitoring very closely to make sure you get your money's worth. If they're sole source with your affiliate, they get another level of scrutiny. And affiliate is now getting more and more reluctant to enter into these contractual relationships because of that. [F-023]

> Even though you can put items in a contract that you hold people accountable to, they're not as accountable as people who actually work for you and are long term and are devoted to XXXX and its veterans. [F-043]

Respondents also described a few reasons why patients may be sent out into the community for care. Five facilities (83 percent) indicated that they used community-based care to some degree. Reasons for outsourcing care included issues with patient access due to geography, insufficient capacity, or the need for complex procedures. However, the preference of facilities was largely to keep patients in house, or at lease within the VA system.

Geography:

> And another issue is if they don't live within a reasonable drive to the VA, that it's very, very hard for somebody to come to a physical therapist that is not by their home. So we will send a lot of that care out to the community because if they have to come here every day or every other day for physical therapy—that's onerous. [F-041]

> Well, CBOCs don't have large physical therapy activity areas, so when we look at backlogs in PM&R, and physical therapy particularly, we have to really balance bringing a patient all the way in from a long distance into the VA Medical Center, where physical therapy is available versus putting them out into the community like my Veterans Choice or a non-VA care facility, so that is one where we have a very large amount of work trying to balance success. [F-032]

Capacity constraints:

> Those patients, when we can't accommodate them, they do get diverted, they do go to the local facilities. We luckily have a good constructive relationship with both local facilities but the patients aren't happy because if they get diverted without preapproval, they carry more of a financial burden, depending on their level of service connectedness. And I have no control over that. That is Congress, that is legislated, how those patients are handled. [F-004]

Complexity:

> I mean, there's certain surgeries that we don't perform so they go to the community. And, other than that, PET scans we send to one of our network facilities. [F-061]

Preference for network over community:

> I think there's some cases where we couldn't hire somebody and say XXXX could so we used them… So we look to the network as a resource first. And if it's something that we can't resolve within our sister facilities then that's when we go out into the community. [F-061]

Productivity

The qualitative interview also explored provider productivity issues and their causes. The most common issues affecting provider productivity related to different kinds of staffing shortages. Shortages related to clerical or administrative staff and clinical support staff were each cited by respondents at four facilities (67 percent).

> And so in many of those areas you'll have a doc that's working without an assigned nurse, with a rotating clerk who may or may not be very familiar with how to be scheduling patients in that area. And it may be a different person the next week. There's clinics where the docs have to be the ones to go out to the waiting room to find the patients to bring them back to check their vital signs, etcetera. And it's not that they can't do it or that it's work that's beneath them to do, that's not the point. It's just that's not an efficient way to be able to utilize very expensive staff and it keeps them from being able to see the volume of patients that they could see. [F-083]

> The problem is not having people to organize it, people like the schedulers, and the intake staff and that kind of thing [F-150]

> We have almost no administrative support…none. So all those people I mentioned to you, in excess of 50 clinical staff, we have one GS5 secretary. [F-150]

> We have all these appointments that we have with thousands and thousands of tests and procedures. We have no scheduler up here. The clinical staff is doing scheduling, calling the patients, licking the envelopes with the appointment letters. [F-150]

> And then you need a clerk obviously for scheduling, and you need the medical assistant, the LVN, to help you with the flow of your patients. So all those things have to be present to be productive and if you have disruption in your team, it just makes you a lot less productive. [F-023]

Respondents at four facilities (67 percent) also discussed how the lack of clerical and clinical support staff means that providers are spending their time on these activities rather than direct patient care.

> Well, the major barriers to doing anything, as I mentioned, is that it's hard to make providers productive if they're not working at the top of their license. So somebody like me, which I think in a way, it's pretty funny. I spend enormous amounts of time doing—I don't have enough clerical help. So I do a lot of clerical work. I mean, I'm a very highly paid clerk but I mean, do they want me doing that? And same with providers. They spend far too much time doing what is done in an office, in the private sector, by clerks or by somebody else. [F-023]

Respondents at four facilities (67 percent) cited infrastructure issues such as lack of exam and operating room space that negatively affected a provider's efficiency.

> But we don't have enough rooms. If you really want to see patients efficiently, you have two rooms for the physician so that you can move patients in and out more easily. [F-164]

> Surgery, we're impacted by the number of OR rooms that are available and have to schedule around there, which sometimes can be challenging when you've got five specialties that all want to operate on the same day and we don't have rooms available. [F-061]

Respondents at all facilities (100 percent) noted issues related to information technology that negatively impact provider productivity. For example, facility administrators indicated that providers spend a lot of time navigating the complex electronic record system. Also, some respondents discussed how there were assumptions that telehealth visits were more efficient and would increase productivity, but in practice these patient encounters take the same amount of time as face-to-face visits.

> What I hear from a lot of the individual docs, is that a lot of their time is spent on view alerts and other…many of which are not really relevant or necessary in the process of taking care of a patient, or on completing various paperwork electronically that, for one reason or the other in the VA system it's not allowed for someone else to do that work.to complete. [F-083]

> But the bottom line is in primary care, each patient generates gazillions of alerts that go onto your computer that you have to respond to in some way, shape or form. It's a terrible provider burnout problem and it's something we have to work on. [F-023]

> When I look into that and "why is that, what is it that we're seeing, why is it we're not bringing more patients in, what is this, why does it take 30 minutes for one of these appointments," and a lot of it I'm being told it's the complexities of the CPRS tool and managing and getting through it today. It's also the mandates from all the various

program offices that it can take you up to 12 minutes to just get through all of the health factor screenings and all the different questions to get through that; [F-081]

And I don't think it's been clearly recognized that it takes at least as much time to do a Tele visit as it does to do an in person visit. [F-083]

Let's say I order a lab work or an X-ray on a person or a consult or whatnot. From the day I do it, anything else that happen to that thing, I get a view alert on it. That's why the five day doesn't really concern me… I get that all the time. What has been driving them nuts. It's on CPRS. View alert on CPRS, so if nationally you guys can help work on actually improving that so that what is succinctly needed by the provider is what comes to the provider; ah, absolutely the providers would love you. But's the main thing they find they're having to work hard on. [F-115]

According to respondents at two facilities (33 percent), issues related to the Choice Act produce inefficiencies that impact staff and provider productivity.

So right now we are wasting so much of our time because we schedule a patient, then we have to put them on the Veterans Choice list, then if the veteran decides to call, they can call, but our staff has to upload all of the medical records and then they may or may not call in. If they call in and they find out on the outside that it's way longer, then we've done a lot of the work that we don't really have the staffing for and it's just wasted work here. [F-041]

Respondents at all facilities identified other factors that negatively impact provider productivity, including the complexity of the patients, and the teaching responsibilities that come with academic resident training programs.

So, one is that the patients that we work with have a very high level of need. They've got usually multiple problems, medical as well as psychiatric. [F-182]

So residents also slow everything up, but we have to supervise them. So that's another limitation of productivity, but if we get rid of the residents to improve our productivity, then you don't really have a VA. [F-023]

So those that run residency programs will have less time in clinic. And then there's those that have administrative time, like a department chair or myself, who have administrative time to actually carry out the business of delivering healthcare. If you cut all that out, there will be nobody to make decisions because we'll be busy all seeing patients. So that does effect productivity in terms of seeing patients. [F-023]

To maintain those appointments, you have to do some academic. So we give them an extra four hours a week in primary care, the ones that have academic appointments. We give everybody four hours a week to do their catch-up and their education, and we give them an extra four hours to have some sort of a chance at an academic career. So that cuts down on productivity right there in terms of seeing patients. [F-023]

Respondents at four facilities (67 percent) described issues with the culture of the VA, including the regulations and restrictions employees must operate under.

But in addition, a lot of them like to maintain control, so they may want to be scheduling their own appointments instead of sending it out to the clerk to do that, or…I get it as a

control issue.
[F-041]

And often in the VA with a unionized workforce, with very specific prescribed job duties and position descriptions, it's much more of a "no, that's not my job" or "no, you're not my boss" or whether it's said overtly or not, there's that whole sense that we're working together to get, together as a team, get the patients seen that need to be seen. That kind of a team based esprit is often not present and really contributes to a lot of physician frustration that have come from the private sector. [F-083]

And it's also I guess part of the sense of, can we trust clinical people or do the clinical people have to be regulated and managed in the sense that, we will give you this and only this, and we're going to expect you to achieve with only what resources we give you. And it's almost like on the administrative side we don't trust that the clinical folks will do the right thing. And again, that seems like an engrained institutional impediment to success. [F-083]

So there's a lot of concern that we're cluttering up everything to the point that a provider can't work anymore because there's just too many things that you have to address regarding one patient, much of which has nothing to do with their health. [F-023]

They've seen a set number of patients or had a way of working that was very flexible, possibly, for them for lack of a better term, and so there's kind of a cultural shift that has to take place in order to get everyone to try to get the same level of productivity from each, struggling with some providers want 45 minutes for their patient per appointment and where others are okay with a 30-minute or shorter or longer, you know, so those are some of the things that we do struggle with and that we are working on, and I think it's just a different way of thinking, a different way of doing that and it's a challenge for those providers to not feel micromanaged and certainly leads to some dissatisfaction as we move forward in this area. [F-002]

It's also an issue, too, with new consults coming in, having the time to review those consults and make a recommendation for whether they should be scheduled in that specialty or whether that's something that can be done as an e-consult or another form. So working through that, but that takes time, too, so it requires the physicians to do that. [F-041]

But the contrast to that is there's some patients that tend to just walk in—I'm sure you must have heard about the walk in issues with the VA—where if they call, they phone in and nobody's answering them—they just walk in and once this habit get developed that they know that once they walk in they'll get seen, they'll keep doing the walk in instead of actually keeping their own appointment. [F-115]

Respondents at all six facilities (100 percent) described specific efforts undertaken to improve provider productivity, including checking the accuracy of the labor mapping, forming a scheduling committee to review scheduling procedures across the facility, creating group clinics for conditions such as Hepatitis C, utilizing hospitalists so that primary care providers do not have to provide inpatient care, developing consistent care teams, holding phone clinics, improving access to same-day lab work in rural areas, providing training to patients and schedulers to reduce no-shows and walk-ins, and developing clear productivity expectations and monitoring them over time.

We used to—talking about supply and demand—one of our access issues had to do with the fact that primary care providers were providing inpatient care and when that happened, they'd have to cancel their clinic. So now that we have hospital based individuals doing it, we opened up more slots in primary care. [F-043]

That's part of what we're doing with the VACCA and the ACI funding, is going back and really trying to put in place teams of docs and support staff that can get used to working together and can be more efficient together. [F-083]

But what we do here is I was the first mental health provider to get a phone clinic, which to me is very, very helpful. My panel is big enough that there's no way I can get people back in the time frame that I would think they need to have some kind of a touch base appointment in to check, say, if I change the medication; sometime in the next two or three weeks there ought to be some kind of a contact made, and there's simply no way that I can bring people back in two to three weeks for an office visit. And no reason to, for the most part. So it turns into a phone clinic visit. [F-106]

We've made an improvement in that before some of the CBOCs don't have the capability to do lab for those kind of patient that same day, and when we…made sure that the labs can be done any time when that clinic is open now. [F-115]

We've educated the providers, the staff, chiefly, that any of those patients like that that show up even though when we're trying to book them for the appointment ask how long and try not to put those kind of patients for morning appointment, it is going to take them a long time to get to you. We can use the afternoon slots. So to reorganize. But sometimes these things fall through the crack and we've educated staff that when patients show up it is not for you to turn them away. They need to be seen. They may have to wait slightly longer because somebody is in the slot because they didn't show up on time. At least they still get seen. But the contrast to that is there's some patients that tend to just walk in—I'm sure you must have heard about the walk in issues with the VA—where if they call, they phone in and nobody's answering them—they just walk in and once this habit get developed that they know that once they walk in they'll get seen, they'll keep doing the walk in instead of actually keeping their own appointment. So we're trying to tackle both ways to reeducating patients to use their clinic appointment times and reeducating staff that look, patients. [F-115]

When we run into particular productivity issues, service chiefs set up what they call provider agreements when they bring a provider on board and it describes exactly how many patients the provider is expected to see, how much administration time they get, how many slots they will have per day, and then the clinical services have an administrative officer in each of their services, along with the business council that's monitoring it, that follows up with the providers and gives the service chiefs a heads-up when it looks like productivity has changed or the provider is out too much time. [F-032]

Administrators at three (50 percent) of the six VAMC's described how the physician productivity cube was used to look at labor mapping and scheduling grids.

You basically compare the labor mapping to the grids that they have and see whether they're appropriate. And by grids, I'm being a little bit more technical, but when you go into the scheduling package, each clinic and provider will have a grid of the

---

appointments that they have and just being able to look in that and see that that is accurate and that matches what the labor mapping is. [F-041]

We went through and looked at them and reviewed all their clinics and all their scheduling practices. Going forward it's something that the chief of staff works with the physician executive groups. They have weekly meetings and it's a standing agenda item that they discuss. [F-061]

…that whole provider productivity cube was developed for departments, but interestingly enough, as I knew it would, headquarters is using that to monitor individual provider productivity. So it's a tool that everybody uses across VA and we use it extensively here. What we're finding is that there are far too many people that are doing administrative work that probably should be doing more clinical work. So we have been slowly but surely relentlessly cracking down on that. [F-023]

Respondents at all facilities (100 percent) described other processes used to assess and measure staff productivity, including routine monitoring of RVUs and other measures by committees or teams, using the OAA and SPARQ tools, and developing other measures of productivity.

And using Medicare work RVUs has finally provided something that the majority of the physicians understand and accept as a way to provide comparability between and among facilities within the same specialty. But even with that as a productivity metric we find that not uncommonly a productivity metric in the private setting is higher than what it is, or at least what the mean is in the VA, and likely related to some of those things that I mentioned earlier, as well as some of the care that's provided and expectations are more intensive than in other settings. [F-083]

Well, there actually are some guidelines that come from OAA and other sources. So we looked at those but then we made some modifications based on we saw our needs are. [F-043]

So we're working on trying to figure out how to measure productivity differently, not just by the number of encounters, but by the patients' level of satisfaction and their improvement in their functioning and moving out of care, rather than just staying stagnant in it. And again, this is a thing that doesn't reflect well when you just look at the numbers. The patient satisfaction and their functional improvements as individuals really matters a lot when you look at "productivity". [F-195]

Knowledge management was set up to constantly monitor all the reports, workload, help us run reports to dig down deeper into particular clinics that seemed to be struggling on access or having problems with longer backlogs, so at the business council we have presentations by groups who have been set up to look at specific areas. We look at productivity, we look at RVUs for clinicians, we monitor panel sizes for providers and every month they have to report back on where they find gaps, why the gaps are happening, what their stop-gap solutions are. Knowledge management is constantly providing senior executives with reports to help us balance the staffing, etc. [F-032]

As noted above, respondents at four facilities (67 percent) described a number of issues with assessing productivity related to labor mapping.

We need to make sure that the chief of staff is watching the physicians and that they are actually having their schedules built on what time they should actually be doing that, so

there can be a lot of variability in that with inpatient consults and whatnot, but we have to make sure that their outpatient clinics are built to really show their real capacity. So that would be an ongoing issue, just making sure that again, that their clinics and their capacity measure truly what their real capacity is. [F-041]

We're also doing a lot of labor mapping and we're finding that our labor mapping is not accurate and that some people have been credit for doing things that they really shouldn't get credit for doing in terms of admin time, education time and so forth. [F-043]

I'll find that that person who I wanted mapped 90 percent to patient care is only mapped 60 percent to patient care because the doctor themselves told the DSS (Decision support systems) person that it takes them a long time to write their notes. [F-004]

Right now I think it's the group practice manager is what will be installed at all of our facilities, but in the private sector people who are group practice managers are paid a heck of a lot more than they're going to get paid in VA, so the current plan is for VA to train these people and then put them in place at each setting. Well, I'm slightly skeptical that we're going to come up with a position description that will adequately pay people to do what we want them to do, and that's absolutely necessary if we're going to be successful, so having, again, knowledgeable, skilled people across the board who are looking at productivity for each provider, for each team, who have the capacity for making adjustments so that resources move to where the patients are would also help so that we don't get into the situation in which we currently find ourselves. [F-063]

Well, we measure the number of nontraditional encounters. We measure of the number of secure messaging, folks that are utilization secure messaging. But there isn't a link between those and access. So by using those the providers are really not getting any credit for their access. So they're just picking up another modality. And many of them have said, "It's a lot more difficult to see my patient, try to answer all my text messages in-between, answer all my phone calls in-between and continue to see the same number of patients. So we really haven't helped and that's part of that provider dissatisfaction. Again, we're worried about the numbers, not worried about the care we're actually delivering and that's what we need. [F-094]

Other capacity constraints

Respondents noted other issues that put a strain on their facilities, outside of or broader than workforce numbers and productivity. The most often-mentioned barrier to providing patients access to timely care was the large, and growing, patient population for most facilities, especially in specialties such as physical therapy, orthopedics, and mental health, without commensurate increases in facility budgets to care for these patients. (Representatives of five facilities [83 percent] described this challenge.)

It is not asking for sufficient resources to meet the increasing number of veterans coming to VA, particularly with the increased eligibility; that is to say veterans of OIF and OEF all had automatic five-year full eligibility for all care and they had, I think it's a year for dental care, so that really increases the volume significantly. It's amazing… so with a lot of folks leaving service or having been activated in the Guard or Reserves, their

eligibility for VA, which was full and unrestricted for an extended amount of time, that represented a large volume of increased users and whatever budget increases came really didn't adequately match their demand for services.
[F-063]

I'd say we're not replacing physicians who leave patient care at the rate at which we need them, considering the demand has increased, both within VA and nationally with the Affordable Care Act, so that's a challenge that we will have, as we have seen with mental health. [F-063]

And the specialty care…oh, and I guess in mental health as well, there's been this push to hire into mental health because of the various initiatives that have been going on. And even though our facility still is pretty significantly behind getting all of those hired, some of which is just due to the enormous scope of the patient base that we have, but specialty care has really suffered. [F-083]

And we do a lot of hip and knee replacements, shoulder surgeries, and that need is very high and so I'm ramping up anesthesia and ramping up orthopedics. [F-004]

Representatives from five facilities (83 percent) also described assorted other capacity constraints, which include issues with Choice Act-imposed access requirements (including wait time benchmarks and service provision requirements), geography-based barriers, issues resulting from telehealth and other IT-initiative implementation, VA regulations that impede facilities from taking on intermittent and contract providers, and implications of the Affordable Care Act.

Wait times*:*

So we haven't had a huge problem such as other medical centers here, but again, if you look at the 30 day time limit to be placed on the Veterans Choice Act, that's a little stringent, and if you look out in the private sector, you're not going to have wait times that are even close to that, regardless. So my input would be is that really reasonable and should we really be going for that level of access? [F-041]

I think the way VA defines it is you have to be able to see any new or follow-up mental health patient within 30 days. But the way we're measured by CNN—you may have noticed lately—is that we have to provide behavioral cognitive therapy to everybody within 30 days and that's just not possible [F-023]

Service provision requirements:

I think the mental health requirement is that we have a provider or mental health access at all of our locations, and that's problematic. That means that I have to, in a very small clinic like XXXX, I have to have some sort of mental health presence. You can do it by Telemedicine, which we are trying to do, having stations in the clinic or taking care of mental health patients at home via computer. That's our so-called Telemedicine mental health programs. But we also have people driving to get to these more remote locations. [F-023]

Mental health has many therapies that are incorporated as part of mental health, including behavioral cognitive therapy, individual psychotherapy and other mental health modalities that you are never going to have enough staff to do. If everybody wanted individual psychotherapy, can you imagine? I'd have 23,000 mental health

patients here. Imagine, I'd have to have how many psychiatrists? You can probably see, what, 10, 12 of these patients. You'd have a tough time seeing all these patients if they all required individual psychotherapy. [F-023]

Physical therapy, PM&R [physical medicine and rehabilitation], there was a point where we have a really fine balance in trying to provide access and enough staff because one of the things you'll find out about physical therapy is it could be unlimited demand. People would like to go to physical therapy the rest of their lives. They would love to have chiropractic constantly, two, three times a week, and so VA has had to say, you know, we're going to look at every episode of care and design a treatment plan and say this is not necessary or appropriate and then cut that off because it would just be constantly growing and growing and growing. [F-032]

Geography-based barriers:

And another issue is if they don't live within a reasonable drive to the VA, that it's very, very hard for somebody to come to a physical therapist that is not by their home. So we will send a lot of that care out to the community because if they have to come here every day or every other day for physical therapy—that's onerous. [F-041]

Telehealth and IT:

Say, for example, I have a primary care doc, maybe a family practitioner who has a face to face clinic and a telehealth clinic. And that person, then their face to face clinic is divided into two sections: new patients and established patients. And when within the established patients there's some that are put in a walk-in clinic versus a scheduled clinic. So here you're already down to—you're at four stop codes per one provider, then you add in that person has telehealth and the telehealth is divided into new patients and established patients, so now you're up to six stop codes. And then I have one doc who also does employee health so that goes into another stop code. So here you got one doc with seven stop codes and he just wants to look at his schedule for the week. [F-004]

However, in rural health when you have remote sites where you cannot get specialties out there, then obvious. [F-024]

It is beneficial financially because you've got to move the patient or you've to get a provider out there. So when you're dealing with your rural areas, yes, there is a benefit. If you're dealing with areas within commute distance, not so much. But it does help, I think, financially for—support rural areas. [F-024]

VA regulations:

Manpower is very easier to get [in the private sector] at as compared to the VA where you have to go with the people that you only have contracts. Sometimes it's a very small locum tenens company that do not have widespread; their catchment is very small so we've utilized that. And we haven't been able to build as quickly as we really would like. And of all the positions that we have now, we have one locum that took maybe about four months to get here. But is already here. He got here last week so we're working on it. Because I affect physician if I get all these national locum companies that send me e-mails almost every day. That if I want to go and work here, let me work there. So the VA

---

can at least improve it so that they don't just have the contract with one or two small, you know…broaden it. Maybe you give the contract to five people so that if I need—especially in these extremely rural areas—if we need, we can send to all the five companies instead of sending to one. [F-115]

ACA:

We don't have enough providers within the country while other things are going on outside VA, like the Affordable Care Act, that is making care more readily available to people to whom it has not been available before. [F-063]

Appendix E.1.3 Physical Infrastructure Resources

In 27 qualitative interviews with VAMC leadership (Associate Directors and Associate Directors for Patient Care Services), VISN leadership (Chief Medical Officers), and VAMC and CBOC clinical staff (providers), interview respondents were asked about the physical infrastructure at their sites, which we defined as non-personnel resources that enabled patient care, such as medical equipment and supplies, diagnostic capabilities, exam rooms, and inpatient facilities. Most interview findings addressed the topics in the interview protocol, including medical equipment and supplies and space (e.g., adequacy of, lack of). Questions focused on challenges posed by infrastructure and strategies used by sites to address any infrastructure challenges, when they occurred. In addition, three interviews with VA experts touched on physical infrastructure topics so that information is also included in this summary. Table E-3 at the end of this section provides the code counts by facility-level interview for each physical infrastructure domain code.

Space

On the topic of adequacy of the physical plant, most respondents reported that lack of space was a challenge to optimal functioning. In addition to general comments about lack of space, respondents noted challenges particular to ED, inpatient, and outpatient care; challenges related to parking; costs and challenges of maintaining old and outdated infrastructure; and the relationship of space to staffing.

General Lack of Space

Respondents made general comments on the state of infrastructure at their facilities. Most respondents described lack of space as an annoyance or inconvenience more than an issue that affected patient access; they would enjoy more space or could imagine better configurations, but most did not consider infrastructure to be their site's most pressing problem. However, several respondents affirmed that they would be able to see more patients if they had more space.

> Yes, there are problems because of our lack of space. For instance [in one region], we've got a [huge] void, or gap, just in our physical infrastructure. We are in an old strip mall that has been cobbled together into this very non-efficient facility to enable us to get our patients seen. So that in itself provides hindrances to patient care. [F-081]

> The [challenges] I was talking about related to the space, we still get people in, in a timely manner. It would make things a lot easier for us if we had more exam rooms -- we could see more patients at the same time -- but [it's] nothing that's going to cause a harm in delaying their care. As I mentioned, if it's access issues, it's usually not related to the infrastructure. [F-061]

> Well, there has been a problem for space for the VA from the beginning. … Multiple services are working to provide [care]. Like cardiology was not at [our] VA before, but then in the last five or six years they have just come in because they want to provide [cardiology services here]. So we work very closely with other services, but it's a limitation. I have to go run around, "Could you please? Can I use this room? Can I do this?" So there has to be all this running around… Of course we need more space, better equipment, and more doctors so we can spread out more…. We will never compromise taking care of the patient, period. But again, it's stressful for us. [F-171]

The stress placed on facilities due to limited space was also described by a respondent who felt that his facility was already operating near capacity, and another who spoke to how demand for VA services within his geographic areas was growing faster than VA could obtain space.

> I think our access numbers are good. It's because we're managing it, alright? But to say can we really expand with one or two more staff folks maybe to provide different services at a higher degree, the answer is no, we're limited by space. We're shackled by limits of space. But for all the probably 80% to 90% of all the services that VA Central Office wants us to provide, we can certainly do that. But if they send another mandate out we're sunk. [F-154]

> We are having such a difficult time getting the space to improve that access. There are some opportunities that we can fine tune and tweak but in certain areas, especially here in our [region] …there are only so many things we can tweak and still not have enough room and access to do what we need to do, just because of the sheer increase in volume that we've had with folks relocating to our area. It really wasn't all just backlog. It's just new demand and not being able to increase the resources and the other things that go along with that. [F-094]

Some respondents described the physical infrastructure of their facilities as being good or excellent. Comments about to adequate or ample space were commonly made in tandem with discussing recent construction or renovation projects.

> Yeah, from what I see, we have everything [we need with regard to infrastructure]. We have the high-level technology and we had—oh, it's probably already ten years or even more, time flies—we had a new hospital built. The old space takes an incredibly long time to be renovated, so certainly there is still competition for space and for rooms, but that is, I would say, minor. Otherwise, from my standpoint, it's very good. [F-184]

> The clinic here is great. It's fairly new. It's fairly large, so we don't really have structural problems here, but the [other clinic I work at] is too small and they actually have been on 4/10 schedules there because they don't have enough rooms for the providers. Access is also a huge problem in [the other region]. They are understaffed. They need a bigger facility or another facility in order to improve access and to keep growing like they are growing. [F-029]

> Well, I think we could take on additional workers in our [newly opened specialty care facility] and not have to expand the physical space. We've got the physical availability which is what we're looking at now, is we're hiring more staff so that we can take on more patients. [F-062]

Space Issues in the Emergency Department, Inpatient, and Outpatient Settings

Providers were generally satisfied with ED facilities. Similar to statements about the challenges of old or outdated infrastructure, one respondent described how standards and expectations have changed for how an ED is organized, which has led to the need for additional space and modifications to existing facilities. Another respondent highlighted the relationship between ED capacity and capacity of and flow to the inpatient unit.

> I would say that in the Emergency Department where some would say that we may be delivering some primary care, emergency department care has changed, so, again,

---

where you would go into an ER [years ago] where there were basically curtains in between every bed. You'd have 16 beds and there'd be curtains in between, so that if you're lying in an ER bed, the guy next to you is just simply separated by the curtain while they're doing whatever it is they're doing, unless of course they're dealing with a trauma or something and ERs have a room for that. The new standard is, ERs should each have, again, an individual room with a door, I mean, with a big open door, but the idea is, you're separated by hard walls, again, to provide patient privacy, patient satisfaction and to minimize the risk of cross-contamination, so things change, and that makes a difference with respect to what you can provide, so what I've seen over the past few years is a lot of VA facilities are remodeling from the inside out, so you're square that not many facilities are going to get a brand-new, knock it down and build a new building, so the way that VHA and facilities have handled it is, they put in a request for a project and they remodel their ER or they remodel their general medicine ward to have individual rooms, private rooms with private baths for their patients, and that's sort of the process that we've gone through over time in order to address these changes in what we know now versus what we knew then. [F-021]

The ER is totally inadequate in terms of the number of patients that it takes in. I mean, they often have patients backing up in the ER, boarding in the ER, because they can't turn over at the beds upstairs. Some of that has to do with nursing shortages and not having enough nurses upstairs. But some of it just has to do with the physical bed situation, so everything backs up. This place should have an ER that's twice the size than it is now... That causes a very big obstruction. [F-164]

Respondents reported varying levels of satisfaction and difficulties relating to inpatient infrastructure, including operating rooms, general inpatient bed, and specialty care programs. There was also some concern specifically that there would be increased need for inpatient care due to the aging of the population and the high needs for substance use treatment among Veterans. On this topic, one respondent discussed the need for inpatient treatment programs for addiction and acute mental health issues.

We don't probably have enough OR space to adequately accommodate all of the surgeries we need to do. We are looking at shifting some ambulatory surgeries, all of our eye surgeries down to XXXX or wherever they can do an ambulatory surgery. [F-081]

Surgery, we're impacted by the number of OR rooms that are available and have to schedule around there, which sometimes can be challenging when you've got five specialties that all want to operate on the same day and we don't have rooms available. Sometimes it's kind of an artifact of our own system where we start digging down and realize that their clinics were set up incorrectly so they're not schedule appropriately. [F-061]

Another concern is that I've seen some data from some planning committees about what will happen in the future and as far as the number of patients in this area and also nationally, and it seems like there's a sense there's going to need to be an expansion of some type but more specifically for the issue it relates to geriatric patients. I foresee that there's going to be a very much increased need for inpatient geriatric type services like combo geri-psych units, nursing home level assisted living…I'm not sure. But we're getting a lot of patients that are somewhere, for example, in between needing medical

and nursing home care, or in between needing inpatient psychiatric and nursing home. [F-195]

> A lot of what was needed [in inpatient care] was not necessarily 24-hour nursing service, but a safe place for people to go and to be treated for co-morbidities at the same time, in other words, alcohol substance abuse and particularly among the younger vets, if they're addicted, they're poly-addicted. So it's not just alcohol and it's not just drugs. And a lot of what's driving it is PTSD. And so there finally is a pretty good residential program up at [one of our facilities], and then they started at first six beds and now it's 18 beds of inpatient intensive therapy that is 21 days long. [V-16]

On the other hand, respondents at several facilities were relatively happy with the state of their inpatient infrastructure.

> There are enough facilities in the general area that we can access an inpatient level of care as we need it and when they're discharged, we so far haven't had any problems getting them in in the time—certainly not in the VA mandated time frame—and what we want to do is usually shorter than that. So no, we haven't had a problem with [inpatient capacity]. [F-106]

The comments about limits of primary care and outpatient specialty care space centered around the need for more exam rooms.

> There are some isolated instances [of infrastructure being a problem], like, I have an office and across the walkway is my LVN… It really works well when we're in close proximity so that if she sees a patient and my door is open, she'll walk the patient right into my office and when I'm done with my patient and her door is open, I can walk the patient right across the way. So I think if there was some more space maybe we could have a better design and have all the providers close to their LVNs. [F-248]

> The first that occurs to me is we're space challenged, as I'm sure probably some other facilities you've spoken with. So in PACT, for example, ideally we'd like to have three exam rooms per provider. We're just now to the point where I think we've gotten pretty much two across the board. So that impacts their productivity to some degree. [F-061]

Parking

Respondents discussed challenges with parking at facilities.

> Parking problems are big. I know you don't think about that when you think about medical care but it's a huge. [A nearby VA] medical clinic finally got a parking garage… Three years ago—of course I didn't jump the curb with my car—but there were some people [who would] literally create their own parking spot to make [it to their] appointment that they otherwise would have to wait three more months to reschedule [if they missed]. [V-09]

> Just being where we are, traffic is always an issue… just getting here is a problem for many people… We're at one of the busiest intersections in the world… Our parking is insufficient. …Once you do fight [through] the traffic, there's delays in actually physically parking. [F-257]

They don't even have parking for the vets. … They decided it was bad form to build a garage because it gave the wrong impression to build a parking structure where we really needed clinic space and other stuff. So they didn't build a parking structure. So you come there and there are handicapped people, have to schlep … to get to the clinic or to get to any place. It's a totally absurd situation. [F-164]

It still seems there are times when parking is a huge issue for patients. We've also had some new construction. That's made it a little more difficult to get into my clinic. [F-153]

Relationship between Space and Staffing

In relation to questions on infrastructure and site capacity, respondents described how lack of available space slowed or prevented hiring because facilities did not have rooms available for providers to see patients.

There's a definite relationship [between hiring new providers and building new space]. We need to hire our providers and I can tell you right now in mental health … I have a meeting later today actually on this very issue. They're holding off on hiring a couple of RN positions and a provider – I can't remember if it's a psychologist or a psychiatrist position, but one of those -- because they don't have the space and I'm saying, "No, you need to move forward with the recruiting and we'll figure this out." They're really nervous about it and we don't have the space for them, but I have someone working on it and so it is an issue and they're not comfortable… so, yeah. We do have that [problem] and it's a good example of what I'm dealing with today. Those positions have not been opened because of space but I'm trying to push them forward. [F-002]

We are a million square feet short of space in just one of our facilities. We can't recruit and hire without having that space. And the lease thing is absolutely lethal. We couldn't expand our leases sufficiently to accommodate some of the demand, so you recruit people and have no place to put them. That really impacted the hiring process. [F-141]

It's been very difficult to convince leadership that we need [some specialist] positions [like psychiatry] because of budgetary constraints and certainly space. Space is our nemesis, and I'll refer to space problems the whole telephone call if you let me. [F-154]

There're all of these doorstops everywhere we turn. We need more space. We need more providers. But if we hire the providers and we have nowhere to put them then it's a waste of resources… And it's all of the things that happen in the background. I mean, just getting a physician and a nurse and a clerk to work on a weekend would be okay. I mean, we could probably get over that hurdle. But if you're talking about a specialty clinic that has reusable medical equipment that needs SCS to turn that around quickly then we have to talk about SCS. We have lab. We have radiology. We have all of these other ancillary services that support those clinics as well and so the ripple effect isn't just opening a clinic for a few extra hours, you're talking about expanding services across the board. And then when you talk about expanding providers, and talking about extra space, then you're also talking about hiring additional environmental management staff, you're talking about extra burden on pharmacy, lab, pathology, radiology. All of those other services also have an impact. And when we do things like our VACAA funding and so forth it's basically just considered the primary care staff, or specialty care staff. It didn't talk about the extra workload that would be generated for lab, radiology, environmental management with a new space, SCS with demand in surgeons, dental. I

mean, all of these areas have an impact outside of their small area that they work. That's why we have these huge systems. [F-094]

Other respondents described how a lack of adequate staffing caused the site's infrastructure to be underutilized.

I don't think the number of beds is as much of an issue [in creating bottlenecks or delays in patient care] as efficiencies in our—the flow, that deal with the flow and the effective use of staff. So I think that has an issue. [F-024]

They often have patients backing up in the ER, boarding in the ER, because they can't turn over at the beds upstairs. Some of that has to do with nursing shortages and not having enough nurses upstairs. But some of it just has to do with the physical bed situation, so everything backs up. [F-164]

We have struggled to find social workers to support our primary care teams and we have been doing major recruiting efforts to try to do that, so the providers can let the social workers help take care of some of the social needs and placement needs and we have not had social work, so now we're suddenly getting social workers on board without space. We need space for social workers, pharmacists and mental health. That's where our biggest struggle has been so our expansions are primarily space expanding. [F-032]

I would say [our facility's problem with inpatient capacity is] 90 percent physical, 10 percent staffing. We do have a problem, as you heard me talking about, having the trained and experienced nursing staff, and getting staff onboard to make sure that we have that percentage of staffing. But the other is that we just physically don't have the beds. And ideally we'd like to be like regular industry and have single occupancy rooms. But we don't; we have double occupancies. Luckily we've reduced all of our quadruple occupancy rooms. But we run right now at about… I think when we actually count the patients we turn about 50 patients a day. That means how many coming in and going out. And we run about 90… I think I saw it was 97 to 98 percent occupancy. So right now I think this morning we had somewhere between 50, I've heard it up to 60 patients a day, that are out in the community in beds because we can't get them in here to the [VAMC]. We have to monitor very closely our surgeries and our catheterizations to make sure that we have a bed for these patients as soon as they're done with their procedure. [F-081]

I think we're appropriately resourced to see patients in clinic and inpatients who have cardiac disease in the hospital. So for the most part, like I said, I think the clinical resources are, for the most part, adequate. I think there might be some isolated areas where we need more. But again, it's this hospital-wide management disconnect, where you would say, of course we need to have nurses on reserve call, so that if someone calls in sick we don't have to close a bed and spend tens of thousands of dollars sending a patient to a private hospital because we didn't have someone to serve as the nurse. It's like the airline industry. They always have crews. They don't cancel flights because someone has the flu. They have a crew on standby. And they're not doing it out of altruism. They're doing it because it's good business. And this kind of thing doesn't happen here. If a couple of nurses call in sick, the beds get closed, patients have to get sent to an outside hospital, taxpayers have to pay a huge amount for that….I have been told, has a budget for fee basis medical care currently that exceeds 100 million dollars a

year. And some of that is needed because we could be responsible for a patient who has a service connected disability and has an emergency hospitalization 100 miles away. We're obligated to pay for the care at another facility. But much of it is because of poor use of the capacity that we have. So getting patients in and out of the hospital is too slow of a process. There is frequently closure of beds because of quote-unquote, "nursing staffing issues." And as a consequence if a bed is closed and, not because of physical availability the bed isn't there, but because there isn't a nurse to staff it, a patient might come into the emergency room, need hospitalization and has to get sent to another facility at VA expense: Huge, huge waste of money and also disruption in the continuity of care between different health care systems, where it's very likely that things will fall between the cracks…very poor use. [F-150]

Old/outdated infrastructure

Several respondents described ways in which old or outdated infrastructure hindered the optimal functioning of their medical centers. Some comments came from a large, older VAMC that felt burdened by maintaining their physical plant, which was no longer suited to their current needs. In general, respondents generally affirmed the idea that equipment was adequate, but that the physical space at many VA facilities is not sized or configured in most contemporary medical settings. This was attributed to the continually changing standards and requirements for health care. One respondent made the analogy:

All the hospitals in the VHA are competing for a finite number of dollars.… I think they try very hard to ensure that the most critical needs are met first, but it's kind of like painting the Golden Gate Bridge: by the time you get to the one end, you've got to turn around and start all over again at the other end because infrastructure-wise, new technology changes the way that a footprint needs to be done. [F-021]

Another respondent echoed the need for continual renovation to keep up with standards.

I would say in general the space is inadequate, the facilities are old, but because material or the equipment, we can turn over and it has a lifetime, our equipment is fairly new, up to date, state of the art… There's been such a big change in the size of operating rooms and the toys that are in the operating rooms and the need for computers and cabling and electricity, even back to the late '80s, early '90s. If you haven't redesigned your operating rooms since the mid-'90s or the late '90s, your operating rooms are too small and they don't have the infrastructure to support towers and video and all those other types of things because they haven't kept up with medicine. [F-073]

Finally, a related anecdote from a VA leader illustrates the challenges of down-sizing or "right-sizing" VA facilities, a theme we heard from multiple respondents who struggled to maintain facilities that were no longer suited to the local demand.

Their average daily census in [the hospital that we closed] was running between two or three. So there were far more staff than there were patients. And it made absolutely no sense. It had not been closed largely because the veteran community was so against it. But there was a local critical access hospital which was also struggling …We made a decision we were going to close the VA, keep it as a clinic but transfer all the inpatient care to the critical access hospital, which was a mile down the road and it basically was a

win/win for everybody. Veterans were still able to be hospitalized in their local community, it helped the critical access hospital with having a higher volume. [V-10]

The problem that we have with major construction nationally, because there's not a big enough budget to take care of all the needs of all VA Medical Centers nationwide that are an aging infrastructure. We were fortunate to have one of those [major construction projects], but we don't believe it's possible that they can replace all of the buildings fast enough to take all the needed construction. There's going to need to be a major infusion of national funding into the VA construction process to support all the needs to repair and to replace our infrastructure. [F-032]

<u>Strategies to Address Space Challenges</u>

Respondents described different challenges to address space challenges that helped provide more space for patient care, programs, and staff, and are often used in combination to expand sites' capabilities.

Evaluating and monitoring space needs. When asked about strategies used to address space challenges, respondents described institutional planning and decisionmaking processes that were in place to monitor usage and respond to bottlenecks when they arose. Sites also referred to the importance of leadership being aware of facility constraints and proactive in addressing them, whether related to space, staffing, or other infrastructure.

So we look at their current [volume], their [projected] growth. We look at their CBOCs, if they plan an expansion of course we take that into consideration. We also look at by location how many uniques do you have in your CBOC? If you are dropping your CBOC, what are you doing with that space… So we not only look at the data over the past two years from 2012 to 2014 and deal with specific facilities, but we also project which ones are going to drop. So when anything comes in like people asking for a lease or build out, we take [that] into account … So we build that into our decision making process to make recommendations of yea or nay. [F-141]

[If patient volume increased rapidly, under the current director, this particular VAMC] would be morphing and getting providers as needed. Because they've got space, I mean they've got space that they could alter or incorporate, because it used to be an inpatient facility. So they watch their flow very closely, like daily, Monday through Friday, so I think they would just expand as needed. I don't think they'd have a problem facility-wise. [F-102]

I have a small group that looks at our physical space and we're doing our very best to utilize every inch that we have and we still don't have enough space to provide everything that we need to provide and to house everyone we need to house, so we're looking at leasing space. [F-002]

When there is a shortage, it's something that you just feel like, "Okay, we have the right amount of space. We need to hire somebody." Maybe we need to figure out where we're going to put this person but you get a feeling like it was planned out well enough for the current state, and when there's changes it'll have to be worked through in some way, but it's reasonable, yeah. Any facility

would have that issue. You don't want to have just caverns of offices that are unused just in case you hire more people later on. Typically it's not an issue. [F-195]

A: I think our access numbers are good. It's because we're managing it, alright? But to say can we really expand with one or two more staff folks maybe to provide different services at a higher degree, the answer is no, we're limited by space. We're shackled by limits of space. But for all the probably 80% to 90% of all the services that VA Central Office wants us to provide, we can certainly do that. But if they send another mandate out we're sunk.

Q: So if you have to provide something much more specialized, for example, and you don't currently have a person in-house that does that, you just can't hire someone else because there's nowhere to put them.

A: Bingo. And we've been struggling with that for probably four or five years. [F-154]

Reconfiguring to maximize use of existing space. Many sites described efforts to make the best use of their existing resources. At the facility level, they implemented space use arrangements that served as stopgap measures, to expand capacity in the short-term while awaiting new leases or new construction. In an effort to ensure adequate rooms for patient care and staff, sites discussed dividing office space, shifting people around, and being creative about how they used spaces, like having providers use a conference room for office space when there are no offices available. Because of the delays in establishing leases or securing a construction commitment from VA, respondents also described a spirit of self-sufficiency within their facility; they emphasized their commitment to patient care, and how they would make do or find a way, although ultimately, most respondents wished that their facility could have more space. Respondents talked about unconventional ideas that their sites had considered for how to maximize patient care capacity within their limited space. They discussed increasing clinic hours in order to run more clinics over the course of the day, only running clinics on certain days to enable space to be efficiently shared between services, and incentivizing telehealth providers and other staff who could to work from home.

> We're doing our very best to utilize every inch that we have and we still don't have enough space to provide everything that we need to provide and to house everyone we need to house…we're dividing offices that we can into two if they're larger…
> [F-002]

> We don't have enough space for everybody; so we're constantly moving people around.
> [F-248]

> There's a constant refrain that there's a shortage of rooms in the clinic to see patients. Well, if you only use your clinic rooms seven hours a day, yes, there could be a shortage. But there's an inability or unwillingness to consider what I would say is obvious solution to that; which is, instead of running two clinics a day in a given room, making use of it. Perhaps seven hours out of the day, run three clinics and make use of it 11 hours out of the day. And that would also expand access to patients who work early in the morning or into the evening. [F-150]

> Some of the things we're doing for space issues is we're looking at we have after hours clinics, weekend clinics and so forth, so opening up more capacity. Looking at kind of

what I call "hot bunking" exam rooms, where we don't have enough exam rooms for services to have their own so we bring in clinics on certain days. [F-081]

Using the various existing mechanisms to connect Veterans with non-VA care. Another common strategy that sites used to deal with lack of space for patient care was to send patients to other VA and non-VA facilities. To many respondents, lack of space was something to be addressed in the short-term by "feeing out" patients to community facilities. Respondents noted that this practice is expensive, but did not seem hopeful that facility expansion was realistic in the near term. A few respondents suggested that the cost of non-VA care was a barrier to this strategy, or at least that facilities lament that fact that it is so costly, despite their obligation to provide and pay for care when indicated. Another non-monetary cost to using fee or contract care as a strategy to address lack of infrastructure is the challenge of coordinating care for patients who receive care outside VA.

Certainly the ED gets congested, especially now with flu season. And we've been on diversion from time to time. But we send them to another hospital. [F-061]

When we go out and conduct our site visits at hospitals, what we're seeing and hearing is that yes, they have resource or staffing issues, but in those situations, if they don't have the resource or staffing available to meet the immediate needs of veterans at the local facility, they have no choice but to refer them outside the VA to get timely care. But they're reluctant to do that because of the cost. But cost should not be a barrier. [V-05]

I think every CBOC in the country does exactly what we [with regard to when to use non-VA care]. They look for the most critical patients. Most patients can come to the VA Medical Center [to receive diagnostic or specialty services]… We provide a bus transportation system to bring them in from those sites and to get their CT scans and their MRIs. They don't have to pay for [transportation]… however, you don't want a frail, 96-year-old man or woman in our most furthest outlying area coming in on a bus to go all the way to the Medical Center, so those types, we look individually and we get [the care] out into the community whenever there's a critical need to get them in, so somebody who is compromised in their immune system, somebody who has gone through chemotherapy, somebody who can't tolerate the trip down, we approve those on a case-by-case basis, fee for service clinical service, so we prevent those most frail patients from having to come all the way in, but the majority of our patients, we try to bring into the VA Medical Center rather than having them go out in a very costly [way in the] community when they're healthy enough to come in with the VA transportation system we provide. [F-032]

I think this morning we had somewhere between 50, I've heard it up to 60 patients a day, that are out in the community in beds because we can't get them in here… we don't have, in reality, an adequate number of beds in order to take care. We're "feeing out" a lot of the inpatients because our facilities are full…. But when we send people out for surgery for a procedure, [we need to make] sure that we're aware of when they're going to schedule their procedure, when all that is going to happen, so that we can make sure that the DME [durable medical equipment] and the care plans, so the DME and all the other things that are available for them, immediately postoperatively. … There have been instances where patients have gone out and had the surgery and they never let us know when that surgery was going to happen. They went ahead with the

surgery and none of the after care, or none of the equipment that they needed, was available for them. And that doesn't happen overnight. [F-081]

Leasing commercial space to increase capacity. Many respondents mentioned leasing additional space as a solution to space challenges, but few discussed leases without describing what they felt were burdensome and time-consuming administrative processes that needed to be navigated before a lease could begin.

> We're working on a proposal for a comprehensive pain clinic and we'd ideally like to find dedicated space to house enough people in there to make it a one-stop shopping, and just logically right now we haven't been able to identify that space. So we're hoping to have that pretty resolved shortly. But we've done things like we moved our outpatient mental health program to an offsite location. Our dental clinic is an offsite location. We moved our human resources out of the building to provide more clinical space. So we're pretty proactive about that. But our preference is not to have anything go outside. [F-061]

> One of the barriers to telehealth expansion is from a contractual standpoint because right now we, of course, in contracting for a new service or new area that might enhance telehealth care, we have the federal acquisition regulations that must be adhered to and sometimes the timeline for that is kind of stretched. For example, it took almost two years of planning for us—and going through the contractual end of things to get a new community-based outpatient clinic. [F-005]

> It takes a very long time, so it's not an easy nor a smooth process and it involves more than contracting and so, no, it takes a very long time to get a lease in place. I do have one potential small site in town that is currently leased by our VISN contracting office and they have sat there and that lease will be up in May and we're trying to do something faster than a normal lease process, to where we could, like, take over that lease…but, yes, timeframes of getting that in place, it is a very big issue and a big constraint. [F-002]

Establishing agreements to use other facilities. Although less common, some sites mentioned coordination or agreements made with non-VA medical facilities that were not leases, per se, but that still expanded VA capacity. These arrangements were made with military treatment facilities, academic medical centers, and community hospitals.

> [Our facility] does not provide intermediate surgery because we don't have the infrastructure that you would need to do that in a safe manner and that's from a lot of things, not just the specialty providers that we may not have but that's also the support staff, as well, and, in theory, sometimes the space capacity so that capacity does exist at [our local community hospital]. What we have is a very unique relationship and this is all done through a Memorandum of Understanding or agreement and, of course, when it was done it went through Legal and was blessed both at the VISN and national levels, but our doctors—and they're privileged to do this—will go over to the [community hospital] and will use their operating room space and infrastructure. [F-005]

> There was an opportunity [to sublease from an nearby academic medical center] on a time-limited [basis]… Well, orthopedics, which was one area that was significantly

backlogged and that was restrained by the OR capacity at the VA Medical Center, made a pitch to lease property for ambulatory surgery that was available that was excess to the medical school's needs at the time, so VA did that. We did not have to go through the – another problem – cumbersome leasing process, and obtained space where they could do off-site surgery. It was using VA staff but it was giving them additional OR capacity than they had at the Medical Center and that allowed them to go through their backlog and reduce their backlog for orthopedic surgery. [F-063]

Constructing new facilities. Construction was frequently mentioned by sites as a strategy that resolved past space issues, and as a strategy they are pursing to address current infrastructure challenges. Renovation and expansions usually increase room for both staff and patient care space. However, respondents also noted the challenges to completing construction projects, including the bureaucratic process and lengthy time frames. Additionally, the VA's limited budget and high demand for construction among sites increases competition for funding and thus may prevent sites from being able to carry out their construction plans.

> We just opened up our new women's health clinic and it's got more space and much nicer space than they had before. But again, that was something that was planned to do several years ago as part of the strategic planning. So in cardiology it would be the same kind of thing. There's some things that we want to do to expand for the future and we're looking at how to make that happen but so far [infrastructure has] not been an impediment to providing care. [F-062]

> Every single site has a construction project or a lease expansion going on as we speak today because we've anticipated that we have to do that to deal with having access to bringing the system, bringing in that 30-day timeline to get everybody in in 30 days and try to take care of our patients closer to home. So every single one of our CBOCs is doing that right now. [F-032]

> To be able to lease space or build space you have to submit a request through central office. That has to be funded through Congress, so you can't just decide that you have a need here at the facility. You have to compete with all the other facilities across the country and then Congress decides what they're actually going to fund for that year and it may be two to three years down the line. … If we had more space and it was easier to get space, easier to build space, that we could actually use our money on capital projects without going through this bureaucratic process and having to deal with the pots of money, we could definitely improve the patient's experience of care as well as the productivity. [F-041]

> Now we're going to go for a "major", which means adding two floors at once. But we're talking a couple years in the future. [F-043]

> We have issues in our ED. Matter of fact, we have a couple projects on the books to solve that problem. … At this facility here actually, we were just approved at least for the design of a replacement facility… Of course, that will take probably—that's about an eight or nine year process to go through design and construction. [F-024]

> We also have construction going on which creates more space issues in that timeframe. We're building a new physical medicine and we have building, so parking is difficult; it's difficult for patients, it's difficult for staff and we're building a new parking garage and so that construction is ongoing so that will alleviate that, once that's [complete]. [F-002]

Medical Equipment and Supplies

Respondents spoke to the challenges and strategies around medical equipment and supplies. Overall, respondents were generally satisfied with medical equipment, although this varied across facilities and according to specific types of equipment.

Facility type, complexity, and volume of care. Respondents spoke about the limitations of medical equipment at their sites, which was sometimes related to the complexity level of or type of site rather than indicating unmet need. However, respondents reflected on the tension between having all the equipment or capabilities they might want and the need to provide care in a cost-effective way, which sometimes requires utilizing VA network facilities and non-VA care for lower volume or more specialized services.

> Some things [diagnostic equipment and laboratory infrastructure] are [sufficient] and some things aren't. They can do basic phlebotomy. Flat-plate x-rays, screening mammograms, and screening ultrasounds are done through contract or through non-VA care, but there are some things that I wish we could do. I mean, we don't have the appropriate refrigeration, and for some reason we can't give shingle shots here. And…the phlebotomy area, if you want to do a QuantiFERON gold, which is a test for TB, I think it has to be processed appropriately so a patient has to go up to [regional VAMC] or to [regional non-VA hospital]. So those are common tests and vaccinations that are inconvenience to the patient. But, you know, we're primary care, there's not a whole lot of sophisticated equipment that we actually have to have. I do a primary care derm[atology] and we seem to have a mess of equipment for that. We have women's health, [and our clinic] seems to be appropriately stored for that. [F-248]

> We hear about it [from providers] if we don't [have sufficient screening and diagnostic equipment and lab facilities]! Basically, they submit it through the equipment committee and our equipment is prioritized based on the money that we receive. Are some a "need" and some a "like"? Yes, absolutely, but if we had more resources to devote towards equipment, that would absolutely help. [F-041]

> We hear this all the time—why do a lot of the VA clinics not have 24 hour CAT scans, colonoscopies? You can essentially call a civilian hospital and say hey, I need to come in for a CAT scan and they say well, we can see you next Thursday at 11:30 at night. That is very common where I come from, where there's a large teaching hospital. Why can we not do that? It doesn't make any sense at all. The resources are there, they can rotate docs through. You don't even need a doctor to do the scan, you just need a tech. So exploratory and testing types of options should not have a backlog. [V-05]

> The frustration for patients is that the diagnostics typically are at what I call "the mother ship" or at a larger independent CBOC. For example, if you have a simple test X-ray that needs to be done they'll have to travel in order to get that, as opposed to us being able to just go out into the local area. And that's limited by the space in the clinic and also by the expense when you have performance measures that measure the amount of dollars per unique for radiology tests or for lab tests or whatever that measurement may be. [F-081]

> [This VAMC] does not provide intermediate surgery because we don't have the infrastructure that you would need to do that in a safe manner and that's from a lot of

things, not just the specialty providers that we may not have but that's also the support staff, as well, and, in theory, sometimes the space capacity so that capacity does exist at [our local community hospital]. [F-005]

VA specialized infrastructure not available in non-VA settings. Several respondents highlighted the strengths of VA medical equipment and infrastructure for certain types of specialty care. For example, as counterpoint to the discussion of deficiencies in VA infrastructure, one respondent spoke about areas of care at which VA excels and around which it has built up impressive clinical infrastructure.

> Well, by and large the VA has experts in the types of service-connected wounds that we have been seeing over the past 100 years, not only with PTSD, traumatic brain injuries, certain types of cancer, you know, [but other things, like] reaction to toxic wounds, and now prosthetics. So the level of care that [Veterans are] able to get—specialized care specifically, like for spinal cord injuries—at the VA would really be cost prohibitive outside the VA. As a matter of fact, we recently toured [a new facility] only to find that they make a lot of their prosthetics on campus. They don't even contract out for it anymore. They have their own machine labs where they machine their own prosthetics and replacement parts. They can do it right there on site. You're not going to be able to get that type of focused care [anywhere else]… I mean where are you going to get that kind of service? [V-05]

Relationship between space and medical equipment. The physical space available for medical equipment was often a consideration when trying to upgrade machines or make efficient use of existing equipment.

> The next thing is the diagnostic services. We do EMG, we do muscle biopsy, we do nerve biopsy in the neuromuscular program. I have a problem. My machine is kind of kaput, although I requested it [be fixed]. Hopefully it will be…we will be able to get a replacement, but there is a problem [in the meantime]. If I have to do a muscle biopsy, I have to beg dermatology to give us their small OR where they do surgery. But I don't have any space to do any surgical procedures…. So diagnostic equipment, [having] the room for doing diagnostic procedures, they happen to be problems. [F-171]

> Infrastructure-wise, new technology changes the way that a [facility] footprint needs to be done. New inspection control requirements change the way an OR should be designed and the need for humidity control and all of those types of things affect-- for example, here we have ten OR suites. … They were state of the art when they were built, but as things change, they have infrastructure issues that we have to try to retrofit into those existing spaces, which is sometimes a challenge. You know, CT scanners are smaller, believe it or not, now, and they have different MRIs now that you can actually stand in instead of lie down, so I think with respect to infrastructure, there's always going to be a challenge, to be able to provide it in such a way that it meets the needs. [F-021]

Strategies to Address Challenges Related to Lack of Medical Equipment or Supplies

Although most respondents reported that medical equipment, lab services, and supplies were available and adequate at their facilities, they also described two strategies they used to meet patient needs when their sites did not have needed services or supplies.

Sending Veterans to other VA or non-VA facilities that had the needed medical equipment or capabilities. Utilizing other facilities that offered needed diagnostic or medical services, either other VA facilities or non-VA facilities, was a common strategy to address a lack of medical equipment. Respondents discussed their reliance on the capacity available in the wider VA network as a resource for providing certain types of care to patients. For lower-complexity facilities that were sometimes distance from other VAMCs, establishing agreements with non-VA hospitals to allow VA staff and patients use their facilities was a less common but still important strategy to addressing patient needs locally. The types of services offered through these arrangements were usually low volume or highly specialized laboratory services or diagnostic equipment (e.g. mammography, PET scan). Mobile MRI, for example, was mentioned by several sites as a strategy for increasing access to this service for their patients.

> Generally speaking, no, [we don't send out lab and diagnostic services]: we do all of that here. I mean, there's certain surgeries that we don't perform so they go to the community. And, other than that, PET scans we send to one of our network facilities. [F-061]

> There are mobile CTs and MRIs that you can contract with. And so, to improve the access for a short period of time while, you know, maybe a provider is being hired or we work on extending hours, extending hours over weekends and evenings, you know, while that's being worked out. So maybe in the short-term—so that's one of the things we were just batting around. [F-074]

Replacing or constructing medical equipment or infrastructure. Respondents also described replacing or constructing medical equipment or infrastructure to address facility needs. The process of requesting medical equipment, however, was not always a smooth or easy one, as it involved interfacing with the contracting process.

> We're adding to meet the demand. And it's an open demand for eye [care services] and that's one of our greatest demands. And we're actually building more eye lanes here. Our national facility just added four eye lanes down in our [sister] facility. [F-081]

> We've just gotten approval for all of our equipment that would become a patient safety issue if that was not replaced and so we will be getting that equipment. [F-002]

> I will tell you that regardless even if we did have the resources and we were able to buy everything that the physicians would like to take care of the patients, we still have the VA contracting process, which is extremely onerous and will take a long, long time. So as the local medical center, we do not have control over the contracting process. So all the documentation [of equipment needs] is done here and then it's submitted and it may be submitted into a black hole. [F-041]

According to some respondents, assessments and decisions about medical equipment were happening in an ever-changing environment of patient care needs, demand for services, and what technology or equipment was considered adequate or up-to-date. Like in the example above, the growing demand for eye care services seen by one respondent site was in part due to patient demographics (i.e. older patients needing more frequent eye exams), but also a result of a recent clarification of VHA policy on preventative eye services, which respondents belief has increased the volume of Veterans seeking eye care. We heard a similar example about audiology that spoke to how the interplay of changing technology and changing demands affects the strategies sites could use to meet patient needs. At

another site, respondents described how advances in telehealth technology have obviated the need for their site to have an audiology booth.

> …the problem with audiology has been, in the past the requirement for the audiology booth which is, oh, my gosh, construction needs to occur around it, so it's a big constraint. We're able now to do tele-audiology without that big booth. I mean, that was a game stopper right there, and as veterans are aging and there are changes to their hearing ability, the increased demand, and that's likely to continue for audiology. Well now we can do it via telehealth without even having to bring the person to the booth… [F-063]

Appendix E.1.4 IT Resources

Twenty-two interviews were conducted with VA leadership (15 VAMC leadership, 1 Central Office staff) and clinical staff (6 respondents) to gain insight into how telehealth is utilized within VA, what barriers exist, and what VA staff think about the potential for telehealth to expand access to healthcare for Veterans.

Telehealth and Access

In discussing the various aspects of telehealth that were the focus of interview questions, respondents directly and indirectly described many ways in which telehealth affects access to care for Veterans, such as by improving "reach" of specialist services and reducing travel burden. Respondents also described challenges to providing and expanding telehealth.

> Anecdotally I heard that an audiologist would get in car and do a circuit of helping people with their hearing aids going from CBOC to CBOC in traffic. If that were happening, they'd be able to see more patients. I've also heard anecdotally that there are no-shows when there is bad weather. I would think telehealth would help with that. [R-536]

> We provide reimbursement for mileage. If we can bring care closer to home then the patient is not on the road and there is less wear and tear on the car. There is also more chance of keeping the appointment. The money saved for travel can be used to care for more patients. There is better use of resources because of telehealth… Think about patient X who lives 398 miles away and needs a cardiology appointment. He is eligible for travel benefits and gets paid $147 for his visit to his VAMC but he lives across the street from a CBOC. If he can go to the CBOC for that care, that is $147 that will not be paid to him… This means more visits for those who are asymptomatic or not willing to drive. More visits, but the costs per visit go down. What is being paid for the patients travel is part of the budget for VA. The dollars not in the beneficiary travel line can be used to provide more care. [R-553]

> Telehealth impacts the no show rate. Although there is a no show rate still with CVT, it is lower than the no show rate for physical face to face visits. Vets are older and they rely on their kids to bring them in. [R-553]

> To be honest most of the time a telehealth visit will require more provider time. More resources are needed than compared to a face-to-face appointment. For example, if you have a provider at a main facility who wants to do a cardiology visit and you have a patient in a remote facility, you do not only need a provider available, but next to the patient you need someone to administer that visit. Sometimes that can be done by a non-technical person that can just connect the equipment. But if it is a follow-up of a cardiac surgery, they may need to have the physician that is following that patient present in the telehealth visit…*with* telehealth, by the time things are set-up it can be more complex. It is patient centered where savings are accrued to them rather than to the providers…To provide the services, you would need to divert resources in the way of taking over exam rooms used for face-to-face care. There is constant competition over space and each site has to determine how to manage this. [R-502]

We are down two positions in a four-position clinic in one of my clinics. At another, we're at full staff, five providers, in really a four-empaneled clinic, so that means there's excess capacity. So we use telehealth to see primary care patients from when the patient's presented in the xxxx clinic, our provider in xxxx sees that patient remotely and then documents that encounter. We do that several days a week as the imbalance of supply and demand surfaces for unforeseen and foreseen reasons throughout our service area…. This load balancing comes at the expense of continuity, so I'm not real happy about that. [F-104]

So we just hired a psychiatrist about six weeks ago—we brought him out here for a month of training… he is brand new to the VA. We trained him up on CPRS and VistA, and then boxed up all his stuff and sent it to Michigan and sent him back home to his home where he is now seeing our patients via telehealth. [F-104]

It's much less a technology issue and much more about the burden and the continuity of care that our veterans receive. And so I think it depends on how you use that technology—there are always pluses and minuses, and again, if you're using it as we are, as a level of supply and demand, I think that is an issue for the use of that technology, if that's how it's being employed. And so I think there's great benefits to access, but it comes at the altar of sometimes continuity, where our veterans have to tell their story or their medical history more frequently than they would otherwise. [F-104]

So on the far end at the CBOC, you need to pull a nurse or someone out of a PACT team to help take care of the vital signs, get the patient prepped and ready. And that's always a challenge because we're already having struggles with access. So we need to figure out some way to have the resources available to support the actual placement of the patient in the room, the scheduling that XXXX mentioned, and then completing the visit…The other time that is precious is the professional time and the specialist time. It turns out that it's actually not a super-efficient way of delivering care because basically the specialist is tied up for the entire time of that visit with that one patient. That's not the way it happens in our face-to-face clinics where you might have a professional, you may have residents, trainees, who are seeing patients and then they present to the attending. The attending goes in and spends like 15 minutes with the patient, as opposed to the full 30 minutes or 40 minutes that it might take for—or even longer—for a telehealth evaluation. So our providers who are doing this, and some of them are scarce professions, right, like a neurosurgeon, might be able to see 6 telehealth patients in a morning, as opposed to 26 in the clinic. So it's really nice from the veteran point of view because they don't have to travel, but we have to somehow realize some of the efficiencies that we get in face-to-face visits. Even if a neurosurgeon were seeing one patient at a time in-clinic, probably that neurosurgeon would be able to see 50% more patients in a standard face-to-face clinic than in a telehealth clinic. [F-024]

And it's a basic thing. I mean, for telehealth, you occupy two exam rooms automatically at different locations. So the organization consumes two exam rooms for one visit. It inevitably is more convenient for veterans. But it's not that efficient, it's not at reduced cost to the system…However, in rural health when you have remote sites where you cannot get specialties out there, then obviously it is beneficial financially because you've got to move the patient or you've got to get a provider out there. So when you're dealing with your rural areas, yes, there is a benefit. If you're dealing with areas within

commuting distance, not so much. But it does help, I think, financially for—support rural areas. [F-024]

For us to survive, we have to make people want to stay in VA and get VA services, and not send everything out. This is one way for us to help to improve our survivability. So it's probably critical to that in many instances. The other thing is that when veterans have to travel very far to see a specialist, even if we can get them in within 30 days, it may be a hardship for them and they may therefore tell their provider, "Please request non-VA care for me because I can't travel down to [the closest VAMC]." And that's very expensive for us, to send people out. And so there could be a business case for telehealth as well. [F-024]

You're going to have a provider doing telehealth, that's great. That reduces the travel time on it. But it still takes the time to do that, so it's still a half an hour slot, say, for the care. So if you can expand the number of veterans who want to and can utilize telehealth, you still have to have the provider here at the medical center to be able to interact with the patient. [F-064]

Telehealth can help in that you become more efficient at using your space and your providers, but the time is not going to change. You still need a half an hour to an hour per patient. If it's a new patient, they claim to need up to an hour. And if it's a follow-up patient, they need to have it up to a half an hour. [F-064]

So but one of the challenges with televisits has been that there's almost been this assumption that it in some way it will either make docs more productive or overcome some of the staffing challenges. And I don't think it's been clearly recognized that it takes at least as much time to do a televisit as it does to do an in person visit. But there's still somebody on the other end that's having to be there for that appointment. And they often take more time than it does to do a face-to-face… We've been told, that you can't mingle televisits with face-to-face visits. You either have a clinic where you're having telehealth encounters, or you have a clinic where you're doing face-to-face. For some of the docs that's a little bit of a challenge because it means that instead of taking existing clinics and putting televisits into open slots, now they've got to find another half a day to set aside as a teleclinic. [F-083]

For example, we have a physician that worked in [one of our urban CBOCs], whose parent is quite ill and [the physician] lives in [farther-out] suburbs of [that city]. And what we have done, because he's providing the care for his elderly parent, is we're allowing him to do telemental health from his home. [F-043]

They go to the CBOC. There's this room set aside. [The telehealth provider is] actually more efficient because he doesn't have the commute and he doesn't have to worry about the weather. XXXX gets a lot of snow. And the patients are happy. They know him. [F-043]

Right now, our transplant program, we used to bring the patients all from different parts of the country to get their initial evaluation. Now we do it all through telehealth. So they stay wherever their facility is. We have a MOU for those facilities. We set it up and we have a technician dedicated to helping the providers at both ends to set up the communication and the equipment, and the patient doesn't have to travel all the way over here just to see if they quality for the program, they meet the clinical needs of the program. That's been huge. [F-084]

They [patients] like it a lot. They like it. They say, "Wow, I didn't know that you could do this." There was one clinic that we started in XXXX. It's a prosthetic clinic and before the patients had to, in order to get their prosthetics equipment or what they needed, they had to drive all the way into XXXX just to get an education. And now we have a technician and a person down in XXXX and the person is over here in XXXX, and they connect through telehealth and the Veteran doesn't have to get on the road for two hours. [F-084]

The most challenging obstruction is the coordination of the telehealth schedule into the schedule of a provider who has other responsibilities such as face to face—it doesn't sync well. So for example, if you're in your face to face clinic, you can walk from room A into room B. But if you've seen three face to face and now you're supposed to see three via telehealth, to be in sync with that remote location and keep things moving in a correct fashion is an extreme challenge. [F-004]

I don't know if that saves the facility a lot of trouble. It saves the patient a lot. So I don't know if it's going to be cheaper. I can't say that. It may be more expensive but when you think about overall, from the economics in the country, we are all going to a big national healthcare system. I think patients are pretty happy to not have to drive 200 miles for care…We pay the patients to travel. You know that. We pay for mileage and travel. [F-023]

Telemental health is great. They like the idea of the remoteness, to kind of help them be more frank in opening up. [F-063]

We've pushed so much onto our primary care providers with the implementation of the PACT model, using telehealth, using My HealtheVet. I've not done a time and motion study, but if a primary care provider was maximally utilizing these models, they would see patients half of the time. Their nurse in their clinic would be seeing most of the patients that have chronic issues. They would be doing a lot of messaging with their panels, their nurses would be doing a lot of messaging, we'd have a lot of group clinics set up for chronic diseases, but we're not there yet. [F-044]

Our guys can read [the teledermatology image] within the next 48 hours, which could mean they can read it at midnight and send the results back, so if you could get your providers, I guess in an ideal world you could have providers seeing patients all day long in the space and then bring in a cadre of other providers that wanted to moonlight or something, do all the readings for your own CBOCs and all the other places after hours, and you would improve the efficiency of the space utilization. I don't know if we have that much volume yet, but we do that with radiology, where radiologists read films at home at night rather than coming in and having to access the data on campus. So it's good for the patient because you have faster turnaround. You could become more efficient instead of having someone reading a tele-slide during the day, they could do it at night so you could have that office space to see patients during the day if you have the providers, so I guess that's a good idea. [F-044]

We recently had a psychiatrist who needed to go home and take care of his ailing mother, and rather than him quit, we set him up so that he could see patients through tele-mental health, so he's still providing care to his patients, but not at the clinic. [F-044]

I've got a mental health patient [at one site] right now who is just a real difficult patient. He threatened the social worker at one of my clinics and so he's barred from coming to the clinic and he's not going to come all the way in here, so he's just constantly on the phone. I mean, 50 times a day, making phone calls to our providers. We tried to use telemental health with him, but he doesn't have a computer and we can't do it, so one thing that would be helpful is … and actually the hospital down the street put in an innovation grant and was funded to provide the hardware to Veterans with, like, hot spot cards or something to Veterans so they can receive their care, especially mental health patients, so they can receive their care without coming into the medical center....We need to provide the care. The VA is obligated to provide the care, but sometimes it's very, very difficult. In the private sector, they say, "You're off my panel," get away from me. We don't have that opportunity. We've got to provide the care, but [the patient I was talking about], he can't go into the clinic because he's threatened to do very bad things to the staff. He won't come in here because our police will escort him around, so using telehealth will give him the care that he needs to, hopefully, stabilize him, but he doesn't have the infrastructure to receive the care. [F-044]

Our Nephrology program…they had a 10.8% no-show rate in the renal clinic and through use of telehealth the rate dropped to 4.4%. [R-525]

Telehealth is not tremendously efficient. I mean, it's great for the patient because they don't have to drive someplace. And I guess it's efficient for physicians because they don't have to drive to someplace. But it's not necessarily a tremendously efficient way to have an office visit. [F-164]

Telehealth gives isolated veterans a bridge to the outside world. Some of my patients in remote areas became confident enough from virtual care and then would start to come in. [R-518]

The facilities use telehealth tools to encourage communication with their spoke facilities when they have medical needs that surpass their capabilities. It is mainly a communication tool in order to do a warm hand-off of patients. [R-532]

And then other issues have been that it takes a provider or mid-level or nurse or someone to bring the person to the room to sit them in there, and this requires staff. [F-195]

I don't know how it goes in other divisions. I can tell you in Cardiology we're not ready for it because it's adding on a service where physicians are already stretched and it's not an efficient service…it would have to add to another timeslot in addition to the times that we're already spending…so if you wanted to do that, you would hire more clinic physicians so that the work was spread around instead of trying to put more work on the same group of people. [F-164]

And telehealth is excellent—I think the patient themselves may not know it can happen. If you ask me, it sort of takes so much of my time, much more than when patient comes in, so I don't like it. Not much more, but more—like, the patient will take 20 minutes and here it will take 30 minutes, which is substantial. Then it means that per hour, in-person I can see three patients instead of two patients, and then it multiplies, so from that standpoint, I don't like it. But from a patient standpoint, I think it's excellent. [F-184]

Telehealth is not a replacement for care; it's an enhancement to, and I think it's kind of, like, high tech, high touch. [F-005]

Telehealth impacts access in two ways. There is the convenience of it. Not having to drive two hours but rather 30 min instead…It offers convenience for specialty care not offered on site but also for things offered at your local CBOC…you can redirect locations that have access to those that don't. For example, primary care and mental health. With teleprimary care or telemental health you can get more timely access when services not available right away available at local site because of staffing… this allows for more efficient use of existing resources… this started first with specialty side and now we are moving to more and more primary care. [R-501]

Well, at my old site we were going to lose a provider. …He got tired of the commute. He lived close to [another city]. He just [said], "I'm done. I can easily get a job [closer to where I live]." We said, "No, we want you," so we used it as a retention tool. We allowed him to see patients from his house so he wouldn't quit…[telehealth] can be used as a retention tool or even a recruitment tool… [F-044]

Telehealth offers the opportunity for more continuous care – can track BP, oxygen saturation – I get an alert every month. If perfect, can make visits every 6 months instead of 3. This is home monitoring types of telehealth. So now my well controlled diabetics are being seen 6 months, opening up slots for other diabetics. [R-519]

Appendix E.1.5 Access/Quality

In this Appendix section, we augment the main Assessment B findings on access and quality, with supplemental information from VA interviewees. The access and quality VA interviews were conducted with administrative staff members and clinical staff from VISNs, VAMCs, and CBOCs.

Table E-4. Types of Interview Questions by Interviewee Type

Interviewee Category	Number of interviews conducted	Basic provider questions (eligibility & initial access, coordinating care within & outside of the VA)	Question on making & attending appointments	Question on measurement (important domains of access)	Question on the domains of access	FULL Access and quality measurement questions
Healthcare Workers						
CBOC providers (5 physicians and 1 nurse)	6	6		6		
VAMC providers	10	10		10		
VAMC chief nurse executives for patient care	1	1	1		1	
VAMC paraprofessionals (3 social workers, 2 medical support assistants; 1 business office)	6	6	6		6	
Administrators						
VISN quality management officers	5					5
VISN Chief Medical Officer	5					5
VAMC Associate Director	3					3
CBOC Director / Medical Director	2					2
CBOC Site Manager	3	3			3	
Total (by column)	41	26	7	16	10	15

These interviews do not reflect the perspective of the Central Office, or VA leadership. Since the majority of the interview content focused on access, we will primarily discuss access to the VA in this section.

How VA Staff Report on Overall Access to the VA for Veterans

A range of reasons was given as to why veterans do and do not enroll in the VA. Interestingly, "word of mouth" and the physical proximity of a Veteran to a VA facility served as both a reason to enroll as well as a reason to seek private health care. For example, living close to a VA facility was cited as a reason to seek VA care, while for others it led to them looking for alternative health care options closer to where

they lived. Once a veteran is enrolled in the system, VA staff indicated that in most places, most of the time, access to care is pretty good where they work.

> There are enough facilities in the general area that we can access an inpatient level of care as we need it and when they're discharged, we so far haven't had any problems getting them in in the time—certainly not in the VA mandated time frame—and what we want to do is usually shorter than that. So no, we haven't had a problem with that. [F-106]

There were problems with providing access in certain locations or at certain facilities, and VA staff we spoke with a very aware of them. Specifically, geographic barriers provide a clear and obvious set of challenges, but one that is difficult for VA staff to overcome. However, some additional services are available for rural veterans in many of the areas we spoke to (more on geographic barriers below).

> There's also … volunteer drivers who pick veterans up at specific locations and bring them to the VA. And then even within the VA we have a transportation system with a few shuttles that go out to specific areas like XXXX and XXXX and will bring patients into the VA [F-076]

A smaller group of respondents were asked about the factors that help or hinder access to the VA. With respect to timely access, the availability of appointments and staffing was referenced as a challenge whereas efforts to extend clinic hours and schedule subsequent appointments were viewed as helpful steps forward. The lack of transportation, traffic, and parking were mentioned as geographic barriers, but voucher programs and specifically the Choice Act were viewed as concrete steps to address these challenges. Regarding financial access, some reported it was difficult to understand if and how income status impacted eligibility and determine the cost of services, though the majority of respondents noted that VA care was far more affordable compared to private sector care. To address digital access, a lack of familiarity with specific programs such as MyHealthVet or telehealth more generally was noted as a barrier among providers whereas respondents listed a lack of access to technology (e.g., among homeless Veterans) or knowledge about how use technology (e.g., among older Veterans) as challenging. Despite this, respondents generally felt that efforts to improve digital access (e.g., through training for providers and help desks for patients) were important. Finally, regarding cultural access, some noted that while efforts are being made to ensure providers as sensitized to the unique experience of Veterans, more should be done to increase their awareness to a range of things such as military-specific language and slang, as well as the changing demographics among Veterans.

For VA staff and patients, access isn't just about providing care within a timeframe. Access is also ensuring trust and confidence that a veteran's provider or health care system will be there when they need it.

> I mean, my experience prior to VA as well with primary care delivery is that if you demonstrate to patients that they can get access to you pretty much whenever they feel like the need to, then the urgency with which they try to get it drops, because they're not panicked all the time about "Oh, my gosh, something terrible's happening, and if I don't start now and press hard, I'm going to get delayed." If they know that they can call or they can send a secure message or they can be seen briefly to get a question answered, then suddenly a lot of that pressure goes away. And except for those few outliers who have what I think are usually psychological issues about fear and about

whatever, if you carve out those few, the vast majority of patients just feel much more comfortable that if they need a question answered, it's going to get answered and it's going to get answered in a timely way, so "I don't need to be calling six times, I don't need to be demanding to be seen, 'cause if I ask to be seen, I'll be seen." [F-070]

Everyday Efforts to Measure and Improve Access

To focus first on the measurement of access, respondents reported that a range of measures was used to evaluate access to care. All respondents reported using measures required by the VA and many mentioned challenges associated with using measures that did not appear to be evidence-based. Relatedly, many acknowledged the need to evaluate patient preference but noted the difficulty in reconciling any gaps between clinically indicated guidelines and patient preference Respondents noted the need to more systematically collect data on patient experiences and satisfaction—recognizing that access and quality are so closely linked—they highlighted that the intense focus on access often means patient experiences are overlooked and that improving patient experience could really impact access.

> … sometimes that 14-day measure isn't realistic based on the patient's needs … sometimes you're striving to meet a measure instead of providing care for the patient results in adverse things, so I would just be cognizant of when we put measures in place, are they for the right reasons? What's the intent of the measure and are we capturing the appropriate thing? [F-060]

> It used to be access had to be within 14 days and seven days and now they've relaxed it to 30 days. Again, it's all about communication. I'll just repeat: if our providers schedule—I mean we can look at the 30 day, no, that's fine, it's 30 days within your desired appointment date or your return date. But really, if we have a patient and they want to be seen sooner, that's what we're here for. We work as a team and whatever it takes to get the patient in, we're committed and we do it and whether that performance measure's there or not, we have 30 days now but if somebody wants to be seen within a week, we pretty much see them within a week because that's just how we are. That's just how we operate. [F-250]

Additionally, several noted challenges around standard measures being able to accurately evaluate the local context.

> So I think in an ideal world, right, you would sort of have the big measure. Central office would give you the big measure, right? …And, here's the things we're going to look at for access, let's say. And you would have the freedom to figure out how that works for you, and what you need to measure for yourself to make it work for your own individual setting. So the problem… Here's what I think happened in the system. What happened in the system was when there was more flexibility at the local level, when there were big national requirements but there was more flexibility at the national level, the organization got into sort of this making excuses model, right? I know that's the measure, right, but here's what's going on locally and therefore we can't meet that. And here's why we can't meet that. Not… It wasn't, "We're unique. Here are the unique things we have to do to meet that." It was, "We're unique and therefore we can't meet that." [F-113]

Further, respondents mentioned either developing additional measures and/or processes (e.g., monthly meetings to discuss access issues at the specific facility) to better understand factors impeding access to

care. Finally, a few respondents indicated that they would like to have more input into the process of measure development.

> One thing that's missing is once they develop a measure of access, run it by the field to see if it makes sense. We've got a ton of smart people who really know what they're doing. They're never asked. And when you give it to them after the fact then they change the measure and then we get into this trouble. [F-141]

Facilities engaged in a variety of day-to-day activities to improve or sustain access for veterans. While a few programs appeared linked to larger, nationally coordinated efforts (e.g., diabetes control), many programs and activities geared toward access improvement were local initiatives. From developing unique partnering arrangements with local providers, to developing innovations in customer service for veterans, we found the range of activities and programs varied greatly by location.

> It's actually a contract that we've done with the community hospital… so we can do our intermediate complexity level procedures at that facility…. It gives our surgeons the ability to keep up on some of those skills and it gives access to our patients who otherwise would have to drive at least 250 miles or be transported to another VA. That's how far they would have to go and so it's been a very positive thing that we've done, and we have a good relationship with the local community hospital. [F-002]

> I think we've all experienced [that frustration]—with large organizations where you call and you're either put on hold for a long period of time or you have to leave a message and you wonder am I really going to be called back… So what they've done is they have created a gigantic call center down in [X-Location]… …And at that point they are able to track how many lost calls come in, how long it takes to answer each call, how many minutes per veteran. … Those patients are automatically routed to the call center where they should be able to speak directly to the veteran and get them—if they can't help them—they get them to where they need to be. Eventually our clinic when they dial our general number which would be XXXX, eventually our general operator line will be transferred automatically to the call center … WE do something a little bit special here in [Y Location] because again, we're a smaller clinic and we have given all our veterans—I have made business cards for each team—and so we give our veterans the option, so for each team—I make them right here in the clinic, they're homemade but they look very professional, and we have the number for the nurse, the number for the scheduler, the telecare nurse, and so they do have the option of once the call center is in effect, and if they dial XXXX, they won't talk to anybody here, but we have these business cards so if they still want to call and talk to their scheduler or talk to the nurse, they will have the direct line to call into our clinic. [F-250]

Access to Coordinated Care within and outside of the VA System

Overall Care within the VA System

Among Veterans who seek care only within the VA, respondents noted that care was very well coordinated, especially as the VA has been at the forefront of electronic medical record implementation, which has streamlined communication between the services provided. Patient Aligned Care Teams (PACT) was highlighted as further contributing to the provision of well-coordinated care. Further, it was noted that VA has made substantial advances in the provision of care to certain groups such as homeless

Veterans and female veterans, alongside those with particular health concerns such as mental health and substance use and abuse. In general, respondents reported that high quality care is provided to all Veterans. It was noted by a small number of participants that the current public and political challenges faced by the VA sometimes lead to pressures in decision making on access issues that may not otherwise exist.

It's kind of political now, how does the Secretary approve closing a CBOC when on the front page of every paper there's access issues. So at this point the veterans groups are on board, the local politicians are all on board, the local elected officials, the veteran's service organizations are onboard and we still are not able to close it. So it's a money pit. [F-073]

Providing Access Outside of the VA is Complex and Unpredictable

The importance of local autonomy and the need for centralized processes were referenced as consistent tensions that persist among efforts to improve access.

> They're certainly dependent on how well we're using the scheduling package. I think the scheduling process… And I'm not all that down on the package. I don't think the package is fabulous, and I think we need a new package and it leads to all kinds of difficulties, but I really think our process is unnecessarily complicated and I think we just invite people to do it wrong. Sometimes I guess sometimes deliberately wrong, although I don't seem to run into that very much. Sometimes deliberately… Let's see. What's the best way to say this? Deliberately doing different from what you've been told in the scheduling package but in an attempt to do the right thing for the patient. [F-113]

> Well, I can give you a great example that we do here in XXXX and it really took an act of Congress, actually, to finally allow the business office to allow us to do it. We do not have radiology services here, so we have…our clinic is like two blocks from, it's called XXXX Radiology. It's a very large group that has several locations all over town and so we have built a rapport over the number of years with them that we would send our patients there and before, it was a contract, and so they would contract them. And easy access (inaudible @ 38:01) if there was a question with the order, they call us direct. The providers have a direct link to look up the result in…it's a secure website. If they send somebody for a hand X-ray, then the provider here has access to it. So it was a great relationship. So what happened when the non-VA care and VA Choice, they changed it all around and so all of a sudden, non-VA care, we couldn't have a contract anymore. And so it was horrible, I mean it was a nightmare. July 31 they said XXXX, you can't send your patients to XXXX Radiology anymore. We don't have a contract, it's all going to non-VA care. And so we—oh, gosh, it just gives me chills when I think about it—so anyway what happened was at the beginning, this shows you how things did get straightened out but at the beginning it was terrible because XXXX Radiology were told they would not get paid. The VA actually told them if you do an X-ray for XXXX, you're not going to get paid unless you have this authorization and all this. So we worked till midnight trying to get authorization forms and get a consult set up in the computer. And it was going pretty smooth and all of a sudden Tri-West came in which a third party administrator and they would see our radiology consult and start calling patients and telling them to go other places. Well, an example would be a mammogram. So if I had a

women's health provider and we have our mammograms done at XXXX Radiology and we know the patients are going there, and Tri West calls and says we're going to send you to [another radiology provider]. We don't know if the picture went there, and we don't know if we're going to get the records. I mean we're talking it was like a major nightmare. And finally we got an agreement through the business office that the third party administrator was not to touch our consult to XXXX Radiology, and that made a huge difference for us so that we were able to continue that relationship. But that's all non-VA care but the way it was set up before with the contracts it was a little bit smoother. We've finally got it smoothed out now. And then on top of it, they didn't pay XXXX Radiology, the fee basis department for care didn't pay Radiology for probably at least 500 denials for claim denials. And at that point XXXX Radiology called me and said I'm not sure we can continue to do business with you because we haven't been paid for like 500 imaging studies. And so I begged. As the manager here I said, oh, I beg you, I beg you, send them to me. I will work on it. I had to look up 500 patients. It was new to our providers, they weren't used to putting in the consult for each one, but instead of the fee basis department, simply looking to see that there was a result there, they just started denying all these claims. So these are the type of things that can really affect the access for the veterans and also affects good patient care. The good news is it's straightened out now after three years, and they have promised us that they will not deny any claims for XXXX Radiology unless they look at it first and then they come to me and if we need a consult, I take care of it and make sure it gets in the computer. But that's just an example of how things can get really out of whack if you don't provide the services on site. [F-250]

A Constantly Changing Process

The constant changing of processes was also referenced as challenges to improving access.

It's been a real struggle for them to know if they're eligible or not, and the training of the people answering the Tri-West or the VA Choice, whoever—I do not even actually know—who mans that. I don't know if it's a third party administrator manning the call center or if it's actually the VA administering the call center. But that really has to improve. The veterans get a lot of misinformation and the runaround and it's not good because it adds extra stress. So an example is the other day I had a patient call, and he was real upset because he lives probably 45 miles from our clinic, he's an elderly gentleman and it's a hardship for him to drive. He lives past XXXX, which means he has to drive…it's a busy XXXX highway. It's just busy. There's a lot of trucks, he's elderly, and I can completely understand why he may choose to want to go with VA Choice to see a provider in his town, which is a mountain town. And when he called the VA Choice line, first they said you're not eligible, then they said he was eligible, then they said well, you have to drive to XXXX and get a consult for that. That's all wrong. So that is one issue that I think is hurting the VA. If they're going to offer that, they need to make sure that it is well staffed and that people are educated, number one; number two, non-VA care is a huge…it's such a bad thing for our veterans. They go through so much. It's so frustrating, you know, the non-VA care, they need to—if this isn't on the topic, then I'll stop, so I don't want to take you off, but here's the problem, if you want problems, this is the problems we see. [F-250]

And I'll tell you why I'm not sure. WE changed the system so much, I'm not sure who's happy anymore. When patients got the appointment they wanted, and then there wasn't access there, we measured that. Then all of a sudden we went into recall and now we're not giving them appointments and they're not happy because we're not giving them appointments, we're denying them that until they call in. So I don't know if they're happy or unhappy with the access or happy or unhappy with the process. The telephone lines don't work, so they can't even get calls. So recall doesn't work for that reason. We have 78,000 pending recall appointments in one facility; 78,000. And that's not our biggest one. So you've got a bunch of people trying to call in on phone lines that don't work and are they happy? No. I think they feel they don't have access. [F-141]

A Complicated Process

Not only are the processes constantly changing but they can be complicated, leaving lots of opportunities for things to simply fall between the cracks. For example, some veterans have had problems because they didn't realize that multiple authorizations were needed for multiple trips. Relatedly, some say it results in 'piecemeal' care and doesn't result in the provision of comprehensive care. Notes from one interview highlighted the fact that sometimes, it a patient has Medicare, it can be easier to say "use Medicare" just because it will be a more simple process and the patient may get seen sooner (Notes from F-031). The following illustrates come of the complications faced by Veterans seeking care.

A lot of it would be with the non-VA care and with the VA Choice, the way that was rolled out. That's been a real…I think it's been a nightmare for many of our veterans. But we are small enough that we work—another we do at our clinic, too—actually monitor to keep tabs on all the different services because we offer audiology, optometry, dental, kinesiotherapy, a large mental health portion with psychiatrists, psychologists, social workers, counselors. We're integrating primary care with mental health. At our clinic once a month we actually meet with every service representative and although we may not be their direct supervisor, as the manager, we meet as a team. And as a team we work to make sure that our veterans are getting what they need, and this may be something might be a little bit unique to our facility, but if our kinesiologist says I need 10 more overbook slots because I'm going to have a group come in, immediately I'll be able to go in and I'll adjust the clinic and add those slots to them. We have such a great working relationship with all the services that we really pay attention to the needs of our veterans here. [F-250]

Going forward, respondents made suggestions regarding how VA access could be improved:

The only thing with access is that when and if Congress continues to change things, that there be a good time frame to actually educate and train their staff so that when it gets rolled out, it gets rolled out as it was intended and there's not so much ambiguity. .. But when something is thrown out there to happen and—my wife got her Choice card before I even fully understood it as an employee—when things are done that way for political gain it really hurts the VA and it hurts their veterans. [F-102]

I think that by and large, the culture was "We are not really primary care providers, we're a secondary backup system, we're a safety net, and we really need you to

acknowledge our needs as a system and work yourself around those if you're the patient." I think a culture that says "We're here to do our best to meet your needs, tell us what those are, and we're going to try to help. We're going to try to do that quickly, efficiently, and even if you're being unreasonable, we're going to try to respond to you in a reasonable way." [F-070]

The Mission of the VA is Important and Matters to Veterans

The end of every access interview guide included a question where respondents could indicate anything about access not discussed to that point. Our research team was surprised to note how often respondents took this unstructured moment (or others) to tell us what they thought was most critical about access at the VA:

First, VA staff are committed to veterans, and willing to do more (even for less) to provide access to care for them.

> We take care of some amazing people… (Notes from F-031)

> We can do anything in VA and we have a very strong health care system and we've got some very talented people who get paid way less than the community that are dedicated to serving our veterans and there's no greater mission [F-102]

Second, VA staff and facilities are in routine contact with their constituents, providing another layer of access to the system. Certain types of VA facilities are required to have regular meetings, and …

Finally, VA staff indicated that veterans within the VA system have access to something 'special.' We did not come into this analysis prepared to measure—and indeed this may be inherently intangible—the 'specialness' of the VA.

> Well, I'll just lead with one thing that's different when a veteran comes to a VA clinic and it is really different, is that they're treated special. They're just not a patient in a waiting room. They're a veteran. And I think eventually even if the patients decide to use Choice—and I think it's really…my personal opinion—it is nice for the veteran. Some of our veterans have to drive down winding mountain roads. I drive myself because I'm from this area so I pretty much know each route to get here and where the patients live. And so I think that there is a purpose for the VA Choice … But there's nothing like coming to the VA. There's nothing like coming when you are with your fellow veterans, and all the different programs that we offer right on site, and all the activities. We have so many activities here for our veterans. We have our welcome home event. We have popcorn in the lobby, we have snow-cones. Our veterans service organizations throughout the city are so supportive of us. And it's just so nice for our patients because I believe that we really do treat them special.
> [F-250]

But more than anything else, what VA staff wanted *us* to hear is that Veterans aren't accessing *any* health system when they go to the VA. This is a community, dedicated to their well-being.

Appendix E.1.6 Policy Options

Policy Options

Our interviews with VA Central Office leadership, VA providers, VISN directors, Congressional staff, Veterans Service Organization representatives, third party administrators were focused on identifying perceived challenges to VA's capabilities and resources for providing timely and accessible care, and potential approaches to addressing those challenges and improving VAs ability to provide timely and accessible care to veterans. Respondents consistently identified issues and solutions across the categories of **workforce, information technology, private sector care, physical infrastructure, and standardization.**

WORKFORCE

Respondents described various challenges to maintaining an adequate workforce to sustain timely and accessible care, including non-competitive physician salaries, difficulty recruiting providers to rural areas, lack of support staff, national workforce shortages, a burdensome hiring process, and a funding system that lags behind actual demand.

Non-competitive salaries

> But the market… The pay is not comparable in all to the private sector. So I think it's still very difficult to recruit good people with the salary and limitations. [V-74]

> It's going to be an issue for VA to attract those types of providers, particularly because of salary rates, special salary rates and etc. that they have. But I think that in order for VA to be a key player in that big arena they're going to have to enhance their salary authorities to be competitive with the private sector. [V-01]

> …there are some specialties that we're just not going to be competitive in the recruitment process. So, what's an example? We're not going to be able to pay a neurosurgeon or an orthopedic surgeon what they're making in the private sector. [V-25]

Recruitment difficulties

> Right. And also we had trouble and still have trouble under the Choice Act finding providers in rural areas. And so, it's sometimes, you just can't find anybody to provide the type of care you need within the limits of the mileage that they're trying to provide or closer to home. So that's another issue. [V-74]

> And so right now there was five million dollars in the Choice funding to provide for staffing and resources, and so the problem that VA is facing, though, with that issue, they're competing with the private sector for the same resources. And so in rural areas it's a very big issue. Metropolitan cities where—particularly in the specialty care arena—where you have a lack of specialized care; a psychologist, psychiatrist and so forth. [V-01]

Inadequate support staff

> So that our physicians may not have three rooms per physician when they're in clinic they may not have the support staff that allows us to optimize three rooms so we can

move people in and move people out as they're seeing a third patient. So I think that's really the first area I would look at is I think we may have a number of physicians, they may be working X number of hours a day but they may not be as efficient in those eight hours as someone who has more examining rooms or a greater staff to support them. [V-25]

National workforce shortages

Well, there's a shortage…psychiatry is, in terms of the medical professions, psychiatry, it can be difficult to recruit specialty…actually, in the report that was done by VA in terms of looking at its own staffing shortages, psychology was also noted as a difficult to recruit profession. However, more importantly than broad statements like that is the fact that it's really a local problem. There are some markets and areas in the country where it would be fairly easy to recruit a psychologist or psychiatrist of other mental health provider, but there are other markets and the boundaries are probably geographic where it's very difficult. There aren't mental health providers in the community and so when VA tries to either recruit or as we may talk about later when we try and send out veterans or provide veterans through the Choice Act with opportunities to get mental health care in the community, there just aren't the resources. [V-39]

But, you know, it's not easy when now across the board a variety of positions are being recruited by the VA when, frankly, nationally we don't have enough providers for the population in this country. So at some point when VA does pull on additional providers' staff, I think it will be way more difficult to find replacements for people who retire or leave for whatever reason, simply because we don't have enough providers within the country… [V-17]

And because if you look at the overall stats of clinicians in America, it's not just military VA coming into a real shortage, you're coming into a big shortage in a society. There aren't going to be enough providers. [V-16]

Burdensome hiring process

The hiring process takes long everywhere and you do miss some really – you have an opportunity where you miss out on really talented folks because they get tired waiting and then they go elsewhere. So that's very real everywhere. [V-19]

But it takes a while to get awhile to get people on board and spun up, etc. [V-39]

Lagging funding system

So today we get funding, for example, to hire staff or to purchase care or to do whatever, but the fact is those things require a year or two to execute. The budget cycle…when somebody comes in in June and gives you three billion dollars, let's say— I'm just making that number up. I think the number was five billion—and they say, "Oh, by the way, you should execute this by October"…even though you may need that, the responsible person can't do that in a responsible way. So I think some of the dilemma at this point is not that the VA has been slow to respond; I think the VA has been very active and very aggressive in responding, but it takes a while to get things in place to really start to affect a change, which I think there has been some changes made. [V-39]

We use Verifunding, so your funding is a population based funding that trails by, I think, two years. So you have a growing population but that growing population, you don't get the funding for that for two years. If you had the funding for it, you can't hire the people you need there, and you have a growing demand. [V-39]

Overall Issues

What about our systems that... You know, it's not that we can't necessarily recruit, can we successfully recruit? So, how long does it take to get a primary care provider credentialed and privileged in the VA? How long does it take them to get appointed? And are they out there? Are we paying them? We each got a small increase in primary care across the country for physician pay. Can we pay them the market value? That has to be fought locally, because we're geographic. It's based on the market. I think the idea that staffing comes into play and can support access is critical and it can't go away. That's a critical aspect. [V-43]

So we knew we had some problems the VA's been struggling with for a long time. Lack of providers in the system and the challenges in recruiting and retaining providers in VA, lack of providers, period, in the country. That definitely makes it a challenge. And also the lack of space and those kinds of… the infrastructure and the sort of supporting considerations that make it more difficult to get folks in. [V-14]

Possible solutions to addressing workforce challenges described by our respondents include:

Use of partnerships to augment VA workforce

I think there are some opportunities for us to partner with academic medical centers and our academic affiliates to help recruit qualified and competent specialists, but specialists who may be interested in education or research, and may not be able to get that protected time if they're in the private sector. So one option is to look at your partners and see how you can leverage partnership and what we have, which is the combination of clinical care, research and education with a specialist interest. [V-25]

I think one of the things we haven't looked at, we've focused on our academic affiliates in larger communities but I think one of the things we haven't done is look at are there ways we can partner with community hospitals in facilities, in towns that don't have an academic affiliation so that much like we partner with an academic affiliate, we partner with a community hospital and maybe between us we could buy somebody that neither of us individually can buy alone. And I think for some of our smaller facilities, and for some of the smaller communities, that's a real opportunity, it's win-win for both. [V-25]

Use of non-physician providers to augment VA capacity

We in some facilities, in some clinics, there might be or there might have been usage when it was more difficult to get physicians to hire nurse practitioners or physicians assistants, and that tends not to be the case in VISN XXXX because we can hire physicians. But at times in some of our locations we will also utilize nurse practitioners and physicians assistants. [V-17]

There aren't going to be enough providers… Particularly the nurses, and that's why many states are now giving much wider range of practice to nurse practitioners. Many will probably follow with PAs, giving them a wider scope of practice. [V-16]

Raising salaries to be market-competitive

> But I think that in order for VA to be a key player in that big arena they're going to have to enhance their salary authorities to be competitive with the private sector. [V-01]

> We've pushed them to make special exceptions so that they can increase the base salary for psychiatrists and so we can recruit more psychiatrists. [V-14]

Respondents also noted that even with increased hiring of providers, optimal provider productivity is dependent on other factors; e.g.: enough space, enough support staff, etc.

> Staffing has a downstream cost, right, so you hire more staff; you have to have more computers, right? You have to have, for higher, faster access. You have to have more buildings. So it creates another host of things. But I like the idea of thinking about measures as signals for the organization to keep tabs of what's going on. [V-39]

> I'm going to start with space because as we have looked at comparisons with the private sector, we have been told, "you're only seeing 10 patients a day but the private sector can see 33 patients a day." I think that ties to the fact that we are not set up as a fee-for system, fee-for-service system, we are set up as an accountable care organization so that we don't necessarily staff to optimize our productivity. So that our physicians may not have three rooms per physician when they're in clinic they may not have the support staff that allows us to optimize three rooms so we can move people in and move people out as they're seeing a third patient. So I think that's really the first area I would look at is I think we may have a number of physicians, they may be working X number of hours a day but they may not be as efficient in those eight hours as someone who has more examining rooms or a greater staff to support them. [V-25]

INFORMATION TECHNOLOGY

Respondents described various challenges to leveraging VAs IT infrastructure to support timely and accessible care. These relate to an outdated and unnecessarily complicated IT systems, particularly related to scheduling software, lack of interoperability of the electronic medical record, and separation of the IT organization from VA healthcare delivery and operations. Tele-health was consistently raised as a potential solution to increasing VA's capability to provide timely and accessible care, although some issues such as ensuring IT support and budget were raised as considerations salient to the success of tele-health.

Outdated IT systems

> One not surprisingly, and one that I'm sure you have heard from others, is the totally outmoded and inadequate scheduling package, as well as some other IT packages that we are using that need to be upgraded.[V-17]

> There's no good excuse that at a higher level in our organization, the upgrading and modernizing our IT systems has not occurred. [V-17]

> You know, I didn't think I needed a person to walk me through the system. So we just need to simplify it. The same with the scheduling package. Make it such that, you know, a not very bright person could figure out how to do it. And we in VA seem to do just the reverse of that. [V-17]

Our scheduling package is, you know, 25 years old. When XXXX talks about multiple modalities care, what you might not realize is that in the VA every single modality has to have a different scheduling grid. We can't see all of them together. So, if you're a clerk and your provider has telephone care and they do some Telehealth and they have secure messaging time or whatever, all of that is on a different scheduling screen. You can't mesh and see an overlay. So the work of primary care, the sheer work of it locally, is almost overwhelming. [V-43]

Lack of interoperability

I used to believe that we should have an integrated medical record, but now that I am dealing with the DOD, I understand. Think about this. In today's atmosphere, where the Department of Defense computer systems are the last think I want to have hacked. Then you have an insecure, it has time and time again been proven that the VA's Internet is not secure. Time and time again. We actually briefed the Secretary on this. So, I sit there and say, "No wonder DOD doesn't want us to have direct access." [V-28]

We have a hard enough time sharing electronic medical records within the VA. Only recently has it become somewhat seamless. But now when we try to expand that between DOD and VA, we're having a huge problem which reflects primarily on the claims side of the house. But it also reflects on the healthcare side. So if we can't get two sister government organizations that are funded by the same funding source, to get on the same electronic health care record system, there's not going to be possible to get the civilian population to work in a comprehensive manner, in a seamless way. [V-01]

Organization of IT accountabilities

Well, I think that one of the barriers is several years back, I don't remember exactly when, there was a reorganization when IT was separated from VHA. IT is a separate silo in VA and I think that, quite frankly, had the IT community were divorced from the healthcare mission in VHA. It's noticeable at facilities. Just the development of the electronic health record, which occurred in VHA, occurred with developers in medical center settings working with clinicians to pull together an electronic medical record that met that needs of clinicians, and that was enormously successful. That ability to work directly with developers has been eliminated. The organizational separation has cast IT out of its support role. IT is a support service, it's not its own entity, and the separation that we have currently, like it's a separate entity and it's not in support of the agency mission, certainly for VHA it's not in support of the VHA health care mission. [V-17]

They don't get it that healthcare mission trumps all, and that's manifest in ways like shutting down a service without adequately consulting with all of the people who are involved, so that you might have patients coming in who are scheduled for care, and the clinicians will find that, oops, that service has been shut down or, you know, utilities have been shut down without recognizing that when work needs to be done, it's done after hours, so that part of your goal is to minimize or eliminate disruption to actual healthcare service. But now with organizational lines being what they are, there isn't that kind of collaborative working together. [V-17]

I don't know a lot about what we're doing with IT. IT, as you know, it's separate from VHA now. When it went separate, we kind of seemed to lose control over what—that's actually one of the barriers. When it used to be under VHA, it seemed like we could do

things more locally, and yet, when you talk to IT, they're saying that VHA, this is what they sent us as their priority. So we do send up our priorities but it seemed like that at like a VISN level or medical center level, you lost any kind of ability to get any IT projects done. It has to a roll up at the VA level. So it was quite challenging. [V-74]

Tele-Health as a solution

I think one of the things as an overall system that maybe we're a little slow in doing but is a tremendous opportunity is our use of tele-health, tele-medicine, which is something that I've been in discussion with that office in terms of how do we develop a better set of business rules and processes, so, for example, if you're in a part of the country that can't hire a provider or find a provider, if that examination can be done via tele-health with, let's say, a part of the country like our part of the country. We can even buy the provider, if you will, and then develop that tele-health relationship, so I think we need to do more of that. [V-19]

One is that it's hard to hire dermatologists. They're expensive, and I think a lot more people need to see them almost like primary care. I don't know about you, but I know when I was growing up we used to slather baby oil all over ourselves, put ourselves out in front of the sun, and there was probably a lot of skin cancer lurking out there. But they're pretty expensive. There's some dermatologists who are largely involved and build a very lucrative practice just around doing cosmetics related things. So dealing with some serious skin illnesses, they're not that easy to recruit; Q - Right. Okay. Excellent. So telehealth also potential in places where you're slightly understaffed. [V-17]

We just did our first C&P exam through tele-health and it was really tremendous because this was one of the most longstanding wait for a C&P exam for mental health for a homeless veteran, and part of the reason was because of having to track down the veteran and then get having to get him to a provider, a C&P provider. It's a difficult population sometimes to engage, but we were able to get the veteran to the medical center. It happened to be here in the XXXX and then do the whole exam through tele-health and the exam was done and completed with results within just a couple of hours. [V-19]

Our goal in thinking about access is to make sure that the veteran has access to the care that he or she needs in the time that they need it. And so the challenge then is to look at things like telemental health. There may be a mental health provider in the clinic, but maybe they don't provide the kind of service that the veteran needs, so it's not just looking at if there's someone on site, but if there's someone on site who can provide the care that the veteran needs. [V-39]

So I think there's a lot of opportunity in virtual care. It has the advantage that I don't need to have a capital infrastructure in a lot of cases. I don't need to have three rooms per patient. And so it makes the use of my resources more efficient. And it's more convenient for the patient and in some cases they can be handled by individuals who don't have to be a doctor. So you've got the advantage of being able to effectively use differing levels of resource. Nurse, physician, nurse practitioner. You've got the ability to use your capital infrastructure in a different way and you've got the ability to provide services at different levels. And maybe they just want to ask a question and you've got the answer in some sort of reading material and that's all they want. [V-25]

> I think the second prong is the expanded use of telemedicine. If I'm remembering correctly, I think close to 40 percent of our patients now, we're touching, if you will, with some mode of electronic communication, be it clinical video telehealth or secure messaging with their providers. And that's, I think, going to continue to be a critical part of the process or the solution to providing more accessible care to people. [V-18]

Enthusiasm from our respondents for tele-health as an opportunity to provide timely and accessible care was tempered by various considerations to ensure success of tele-health, including the need to sort out coding/billing and workload issues, ensuring adequate IT support, and training, space and equipment needs.

Coding/Billing and Workload

> I don't think it's clear for folks how do we establish these maybe service agreements between two networks or two facilities? One is we have to make sure that whoever the provider is doesn't have … that's there's no insurance issues for providing to another state or to another facility. I think there's still some question about that, that they have capabilities to get into the CPRS record, so most of it is technological processes, but in addition that, the provider, there's no problem with the provider being boarded and whatever competencies that they have is transferable across state lines and across another facility, capturing the patient. How does that impact VERA allocations, for example, in cases where we buy the provider, meaning that we hire a provider for another facility? How do we work out those cost transfers? None of this is insurmountable and it's certainly being done; it's just if we could do it in one sort of standardized way, it wouldn't be so onerous every time you want to set it up. And I think that if there was these standard processes, sort of just a rule book to this, then facilities would be more inclined to get it started. [V-19]

> So just the fact that we might not be able to bill for these services because their coding structure's still being developed is one thing. Another thing is, say you're seeing a patient. You're in Atlanta and the patient is four hours away in a different state, and you're not credentialed. The credentialing and privileging has been a real challenge because, even though we're a federal system and our docs do not have to be credentialed in the state—so they don't have to have state credentialing and privileging done—they do have to have it at the facility that they work. And so they may be a seeing patient that's not in their facility, and we run into issues with that. So how do we have that provider have the credentialing and privileging. Those are things they're working out. [V-74]

> Coding and billing issues is a big issue. We need to develop some sort of, you know, there has to be coding that's developed in a streamlined way that would enable workload credit to be accurately obtained for providers, whether it's in a medical center or a CBOC clinic or a home. [V-19]

> They're looking at the stock codes with the decision-support folks to try to get the workload issues resolved and being able to keep track of the workload. To me, like even if we can't track our workload and we can't bill for it, we can still provide it. It's just the VISN directors and the facility directors I was going to say, but where we going to get the money for it if we don't have a way to get VERA, which is our payment allocation

system. If there's no credit in VERA, we're not going to get that reimbursement. So yeah, there are a lot of issues that still need to be worked out. [V-74]

IT support

The challenge with it, frankly, I think, is IT, first of all, and making sure that we have good IT support and good IT budget. [V-18]

I think some the barriers that we still run into is having enough bandwidth, you know. I went out for a visit to XXXX, so they're very rural areas, and I complimented them for their work with Telehealth because they really started to use it and increase it. And they said, "You know, if you could get us more bandwidth, it would really help." And I had not realized they would be struggling with something like that, because everybody has a cell phone and cellular FaceTime. But people, like all across the world, have it, so you wouldn't think about in the United States we still have areas where they don't have—they can't reach in some of these isolated areas. So those are challenges, but they certainly can be overcome. [V-74]

Training, space and equipment needs

Not all providers are trained in the use of tele-health, although I think some of the younger providers have been and the more we use tele-health and normalize it, including with our medical students, the more buy-in we will get. In some cases there's a lack of space so you still need space to provide tele-health, like an office with the equipment, but in terms of the challenges, we need sort of a – this one was interesting. A tele-health help desk for Veterans particularly because we could do video to home which provides an alternative to in person clinic care, particularly for Veterans who can't, you know, for a variety of reasons, do a far distance to get to a facility or to a provider, but they just would need, like, a Help desk in order to help them set it up. We need more clinical engineering support. We've had some great support here in VISN XXXX, but we need to build it into our engineering support so that when we develop office space, for example, it supports tele-health and the equipment. We need to invest some resources for virtual care if we want to move out of bricks and mortar, and some of that would be a greater focus on the business aspects of tele-health through data analysis. [V-19]

PRIVATE SECTOR CARE

Respondents also discussed a range of challenges to efficiently utilizing the private sector to provide care to Veterans, including whether or not there was adequate capacity outside VA, the lack of standardization in rules, processes and utilization of existing community care programs such as PC3 and CHOICE, and the fact that community providers often were not reimbursed in a timely manner, reducing their participation in the network and therefore reducing overall capacity. The most consistently raised issue was the lack of standardization across community care program.

Lack of standardization in the use of existing programs

But right now you have these different methods of non-VA care which are actually competing against each other. You've got the local contracts, some of them that are paying extremely high rates, Medicare plus 140%—a high rate of coverage. And then you've got PC3 which, you know, the contractors are negotiating with individual

providers, so it's Medicare usually plus a discount based on the population of providers, the availability of providers. I guess XXXX they can get a higher—a better discount rate versus XXXX or something like that. And then you've got Choice which is also kind of wrapped into PC3, network versus non-network. You know, network is at the PC3 rate, non-network is Medicare rate. And then you've got your one-off individual referrals which we don't know what those are going at. So they're all competing against each other and some medical centers, like, well, we've always contracted with this facility, we use them all the time. Why should we go with this other provider? And then you look at the providers in the communities, well, why should I go PC3 if I can stay here on this contract that pays significantly more? So there's got to be kind of a one pathway forward that compensates providers adequately to encourage them to participate, but then is also fiscally responsible on the VA side. [V-08]

So there's just a confusing process system, there's no standardized process across— every medical center is different. Sometimes VA uses that as a point of pride that everyone's different but in some ways that lack of standardization on just some basic business processes allows for just a lot of blocks and a lot of (instances [inaudible] @ 0:31:02) and a lot of frustration on the vets' part especially if the veterans are just (inaudible @ 0:31:06) or things like that. And I understand the need for flexibility and diversity between the medical centers, you know, different regions have a different flavor and they also provide different services. But if the skeleton of the system is consistent across the system then there aren't so many opportunities for confusion or not—you know, just—I don't know—manipulation is (the only word that [inaudible] @ 0:31:43). [V-08]

VA begrudges the existing contracting authorities. They don't like PC3, they don't like the ARCH program, they're resistant to use it, and we're angry about that because we consider it to be a great program. They consider it to be an inconvenience. But what we're finding is they are exuberant about the Choice card. So we're a little confused about that and if it's nothing more than from a sales position, we have to get VA to buy into using their contracting authority. [V-01]

Confusion regarding existing programs

And through our whole, non-VA care, PC3 and Choice, the communication process has really been a challenge. My perception, this is my opinion, we have focused more on the business aspect of that model than we have on the clinical aspect of that model. So that is, how do I get somebody out? How do I get information and appointments scheduled? How do I get a bill from that person? How to I pay that bill and how do I close that encounter? The concept of actually getting something back and getting it to a provider as a useable piece of information isn't always something that's been stressed. [V-25]

So yeah, I can think of a few things that really, really make it difficult. For instance, to get the care referred in the community, there's a bureaucratic piece to that, so the veteran just can't go, even with the Choice Card, and go and just say, "Here's my insurance card. Take it." There has to be a list generated that says that this veteran is eligible and you'd have to check all the rules and the mileage. [V-74]

One of the biggest barriers is how they apply the 40 mile rules, the criteria which we all know. But then if they live close to a CBOC and they're directed to that CBOC, when they call the CBOC and they need some care other than primary care and they can't

provide that care, then they're directed to the parent facility and the parent facility in some situations can be a three hour drive one way. [V-01]

One of the veterans also—they're confused on all of that stuff as well. What we've seen is the episode of care component is so in the weeds that they haven't even gone past the first several layers of confusion. No, I'm serious; like they haven't. I'm just going to rattle off some stuff; this is not scientific, not just because it's printed off on a piece of paper. So we had—these are confirmed members of our—so they're confirmed veterans, 226—this will roll over and I can provide this later. But 44% of our roughly 227 folks that have done this said the current eligibility requirements for Choice don't apply to them. Two of three said they had received a Choice card in the mail. Ten percent didn't know. And I can go anecdotally as well across the VSOs as well as veteran friends and neighbors; it's just so confusing. [V-09]

Community provider reimbursement

The reason also, it needs to be directly connected to immediate payment. A lot of docs won't go anywhere the Choice program because they've had the experience with fee basis of having to wait forever. And they're cash flow, they're still paying their people, and so they're just not going to deal with it. They won't take them because VA's sorry, sorry record of not paying, and I'll use as an example something that's gone on for a very long time. [V-16]

If you're service connected disabled, and/or you're just part of VA and you're nowhere near a VA hospital and you have an episode like you're having a heart attack and you go to the nearest hospital and they get you through the first 48 hours and then transport you by ambulance to a VA hospital, and they send the bill to VA, VA doesn't pay it, eight times out of 10. So what happens is ambulance services don't want to transfer for you anymore because they run on an even thinner margin than the hospital. The hospitals don't want to take you unless you have private insurance, because they're already swamped with indigent people in their emergency room. [V-16]

VA's reputation for payment stinks and it has…it's gotten no better over the last 30 years and it's something we've come back and come back to the Congress and the VA [V-16]

So, I would say that the biggest problem now with purchased care, across, is that a lot of the people who are providers and have been for some time are backing out because they have not been receiving their money, their reimbursement, in a timely manner. And why that happens, I do not know. [V-28]

STANDARDIZATION/CENTRALIZATION

Respondents also highlighted the lack of standardization of administrative processes and lack of centralization of authority as a key challenge to efficient delivery of care.

Specific to the VA, I mean, having been in DoD and VA I think it's that lack of the skeleton, that lack of underlying standardization that really kind of feeds this, you know, the one-off. And I know probably—"Well, if you've seen one VA you've seen one VA," that whole statement I find very offensive. It's like why do you have to keep buying into this idea that every medical center has to be different and when it's that different, there is no chain of reporting, there is no clear cut line of authority. I mean, you go around

asking who's in charge of the homeless program here? At one VA it's the mental health director, one of them it's the chief of staff, another one—so you never know who's in charge. Who's in charge? Who do I talk to? Having been in DoD, you go to an Air Force Base, doesn't matter what airplane is on the ramp or what the mission is, I can go on base, I know exactly where base ops is, I know exactly who's in charge of the landscaping, I know exactly who's in charge of the control tower, I know exactly where the flight (kitchen is in relation to… I mean, it doesn't matter what's going on; that base is all skeletons there, that kind of standardization. And when directives come down or things like that then everyone at least follows them. And then you have latitude to be flexible, actually you have more latitude to be more creative around the edges, so you're not worried about all the kind of minutia. I think that's probably in my mind one of the biggest challenges with VA, is it's too many—152 little VAs that aren't reporting to each other. [V-08]

Let me just say this. There is no standardization in VHA. No. There is a lot left to the discretion of the medical center director and/or the chief of staff. That's probably the biggest problem in VA because if you are thinking that you're going to get the same care in the XXXX VA that you're going to get in XXXX, they are both VA MCs, but the care if very different. [V-28]

So when you contract for services you have to abide by contracting rules and VA some years ago centralized this contracting process. So through that centralized process, it's limited local contracting officials' abilities to meet the needs of the local health care facility. And so it has to follow all the way up through central office. And it doesn't follow the principle of health care is local. And so they need to reexamine their contracting process to minimize it and ensure that local contracting officials have the ability to do what they need to do within the confines of law to meet the needs of local veterans. [V-01]

PHYSICAL INFRASTRUCTURE

Respondents commonly described the lack of physical space, particularly exam space for provider to see patients in and a lengthy and burdensome leasing and contracting process, as key challenges related to VA's physical infrastructure for providing timely and accessible care.

Lack of space

And also the lack of space and those kinds of… the infrastructure and the sort of supporting considerations that make it more difficult to get folks in. [V-14]

You know, VA says we don't have the space. They have space. If you go to some of their facilities they have an awful lot of admin space. Their executive suites are rather grand. And I understand the need for having multiple exam rooms where a doctor doesn't have to wait until that exam room is empty before they can go back in there, I get that. And that's why we gave $2.5 billion for that kind of improvement. I'm a little concerned that VA is not utilizing even kind of immediate solutions, you know, mobile exam rooms, kind of like the schools. [V-08]

So the challenges, of course, with our infrastructure is that many of our buildings are old. And whether we want to rebuild, renew buildings that are... A lot of them were built before the 50s, and so they're needing a lot of care if we're going to continue with

those buildings. The other thing that folks I know in the field have said there was some sort of limit on being able to lease space too, so there was like we had to decrease our leasing of space, footprint. We have a declining infrastructure... [V-74]

Space in the context of provider efficiency

And they said it could be much more efficient if each physician had two rooms so they could see the patient, and the next patient is getting ready, go to the next room. We don't have that. I don't know anywhere that actually has that model because of our limited space. They normally have one room and they have to wait for the new patient to get in there and get ready. So space has been a real constraint with access, and I don't know the clinical people talk to the space people. I'm really not sure about that, because those are two very separate areas in Central Office. [V-74]

I'm going to start with space because as we have looked at comparisons with the private sector, we have been told, "you're only seeing 10 patients a day but the private sector can see 33 patients a day." I think that ties to the fact that we are not set up as a fee-for system, fee-for-service system, we are set up as an accountable care organization so that we don't necessarily staff to optimize our productivity. So that our physicians may not have three rooms per physician when they're in clinic they may not have the support staff that allows us to optimize three rooms so we can move people in and move people out as they're seeing a third patient. So I think that's really the first area I would look at is I think we may have a number of physicians, they may be working X number of hours a day but they may not be as efficient in those eight hours as someone who has more examining rooms or a greater staff to support them. [V-25]

Difficulties with leasing/contracting space

But I was saying, okay, maybe it would be better than rather us trying to build a crumbling building, that we rent a floor in the local hospital. You know, we lease space there and we take care of our patients there, but in a brand-new community hospital. And they said there had been a limit to leasing any new space, and they were very challenged by that, the people who, even to start a new clinical outpatient... It has to all be approved. Well, it has to be approved by the capital assets management group here. [V-74]

I mean, a real difficulty is that it takes us so long for getting anything through contracting. It's just crazy when you look at trying to expand. When you look at the need for an additional clinic space, it's several years before you can open it. And, you know, right now that's particularly frustrating because here we've been given the dollars, we've been given to hire additional staff and in many cases people think, where am I going to put them. I need leased space if just to move some administrative activity out of the medical center, so I can then sort of fix the space, convert the space for clinical use, and it just doesn't happen because of the need to go through contracting. [V-17]

I would start with our leasing program, which again, impacts our plans for our community outpatient clinics. It really needs a fresh look. It's a very cumbersome process that takes a lot of time. It's a very layered process from all the multiple approvals. Each takes time to get through. It creates, in essence, a multi-year planning cycle, so you need to know what it is that you want and you need to start working for it at least three years ahead of time in order to get through the process. [V-18]

Appendix F Access

Appendix F.1. Geographic Access to VA Services for Overall Population

Tables F-1 through F-9 show various measures of access to the VA health care system. After a total count of Veterans, enrollees, and health care users (defined as enrollees who have used the VA health care system) in Table F-1, we show access to all VAMCs (Table F-2), to VAMCs by complexity level (Tables F-3 through F-6), to health care centers (Table F-7), to multi-specialty CBOCs (Table F-8), and primary care CBOCs (Table F-9). The access tables all show access by enrollees and health care users, with access defined as a 40-mile driving distance or 60-minute drive time. All tables show summary figures as well as by VISN.

The source for Table F-1 was the VA Planning Systems Support Group (PSSG) Enrollee file. Tables F2-F9 contain RAND estimates produced from VA Planning Systems Support Group (PSSG) Enrollee file and an April 2015 extract from the VA Site Tracking (VAST) system.

Appendix F.2: Geographic Access to VA Services for Illustrative Clinical Populations

Tables F-10 through F-39 show various measures of access to the services required to treat various medical conditions. First, Table F-10 summarizes the services required to treat patients with each of the clinical conditions, based on VA's clinical inventories of profiles and services. These are the basis of the analyses in the remainder of this appendix. Then, each following table shows the number of facilities where the service is available and the percent of enrollees and health care users who are within either a 40-mile driving distance or a 60 minute drive, by VISN. Two tables also include additional measures: the percent of enrollees whose closest hospital provides a service, and the median driving distance and time to the nearest facility with such services (Table F-11 for EDs, Table F-16 for interventional cardiology). The tables are organized by the illustrative conditions: acute coronary syndrome (Tables F-11 through F-17), colon cancer (Tables F-18 through F-23), diabetes (Tables F-24 through F-27), traumatic brain injury (Tables F-28 through F-31), Post-Traumatic Stress Disorder (Table F-32 through Tables F-34), substance use disorder (Tables F-35 through F-38), and gynecological surgery (Table F-39).

Data in Tables F11–F39 are RAND estimates derived from the VA Planning Systems Support Group (PSSG) Enrollee file, the VA Clinical Inventory Facility Profile Report, and the VA Clinical Inventory Facility Services Report.

Table F-10 Mapping of Clinical Inventory Profiles and Services to the Seven Clinical Conditions

	Clinical Inventory Profile	Clinical Inventory Services
Acute Coronary Syndromes		
Emergency department	ED (Emergency Department) or EDUCC (Emergency Department combined with Urgent Care Center)	

	Clinical Inventory Profile	Clinical Inventory Services
Coronary care unit	ICU level > 0 (Intensive Care Units with a complexity level of 1-4)	
Non-invasive cardiology services		Cardiac Stress Testing On Site
Telemetry (If CCU/ICU not available	Acute Telemetry On Site	
Diagnostic cardiac catheterization		Cardiac Catheterization-Diagnostic On Site
Interventional cardiology		Cardiac Catheterization-Interventional On Site or Cardiology-Interventional On Site
Cardiac Surgery		Cardiac Surgery Services On Site
Colon Cancer		
Primary Care Clinic		Primary Care General On Site or Primary Care Group On Site
Colonoscopy		Colonoscopy On Site
CT Scan		CT Routine On Site
Surgical Services		General Surgery Services On Site
Oncology Services		Chemotherapy Clinic On Site or Oncology-General On Site or any type of Radiation Oncology On Site
Traumatic Brain Injury		
Polytrauma Support Clinic Team	Polytrauma Support Clinic Team	
Polytrauma Network Site	Polytrauma Network Site	
Polytrauma Rehabilitation Center (Program)	Polytrauma Rehabilitation Clinic	
TBI Specialty Care		If any 3 or more of the following 6 services are present On Site: Audiology, Balance Assessment, Occupational Therapy, Physiatrist / PM & R Services, Physical Therapy, Vocational Rehabilitation Therapy
Type 2 Diabetes Mellitus		

	Clinical Inventory Profile	Clinical Inventory Services
Primary care clinic		Primary Care General On Site or Primary Care Group On Site
Diabetes specialty or endocrinology clinic		Diabetes Clinic On Site; Endocrinology On Site
Podiatry clinic		Podiatry Foot Care On Site
Opthamology clinic		Opthamology On Site
Post Traumatic Stress Disorder		
Domiciliary Mental Rehabilitative Treatment Program	PTSD_RRTPDOM or No-Acute Specialized PTSD	
Mental Health Services		Mental Health Integrated Care On Site, or Mental Health Outpatient Individual and Group Services On Site, or Psychiatry Services-Individual/Group On Site, or Psychology Services-Individual/Group On Site
PTSD psychotherapy		PTSD Group On Site, or PTSD Individual On Site, or PTSD Teams On Site, or Services Related to Military Sexual trauma On Site
SUD		
Residential SUD treatment	Substance Abuse DOM/RRTP	
Methadone	Opiod/Methadone Maintenance Program	Opiod Substitution On Site or Substance Use Disorder Medication Clinic On Site
Outpatient specialty SUD care		Substance Use Disorder Intensive Counseling - Individual / Group On Site or Substance Use Disorder Treatment - Individual / Group On Site
Inpatient detoxification	Acute Medical, or Acute Psychiatric, or Acute Substance Abuse	

	Clinical Inventory Profile	Clinical Inventory Services
Mental health services		Mental Health Integrated Care On Site, or Mental Health Outpatient Individual and Group Services On Site, or Psychiatry Services-Individual/Group On Site, or Psychology Services-Individual/Group On Site
Gynecological Surgery		
Gynecological Surgery services		Gynecology Surgery Services On Site

Appendix F.2.1 Services for Populations with Acute Coronary Syndrome (ACS)

Appendix F.3 Access to Non-VA Hospital Types by VISN

This section contains tables showing access to non-VA hospital types for enrollees and health care users, for the 40-mile driving distance and 60-minute drive time, by both all enrollees and users and those who are eligible for VA Choice because they live outside the 40-mile boundary. These tables show such access for all non-VA hospitals (Table F-40), for teaching hospitals (Table F-41), and academic hospitals (Table F-42).

All three tables also show the mean driving distance (in miles) and driving time (in minutes), along with the standard deviation for each. The mean driving distance is defined as the mean distance along the existing road network (as opposed to straight-line distance) for all enrollees in that VISN to the hospital nearest where they live. For all enrollees and those who are eligible for Choice, we used a cutoff of 240 miles or 240 minutes, meaning that we took the mean distance to the nearest hospital within 240 miles and the mean driving time to the nearest hospital within a 240-minute drive. For enrollees who are not eligible for Choice (because they already live within 40 miles of a VA medical facility), we used a cutoff of 40 miles, assuming that since they were already 40 miles or less from a VA medical facility they would be unwilling to travel a longer distance. The driving time cutoff remained at 240 minutes.

In many cases the standard deviation is larger than the mean distance or driving time. This suggests that the distribution of mean distances and driving times skews to the right, meaning that a few enrollees live quite far from the nearest hospital. This would tend to be the case in more rural areas.

Tables F-43 and F-44 show the distribution of differences in drive times to VA vs. non-VA facilities across the population of VA enrollees. Mean differences (in minutes) are reported, as are 25th, 50th, and 75th percentiles. Also shown are the proportions of enrollees for whom VA facilities are less than 15 or 30 additional minutes of drive time, as compared to non-VA facilities. Tables F-46 and F-47 are similar, except that F-46 shows the differences between any VA facility vs. any non-VA facility, whereas F-47

shows the differences between the nearest VA facility with interventional cardiology capability vs. the nearest non-VA facility with interventional cardiology.

Data in Tables F40–F55 are RAND estimates derived from the VA Planning Systems Support Group (PSSG) Enrollee file and the American Hospital Association's 2011 Annual Survey of Hospitals.

Table F-40 Access to Any Non-VA Hospital

Appendix F.4: Access to Non-VA Services by VISN

Tables F-45 to F-55 are similar to those in Appendix F.2, except they show access to services at non-VA facilities, and they break out access by whether enrollees and users are eligible for the VA Choice program. These do not exactly match the tables in Appendix F.2 because comparable information was not always available. Information is provided for EDs (Table F-45), interventional cardiology (Table F-46), coronary care units (Table F-47), diagnostic cardiac catheterization (Table F-48), cardiac surgery (Table F-49), surgery (Table F-50), chemotherapy (Table F-51), oncology (Table F-52), palliative care (Table F-53), inpatient palliative care (Table F-54), and hospice care (Table F-55).

All tables show the mean driving distance (in miles) and driving time (in minutes), along with the standard deviation for each. The mean driving distance is defined as the mean distance along the existing road network (as opposed to straight-line distance) for all enrollees in that VISN to the hospital nearest where they live. For all enrollees and those who are eligible for Choice, we used a cutoff of 240 miles or 240 minutes, meaning that we took the mean distance to the nearest hospital within 240 miles and the mean driving time to the nearest hospital within a 240-minute drive. For enrollees who are not eligible for Choice (because they already live within 40 miles of a VA medical facility), we used a cutoff of 40 miles, assuming that since they were already 40 miles or less from a VA medical facility they would be unwilling to travel a longer distance. The driving time cutoff remained at 240 minutes.

In many cases the standard deviation is larger than the mean distance or driving time. This suggests that the distribution of mean distances and driving times skews to the right, meaning that a few enrollees live quite far from the nearest hospital. This would tend to be the case in more rural areas.

Table F-45 Access to Emergency Department within 40 mile and 60 minute driving distances

Appendix F.5 Access to Non-VA Specialists

This section, Tables F-56 to F-67, provides more limited information for non-VA physician services from our analysis of the SK&A physician database. For each service, the tables show the mean distance in miles and the mean travel time in minutes for all enrollees, enrollees eligible for Choice, and enrollees not eligible for Choice. The percent of enrollees and users with access is not included. The physician services include cardiologists (Table F-56), endocrinologists (Table F-57), gastroenterologists (Table F-58), general surgeons (Table F-59), hematologists-oncologists (Table F-60), mental health providers (psychologists and psychiatrists((Table F-61), neurosurgeons (Table F-62), neurologists (Table F-63), obstetricians and gynecologists (Table F-64), physical medicine and rehabilitation specialists (Table F-65), primary care physicians (Table F-66), and thoracic surgeons (Table F-67).

All tables show the mean driving distance (in miles) and driving time (in minutes), along with the standard deviation for each. The mean driving distance is defined as the mean distance along the existing road network (as opposed to straight-line distance) for all enrollees in that VISN to the hospital nearest where they live. For these analyses we used a cutoff of 40 miles, meaning that we took the mean driving distance and mean drive time to the nearest non-VA providing within 40 miles.

In some cases the standard deviation is larger than the mean distance or driving time. This suggests that the distribution of mean distances and driving times skews to the right, meaning that a few enrollees live quite far from the nearest physician office. This would tend to be the case in more rural areas.

Data in Tables F56-F67 are RAND estimates derived from the VA Planning Systems Support Group (PSSG) Enrollee file and the SK&A Office-Based Physician, Nurse Practitioner, and Physician Assistant Database.

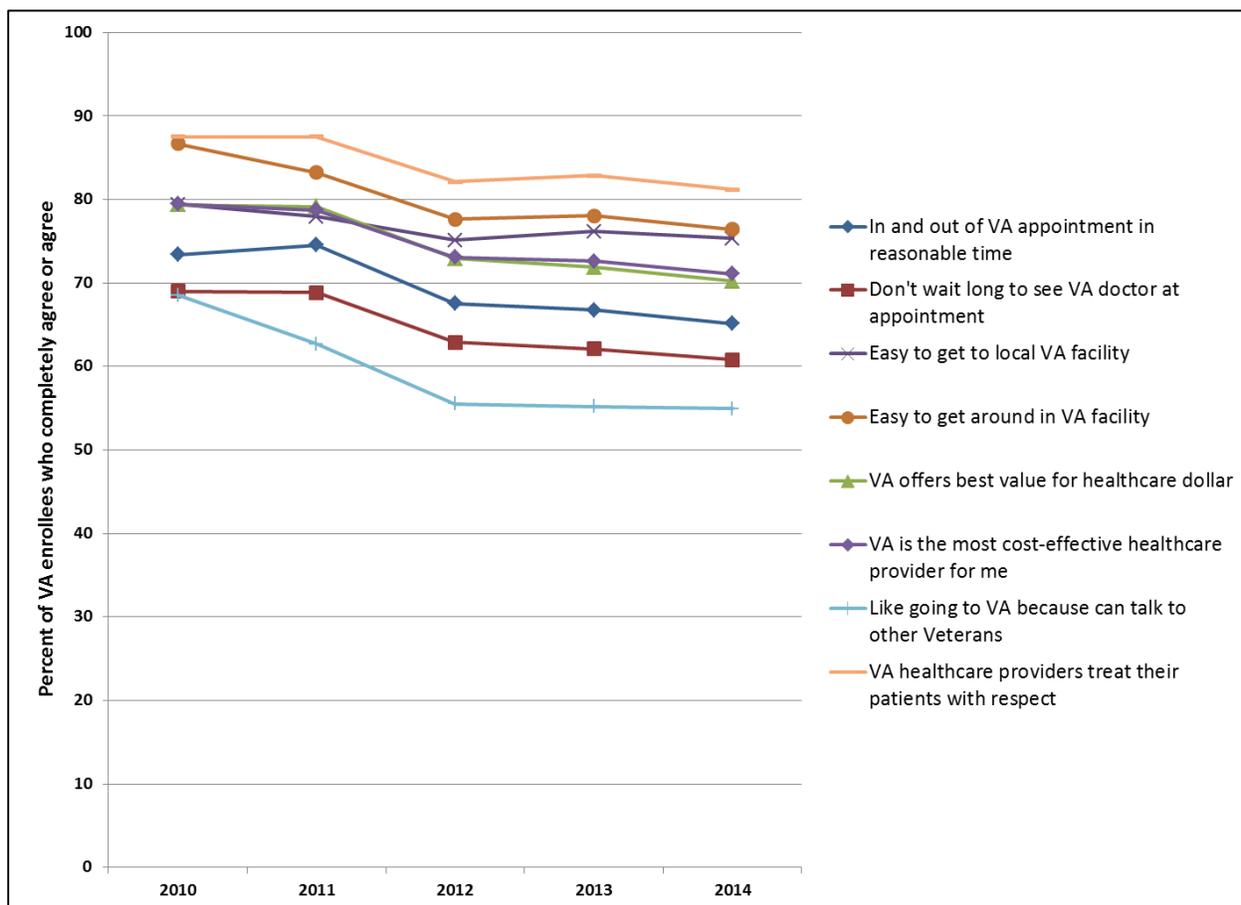
Appendix F.6 Veteran Responses to Access Questions

Figure F-1 summarizes Veteran responses over time to survey questions about access. All questions show a significant decline in the proportion of respondents who agree or strongly agree with the statements.

Figure F-1. Responses to Access Questions on VA Survey of Enrollees, 2010–2014.


Source: RAND analysis of data from VA Survey of Enrollees, 2010 – 2014.

Appendix F.7 Veteran Wait Times

The tables and figures in this section show wait times for different types of appointments. Table F-68 shows number of appointments completed within 0-14, 15-30, 31-60, and 61 or more days of the preferred date by appointment type for two time periods, the first half of FY 2014 and the first half of FY 2015, while Table F-69 shows average performance and variation in performance of VA facilities with regard to wait times for each of these appointment types, including mean performance of the best-performing facilities, in the first half of FY 2015.

Figure F-2 displays maps of wait time performance at VA facilities across the United States, measured as the percent of appointments of each type that were completed within 30 days of the preferred date. The color coding indicates the facility's performance against a benchmark of the best-performing VA

facilities, and the shape of the icon represents whether wait times improved or worsened from the first half of FY2014 to the first half of FY 2015. Performance benchmarks were calculated as the average proportion of appointments completed within 30 days of preferred date at the best-performing VA facilities, defined as the top 10 percent of facilities with regard to wait time for each appointment type. The performance of each facility was then classified into one of three categories relative to the benchmark: "near the benchmark" (within 0.5 standard deviation above or below the benchmark), "below the benchmark" (>0.5 to 2.0 standard deviation below the benchmark), or "far below the benchmark" (>2.0 standard deviation below the benchmark).

During the first half of FY 2015, for primary care appointments for new (established) patients, the benchmark was 99.95 percent (99.74 percent), and facilities were categorized as near benchmark if the percentage of appointments completed within 30 days of preferred date was above 95.98 percent (98.22 percent); below benchmark if between 84.05 percent and 95.98 percent (93.68 percent and 98.22 percent); and far below benchmark if below 84.05 percent (93.68 percent). The corresponding benchmark was 99.16 percent (98.97 percent) for specialty care appointments for new (established) patients, and thresholds were above 96.90 percent (97.73 percent) for near benchmark, between 90.13 percent and 96.90 percent (94.00 percent and 97.73 percent) for below benchmark, and less than 90.13 percent (94.00 percent) for far below benchmark. The corresponding benchmark was 99.96 percent (99.62 percent), and thresholds for mental health appointments for new (established) patients were above 99.02 percent (98.51 percent) for near benchmark, between 96.21 percent and 99.02 percent (95.19 percent and 98.51 percent) for below benchmark, and less than 96.21 percent (95.19 percent) for far below benchmark.

Changes in wait time performance over time were classified as improved, same, or worsened according to the standardized difference between the first half of FY 2014 and the first half of FY 2015. We calculated the standardized difference as the change over time in wait time performance divided by the standard deviation of the wait time performance for that appointment type across all VA facilities. Changes were deemed worsened if the standardized difference was -0.8 or smaller, same if between -0.8 and 0.8, and improved if 0.8 or greater.

Finally, the last two tables show survey responses about access to timely appointments, care and information. Table F-70 shows the average performance and variation in performance of VA facilities with regard to patient-reported measures of timely appointments, care and information, such as getting responses to medical questions or time spent in the waiting room. Table F-71 reports the percent of survey respondents at VA facilities who reported "always" getting needed appointments as soon as needed for urgent and routine care, by the wait time performance of those facilities for each appointment type.

Table F-68 Number of Appointments Completed Within 0-14, 15-30, 31-60, and 61+ Days of Preferred Date, by Appointment Type, First Half FY2014 and First Half FY2015

Appointment Type	First Half of FY2014				First Half of FY2015			
	0-14 days	15-30 days	31-60 days	61+ days	0-14 days	15-30 days	31-60 days	61+ days

Table F-71 Percent of Veterans in VA Facilities Responding that They "Always" Got Appointment for Routine or Urgent Care as Soon as Needed on SHEP PCMH FY2014, by Facility Performance on Wait Times in First Half FY2015.

Appointment Type	Percent reporting ALWAYS got <u>routine</u> appointment as soon as needed	Percent reporting ALWAYS got <u>urgent</u> appointment as soon as needed
Primary Care – New Patients		
Wait Times Near Benchmark	57.0	48.9
Wait Times Below Benchmark	51.8	43.0
Wait Times Far Below Benchmark	45.2	36.1
Primary Care – Established Patients		
Wait Times Near Benchmark	58.5	50.0
Wait Times Below Benchmark	52.3	44.2
Wait Times Far Below Benchmark	45.2	36.3
Specialty Care – New Patients		
Wait Times Near Benchmark	56.1	48.1
Wait Times Below Benchmark	54.7	46.4
Wait Times Far Below Benchmark	51.5	42.2

Appointment Type	Percent reporting ALWAYS got <u>routine</u> appointment as soon as needed	Percent reporting ALWAYS got <u>urgent</u> appointment as soon as needed
Specialty Care – Established Patients		
Wait Times Near Benchmark	58.4	50.4
Wait Times Below Benchmark	53.4	44.7
Wait Times Far Below Benchmark	51.0	42.7
Mental Health – New Patients		
Wait Times Near Benchmark	56.4	48.3
Wait Times Below Benchmark	53.2	44.8
Wait Times Far Below Benchmark	51.9	42.9
Mental Health – Established Patients		
Wait Times Near Benchmark	57.5	48.6
Wait Times Below Benchmark	53.6	45.6
Wait Times Far Below Benchmark	47.0	38.7
Notes: During the first half of FY 2015, for primary care appointments for new (established) patients, the benchmark was 99.95 percent (99.74 percent), and facilities were categorized as near benchmark if the percentage of appointments completed within 30 days of preferred date was above 95.98 percent (98.22 percent); below benchmark if between 84.05 percent and 95.98 percent (93.68 percent and 98.22 percent); and far below benchmark if below 84.05 percent (93.68 percent). The corresponding benchmark was 99.16 percent (98.97 percent) for specialty care appointments for new (established) patients, and thresholds were above 96.90 percent (97.73 percent)		

Appointment Type	Percent reporting ALWAYS got <u>routine</u> appointment as soon as needed	Percent reporting ALWAYS got <u>urgent</u> appointment as soon as needed
for near benchmark, between 90.13 percent and 96.90 percent (94.00 percent and 97.73 percent) for below benchmark, and less than 90.13 percent (94.00 percent) for far below benchmark. The corresponding benchmark was 99.96 percent (99.62 percent), and thresholds for mental health appointments for new (established) patients were above 99.02 percent (98.51 percent) for near benchmark, between 96.21 percent and 99.02 percent (95.19 percent and 98.51 percent) for below benchmark, and less than 96.21 percent (95.19 percent) for far below benchmark. Source: Benchmark categories were established by RAND analysis of VA wait time data for the first half of FY2015 that were obtained from the VHA Support Service Center (VSSC) by the MITRE Corporation. Facility-level patient experience data for VA patients from the Survey of Healthcare Experiences of Patients Primary Care Medical Home in FY2014 were obtained from the VA Office of Performance Measurement.		

Appendix G Quality

Appendix G.1 Evidence Table for Quality Review

Author, Year	Quality Dimension(s) [Assessment*]	Data Level	VA Sample [Sample Size]	Years Collected	Data Level	Non-VA Sample [Sample Size]	Years Collected	Conditions	Outcomes	Primary Findings**	Final Grade†
						New articles abstracted for this review					
Bean-Mayberry et al., 2007	Effectiveness [Mixed]	Mult ctrs	VA comprehensive Womens Health Centers [N= 8]	2003	Nat'l	Department of Health and Human Services National Centers of Excellence [N=13]	2003	None	Availability of services	Preventive cancer screening and general reproductive services were uniformly available at all centers, although DHHS centers offered extensive reproductive services on-site more frequently, and VA centers more often had on-site mental health care.	B
Belote et al., 2012	Patient Centeredness [Better]	Nat'l	Veterans at VA-staffed community-based outpatient clinics [N=2838]	2007-2008	Nat'l	Veterans at contract staffed community-based outpatient clinics [N=941]	2007-2008	None	Patient satisfaction, unadjusted	VA had significantly better satisfaction scores for continuity of care (mean % difference = 8.603, p<0.001), education and information (mean % difference = 1.111, p<0.001), emotional support (mean % difference = 0.847, p=0.014), overall coordination of care (mean % difference: 1.682, p<0.001), patient preferences (mean % difference: 1.083, p=0.002). No significant differences for patient access, courtesy, or visit coordination.	B
Berke et al., 2009	Efficiency [Worse]	Nat'l	Veterans in VA Hospitals [N=3,232,196 total patients; sample size not broken down by VA/non-VA]	2000	Nat'l	Medicare-eligible Veterans in non-VA Hospitals [N=3,232,196 total patients; sample size not broken down by VA/non-VA]	2000	None	Difference between length-of-stay and the expected length-of-stay based on DRG weight, for patients 65 or older, adjusted by complexity	VA hospitals had much longer than expected lengths-of-stay when compared to non-VA hospitals (6.5 days vs. 3 days in urban hospitals, 5 vs. 2 days in rural hospitals, and 3 vs. 1 days in highly rural hospitals; no statistical tests).	A

Author, Year	Quality Dimension(s) [Assessment*]	Data Level	VA Sample [Sample Size]	Years Collected	Data Level	Non-VA Sample [Sample Size]	Years Collected	Conditions	Outcomes	Primary Findings**	Final Grade†
Boitano et al., 2012	Safety [Same]	Single ctr	Veterans at a VA hospital [N=322]	2006-2009	Single ctr	Patients at Northwestern Memorial Hospital [N=269]	2006-2009	Vascular Surgery	Post-operative outcomes (morbidity and mortality), risk-adjusted	Multivariate analysis showed that hospital setting was not an independent predictor of complications, major adverse events, or death, suggesting no difference in outcomes between the VA and private sector.	A/B
Bond et al., 2008	Effectiveness [Better]	Nat'l	VA hospitals [N=84]	2006	Nat'l	Non-VA hospitals [N=1041]	2006	None	Clinical pharmacy services offered	Eight of 15 clinical pharmacy services were more commonly provided in VA hospitals. In-service education was higher by 25% (p=0.003), clinical research by 154% (p<0.0001), drug protocol management by 28% (p<0.0001), drug therapy counseling by 80% (p<0.0001), participation on rounds by 38% (p=0.001), and admission drug histories by 310% (p<0.0001).	A
Borzecki et al., 2010	Safety [Better] Effectiveness [Mixed]	Nat'l	IQI-related discharge at VA [N=403828]	2003-2007	Nat'l	HCUP-NIS IQI-related discharges [sample size not reported]	2003-2007	CHF, IHD, Pulm, TIA, Hip fracture, gastrointestinal hemorrhage, Surgical (General,Cardio, Ortho, Oncology, Other)	Inpatient quality indicators	Comparing VA and NIS risk-adjusted rates from 2003 through 2007, slope estimates differed significantly for AMI, acute stroke, hip fracture and pneumonia mortality, hip replacement, and all 3 utilization indicators. AMI, stroke, hip fracture, pneumonia and hip replacement mortality rates, and incidental appendectomy utilization rates declined more rapidly in the VA. Laparascopic cholecystectomy rates rose more steeply, whereas bilateral catheterization rates decreased more slowly, in the VA compared with NIS.	A

Author, Year	Quality Dimension(s) [Assessment*]	Data Level	VA Sample [Sample Size]	Years Collected	Data Level	Non-VA Sample [Sample Size]	Years Collected	Conditions	Outcomes	Primary Findings**	Final Grade†
Chakkera et al., 2005	Safety [Worse] Equity [Same]	Nat'l	VA patients who received pretransplant care in VA or paid by VA [N=1646]	1991-2001	Nat'l	Non-VA patients who did not receive pretransplant care in VA or paid for by VA [N=77715]	1999-2001	Kidney Transplant	Graft and patient survival after kidney transplant, adjusted	African-American race was associated with poorer allograft survival even after adjustment. The relative risk (RR) of graft failure by race was similar among VA users and non-VA users and VA users who received a transplant within and outside the VA. Among all recipients, VA users had a 20% higher risk for graft failure (RR 1.21; 95% CI 1.12-1.30) and 14% higher risk of mortality (RR 1.14; 95% CI 1.07-1.22) compared with non-VA users. There was no interaction of race with VA user status in graft failure (P = 0.32) or patient survival (P = 0.63), no difference in graft (RR for VA users who received a transplant within the VA 0.86; 95% CI 0.68-1.10; P = 0.23) or patient (RR 0.97; 95% CI 0.74-1.26; P = 0.82) survival among VA users who received a transplant within versus outside VA, and interaction of race with VA user status was not significant for graft (P = 0.79) or patient (P = 0.97) survival. Vaughan-Sarrazin et al., 2007	Safety [Worse]	Nat'l	Male VA users [N=139331]	1996-2002	Nat'l	Male Medicare patients [N=1212729]	1996-2002	Cardio	30, 90, 365 day mortality, adjusted	Adjusted mortality after CABG was higher (p<.001) in VA users compared with nonusers at 30, 90, and 365 days: OR 1.07 (95% CI 1.03-1.11), 1.07 (95% CI 1.04-1.10), and 1.09 (95% CI, 1.06-1.12), respectively. For PCI, adjusted mortality at 30 and 90 days was similar (p>.05), but was higher for VA users at 365 days (OR 1.09; 95 percent CI, 1.06-1.12).	A
Wang et al., 2005	Effectiveness [Better]	Nat'l	VA users [N=3391]	2000	Nat'l	Non-VA users [N=178735]	2000	Overweight/ Obesity	Association between being an obese VA user and weight control advice, adjusted	Obese VA users were twice as likely to have received professional advice to lose weight (OR 2.06; 95% CI 1.64 to 2.59) and as likely to have received professional advice to maintain weight (OR 1.72; 95% CI 0.75 to 3.97).	B
Wang et al., 2013	Safety [Same] Efficiency [Worse]	Mult VISNs	VA dialysis users [N=381]	2007-2008	Mult VISNs	Veterans who received outpatient dialysis exclusively in VA-outsourced settings [N=659]	2007-2008	ESRD	Adjusted all-cause hospitalization at 1 y, adjusted all-cause mortality at 1 y, adjusted	There was no difference in mortality outcomes among veterans who received outpatient dialysis exclusively in VA-outsourced compared to VA dialysis users (OR 0.80, 95% CI 0.48-1.3). Veterans who received outpatient dialysis exclusively in VA-outsourced settings were also less likely to be hospitalized within a year (OR 0.35, 95% CI 0.24-0.51, p<0.001) and, if hospitalized, had shorter length-of-stay (β= −0.37, p<0.05).	A
Weeks et al., 2009	Effectiveness [Better]	Nat'l	VA patients [sample size not reported]	2005-2006	Nat'l	Medicare FFS patients [sample size not reported]	2005-2006	CHF, DM, IHD, Pulm, Preventive care, general anc cardiovascular surgery	Quality measures of outpatient and inpatient care	The VA outperformed Medicare fee-for-service performance in one measure of mammography and two measures of outpatient diabetic management. In addition, in 2005 and 2006, the VA uniformly performed better than hospitals contributing to Hospital Compare.	B
West et al., 2006	Effectiveness [Better]	Nat'l	VA users [N=1928]	2000	Nat'l	Veteran VA non-users and non-Veterans [N=12461]	2000	None	Routine checkup within last 2 years	VA patients reported the higher rates of seeing a doctor for a routine checkup within the past 2 years (91.6% vs. other groups [data not reported]; P < .0001).	B

Lautz et al., 2007	Safety [Worse]	Nat'l	VA patients [N=374]	2001-2004	Mult. Ctrs	Private sector patients [N=2064]	2001-2004	Other surgical	30-day postoperative outcomes: morbidity (overall, specific adverse events, number of complications), mortality, LOS	No significant difference in postop morbidity or mortality among women in the VA versus non-VA settings (16.07 vs. 12.02 % p =0.21 and 0.89 vs. 0.42%, p=0.47). Unadjusted and adjusted morbidity rates were higher among men treated at the VA versus non-VA (OR 2.77, 95% CI 1.78-4.31 unadjusted and OR 2.29, 95% CI 1.28-4.10 adjusted). Unadjusted mortality rates significantly higher among men treated at VA versus non-VA (1.91% vs. 0.25% p=0.03).	A/B
Nelson et al., 2005	Effectiveness [Better]	Nat'l	Veterans with some VA care [N=254] Veterans with all VA care [N=281]	2000	Nat'l	Adults with other insurance types [N=10632]	2000	DM	Five self-reported measures of diabetes self-management and preventive care practices	Persons who received care through the VA were more likely to report taking a diabetes education class and HbA1c testing than those covered by private insurance.	B
Neumayer et al., 2007	Safety [Same]	Nat'l	VA patients [N=644]	2001-2004	Mult. Ctrs	Private sector patients [N=3179]	2001-2004	General surgical	30-day postoperative morbidity and mortality, LOS	After adjusting for comorbidities and preoperative factors, there was no significant difference in 30-day morbidity or mortality in female patients at the VA compared with the PS (OR 1.404, 95% CI 0.894-2.204).	B

Author, Year	Quality Dimension(s) [Assessment*]	Data Level	VA Sample [Sample Size]	Years Collected	Data Level	Non-VA Sample [Sample Size]	Years Collected	Conditions	Outcomes	Primary Findings**	Final Grade†
Polsky et al., 2007	Equity [Same]	Nat'l	VA hospitalizations [N=369155]	1995-2001	Lrg geo	Non-VA hospitalizations [N=1509891]	1995-2001	CHF, IHD, Pulmonary Disease, TIA/Stroke	30-day mortality (for white and black males after hospital admission for any of the above conditions)	After risk adjustment, racial (black vs. white) differences in 30-day mortality rates after admission for 6 medical conditions were similar among VA and non-VA care settings.	B
Rehman et al., 2005	Effectiveness [Better]	One VISN	VA patients [N=12366]	2001-2003	Lrg geo	Non-VA patients [N=7734]	2001-2003	HTN	Control of blood pressure below 140/90	Blood pressure control to below 140/90 mmHg was comparable among white hypertensive men at VA (55.6%) and non-VA (54.2%) settings (P=.12). In contrast, BP control was higher among African American hypertensive men at VA (49.4%) compared with non-VA (44.0%) settings (P<.01), even after controlling for age, numerous comorbid conditions, and rural-urban classification. Being in a non-VA site was negatively associated with blood control adjusted OR 0.839 (0.742-0.949).	A

Author, Year	Quality Dimension(s) [Assessment*]	Data Level	VA Sample [Sample Size]	Years Collected	Data Level	Non-VA Sample [Sample Size]	Years Collected	Conditions	Outcomes	Primary Findings**	Final Grade†
Ross et al., 2008	Effectiveness [Better]	Nat'l	Adults receiving care at VAMCs [N=10007]	2000, 2004	Nat'l	Adults receiving care elsewhere [N=393873]	2000, 2004	DM, IHD, HTN, Preventive Care	Self-reported use of 17 recommended health care services including cancer prevention, cardiovascular risk reduction, diabetes management and infection prevention.	VA care was associated with greater use of recommended services in both years of study (6/17 services more used in 2000, 12/17 more used in 2004).	B
Selim et al., 2007	Safety [Better]	Nat'l	VHA patients [N=16725 at baseline and 12177 at follow-up]	1998-2000	Nat'l	Medicare Advantage (MA) Program patients [N=62614 at baseline and 26225 at follow-up]	1998-2000	None	Risk-adjusted 2 year mortality, change in physical and mental health status	Lower risk-adjusted mortality in the VA compared to MA (2 year mortality 7.6% in VA vs. 9.2% in MA); There were no significant differences in the probability of being alive with the same or better physical health except for the South (VA 65.8% vs. MA 62.5%, P = .0014).VA patients had a slightly higher probability than Medicare patients of being alive with the same or better mental health (71.8% vs. 70.1%, P = .002).	B
Selim et al., 2006	Safety [Better]	Nat'l	VHA patients [N=420514]	1999-2004	Nat'l	Medicare Advantage Program [N=584294]	1998-2004	Other medical/ nonsurgical condition	Risk-adjusted mortality	After adjusting for case-mix, the HR for mortality in Medicare was significantly higher than that in VA (HR, 1.404; 95% CI = 1.383–1.426).	B

Author, Year	Quality Dimension(s) [Assessment*]	Data Level	VA Sample [Sample Size]	Years Collected	Data Level	Non-VA Sample [Sample Size]	Years Collected	Conditions	Outcomes	Primary Findings**	Final Grade†
Selim et al., 2009	Safety [Better]	Nat'l	Medicaid-eligible VHA patients [N=2361]	1999-2000	Nat'l	Medicaid-eligible Medicare Advantage patients [N=1912]	1999-2000	Other medical/ nonsurgical condition	3-year risk adjusted mortality rate	The adjusted HR of mortality in the MA dual enrollees was significantly higher than in VA dual enrollees (HR, 1.260 [95% CI, 1.044–1.520]).	B
Turrentine et al., 2007	Safety [Same]	Nat'l	VA patients [N=178]	2001-2004	Mult. Ctrs	Private sector patients [N=371]	2001-2004	Other surgical	30-day morbidity and mortality	Unadjusted morbidity and mortality rates were higher in VA compared with PS (16.3% vs. 6.7%, p=0.003 and 2.8% vs. 0.4%, p=0.0074). Mortality event rate was too low for adjustment. Adjusting for comorbidities, the 30-day postoperative morbidity ratio in VA versus the PS was no longer significant (adjusted OR 1.33, 95% CI 0.49-3.6 compared with unadjusted OR 2.75, 95% CI: 1.55-4.91).	B
Weeks et al., 2008	Efficiency [Worse]	One VISN	Admissions inside VA system [N=107026]	1998-2000	Lrg geo	Veteran admissions outside VA system [N=159843]	1998-2000	None	Length of stay, readmission within 30 days	Across conditions, the length of stay was longer for VA admissions compared with non-VA admissions. In logistic regression, VA care was not a significant predictor of 30day readmission for veterans <65years old, however for veterans >=65 years of age initial VA admission was associated with a significantly higher odds of readmission within 30 days than non-VA index admission (OR 2.79, 95% CI 1.4-5.6).	B
Weeks et al., 2008	Safety [Mixed]	One VISN	Male VA enrollees receiving care within VA [N=50429]	1998-2000	Lrg geo	Male VA enrollees receiving care outside VA [N=74017]	1998-2000	Patient Safety Indicators (PSIs)	Risk-adjusted rates of non-obstetric patient safety indicators	Rates similar for 9 of 15 PSIs, ulcer, sepsis, iatrogenic infection, postoperative respiratory failure, postoperative metabolic derangement lower in VA, mortality higher in VA for low-risk DRGs.	B

Author, Year	Quality Dimension(s) [Assessment*]	Data Level	VA Sample [Sample Size]	Years Collected	Data Level	Non-VA Sample [Sample Size]	Years Collected	Conditions	Outcomes	Primary Findings**	Final Grade†
Weiss et al., 2006	Safety [Same]	One VISN	VA patients [N=140]	1997-2002	Lrg geo	Private sector patients [N=6949]	1997-2002	Vascular	Perioperative mortality, stroke and cardiac complications	After risk adjustment, having surgery at the VA was not a significant predictor of death (OR 2.98, 95% CI 0.51-17.6), stroke (OR 0.95, 95% CI 0.3-3.4) or cardiac complications (OR 1.07, 95% CI 0.37-3.1).	B

*We assessed each study in the review according to the statistically significant differences in performance on quality of care measures for VA care relative to a non-VA comparison group. If the VA quality of care was shown to be better than quality for non-VA care, the study was classified as "VA better." If VA quality of care was better in some instances and the same in other instances compared to non-VA care in the same study, the study was also classified as "VA better". If multiple quality measures were reported in the study and VA care was better than non-VA on some and worse on others, the study was classified as "mixed." If the quality of care in the VA and non-VA did not differ, the study was classified as "same." If the VA quality of care was shown to be worse than non-VA, the study was classified as "VA worse" (as were studies where the quality of care was worse in some instances and the same in other instances).

**The Primary Findings text has been drawn directly from the reviewed articles, and in some cases may be similar or identical to the article's text.

†Each article was given an overall assessment of quality shown in the Final Grade column. This assessment was based on the following criteria: time frames; samples (both VA and non-VA); quality measurements; outcomes; importance of measures; and statistical methods. Each of these factors was assigned a grade (A, B, or C) based on the data abstraction grading guidelines developed in the original systematic review. The overall assessment was predicated on the global assessment of the article considering the individual components, but was not an average. Thus an article that had, for example, a critical flaw in methodology would be a "C," even if other issues were satisfactory. Articles that received an overall grade of "C" were rejected from the review.

*National means based on VA facility-level data may differ from national measure rates in VA publications, which are based on patient-level data.

**Mean of measure rates for best-performing 10 percent of VA facilities.
***For this measure, a lower rate indicates better performance.

† To assess variation in inpatient SHEP scores across facilities within VA, we used inpatient SHEP scores that the VA adjusted using VA's internal patient mix adjustment model, which includes the following variables: age, sex, priority group, urban/rural residence, hospital service line (surgical/medical), self-reported health status, self-reported mental health status, education, and race/ethnicity.

Sources: VA facility-level data for patient experience measures for FY2014 was obtained from the VA Office of Performance Measurement. VA facility-level data for patient safety indicator measures for FY2014 was obtained from the VA Inpatient Evaluation Center. VA facility-level data for all other measures was obtained from the CMS Hospital Compare website for Quarter 4 of FY2014.

*National means based on VA facility-level data may differ from national measure rates in VA publications, which are based on patient-level data.

**For this measure, a lower rate indicates better performance.

Sources: VA facility-level data for patient experience measures for FY2014 was obtained from the VA Office of Performance Measurement. VA facility-level data for patient safety indicator measures for FY2014 was obtained from the VA Inpatient Evaluation Center. VA facility-level data for all other measures and all non-VA facility-level data for Quarter 4 of FY2014 were obtained from the CMS Hospital Compare website. For patient-centeredness measures derived from the inpatient SHEP and HCAHPS, results for both VA and non-VA facilities are adjusted for patient characteristics, mode of survey administration, and national mean hospital performance using guidance provided by CMS.

Sources: Milliman, Inc. August 8, 2014; 2014 VA Enrollee Health Care Projection Model - Base Year 2013 - 2014 Model Documentation & Analysis; Milliman Health Practice Seattle; RAND analyses of VA provider supply; RAND analyses of VA productivity data.

Table H-2 Projected Demand and Supply in FY19, Under Supply Scenario Two, By VISN and Specialty

The table below shows the following:
1.   FY14: # of RVUs forecasted by Milliman for FY14
2.   FY19: # of RVUs forecasted by Milliman for FY19
3.   50th: RVUs at the 50th percentile with forecasted FY19 provider FTEs and under Sensitivity Analysis Productivity Level 2

The cell shading indicates how well Sensitivity Analysis Level 2 50th percentile performs relative to forecasted FY19 RVU demand given the forecast provider FTE change in FY19:
1.   Red: Less than 10% below FY19 RVU
2.   Yellow: Within 10% of FY19 RVU
3.   Green: Exceeds FY19 RVU

Table H-4. Projected Demand and Supply in FY19, Under Supply Scenario Three, By VISN and Specialty

The tables below show the following:
4.   FY14: # of RVUs forecasted by Milliman for FY14
5.   FY19: # of RVUs forecasted by Milliman for FY19
6.   50th: RVUs at the 50th percentile under Sensitivity Analysis Productivity Level 2
7.   Incr: Forecasted RVUs resulting from forecasted FTE increase with FY14 productivity per FTE (i.e., no productivity increase)

The cell shading indicates how well Sensitivity Analysis Level 2 50th percentile performs relative to forecasted FY19 RVU demand:
8.   Red: Less than 10% below FY19 RVU
9.   Yellow: Within 10% of FY19 RVU
10.   Green: Exceeds FY19 RVU

Appendix I Survey Data Tables and Participant Comments

Appendix I.1 Tables

In the following tables, we present survey results for each survey question by survey module, starting with the Facility module for which the Chief of Staff was the intended respondent, followed by the modules for each of the seven clinical conditions. The clinical modules were designed to be answered by the most appropriate service chief. Results with fewer than ten respondents are not presented.

The survey questions first elicit respondents' perceptions about the existence of *clinically meaningful* delays. Specifically, respondents were asked to "*Consider delays which might put a patient at risk for adverse outcomes, slow resolution of symptoms, or which are not compliant with VA/DoD guidelines.*" Respondents who indicated that delays sometimes exist were asked to formulate a solution for reducing delays and then to rate the importance of various components to that solution.

Each module also contained a question that asked respondents to identify issues that affect provider and system efficiency, and several questions intended to determine if respondents had difficulty recruiting and retaining clinicians with expertise in the clinical condition of interest, or in the case of the facility module, staff in categories that spanned multiple conditions. In facilities reporting difficulties with recruitment and retention, respondents were asked to identify barriers that caused these problems.

Appendix I.1.1 Chief of Staff

2015 Survey of VA Capabilities and Resources
Section 1: General Facility Questions for the Chief of Staff

1. In the PAST 90 DAYS**, what percentage of patients trying to obtain a new primary care appointment experienced a *clinically meaningful delay***?

Table I-1. Chief of Staff: Question 1

Service		No Delay		1-10% of patients experience delay		11-25% of patients experience delay		26-50% of patients experience delay		51% or more of patients experience delay		Not applicable	
	N	n	%	n	%	n	%	n	%	n	%	n	%
New primary care appointment	115	63	54.8	45	39.1	5	4.3	1	0.9	0	0.0	1	0.9

2. Think of the most effective way to reduce the number of *clinically meaningful delays* for patients trying to obtain a **new** primary care appointment. Now, **in your solution, how important are each of the following elements**?

Table I-2. Chief of Staff: Question 2

Solution	N	Critically Important		Very Important		Somewhat Important		Unimportant		Not applicable	
		n	%	n	%	n	%	n	%	n	%
a. Create additional space for patient care (e.g., more exam rooms, procedure rooms, inpatient beds)	49	22	44.9	13	26.5	12	24.5	1	2.0	1	2.0
b. Increase the number of licensed independent practitioners (e.g., physicians, nurse practitioners, psychologists).	49	21	42.9	25	51.0	3	6.1	0	0.0	0	0.0
c. Increase the number of other personnel (e.g., nursing, technicians, pharmacists, clerical staff).	49	11	22.4	28	57.1	8	16.3	2	4.1	0	0.0
d. Acquire and/or improve availability of equipment	49	1	2.0	11	22.4	20	40.8	12	24.5	5	10.2
e. Implement or increase the availability of telehealth services	49	2	4.1	20	40.8	20	40.8	6	12.2	1	2.0
f. Improve information technology (e.g., scheduling system, electronic health record).	48	21	43.8	16	33.3	8	16.7	2	4.2	1	2.1
g. Change "central office policies" that affect workflow and efficiency (e.g., rules governing documentation or how quickly certain services must be provided)	49	19	38.8	17	34.7	8	16.3	4	8.2	1	2.0
h. Improve personnel supervision, management, or incentives.	49	9	18.4	24	49.0	12	24.5	4	8.2	0	0.0
i. Increase weekend and evening availability of services	49	1	2.0	14	28.6	25	51.0	8	16.3	1	2.0
j. Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community	49	5	10.2	17	34.7	15	30.6	11	22.4	1	2.0
k. Some other solution(s).	49	7	14.3	9	18.4	2	4.1	1	2.0	30	61.2
This question (question 2) is based on respondents who indicated that patients experienced delays (n=51) in obtaining a new primary care appointment (question 1).											

The views, opinions, and/or findings contained in this report are those of RAND Corporation and should not be construed as an official government position, policy, or decision.

3. In the **PAST 90 DAYS**, what percentage of patients trying to obtain a **follow-up** primary care appointment experienced a *clinically meaningful delay*?

Table I-3. Chief of Staff: Question 3

Service		No Delay		1-10% of patients experience delay		11-25% of patients experience delay		26-50% of patients experience delay		51% or more of patients experience delay		Not applicable	
	N	n	%	n	%	n	%	n	%	n	%	n	%
Follow-up primary care appointment	113	58	51.3	46	40.7	8	7.1	0	0.0	0	0.0	1	0.9

4. Think of the most effective way to reduce the number of delays for patients trying to obtain a **follow-up** primary care appointment. Now, **in your solution, how important are each of the following elements?**

Table I-4. Chief of Staff: Question 4

Solution	N	Critically Important		Very Important		Somewhat Important		Unimportant		Not applicable	
		n	%	n	%	n	%	n	%	n	%
a. Create additional space for patient care (e.g., more exam rooms, procedure rooms, inpatient beds)	53	19	35.8	16	30.2	14	26.4	4	7.5	0	0.0
b. Increase the number of licensed independent practitioners (e.g., physicians, nurse practitioners, psychologists).	53	20	37.7	28	52.8	5	9.4	0	0.0	0	0.0
c. Increase the number of other personnel (e.g., nursing, technicians, pharmacists, clerical staff).	52	10	19.2	32	61.5	7	13.5	3	5.8	0	0.0
d. Acquire and/or improve availability of equipment.	52	4	7.7	12	23.1	14	26.9	19	36.5	3	5.8
e. Implement or increase the availability of telehealth services	53	1	1.9	18	34.0	21	39.6	13	24.5	0	0.0
f. Improve information technology (e.g., scheduling system, electronic health record).	52	13	25.0	26	50.0	8	15.4	5	9.6	0	0.0
g. Change "central office policies" that affect workflow and efficiency (e.g., rules governing documentation or how quickly certain services must be provided)	53	19	35.8	15	28.3	12	22.6	6	11.3	1	1.9
h. Improve personnel supervision, management, or incentives.	53	8	15.1	18	34.0	23	43.4	4	7.5	0	0.0
i. Increase weekend and evening availability of services	53	0	0.0	9	17.0	31	58.5	13	24.5	0	0.0
j. Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community	53	6	11.3	14	26.4	12	22.6	20	37.7	1	1.9
k. Some other solution(s).	52	8	15.4	6	11.5	2	3.8	3	5.8	33	63.5
This question (question 4) is based on respondents who indicated that patients experienced delays (n=54) in obtaining a follow-up primary care appointment (question 3).											

Issues that Affect Provider and System Efficiency

5. IN THE PAST YEAR, how much did the following issues negatively impact provider and system efficiency?

Table I-5. Chief of Staff: Question 5

Solution	N	None		A little		A fair amount		A lot		Not Applicable	
		n	%	n	%	n	%	n	%	n	%
a. Providers performing clinical activities that could be performed by individuals with less training	112	5	4.5	30	26.8	43	38.4	33	29.5	1	0.9
b. Providers performing administrative activities that could be performed by others	112	4	3.6	14	12.5	44	39.3	50	44.6	0	0.0
c. Residency training/teaching requirements	112	35	31.3	42	37.5	17	15.2	5	4.5	13	11.6
d. Insufficient clinical/administrative support staff	112	3	2.7	26	23.2	36	32.1	47	42.0	0	0.0
e. Inadequate scheduling system and policies (e.g., hard to cancel or reschedule, coordinate)	112	1	0.9	19	17.0	29	25.9	62	55.4	1	0.9
f. Unnecessary documentation requirements or inefficient CPRS interface	112	3	2.7	17	15.2	33	29.5	58	51.8	1	0.9
g. Patient no-show rates	112	2	1.8	56	50.0	41	36.6	13	11.6	0	0.0
h. Poor patient flow management (room/bed turnover, appointments)	112	12	10.7	42	37.5	40	35.7	18	16.1	0	0.0
i. Too many administrative requirements (Initiatives/Policies/Programs)	112	3	2.7	11	9.8	29	25.9	67	59.8	2	1.8

Workforce

6A. IN THE PAST YEAR, did your local health care system have problems **RECRUITING OR HIRING** the following personnel categories?

Table I-6. Chief of Staff: Question 6A

		Yes		No		Not Applicable	
Staff Positions	**N**	**n**	**%**	**n**	**%**	**n**	**%**
a. Primary Care Providers	112	86	76.8	26	23.2	0	0.0
b. General Surgeons	111	39	35.1	52	46.8	20	18.0
c. Hospitalists	112	56	50.0	46	41.1	10	8.9

N refers to the proportion of respondents who listed each "reason" as one of the two most important affecting recruitment and hiring. This question (question 7) is based on respondents who indicated that their local health care system had problems recruiting or hiring certain personnel categories (question 6A). Question 7 was asked for each personnel type marked "yes" in question 6A.

The views, opinions, and/or findings contained in this report are those of RAND Corporation and should not be construed as an official government position, policy, or decision.

6B. IN THE PAST YEAR, did your local health care system have problems **RETAINING t**he following personnel categories?

Table I-8. Chief of Staff: Question 6B

Staff Positions	N	Yes		No		Not Applicable	
		n	%	n	%	n	%
a. Primary Care Providers	111	72	64.9	39	35.1	0	0.0

N refers to the proportion of respondents who listed each "reason" as one of the two most important affecting retention. This question (question 8) is based on respondents who indicated that their local health care system had problems retaining certain personnel categories (question 8B). Question 10 was asked for each personnel type marked "yes" in question 6B.

Use of fee-basis or contracted care

9. How frequently do you refer Veterans to fee-basis or contracted care?

Table I- 10. Chief of Staff: Question 9

	n	%
N	111	
1% or less of the time	18	16.2
2-4% of the time	31	27.9
5-10% of the time	33	29.7
11-100% of the time	29	26.1

10. On a scale from 1 to 3 where 1 is the **most important** reason and 3 is the **least important** reason, please rank which of the following are the most important reasons for referring veterans to fee-basis care.

Table I-11. Chief of Staff: Question 10

		Ranking (1 - 3) Where 1 = most important		
	N	n (%) ranked #1	n (%) ranked #2	n (%) ranked #3
a. Lack of clinical services available at VA facilities	111	86 (77.5)	14 (12.6)	11 (9.9)
b. Veteran travel distance to VA facilities	111	12 (10.8)	51 (45.9)	48 (43.2)
c. Veteran wait times at VA facilities	111	15 (13.5)	46 (41.4)	50 (45.0)
Some individuals ranked more than one reason for referral as "the most important reason" or the "least important reason." As a result, the columns do not add up to 111.				

10D. Are there other important reasons why your local health care system refers veterans to fee-basis or contracted care?

Table I-12. Chief of Staff: Question 10D

	n	%
	111	
Yes	37	33.3
No	74	66.7

11. Please mark 'YES' or 'NO' for the following questions.

Table I-13. Chief of Staff: Question 11

		Yes	No
	N	**n (%)**	**n (%)**
a. Has your local health care system implemented the Non-VA Care Coordination (NVCC) internal referral management program?	111	106 (95.5)	5 (4.5\)
b. At your local health care system, are veteran priority ratings and the service-connection of the injury or illness considered when scheduling appointments?	111	45 (40.5)	66 (59.5)
c. Does your local health care system "bump" a veteran from a scheduled appointment to accommodate the appointment needs of a veteran of a higher priority group?	111	2 (1.8)	109 (98.2)

12. How often does your local health care system do the following things?

Table I-14. Chief of Staff: Question 12

		All of the Time	Most of the time	Some of the time	None of the time
	N	**n (%)**	**n (%)**	**n (%)**	**n (%)**
a. Share records with non-VA health care providers in electronic format?	110	5 (4.5)	10 (9.1)	43 (39.1)	52 (47.3)
b. Collect data about how long veterans wait for appointments at non-VA health care providers?	111	15 (13.5)	23 (20.7)	45 (40.5)	28 (25.2)

13A. If you have to refer veterans out for non-VA care, and the care requires more than one visit, do they need a referral for each visit?

Table I-15. Chief of Staff: Question 13A

	n	%
	111	
Separate referral for each visit	9	8.1
One referral will cover all related visits to this specialist within 60 day timeframe	51	45.9
Other	51	45.9

13B. What if the veteran requires more than one visit to this specialist for his/her broken leg, but the care is anticipated to span a period longer than 60 days (e.g., 7 months)-do they need a referral for each visit?

Table I-16. Chief of Staff: Question 13B

	n	%
	111	
Separate referral for each visit	23	20.7
One referral will cover all related visits to this specialist regardless of timeframe	41	36.9
Other	47	42.3

Information Technology

14. WIFI Access: Is there wireless Internet access in your Administrative Parent for the following people at your VAMC(s) and CBOC(s)?

Table I-17. Chief of Staff: Question 14

		Yes, everywhere and reliable	Yes, everywhere but spotty	Yes, some places reliably	Yes, some places and spotty	No, no wireless Internet
	N	n (%)	n (%)	n (%)	n (%)	n (%)
VAMC (s) Wireless Internet Access						
a. For patients and guests?	111	13 (11.7)	8 (7.2)	33 (29.7)	14 (12.6)	43 (38.7)
b. For VA staff?	111	31 (27.9)	9 (8.1)	21 (18.9)	12 (10.8)	38 (34.2)
CBOC(s) Wireless Internet Access:						
c. For patients and guests?	111	9 (8.1)	3 (2.7)	9 (8.1)	10 (9.0)	80 (72.1)
d. For VA staff?	111	15 (13.5)	5 (4.5)	12 (10.8)	8 (7.2)	71 (64.0)

15. Do facilities in your local health care system send radiology exams for **remote reading**?

Table I-18. Chief of Staff: Question 15

	n	%
N	111	
Yes, both day and night	38	34.2
Yes, only at night	62	55.9
No, neither day nor night	11	9.9

16. Where is the remote reading done? Please mark all that apply.

Table I-19. Chief of Staff: Question 16

	n	%
N	100	
At a VAMC within this Administrative Parent	14	14.0
At a CBOC within this Administrative Parent	4	4.0
At a VA facility **outside** this Administrative Parent	58	58.0
At a **non-VA facility**	47	47.0
This question (question 16) is based on respondents who indicated that facilities in their local health care system send radiology exams for remote reading (question 15).		

17. In the PAST YEAR, what percentage of radiology exams were read remotely? Just your best guess.

Table I-20. Chief of Staff: Question 17

	N	Mean	Median	Standard Deviation	Range
Percent of radiology exams were read remotely	99	15.4	10	17.9	0 - 100
This question (question 17) is based on respondents who indicated that facilities in their local health care system send radiology exams for remote reading (question 15).					

Tele-Medicine Technology

18. What kind of tele-medicine technology is used for the following conditions in your local health care system? **Please select all that apply for each medical condition listed.**

Table I-21. Chief of Staff: Question 18

		Clinical Video Tele-Health (CVT) *provider to patient*		Clinical Video CVT- Virtual Consultations *provider to provider*		Home Telehealth/ Remote monitoring technology		Store and Forward Technology- storage of images or other data for later processing		None of these technologies are available at this Administrative Parent	
	N	n	%	n	%	n	%	n	%	n	%
a. Post-Traumatic Stress Disorder (PTSD)	111	101	91.0	25	22.5	43	38.7	13	11.7	8	7.2
b. Substance Use Disorders (SUD)	111	81	73.0	21	18.9	23	20.7	3	2.7	27	24.3
c. Traumatic Brain Injury (TBI)	110	62	56.4	25	22.7	18	16.4	4	3.6	38	34.6
d. Colon Cancer	111	32	28.8	16	14.4	4	3.6	3	2.7	73	65.8
e. Type 2 Diabetes	111	72	64.9	25	22.5	60	54.1	17	15.3	16	14.4

19/20. Within your local health care system, where are **providers and patients** located when using CVT? This includes CVT use for any medical condition. Include only CVT provider to patient. Just give us your best guess.

Table I-22. Chief of Staff: Question 19/20

Percentage of Clinical Video Telehealth (CVT Provider to Patient)					
	N	**Mean**	**Median**	**Standard Deviation**	**Range**
19. What percentage of the time is the PROVIDER at a:					
a. VAMC?	101	77.3	80.0	23.3	0.0 – 100.0
b. Small or medium CBOC?	101	11.2	5.0	15.3	0.0 – 70.0
c. Large or very large CBOC?	100	6.3	0.0	10.9	0.0 - 75.0
d. Other locations	100	5.3	0.0	15.9	0.0 – 100.0
20. What percentage of the time is a PATIENT at a:					
a. VAMC?	101	27.8	10.0	30.7	0.0 – 100.0
b Small or medium CBOC?	102	51.4	50.0	31.8	0.0 – 100.0
c. Large or very large CBOC?	102	15.6	10.0	20.5	0.0 – 95.0
d. Other locations	101	5.1	0.0	12.1	0.0 – 80.0
These questions (questions 19 and 20) are based on respondents who indicated that CVT provider to patient is used for any condition (question 18). Note % for a+b+c+d = 100% in Q19 and Q20					

Home Telehealth (HT) (Remote Monitoring Programs)

21. What is the average amount of time that a patient is part of a home telehealth monitoring program at your local health care system?

Table I-23. Chief of Staff: Question 21

	n	**%**
N	74	
Less than 1 month	1	1.4
1-3 months	12	16.2
4-6 months	21	28.4
7-12 months	19	25.7
More than 12 months	21	28.4
This question (question 21) is based on respondents who indicated use of a home telehealth monitoring program (question 18).		

22. What is the primary reason patients stop being part of a **home telehealth monitoring program**? Select ONE reason.

Table I-24. Chief of Staff: Question 22

	n	%
N	76	
Death	7	9.2
Improvement in health	34	44.7
Decline in health	4	5.3
Inpatient Admission	1	1.3
Transfer to nursing home or long-term care	7	9.2
Technical issues (such as Internet/phone issues)	3	4.0
Some other reason	20	26.3
This question (question 22) is based on respondents who indicated use of a home telehealth monitoring program (question 18).		

23. What is the **largest** number of patients enrolled in a **home telehealth monitoring program** at any given time from your local health care system?

Table I-25. Chief of Staff: Question 23

	n	%
N	76	
Less than 100	7	9.2
101 – 500	41	54.0
More than 500	28	36.8
This question (question 23) is based on respondents who indicated use of a home telehealth monitoring program (question 18).		

24. What is the **smallest** number of patients enrolled in a **home telehealth monitoring program** at any given time from your local health care system?

Table I-26. Chief of Staff: Question 24

	n	%
N	76	
Less than 100	21	27.6
101 – 500	37	48.7
More than 500	18	23.7
This question (question 24) is based on respondents who indicated use of a home telehealth monitoring program (question 18).		

25. Where do the providers who oversee the **home telehealth monitoring program** at your local health care system **work**? Select all that apply

Table I-27. Chief of Staff: Question 25

	n	%
N	76	
At the patient's primary CBOC	40	52.6
At a different VA facility within the local health care system	27	35.5
Oversight provided by an external vendor company	0	0.0
Some other place	26	34.2
This question (question 25) is based on respondents who indicated use of a home telehealth monitoring program (question 18). Respondents were permitted to select all answer choices that applied.		

Appendix I.1.2 PTSD

Section 2: Post-Traumatic Stress Disorder (PTSD)

PTSD Diagnosis and Assessment

1. Please think about patients who need a **referral for an evaluation** for PTSD.
IN THE PAST 90 DAYS, how often were there *clinically meaningful delays* in getting these patients an **evaluation** leading up to either a diagnosis or initial treatment plan? Indicate the percent of patients that experienced delays for whom the service was required.

Table I-28. Post-Traumatic Stress Disorder: Question 1

Service		No Delay		1-10% of patients experience delay		11-25% of patients experience delay		26-50% of patients experience delay		51% or more of patients experience delay		Not applicable	
	N	n	%	n	%	n	%	n	%	n	%	n	%
a. Evaluation in general mental health within your local health care system	117	54	46.2	49	41.9	8	6.8	2	1.7	2	1.7	2	1.7
b. Evaluation by the PTSD clinical team	117	53	45.3	33	28.2	8	6.8	6	5.1	4	3.4	13	11.1
c. Evaluation using telehealth in CBOCs (all sizes)	117	47	40.2	33	28.2	11	9.4	7	6.0	2	1.7	17	14.5
d. Evaluation for mental health services in CBOCs (all sizes)	117	36	30.8	42	35.9	20	17.1	7	6.0	6	5.1	6	5.1
e. Getting appointments when patients are self-referred for an evaluation in general mental health	117	55	47.0	44	37.6	7	6.0	2	1.7	2	1.7	7	6.0

2. Think about those PTSD patients who experienced *clinically meaningful delays* getting an **evaluation. IN THE PAST 90 DAYS**, which of these delays had the **most negative impact on patients**?

Results not presented. Respondents were only asked this question if they identified more than three delays in Q1 in order to identify their top three delays for Q3.

Reducing Delays in Obtaining a Diagnostic Assessment

3A. **Your solution for delays in getting an:** Evaluation in general mental health within your local health care system. Think of the most effective way to reduce the number of *clinically meaningful delays* at this junction? Now, **in your solution, how important are each of the following elements**?

Table I-29. Post-Traumatic Stress Disorder: Question 3A

Solution	N	Critically important n	Critically important %	Very important N	Very important %	Somewhat important n	Somewhat important %	Unimportant n	Unimportant %	Not applicable n	Not applicable %
a. Create additional space for patient care (e.g., more exam rooms, procedure rooms, inpatient beds).	36	13	36.1	12	33.3	7	19.4	3	8.3	1	2.8
b. Increase the number of licensed independent practitioners (e.g., physicians, nurse practitioners, psychologists).	36	20	55.6	10	27.8	6	16.7	0	0.0	0	0.0
c. Increase the number of other personnel (e.g., nursing, technicians, pharmacists, clerical staff).	36	11	30.6	14	38.9	8	22.2	3	8.3	0	0.0
d. Acquire and/or improve availability of equipment.	36	3	8.3	5	13.9	10	27.8	10	27.8	8	22.2
e. Implement or increase the availability of telehealth services.	36	3	8.3	9	25.0	15	41.7	7	19.4	2	5.6
f. Improve information technology (e.g., scheduling system, electronic health record).	36	14	38.9	9	25.0	6	16.7	6	16.7	1	2.8
g. Change 'central office policies' that affect workflow and efficiency (e.g., rules governing documentation or how quickly certain services must be provided).	36	8	22.2	14	38.9	7	19.4	5	13.9	2	5.6
h. Improve personnel supervision, management, or incentives.	36	8	22.2	14	38.9	9	25.0	3	8.3	2	5.6
i. Increase weekend and evening availability of services.	36	3	8.3	4	11.1	15	41.7	12	33.3	2	5.6
j. Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community.	36	6	16.7	4	11.1	13	36.1	12	33.3	1	2.8
k. Some other solution(s).	34	6	17.7	9	26.5	1	2.9	1	2.9	17	50.0

This question (question 3) is based on respondents who indicated that patients experienced delays in getting an evaluation (question 1). If 1-3 delays were mentioned in question 1, this question was repeated for each delay mentioned. If 4 or more delays were mentioned in question 1, this question was repeated for the top three delays mentioned in question 2. Respondents were eligible to answer question 3a (N=36, 30.77% of those who answered question 1 and 59.02% of those who reported any delay) if they identified delays in four or more services and indicated that this was one of the three delays that had the most negative impact on patients or if this service was one of the three or fewer services for which a delay was indicated.

3B. **Your solution for delays in getting an:** Evaluation by the PTSD clinical team . Think of the most effective way to reduce the number of *clinically meaningful delays* at this junction? Now, **in your solution, how important are each of the following elements**?

Table I-30. Post-Traumatic Stress Disorder: Question 3B

j. Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community.	35	3	8.6	6	17.1	16	45.7	9	25.7	1	2.9
k. Some other solution(s).	35	8	22.9	6	17.1	3	8.6	1	2.9	17	48.6

This question (question 3) is based on respondents who indicated that patients experienced delays in getting an evaluation (question 1). If 1-3 delays were mentioned in question 1, this question was repeated for each delay mentioned. If 4 or more delays were mentioned in question 1, this question was repeated for the top three delays mentioned in question 2. Respondents were eligible to answer question 3b (N=35, 29.91% of those who answered question 1 and 68.63% of those who reported any delay) if they identified delays in four or more services and indicated that this was one of the three delays that had the most negative impact on patients or if this service was one of the three or fewer services for which a delay was indicated.

3C. **Your solution for delays in getting an:** Evaluation using telehealth in CBOCs (all sizes). Think of the most effective way to reduce the number of *clinically meaningful delays* at this junction? Now, **in your solution, how important are each of the following elements**?

Table I-31. Post-Traumatic Stress Disorder: Question 3C

j. Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community.	29	1	3.5	4	13.8	11	37.9	11	37.9	2	6.9
k. Some other solution(s).	28	2	7.1	3	10.7	4	14.3	0	0.0	19	67.9

This question (question 3) is based on respondents who indicated that patients experienced delays in getting an evaluation (question 1). If 1-3 delays were mentioned in question 1, this question was repeated for each delay mentioned. If 4 or more delays were mentioned in question 1, this question was repeated for the top three delays mentioned in question 2. Respondents were eligible to answer question 3c (N=29, 24.79% of those who answered question 1 and 54.72% of those who reported any delay) if they identified delays in four or more services and indicated that this was one of the three delays that had the most negative impact on patients or if this service was one of the three or fewer services for which a delay was indicated.

3D. **Your solution for delays in getting an: e**valuation for mental health services in CBOCs (all sizes). Think of the most effective way to reduce the number of *clinically meaningful delays* at this junction? Now, **in your solution, how important are each of the following elements**?

f. Improve information technology (e.g., scheduling system, electronic health record).	24	7	29.2	7	29.2	7	29.2	2	8.3	1	4.2
g. Change 'central office policies' that affect workflow and efficiency (e.g., rules governing documentation or how quickly certain services must be provided	24	3	12.5	7	29.2	6	25.0	7	29.2	1	4.2
h. Improve personnel supervision, management, or incentives.	24	3	12.5	7	29.2	8	33.3	5	20.8	1	4.2
i. Increase weekend and evening availability of services.	24	0	0.0	6	25.0	11	45.8	7	29.2	0	0.0
j. Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community.	24	1	4.2	6	25.0	9	37.5	7	29.2	1	4.2
k. Some other solution(s).	24	5	20.8	5	20.8	2	8.3	1	4.2	11	45.8

This question (question 3) is based on respondents who indicated that patients experienced delays in getting an evaluation (question 1). If 1-3 delays were mentioned in question 1, this question was repeated for each delay mentioned. If 4 or more delays were mentioned in question 1, this question was repeated for the top three delays mentioned in question 2. Respondents were eligible to answer question 3e (N=25, 21.37% of those who answered question 1 and 45.45% of those who reported any delay) if they identified delays in four or more services and indicated that this was one of the three delays that had the most negative impact on patients or if this service was one of the three or fewer services for which a delay was indicated.

PTSD Treatment

3. Now please think about patients who have a PTSD diagnosis. IN THE PAST 90 DAYS, how often were there *clinically meaningful delays* scheduling these patients for **PTSD treatment**? Indicate the percent of patients who experienced delays for whom the service was indicated.

Table I-34. Post-Traumatic Stress Disorder: Question 4

j. Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community.	11	0	0.0	2	18.2	3	27.3	5	45.5	1	9.1
k. Some other solution(s).	11	0	0.0	0	0.0	0	0.0	2	18.2	9	81.8

This question (question 6) is based on respondents who indicated that patients experienced delays in obtaining PTSD treatment (question 4). If 1-3 delays were mentioned in question 4, this question was repeated for each delay mentioned. If 4 or more delays were mentioned in question 4, this question was repeated for the top three delays mentioned in question 5. Respondents were eligible to answer question 6c (N=11, 9.48% of those who answered question 4 and 20% of those who reported any delay) if they identified delays in four or more services and indicated that this was one of the three delays that had the most negative impact on patients or if this service was one of the three or fewer services for which a delay was indicated.

6D. **Your solution for delays in:** Group or individual psychotherapy in general mental health. Think of the most effective way to reduce treatment delays for PTSD patients. Now, **in your solution, how important are each of the following elements**?

Table I-38. Post-Traumatic Stress Disorder: Question 6D

Solution	N	Critically important		Very important		Somewhat important		Unimportant		Not applicable	
		n	%	n	%	n	%	n	%	n	%
a. Create additional space for patient care (e.g., more exam rooms, procedure rooms, inpatient beds).	35	13	37.1	11	31.4	4	11.4	5	14.3	2	5.7
b. Increase the number of licensed independent practitioners (e.g., physicians, nurse practitioners, psychologists).	35	20	57.1	9	25.7	6	17.1	0	0.0	0	0.0
c. Increase the number of other personnel (e.g., nursing, technicians, pharmacists, clerical staff).	35	8	22.9	11	31.4	11	31.4	4	11.4	1	2.9
d. Acquire and/or improve availability of equipment.	35	1	2.9	4	11.4	9	25.7	9	25.7	12	34.3
e. Implement or increase the availability of telehealth services.	35	2	5.7	6	17.1	14	40.0	7	20.0	6	17.1
f. Improve information technology (e.g., scheduling system, electronic health record).	34	8	23.5	9	26.5	8	23.5	7	20.6	2	5.9
g. Change 'central office policies' that affect workflow and efficiency (e.g., rules governing documentation or how quickly certain services must be provided).	35	7	20.0	4	11.4	13	37.1	6	17.1	5	14.3
h. Improve personnel supervision, management, or incentives.	35	5	14.3	12	34.3	10	28.6	3	8.6	5	14.3
i. Increase weekend and evening availability of services.	35	0	0.0	4	11.4	15	42.9	15	42.9	1	2.9
j. Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community.	35	1	2.9	6	17.1	11	31.4	12	34.3	5	14.3
k. Some other solution(s).	35	9	25.7	5	14.3	2	5.7	1	2.9	18	51.4

This question (question 6) is based on respondents who indicated that patients experienced delays in obtaining PTSD treatment (question 4). If 1-3 delays were mentioned in question 4, this question was repeated for each delay mentioned. If 4 or more delays were mentioned in question 4, this question was repeated for the top three delays mentioned in question 5. Respondents were eligible to answer question 6d (N=35, 30.7% of those who answered question 4 and 51.47% of those who reported any delay) if they identified delays in four or more services and indicated that this was one of the three delays that had the most negative impact on patients or if this service was one of the three or fewer services for which a delay was indicated.

6E. **Your solution for delays in:** Group or individual psychotherapy in CBOCs (all sizes). Think of the most effective way to reduce treatment delays for PTSD patients. Now, **in your solution, how important are each of the following elements**?

Table I-39. Post-Traumatic Stress Disorder: Question 6E

Solution	N	Critically important		Very important		Somewhat important		Unimportant		Not applicable	
		n	%	n	%	n	%	n	%	n	%

i. Increase weekend and evening availability of services.	17	0	0.0	3	17.7	3	17.7	5	29.4	6	35.3
j. Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community.	17	0	0.0	4	23.5	3	17.7	3	17.7	7	41.2
k. Some other solution(s).	17	5	29.4	2	11.8	1	5.9	0	0.0	9	52.9

This question (question 6) is based on respondents who indicated that patients experienced delays (n= in getting an evaluation (question 4). If 1-3 delays were mentioned in question 4, this question was repeated for each delay mentioned. If 4 or more delays were mentioned in question 4, this question was repeated for the top three delays mentioned in question 5. Respondents were eligible to answer question 6j (N=17, 14.66% of those who answered question 4 and 34% of those who reported any delay) if they identified delays in four or more services and indicated that this was one of the three delays that had the most negative impact on patients or if this service was one of the three or fewer services for which a delay was indicated.

6K. **Your solution for delays in:** Intake with the Substance Use Disorder/PTSD treatment program. Think of the most effective way to reduce treatment delays for PTSD patients. Now, **in your solution, how important are each of the following elements**?

Responses to this question are not presented due to small number of respondents who identified delays in intake with substance use disorder/PTSD treatment program (N = 8).

Issues that Affect Provider and System Efficiency

7. IN THE PAST YEAR, how much did the following issues negatively impact provider and system efficiency in the provision of care for PTSD patients?

Table I-44. Post-Traumatic Stress Disorder: Question 7

	N	None		A little		A fair amount		A lot		Not Applicable	
		n	%	n	%	n	%	n	%	n	%
a. Providers performing clinical activities that could be performed by individuals with less training	115	20	17.4	39	33.9	27	23.5	25	21.7	4	3.5
b. Providers performing administrative activities that could be performed by others	115	7	6.1	25	21.7	37	32.2	46	40.0	0	0.0
c. Residency training/teaching requirements	115	51	44.3	36	31.3	11	9.6	6	5.2	11	9.6
d. Insufficient clinical/administrative support staff	115	9	7.8	23	20.0	33	28.7	50	43.5	0	0.0

N refers to the proportion of respondents who listed each "reason" as one of the two most important affecting retention
This question (question 10) is based on respondents who indicated that their local health care system had problems retaining certain personnel categories (question 8B). Question 10 was asked for each personnel type marked "yes" in question 8B.

Appendix I.1.3 SUD

Section 3: Substance Use Disorders (SUD)

Comprehensive Evaluation for SUD

1. Please think about patients who are in need of an **initial evaluation** for a SUD. **IN THE PAST 90 DAYS**, how often were there *clinically meaningful delays* in getting these patients an **initial evaluation** leading up to either a diagnosis or initial treatment plan? Indicate the percent of SUD patients that experienced delays for whom the service was indicated.

Table I-49. Substance Use Disorders: Question 1

Service	N	No Delay		1-10% of patients experience delay		11-25% of patients experience delay		26-50% of patients experience delay		51% or more of patients experience delay		Not applicable	
		n	%	n	%	n	%	n	%	n	%	n	%
a. Referral to general mental health	112	65	58.	33	29.5	6	5.4	1	0.9	0	0.0	7	6.3
b. Referral to SUD specialty care	112	76	67.9	24	21.4	8	7.1	1	0.9	0	0.0	3	2.7
c. Referral to tele-mental health	108	42	38.9	22	20.4	6	5.6	0	0.0	2	1.9	36	33.3
d. Referral to SUD services located in CBOCs (all sizes)	111	47	42.3	29	26.1	10	9.0	3	2.7	2	1.8	20	18.0
e. Referral to methadone clinic	112	28	25.0	12	10.7	5	4.5	1	0.9	4	3.6	62	55.4
f. Patients who are self-referred for a SUD evaluation in general mental health	112	73	65.2	23	20.5	3	2.7	1	0.9	1	0.9	11	9.8
g. Referral to SUD services from the Administrative Parent to fee-basis or contracted care	112	23	20.5	11	9.8	6	5.4	2	1.8	6	5.4	64	57.1
h. Referral to residential treatment at another Administrative Parent	112	19	17.0	29	25.9	11	9.8	7	6.3	20	17.9	26	23.2

2. Think about those SUD patients who experienced *clinically meaningful delays* in getting an **initial evaluation. I**n the **PAST 90 DAYS**, which of these delays had the **most negative impact** on patients?

Results not presented. Respondents were only asked this question if they identified more than three delays in Q1 in order to identify their top three delays for Q3.

Reducing Delays in Initial Evaluation for SUD

3A. **Your solution for delays in:** Referral to general mental health. Think of the most effective way to reduce the number of *clinically meaningful delays* at this junction. Now, **in your solution, how important are each of the following elements in your solution**?

Table I-50. Substance Use Disorders: Question 3A

Solution	N	Critically important		Very important		Somewhat important		Unimportant		Not applicable	
		n	%	n	%	n	%	n	%	n	%
a. Create additional space for patient care (e.g., more exam rooms, procedure rooms, inpatient beds).	20	6	30.0	7	35.0	5	25.0	1	5.0	1	5.0
b. Increase the number of licensed independent practitioners (e.g., physicians, nurse practitioners, psychologists).	20	9	45.0	8	40.0	3	15.0	0	0.0	0	0.0
c. Increase the number of other personnel (e.g., nursing, technicians, pharmacists, clerical staff).	20	4	20.0	6	30.0	7	35.0	2	10.0	1	5.0
d. Acquire and/or improve availability of equipment.	20	0	0.0	3	15.0	3	15.0	9	45.0	5	25.0
e. Implement or increase the availability of telehealth services.	20	0	0.0	4	20.0	11	55.0	4	20.0	1	5.0
f. Improve information technology (e.g., scheduling system, electronic health record).	20	6	30.0	6	30.0	1	5.0	7	35.0	0	0.0
g. Change 'central office policies' that affect workflow and efficiency (e.g., rules governing documentation or how quickly certain services must be provided).	20	5	25.0	3	15.0	5	25.0	7	35.0	0	0.0
h. Improve personnel supervision, management, or incentives.	20	4	20.0	7	35.0	7	35.0	2	10.0	0	0.0
i. Increase weekend and evening availability of services.	20	1	5.0	2	10.0	7	35.0	10	50.0	0	0.0
j. Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community.	20	1	5.0	5	25.0	2	10.0	8	40.0	4	20
k. Some other solution(s).	19	4	21.1	0	0.0	2	10.5	1	5.3	12	63.2

This question (question 3) is based on respondents who indicated that patients experienced delays in getting an evaluation (question 1). If 1-3 delays were mentioned in question 1, this question was repeated for each delay mentioned. If 4 or more delays were mentioned in question 1, this question was repeated for the top three delays mentioned in question 2. Respondents were eligible to answer question 3a (N=20, 17.86% of those who answered question 1 and 50% of those who reported any delay) if they identified delays in four or more services and indicated that this was one of the three delays that had the most negative impact on patients or if this service was one of the three or fewer services for which a delay was indicated.

3B. **Your solution for delays in:** Referral to SUD specialty care. Think of the most effective way to reduce the number of *clinically meaningful delays* at this junction. Now, **in your solution, how important are each of the following elements in your solution**?

Table I-51. Substance Use Disorders: Question 3B

Solution	N	Critically important		Very important		Somewhat important		Unimportant		Not applicable	
		n	%	n	%	n	%	n	%	n	%
a. Create additional space for patient care (e.g., more exam rooms, procedure rooms, inpatient beds).	22	10	45.5	6	27.3	3	13.6	2	9.1	1	4.6
b. Increase the number of licensed independent practitioners (e.g., physicians, nurse practitioners, psychologists).	22	16	72.7	5	22.7	1	4.6	0	0.0	0	0.0
c. Increase the number of other personnel (e.g., nursing, technicians, pharmacists, clerical staff).	21	5	23.8	10	47.6	6	28.6	0	0.0	0	0.0
d. Acquire and/or improve availability of equipment.	21	1	4.8	4	19.1	3	14.3	10	47.6	3	14.3
e. Implement or increase the availability of telehealth services.	22	2	9.1	8	36.4	11	50.0	1	4.6	0	0.0
f. Improve information technology (e.g., scheduling system, electronic health record).	22	7	31.8	2	9.1	3	13.6	8	36.4	2	9.1
g. Change 'central office policies' that affect workflow and efficiency (e.g., rules governing documentation or how quickly certain services must be provided).	22	3	13.6	3	13.6	5	22.7	7	31.8	4	18.2
h. Improve personnel supervision, management, or incentives.	22	4	18.2	9	40.9	4	18.2	4	18.2	1	4.6
i. Increase weekend and evening availability of services.	22	1	4.6	4	18.2	8	36.4	9	40.9	0	0.0
j. Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community.	22	3	13.6	5	22.7	5	22.7	6	27.3	3	13.6
k. Some other solution(s).	22	4	18.2	0	0.0	1	4.6	1	4.6	16	72.7

This question (question 3) is based on respondents who indicated that patients experienced delays in getting an evaluation (question 1). If 1-3 delays were mentioned in question 1, this question was repeated for each delay mentioned. If 4 or more delays were mentioned in question 1, this question was repeated for the top three delays mentioned in question 2. Respondents were eligible to answer question 3b (N=22, 19.64% of those who answered question 1 and 66.67% of those who reported any delay) if they identified delays in four or more services and indicated that this was one of the three delays that had the most negative impact on patients or if this service was one of the three or fewer services for which a delay was indicated.

3C. **Your solution for delays in:** Referral to tele-mental health. Think of the most effective way to reduce the number of *clinically meaningful delays* at this junction. Now, **in your solution, how important are each of the following elements in your solution**?

Table I-52. Substance Use Disorders: Question 3C

Solution	N	Critically important		Very important		Somewhat important		Unimportant		Not applicable	
		n	%	n	%	n	%	n	%	n	%
a. Create additional space for patient care (e.g., more exam rooms, procedure rooms, inpatient beds).	16	5	31.3	7	43.8	1	6.25	2	12.5	1	6.3
b. Increase the number of licensed independent practitioners (e.g., physicians, nurse practitioners, psychologists).	16	4	25.0	7	43.8	4	25.0	0	0.0	1	6.3
c. Increase the number of other personnel (e.g., nursing, technicians, pharmacists, clerical staff).	16	2	12.5	4	25.0	8	50.0	2	12.5	0	0.0
d. Acquire and/or improve availability of equipment.	16	2	12.5	2	12.5	5	31.3	5	31.3	2	12.5
e. Implement or increase the availability of telehealth services.	16	2	12.5	3	18.8	6	37.5	5	31.3	0	0.0
f. Improve information technology (e.g., scheduling system, electronic health record). .	16	3	18.8	1	6.3	5	31.3	5	31.3	2	12.5
g. Change 'central office policies' that affect workflow and efficiency (e.g., rules governing documentation or how quickly certain services must be provided).	16	2	12.5	1	6.3	1	6.3	8	50.0	4	25.0
h. Improve personnel supervision, management, or incentives.	16	2	12.5	3	18.8	4	25.0	4	25.0	3	18.8
i. Increase weekend and evening availability of services.	16	0	0.0	7	43.8	6	37.5	3	18.8	0	0.0
j. Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community.	16	1	6.3	2	12.5	4	25.0	7	43.8	2	12.5
k. Some other solution(s).	16	2	12.5	1	6.3	2	12.5	3	18.8	8	50.0

This question (question 3) is based on respondents who indicated that patients experienced delays in getting an evaluation (question 1). If 1-3 delays were mentioned in question 1, this question was repeated for each delay mentioned. If 4 or more delays were mentioned in question 1, this question was repeated for the top three delays mentioned in question 2. Respondents were eligible to answer question 3c (N=16, 14.81% of those who answered question 1 and 53.33% of those who reported any delay) if they identified delays in four or more services and indicated that this was one of the three delays that had the most negative impact on patients or if this service was one of the three or fewer services for which a delay was indicated.

3D. **Your solution for delays in:** Referral to SUD services located in CBOCs (all sizes). Think of the most effective way to reduce the number of *clinically meaningful delays* at this junction. Now, **in your solution, how important are each of the following elements in your solution**?

Table I-53. Substance Use Disorders: Question 3D

Solution	N	Critically important		Very important		Somewhat important		Unimportant		Not applicable	
		n	%	n	%	n	%	n	%	n	%
a. Create additional space for patient care (e.g., more exam rooms, procedure rooms, inpatient beds).	35	11	31.4	12	34.3	6	17.1	2	5.7	4	11.4
b. Increase the number of licensed independent practitioners (e.g., physicians, nurse practitioners, psychologists).	35	14	40.0	9	25.7	8	22.9	1	2.9	3	8.6
c. Increase the number of other personnel (e.g., nursing, technicians, pharmacists, clerical staff).	35	6	17.1	11	31.4	12	34.3	3	8.6	3	8.6
d. Acquire and/or improve availability of equipment.	35	1	2.9	4	11.4	10	28.6	10	28.6	10	28.6
e. Implement or increase the availability of telehealth services.	35	3	8.6	12	34.3	13	37.1	4	11.4	3	8.6
f. Improve information technology (e.g., scheduling system, electronic health record). Describe the technology improvements needed in the comments box below.	35	8	22.9	7	20.0	7	20.0	8	22.9	5	14.3
g. Change 'central office policies' that affect workflow and efficiency (e.g., rules governing documentation or how quickly certain services must be provided).	35	5	14.3	7	20.0	8	22.9	10	28.6	5	14.3

i. Increase weekend and evening availability of services.	35	1	2.9	8	22.9	13	37.1	10	28.6	3	8.6
j. Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community.	35	2	5.7	8	22.9	6	17.1	12	34.3	7	20.0
k. Some other solution(s).	35	3	8.6	6	17.1	3	8.6	2	5.7	21	60.0

This question (question 3) is based on respondents who indicated that patients experienced delays in getting an evaluation (question 1). If 1-3 delays were mentioned in question 1, this question was repeated for each delay mentioned. If 4 or more delays were mentioned in question 1, this question was repeated for the top three delays mentioned in question 2. Respondents were eligible to answer question 3d (N=35, 31.53% of those who answered question 1 and 79.55% of those who reported any delay) if they identified delays in four or more services and indicated that this was one of the three delays that had the most negative impact on patients or if this service was one of the three or fewer services for which a delay was indicated.

3E. **Your solution for delays in:** Referral to methadone clinic. Think of the most effective way to reduce the number of *clinically meaningful delays* at this junction. Now, **in your solution, how important are each of the following elements in your solution**?

Table I-54. Substance Use Disorders: Question 3E

Solution	N	Critically important		Very important		Somewhat important		Unimportant		Not applicable	
		n	%	n	%	n	%	n	%	n	%
a. Create additional space for patient care (e.g., more exam rooms, procedure rooms, inpatient beds).	15	1	6.7	2	13.3	3	20.0	3	20.0	6	40.0
b. Increase the number of licensed independent practitioners (e.g., physicians, nurse practitioners, psychologists).	15	3	20.0	3	20.0	3	20.0	1	6.7	5	33.3
c. Increase the number of other personnel (e.g., nursing, technicians, pharmacists, clerical staff).	15	2	13.3	1	6.7	7	46.7	2	13.3	3	20.0

h. Improve personnel supervision, management, or incentives.	15	0	0.0	2	13.3	2	13.3	5	33.3	6	40.0
i. Increase weekend and evening availability of services.	15	1	6.7	3	20.0	2	13.3	3	20.0	6	40.0
j. Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community.	15	6	40.0	6	40.0	2	13.3	1	6.7	0	0.0
k. Some other solution(s).	15	4	26.7	3	20.0	1	6.7	0	0.0	7	46.7
This question (question 3) is based on respondents who indicated that patients experienced delays in getting an evaluation (question 1). If 1-3 delays were mentioned in question 1, this question was repeated for each delay mentioned. If 4 or more delays were mentioned in question 1, this question was repeated for the top three delays mentioned in question 2. Respondents were eligible to answer question 3e (N=15, 13.39% of those who answered question 1 and 68.18% of those who reported any delay) if they identified delays in four or more services and indicated that this was one of the three delays that had the most negative impact on patients or if this service was one of the three or fewer services for which a delay was indicated.											

3F. **Your solution for delays in:** Patients who are self-referred for a SUD evaluation in general mental health. Think of the most effective way to reduce the number of *clinically meaningful delays* at this junction. Now, **in your solution, how important are each of the following elements in your solution**?

Table I-55. Substance Use Disorders: Question 3F

Solution	N	Critically important		Very important		Somewhat important		Unimportant		Not applicable	
		n	%	n	%	n	%	n	%	n	%
a. Create additional space for patient care (e.g., more exam rooms, procedure rooms, inpatient beds).	12	5	41.7	2	16.7	4	33.3	0	0.0	1	8.3
b. Increase the number of licensed independent practitioners (e.g., physicians, nurse practitioners, psychologists).	12	4	33.3	5	41.7	3	25.0	0	0.0	0	0.0
c. Increase the number of other personnel (e.g., nursing, technicians, pharmacists, clerical staff).	12	3	25.0	4	33.3	4	33.3	1	8.3	0	0.0
d. Acquire and/or improve availability of equipment.	12	0	0.0	2	16.7	4	33.3	5	41.7	1	8.3
e. Implement or increase the availability of telehealth services.	12	2	16.7	4	33.3	5	41.7	1	8.3	0	0.0
f. Improve information technology (e.g., scheduling system, electronic health record).	12	4	33.3	2	16.7	4	33.3	2	16.7	0	0.0
g. Change 'central office policies' that affect workflow and efficiency (e.g., rules governing documentation or how quickly certain services must be provided).	12	1	8.3	2	16.7	3	25.0	6	50.0	0	0.0
h. Improve personnel supervision, management, or incentives.	12	0	0.0	7	58.3	5	41.7	0	0.0	0	0.0
i. Increase weekend and evening availability of services.	12	1	8.3	3	25.0	6	50.0	2	16.7	0	0.0
j. Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community.	12	1	8.3	1	8.3	4	33.3	3	25.0	3	25.0
k. Some other solution(s).	12	1	8.3	0	0.0	2	16.7	1	8.3	8	66.7

This question (question 3) is based on respondents who indicated that patients experienced delays in getting an evaluation (question 1). If 1-3 delays were mentioned in question 1, this question was repeated for each delay mentioned. If 4 or more delays were mentioned in question 1, this question was repeated for the top three delays mentioned in question 2. Respondents were eligible to answer question 3f (N=12, 10.71% of those who answered question 1 and 42.86% of those who reported any delay) if they identified delays in four or more services and indicated that this was one of the three delays that had the most negative impact on patients or if this service was one of the three or fewer services for which a delay was indicated.

3G. **Your solution for delays in:** Referral to SUD services from the Administrative Parent to fee-basis or contracted care. Think of the most effective way to reduce the number of *clinically meaningful delays* at this junction. Now, **in your solution, how important are each of the following elements in your solution**?

Table I-56. Substance Use Disorders: Question 3G

f. Improve information technology (e.g., scheduling system, electronic health record). Describe the technology improvements needed in the comments box below.	24	2	8.3	5	20.8	4	16.7	8	33.3	5	20.8
g. Change 'central office policies' that affect workflow and efficiency (e.g., rules governing documentation or how quickly certain services must be provided).	24	5	20.8	3	12.5	3	12.5	8	33.3	5	20.8
h. Improve personnel supervision, management, or incentives.	24	3	12.5	4	16.7	4	16.7	8	33.3	5	20.8
i. Increase weekend and evening availability of services.	24	0	0.0	4	16.7	4	16.7	10	41.7	6	25.0
j. Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community.	24	7	29.2	10	41.7	2	8.3	3	12.5	2	8.3
k. Some other solution(s).	24	3	12.5	3	12.5	2	8.3	1	4.2	15	62.5

This question (question 3) is based on respondents who indicated that patients experienced delays in getting an evaluation (question 1). If 1-3 delays were mentioned in question 1, this question was repeated for each delay mentioned. If 4 or more delays were mentioned in question 1, this question was repeated for the top three delays mentioned in question 2. Respondents were eligible to answer question 3g (N=24, 21.43% of those who answered question 1 and 96% of those who reported any delay) if they identified delays in four or more services and indicated that this was one of the three delays that had the most negative impact on patients or if this service was one of the three or fewer services for which a delay was indicated.

3H. **Your solution for delays in:** Referral to residential treatment at another Administrative Parent. Think of the most effective way to reduce the number of *clinically meaningful delays* at this junction. Now, **in your solution, how important are each of the following elements in your solution**?

Table I-57. Substance Use Disorders: Question 3H

Solution	N	Critically important		Very important		Somewhat important		Unimportant		Not applicable	
		n	%	n	%	n	%	n	%	n	%
a. Create additional space for patient care (e.g., more exam rooms, procedure rooms, inpatient beds).	58	18	31.0	19	32.8	6	10.3	6	10.3	9	15.5
b. Increase the number of licensed independent practitioners (e.g., physicians, nurse practitioners, psychologists).	58	18	31.0	12	20.7	11	19.0	8	13.8	9	15.5
c. Increase the number of other personnel (e.g., nursing, technicians, pharmacists, clerical staff).	58	15	25.9	13	22.4	13	22.4	7	12.1	10	17.2
d. Acquire and/or improve availability of equipment.	58	2	3.5	3	5.2	10	17.2	18	31.0	25	43.1
e. Implement or increase the availability of telehealth services.	58	0	0.0	10	17.2	15	25.9	13	22.4	20	34.5
f. Improve information technology (e.g., scheduling system, electronic health record). Describe the technology improvements needed in the comments box below.	58	6	10.3	7	12.1	11	19.0	15	25.9	19	32.8
g. Change 'central office policies' that affect workflow and efficiency (e.g., rules governing documentation or how quickly certain services must be provided).	58	7	12.1	12	20.7	11	19.0	14	24.1	14	24.1
h. Improve personnel supervision, management, or incentives.	58	5	8.6	17	29.3	8	13.8	8	13.8	20	34.5
i. Increase weekend and evening availability of services.	58	2	3.5	2	3.5	20	34.5	16	27.6	18	31.0
j. Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community.	58	5	8.6	13	22.4	15	25.9	13	22.4	12	20.7
k. Some other solution(s).	57	9	15.8	3	5.3	9	15.8	2	3.5	34	59.7

This question (question 3) is based on respondents who indicated that patients experienced delays in getting an evaluation (question 1). If 1-3 delays were mentioned in question 1, this question was repeated for each delay mentioned. If 4 or more delays were mentioned in question 1, this question was repeated for the top three delays mentioned in question 2. Respondents were eligible to answer question 3h (N=58, 51.79% of those who answered question 1 and 86.57% of those who reported any delay) if they identified delays in four or more services and indicated that this was one of the three delays that had the most negative impact on patients or if this service was one of the three or fewer services for which a delay was indicated.

SUD Treatment

4. Now please think about patients who have a SUD diagnosis. **IN THE PAST 90 DAYS,** how often were there *clinically meaningful delays* scheduling these patients for **SUD treatment or follow-up care** in the following areas? Indicate the percent of SUD patients that experienced delays for whom the service was indicated.

Table I-58. Substance Use Disorders: Question 4

Service	N	No Delay		1-10% of patients experience delay		11-25% of patients experience delay		26-50% of patients experience delay		51% or more of patients experience delay		Not applicable	
		n	%	n	%	n	%	n	%	n	%	n	%
a. Medication-assisted Withdrawal Management for Alcoholism provided as an inpatient within your local health care system	113	71	62.8	15	13.3	5	4.4	1	0.9	1	0.9	20	17.7

n. Maintenance Pharmacotherapy for Opiate Dependence: Buprenorphine within your local health care system	113	53	46.9	30	26.6	8	7.1	2	1.8	5	4.4	15	13.27
o. Maintenance Pharmacotherapy for Opiate Dependence: Buprenorphine provided through fee-basis or contracted care	113	17	15.0	18	15.9	4	3.5	5	4.4	8	7.1	61	54.0
p. Methadone Maintenance within your local health care system	113	15	13.3	7	6.2	2	1.8	2	1.8	3	2.7	84	74.3
q. Methadone Maintenance provided through fee-basis or contracted care	113	35	31.0	7	6.2	9	8.0	2	1.8	8	7.1	52	46.0

5. Think about those SUD patients who experienced *clinically meaningful delays* in obtaining treatment and follow-up care. In the **PAST 90 DAYS,** which of these delays had the **most negative impact** on patients?

Results not presented. Respondents were only asked this question if they identified more than three delays in Q4 in order to identify their top three delays for Q6.

Reducing Delays in Accessing SUD Treatment

6A. **Your solution for delays in:** Medication-assisted Withdrawal Management for Alcoholism provided as an inpatient within your local health care system**.** Think about the most effective way to reduce the number of *clinically meaningful delays* for SUD patients at this junction. Now, **in your solution, how important are each of the following elements?**

Table I-59. Substance Use Disorders: Question 6A

Solution	N	Critically important		Very important		Somewhat important		Unimportant		Not applicable	
		n	%	n	%	n	%	n	%	n	%
a. Create additional space for patient care (e.g., more exam rooms, procedure rooms, inpatient beds).	11	2	18.2	6	54.6	2	18.2	1	9.1	0	0.0
b. Increase the number of licensed independent practitioners (e.g., physicians, nurse practitioners, psychologists).	12	5	41.7	6	50.0	1	8.3	0	0.0	0	0.0
c. Increase the number of other personnel (e.g., nursing, technicians, pharmacists, clerical staff).	12	5	41.7	6	50.0	1	8.3	0	0.0	0	0.0
d. Acquire and/or improve availability of equipment.	12	1	8.3	4	33.3	5	41.7	1	8.3	1	8.3
e. Implement or increase the availability of telehealth services.	11	0	0.0	3	27.3	2	18.2	2	18.2	4	36.4
f. Improve information technology (e.g., scheduling system, electronic health record).	12	0	0.0	5	41.7	1	8.3	1	8.3	5	41.7
g. Change 'central office policies' that affect workflow and efficiency (e.g., rules governing documentation or how quickly certain services must be provided).	12	0	0.0	3	25.0	3	25.0	3	25.0	3	25.0

k. Some other solution(s).	10	2	20	3	30.0	0	0.0	0	0.0	5	50.0

This question (question 6) is based on respondents who indicated that patients experienced delays in obtaining treatment and follow-up care (question 4). If 1-3 delays were mentioned in question 4, this question was repeated for each delay mentioned. If 4 or more delays were mentioned in question 4, this question was repeated for the top three delays mentioned in question 5. Respondents were eligible to answer question 6a (N=12, 10.62% of those who answered question 4 and 54.55% of those who reported any delay) if they identified delays in four or more services and indicated that this was one of the three delays that had the most negative impact on patients or if this service was one of the three or fewer services for which a delay was indicated.

6B. **Your solution for delays in:** Medication-assisted Withdrawal Management for Alcoholism provided as an inpatient through fee-basis or contracted care**.** Think about the most effective way to reduce the number of *clinically meaningful delays* for SUD patients at this junction. Now, **in your solution, how important are each of the following elements?**

Responses to this question are not presented due to small number of respondents who identified delays in accessing medication-assisted withdrawal management for alcoholism provided as an impatient through fee-basis or contracted care and answered question 6b with solutions to this delay (N = 5).

6C. **Your solution for delays in:** Medication-assisted Withdrawal Management for Alcoholism provided as an outpatient within your local health care system**. Think about the most effective way to reduce the number of *clinically meaningful delays* for SUD patients at this junction. Now, **in your solution, how important are each of the following elements?**

Table I-60. Substance Use Disorders: Question 6C

		Critically important		Very important		Somewhat important		Unimportant		Not applicable

k. Some other solution(s).	9	3	33.3	2	22.2	0	0.0	0	0.0	4	44.4

This question (question 6) is based on respondents who indicated that patients experienced delays in obtaining treatment and follow-up care (question 4). If 1-3 delays were mentioned in question 4, this question was repeated for each delay mentioned. If 4 or more delays were mentioned in question 4, this question was repeated for the top three delays mentioned in question 5. Respondents were eligible to answer question 6c (N=10, 8.85% of those who answered question 4 and 45.45% of those who reported any delay) if they identified delays in four or more services and indicated that this was one of the three delays that had the most negative impact on patients or if this service was one of the three or fewer services for which a delay was indicated.

6D. **Your solution for delays in:** Medication-assisted Withdrawal Management for Opiate Dependence provided as an inpatient within your local health care system**.** Think about the most effective way to reduce the number of *clinically meaningful delays* for SUD patients at this junction. Now, **in your solution, how important are each of the following elements?**

Responses to this question are not presented due to small number of respondents who identified delays in accessing Medication-assisted Withdrawal Management for Opiate Dependence provided as an inpatient within your local health care system and answered question 6d with solutions to this delay (N = 7).

6E. **Your solution for delays in:** Medication-assisted Withdrawal Management for Opiate Dependence provided as an inpatient through fee-basis or contracted care**.** Think about the most effective way to reduce the number of *clinically meaningful delays* for SUD patients at this junction. Now, **in your solution, how important are each of the following elements?**

Responses to this question are not presented due to small number of respondents who identified delays in accessing Medication-assisted Withdrawal Management for Opiate Dependence provided as an inpatient through fee-basis or contracted care and answered question 6d with solutions to this delay (N = 4).

6F. **Your solution for delays in:** Medication-assisted Withdrawal Management for Opiate Dependence provided as an outpatient within your local health care system**.** Think about the most effective way to reduce the number of *clinically meaningful delays* for SUD patients at this junction. Now, **in your solution, how important are each of the following elements?**

j. Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community.	25	3	12.0	4	16.0	10	40.0	7	28.0	1	4.0
k. Some other solution(s).	23	2	8.7	1	4.4	3	13.0	1	4.4	16	69.6

This question (question 6) is based on respondents who indicated that patients experienced delays in obtaining treatment and follow-up care (question 4). If 1-3 delays were mentioned in question 4, this question was repeated for each delay mentioned. If 4 or more delays were mentioned in question 4, this question was repeated for the top three delays mentioned in question 5. Respondents were eligible to answer question 6i (N=25, 22.52% of those who answered question 4 and 53.19% of those who reported any delay) if they identified delays in four or more services and indicated that this was one of the three delays that had the most negative impact on patients or if this service was one of the three or fewer services for which a delay was indicated.

6J. **Your solution for delays in:** SUD Psychosocial Treatment (either group or individual) using tele-mental health in CBOCs (all sizes)**.** Think about the most effective way to reduce the number of *clinically meaningful delays* for SUD patients at this junction. Now, **in your solution, how important are each of the following elements?**

Table I-65. Substance Use Disorders: Question 6J

Solution	N	Critically important		Very important		Somewhat important		Unimportant		Not applicable	
		n	%	n	%	n	%	n	%	n	%
a. Create additional space for patient care (e.g., more exam rooms, procedure rooms, inpatient beds).	12	9	75.0	0	0.0	2	16.7	0	0.0	1	8.3

j. Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community.	12	1	8.3	2	16.7	5	41.7	2	16.7	2	16.7
k. Some other solution(s).	11	0	0.0	1	9.1	3	27.3	0	0.0	7	63.6

This question (question 6) is based on respondents who indicated that patients experienced delays in obtaining treatment and follow-up care (question 4). If 1-3 delays were mentioned in question 4, this question was repeated for each delay mentioned. If 4 or more delays were mentioned in question 4, this question was repeated for the top three delays mentioned in question 5. Respondents were eligible to answer question 6j (N=12, 10.81% of those who answered question 4 and 44.44% of those who reported any delay) if they identified delays in four or more services and indicated that this was one of the three delays that had the most negative impact on patients or if this service was one of the three or fewer services for which a delay was indicated.

6K. **Your solution for delays in:** Pharmacotherapy for Alcoholism provided in specialty mental health clinics within your local health care system**.** Think about the most effective way to reduce the number of *clinically meaningful delays* for SUD patients at this junction. Now, **in your solution, how important are each of the following elements?**

Responses to this question are not presented due to small number of respondents who identified delays in accessing Pharmacotherapy for Alcoholism provided in specialty mental health clinics within your local health care system and answered question 6k with solutions to this delay (N = 8).

6L. **Your solution for delays in:** Pharmacotherapy for Alcoholism provided in specialty SUD clinics within your local health care system**.** Think about the most effective way to reduce the number of *clinically meaningful delays* for SUD patients at this junction. Now, **in your solution, how important are each of the following elements?**

Responses to this question are not presented due to small number of respondents who identified delays in accessing Pharmacotherapy for Alcoholism provided in specialty SUD clinics within your local health care system and answered question 6l with solutions to this delay (N = 5).

6M. **Your solution for delays in:** Pharmacotherapy for Alcoholism provided in CBOCs (all sizes)**.** Think about the most effective way to reduce the number of *clinically meaningful delays* for SUD patients at this junction. Now, **in your solution, how important are each of the following elements?**

k. Some other solution(s).	17	5	29.4	5	29.4	0	0.0	1	5.9	6	35.29
This question (question 6) is based on respondents who indicated that patients experienced delays in obtaining treatment and follow-up care (question 4). If 1-3 delays were mentioned in question 4, this question was repeated for each delay mentioned. If 4 or more delays were mentioned in question 4, this question was repeated for the top three delays mentioned in question 5. Respondents were eligible to answer question 6o (N=17, 15.04% of those who answered question 4 and 48.57% of those who reported any delay) if they identified delays in four or more services and indicated that this was one of the three delays that had the most negative impact on patients or if this service was one of the three or fewer services for which a delay was indicated.											

6P. **Your solution for delays in:** Methadone Maintenance within your local health care system**.** Think about the most effective way to reduce the number of *clinically meaningful delays* for SUD patients at this junction. Now, **in your solution, how important are each of the following elements?**

Responses to this question are not presented due to small number of respondents who identified delays in accessing Methadone Maintenance within your local health care system and answered question 6p with solutions to this delay (N = 5).

6Q. **Your solution for delays in:** Methadone Maintenance provided through fee-basis or contracted care**.** Think about the most effective way to reduce the number of *clinically meaningful delays* for SUD patients at this junction. Now, **in your solution, how important are each of the following elements?**

Responses to this question are not presented due to small number of respondents who identified delays in accessing Methadone Maintenance provided through fee-basis or contracted care and answered question 6q with solutions to this delay (N = 9).

SUD Care Transitions

7. Please think about patients with a SUD diagnosis who need to **be transitioned to another level of care**. **IN THE PAST 90 DAYS**, how often were there *clinically meaningful delays* in transitioning a patient to another level of care when needed? Indicate the percent of patients that experienced delays for whom the service was indicated.

Table I-69. Substance Use Disorders: Question 7

Service	N	No Delay		1-10% of patients experience		11-25% of patients experience delay		26-50% of patients experience delay		51% or more of patients experience delay		Not applicable	
		n	%	n	%	n	%	n	%	n	%	n	%
a. From primary care (excluding CBOCs) to outpatient specialty SUD care	112	82	73.2	24	21.4	2	1.8	2	1.8	0	0.0	2	1.8
b. From general mental health to residential SUD care	112	39	34.8	29	25.9	7	6.3	7	6.3	17	15.2	13	11.6
c. From Emergency Department to outpatient specialty SUD care	112	71	63.4	25	22.3	1	0.9	1	0.9	1	0.9	13	11.6
d. From Emergency Department to inpatient detox	112	70	62.5	20	17.9	4	3.6	0	0.0	1	0.9	17	15.2
e. From ambulatory detox to residential SUD treatment	112	29	25.9	23	20.5	8	7.1	5	4.5	18	16.1	29	25.9
f. From CBOCs (all sizes) to specialty residential SUD care at your local health care system	112	27	24.1	35	31.3	8	7.1	6	5.4	14	12.5	22	19.6

8. Think about those SUD patients who experienced **transition delays.** In the **PAST 90 DAYS**, which of these delays had the **most negative impact** on patients?

Results not presented. Respondents were only asked this question if they identified more than three delays in Q7 in order to identify their top three delays for Q9.

The views, opinions, and/or findings contained in this report are those of RAND Corporation and should not be construed as an official government position, policy, or decision.

Reducing Delays in SUD Care Transitions

9A**. Your solution for delays in transitioning:** From primary care (excluding CBOCs) to outpatient specialty. Think about the most effective way to reduce the *number of clinically meaningful delays* at this junction. Now, **in your solution, how important are each of the following elements?**

Table I-70. Substance Use Disorders: Question 9A

Solution	N	Critically important		Very important		Somewhat important		Unimportant		Not applicable	
		n	%	n	%	n	%	n	%	n	%

f. Improve information technology (e.g., scheduling system, electronic health record).	11	1	9.1	2	18.2	1	9.1	5	45.5	2	18.2
g. Change 'central office policies' that affect workflow and efficiency (e.g., rules governing documentation or how quickly certain services must be provided).	11	1	9.1	2	18.2	2	18.2	6	54.6	0	0.0
h. Improve personnel supervision, management, or incentives.	11	1	9.1	1	9.1	2	18.2	4	36.4	3	27.3
i. Increase weekend and evening availability of services.	11	0	0.0	2	18.2	4	36.4	4	36.4	1	9.1
j. Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community.	11	0	0.0	2	18.2	3	27.3	3	27.3	3	27.3
k. Some other solution(s).	11	1	9.1	1	9.1	0	0.0	1	9.1	8	72.7

This question (question 9) is based on respondents who indicated that patients experienced transition delays (question 7). If 1-3 delays were mentioned in question 7, this question was repeated for each delay mentioned. If 4 or more delays were mentioned in question 7, this question was repeated for the top three delays mentioned in question 8. Respondents were eligible to answer question 9c (N=11, 9.82% of those who answered question 7 and 39.29% of those who reported any delay) if they identified delays in four or more services and indicated that this was one of the three delays that had the most negative impact on patients or if this service was one of the three or fewer services for which a delay was indicated.

9D**. Your solution for delays in transitioning:** From Emergency Department to inpatient detox. Think about the most effective way to reduce the *number of clinically meaningful delays* at this junction. Now, **in your solution, how important are each of the following elements?**

Table I-73. Substance Use Disorders: Question 9D

Solution	N	Critically important		Very important		Somewhat important		Unimportant		Not applicable	
		n	%	n	%	n	%	n	%	n	%
a. Create additional space for patient care (e.g., more exam rooms, procedure rooms, inpatient beds).	18	5	27.8	5	27.8	1	5.6	5	27.8	2	11.1
b. Increase the number of licensed independent practitioners (e.g., physicians, nurse practitioners, psychologists).	18	3	16.7	5	27.8	3	16.7	4	22.2	3	16.7
c. Increase the number of other personnel (e.g., nursing, technicians, pharmacists, clerical staff).	18	4	22.2	4	22.2	3	16.7	5	27.8	2	11.1
d. Acquire and/or improve availability of equipment.	18	2	11.1	1	5.6	0	0.0	10	55.6	5	27.8
e. Implement or increase the availability of telehealth services.	18	0	0.0	3	16.7	0	0.0	10	55.6	5	27.8
f. Improve information technology (e.g., scheduling system, electronic health record).	18	1	5.6	2	11.1	0	0.0	10	55.6	5	27.8
g. Change 'central office policies' that affect workflow and efficiency (e.g., rules governing documentation or how quickly certain services must be provided).	18	0	0.0	3	16.7	2	11.1	9	50.0	4	22.2
h. Improve personnel supervision, management, or incentives.	18	0	0.0	7	38.9	1	5.6	8	44.4	2	11.1
i. Increase weekend and evening availability of services.	18	2	11.1	1	5.6	1	5.6	9	50.0	5	27.8
j. Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community.	18	2	11.1	4	22.2	5	27.8	3	16.7	4	22.2
k. Some other solution(s).	17	5	29.4	4	23.5	2	11.78	1	5.9	5	29.4

This question (question 9) is based on respondents who indicated that patients experienced transition delays (question 7). If 1-3 delays were mentioned in question 7, this question was repeated for each delay mentioned. If 4 or more delays were mentioned in question 7, this question was repeated for the top three delays mentioned in question 8. Respondents were eligible to answer question 9d (N=18, 16.07% of those who answered question 7 and 72% of those who reported any delay) if they identified delays in four or more services and indicated that this was one of the three delays that had the most negative impact on patients or if this service was one of the three or fewer services for which a delay was indicated.

9E**. Your solution for delays in transitioning:** From ambulatory detox to residential SUD treatment. Think about the most effective way to reduce the *number of clinically meaningful delays* at this junction. Now, **in your solution, how important are each of the following elements?**

Table I-74. Substance Use Disorders: Question 9E

Solution	N	Critically important		Very important		Somewhat important		Unimportant		Not applicable	
		n	%	n	%	n	%	n	%	n	%
a. Create additional space for patient care (e.g., more exam rooms, procedure rooms, inpatient beds).	48	21	43.8	13	27.1	7	14.6	4	8.3	3	6.5
b. Increase the number of licensed independent practitioners (e.g., physicians, nurse practitioners, psychologists).	48	14	29.2	14	29.2	7	14.6	5	10.4	8	16.7
c. Increase the number of other personnel (e.g., nursing, technicians, pharmacists, clerical staff).	48	9	18.8	20	41.7	6	12.5	5	10.4	8	16.7
d. Acquire and/or improve availability of equipment.	48	1	2.1	5	10.4	9	18.8	18	37.5	15	31.3

f. Improve information technology (e.g., scheduling system, electronic health record).	48	2	4.2	6	12.5	6	12.5	20	41.7	14	29.2
g. Change 'central office policies' that affect workflow and efficiency (e.g., rules governing documentation or how quickly certain services must be provided).	48	1	2.1	7	14.6	9	18.8	17	35.4	14	29.2
h. Improve personnel supervision, management, or incentives. P	48	6	12.5	8	16.7	11	22.9	12	25.0	11	22.9
i. Increase weekend and evening availability of services.	48	3	6.3	6	12.5	14	29.2	13	27.1	12	25.0
j. Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community.	48	5	10.4	12	25.0	12	25.0	8	16.7	11	22.9
k. Some other solution(s).	48	6	12.5	7	14.6	6	12.5	3	6.3	26	54.2

This question (question 9) is based on respondents who indicated that patients experienced transition delays (question 7). If 1-3 delays were mentioned in question 7, this question was repeated for each delay mentioned. If 4 or more delays were mentioned in question 7, this question was repeated for the top three delays mentioned in question 8. Respondents were eligible to answer question 9e (N=48, 42.86% of those who answered question 7 and 88.89% of those who reported any delay) if they identified delays in four or more services and indicated that this was one of the three delays that had the most negative impact on patients or if this service was one of the three or fewer services for which a delay was indicated.

9F**. Your solution for delays in transitioning:** From CBOCs (all sizes) to specialty residential SUD care at your local health care system. Think about the most effective way to reduce the *number of clinically meaningful delays* at this junction. Now, **in your solution, how important are each of the following elements?**

Table I-75. Substance Use Disorders: Question 9F

Solution	N	Critically important		Very important		Somewhat important		Unimportant		Not applicable	
		n	%	n	%	n	%	n	%	n	%
a. Create additional space for patient care (e.g., more exam rooms, procedure rooms, inpatient beds).	49	20	40.8	10	20.4	11	22.5	3	6.1	5	10.2
b. Increase the number of licensed independent practitioners (e.g., physicians, nurse practitioners, psychologists).	49	21	42.9	10	20.4	5	10.2	5	10.2	8	16.3
c. Increase the number of other personnel (e.g., nursing, technicians, pharmacists, clerical staff).	49	17	34.7	11	22.5	7	14.3	5	10.2	9	18.4
d. Acquire and/or improve availability of equipment.	49	3	6.1	5	10.2	12	24.5	13	26.5	16	32.7
e. Implement or increase the availability of telehealth services.	49	2	4.1	8	16.3	12	24.5	13	26.5	14	28.6
f. Improve information technology (e.g., scheduling system, electronic health record).	49	3	6.1	4	8.2	10	20.4	18	36.7	14	28.6
g. Change 'central office policies' that affect workflow and efficiency (e.g., rules governing documentation or how quickly certain services must be provided).	49	4	8.2	7	14.3	8	16.3	17	34.7	13	26.5
h. Improve personnel supervision, management, or incentives.	49	6	12.2	8	16.3	9	18.4	12	24.5	14	28.6
i. Increase weekend and evening availability of services.	49	3	6.1	4	8.2	13	26.5	14	28.6	15	30.6
j. Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community.	49	6	12.2	8	16.3	8	16.3	11	22.5	16	32.7
k. Some other solution(s).	49	5	10.2	6	12.2	2	4.1	3	6.1	33	67.4

This question (question 9) is based on respondents who indicated that patients experienced transition delays (question 7). If 1-3 delays were mentioned in question 7, this question was repeated for each delay mentioned. If 4 or more delays were mentioned in question 7, this question was repeated for the top three delays mentioned in question 8. Respondents were eligible to answer question 9f (N=49, 43.75% of those who answered question 7 and 77.78% of those who reported any delay) if they identified delays in four or more services and indicated that this was one of the three delays that had the most negative impact on patients or if this service was one of the three or fewer services for which a delay was indicated.

Issues that Affect Provider and System Efficiency

10. IN THE PAST YEAR, how much did the following issues negatively impact provider and system efficiency related to the provision of care for SUD patients?

Table I-76. Substance Use Disorders: Question 10

	N	None		A little		A fair amount		A lot		Not Applicable	
		n	%	n	%	n	%	n	%	n	%
a. Providers performing clinical activities that could be performed by individuals with less training	112	30	26.8	38	33.9	25	22.3	15	13.4	4	3.6
b. Providers performing administrative activities that could be performed by others	113	17	15.0	23	20.4	32	28.3	41	36.3	0.0	0.0
c. Residency training/teaching requirements	113	51	45.1	33	29.2	9	8.0	4	3.5	16	14.2
d. Insufficient clinical/administrative support staff	113	15	13.3	23	20.4	26	23.0	48	42.5	1	0.9
e. Inadequate scheduling system and policies (e.g., hard to cancel or reschedule, coordinate)	113	24	21.2	29	25.7	27	23.9	31	27.4	2	1.8
f. Unnecessary documentation requirements or inefficient CPRS interface	113	25	22.1	30	26.5	30	26.5	26	23.0	2	1.8
g. Patient no-show rates	113	9	8.0	29	25.7	52	46.0	23	20.4	0.0	0.0
h. Poor patient flow management (room/bed turnover, appointments)	113	34	30.1	42	37.2	21	18.6	8	7.1	8	7.1
i. Too many administrative requirements (Initiatives/Policies/Programs)	113	14	12.4	31	27.4	26	23.0	38	33.6	4	3.5

Workforce

11A. IN THE PAST YEAR, did your local health care system have problems **RECRUITING OR HIRING** the following personnel categories?

Table I-77. Substance Use Disorders: Question 11A

Staff Positions	N	Yes		No		Not Applicable	
		n	%	n	%	n	%
a. Prescribing mental health providers	113	86	76.1	21	18.6	6	5.3
b. Prescribing providers with X-waiver for office-based Buprenorphine	113	66	58.4	34	30.1	13	11.5
c. Mental health social workers	113	36	31.9	73	64.6	4	3.5
d. Psychologists	113	53	46.9	51	45.1	9	8.0
e. Clinical nurse specialists or psychiatric physician assistants	113	55	48.7	35	31.0	23	20.4
f. Clerical staff/appointment schedulers (other administrative staff in mental health clinics)	113	41	36.3	61	54.0	11	9.7
g. Other substance use clinicians	113	29	25.7	64	56.6	20	17.7

Reasons for Staff Recruitment/Hiring Problems

12. Please enter the **top two reasons** why there were problems **RECRUITING AND HIRING** these personnel types in the PAST YEAR.

Table I-78. Substance Use Disorders: Question 12

Staff Positions	N	Senior management does not agree to post new position		Non-competitive wages		Work schedule (e.g., call requirements)		Benefits (e.g., health insurance, leave, continuing education, travel)		Equipment/resources/office space		Facility condition		Case types/complexity		VA reputation		No academic affiliation/lack of protected time for early career investigator		Geographic location of facility		HR process (e.g., time to advertise; length of time from job offer to start date)		Lack of qualified applicants	
	N	n	%	n	%	n	%	n	%	n	%	n	%	n	%	n	%	n	%	n	%	n	%	n	%

N refers to the proportion of respondents who listed each "reason" as one of the two most important affecting retention
This question (question 13) is based on respondents who indicated that their local health care system had problems retaining certain personnel categories (question 11B). Question 13 was asked for each personnel type marked "yes" in question 11B.

The views, opinions, and/or findings contained in this report are those of RAND Corporation and should not be construed as an official government position, policy, or decision.

Appendix I.1.4 5.4 TBI

Section 4: Traumatic Brain Injury (TBI)

TBI Assessment After Screening (Comprehensive TBI Evaluation)

1. Consider patients who "screen positive" for possible TBI symptoms during a primary care or mental health clinic visit. IN THE PAST YEAR, where would these patients typically be sent to receive a **comprehensive TBI evaluation (CTBIE)**?

Table I-81. Traumatic Brain Injury: Question 1

	N	n	%
Neurology clinic	107	20	18.7
Mental health clinic	107	11	10.3
Primary care clinic	107	9	8.4
Physical medicine & rehabilitation clinic	107	47	43.9
Interdisciplinary TBI clinic within your local health care system	107	56	52.3
Interdisciplinary TBI clinic at a different local health care system	107	6	5.6
Interdisciplinary TBI clinic at a non-VA facility (fee-basis or contracted care)	107	1	0.9
Depends upon where the primary care & mental health clinics are located (VAMC vs. CBOC, and if CBOC, its size and location).	107	2	1.9
Other	107	5	4.7

2. Think about patients who "screen positive" for possible TBI and across all settings. IN THE **PAST YEAR,** how often were there delays in obtaining a **comprehensive TBI evaluation** (CTBIE)? Indicate the percent of patients that experienced this delay for whom the service was indicated.

Table I-82.Traumatic Brain Injury: Question 2

Service	N	No Delay		1-10% of patients experience delay		11-25% of patients experience delay		26-50% of patients experience delay		51% or more of patients experience delay		Not applicable	
		n	%	n	%	n	%	n	%	n	%	n	%
CTBIE	107	47	43.9	32	29.9	11	10.3	10	9.3	3	2.8	4	3.7

Reducing Delays in Completing Comprehensive TBI Evaluation

3. Think of the most effective way to reduce the number of delays that TBI patients experience obtaining a **comprehensive TBI evaluation** (CTBIE). Now, **in your solution, how important are each of the following elements in your solution?**

Table I-83. Traumatic Brain Injury: Question 3

Solution	N	Critically Important		Very Important		Somewhat Important		Unimportant		Not applicable	
		n	%	n	%	n	%	n	%	n	%
a. Create additional space for patient care (e.g., more exam rooms, procedure rooms, inpatient beds)	56	4	7.1	10	17.9	22	39.3	14	25.0	6	10.7
b. Increase the number of licensed independent practitioners (e.g., physicians, nurse practitioners, psychologists).	56	17	30.4	12	21.4	18	32.1	5	8.9	4	7.1
c. Increase the number of other personnel (e.g., nursing, technicians, pharmacists, clerical staff).	56	7	12.5	15	26.8	17	30.4	12	21.4	5	8.9
d. Acquire and/or improve availability of equipment.	56	0	0.0	6	10.7	15	26.8	26	46.4	9	16.1
e. Implement or increase the availability of telehealth services	56	1	1.8	18	32.1	17	30.4	15	26.8	5	8.9
f. Improve information technology (e.g., scheduling system, electronic health record).	56	10	17.9	17	30.4	15	26.8	9	16.1	5	8.9
g. Change "central office policies" that affect workflow and efficiency (e.g., rules governing documentation or how quickly certain services must be provided)	56	10	17.9	11	19.6	19	33.9	11	19.6	5	8.9
h. Improve personnel supervision, management, or incentives.	56	4	7.1	11	19.6	17	30.4	15	26.8	9	16.1
i. Increase weekend and evening availability of services	55	2	3.6	5	9.1	21	38.2	19	34.5	8	14.5
j. Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community	56	2	3.6	4	7.1	15	26.8	27	48.2	8	14.3
k. Some other solution(s).	34	2	5.9	8	23.5	4	11.8	5	14.7	15	44.1
This question (question 3) is based on respondents who indicated that patients experienced delays (n=56) in obtaining a comprehensive TBI evaluation (question 2).											

Additional Assessments After Comprehensive TBI Evaluation

4. Please think about TBI patients for whom the following assessments are ordered. IN THE **PAST YEAR,** how often were there delays in obtaining the following assessments? Indicate the percent of patients that experienced delays for whom the service was ordered.

Table I-84. Traumatic Brain Injury: Question 4

Service	N	No Delay		1-10% of patients experience delay		11-25% of patients experience delay		26-50% of patients experience delay		51% or more of patients experience delay		Not applicable	
		n	%	n	%	n	%	n	%	n	%	n	%
a. MRI	107	50	46.7	31	29.0	7	6.5	7	6.5	6	5.6	6	5.6

5. Think about TBI patients who experienced delays in their additional assessments. IN THE **PAST YEAR**, which of these delays had the **most negative impact** on patients?

Results not presented. Respondents were only asked this question if they identified more than three delays in Q4 in order to identify their top three delays for Q6.

Reducing Delays for Assessment After Comprehensive TBI evaluation

6A. **Your solution to delays in** obtaining an MRI**.** Think of the most effective way to reduce the delays that TBI patients experience at this junction. Now, **in your solution, how important are each of the following elements**?

Table I-85. Traumatic Brain Injury: Question 6A

		Critically important		Very important		Somewhat important		Unimportant		Not applicable	
Solution	N	n	%	n	%	n	%	n	%	n	%
a. Create additional space for patient care (e.g., more exam rooms, procedure rooms, inpatient beds).	24	5	20.8	10	41.7	3	12.5	2	8.3	4	16.7
b. Increase the number of licensed independent practitioners (e.g., physicians, nurse practitioners, psychologists).	24	5	20.8	8	33.3	5	20.8	1	4.2	5	20.8
c. Increase the number of other personnel (e.g., nursing, technicians, pharmacists, clerical staff).	24	5	20.8	8	33.3	5	20.8	2	8.3	4	16.7
d. Acquire and/or improve availability of equipment.	24	7	29.2	10	41.67	3	12.5	1	4.2	3	12.5
e. Implement or increase the availability of telehealth services.	23	0	0.0	6	26.1	3	13.0	4	17.4	10	43.5
f. Improve information technology (e.g., scheduling system, electronic health record).	23	1	4.4	9	39.1	7	30.4	2	8.7	4	17.4
g. Change 'central office policies' that affect workflow and efficiency (e.g., rules governing documentation or how quickly certain services must be provided). Describe the policy changes needed in the comments box below.	24	2	8.3	8	33.3	1	4.2	5	20.8	8	33.3
h. Improve personnel supervision, management, or incentives.	24	2	8.3	6	25.0	5	20.8	2	8.3	9	37.5
i. Increase weekend and evening availability of services.	24	2	8.3	8	33.3	8	33.3	3	12.5	3	12.5
j. Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community.	24	0	0.0	12	50.0	5	20.8	3	12.5	4	16.7
k. Some other solution(s).	17	2	11.8	3	17.7	0	0.0	0	0.0	12	70.6
This question (question 6) is based on respondents who indicated that patients experienced delays in obtaining assessments (question 4). If 1-3 delays were mentioned in question 4, this question was repeated for each delay mentioned. If 4 or more delays were mentioned in question 4, this question was repeated for the top three delays mentioned in question 5. Respondents were eligible to answer question 6a (N=24, 22.43% of those who answered question 4 and 47.06% of those who reported any delay) if they identified delays in four or more services and indicated that this was one of the three delays that had the most negative impact on patients or if this service was one of the three or fewer services for which a delay was indicated.											

6B. **Your solution to delays in obtaining** Comprehensive sleep evaluation**.** Think of the most effective way to reduce the delays that TBI patients experience at this junction. Now, **in your solution, how important are each of the following elements**?

Table I-86. Traumatic Brain Injury: Question 6B

a. Create additional space for patient care (e.g., more exam rooms, procedure rooms, inpatient beds).	13	0	0.0	9	69.2	2	15.4	2	15.4	0	0.0
b. Increase the number of licensed independent practitioners (e.g., physicians, nurse practitioners, psychologists).	14	1	7.1	8	57.1	4	28.6	0	0.0	1	7.1
c. Increase the number of other personnel (e.g., nursing, technicians, pharmacists, clerical staff).	14	1	7.1	5	35.7	5	35.7	2	14.3	1	7.1
d. Acquire and/or improve availability of equipment.	14	0	0.0	6	42.9	4	28.6	3	21.4	1	7.1
e. Implement or increase the availability of telehealth services.	14	0	0.0	3	21.4	4	28.6	5	35.7	2	14.3
f. Improve information technology (e.g., scheduling system, electronic health record).	14	1	7.1	4	28.6	4	28.6	4	28.6	1	7.1
g. Change 'central office policies' that affect workflow and efficiency (e.g., rules governing documentation or how quickly certain services must be provided).	14	0	0.0	6	42.9	1	7.1	5	35.7	2	14.3
h. Improve personnel supervision, management, or incentives.	14	1	7.1	4	28.6	6	42.9	2	14.3	1	7.1
i. Increase weekend and evening availability of services.	14	0	0.0	2	14.3	9	64.3	3	21.4	0	0.0
j. Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community.	14	1	7.1	3	21.4	3	21.4	6	42.9	1	7.1
k. Some other solution(s).	8	0	0.0	1	12.5	1	12.5	0	0.0	6	75.0

This question (question 6) is based on respondents who indicated that patients experienced delays in obtaining assessments (question 4). If 1-3 delays were mentioned in question 4, this question was repeated for each delay mentioned. If 4 or more delays were mentioned in question 4, this question was repeated for the top three delays mentioned in question 5. Respondents were eligible to answer question 6i (N=14, 13.21% of those who answered question 4 and 35.9% of those who reported any delay) if they identified delays in four or more services and indicated that this was one of the three delays that had the most negative impact on patients or if this service was one of the three or fewer services for which a delay was indicated.

6J. **Your solution to delays in** obtaining Occupational therapy evaluation**.** Think of the most effective way to reduce the delays that TBI patients experience at this junction. Now, **in your solution, how important are each of the following elements**?

Responses to this question are not presented due to small number of respondents who identified delays in accessing Occupational therapy evaluation and answered 6j (N = 7).

TBI Care Transition

7. Please think about patients who have previously been assessed for TBI in the DoD system. IN THE **PAST YEAR,** how often were there delays receiving **necessary medical records from the DoD assessment**? Indicate the percent of patients that experienced delays in having their records transferred to the VA.

Table I-94. Traumatic Brain Injury: Question 7

		No Delay		1-10% of patients experience delay		11-25% of patients experience delay		26-50% of patients experience delay		51% or more of patients experience delay		Not applicable	
Service	N	n	%	n	%	n	%	n	%	n	%	n	%
DoD records	106	32	30.2	24	22.6	13	12.3	7	6.6	21	19.8	9	8.5

TBI Ongoing Care

8/9. Is your local VA health care system a Polytrauma Network Site? How would you best characterize provision of care to patients with ongoing TBI symptoms at your local health care system?

Table I-95. Traumatic Brain Injury: Question 8/9

		N	n	%
Q8: Is your local VA health care system a Polytrauma Network Site?				
Yes		107	34	31.8
No	107	73	68.2	
Q9: How would you best characterize provision of care to patients with ongoing TBI symptoms at your local health care system?				
Most ongoing TBI care occurs at my local health care system rather than the regional polytrauma network site	73	64	87.7	
Most patients who need ongoing TBI care are referred out to the regional polytrauma network site	73	9	12.3	
This question (question 9) is based on respondents who indicated that their local VA health care system is not a Polytrauma Network Site.				

10. Please think about patients who require ongoing TBI care. IN THE **PAST YEAR**, how often were there delays in accessing the following services? Indicate the percent of patients that experienced delays for whom the service was required.

Table I-96. Traumatic Brain Injury: Question 10

Service	N	No Delay		1-10% of patients experience delay		11-25% of patients experience delay		26-50% of patients experience delay		51% or more of patients experience delay		Not applicable	
		n	%	n	%	n	%	n	%	n	%	n	%
a. Ongoing care by a TBI specialist at your facility	107	65	60.8	23	21.5	7	6.5	3	2.8	4	3.7	5	4.7
b. Ongoing care at a regional polytrauma network site	107	53	49.5	13	12.2	4	3.7	2	1.9	2	1.9	33	30.8
c. Neuropsych therapy	107	48	44.9	27	25.2	11	10.3	3	2.8	5	4.7	13	12.2
d. Other mental health therapy	105	67	63.8	19	18.1	8	7.6	6	5.7	2	1.9	3	2.9
e. Pain clinic for refractory symptoms	106	33	31.1	30	28.3	13	12.3	8	7.6	12	11.3	10	9.4
f. Sleep clinic follow-up for refractory symptoms	106	31	29.3	28	26.4	16	15.1	6	5.7	9	8.5	16	15.1
g. Physical therapy	106	65	61.3	25	23.6	9	8.5	2	1.9	1	0.9	4	3.8
h. Occupational therapy	106	78	73.6	14	13.2	3	2.8	3	2.8	1	0.9	7	6.6
i. Speech therapy	107	75	70.1	16	145.0	8	7.5	0	0.0	3	2.8	5	4.7
j. Vocational rehabilitation	105	59	56.2	14	13.3	8	7.6	1	1.0	4	3.8	19	18.1

11. Think about delays among patients who need ongoing TBI care. IN THE **PAST YEAR**, which of these delays had the **most negative impact** on patients?

Results not presented. Respondents were only asked this question if they identified more than three delays in Q10 in order to identify their top three delays for Q11.

Reducing Delays in TBI Treatment

12A. **Your solution to delays in: accessing** Ongoing care by a TBI specialist at your facility. Think of the most effective way to reduce the number of delays that TBI patients experience at this junction. Now, **in your solution, how important are each of the following elements**?

Table I-97. Traumatic Brain Injury: Question 12A

Solution	N	Critically important		Very important		Somewhat important		Unimportant		Not applicable	
		n	%	n	%	n	%	n	%	n	%
a. Create additional space for patient care (e.g., more exam rooms, procedure rooms, inpatient beds).	17	4	23.5	3	17.7	5	29.4	4	23.5	1	5.9
b. Increase the number of licensed independent practitioners (e.g., physicians, nurse practitioners, psychologists).	17	7	41.2	7	41.2	2	11.8	0	0.0	1	5.9
c. Increase the number of other personnel (e.g., nursing, technicians, pharmacists, clerical staff).	17	3	17.7	6	35.3	7	41.2	1	5.9	0	0.0

f. Improve information technology (e.g., scheduling system, electronic health record).	17	1	5.9	5	29.4	4	23.5	4	23.5	3	17.7
g. Change 'central office policies' that affect workflow and efficiency (e.g., rules governing documentation or how quickly certain services must be provided).	16	2	12.5	3	18.8	2	12.5	5	31.3	4	25.0
h. Improve personnel supervision, management, or incentives.	16	2	12.5	2	12.5	0	0.0	7	43.8	5	31.3
i. Increase weekend and evening availability of services.	17	2	11.8	3	17.7	6	35.3	4	23.5	2	11.8
j. Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community.	17	1	5.9	2	11.8	4	23.5	6	35.3	4	23.5
k. Some other solution(s).	13	1	7.7	4	30.8	1	7.7	0	0.0	7	53.9
This question (question 12) is based on respondents who indicated that patients experienced delays in accessing ongoing TBI care (question 10). If 1-3 delays were mentioned in question 10, this question was repeated for each delay mentioned. If 4 or more delays were mentioned in question 10, this question was repeated for the top three delays mentioned in question 11. Respondents were eligible to answer question 12a (N=17, 15.89% of those who answered question 10 and 45.95% of those who reported any delay) if they identified delays in four or more services and indicated that this was one of the three delays that had the most negative impact on patients or if this service was one of the three or fewer services for which a delay was indicated.											

12B. **Your solution to delays in: accessing** Ongoing care at a regional polytrauma network site. Think of the most effective way to reduce the number of delays that TBI patients experience at this junction. Now, **in your solution, how important are each of the following elements**?

g. Change 'central office policies' that affect workflow and efficiency (e.g., rules governing documentation or how quickly certain services must be provided).	11	0	0.0	0	0.0	5	45.5	5	45.5	1	9.1
h. Improve personnel supervision, management, or incentives. .	10	0	0.0	2	20	4	40.0	3	30.0	1	10.0
i. Increase weekend and evening availability of services.	11	0	0.0	3	27.3	3	27.3	3	27.3	2	18.2
j. Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community.	11	1	9.1	3	27.3	2	18.2	3	27.3	2	18.2
k. Some other solution(s).	7	0	0.0	0	0.0	1	14.3	0.0	0.0	6	85.7
This question (question 12) is based on respondents who indicated that patients experienced delays in accessing ongoing TBI care (question 10). If 1-3 delays were mentioned in question 10, this question was repeated for each delay mentioned. If 4 or more delays were mentioned in question 10, this question was repeated for the top three delays mentioned in question 11. Respondents were eligible to answer question 12g (N=12, 11.32% of those who answered question 10 and 32.43% of those who reported any delay) if they identified delays in four or more services and indicated that this was one of the three delays that had the most negative impact on patients or if this service was one of the three or fewer services for which a delay was indicated.											

12H. **Your solution to delays in: accessing** Occupational therapy. Think of the most effective way to reduce the number of delays that TBI patients experience at this junction. Now, **in your solution, how important are each of the following elements**?

Responses to this question are not presented due to small number of respondents who identified delays in accessing Occupational therapy and answered 12h (N = 4).

12I. **Your solution to delays in: accessing** Speech therapy . Think of the most effective way to reduce the number of delays that TBI patients experience at this junction. Now, **in your solution, how important are each of the following elements**?

Responses to this question are not presented due to small number of respondents who identified delays in accessing Speech therapy and answered 12i (N = 9).

12J. **Your solution to delays in: accessing** Vocational rehabilitation. Think of the most effective way to reduce the number of delays that TBI patients experience at this junction. Now, **in your solution, how important are each of the following elements**?

Table I-104. Traumatic Brain Injury: Question 12J

Solution	N	Critically important n	%	Very important n	%	Somewhat important n	%	Unimportant n	%	Not applicable n	%
a. Create additional space for patient care (e.g., more exam rooms, procedure rooms, inpatient beds).	10	2	20.0	1	10.0	3	30.0	1	10.0	3	30.0
b. Increase the number of licensed independent practitioners (e.g., physicians, nurse practitioners, psychologists).	10	2	20.0	3	30.0	2	20.0	1	10.0	2	20.0
c. Increase the number of other personnel (e.g., nursing, technicians, pharmacists, clerical staff).	9	1	11.1	1	11.1	5	55.6	0	0.0	2	22.2
d. Acquire and/or improve availability of equipment.	10	0	0.0	1	10.0	0	0.0	2	20.0	7	70.0
e. Implement or increase the availability of telehealth services.	10	0	0.0	1	10.0	3	30.0	1	10.0	5	50.0
f. Improve information technology (e.g., scheduling system, electronic health record).	10	1	10.0	1	10.0	3	30.0	2	20.0	3	30.0
g. Change 'central office policies' that affect workflow and efficiency (e.g., rules governing documentation or how quickly certain services must be provided).	10	3	30.0	0	0.0	3	30.0	2	20.0	2	20.0
h. Improve personnel supervision, management, or incentives.	10	1	10.0	0	0.0	3	30.0	2	20.0	4	40.0
i. Increase weekend and evening availability of services.	10	0	0.0	1	10.0	3	30.0	2	20.0	4	40.0
j. Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community.	10	0	0.0	1	10.0	4	40.0	1	10.0	4	40.0
k. Some other solution(s).	8	2	25.0	0	0.0	1	12.5	0	0.0	5	62.5

This question (question 12) is based on respondents who indicated that patients experienced delays in accessing ongoing TBI care (question 10). If 1-3 delays were mentioned in question 10, this question was repeated for each delay mentioned. If 4 or more delays were mentioned in question 10, this question was repeated for the top three delays mentioned in question 11. Respondents were eligible to answer question 12j (N=10, 9.52% of those who answered question 10 and 37.04% of those who reported any delay) if they identified delays in four or more services and indicated that this was one of the three delays that had the most negative impact on patients or if this service was one of the three or fewer services for which a delay was indicated.

Issues that Affect Provider and System Efficiency

13. IN THE PAST YEAR, how much did the following issues negatively impact provider and system efficiency related to the provision of TBI care?

Table I-105. Traumatic Brain Injury: Question 13

	N	None n	None %	A little n	A little %	A fair amount n	A fair amount %	A lot n	A lot %	Not Applicable n	Not Applicable %
a. Providers performing clinical activities that could be performed by individuals with less training	106	44	41.5	26	24.5	13	12.3	18	17.0	5	4.7
b. Providers performing administrative activities that could be performed by others	104	17	16.3	23	22.1	25	24.0	34	32.7	5	4.8
c. Residency training/teaching requirements	105	43	41.0	26	24.8	2	1.9	3	2.9	31	29.5
d. Insufficient clinical/administrative support staff	106	15	14.2	24	22.6	25	23.6	38	35.8	4	3.8
e. Inadequate scheduling system and policies (e.g., hard to cancel or reschedule, coordinate)	106	20	18.9	14	13.2	25	23.6	42	39.6	5	4.7
f. Unnecessary documentation requirements or inefficient CPRS interface	106	10	9.4	29	27.4	25	23.6	37	34.9	5	4.7

N refers to the proportion of respondents who listed each "reason" as one of the two most important affecting recruitment and hiring.

This question (question 15) is based on respondents who indicated that their local health care system had problems recruiting or hiring certain personnel categories (question 14A). Question 15 was asked for each personnel type marked "yes" in question 14A.

Reasons for Staff Retention Problems

14B. IN THE PAST YEAR, did your local health care system have problems **RETAINING** the following personnel categories?

Table I-108. Traumatic Brain Injury: Question 14B

Staff Positions	N	Yes		No		Not Applicable	
		n	%	n	%	n	%
a. Neurologists	102	22	21.6	50	49.0	30	29.4

N refers to the proportion of respondents who listed each "reason" as one of the two most important affecting retention. This question (question 16) is based on respondents who indicated that their local health care system had problems retaining certain personnel categories (question 14B). Question 16 was asked for each personnel type marked "yes" in question 14B.

Appendix I.1.5 5.5 ACS

Section 5: Acute Coronary Syndrome (ACS)

ACS Diagnosis and Assessment

1. Please think about patients presenting to your Emergency Department with symptoms suggestive of Acute Coronary Syndrome (ACS). **IN THE PAST 90 DAYS,** how often did patients experience delays receiving the following services? Indicate the percent of patients that experienced delays for whom the services were required.

Table I-110. Acute Coronary Syndrome: Question 1

Service	N	No Delay		1-10% of patients experience delay		11-25% of patients experience delay		26-50% of patients experience delay		51% or more of patients experience delay		Not applicable	
		n	%	n	%	n	%	n	%	n	%	n	%
a. Completing the Emergency Department (ED) evaluation	98	48	49.0	36	36.7	5	5.1	0	0.0	0	0.0	9	9.2
b. Transfer from the ED to a short-stay observation unit (i.e., 'chest pain unit')	98	22	22.5	16	16.3	4	4.1	0	0.0	0	0.0	56	57.1
c. Transfer from the ED to a telemetry bed	98	30	30.6	36	36.7	14	14.3	2	2.0	3	3.06	13	13.3
d. Transfer from the ED to a CCU or ICU bed	98	34	34.7	38	38.8	7	7.1	0	0.0	3	3.06	16	16.3

2. Think about those ACS patients who experienced delays getting an **evaluation.** IN THE PAST 90 DAYS, which of these delays had the **most negative impact on patients**?

Results not presented. Respondents were only asked this question if they identified more than three delays in Q1 in order to identify their top three delays for Q3.

3A. **Your solution to delays in**: Completing the Emergency Department (ED) evaluation. Think of the most effective way to reduce the number of delays that ACS patients experience at this junction. Now, **in your solution, how important are each of the following elements?**

Table I-111. Acute Coronary Syndrome: Question 3A

Solution	N	Critically important		Very important		Somewhat important		Unimportant		Not applicable	
		n	%	n	%	n	%	n	%	n	%
a. Create additional space for patient care (e.g., more exam rooms, procedure rooms, inpatient beds).	36	13	36.1	14	38.9	6	16.7	2	5.6	1	2.8
b. Increase the number of licensed independent practitioners (e.g., physicians, nurse practitioners, psychologists).	36	4	11.1	12	33.3	16	44.4	2	5.6	2	5.6
c. Increase the number of other personnel (e.g., nursing, technicians, pharmacists, clerical staff).	35	7	20.0	15	42.9	9	25.7	2	5.7	2	5.7
d. Acquire and/or improve availability of equipment.	36	3	8.3	5	13.89	17	47.2	9	25.0	2	5.6
e. Implement or increase the availability of telehealth services.	34	0	0.0	6	17.7	11	32.4	12	35.3	5	14.7
f. Change 'central office policies' that affect workflow and efficiency (e.g., rules governing documentation or how quickly certain services must be provided).	36	6	16.7	7	19.4	13	36.1	8	22.2	2	5.6
g. Improve personnel supervision, management, or incentives.	36	9	25.0	7	19.4	9	25.0	10	27.8	1	2.8
h. Increase weekend and evening availability of services.	35	7	20.0	7	20.0	13	37.1	7	20.0	1	2.89
i. Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community.	34	5	14.7	6	17.7	15	44.1	5	14.7	3	8.8
j. Some other solution(s).	36	8	22.2	9	25.0	9	25.0	9	25.0	1	2.8
This question (question 3) is based on respondents who indicated that patients experienced delays in getting an evaluation (question 1). If 1-3 delays were mentioned in question 1, this question was repeated for each delay mentioned. If 4 or more delays were mentioned in question 1, this question was repeated for the top three delays mentioned in question 2. Respondents were eligible to answer question 3a (N=36, 36.73% of those who answered question 1 and 87.8% of those who reported any delay) if they identified delays in four or more services and indicated that this was one of the three delays that had the most negative impact on patients or if this service was one of the three or fewer services for which a delay was indicated.											

3B. **Your solution to delays in**: Transferring from the ED to a short –stay observation unit (i.e., "chest pain unit").Think of the most effective way to reduce the number of delays that ACS patients experience at this junction. Now, **in your solution, how important are each of the following elements?**

Table I-112. Acute Coronary Syndrome: Question 3B

Solution	N	Critically important		Very important		Somewhat important		Unimportant		Not applicable	
		n	%	n	%	n	%	n	%	n	%
a. Create additional space for patient care (e.g., more exam rooms, procedure rooms, inpatient beds).	12	6	50.0	6	50.0	0	0.0	0	0.0	0	0.0
b. Increase the number of licensed independent practitioners (e.g., physicians, nurse practitioners, psychologists).	12	4	33.3	2	16.7	4	33.3	1	8.3	1	8.3
c. Increase the number of other personnel (e.g., nursing, technicians, pharmacists, clerical staff).	12	3	25.0	6	50.0	3	25.0	0	0.0	0	0.0
d. Acquire and/or improve availability of equipment.	12	2	16.7	0	0.0	6	50.0	4	33.3	0	0.0
e. Implement or increase the availability of telehealth services.	12	0	0.0	0	0.0	4	33.3	6	50.0	2	16.7
f. Change 'central office policies' that affect workflow and efficiency (e.g., rules governing documentation or how quickly certain services must be provided).	11	0	0.0	2	18.2	6	54.6	1	9.1	2	18.1
g. Improve personnel supervision, management, or incentives.	12	0	0.0	6	50.0	2	16.7	4	33.3	0	0.0
h. Increase weekend and evening availability of services.	12	2	16.7	3	25.0	4	33.3	3	25.0	0	0.0
i. Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community.	12	0	0.0	4	33.3	6	50.0	2	16.7	0	0.0
j. Some other solution(s).	12	0	0.0	1	8.3	7	58.3	3	25.0	1	8.3
This question (question 3) is based on respondents who indicated that patients experienced delays in getting an evaluation (question 1). If 1-3 delays were mentioned in question 1, this question was repeated for each delay mentioned. If 4 or more delays were mentioned in question 1, this question was repeated for the top three delays mentioned in question 2. Respondents were eligible to answer question 3b (N=12, 12.24% of those who answered question 1 and 60% of those who reported any delay) if they identified delays in four or more services and indicated that this was one of the three delays that had the most negative impact on patients or if this service was one of the three or fewer services for which a delay was indicated.											

3C. **Your solution to delays in**: Transferring from the ED to a telemetry bed. Think of the most effective way to reduce the number of delays that ACS patients experience at this junction. Now, **in your solution, how important are each of the following elements?**

Table I-113. Acute Coronary Syndrome: Question 3C

Solution	N	Critically important		Very important		Somewhat important		Unimportant		Not applicable	
		n	%	n	%	n	%	n	%	n	%
a. Create additional space for patient care (e.g., more exam rooms, procedure rooms, inpatient beds).	50	17	34.0	26	52.0	6	12.0	1	2.0	0	0.0
b. Increase the number of licensed independent practitioners (e.g., physicians, nurse practitioners, psychologists).	49	8	16.3	13	26.5	17	34.7	9	18.4	2	4.1
c. Increase the number of other personnel (e.g., nursing, technicians, pharmacists, clerical staff).	49	15	30.6	13	26.5	17	34.7	4	8.2	0	0.0
d. Acquire and/or improve availability of equipment.	50	6	12.0	6	12.0	16	32.0	19	38.0	3	6.0

j. Some other solution(s).	39	4	10.3	8	20.5	6	15.4	19	48.7	2	5.1
This question (question 3) is based on respondents who indicated that patients experienced delays in getting an evaluation (question 1). If 1-3 delays were mentioned in question 1, this question was repeated for each delay mentioned. If 4 or more delays were mentioned in question 1, this question was repeated for the top three delays mentioned in question 2. Respondents were eligible to answer question 3d (N=41, 41.84% of those who answered question 1 and 85.42% of those who reported any delay) if they identified delays in four or more services and indicated that this was one of the three delays that had the most negative impact on patients or if this service was one of the three or fewer services for which a delay was indicated.											

4. Please think about "pain-free" inpatients or observation unit patients in whom a definitive ACS diagnosis has not yet been made, or whose coronary anatomy is not yet defined. **IN THE PAST 90 DAYS,** how often were there delays in obtaining the following services? Indicate the percent of patients that experience delays for whom the service was required.

Table I-115. Acute Coronary Syndrome: Question 4

Service	N	No Delay		1-10% of patients experience delay		11-25% of patients experience delay		26-50% of patients experience delay		51% or more of patients experience delay		Not applicable	
		n	%	n	%	n	%	n	%	n	%	n	%
a. Cardiology consultation	99	69	69.7	15	15.2	2	2.0	2	2.0	1	1.0	10	10.1

5. Think about those ACS patients who experienced delays getting an **evaluation.** IN THE PAST 90 DAYS, which of these delays had the **most negative impact on patients**?

Results not presented. Respondents were only asked this question if they identified more than three delays in Q4 in order to identify their top three delays for Q6.

6A. **Your solution to delays in**: Cardiology consultation. Think of the most effective way to reduce the number of delays that ACS patients experience at this junction. Now, **in your solution, how important are each of the following elements?**

Table I-116. Acute Coronary Syndrome: Question 6A

Solution	N	Critically important		Very important		Somewhat important		Unimportant		Not applicable

j. Some other solution(s).	12	2	16.7	3	25.0	3	25.0	2	16.7	2	16.7

This question (question 6) is based on respondents who indicated that patients experienced delays in getting an evaluation (question 4). If 1-3 delays were mentioned in question 4, this question was repeated for each delay mentioned. If 4 or more delays were mentioned in question 4, this question was repeated for the top three delays mentioned in question 5. Respondents were eligible to answer question 6a (N=13, 13.13% of those who answered question 4 and 65% of those who reported any delay) if they identified delays in four or more services and indicated that this was one of the three delays that had the most negative impact on patients or if this service was one of the three or fewer services for which a delay was indicated.

6B. **Your solution to delays in**: Echocardiography. Think of the most effective way to reduce the number of delays that ACS patients experience at this junction. Now, **in your solution, how important are each of the following elements?**

Table I-117. Acute Coronary Syndrome: Question 6B

Solution	N	Critically important		Very important		Somewhat important		Unimportant		Not applicable	
		n	%	n	%	n	%	n	%	n	%
a. Create additional space for patient care (e.g., more exam rooms, procedure rooms, inpatient beds).	35	6	17.1	9	25.7	9	25.7	8	22.9	3	8.6
b. Increase the number of licensed independent practitioners (e.g., physicians, nurse practitioners, psychologists).	35	6	17.1	7	20.0	11	31.4	9	25.7	2	5.7
c. Increase the number of other personnel (e.g., nursing, technicians, pharmacists, clerical staff).	33	12	36.4	11	33.3	7	21.2	3	9.1	0	0.0

j. Some other solution(s).	20	8	40.0	3	15.0	5	25.0	3	15.0	1	5.0
This question (question 6) is based on respondents who indicated that patients experienced delays in getting an evaluation (question 4). If 1-3 delays were mentioned in question 4, this question was repeated for each delay mentioned. If 4 or more delays were mentioned in question 4, this question was repeated for the top three delays mentioned in question 5. Respondents were eligible to answer question 6f (N=20, 20.2% of those who answered question 4 and 74.07% of those who reported any delay) if they identified delays in four or more services and indicated that this was one of the three delays that had the most negative impact on patients or if this service was one of the three or fewer services for which a delay was indicated.											

ACS Treatment

7. Think about patients who present to your **local VA health care system** with STEMI. **IN THE PAST YEAR**, how often were there delays in the following services?

Table I-122. Acute Coronary Syndrome: Question 7

Service	N	No Delay (%)		1-10% of patients experience delay		11-25% of patients experience delay		26-50% of patients experience delay		51% or more of patients experience delay		Not applicable	
		n	%	n	%	n	%	n	%	n	%	n	%
a. Emergency department activation of STEMI protocol	97	48	49.5	27	27.8	8	8.3	2	2.1	0	0	12	12.4
b. Primary PCI at an on-site catheterization laboratory	99	36	36.4	8	8.1	4	4	2	2	0	0	49	49.5
c. Primary PCI at a different VA facility (via transfer)	98	11	11.2	6	6.1	2	2	2	2	0	0	77	78.6
d. Primary PCI at a non-VA facility (via transfer)	99	33	33.3	25	25.3	6	6.1	3	3	0	0	32	32.3
e. Thrombolytic therapy	99	25	25.3	8	8.1	0	0	0	0	0	0	66	66.7

8. Think about those ACS patients who experienced delays getting an **evaluation.** IN THE PAST 90 DAYS, which of these delays had the **most negative impact on patients**?
Results not presented. Respondents were only asked this question if they identified more than three delays in Q7 in order to identify their top three delays for Q9.

9A. **Your solution to delays in:** Emergency department activation of STEMI protocol**.** Think of the most effective way to reduce the number of delays that ACS patients experience at this junction. Now, **in your solution, how important are each of the following elements**?

Table I-123. Acute Coronary Syndrome: Question 9A

Solution	N	Critically important		Very important		Somewhat important		Unimportant		Not applicable	
		n	%	n	%	n	%	n	%	n	%
a. Create additional space for patient care (e.g., more exam rooms, procedure rooms, inpatient beds).	34	3	8.8	10	29.4	7	20.6	12	35.3	2	5.9
b. Increase the number of licensed independent practitioners (e.g., physicians, nurse practitioners, psychologists).	34	7	20.6	8	23.5	7	20.6	12	35.3	0	0.0
c. Increase the number of other personnel (e.g., nursing, technicians, pharmacists, clerical staff).	33	7	21.2	9	27.3	6	18.2	11	33.3	0	0.0
d. Acquire and/or improve availability of equipment.	34	4	11.8	2	5.9	8	23.5	19	55.9	1	2.9
e. Implement or increase the availability of telehealth services.	34	1	2.9	1	2.9	11	32.4	15	44.1	6	17.7
f. Change 'central office policies' that affect workflow and efficiency (e.g., rules governing documentation or how quickly certain services must be provided).	34	3	8.8	6	17.7	8	23.5	14	41.2	3	8.8
g. Improve personnel supervision, management, or incentives.	33	7	21.2	4	12.1	5	15.2	14	42.4	3	9.1
h. Increase weekend and evening availability of services.	34	5	14.7	6	17.7	10	29.4	12	35.3	1	2.9
i. Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community.	34	5	14.7	4	11.8	8	23.5	11	32.4	6	17.7
j. Some other solution(s).	34	6	17.7	6	17.7	8	23.5	11	32.4	3	8.8

This question (question 9) is based on respondents who indicated that patients experienced delays in getting an evaluation (question 7). If 1-3 delays were mentioned in question 7, this question was repeated for each delay mentioned. If 4 or more delays were mentioned in question 7, this question was repeated for the top three delays mentioned in question 8. Respondents were eligible to answer question 9a (N=34, 35.05% of those who answered question 7 and 91.89% of those who reported any delay) if they identified delays in four or more services and indicated that this was one of the three delays that had the most negative impact on patients or if this service was one of the three or fewer services for which a delay was indicated.

9B. **Your solution to delays in:** Primary PCI at an on-site catheterization laboratory**.** Think of the most effective way to reduce the number of delays that ACS patients experience at this junction. Now, **in your solution, how important are each of the following elements**?

Table I-124. Acute Coronary Syndrome: Question 9B

Solution	N	Critically important		Very important		Somewhat important		Unimportant		Not applicable	
		n	%	n	%	n	%	n	%	n	%
a. Create additional space for patient care (e.g., more exam rooms, procedure rooms, inpatient beds).	14	5	35.7	0	0.0	3	21.4	4	28.6	2	14.3
b. Increase the number of licensed independent practitioners (e.g., physicians, nurse practitioners, psychologists).	14	5	35.7	4	28.6	1	7.1	2	14.3	2	14.3
c. Increase the number of other personnel (e.g., nursing, technicians, pharmacists, clerical staff).	14	5	35.7	4	28.6	1	7.1	2	14.3	2	14.3

j. Some other solution(s).	32	9	28.1	3	9.4	11	34.4	4	12.5	5	15.6
This question (question 9) is based on respondents who indicated that patients experienced delays in getting an evaluation (question 7). If 1-3 delays were mentioned in question 7, this question was repeated for each delay mentioned. If 4 or more delays were mentioned in question 7, this question was repeated for the top three delays mentioned in question 8. Respondents were eligible to answer question 9d (N=33, 33.33% of those who answered question 7 and 97.06% of those who reported any delay) if they identified delays in four or more services and indicated that this was one of the three delays that had the most negative impact on patients or if this service was one of the three or fewer services for which a delay was indicated.											

9E. **Your solution to delays in:** Thrombolytic therapy**.** Think of the most effective way to reduce the number of delays that ACS patients experience at this junction. Now, **in your solution, how important are each of the following elements**?

Responses to this question are not presented due to small number of respondents who identified delays in accessing Thrombolytic therapy and answered 9e (N = 4).

10. Please think about inpatients who have already undergone diagnostic catheterization, are currently pain-free, but who have one or more unstable coronary lesions. **IN THE PAST 90 DAYS**, how often were there delays in getting the following services?

Table I-127. Acute Coronary Syndrome: Question 10

Service	N	No Delay		1-10% of patients experience delay		11-25% of patients experience delay		26-50% of patients experience delay		51% or more of patients experience delay		Not applicable

This question (question 12) is based on respondents who indicated that patients experienced delays in getting services (question 10). If 1-3 delays were mentioned in question 10, this question was repeated for each delay mentioned. If 4 or more delays were mentioned in question 10, this question was repeated for the top three delays mentioned in question 11. Respondents were eligible to answer question 12d (N=21, 21.43% of those who answered question 10 and 105% of those who reported any delay) if they identified delays in four or more services and indicated that this was one of the three delays that had the most negative impact on patients or if this service was one of the three or fewer services for which a delay was indicated.

12E. **Your solution to delays in:** Transfer to another VA facility for CABG**.** Think of the most effective way to reduce the number of delays that ACS patients experience at this junction. Now, **in your solution, how important are each of the following elements**?

Table I-132. Acute Coronary Syndrome: Question 12E

Solution	N	Critically important		Very important		Somewhat important		Unimportant		Not applicable	
		n	%	n	%	n	%	n	%	n	%
a. Create additional space for patient care (e.g., more exam rooms, procedure rooms, inpatient beds).	28	9	32.1	2	7.1	4	14.3	6	21.4	7	25.0
b. Increase the number of licensed independent practitioners (e.g., physicians, nurse practitioners, psychologists).	28	8	28.6	5	17.9	3	10.7	9	32.1	3	10.7
c. Increase the number of other personnel (e.g., nursing, technicians, pharmacists, clerical staff). .	28	6	21.4	3	10.7	5	17.9	9	32.1	5	17.9
d. Acquire and/or improve availability of equipment.	28	4	14.3	2	7.1	3	10.7	10	35.7	9	32.1
e. Implement or increase the availability of telehealth services.	28	1	3.6	3	10.7	3	10.7	12	42.9	9	32.1
f. Change 'central office policies' that affect workflow and efficiency (e.g., rules governing documentation or how quickly certain services must be provided).	28	2	7.1	5	17.9	4	14.3	12	42.9	5	17.9
g. Improve personnel supervision, management, or incentives.	28	3	10.7	6	21.4	6	21.4	8	28.6	5	17.9
h. Increase weekend and evening availability of services.	28	7	25.0	2	7.1	6	21.4	8	28.6	5	17.9
i. Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community.	28	7	25.0	3	10.7	7	25.0	6	21.4	5	17.9
j. Some other solution(s).	28	8	28.6	8	28.6	5	17.9	4	14.3	3	10.7

This question (question 12) is based on respondents who indicated that patients experienced delays in getting services (question 10). If 1-3 delays were mentioned in question 10, this question was repeated for each delay mentioned. If 4 or more delays were mentioned in question 10, this question was repeated for the top three delays mentioned in question 11. Respondents were eligible to answer question 12e (N=31, 31.31% of those who answered question 10 and 93.94% of those who reported any delay) if they identified delays in four or more services and indicated that this was one of the three delays that had the most negative impact on patients or if this service was one of the three or fewer services for which a delay was indicated.

12F. **Your solution to delays in:** Transfer to a non-VA facility for CABG**.** Think of the most effective way to reduce the number of delays that ACS patients experience at this junction. Now, **in your solution, how important are each of the following elements**?

Table I-133. Acute Coronary Syndrome: Question 12F

Solution	N	Critically important		Very important		Somewhat important		Unimportant		Not applicable	
		n	%	n	%	n	%	n	%	n	%

j. Some other solution(s). .	32	1	3.1	6	18.8	9	28.1	10	31.3	6	18.8

This question (question 17) is based on respondents who indicated that patients experienced delays in getting services after being discharged from the hospital (question 15). If 1-3 delays were mentioned in question 15, this question was repeated for each delay mentioned. If 4 or more delays were mentioned in question 15, this question was repeated for the top three delays mentioned in question 16. Respondents were eligible to answer question 17a (N=33, 33.67% of those who answered question 15 and 82.5% of those who reported any delay) if they identified delays in four or more services and indicated that this was one of the three delays that had the most negative impact on patients or if this service was one of the three or fewer services for which a delay was indicated.

17B. **Your solution for delays in:** Non-invasive coronary evaluation (e.g., nuclear stress testing) as outpatients. Think of the most effective way to reduce the number of delays that ACS patients experience at this junction. Now, **in your solution, how important are each of the following elements?**

Table I-138. Acute Coronary Syndrome: Question 17B

a. Create additional space for patient care (e.g., more exam rooms, procedure rooms, inpatient beds).	11	1	9.1	3	27.3	1	9.1	4	36.4	2	18.2
b. Increase the number of licensed independent practitioners (e.g., physicians, nurse practitioners, psychologists).	11	1	9.1	1	9.1	5	45.5	2	18.2	2	18.2
c. Increase the number of other personnel (e.g., nursing, technicians, pharmacists, clerical staff).	11	1	9.1	2	18.2	2	18.2	4	36.4	2	18.2
d. Acquire and/or improve availability of equipment.	11	2	18.2	1	9.1	0	0.0	6	54.6	2	18.2
e. Implement or increase the availability of telehealth services.	11	0	0.0	0	0.0	2	18.2	7	63.6	2	18.2
f. Change 'central office policies' that affect workflow and efficiency (e.g., rules governing documentation or how quickly certain services must be provided).	11	1	9.1	0	0.0	3	27.3	5	45.5	2	18.2
g. Improve personnel supervision, management, or incentives.	11	0	0.0	1	9.1	2	18.2	7	63.6	1	9.1
h. Increase weekend and evening availability of services.	11	1	9.1	0	0.0	3	27.3	6	54.6	1	9.1
i. Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community.	11	1	9.1	0	0.0	3	27.3	6	54.6	1	9.1
j. Some other solution(s).	11	2	18.2	2	18.2	1	9.1	5	45.5	1	9.1

This question (question 17) is based on respondents who indicated that patients experienced delays in getting services after being discharged from the hospital (question 15). If 1-3 delays were mentioned in question 15, this question was repeated for each delay mentioned. If 4 or more delays were mentioned in question 15, this question was repeated for the top three delays mentioned in question 16. Respondents were eligible to answer question 17f (N=12, 12.37% of those who answered question 15 and 60% of those who reported any delay) if they identified delays in four or more services and indicated that this was one of the three delays that had the most negative impact on patients or if this service was one of the three or fewer services for which a delay was indicated.

Issues that Affect Provider and System Efficiency

18. IN THE PAST YEAR, how much did the following issues negatively impact provider and system efficiency related to the provision of care for ACS patients?

Table I-143. Acute Coronary Syndrome: Question 18

	N	None n	None %	A little n	A little %	A fair amount n	A fair amount %	A lot n	A lot %	Not Applicable n	Not Applicable %
a. Providers performing clinical activities that could be performed by individuals with less training	98	30	30.6	30	30.6	19	19.4	13	13.3	6	6.1
b. Providers performing administrative activities that could be performed by others	98	13	13.3	20	20.4	32	32.7	28	28.6	5	5.1
c. Residency training/teaching requirements	98	39	39.8	20	20.4	15	15.3	6	6.1	18	18.4
d. Insufficient clinical/administrative support staff	98	12	12.2	16	16.3	22	22.4	43	43.9	5	5.1
e. Inadequate scheduling system and policies (e.g., hard to cancel or reschedule, coordinate)	98	12	12.2	27	27.6	20	20.4	32	32.7	7	7.1
f. Unnecessary documentation requirements or inefficient CPRS interface	97	19	19.6	27	27.8	19	19.6	27	27.8	5	5.2
g. Patient no-show rates	98	13	13.3	48	49	28	28.6	1	1.0	8	8.2
h. Poor patient flow management (room/bed turnover, appointments)	98	18	18.4	38	38.8	19	19.4	14	14.3	9	9.2
i. Too many administrative requirements (Initiatives/Policies/Programs)	98	15	15.3	19	19.4	21	21.4	36	36.7	7	7.1
j. Inadequate number of staffed inpatient beds	98	19	19.4	21	21.4	16	16.3	31	31.6	11	11.2
k. Inefficient processes related to outmoded or suboptimal physical infrastructure (e.g., catheterization laboratory) or equipment	98	25	25.5	22	22.4	18	18.4	13	13.3	20	20.4
l. Delays in obtaining specialized supplies or devices (e.g., catheters or defibrillators)	98	35	35.7	21	21.4	12	12.2	9	9.2	21	21.4

ACS Workforce

19A. IN THE PAST YEAR, did your facility have problems **RECRUITING OR HIRING** the following personnel categories?

Table I-144. Acute Coronary Syndrome: Question 19A

Staff Positions	N	Yes n	Yes %	No n	No %	Not Applicable n	Not Applicable %
a. Cardiologists (interventional)	97	17	17.5	32	33.0	48	49.5
b. Cardiologists (echocardiography)	97	26	26.8	34	35.1	37	38.1
c. Cardiologists (electrophysiology)	97	22	22.7	21	21.6	54	55.7
d. Cardiologists (general)	98	35	35.7	37	37.8	26	26.5
e. Cardiothoracic Surgeons	98	15	15.3	17	17.3	66	67.3
f. Physician Assistants or Nurse Practitioners with expertise in cardiology	98	30	30.6	36	36.7	32	32.7
g. RN Cardiovascular Specialists	96	25	26.0	22	22.9	49	51.0

k. Emergency physicians	37	0	0.0	29	78.4	3	8.1	0	0.0	1	2.7	1	2.7	0	0.0	7	18.9	0	0.0	8	21.6	11	29.7	9	24.3

N refers to the proportion of respondents who listed each "reason" as one of the two most important affecting recruitment and hiring.

This question (question 20) is based on respondents who indicated that their facility had problems recruiting or hiring certain personnel categories (question 19A). Question 20 was asked for each personnel type marked "yes" in question 19A.

Reasons for Staff Retention Problems

19B. IN THE PAST YEAR, did your facility have problems **RETAINING** the following personnel categories?

Table I-146. Acute Coronary Syndrome: Question 19B

Staff Positions	N	Yes		No		Not Applicable	
		n	%	n	%	n	%
a. Cardiologists (interventional)	98	11	11.2	50	51.0	37	37.8
b. Cardiologists (echocardiography)	98	9	9.2	58	59.2	31	31.6
c. Cardiologists (electrophysiology)	97	8	8.2	40	41.2	49	50.5
d. Cardiologists (general)	95	11	11.6	63	66.3	21	22.1
e. Cardiothoracic Surgeons	97	6	6.2	29	29.9	62	63.9
f. Physician Assistants or Nurse Practitioners with expertise in cardiology	98	18	18.4	46	46.9	34	34.7
g. RN Cardiovascular Specialists	98	15	15.3	37	37.8	46	46.9
h. Echocardiography Technicians	95	25	26.3	54	56.8	16	16.8
i. Catheterization Lab Technicians	98	19	19.4	37	37.8	42	42.9
j. Perfusionists	97	3	3.1	26	26.8	68	70.1
k. Emergency physicians	97	26	26.8	36	37.1	35	36.1

21. Please enter **top two reasons** why there were problems **RETAINING** these personnel types in the PAST YEAR. Use the drop-down menu to select the top two reasons per personnel type.

Table I-147. Acute Coronary Syndrome: Question 21

Staff Positions	N	01 Lack of opportunity for professional growth/promotion n	%	02 Dissatisfaction with supervision/management support n	%	03 Dissatisfaction with support staff n	%	04 Dissatisfaction with physical demands of the job n	%	05 Dissatisfaction with workload n	%	06 Lack of incentives or "management levers" to encourage productivity (i.e., no accountability) n	%	07 Organizational culture that does not prioritize/encourage productivity n	%	08 Administrative/Program Demands n	%	09 Lack of professional autonomy n	%	10 Dissatisfaction with pay n	%	11 Work schedule n	%	12 Inadequate equipment/resources/office space n	%	13 Burnout n	%

N refers to the proportion of respondents who listed each "reason" as one of the two most important affecting retention

This question (question 21) is based on respondents who indicated that their facility had problems retaining certain personnel categories (question 19B). Question 21 was asked for each personnel type marked "yes" in question 19B.

Appendix I.1.6 Colon Cancer

Section 6: Colon Cancer

Screening

1. Which of the following are commonly-used methods of **Colon Cancer screening** for average-risk patients over age 50 in your local health care system? **Consider patients screened within the PAST 90 DAYS.**

Table I-148. Colon Cancer: Question 1

	N	n	%
Fecal occult blood test (standard guaiac)	109	39	35.8
Fecal immunochemical test	109	76	69.7
Flexible sigmoidoscopy every 5 years	109	18	16.5
Colonoscopy every 10 years	109	100	91.7
Double contrast barium enema every 5 years	109	4	3.7

2. Which of the following would best characterize the availability of the **fecal immunochemical test** at your local health care system?

Table I-149. Colon Cancer: Question 2

	N	n	%
Available at **all** facilities associated with this local health care system (i.e., VAMC and all CBOCs)	109	80	73.4
Available at **some locations** within this local health care system but not others	109	11	10.1
Not available at any facilities within this local health care system	109	18	16.5

3. Which of the following would best characterize the CPRS implementation of automated clinical reminders to perform Colon Cancer screening at your facilities?

Table I-150. Colon Cancer: Question 3

	N	n	%
Reminders for Colon Cancer screening are implemented	107	107	100.0
Reminders for Colon Cancer screening are **not** implemented	107	0	0.0

4. It is our understanding that providers can change their CPRS settings to turn off some types of laboratory alerts and not others, and that sometimes alerts are easy to miss. Which of the following would best characterize implementation of CPRS "view alerts" for positive Fecal Occult Blood Test (FOBT) results for patients in your local health care system?

Table I-151. Colon Cancer: Question 4

	N	n	%
An abnormal FOBT generates an alert that can be suppressed based upon a clinician's CPRS settings	109	16	14.7
An abnormal FOBT generates an alert which may easily be overlooked (e.g., if a clinician becomes distracted while viewing a patient's chart)	109	35	32.1
An abnormal FOBT generates an alert which requires some sort of acknowledgement by the clinician	109	49	45.0
An abnormal FOBT is automatically routed to gastroenterology for follow-up	109	24	22.0
FOBT alerts are **not** implemented	109	5	4.6
Other	109	20	18.3

Colonoscopy

5. Consider the use of **colonoscopy** for patients with the following indications. In the 12 MONTHS, what do you estimate to have been the **average wait time** (elapsed days from consult request to scheduled procedure date) for the procedures listed below?

Table I-152. Colon Cancer: Question 5

		Days				Not applicable	
Procedure	N	Mean	Median	Standard Deviation	Range	n	%
a. Colonoscopy screening for average-risk patients (if used)	105	56.1	55	35.3	1 – 200 days	20	19.0
b. Colonoscopy screening for high-risk patients (e.g., strong family of Colon Cancer or personal history of inflammatory bowel disease)	106	42.0	30	25.9	7 - 150	17	16.0
c. Colonoscopy for patients with positive FOBT test	106	33.4	30	17.1	5 - 90	15	14.2
d. Colonoscopy for patients with iron deficiency anemia	106	34.4	30	18.3	5 - 90	19	17.9
e. Colonoscopy for patients with other symptoms or indications	106	35.1	30	21.4	5 - 90	25	23.6
This question (question 5) allowed respondents to either mark a numerical entry or mark N/A or can't assess with an explanation.							

6. Please think about patients who need a **colonoscopy. IN THE PAST 12 MONTHS,** how often did patients experience *clinically meaningful* delays in getting a **colonoscopy** for the following indications? Indicate the percent of patients that experienced delays for whom the service was indicated.

Table I-153. Colon Cancer: Question 6

Service	N	No Delay		1-10% of patients experience a delay		11-25% of patients experience delay		26-50% of patients experience delay		51% or more of patients experience delay		Not Applicable	
		n	%	n	%	n	%	n	%	n	%	n	%
a. Colonoscopy screening for average-risk patients	107	57	53.3	24	22.4	11	10.3	6	5.6	4	3.7	5	4.7
b. Colonoscopy screening for high-risk patients (e.g., strong family of Colon Cancer or personal history of inflammatory bowel disease)	107	66	61.7	25	23.4	6	5.6	7	6.5	1	0.9	2	1.9
c. Colonoscopy for patients with positive FOBT test	107	64	59.8	33	30.8	3	2.8	5	4.7	0	0.0	2	1.9
d. Colonoscopy for patients with iron deficiency anemia	107	67	62.6	26	24.3	8	7.5	4	3.7	0	0.0	2	1.9
e. Colonoscopy for patients with other symptoms or indications	107	60	56.1	31	29.0	9	8.4	4	3.7	0	0.0	3	2.8

7. *The colon cancer module did not include a question 7.*

8. Think of the most effective way to reduce the number of *clinically meaningful delays* in patients receiving a colonoscopy. Now**, in your solution, how important are each of the following elements**?

Table I-154. Colon Cancer: Question 8

		Critically Important		Very Important		Somewhat Important		Unimportant		Not applicable	
Solution	N	n	%	n	%	n	%	n	%	n	%
a. Create additional space for patient care (e.g., more exam rooms, procedure rooms, inpatient beds)	64	17	26.6	16	25.0	15	23.4	8	12.5	8	12.5
increase the number of licensed independent practitioners (e.g., physicians, nurse practitioners, psychologists).	64	32	50.0	18	28.1	8	12.5	2	3.1	4	6.3
c. Increase the number of other personnel (e.g., nursing, technicians, pharmacists, clerical staff).	64	26	40.6	17	26.6	14	21.9	2	3.1	5	7.8
d. Acquire and/or improve availability of equipment.	64	10	15.6	11	17.2	18	28.1	19	29.7	6	9.4
e. Implement or increase the availability of telehealth services	63	1	1.6	1	1.6	16	25.4	31	49.2	14	22.2
f. Improve information technology (e.g., scheduling system, electronic health record).	64	12	18.8	20	31.3	13	20.3	14	21.9	5	7.8
g. Change "central office policies" that affect workflow and efficiency (e.g., rules governing documentation or how quickly certain services must be provided)	63	12	19.0	18	28.6	19	30.2	9	14.3	5	7.9
h. Improve personnel supervision, management, or incentives.	64	8	12.5	13	20.3	26	40.6	13	20.3	4	6.3
i. Increase weekend and evening availability of services	64	0	0.0	6	9.4	22	34.4	29	45.3	7	10.9
j. Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community	64	3	4.7	13	20.3	30	46.9	16	25.0	2	3.1
k. Some other solution(s).	62	15	24.2	13	21.0	8	12.9	3	4.8	23	37.1
This question (question 8) is based on respondents who indicated that patients experienced any delay in getting a colonoscopy (question 6) (N=64)											

Management of Biopsy-Proven Colon Cancer

9. Please think about patients who have already had a colonoscopy and have biopsy-proven Colon Cancer. **IN THE PAST 12 MONTHS,** how often were there *clinically meaningful* delays in the following assessment and treatment steps (among patients for whom the step is indicated)? Indicate the percent of colon cancer patients that experienced delays for whom the service was indicated.

Table I-155. Colon Cancer: Question 9

Service	N	No Delay		1-10% of patients experience delay		11-25% of patients experience delay		26-50% of patients experience delay		51% or more of patients experience delay		Not applicable	
		n	%	n	%	n	%	n	%	n	%	n	%
a. Initial evaluation by a surgeon	107	81	75.7	16	15.0	4	3.7	2	1.9	0	0.0	4	3.7
b. CT scan for staging	107	91	85.1	12	11.2	1	0.9	0	0.0	1	0.9	2	1.9
c. Elective surgery (i.e., partial colectomy) at your local VA health care system	107	62	57.9	14	13.1	4	3.7	3	2.8	0	0.0	24	22.4
d. Elective surgery (i.e., partial colectomy) at another VA health care system	106	27	25.5	15	14.2	5	4.7	3	2.8	1	0.9	55	51.9
e. Elective surgery (i.e., partial colectomy) at a non-VA facility (fee-basis or contracted care)	107	35	32.7	15	14.0	6	5.6	1	0.9	1	0.9	49	45.8
f. Starting chemotherapy at your local VA health care system	107	71	66.4	13	12.2	3	2.8	0	0.0	0	0.0	20	18.7
g. Starting chemotherapy at another VA health care system	106	27	25.5	6	5.7	4	3.8	2	1.9	0	0.0	67	63.2
h. Starting chemotherapy a non-VA facility (fee-basis or contracted care)	107	35	32.7	11	10.3	1	0.9	0	0.0	1	0.9	59	55.1

10. Think about those Colon Cancer patients who experienced *clinically meaningful delays*. In the PAST 12 MONTHS, which of these delays had the **most negative impact** on patients?

Results not presented. Respondents were only asked this question if they identified more than three delays in Q9 in order to identify their top three delays for Q11.

11A**. Your solution for delays in:** Initial evaluation by a surgeon. Think about the most effective way to reduce the number of *clinically meaningful delays* at this junction. Now**, in your solution, how important are each of the following elements?**

Table I-156. Colon Cancer: Question 11A

Solution	N	Critically important		Very important		Somewhat important		Unimportant		Not applicable	
		n	%	n	%	n	%	n	%	n	%
a. Create additional space for patient care (e.g., more exam rooms, procedure rooms, inpatient beds).	14	3	21.4	1	7.1	5	35.7	0	0.0	5	35.7
b. Increase the number of licensed independent practitioners (e.g., physicians, nurse practitioners, psychologists).	14	9	64.3	3	21.4	2	14.3	0	0.0	0	0.0

i. Increase weekend and evening availability of services.	14	0	0.0	2	14.3	3	21.4	6	42.9	3	21.4
j. Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community.	14	4	28.6	1	7.1	3	21.4	5	35.7	1	7.1
k. Some other solution(s).	13	5	38.5	0	0.0	2	15.4	0	0.0	6	46.2

This question (question 11) is based on respondents who indicated that patients experienced delays in the management of biopsy-proven Colon Cancer (question 9). If 1-3 delays were mentioned in question 9, this question was repeated for each delay mentioned. If 4 or more delays were mentioned in question 9, this question was repeated for the top three delays mentioned in question 10. Respondents were eligible to answer question 11a (N=14, 13.08% of those who answered question 9 and 63.64% of those who reported any delay) if they identified delays in four or more services and indicated that this was one of the three delays that had the most negative impact on patients or if this service was one of the three or fewer services for which a delay was indicated.

11B**. Your solution for delays in:** CT scan for staging. Think about the most effective way to reduce the number of *clinically meaningful delays* at this junction. Now**, in your solution, how important are each of the following elements?**

Responses to this question are not presented due to small number of respondents who identified delays in accessing CT scan for staging and answered 11b (N = 8).

11C**. Your solution for delays in:** Elective surgery (i.e., partial colectomy) at your local VA health care system. Think about the most effective way to reduce the number of *clinically meaningful delays* at this junction. Now**, in your solution, how important are each of the following elements?**

Table I-157. Colon Cancer: Question 11C

j. Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community.	17	2	11.8	6	35.3	4	23.5	3	17.7	2	11.8
k. Some other solution(s).	17	5	29.4	2	11.8	2	11.8	1	5.9	7	41.2

This question (question 11) is based on respondents who indicated that patients experienced delays in the management of biopsy-proven Colon Cancer (question 9). If 1-3 delays were mentioned in question 9, this question was repeated for each delay mentioned. If 4 or more delays were mentioned in question 9, this question was repeated for the top three delays mentioned in question 10. Respondents were eligible to answer question 11c (N=17, 15.89% of those who answered question 9 and 80.95% of those who reported any delay) if they identified delays in four or more services and indicated that this was one of the three delays that had the most negative impact on patients or if this service was one of the three or fewer services for which a delay was indicated.

11D**. Your solution for delays in:** Elective surgery (i.e., partial colectomy) at another VA health care system. Think about the most effective way to reduce the number of *clinically meaningful delays* at this junction. Now**, in your solution, how important are each of the following elements?**

This question (question 16) is based on respondents who indicated that their local health care system had problems retaining certain personnel categories (question 15). Question 16 was asked for each personnel type marked "yes" in question 15. Due to a programming error, respondents who indicated problems with retaining Nurse Specialists with oncologic expertise were not asked to provide the top two reasons for retention problems for this specialty. Therefore this data should be considered missing.

The views, opinions, and/or findings contained in this report are those of RAND Corporation and should not be construed as an official government position, policy, or decision.

Appendix I.1.7 Diabetes Mellitus (type 2)

Section 7: Type 2 Diabetes

Delays in Management After Diagnosis

1. Please think about patients who are in need of the following Type 2 Diabetes management services. **IN THE PAST 90 DAYS**, how often were there *clinically meaningful delays* in patients' access to the following diabetes management services? Indicate the percent of Type 2 Diabetes patients that experienced delays for whom the service was indicated.

Table I-167. Type 2 Diabetes: Question 1

Service	N	No Delay		1-10% of patients experience delay		11-25% of patients experience delay		26-50% of patients experience delay		51% or more of patients experience delay		Not applicable	
		n	%	n	%	n	%	n	%	n	%	n	%
a. Primary care clinic appointment for issues related to glycemic control (e.g., symptoms or glucometer reading)	110	44	40.0	37	33.6	11	10.0	3	2.7	6	5.5	9	8.2
b. Consult with endocrinologist/diabetes specialist (e.g., or poor glycemic control, or for patients at high risk for complications)	110	44	40.0	32	29.1	19	17.3	5	4.6	4	3.6	6	5.5
c. In-person care at endocrinology, for poor glycemic control, or for patients at high risk for complications	110	44	40.0	36	32.7	12	10.9	6	5.5	3	2.7	9	8.2
d. Nutritionist	110	75	68.2	20	18.2	11	10.0	1	0.9	2	1.8	1	0.9
e. Podiatry clinic for preventative care	110	44	40.0	33	30.0	16	14.6	8	7.3	4	3.6	5	4.6
f. Retinopathy screening services	110	73	66.4	20	18.2	7	6.4	3	2.7	3	2.7	4	3.6
g. Retinopathy treatment services	110	48	43.6	41	37.3	5	4.6	6	5.5	0	0.0	10	9.1
h. Bariatric surgery (in patients deemed to be good candidates)	110	18	16.4	12	10.9	5	4.6	7	6.4	18	16.4	50	45.5
i. Dispensing diabetes-related personal equipment such as glucometers or special footwear	110	84	76.4	18	16.4	6	5.5	1	0.9	0	0.0	1	0.9

2. Think about those Type 2 Diabetes patients who experienced *clinically meaningful delays.* In the PAST 90 DAYS which of these delays had the **most negative impact** on patients?

Results not presented. Respondents were only asked this question if they identified more than three delays in Q1 in order to identify their top three delays for Q3.

3A**. Your solution for delays in:** Primary care clinic appointment for issues related to glycemic control (e.g., symptoms or glucometer reading)**.** Think of the most effective way to reduce the number of *clinically meaningful delays* at this junction. Now, **in your solution, how important are each of the following elements**?

Table I-168. Type 2 Diabetes: Question 3A

Solution	N	Critically important		Very important		Somewhat important		Unimportant		Not applicable	
		n	%	n	%	n	%	n	%	n	%
a. Create additional space for patient care (e.g., more exam rooms, procedure rooms, inpatient beds).	44	15	34.1	12	27.3	10	22.7	6	13.6	1	2.3
b. Increase the number of licensed independent practitioners (e.g., physicians, nurse practitioners, psychologists).	44	20	45.5	10	22.7	10	22.7	2	4.6	2	4.6
c. Increase the number of other personnel (e.g., nursing, technicians, pharmacists, clerical staff).	44	13	29.6	19	43.2	9	20.5	3	6.8	0	0.0
d. Acquire and/or improve availability of equipment.	44	1	2.3	8	18.2	14	31.8	13	29.6	8	18.2
e. Implement or increase the availability of telehealth services.	44	5	11.4	9	20.5	21	47.7	8	18.2	1	2.3
f. Improve information technology (e.g., scheduling system, electronic health record).	44	17	38.6	8	18.2	7	15.9	11	25.0	1	2.3
g. Change 'central office policies' that affect workflow and efficiency (e.g., rules governing documentation or how quickly certain services must be provided).	44	10	22.7	12	27.3	14	31.8	8	18.2	0	0.0
h. Improve personnel supervision, management, or incentives.	44	9	20.5	9	20.5	13	29.6	9	20.5	4	9.1
i. Increase weekend and evening availability of services.	44	3	6.8	6	13.6	16	36.6	15	34.1	4	9.1
j. Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community.	44	1	2.3	4	9.1	17	38.6	17	38.6	5	11.4
k. Some other solution(s).	44	11	25.0	7	15.9	4	9.1	2	4.6	20	45.5

This question (question 3) is based on respondents who indicated that patients experienced delays in accessing diabetes management services (question 1). If 1-3 delays were mentioned in question 1, this question was repeated for each delay mentioned. If 4 or more delays were mentioned in question 1, this question was repeated for the top three delays mentioned in question 2. Respondents were eligible to answer question 3a (N=44, 40.0% of those who answered question 1 and 77.2% of those who reported any delay) if they identified delays in four or more services and indicated that this was one of the three delays that had the most negative impact on patients or if this service was one of the three or fewer services for which a delay was indicated.

3B**. Your solution for delays in:** Consult with endocrinologist/diabetes specialist (e.g., or poor glycemic control, or for patients at high risk for complications)**.** Think of the most effective way to reduce the number of *clinically meaningful delays* at this junction. Now, **in your solution, how important are each of the following elements**?

h. Improve personnel supervision, management, or incentives.	21	4	19.1	4	19.1	9	42.9	3	14.3	1	4.8
i. Increase weekend and evening availability of services.	21	1	4.8	3	14.3	6	28.6	8	38.1	3	14.3
j. Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community.	21	1	4.8	5	23.8	10	47.6	5	23.8	0	0.0
k. Some other solution(s).	21	1	4.8	3	14.3	2	9.5	0	0.0	15	71.4

This question (question 3) is based on respondents who indicated that patients experienced delays in accessing diabetes management services (question 1). If 1-3 delays were mentioned in question 1, this question was repeated for each delay mentioned. If 4 or more delays were mentioned in question 1, this question was repeated for the top three delays mentioned in question 2. Respondents were eligible to answer question 3g (N=21, 19.1% of those who answered question 1 and 40.4% of those who reported any delay) if they identified delays in four or more services and indicated that this was one of the three delays that had the most negative impact on patients or if this service was one of the three or fewer services for which a delay was indicated.

3H**. Your solution for delays in:** Bariatric surgery (in patients deemed to be good candidates)**.** Think of the most effective way to reduce the number of *clinically meaningful delays* at this junction. Now, **in your solution, how important are each of the following elements**?

Table I-175. Type 2 Diabetes: Question 3H

Solution	N	Critically important		Very important		Somewhat important		Unimportant		Not applicable	
		n	%	n	%	n	%	n	%	n	%
a. Create additional space for patient care (e.g., more exam rooms, procedure rooms, inpatient beds).	25	4	16.0	3	12.0	10	40.0	1	4.0	7	28.0
b. Increase the number of licensed independent practitioners (e.g., physicians, nurse practitioners, psychologists).	25	5	20.0	8	32.0	5	20.0	1	4.0	6	24.0
c. Increase the number of other personnel (e.g., nursing, technicians, pharmacists, clerical staff).	25	4	16.0	5	20.0	6	24.0	1	4.0	9	36.0
d. Acquire and/or improve availability of equipment.	24	3	12.5	2	8.3	6	25.0	6	25.0	7	29.2
e. Implement or increase the availability of telehealth services.	25	1	4.0	2	8.0	6	24.0	9	36.0	7	28.0
f. Improve information technology (e.g., scheduling system, electronic health record).	25	2	8.0	1	4.0	8	32.0	7	28.0	7	28.0
g. Change 'central office policies' that affect workflow and efficiency (e.g., rules governing documentation or how quickly certain services must be provided).	24	7	29.2	4	16.7	6	25.0	3	12.5	4	16.7

i. Increase weekend and evening availability of services.	25	0	0.0	1	4.0	4	16.0	10	40.0	10	40.0
j. Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community.	25	7	28.0	8	32.0	5	20.0	3	12.0	2	8.0
k. Some other solution(s).	25	6	24.0	2	8.0	3	12.0	2	8.0	12	48.0

This question (question 3) is based on respondents who indicated that patients experienced delays in accessing diabetes management services (question 1). If 1-3 delays were mentioned in question 1, this question was repeated for each delay mentioned. If 4 or more delays were mentioned in question 1, this question was repeated for the top three delays mentioned in question 2. Respondents were eligible to answer question 3h (N=25, 22.7% of those who answered question 1 and 59.5% of those who reported any delay) if they identified delays in four or more services and indicated that this was one of the three delays that had the most negative impact on patients or if this service was one of the three or fewer services for which a delay was indicated.

3I**. Your solution for delays in:** Dispensing diabetes-related personal equipment such as glucometers or special footwear**.** Think of the most effective way to reduce the number of *clinically meaningful delays* at this junction. Now, **in your solution, how important are each of the following elements**?

Responses to this question are not presented due to small number of respondents who identified delays in Dispensing diabetes-related personal equipment such as glucometers or special footwear *and answering question 3i (N = 2).*

Complications of Type 2 Diabetes

4. Please think about patients who had the following **complications** from Type 2 Diabetes. **IN THE PAST 90 DAYS**, how often were there *clinically meaningful delays* in patients' access to treatment for these **complications of diabetes**? Indicate the percent of Type 2 Diabetes patients that experienced delays for whom the service was indicated.

Table I-176. Type 2 Diabetes: Question 4

Service	N	No Delay		1-10% of patients experience delay		11-25% of patients experience delay		26-50% of patients experience delay		51% or more of patients experience delay		Not applicable	
		n	%	n	%	n	%	n	%	n	%	n	%
a. Evaluation and treatment by vascular surgery for non-acute limb ischemia	110	51	46.4	28	25.5	14	12.7	3	2.7	2	1.8	12	10.9
b. Evaluation and treatment by ophthalmology for declining vision	110	60	54.6	32	29.1	7	6.4	4	3.6	1	0.9	6	5.5
c. Evaluation and treatment by nephrology for worsening renal function	110	62	56.4	22	20.0	13	11.8	2	1.8	3	2.7	8	7.3
d. Evaluation and treatment by cardiology for new symptoms or refractory hyperlipidemia	110	62	56.4	24	21.8	11	10.0	3	2.7	0	0.0	10	9.1
e. Evaluation and treatment by podiatry for new foot lesions	110	56	50.9	32	29.1	12	10.9	4	3.6	2	1.8	4	3.6

5. Think about those Type 2 Diabetes patients who experienced *clinically meaningful delays*. In the **PAST 90 DAYS**, which of these delays had the **most negative impact** on patients?

Results not presented. Respondents were only asked this question if they identified more than three delays in Q4 in order to identify their top three delays for Q6.

Reducing Delays in Care for Complications of Diabetes

6A. **Your solution for delays in:** Evaluation and treatment by vascular surgery for non-acute limb ischemia. Think about the most effective way to reduce the number of *clinically meaningful delays* at this junction. Now, **in your solution, how important are each of the following elements**?

Table I-177. Type 2 Diabetes: Question 6A

Solution	N	Critically important n	Critically important %	Very important n	Very important %	Somewhat important n	Somewhat important %	Unimportant n	Unimportant %	Not applicable n	Not applicable %
a. Create additional space for patient care (e.g., more exam rooms, procedure rooms, inpatient beds).	36	7	19.4	8	22.2	10	27.8	9	25.0	2	5.6

i. Increase weekend and evening availability of services.	36	3	8.3	2	5.6	10	27.8	14	38.9	7	19.4
j. Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community.	35	2	5.7	7	20.0	16	45.7	7	20.0	3	8.6
k. Some other solution(s). .	35	4	11.4	7	20.0	0	0.0	0	0.0	24	68.6

This question (question 6) is based on respondents who indicated that patients experienced delays in accessing diabetes management services (question 4). If 1-3 delays were mentioned in question 4, this question was repeated for each delay mentioned. If 4 or more delays were mentioned in question 4, this question was repeated for the top three delays mentioned in question 5. Respondents were eligible to answer question 6a (N=36, 32.7% of those who answered question 4 and 76.6% of those who reported any delay) if they identified delays in four or more services and indicated that this was one of the three delays that had the most negative impact on patients or if this service was one of the three or fewer services for which a delay was indicated.

6B. **Your solution for delays in:** Evaluation and treatment by ophthalmology for declining vision. Think about the most effective way to reduce the number of *clinically meaningful delays* at this junction. Now, **in your solution, how important are each of the following elements**?

Table I-178. Type 2 Diabetes: Question 6B

Solution	N	Critically important		Very important		Somewhat important		Unimportant		Not applicable	
		n	%	n	%	n	%	n	%	n	%
a. Create additional space for patient care (e.g., more exam rooms, procedure rooms, inpatient beds).	31	7	22.6	7	22.6	9	29.0	2	6.5	6	19.4

N refers to the proportion of respondents who listed each "reason" as one of the two most important affecting recruitment and hiring

This question (question 9) is based on respondents who indicated that their local health care system had problems recruiting certain personnel categories (question 8A). Question 9 was asked for each personnel type marked "yes" in question 8A.

8B. IN THE PAST YEAR, did your local health care system have problems **RETAINING** the following personnel categories?

Table I-185. Type 2 Diabetes: Question 8B

Staff Positions	N	Yes		No		Not Applicable	
		n	%	n	%	n	%
a. Primary Care Physicians	110	69	62.7	28	25.5	13	11.8
b. Non-Physician Primary Care Providers (Physician Assistants/Nurse Practitioners)	110	34	30.9	63	57.3	13	11.8
c. Endocrinologists	110	19	17.3	57	51.8	34	30.9

N refers to the proportion of respondents who listed each "reason" as one of the two most important affecting retention
This question (question 10) is based on respondents who indicated that their local health care system had problems retaining certain personnel categories (question 8B). Question 10 was asked for each personnel type marked "yes" in question 8B.

Appendix I.1.8 Gynecologic Surgery

Section 8: Gynecologic Surgery

Gynecologic Surgery

1. Please think about patients who need gynecologic surgery either as an in-patient or an outpatient, for conditions, which include, but are not limited to, endometriosis, cervical, uterine or ovarian cancer, fibroids, or a miscarriage. **IN THE PAST 12 MONTHS**, how often were there *clinically meaningful delays* scheduling these patients for an initial surgical evaluation with the following providers?

Table I-187. Gynecologic Surgery: Question 1

		No Delay		1-10% of patients experience delay		11-25% of patients experience delay		26-50% of patients experience delay		51% or more of patients experience delay		Not applicable	
	N	**n**	**%**	**n**	**%**	**n**	**%**	**n**	**%**	**n**	**%**	**n**	**%**
a. VA Gynecologist located at **this Administrative Parent** (local health care system)	107	58	54.2	15	14.0	7	6.5	0	0.0	0	0.0	27	25.2
b.VA Gynecologist located at **another VA health care system**	107	29	27.1	7	6.5	5	4.7	2	1.9	2	1.9	62	57.9
c. Community Gynecologist (fee-basis or contracted care)	107	52	48.6	21	19.6	9	8.4	5	4.7	1	0.9	19	17.8

Reducing Delays in Evaluations for Gynecologic Surgery

2A. **Your solution for delays in getting an initial surgical evaluation with a: VA Gynecologist located at this Administrative Parent (local health care system)**. Think of the most effective way to reduce the number of *clinically meaningful delays* in patients receiving an **initial surgical evaluation.** Now, **in your solution, how important are each of the following elements**?

Table I-188. Gynecologic Surgery: Question 2A

Solution	N	Critically Important n	%	Very Important n	%	Somewhat Important n	%	Unimportant n	%	Not applicable n	%
a. Create additional space for patient care (e.g., more exam rooms, procedure rooms, inpatient beds)	22	5	22.7	8	36.4	4	18.2	3	13.6	2	9.1
b. Increase the number of licensed independent practitioners (e.g., physicians, nurse practitioners, psychologists).	22	7	31.8	9	40.9	4	18.2	1	4.5	1	4.5
c. Increase the number of other personnel (e.g., nursing, technicians, pharmacists, clerical staff).	22	7	31.8	9	40.9	4	18.2	1	4.5	1	4.5
d. Acquire and/or improve availability of equipment.	22	3	13.6	9	40.9	3	13.6	4	18.2	3	13.6
e. Implement or increase the availability of telehealth services	22	0	0.0	6	27.3	9	40.9	3	13.6	4	18.2
f. Improve information technology (e.g., scheduling system, electronic health record).	22	5	22.7	4	18.2	8	36.4	2	9.1	3	13.6
g. Change "central office policies" that affect workflow and efficiency (e.g., rules governing documentation or how quickly certain services must be provided)	22	2	9.1	8	36.4	4	18.2	5	22.7	3	13.6
h. Improve personnel supervision, management, or incentives.	22	7	31.8	4	18.2	4	18.2	5	22.7	2	9.1
i. Increase weekend and evening availability of services	22	1	4.5	0	0.0	14	63.6	5	22.7	2	9.1
j. Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community	22	2	9.1	4	18.2	7	31.8	8	36.4	1	4.5
k. Some other solution(s).	22	3	13.6	6	27.3	2	9.1	0	0.0	11	50.0
This question (question 2a) is based on respondents who indicated that patients experienced delays (n=22) in getting an initial surgical evaluation with a VA Gynecologist located at this Administrative Parent (question 1a)											

2B. **Your solution for delays in getting an initial surgical evaluation with a: VA Gynecologist located at another VA health care system**. Think of the most effective way to reduce the number of *clinically meaningful delays* in patients receiving an **initial surgical evaluation.** Now, **in your solution,**

Table I-189. Gynecologic Surgery: Question 2B

Solution	N	Critically Important n	%	Very Important n	%	Somewhat Important n	%	Unimportant n	%	Not applicable n	%
a. Create additional space for patient care (e.g., more exam rooms, procedure rooms, inpatient beds)	16	1	6.3	3	18.8	4	25.0	0	0.0	8	50.0
b. Increase the number of licensed independent practitioners (e.g., physicians, nurse practitioners, psychologists).	16	2	12.5	9	56.3	0	0.0	0	0.0	5	31.3
c. Increase the number of other personnel (e.g., nursing, technicians, pharmacists, clerical staff).	16	3	18.8	3	18.8	3	18.8	0	0.0	7	43.8
d. Acquire and/or improve availability of equipment.	16	2	12.5	2	12.5	3	18.8	2	12.5	7	43.8
e. Implement or increase the availability of telehealth services	15	0	0.0	2	13.3	7	46.7	1	6.7	5	33.3
f. Improve information technology (e.g., scheduling system, electronic health record).	15	0	0.0	1	6.7	6	40.0	2	13.3	6	40.0
g. Change "central office policies" that affect workflow and efficiency (e.g., rules governing documentation or how quickly certain services must be provided)	15	0	0.0	2	13.3	4	26.7	2	13.3	7	46.7
h. Improve personnel supervision, management, or incentives.	16	1	6.3	3	18.8	6	37.5	0	0.0	6	37.5
i. Increase weekend and evening availability of services	16	0	0.0	1	6.3	7	43.8	2	12.5	6	37.5
j. Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community	16	3	18.8	3	18.8	4	25.0	1	6.3	5	31.3
k. Some other solution(s).	16	0	0.0	6	37.5	1	6.3	1	6.3	8	50.0

This question (question 2b) is based on respondents who indicated that patients experienced delays (n=16) in getting an initial surgical evaluation with a VA Gynecologist located at another VA health care system (question 1b).

2C. **Your solution for delays in getting an initial surgical evaluation with a: Community Gynecologist (fee-basis or contracted care)**. Think of the most effective way to reduce the number of *clinically meaningful delays* in patients receiving an **initial surgical evaluation.** Now, **in your solution,**

Table I-190. Gynecologic Surgery: Question 2C

Solution	N	Critically important		Very Important		Somewhat Important		Unimportant		Not applicable	
		n	%	n	%	n	%	n	%	n	%
a. Create additional space for patient care (e.g., more exam rooms, procedure rooms, inpatient beds)	36	4	11.1	5	13.9	6	16.7	8	22.2	13	36.1
b. Increase the number of licensed independent practitioners (e.g., physicians, nurse practitioners, psychologists).	36	8	22.2	9	25.0	4	11.1	6	16.7	9	25.0
c. Increase the number of other personnel (e.g., nursing, technicians, pharmacists, clerical staff).	35	10	28.6	6	17.1	8	22.9	3	8.6	8	22.9
d. Acquire and/or improve availability of equipment.	36	4	11.1	10	27.8	3	8.3	6	16.7	13	36.1
e. Implement or increase the availability of telehealth services	35	0	0.0	7	20.0	9	25.7	9	25.7	10	28.6
f. Improve information technology (e.g., scheduling system, electronic health record).	35	5	14.3	9	25.7	11	31.4	4	11.4	6	17.1
g. Change "central office policies" that affect workflow and efficiency (e.g., rules governing documentation or how quickly certain services must be provided)	35	3	8.6	5	14.3	14	40.0	5	14.3	8	22.9
h. Improve personnel supervision, management, or incentives.	35	5	14.3	5	14.3	9	25.7	9	25.7	7	20.0
i. Increase weekend and evening availability of services	35	0	0.0	4	11.4	12	34.3	9	25.7	10	28.6
j. Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community	36	4	11.1	16	44.4	10	27.8	3	8.3	3	8.3
k. Some other solution(s).	36	3	8.3	9	25.0	5	13.9	4	11.1	15	41.7
This question (question 2c) is based on respondents who indicated that patients experienced delays (n=36) in getting an initial surgical evaluation with a Community Gynecologist (fee-basis or contracted care) (question 1c).											

3. Now please think about patients who have an indication for gynecologic surgery. IN THE PAST 12 MONTHS, how often were there *clinically meaningful delays* in the patient **receiving the surgical procedure at the following locations**?

Table I-191. Gynecologic Surgery: Question 3

		No Delay		1-10% of patients experience delay		11-25% of patients experience delay		26-50% of patients experience delay		51% or more of patients experience delay		Not applicable	
	N	n	%	n	%	n	%	n	%	n	%	n	%
a. At this local VA health care system	107	50	46.7	16	15.0	6	5.6	2	1.9	1	0.9	32	29.9
b. At another local VA health care system	107	28	26.2	5	4.7	6	5.6	3	2.8	1	0.9	64	59.8
c. In the community using fee-basis or contracted care	107	58	54.2	19	17.8	10	9.3	2	1.9	2	1.9	16	15.0

Reducing Delays in Gynecologic Surgery

4A. **Your solution to delays in patients receiving gynecologic surgery:** at this local VA health care system. Think about the most effective way to reduce the number of *clinically meaningful delays* for **patients receiving gynecologic surgery**. Now, **in your solution, how important are each of the following elements**?

Table I-192. Gynecologic Surgery: Question 4A

	N	Critically important		Very Important		Somewhat Important		Unimport ant		Not applicable	
		n	%	n	%	n	%	n	%	n	%
a. Create additional space for patient care (e.g., more exam rooms, procedure rooms, inpatient beds)	25	4	16.0	11	44.0	4	16.0	4	16.0	2	8.0
b. Increase the number of licensed independent practitioners (e.g., physicians, nurse practitioners, psychologists).	25	7	28.0	7	28.0	6	24.0	3	12.0	2	8.0
c. Increase the number of other personnel (e.g., nursing, technicians, pharmacists, clerical staff).	25	7	28.0	10	40.0	6	24.0	1	4.0	1	4.0
d. Acquire and/or improve availability of equipment.	25	6	24.0	5	20.0	8	32.0	3	12.0	3	12.0
e. Implement or increase the availability of telehealth services	25	0	0.0	2	8.0	10	40.0	6	24.0	7	28.0
f. Improve information technology (e.g., scheduling system, electronic health record).	25	5	20.0	6	24.0	9	36.0	3	12.0	2	8.0
g. Change "central office policies" that affect workflow and efficiency (e.g., rules governing documentation or how quickly certain services must be provided)	25	3	12.0	5	20.0	6	24.0	4	16.0	7	28.0
h. Improve personnel supervision, management, or incentives.	25	5	20.0	3	12.0	8	32.0	5	20.0	4	16.0
i. Increase weekend and evening availability of services	25	1	4.0	2	8.0	8	32.0	7	28.0	7	28.0
j. Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community	24	3	12.5	3	12.5	11	45.8	3	12.5	4	16.7
k. Some other solution(s).	25	3	12.0	4	16.0	5	20.0	3	12.0	10	40.0

This question (question 4a) is based on respondents who indicated that patients experienced delays (n=25) in receiving surgery at this local VA health care system (question 2a).

4B. **Your solution to delays in patients receiving gynecologic surgery:** at another local VA health care system**.** Think about the most effective way to reduce the number of *clinically meaningful delays* for **patients receiving gynecologic surgery**. Now, **in your solution, how important are each of the following elements**?

Table I-193. Gynecologic Surgery: Question 4B

Solution	N	Critically important		Very Important		Somewhat Important		Unimportant		Not applicable	
		n	%	n	%	n	%	n	%	n	%
a. Create additional space for patient care (e.g., more exam rooms, procedure rooms, inpatient beds)	15	2	13.3	2	13.3	4	26.7	1	6.7	6	40.0
b. Increase the number of licensed independent practitioners (e.g., physicians, nurse practitioners, psychologists).	15	3	20.0	5	33.3	2	13.3	1	6.7	4	26.7
c. Increase the number of other personnel (e.g., nursing, technicians, pharmacists, clerical staff).	15	5	33.3	2	13.3	2	13.3	1	6.7	5	33.3
d. Acquire and/or improve availability of equipment.	15	3	20.0	4	26.7	1	6.7	1	6.7	6	40.0
e. Implement or increase the availability of telehealth services	15	1	6.7	1	6.7	3	20.0	4	26.7	6	40.0
f. Improve information technology (e.g., scheduling system, electronic health record).	15	2	13.3	2	13.3	3	20.0	3	20.0	5	33.3
This question (question 4b) is based on respondents who indicated that patients experienced delays (n=15) in receiving surgery at another local VA health care system (question 2b). Due to a technical problem in the survey software, we do not have data about the importance of the following solutions for resolving delays at another local VA health care system: g. Change "central office policies" that affect workflow and efficiency (e.g., rules governing documentation or how quickly certain services must be provided); h. Improve personnel supervision, management, or incentives. Please describe in the comments box below; i. Increase weekend and evening availability of services; j. Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community; k. Some other solution(s). Please describe your recommendations in the comments box below.											

4C. **Your solution to delays in patients receiving gynecologic surgery:** in the community using fee-basis or contracted care**.** Think about the most effective way to reduce the number of *clinically meaningful delays* for **patients receiving gynecologic surgery**. Now, **in your solution, how important are each of the following elements**?

Table I-194. Gynecologic Surgery: Question 4C

Solution	N	Critically important		Very Important		Somewhat Important		Unimportant		Not applicable	
		n	%	n	%	n	%	n	%	n	%
a. Create additional space for patient care (e.g., more exam rooms, procedure rooms, inpatient beds)	33	5	15.2	4	12.1	4	12.1	8	24.2	12	36.4
b. Increase the number of licensed independent practitioners (e.g., physicians, nurse practitioners, psychologists).	33	7	21.2	11	33.3	5	15.2	5	15.2	5	15.2
c. Increase the number of other personnel (e.g., nursing, technicians, pharmacists, clerical staff).	33	8	24.2	8	24.2	5	15.2	5	15.2	7	21.2
d. Acquire and/or improve availability of equipment.	33	7	21.2	5	15.2	4	12.1	6	18.2	11	33.3
e. Implement or increase the availability of telehealth services	33	1	3.0	6	18.2	8	24.2	7	21.2	11	33.3
f. Improve information technology (e.g., scheduling system, electronic health record).	33	6	18.2	4	12.1	9	27.3	5	15.2	9	27.3
This question (question 4c) is based on respondents who indicated that patients experienced delays (n=33) in receiving surgery in the community using fee-basis or contracted care (question 2c). Due to a technical problem with the survey software, we do not have data about the importance of the following solutions for resolving delays in the community using fee-basis or contracted care: g. Change "central office policies" that affect workflow and efficiency (e.g., rules governing documentation or how quickly certain services must be provided); h. Improve personnel supervision, management, or incentives. Please describe in the comments box below; i. Increase weekend and evening availability of services; j. Increase use of fee-basis or contracted care and/or simplify administrative processes for approval and transfer to care in the community; k. Some other solution(s). Please describe your recommendations in the comments box below.											

Issues that Affect Provider and System Efficiency

5. IN THE PAST YEAR, how much did the following issues negatively impact provider and system efficiency related to the provision of gynecologic surgery?

Table I-195. Gynecologic Surgery: Question 5

	N	None		A little		A fair amount		A lot		Not Applicable	
		n	%	n	%	n	%	n	%	n	%
a. Providers performing clinical activities that could be performed by individuals with less training	106	33	31.1	21	19.8	20	18.9	11	10.4	21	19.8
b. Providers performing administrative activities that could be performed by others	106	17	16.0	23	21.7	18	17.0	28	26.4	20	18.9
c. Residency training/teaching requirements	106	37	34.9	13	12.3	11	10.4	2	1.9	43	40.6
d. Insufficient clinical/administrative support staff	106	14	13.2	26	24.5	20	18.9	28	26.4	18	17.0
e. Inadequate scheduling system and policies (e.g., hard to cancel or reschedule, coordinate)	106	27	25.5	20	18.9	24	22.6	18	17.0	17	16.0
f. Unnecessary documentation requirements or inefficient CPRS interface	106	24	22.6	24	22.6	21	19.8	20	18.9	17	16.0
g. Patient no-show rates	106	10	9.4	35	33.0	30	28.3	16	15.1	15	14.2
h. Poor patient flow management (room/bed turnover, appointments)	106	32	30.2	27	25.5	15	14.2	6	5.7	26	24.5
i. Too many administrative requirements (Initiatives/Policies/Programs)	106	27	25.5	20	18.9	24	22.6	17	16.0	18	17.0

Workforce

6. IN THE PAST YEAR, did your local health care system have problems **RECRUITING AND HIRING** gynecologists?

Table I-196. Gynecologic Surgery: Question 6

		Yes		No		Not Applicable	
Staff Positions	**N**	**n**	**%**	**n**	**%**	**n**	**%**
Gynecologist	106	30	28.3	76	71.7	0	0.0

7. Please enter up to **FIVE** reasons why there were problems **RECRUITING AND HIRING** gynecologists.

Table I-197. Gynecologic Surgery: Question 7

	N	n	%
Senior management does not agree to post new position –	30	7	23.3
Non-competitive wages	30	25	83.3
Work schedule (e.g., call requirements)	30	10	33.3
Benefits (e.g., health insurance, leave, continuing education, travel)	30	3	10.0
Equipment/resources/office space	30	15	50.0
Facility condition	30	5	16.7
Case types/complexity	30	10	33.3
VA reputation	30	12	40.0
No academic affiliation/lack of protected time for early career investigator	30	6	20.0
Geographic location of facility	30	13	43.3
HR process (e.g., time to advertise; length of time from job offer to start date)	30	25	83.3
Lack of qualified applicants	30	11	36.7
This question (question 7) is based on respondents who indicated that their local health care system had problems recruiting or hiring gynecologists (question 6). N refers to the proportion of respondents who listed each "reason" as one of the five most important affecting recruitment and hiring. This question (question 7) is based on respondents who indicated that their local health care system had problems recruiting or hiring gynecologists (question 6).			

8. IN THE PAST YEAR, did your local health care system have problems **RETAINING** gynecologists?

Table I-198. Gynecologic Surgery: Question 8

Staff Positions	**N**	**n**	**%**
Yes	106	13	12.3
No	106	93	87.7

9.   Please enter up to **FIVE** reasons why there were problems **RETAINING** gynecologists.

Table I-199. Gynecologic Surgery: Question 9

	N	n	%
01 Lack of opportunity for professional growth/promotion	13	7	53.8
02 Dissatisfaction with supervision/management support	13	4	30.8
03 Dissatisfaction with support staff	13	4	30.8
04 Dissatisfaction with physical demands of the job	13	1	7.7
05 Lack of frozen pathology or gynecology backup	13	2	15.4
06 Lack of trained operating room support or lack of post-operating room nursing support	13	5	38.5
07 Dissatisfaction with workload	13	5	38.5
08 Lack of incentives or "management levers" to encourage productivity (i.e., no accountability)	13	3	23.1
09 Organizational culture that does not prioritize/encourage productivity–	13	4	30.8
10 Administrative/Program Demands–	13	5	38.5
11 Lack of professional autonomy–	13	4	30.8
12 Dissatisfaction with pay–	13	8	61.5
13 Work schedule–	13	2	15.4
14 Inadequate equipment/resources/office space–	13	8	61.5
15 Burnout–	13	3	23.1
N refers to the proportion of respondents who listed each "reason" as one of the five most important affecting retention This question (question 9) is based on respondents who indicated that their local health care system had problems retaining gynecologists (question 8).			

Appendix I.2 Survey Participant Comments

The comments from each survey respondent are grouped together, separated by a blank line between respondents. Comments are provided verbatim, except that: (1) Potentially identifiable comments have been redacted and redactions are noted as such (2) Some typographic errors have been corrected, and (3) duplicate comments from a given respondent have been deleted.

- **Chief of Staff**

Walk in visits to PC are acceptable and the Urgent Care Clinic is available for emergent/urgent care needs between 8am and 8pm
"Streamline documentation processes (utilize scribes, dictation software), decrease amount of clinically insignificant alerts, staff in PACT team work to highest level of scope. The physician should not be a "secretary"
Medical issues that are not clinically meaningful/urgent can be delayed.
Need to focus on basics; special initiatives and programs are mandated without thought of impact on the field or the needs of Veterans. There is a disconnect between Central Office and the facilities providing the care
"As applicable for primary care
If for all services, up to 10%"
"Closure of intensive care unit, ED and decrease of surgical services available on site"
At the main campus

Not able to assess whether and to what extent such occurs
Unable to determine
Some authorizations are for care of a specified duration
Some authorizations include a sufficient timespan so that f/u encounters for that problem are included
Educational sessions

"Unable to determine with any level of confidence. 88% of patients are getting in within 30 days. Some of the remaining 12% may have experienced a clinically meaningful delay. On the chance that some small number may have experienced a clinically meaningful delay, we answered 1 - 10%."
"Need to expand one of our rural CBOCs to provide space for an additional PACT provider and staff.
Need to hire growth teams at the parent site and one CBOC
Additional resources for FEE basis staff will help fill gaps."
No show rates impact some clinics more than others.
"Section on hiring issues did not give the opportunity to address our real problem areas. Urology is a critical shortage and non-competitive salaries are the major driving factor. Psychiatrists are in very short supply. Salaries are currently competitive, but may get to the point where they are not if supply and demand continue to be out of balance in both public and private sectors."
VLER penetration rate is low but increasing. We expect to do much more sharing of records electronically in the future. When the two large local healthcare systems are part of VLER sharing will increase dramatically.
The consult is valid for 12 months

We use hot spots in a few locations
Patients from other VA facilities and/or home to Providers in [location redacted].
Also within the Primary Care at [location redacted] VA

Decrease amount of hours required of LIPs to complete mandatory training.
Access to care
Cable not run through entire facility due to the presence of asbestos

"We have the capacity and systems in place to assure new patient access to primary care. Although some sites are at capacity, alternate sites are available within a modest distance <15 miles."

We have added provider extenders (NPs and PAs) specifically to assure same day/next day access for needed care.

The lack of sufficient exam rooms makes it very difficult to have efficient speciallty clinic flow or to expand capacity even when we have providers. Inpatient bed flow is similarly impaired by the lack of single patient rooms. The difficulties in trying to assure coordination of care through NVCC and the Choice program is creating substantial additional workload on clinicians that diminishes efficiency.

"Varies depending on the scenario. If we know in advance that the care will span a period longer than 60D, we can authorize a longer period. However, we would not authorize an indefinite time frame."

"CBOC Wifi is needed. ALthough delayed, we finally had our facility wifi upgrade completed in 12/14. We did out own internal guest wifi for the main facility encompassing selected inpatient wards and waiting areas."

We use the VA teleradiology program as well as internal resources (e.g radiologists with access from home).

"As noted on earlier response, we also use our providers reading from home as well as VHA teleradiology. We are collaborating with other VISN facilitiese to create an internal VISN teleradiology program housed at our VA"

This is a high end estimate and it is only certain urgent ED and off tour inpatient studies (e.g. stroke code) that might require this.

A large portion of our Telehealth program (including the Regional telemental health program) is housed offsite co-located with a PTSD/TBI-focused RRTP.

Direct to home CVT

Off-site facility telehealth center

Veterans sometimes choose not to get their care at the VA and demand we pay for them. They also demand second opinions which puts us in an awkward situation

"NVCC authorizations are good for 90 days. So after 90 days, they need a new authorization."

cooperation of other major VA to provide consultation service in a timely manner

n/a

parent va

"Need competive hiring processes such as direct funding for interviews, use of Public Health Service, home buy out, higher salaries"

"Need ability to work with community providers and not necessarily go thru 3rd party admin for local fee, DoD, and native sharing agreements"

Clinical reminders and alerts are overwhelming staff

We purchase some primary care and we purchase a high amount of specialty care that we do not offer in house.

We offer care closer to home which results in purchased care and we do not offer many specialty services so we purchase them.

There are barriers to sharing records with non VA providers electronically for over a year tied to info security and back ground checks.

We authorize a period of care of 90 days with a number of visits within the period of care under one referral

"If patient needs additional visits beyond hte initial period of care, we amend the original to the end of the fiscal year for reconcilation."

VAMC has WIFI for med equipment only.

We have a full time radiologist for our outpatient facility. We send exams for remote reads when he is on leave for coverage.
We send to another VA in VISN and VA National Tele Radiology program.
We provide teleMH with services from Dom to CBOC; CBOC to CBOC; VAMC to CBOC; VAMC to [location redacted] site.

temporary loses of staff
Depends on the service and provider
National VA Tele-radiology services

We specify the number of visits allowed within a 90-day window. We use the same referral to add more visits if necessary.
"After 90 days, we request a second referral for additional care."

Specify number/duration of follow up in NVCC consult request
telegenomics is in[location redacted]
VAMC

"I would estimate that very few patients, if any, experienced a clinically meaningful delay. Veterans are given the option of receiving primary care in the community, if we cannot provide access within 30 days."
"Information technology revolves around security ONLY and not the needs of those caring for Veterans. We use slow, outdated, and underpowered equipment that is geared to care in the late 20th century and not the needs of caregivers in 2015 and beyond. There is no flexibility of use.
Central Office policies, although possibly well-intentioned, often fly in direct contrast to the needs of our Veterans or with requirements made for those at the facility level. The shear amount of documentation often dwarfs the actual time caring for the Veteran."
"The VA has been overrun with beaurocratic policies and oversight that often lays in direct contrast to access and quality of care needs of our Veterans. The idea that "if a little is good, much more must be better" is the standard operating procedure of the VA."
"Lack of inpatient beds
Ugent/Emergent Care"

home

particularly women Veterans with mammography based on VHA Directive
one referral will cover all EXPECTED visits for a given condition during a specified (EXPECTED) timeframe. these are not open ended and may require additional approval for UNEXPECTED number of visits/conditions

support the facility staff; leadership is leaving with substantial gaps

Space and lack of exam rooms is the primary barrier.
"While eligibility category is considered, the major focus is on clinical needs and acuity."
Difficult to get good data about non-VA wait times.

"One referral is used for an episode of care which may include multiple visits depending on the nature of the referral. As much as possible, additional services of visits are identified and approved in the intial referral."
"If the length of a course of therapy is known, we try and approve it as a whole. Where needed, separate 60 day authorizations may be used, but to the extent possible, one referral is used."
"Guest Wifi is available and installed in designated inpatient areas, waiting rooms, and cafeterias."
Only certain studies. Most are interpreted by on-call radiology staff
VA TeleRadiology Program as needed
We have a large telehealth center that is stationed at an offsite location that also houses a VA residential treatment program. It is not a CBOC.
Telehealth services to home
Off-site telehealth center co-located with a VA RRTP

increased space less fee for care...not veteran centric
space

dependent on services requested
primarily the primary VA medical center

"Prescriptive directives regarding required language to be documented, clinical reminders, informed consent documentation and discipline requirements."
Tertiary Care VA referral site has no access
"f/u appointments do not need a separate referral, but do require a second authorization review."
Methods are in place to bring the patient back in to the VA system if clinically appropriate.
home CVT
local VA

"Central office policies pertain to use of create date vs. desired date for new patients. A new patient may not want an appointment right away, particularly if they have previously been under the care of an outside provider.
Improved management relates to standardizing approaches for demand management across clinics."
"Improved IT relates to the scheduling system - there have been ongoing problems with selecting the correct desired date.
Changing central office policies refers to the many yearly clinical reminders that physicians need to clear even if a yearly appt is not otherwise necessary for the patient."
We focus on providing appointments to all Veterans who need care
"Prefer to bundle, but will question appropriateness for period longer than 60 days out"
Colon cancer and Diabetes clinics use telehealth for patient education
We have a speech language pathologist who provides care from [location redacted]
we provide clinical video telehealth to the home

depends on how consult is entered by physician and how it is approved.
based on review by the clinical chief

Unanticipated loss of providers at 2 CBOCS
"1. Need to be able to hire Physiciand- primary care and mental health -non competetive salaries, lack of efficient HR and contracting support are major impediments

2. Having adequate support staff- to answer phone calls and make scheduling changes
3. Easy to use scheduling software including options that allow Veterans to select and manage their own schedules- see commercial app"ZocDoc"; as an example
4. the process for using purchased care and the veterans choice options is deeply flawed and the contractor incapable of handling the needs"
"1. Reduce the lag time in hiring processes
2. Allow rentives etcapid implementation of locum contracts for temporary staffing
3. Improve the incentive process - repayment of educational debt, sign up incentives
4. Allow efficient staffing of front desk clerks and telephone call centers.
5. Multiple clinic rooms for effient throughput
6. VA policies to allow nurses etc to be more independent
7. Efficient scheduling software to allow for scrubbing and managing schedules
8. Higher graded clerical staff who can be trained to better interact with Veterans"
Loss of providers at 3 sites has required the remaing providers to take on their panels and limited the available capacity in the remaing providers
The PACT team has to function like a doctors office- where all but the essentila medical work is handled by other staff. Here the support staff have no incentive to support the doctor- just do the minimum work as listed in their PD or functional statements thansk to VA policies and labor agreements
Lack of capacity at the more complex sister Vas
Clical Urgency takes precedence
Sharing records is very difficult
Depends on the clinical situation- Usually for one visit unless its obvious that a follow up wil be needed
Depends on the situation

Fixed number of visits - depending on the need - specific time frame
Several of our PT providers located out of state and provide tele PT
We provide CVT to home and other NON VA locations

Where we have not had timely access we have utilized Non-VA care to provide
Need MDs and NPs to provide the care; Need PACT team support staff for team to function; Need equipment to make clinic rooms functional; Scheduling package wholly out dated and meets our needs poorly and is far from user friendly needs replacement critically; central office seems solely politically driven is not using best medical evidence to drive decisions on access and focuses on process not outcome measures; HR systems outdated and OPM rules cumbersome and limiting
"We have become a system driven by process measures which have cause and effect relationship to quality outcomes, there is little to no interest in getting input from those in the field; the bureaucracy from VISN upward needs "constant feeding" and adds next to no value and has grown 15-20 fold in 15 years; the last 6 years the VA seems to be solely guided by politics; The functional business unit is the facilities"

"LIP: Having more physicians and mid-levels are needed to see new patients in a more timely manner. Support personnel: Need PACT specific support personnel and other non-PACT hospital/clinical support such as pharmacists, techs, phlebotomists, clerks.
IT: A new scheduling package is important to help ensure appropriate scheduling and the EHR would be improved by having modern abilities for automation.
Central Office Policies: Policies get pushed down from Central Office that are often more mandates than guidelines and recommendations without field input or sufficient consideration for clinical repercussions."

"LIP: Having more physicians and mid-levels are needed to see new patients in a more timely manner.
Support personnel: Need PACT specific support personnel and other non-PACT hospital/clinical support
such as pharmacists, techs, phlebotomists, clerks.
IT: A new scheduling package is important to help ensure appropriate scheduling and the EHR would be
improved by having modern abilities for automation.
Central Office Policies: Policies get pushed down from Central Office that are often more mandates than
guidelines and recommendations without field input or sufficient consideration for clinical
repercussions."
"No, our local guidelines are that the NVCC request state a timeframe for all necessary follow-up care.
e.g. referral for broken leg with 5 visits and necessary associated care for the next 2 months."
"No, our local guidelines are that the NVCC request state a timeframe for all necessary follow-up care.
e.g. referral for broken leg with 5 visits and necessary associated care for the next 2 months."
"Tele-radiology services will start for weekend coverage in our facility as of July 1st, 2015."
Not sure this question makes sense to us. Each CBOC has different providers who provide tele-health
services.

"We offer all patients who enroll, same day PC appointments. Patient scheduled only if they decline
same day"
"Depends, some reerrals are eval and some are eval and treat"
"Again, depends on the condition and referring providers concerns, documentation and nature of
request"

Too many alerts
Complex care
Patient satisfaction data from SAIL
Re-consult for ongoing care past 6 months
Telework

AGILE HR SERVICES AND PROCESSES!
THE PROLIFERATION OF COMPETING/SUPERFLUOUS/OVERLAPPING POLICIES BROUGHT FORTH BY CO
AND PGM OFFICES NEGATIVELY IMPACTS TIMELINESS AND QUALITY OF PATIENT CARE
"One referral will cover all related visits to this specialist WITHIN THE LENGTH OF TIME ALLOWABLE FOR
THE AUTHORIZATION, typically 60 days, and providing that the number of related visits requested is
evidence based."
a separate referral will be needed after 60 days for further visits

"Better access to gap providers when urgent need arises, i.e., VA locums or related. It is taking way too
long to get new hires for backfilled positions on board."
"Provider education re use of other VA facilities not uniformly good at this time; also, regional VA
partners will occasionally indicate their inability to see patients even though they have the services"

"Increased access by expanding space, practitioners and support staff including clerks and nursing.
Telehealth here is doing well although primary Tele-health is just starting. A reliable system of note
dictation is crucial since enormous time is spent typing. Supervision of timely scheduling is very
important. I believe that "fee" care for primary care services is to be avoided if possible since the model
of delivery that is a hallmark of VHA quality cannot be assured under these circumstances."
Issues for new appointments less critical although the time saved by good record creation would also be
an issue here. Current weekend and night hours are poorly attended by Veterans.

Follow-up care is rarely delayed.

Scheduling rules do not always allow clerks to meet Veteran needs. Excessive educational requirements subtract from time with Vets.

VCL offered to Vets based upon distance or access. For access rarely accepted. Otherwise it is for services we do not do.

The local health care system cannot make those judgments.

We are looking at the average time. Data should be collected but it is not.

"Referral includes the number of visits necessary, procedures and post procedure visits for up to six months."

will need another referral if is past 6 months. Facility is capable of follow-up.

"Wireless internet access available in one CBOC. However, access meant for Vets and families and not staff."

Nighttime coverage outside this Admin. Parent.

STAT readings

Data sent to Veteran's outpatient PCP

Clinical space for efficient flow is an issue. Providers are not assigned multiple rooms for efficient patient flow

Maternity Care isnot done at VA medical centers. Space needs at the medical center prevent expansion of services locally

If a service connected veteran cannot be scheduled in a timely manner then this is brought to the attention of MAS and clincal supervisors in the area and resolved.

One referral will cover related visits for a period of 60 days

Authorization will be extended for the required time frame.

less than 5% but all are re-read by our radiologist

We are now starting CVT in the home. largest CVT is in MH

and Main VA hospital

VA interpretation of OPM rules constrain our ability to hire staff at salaries that are competitive with our private sector competition. We cannot hire health techs since they were downgraded to GS5. HR has been decimated by downgrades and cannot hire the VACAA positions we were designated to receive.

We have 650 positions stuck in the hiring queue

"Scheduling package: see Jon Stewart

We have 1985 tools to manage our systems of care. VACO imposes reporting criteria that make it difficult to schedule, but facilitate their reporting of our scheduling."

We prioritize almost exclusively based on medical need.

All of our teleradiology reads are overread the following morning. THe only official reads are VA reads. We use teleradiology for emergencies at night

"Ability to recruit and retain physicians is a huge problem. VA pay for providers has not kept track with what has been available in our area. Additionally, once we get good providers in place, in unending bureaucracy, difficulty dealing with non-productive clerical staff, and burdensome clinical reminders leads them to consider other jobs. Too many of our provider hires consider the VA at "temporary"; job until something better comes along or they can move to another area. For the most part, we have the appropriate number of support personnel, but maintaining those with a good work ethic is difficult and getting rid of those who are unproductive is even more difficult. Equipment procurement and contracting are extremely difficult to navigate, making new purchases a challenge. Central Office's

requirements, while noble, fail to take in to account the current status of non-VA health care systems across the country. Mandating 30 day evaluations for the VA when most clinicians in our area can't accommodate similar requests is unreasonable. Patients that we send out via Choice are rarely seen any sooner than we could see them in our facility."

Issues are similar to those expressed in previous section. I would add that the VA scheduling program is extremely outdated and very user unfriendly.

Approval will typically cover initial visit and necessary follow-up visits.

question makes no sense; what is the denominator?

not sure about last question

home or on college campus as part of VITAL program

"Information management - need updated EMR

h. change pay to incentivize productions, also change Title 38 leave to be used hourly.

j. administrative burden"

Generally panel specific--as a composite we do not have delays.

Overall administrative burden is out of control.

limited local specialty care

"Limited specialty care.

Serve large population."

Will structure based on episode of care

Home/telework

home/telework

"Currently Home Telehealth and Home TeleMOVE combined have over 500 patients. 1 Lead RN, 4 RNs and 2.2 RDs."

"RDs are stationed out of Medical Center,(telework from home). 3 RNs are at CBOCs (telwork from home). 2 RNS stated at Medical Center (telework from home). The RNs are assigned to specific PACT teams with geographical location kept in mind when assigning."

"1. In [location redacted], space is one of our most critical needs. It has been very difficult to obtain space in a timely manner due to the incredibly cumbersome contracting process.

2. VHA contracting policies/practices must be redesigned to be more user friendly, efficient and timely. This is one of our biggest barriers to providing timely care.

3. The rules/regulations around Non-VA care must be simplified and the process must be streamlined if we are to ever be successful in obtaining care in the community.

4. [Location redacted] is in the process of reorganizing our services into product lines to have higher accountability from mid-level supervisors."

"See comments on prior section - many relate to established pts as well. In addition:

1. We have hired many new providers. We just need to get their panels up to capacity which takes some time.

2. We must continue to aggressively hire the support staff that helps compose the rest of the primary care team.

3. We will never be successful if we continue to expect some of our lowest graded (entry level) employees to use an antiquated, overly complex scheduling system. We need a new system asap or we are setting ourselves up for failure."

"1. The current volume of suspenses, reports, etc. coming from VHA is untenable. Many of our leaders spend great amounts of time completing these and then never receive feedback. For example, we just

---

completed the bi-annual Uniformed Mental Health Services survey - nearly 600 questions that we will never see the results of and that will not help us improve.
2. We burden our providers with administrative tasks that are either not-value-added OR that could be done by someone else."
1. [Location redacted] is reportedly the largest user of Non-VA care in the U.S.
"We have allowed for longer timeframes, but not unlimited."
only VA issued equipment are allowed on the wifi. patients do not have access to the system.
I'm not 100% certain about this.
"we use telehealth/teleconsultation with other VAs. For example, Tele-genomics with Salt Lake City."

Under this last question would include significant TMS requirements especially a flood of new requirements recently that are taking providers out of patient care to complete
Lack of appointment availability in [location redacted]
Veteran priority/SC are considered sometimes when scheduling surgery appointments. These issues do not affect clinic appointments
Usually all visits will be covered within a specified global period.
"Visits outside the global period are reviewed and normally authorized on the same consult. Sometimes another consult is required depending upon the situation, time since last appointment, how far outside the global period the requested appointment is"
Also weekends and holidays
Home telehealth (other than monitoring) or telehealth for Alaska

"For surgical cases, as described above, the pt would be covered under global period for 90 days for all visits and would not require an additional referral. For physical therapy, a certain number of visits are authorized on a single request. For follow-up visits not within the scope of the initial referral, an additional consult would be required. Short answer, it depends on the service and whether or not multiple visits are required to provide the service"
See previous response
At a referring facility or at home

More flexibility at Medical Center level to solve problems.
Provider turnover - note the difference between services we normally would provide to those that we would not.
One referral to provide all clinically indicated services.

one referral will cover all related visits within the designated timeframe.
they would need a subsequent referral for the extended time frame

systems redesign
systems redesign
one referral with time limit on approval
one referral with approval for increased timeframe

Veteran gaming the system

PC has a 1-2 day wait time.
Need to work on cultural transformation in some clinics.
Compassionate care when distance is involved or end of life are.

We share images from radiology with outside providers when appropriate. We routine use data on wait times.

Change VA primary care model staffing similar to Kaiser.
Fully staff PACT and get people work at top of license.
Excessive clinical reminders. Too much typing.

"If Veteran is frail and condition requires frequent visits to medical center may refer to fee basis to avoid undue stress to vet, at times a second opinion is sometimes requested and is not readily available at another VA"
"1% of the CVT encounters by provider are conducted by Geneticist out of network located in Salt-Lake City, UT.
1% of the CVT encounters by provider are also conducted by SCI providers outside our network."
"1% of TH patients outside our network are seen by Spinal Cord Injury providers in EOVAMC.
3% of TH patients are seen via ?Video to Home(CVT)? which precludes the patient from presenting at a CBOC or VAMC and instead present in the comfort of their homes."

Home

We allow walk-in appointments and we have an ED for patients to use.
"We only have one exam room per PCC MD. This makes patient flow inefficient. We have a shortage of Primary Care MD/DOs. Our scheduling system is poor and makes us spend too much time trying to justify mistakes. Telehealth is something we have begun to use, but it requires more space. The number of clinical reminders is too large, thus making it difficult to address all issues in the allotted appointment time.We have not found weekend clinics to be used by Veterans. The difficulty in receiving information from outside venders is an ongoing problem."
We unexpectedly lost providers and have been detailing providers from other sections to help cover.
We do not have a neurosurgeon and we just recently hired our second ortho doc.
One provider works from home.

"Delays have resulted only when a miscommunication has occurred and a pattern is that the patient themself has contributed. At this facility, there has been a minimum of clinically meaningful delays."
"1. Create additional space for patient care:
Primary care providers at [location redacted] are limited as they must perform all activities and a single examination room. Flow of busy clinics is enhanced by increasing the number of available clinic once per provider. 2 exam rooms per provider would greatly facilitate workload. Note as well that mandatory assignment of full large rooms for supportive staff seems wasteful. Smaller cubical type environments would likely suffice for nursing intakes and nursing clinic visits.
The strengths of this largely rural facility are in its outpatient venues with the exception of some areas where strengths should be maximized (orthopedic surgery program). Maximization of outpatient capabilities will be more effectively and efficiently utilize the resources available. His facilities greatest vulnerability as its inpatient acute care service and it is quite difficult to higher skilled hospitalist and intensivist and emergency department physicians. Additional inpatient beds are therefore not currently warranted.
2. Increase the number of licensed independent practitioners:
[Location redacted] Health Care System resides primarily in the [location redacted]. The geographic isolation of this area influences the availability of care. Hiring young professionals into our city and county is difficult. Private sector resources are also limited. Many specialties are served by monopolies.

Inpatient hospitalist coverage and outpatient primary care provider coverage are limited and additional providers in these venues would be greatly valued. Specialty care in urology is a huge challenge. Other specialties such as general surgery are currently meeting demand. Both physician assistant and nurse practitioner resources would be evaluated as well. Mental health support/psychologists and psychiatrists is a huge needed.

3. Increase the number of other personnel:

Pharmacist support is lacking. The sophistication of medications and especially psychotropic medications is often beyond the vernacular of primary care providers and the expertise of pharmacist availability would be greatly valued. Current requirements for medication reconciliation, oversight of psychotropic medications, use of hepatitis C therapies and other venues require on the spot expertise that has become outside the usual fund of knowledge for physicians. The quality of care can only increase by optimizing pharmacist support. Clerical support is very lacking. The entry nature of the position of a clerk, particularly a clerk assigned to scheduling, results in rapid transitions. The expertise of an individual in a clerical roll is therefore quickly lost. Additionally the scheduling software, ancillary tasks assigned by auditing agencies and the need for data extraction frequently overwhelmed these personnel. Centralizing clerical services appears to be a favorable influence however functional interactions between clerical services and clinical services is not occurring as is standard.

4. Acquire and/or improve availability of equipment:

This is a more difficult question to answer. Budgetary constraints often truncate the wish was to this facility however I respect the organizations prioritization of equipment that contributes to patient care. Acquisitions are encumbered by contracting and processes are quite challenging.

5. Implement or increase the availability until a health services:

Telemedicine and tele-health are exceptional attributes of the VA. Growth of this modality is in the organization?s best interest. Telemedicine can provide backup for absent providers and reach Veteran patients in remote locations. Specialty care not available locally is accessed and distant resources.

6. Improve information technology:

This cannot be answered quickly. Scheduling software is defective antiquated inefficient non-intuitive. The methodology by which electron a size data is extracted requires a substrate of clinic in location definitions that is also overwhelmingly confusing and, because of its complexity, often misused. It appears that the priority is the VERA capitation model. The entire system is built on a Foundation that collecting capitation data is optimized. Clinical data is de-prioritized to the top of the pyramid. Rather than starting out with the clinical report and extracting encounter data and other data from the clinical information, the current system asks that the encounter location and definition either platform upon which the clinical information is built. This inversion of priorities as a basic programming assumption results in a lack of understanding throughout the system. CPRS, the actual EMR, is user-friendly in many ways that normal gallop is are not. It allows speech to text input. It is moldable. It is not however standardized and in position of some standardization would help. Short staffing of IT and helpfullness of IT are extraordinarily poor. There is poor attitude in the IT staff there is a lack of willingness to facilitate the organization omission and there is a sense of self abuse and punishment imposed from outside. It is difficult to describe the frustration of day-to-day computer and software dysfunction. It is even more difficult to realize that they help available from information technology is essentially absent most of the time.

7. Change central office policies that affect work flow and efficiency:

Central office policies are often a "one size fits all" mandate that does not match the needs of any specific facility but represents a lowest common denominator of expectation. Mandated programs such as the women"

See answers already submitted in earlier question.

"Followup has been more challenging than an initial appointment. Particularly in CBOCs, support personnel are limited. Providers themselves have demonstrated lack of flexibility to facilitating scheduling. Clerical behavior has also been in obstruction. Clinically meaningful delay does occur more often with followup visits then with an initial appointment."

Requirements imposed by off as an inspector general are many times opaque to the providers that must comply. For example documentation that the patient understands the instructions regarding flouroquinolone administration is a requirement that has been emphasized to the point of ridiculousness. The history of many requirements he is obscure and the rationalization has been lost

Limited resources available on station. Geographic isolation of our location. These factors for small business out to the private sector.

A multitude of reasons exist. Travel difficulties for veterans who are not qualified for travel reimbursement is an issue.

Data regarding her patient's electronically with private sector providers is a huge handicap to the care of patient's. The over-prioritization of privacy restrictions hamstrings our ability to share vital information with outside hospitals and providers.

"Generally speaking, non-VA coordinated care is managed our facility by optimizing the likelihood that additional referrals will not be needed."

"Generally speaking

Episodes of care require additional referrals. Cases that span extraordinarily long times are discussed on a daily basis for decision-making purposes."

Wireless has been handicapped by privacy issues. General availability of wireless is not present. It is difficult to access the Internet in this facility.

Use of NTP has been extremely common in this facility.

Some of this utilization has been the discretion of the radiology service and less autonomy in this decision-making is anticipated.

Tele-health services are also provided by specialists are station to patient's at the facility/administrative parent.

At the main facility/administrator parent

"Need locum tenems capability or gap/surge providers when providers are out or leave. Also, increase retention incentives to minimize turnover"

Loss of providers often leads to delay in follow-up appointments that rely on a patient's interpretation of clinically meaningful as they have walkin availability but often don't utilize it.

one referral but authorization will be updated based on clinical review of request from non va provider. new but related followup managed for up to 1 year on same referral.

Provider at home.

patient at home

Eliminate the arbitrarily set expectation that patients must receive an appointment within 30 days of the clinically indicated date. It has no clinical relevance.

eliminate unnecessary clinical reminders that have no clinical relevance.

"A specific clinical service is not available, or vacancies exist that contribute to delays.l"

We have access to some non-VA provider's electronic record portals

For Veterans Choice One referral covers all related visits up to 60 days. A reevaluation is then completed to determine the need for further care.

probably 11-20% of the time

ED diversion due to full inpatient beds
one referral covers all related visits within a specific timeframe

Use of Contract Providers and Locums Tenems; expand affiliation with local PA Schools
Too many View Alerts with limited clinical value added
"one referral will cover all related visits within a stipulated timeframe, eg 3 visits in 6months"
additional referrals are required for services to be rendered that will involves other diagnostic and
therapeutic interventions
at the Parent facility with satellite offices in the CBOC

"The system is perfectly designed to get the results it achieves.
Serious IT interface issues, network speed, built space layout issues, training and competency issues for
non-physician and physician staff, ineffective staffing on PACT's (why LPN, RN and clerk....was the old
physician with 3 MA's and an RN case manager, Pharm D and APN to cover 1100-1500 in a panel so
bad?) Also....illness and complexity of patients in panels not considered in staffing. No consideration for
standardized work and real competency on the teams. A 85K a year RN answering phones is a waste of
personnel. And if a physician does not have three exam rooms and a mobile computer, how do you ever
expect them to see more than 8 -9 a day. I would invite anyone who thinks they can do it, rather than
pontificating on the merits of PACT or PCMH within the VA to come down and try it out for themselves.
PACT can work, but it is a fignewton of the imagination in it's current structure. Almost no VA's have the
full elements that were found in the Commonwealth Fund article to be needed to make PACT really
work. You can get mad at Dr. Stark, bit no one is listening to the 49% of providers that are burnt out or
the front lines. The plan forward is to make the VA physician led on PACT's. Providers are paid a
capitated amount based on quality, panel size and disease severity, access and patient satisfaction and
total costs of care. Providers can earn more by practicing better medicine and getting larger panels. Pay
issues are self correcting. Providers select their team members who are also incentivized to share in the
success of the team. Team members who do not perform can be replaced if they cannot produce to the
level of care that is needed. Providers, must however, work with HR to help replenish team members
that are lost. The Union should be the fiduciary owner of worker quality. The new bargaining
agreement should include FTE hiring and incentive pay plans based on achieving certain value based
metrics for outcomes in quality, cost of care, patient satisfaction, access and overall health of the
population."
"Political pressure by local politicians to do so, especially in [location redacted]. DAV is telling veterans
they can go wherever they want due to the new ACT. We try to explain the ACT politely and accurately
but there is little willingness to listen as this is not reinforced in political offices which have even turned
us over to the press when the answer has not pleased the veteran."
"This would be considered unethical from a medical perspective. In reality, it creates a caste system in
the VA and breeds disrespect on both sides, high ranking and low ranking. Either give everyone the
same benefits or don't give benefits at all. On no planet is this even remotely ethical."
We do this with the new VCL program and they are waiting in general significantly more than within the
VA. Forget trying to find a new PCP in the community.
There is usually a limit but we try to cover the entire episode of care or one year whichever is most
appropriate.
"They might, but usually this does not happen. Globals cover the surgery and global period. Outside of
the global period, the surgeon usually just calls and requests and we approve. It was being gamed a bit
in the past so this is why the re-referral."

establish a pool of primary care provider to cover new or existing positions

it depends

"For patients that cannot be scheduled quickly, we make telephone contact with each one to ensure that no urgent need exists (i.e., a delay would be clinically meaningful). If one exists, they are seen immediately. Otherwise they are given a true choice - wait for PCP or use Choice for the community options. Almost all choose to wait."

"At 90 days we can see all returning patients. 30-day timeframe is a little tighter with their own provider. However, if there is an urgent need, they will be seen by someone, but perhaps not their own PCP."

"There are many activities that to a clinician are considered clerical, but somehow are defined as clinical by others (arranging travel, facilitating procurement of OTC prosthetic items like socks). There is a fair amount of required training with no medical value that negatively impacts access. We manage our no-show rates by appropriate overbooking once we hit the lowest rate we can, so that is not actually a problem. CPRS inefficiencies, including documentation requirements for regulatory and not medical reasons, definitely lowers productivity (I have a list of these if anyone asks)."

"[Location redacted] is unique in that we have > 100,000 enrolled veterans [informationr edacted] but no inpatient facilities, so ALL tertiary care must be bought in the community. This will change very shortly (2015) with the activation of our new/first hospital. Even so, over the last 5 years we have been steadily increasnig the complexity and capacity of the care we can provide as an outpatient facility (e.g. 450 surgeries per month, advanced endoscopy)"

"As stated before, [name redacted] is huge [redacted]). Geographically, we live in a veteran-dense area, so < 1% of our veterans live more than 40 miles from any facility. It is solely a question of having a limited portfolio, and as we activate our hospital in the next 6 months, we will be able to bring much more care into the system; we expect our community reliance to drop by at least half."

"We triage by medical necessity. Having said that, we have never had the situation where we would need to "bump"; one veteran at the expense of another; all receive the care they need in a timely fashion, either internally or through one of the purchased care mechanisms."

"For electronic sharing, we have a va-employed hospitalist team at a local hospital for up to 30 admitted patients and can see their electronic record, but no one else's (and we fee out $140M per year, so this is the minority). We do track wait times through NVCC-managed care, and the community is in many ways worse than we are. Choice-ACT/VCL care is much harder to track, and we review that as well; again, the VA does at least as well as the community in the things we do offer. Many patients have asked to cancel their VCL-appointments when the realize the VA may actually see them sooner. We have much better overall control of care through NVCC, though, and will make sure patients are seen when they medically need to be."

"Depends on the indication. For some things we know in advance will require comprehensive care (multidisciplinary cancer treatment, e.g.), we attempt to authorize the entire episode up front. For specific surgeries, e.g., we authorize the post-op visits and rehab, but additional care will need additional review."

"As before. We try to anticipate the length of the episode of care needed to address a problem completely and preauthorize it. Sometimes we guess wrong and the veterans do need additional authorizations for a single issue, but this is rare in our system."

"This is an evolving topic. In two of our OPC's and our hospital, WiFi is available. It is not yet available in 4 of our CBOCs, but there is a firm plan to implement it."

"We are an outpatient-only facility at this time, but we do use remote reading when appropriate, either among our own sites and through the national VA telerads contract (who does much of their work overnight)."

As previously described in question 15.

"We use the national telerads program to cover unanticipated absences and manage variability in radiology supply. [redacted] Our goal is to have the majority of our studies read by our own physicians, even if at different sites, and use teleradiology for a small amount to smooth out demand / supply."

"We use telemedicine extensively in a provider-patient modality (including with patients who are abroad), and for selected clinics with provider-provider modality for access to specialists as listed above."

We have no hospital; but we have three very large OPC

"We have no hospital in our system.

Our 3 very large OPC's support each other, but the majority of that support is directed at CBOC's which have fewer specialists or even primary providers. A small amount of our patients receive telecare directly outside of a VA facility."

"Keep in mind that we have > 100,000 patients enrolled, so even with the same % of adoption, we will also have one of the largest absolute number of enrollees."

We maintain a high absolute number of patients enrolled because of our innately large patient base.

"The number of clinical reminders, performance measures have ballooned since Kyser's initial items to where there are over 300+ measures. Also requirements for encounter completion, adds workload to providers which from the patient's prospective would not be value added. Also direct enter of progress notes with out facilitated technologies greatly limit our primary care and specialty care providers to numbers of patients that can be seen in comparison to private practice providers."

"Authorizations are specific to type of care that is requested, some consults cover a whole episode of care with associated procedures (e.g. Hemodialysis 3 times a week; Nephrologist office visits 2-3 times a month; Temporary catheter if indicated, monthly labs, AV fistula or graft if indicated, to include venous mapping, revision of fistula/graft, post imaging, shunt replacements/revisions certification period 10/01/14-09/30/15). Other authorizations specify evaluations with requirement for present recommendations pre-authorized care (e.g. Veteran is approved to be outsourced to neurosurgeon for evaluation and treatment recommendations for lumbar disc prolapse with radiculopaty. All labs, radiology exams, physical therapy and durable medical equipment are to be requested through the additional COS consult for pre-authorization. Review of administrative eligibility has been completed.)"

"Care is outlined in authorization, with when to re-contact facility for additional authorization, (e.g. Veteran is approved to be outsourced to community urologist for cystscopy for evaluation of hematuria, also approved is one UA with cytology, follow-up office visit to discuss findings. All pathology slides positive for malignancy must be sent to Veterans Healthcare System [location redacted]. Review of administrative eligibility has been completed.)"

"There is Wi-Fi at main facility for medical instruments, VA lap tops, but there is no access available currently for private use of staff or Veterans and visitors."

VISN with contract radiology providers.

Just a guess

Tele retinal reading for store and forward

Tele-Health program is supervised by ACOS of primary care. Most of the Tele-Health staff are located at the Medical Center a few in larger CBOC

I am not aware of any untoward events in this arena.

Vista appointment sytem should be replaced with off the shelf product. very old and complex. CPRS needs to be either refurbished on the user interface or be repalced.

"This varies based on volume, inpatient capability, overall lack of supportive resources throughout the enterprise."

Lack of resources.

This is performed by PC-3 they provide dashboard data.

Defined number of vists and scope of care are given. We can always add or subtract additional visits based on the Veterans needs.

Some may go during the normal work hours based on demand.

New PC appointments scheduled between 91 and 120 Days = 13.38 % and PC appointments scheduled > 120 Days =10.51% based on the Veterans Preferred Date

Established PC appointments > 90 Days = 15.58% and Established PC appointments > 120 Days = 5.23% based on the Veterans Preferred Date

"[Location redacted] VAMC utilizes a high percentage of NVCC, Choice, and PC3, as a level 3 facility much of our specialty services are fee-basis or contracted care"

"The items marked "a lot" are common themes in provider feedback provided to the facility, and are a significant hindrance to providers attempting to deliver care"

Patients feel entitled to non-VA care and demand we fund it.

"We consider priority in new patient evaluations (in primary care), otherwise not"

Word of mouth is that veterans wait significantly longer for care in the private sector.

"We authorize an "episode of care". This is typically one visit, but sometimes more depending on the service required (eg. surgery will authorize a follow-up visit along with the surgery itself)"

"I believe our timeframe is 90 days. If it requires more than 90 days to complete the episode of care, we require a separate consult/auth"

Nights and weekends

NTP program

"Surgical post-ops and some pre-ops can be done via CVT technology.

TBI requires face-to-face evaluation."

"We primarily use telehealth from the parent. Occasionally, one CBOC helps another. We are investigating the possibility of some care from remote areas (interstate)"

"The only patients at the main facility (for CVT) are ones receiving services from another main facility (spoke and hub, where hub reaches out to us)"

One referral will cover related visits to this specialist regardless of timeframe unless it crosses fiscal years and then a new consult is required.

nothing to add

one referral will cover all related visits within a given timeframe

for VA devices

No cases have been identified indicating that patients experienced a clinically meaningful delay but it is plausible that that may have occurred.

"Though no adverse outcome has been identified, delay and lack of continuity of care has occurred due to vacancies and Provider turnover."

Referral sites may not be able to provide timely access to specialty care (depending on the specialty).

"It depends on the reason for referral. Evaluation and recommendations only or evaluation and treatment or evaluation treatment and follow up. If recommendation is made for further follow up, then it is approved by adding an addendum (separate referral is not needed)"

This also depends on the reason for referral. We try to get patients back to the VA system. If needed we authorize for further nonva care.

"For MRI and Nuclear medicine tests, as well as for STAT requests when staff radiologist is not available."
Utilize CVT into the Veterans home

Requests for fee care are reviewed on an occasional basis to accommodate special circumstances. We also get pressured to approve fee care by our Congressional folks in area
Dependent on the condition being requested on the referral. Some will automatically include other visits for the management of the care
Most likely one referral will cover the related condition and the approval will be added to the consult

We need to be able to shift funds between the 3 major appropirations.

depending on the clinical necessity
depending on clinical necessity and travel distance
NTP MOU
at parent facility also

"Our facility needs more space for primary care, better incentives and pay to recruit and retain high quality providers (loss of retention pay 2 years ago is difficult), and authority to increase the number of primary care teamlets to make our growth in uniques (there is a horrible lag in this regard, meaning that we only add teamlets when we've gone beyond capacity)."
Referrals are authorized for specific care delineated within the authorization for NVC. Timelines are rarely given to providers that state how much time they have to complete that care.
We would love to have this but it is simply not affordable based on our current local budget.
We use the another facility in our network on occasion and use NTP every day for after hours work that needs a STAT reading.
Other locations is medical genetic consults at SLC.

[Location redacted] is trending in the right direction
"Under primary care provider retention, View Alerts are the biggest reason for provider burn-out. A primary care provider will receive approximately 100+ View Alerts per day. A large part of the view alerts involve either esoteric clinically irrelevant information or alerts sent to multiple individuals leaving the primary care physician with the burden of determining who may have already taken action on a certain alert. [Location redacted] VAMC has done
all it can within the current flexibilities of CPRS to decrease the view alert burden. Facilities must acquire additional authorities to locally modify CPRS such that primary care providers can focus their efforts on those alerts that they must take action on. Under "other solutions", primary care providers must provide pain management to medically complex patients with significant psycho-social issues. Under the Opioid Safety Initiative (OSI), primary care physicians must offer alternatives to narcotics, which does not easily lend itself to a 30-minute appointment. TMS pain management education modules give interesting but operationally impractical information. I propose that VHA fund one pain management specialist for each Patient Aligned Care Team (PACT).
Under "central office policies", Facilities must obtain the authority to hire, fire, and promote on the spot with minimal interference from federal statutes or VHA policy."
"See comments under "new patients""
[Location redacted] is trending in the right direction.

"[Location redacted] VAMC is working to change the culture towards improving the above. However, VACO can assist with the following:

1. Eliminate administrative burdens such as the verbal consent requirement for HIV testing. The private sector does not do this.

2. Increase authorities for facilities to modify CPRS.

3. Enable facilities to hire, fire, and promote personnel on the spot with minimal interference from federal statutes or VHA policy. This will go far in changing the culture and increasing morale."

Varies among specialties

Veteran eligibility for NVCC is determined prior to appointment being made. COS approves all exceptions to eligibility.

[Location redacted] VAMC must scan in records from the private sector into Vista.

"Generally, non-VA care will authorize a limited number of visits with a specific provider. However, if the conditions require other services such as diagnostic studies or treatment modalities (eg: physical therapy, prosthetics, etc), then VA must submit an additional referral."

"If beyond 60 days, VA requires a referral to cover the additional 60 days."

"Remote by an outside vendor takes place every night, weekend, and holiday."

"For diabetes, [location redacted] VAMC will implement "downloadable"; glucometers so primary care providers can improve diabetic control."

"equipment-just BP cuffs, ekg machines, etc

EHR: information needed is not at point of care. I would like to have information on which patients had recent med changes, specialty recommendations.

Policies/procedures. The return to clinic mandatory electronicordering as per VISN [location redacted] has created difficulty in workflow. the provider gets the order in sometimes after the patient leaves, so the scheduling is not face to face.

Med recon is hard to implement. It is 1 more task on the providers. There should be a way for the patient to enter his meds and flag any questions or concerns for review with the provider.

A standard intake form electronically that would populate the provider note would really help. The veteran could enter his fall data, med changes, med questions and it would pull into doc note. The specialist recommendations would pull in. Then patient education material could be automatically printed (on fall recuction, medication side effects) for the provider to review with the veteran."

"see previous question response.

Also, realign clerical and nsg staff under PACT to decrease silos."

"The COS and nursing office often has to make up for inefficiencies and poor performance in the business office and HR, leading to loss of focus on access. Our AA to the COS spends most of her time on HR. Which is ironic, since we have only hired 10 VACAA positions so far, of which 5 were internal hires, and only 1 is a provider. There is a lot of time spent with little seen for the effort."

lack of inpatient mental health and medicine/ICU beds

"we are moving toward 1 referral (example: orthopedic surgery will have a preop visit, surgery and PT)"

If over 90 days per the NVCC staff

VA contract

Home

At parent facility

"Need more nurses and clerical staff.

Our scheduling software is archaic and is not flexible enough to accommodate the types and complexities of appointments.

The access standards are inflexible and "one size fits all". Expectations are often unrealistic.

Physician/provider compensation is not aligned with access and productivity. Incentives do not adequately reward high performers."
"Documentation requirements are excessive and sometimes comical.
Other comments same as in previous section"
"We used a contract, but transitioned to a VA contract in past year or thereabouts"

"Depends on the referral; for example, surgical oncology would be approved for a pre-op visit, the surgery, and a specified number of post-op visits over a year"
"Depends on the specialty, but generally would be approved for a certain number of visits over a certain period of time"
CVT to home

Provider works from home

At another VA providing telehealth consultation not at our location
Patients to receive these services at home

urgency not able to be accomodated
only in EWL are these things considered per policy
"it depends on what is approved. sometimes follow up is approved on initial authorization, sometimes not"
it depends on the authorization
the NTP system has been a game-changer
NTP
at the main site

"We have significant space issues. We have turned providers away because of lack of space. It takes far to long to obtain space.
Everyone thinks to hire the doc, but truly the doc can be far more efficient with support staff. We need more nurses and techs.
Every year we have equipment needs that get placed to the bottom of the list. I need new OR lights, all defibrillators are at end of life. I could use 5 million more surgical instruments.
surgical complexity requirements are too restrictive on smaller, rural facilities.
The NVCC process is difficult at best. Far to many requirements and steps. It just creates barriers to care."
see other responses
"Providers approving eye glasses and all sorts of prosthetic items, Nurses can play a larger role, the electronic records makes things more difficult especially with scanning etc.
Consult process is cumbersome. Would be great to have support staff assist in process.
The alert process is difficult for providers.
Providers required to do the coding pieces.
Too many clinics-- required do to copays, billable, non billable, Inpt clinics now.
CPRS has become admin record and not a clinical record."
lack of space to hire specialists Too many restrictions to keep a provider competent
"This is not usually needed, our wait times are not clinically excessive."
another VA facility
Indian Health reservation

"Administrative burden including inordinate amount of clinical reminders, view alerts, suspenses, metrics requires large amount of administrative time that could be better used to see patients"
We try to approve all visits with one referral but does not happen consistently
One telehealth psychiatrist works in Minnesota but is on staff here.
Main facility

Can authorize several visits and then extend if needed
not really sure on this one. Some of the patients are at one of our CBOCs while others are at the main facility
currently in [location redacted]

VACO policies are contributing to the problem. Please let us do our job.
Veterans requiring obstetric care are covered by a single referral
We've not had an issue takinig care of these patients in-house
"If you's stop asking mind-numbingly stupid questions, we could get on with real work"

May require separate approval if a procedure is recommended after consultation.
Done on case by case basis as clinically indicated.
There is wireless internet but it can only be accessed via VA devices.
Tele-retinal cameras are in CBOCs where images are acquired and then forwarded to another facility in the VISN for interpretation.

"most troublesome admin barriers are leasing delays, no space's poor flow
hiring barriers"
uncertain the projected impact of the CARE program.
home

Too many non clinical requirements take away time from meaningful and value added Veteran care expereience and timely acces for Veterans

Lack of availability of timely care from neighboring tertiary care VA facilities - esp. since the close tracking of timely acces to care

Is based on clinical needs.

"All outpatient visists can be on one referral

Inpatient care requests need another referral and authorization accoding to CBO

In the example above, if the Veteran needs an inaptient stay following operative fixation, then he needs another authorization - significantly adds to admin workload and at times scrambing to avoid delays in care for Veterans"

Home

Lack of space to expand services. Lack of support staff to schedule.

Expect that emergent/urgent care needs would be prioritized by clinical staff without delay.

Same as prior answer

"Fee basis is growing rapidly as system and expectations change. However, the vast majority of care is still being delivered in VA."

Usually for specialized services that VA does not provide

within reason. Additional referral and approval may be needed if the care plan changes.

We do follow national guidelines for Dental eligibility

We do share paper copies when clinically indicated at the patients request.

We use a combination of one referrals and multiple referrals based on the individual patient's clinical need.

One referral will cover all related visits to this specialist within a specific timeframe.

But we also have onsite staff as well.

We have Radiologists that telework readings from home.

Some on-call and telework reading

Also at our parent facility

Remote location (designated rural health hospital); Tertiary care facilities in VISN [location redacted] do not accept patients readily: preserve their own numbers (performance measures)

"Other VISN [location redacted] facilities have those that approve the transfers in low clinical levels, which allows for inconsistent decisions secondary to work load requirements on transfer."

"To reduce potential cost issues, f/u visits are required to be approved by chief of staff before scheduling."

Older buildings with blackage of wireless access by degree of obstructive materials used in older constructions.

CVT is located where specialty services are available at VA facilities.

"At the parent facility (VAMC). The facility is a rural access hospital, and all home telehealth is supported by in house providers."

One referral with specific time frames and services.

Extension of time frame is authorized.

Ease from restrictive Civil Service (H R) Rules would facilitate hiring

care is covered for up to 60 days
individual decision: will be reviewed for need of further care
at the Parent Facility

"* Psychologist, LCSW or equiv, nursing, Psychiatrist, pharmd and admin
* build teams with supervision internally"
"*Space for CBOCs to include exam space and additional inpt beds due to growing demands
*Telehealth-space,equipment and staff needed to include prescribers, therapists, technicians admin, nursing
*User friendly scheduling pkg
*create teams supervised by member of the team"
"*Space to build more treatment teams to include prescribers, therapists, nursing and admin equipment to include bp machines
*pbm also exists in scheduling return appts. this is critical once initial visit/diagnosis made"
"*need space, staff to include prescribers, therapists, nursing, admin, pharm d.
*Teams function as a unit supervised by team member
*Major pbm is scheduling timely return appts after initial eval/diagnosis"
"*space for staff, additional staff to include therapists, admin, technicians who can perform testing
*build teams with leads and supervision in teams
*Pbms rescheduling timely follow up appts once initially seen"
"*physicians tend to carry the burden of care
*improve flow with additional staff and space
*too many clinical reminders"

"b. Reassign [location redacted]telehealth responsibility away fron [location redacted]. Have CHOICE telemental health provider
c. Someday more newly hired-MHI social workerinto offices in [location redacted] CBOC and [location redacted] CBOC.
g. Reduce SPRS reminders and required TMS training."

"More LIP therapists, particularly psychologists and LCSWs.
Mental health Suite consumes more time than is neccessary and is redundant information. Such information should be in the providers note.
Nurse Case managers could be extremely helpful particularly with managing individuals with multiple conditions (i.e. Polytrauma (PTSD, TBI, and Chronic Pain))
Desperately need admin person or persons dedicated exclusively to our Psychology and LCSW Training Programs."
"Need for more general mental health therapists (psychologists, LCSWs).
Redundancy of Mental Health Suite; information in the MHS should be included in the clinicians evaluation report, usually in a more efficient, concise and readable fashion.
Nurse Case Managers could help facilitate and ensure continuity of care for patient''s with comorbidities and complex conditions (i.e. Polytrauma (PTSD, Ortho, TBI, Chronic Pain)"
Mental health Suite is redundant and does not provide useful information.

"Need tele-screening capability--working on this at present.
Weekend and evening coverage will require a ""culture shift for both patients and clinicians."
scheduling system is too old/cumbersome

"We are lucky to be hiring more staff, but HR policies and not enough HR staff are slowing down the hiring process. Without MH new staff, mainly psychologists, GMH and PCT cannot keep up with psychotherapy demands. Metrics do not help us, but rather slow us down and often use data that does not accurately reflect our work and patient care. Admin support is inadequate due to low staff and poor training. Administrative processes for non-va care are slow and have gaps in the process. Solution: stop asking current staff to take on the work of these deficiencies and give more staff who are trained and most importantly, give us space. Contracting issues have slowed our leased emergency space to 2 yrs!!! It is taking years to build new buildings. Solution: cut the red tape especially in contracting."
"Need more staff to meet psychotherapy demands with the space to go with that. It is taking 2 yrs for our emergency lease space and years to build any new buildings. Solution: cut red tape in contracting. Admin staff need more training. Veterans are telling us that vcl is taking longer than being seen at the VA. Hire staff to manage vcl and ewls for psychotherapy. Needs for psychotherapy are different than PC or even psychiatry since psychotherapists see the same vets weekly for 3-6 months. That leaves no room to take on new cases until the others are done. Productivity measures for psychologists need to be different than one size fits all disciplines since psychologists have many roles which are not always direct patient care. Need more staff for infrastructure to support our work such as clinic profiles staff, HR staff, clerical staff. Archaic processess like vista scheduling and multiple forms needing multiple signatures delay work. It took me almost 3 mos to get the paperwork for teleworking through and we got it done when I mentioned we"
"The same 3 things are critical for every section in this survey 1) More staff 2) More space 3) More admin support. Not able to retain staff due to overloading them with clerical tasks, not providing adequate training (MSAs), Same gaps in the process for vcl as mentioned before."
"Staff are coming, but until then (months) we are understaffed for psychotherapy. We are almost doubling our staff size, but have no space for when they get here. Our waiting room holds 8 seats. Emergency lease space is taking 2 yrs!! Our new building is taking yrs to build. Vista scheduling is archaic. The paperwork to start to telework staff creates delays. There is no wait for telehealth because the demand is low. The wait for our cbocs for psychotherapy was clinically significant until recently because we hired more staff."

Our SUD/PTSD services are in the same PCT clinic. The same comments for the other sections apply here.

"As providers, we have to do many clerical tasks since our admin support is overwhelmed with patient demand. Our infrastructure is a house of cards....we have to double check the work of support staff because there are either errors or things are not done because support staff are a skeleton crew. Constantly having to remind support staff (this is not just clerks) to get things done or fix mistakes is frustrating and doubles the provider''s work. The scheduling system is inflexible and so, does not reflect how we work to meet the veteran''s needs. Veterans no-show because there is no consequence for not showing (being charged or losing sessions authorized). They know they can show when they want. However, this often means another veteran could have been seen. The no-show veteran for intakes goes to the back of the line which makes the consult open for months. There are so many policies regarding cancelling clinics, tours,taking leave, working hours, etc., that are rigid and do not provide flexibility for employees."

"We currently have a 1.0 FTEE SW providing 100% of EBPs for PTDS at Rockford. There are occasional delays for Veterans to commence psychotherapy for PTSD in [location redacted]when referral rates are higher. This waxes and wanes over the course of a year. If new FTEE were requested for [location redacted], it would be for a psychologist or social worker."

"1. We literally hae no space for the additional providers that we need to serve our Veterans. We have money for new staff, but cannot use it because of lack of office space.
2. Because of the emphasis upon hiring staff for the Homeless Veterans program, HRMS is forced to delay many hiring actions for other staff.
3. We need additional clinicians in all disciplines. Workload data indicates that average clinician productivity in this station exceeds Directive 1161 RVU targets by about 50%, and we still have difficulty meeting the clinical needs of our Veterans.
4. Additional clerical staff (schedulers) and at least one additional administrative staff member are needed in MH.
5. The scheduling system is archaic, cumbersome, and does not meet the needs of modern healthcare systems. It needs not a set of ”fixes”“, but replacement.
6. ACRP is extremely limited in its capabilty to provide meaningful reports on provider productivity. The interfaces that have been developed to pull data from VISTA cnstitute improvements, but they too are very limited, and I have found mathematical errors in the one being promulgated nationally.
7. As a manager, I am extremely limited in the incentives I can offer my staff. Given how hard most of them are working, this means I cannot adequately reward the degree to which some of them truly go ““above and beyond””. This leads to poor morale.
8. This station has for years had the lowest salaries for most disciplines in the VISN, and indeed, is among the lowest int he country, despite having one of the highest costs of living. With our budgetary restraints, we have staff in various disciplines leaving here to go elsewhere within the VA system, for similar positions, and getting ~10% more pay in lower cost of living areas.
”“[comment redacted because potentially identifiable]
11. Weekend and evening hours have been extremely underutilized despite extensive marketing."
Already addressed previously in survey
"Greatest needs are:
1. Support staff for telehealth
2. Greater bandwidth
3. More space for equipment, though ideally this would be accommodated by desktop telehealth units in provider offices(but too few offices)

4. Providers..."
"1. Personnel needed:
   a. Providers: psychologists, LCSWs
   b. Support staff: clerks & admin
2. IT: scheduling package. Also, I should have mentioned earlier, that CPRS needs a significant "overhaul"" or replacement:
   a. Notes and Discharge Summaries modules should function like a word processor, not like a typewriter.
   b. Notes Module should permit direct insertion of images.
   c. Template system should be both more capable and user-friendly.
3. VACO polices - as previously addressed.
4. Incentives, as previously addressed."
"1. Psychiatrists spending hours per week literally doing social work care coordination, similar examples in all disciplines.
2. Providers and managers spending MANY hours each week doing scheduling, running administrative reports, etc., that could be effectively done by personnel at the GS9-11 level, but are being done by personnel at the GS13-GS15 level due to lack of such support staff.
3. Terrible scheduling software, as mentioned previously.
4. Outdated CPRS interface, as discussed.
5. Poor bed management system for residential care.
6. Providers spend substantial time meeting "clinical" performance measures that are actually of very limited value."

Other solution: decrease administrative burden on clinicians which would allow more time for patient care
Decrease administrative burden on clinicians
Our residential program has been reduced to 6 beds (from 12 beds) due to space constraints. Additional space is of essence for this program to be fully functional.

"We are currently operating at 60% mental health staffing which has impacted clinicians ability to schedule additional appointments for veterans. Initial Access to care has not been impacted, but has adversely impacted morale of staff as staff work through lunches, essentially triaging scheduling of returning veterans, and working late or coming in early. Given that PTSD is the 3rd most common diagnosis for this facility, it would be helpful to have a defined PTSD program. Having a defined PTSD program would help flow over veterans from specialty care to less intensive mental health services delivered through PCMHI. Difficult to do telemental health groups as there are usually problems with the equipment either at the main clinic or at the CBOC. On average it would take 20 minutes to start a group using telemental health equipment which negatively impacted veteran care. IT support staff available would be helpful. Central policies are well intentioned and useful; however, we need to have an active role at the local level in implementation and development in writing for how these policies will work in outpatient. I hear this frequently "we need more things written down." The strongest concern from local staff is that the policies are not reviewed and discussed in a timely manner. It would be helpful to have additional support staff with clear expectations of roles in scheduling and coordinating communication between veterans and clinicians. For example, some days MSAs use outlook to check clinicians schedules and on other days just Vista. When veterans are rescheduled or request to have an appointment change, it would be helpful for the MSA to make the appointment change instead of asking the clinician make the call. Given the decrease in clincians, it would be helpful to not have to make additional administrative calls. Management could be better supported in assisting staff with barriers to

doing their job or holding staff accountable to do their assigned job. Improve role definition between different displines (i.e., psychologist, social worker, RN) would likely improve morale as clinicians would be working towards the top of their license. Increase incentives/recognition for clinicians working towards making positive changes in the department. We already have extened hours in outpatient mental health. We are already utilizing fee-based care with positive results."

Recommend increased incentives for hiring and retaining psychiatrist or nurse practioners for CBOCs. Additional support staff and clinicians may help improve retention of psychiatrist or nurse practioners. Increase availability to use and improve system for telemental health so psychiatrist or nurse practioners at the Anchorage clinic can readily deliver these services to CBOC's. Have a SOP in place for this process and how to manage staffing issues in the CBOC. Increase availability of rooms for telehealth. Fee-based care is highly utilized in the CBOCs.

"Increase support for psychiatrist and nurse practioners to do telemental health. For example, have IT available to answer questions quickly. Support in scheduling appointments. Make space available for veteran to be seen by a psychiatrist or nurse practioner from the main clinic to a CBOC."

"Psychology and LCSW staff needed.
Scheduling system should be made more user-friendly to improve efficiencies.
In order to increase evening/weekend clinical hours there need to be increased support staff hours as well.
Discharge planning needs are made difficult in an entitlement-based system."
"See previous comments, as they apply here as well."

clerical support

"Vista is so old, would be nice to have a new system."
"CBOCs have limited space and are understaffed in BH services. Social workers are wearing 3 hats: PACT social work, PCMHI, and BH. Some CBOCs might have only a BH prescriber and a social worker or have these services only available via tele-health during very limited hours. Policies that are predicated on attendance, which VA staff have no control over, should be recinded.
We need a scheduling system that allows schedulers to see clinic availability in multiple clinics at one time."
Space and personnel are primary issues. Reference the literature or VA studies regarding evening and weekend hours. No-shows during these times are problematic.
"Policy can dictate; but without staff to support, will be impossible to implement. In addition, policy can dictate by xxx time, xx% of all visits will be non-F2F. What if the Veterans prefer F2F. Which is more important, Veteran centered-care or policy?"
"During the recent allocation of Choice positions, our facility "received"" 4.1 additional BH slots. Need is much greater. Only 1 of those 4.1 positions went to a CBOC."
"When staff is limited (7 psychologists in our entire system) and programs/initiatives require o.3 to 0.5 or more time allotment for implementation AND staff are assigned more than one program, staff availability for treatment is significantly impacted.
We have attempted to assign these program duties to other staff, with the result that implementation was negatively impacted."

"Additional Psychiatry, Social Work (LCSW) and/or Psychoolgy staff at some of our CBOC''s is needed."

"More staff (LCSW;LPMHC;PhD) would improve access. Limited telepsych is staff related, not equipment related; lack of administrative support (e.g. clerks) leaves clinical staff doing admin. work that takes from clinical time; multiple "coordinator"" positions and collateral duties also reduce clinical availability;
Strong emphasis on specific credentials (e.g. jobs rolled out by VACO for only psychologists) can also limit availability. Strong emphasis on hiring Veterans sometimes makes recruitment of the best possible clinicians difficult."
"As stated in previous section - more staff are most important, office space will be a problem if more staff are hired, lack of admin support that is program specific is a problem; limitations of supervision (e.g. GS 12 team lead can"
As noted previously - pay incentives for clinicians to travel to remote CBOCS would be helpful in recruiting.
Incentives to work at remote CBOCS. More streamlined supervision process. More ability to recruit external providers who are not Veterans or internal candidates when jobs are posted
"As noted before - we are understaffed. CBOCs are more understaffed, but everywhere is. More staff will need more office space, which is also a problem, especially at the CBOCs"
"Providers must do consult management, schedule appointments, handle all administrative tasks.
Training programs pull psychologists' time a good deal, so do the multiple coordinator positions; as

team lead, I have spent hours reviewing charts related to measures and writing business case plans to beg for more staff when, as an EBP trained trauma therapist, I could have been seeing clients."

"Scheduling software needs a lot of improvement, not flexible and we are trying to do too much with it that it was not designed to do."
Need more providers in certain CBOCs and is hard to recruit particularly with non-compete clauses that the community has them sign. Community will also often pay them a stipend while in residency in exchange for a certain number of years of work. We cannot compete with that.
Space and staffing are important factors in most of our CBOCs. Groups do not work well with tele-health so we need on-site staff for this.
Scheduling software needs to be modernized

More demand than beds available; no community residential PTSD programs

"need to cease using ancient scheduling system, including use of "clinical profiles" in this system which are so restrictive and arduous to update when providers'' availability changes. Our #1 problem with access for PTSD patients is in regards to the way scheduling is done!"
"MH supervisors need dedicated time to provide meaningful clinical supervision to assure PTSD services are done in accordance to Best Practice Guidelines and to assure clinical CPRS templates are updated and being used appropriately. Also, MH supervisors need dedicated time to establish and maintain telehealth arrangements with Hub sites."
see previous comments as they all apply for this section as well
we don''t have enough dedicated PTSD providers nor do we have the space for additional offices or group treatment rooms
please see previous comments
wait time for residential treatment is terrible

"b. Psychologists, Social Workers, Family Therapists
c. LMFTs, Nurses, Clerks, Pharmacy support for CBOCs
f. Scheduling system does not accomodate groups well
g. NEPEC reporting takes too much time away from clinical care; EBP is not for everyone; EBP training programs are rigid, cumbersome, and at times traumatic to therapists; Performance measure ""force"" patients into therapy whether they need it or not.
h. Clinicians need more autonomy and increasaed flexibility in the workplace."
same as previous

"We need general mental health support for stable, long term PTSD patients outside of the PTSD Clinical team. PTSD
Team needs a single, "dedicated" Administrative Staff person to coordinate all scheduling and monitoring of all required paperwork."
We need more clinical staff who can see patients for medication. Delays are critically difficult when a patient misses an appt. and cannot get a new one for weeks.

"Additional Clinical VA Staff vice locums or fee-based.
Additonal Administrative Staff would also be beneficial."
"Incentives would be nice.
Policies could be more flexible to recognize differences in facilities

Reports/Ratios are not the same for rural and urban medical centers, yet we are all held to and judged by, the same standards.

An IT system, or Enterprise Resource System, that is web based and can "talk"" to all facets of treatment - unlike the hodge podge of systems of wildly vintages that the VA uses now.

Just interoperability of what we have now would be an improvement."

"IT infrastructure is critical to CBOC care.

Incentives would be nice.

Additional clinical staff would be nice as well."

More clinical personnel would allow for a slight increase in the number of cohorts being conducted at any one time.

"Increasing the # of Admin Staff, Scheduling software, and CPRS upgrades would all be desirable."

the scheduling package that we currently use is antiquated and not practical for use in Mental health services where you have both individual and group therapy

"the schedulilng package makes it very difficult with so many grids, due to liminitation of the package and multiple stop codes"

"We are in dire need of more space and more providers. If both were increased, the access issue would be resolved. We have well trained and dedicated staff. The situation is worsening, and CHOICE is making it worse for a variety of reasons. VACO needs to set and disseminate feasible standards for mental health care in terms of expected productivity of providers. The mandates on our providers are MUCH more extensive than they were even 5 years ago, yet know additional time has been allocated for those "non-direct care"" tasks. CPRS is okay, but the scheduling software is very outdated and causes huge inefficiencies. The fact that we have over 20 distinct passwords that change every 90 days is also inefficient - why not one password connected to our PIV cards?"

"The environment in VHA currently is punitive in many cases rather than offering rewards for excellent ideas, policies, and procedures."

"The demand for mental health services has skyrocketed in recent years, and the number of truly new, independent providers has not kept pace. We need space to put new providers in."

It is difficult for us to recruit and retain psychiatrists - many have left the VA or reduced hours due to salary and burnout (they report feeling overwhelmed by the workload).

"We have some of the best trained staff in the nation - including trainers in EBPs. However, there are insufficient therapy slots because of the multiple cometing demands on our providers."

"EPBs work very well, but they require a bit more prep time and sometimes more time during and after appointments. Without incentives, therapists find it difficult to add this additional workload when productivity doesn''t change."

"No shows are seen as a system cost, but to individual providers no shows are seen as an oppotunity to catch up on the many other required duties. It is critical to understand this when solutions are proposed. "Missed Opportunities"" often means "Opportunity for something else that helps Veterans.""

"Licensed independent practitioners: are in great need of additional therapists (psychologists and LCSW), as well as mid-levels to support medication management services.

Technology: MHS is very cumbersome and time-consuming

Central Office policies: having to call all no-show patients 3x regardless of risk status (particularly time-consuming for groups)

Personnel incentives: for some disciplines, the compensation at VA is not competitive with private sector, and make it difficult to recruit and retain high quality professionals

Other solutions: need to create ways to have some variety in duties/responsibilities as well as some ”down time”“ in order to reduce provider burn out; would be good to partner more with VSOs and other organizations regarding some of the ”myths”“ that many veterans buy into regarding types of services/frequency, etc that is needed to obtain/increase/keep their level of service connection"

"For areas that are same for initial evaluation in previous question, would have the same comments. For this section, would recommend need for additional tele-health equipment with adequate time for training of staff"

"Would give same comments as in previous sections. Would also add that for our facility the majority of MH is provided via tele-health, with little face-to-face contact- often this is a complaint of veterans. Additionally, except for MH staff most of the providers in our CBOCs are contracted, and veterans often complain about this- the quality of care they receive, and the high turn over rate. This impacts their medical care for physical health concerns, but also impacts their MH care as well (ex: veterans become frustrated and either don''t come back or request to have their care transferred back to the main VA, which limits their ability to come for appts due to the distance travelled; often the contracted staff are not as aware of the MH services available to the veterans so may not refer as needed/appropriately"

"Critically important to have more clinical psychologsits and LCSW to provide group and indvidual therapy; also, office space for these providers is essential.
Technology: use of MHS is cumbersome and time consuming, especially so for documenting group interventions; scheduling technology is slow and not very user friendly, especially when trying to schedule multiple appts (ie, for a group or an EBT protocol)
Other solutions: better educate non-EBT providers regarding the EBTs- what they are, what makes a good referral for this type of treatment, educating veterans of what to expect"

Would offer same comments as in previous section.

Would offer same comments as in previous section.

"Need more clerical staff who are competent to do their job and who are well/appropriately supervised Need additional group rooms. We are very constrained space-wise"

There are too many reporting requirements and metrics that are not meaningful from a care perspective. These duties take away from valuable patient care time and do not add to the well-being of the Veterans.

need more space in CBOC''s and more TCT''s to room the pts and monitor.

need more space to provide services

continue to offer EBT training and we are trying to make sure we have enough in the CBOC

Need more PTSD MHRRTP programs. maybe if we had more space and it was easier to start them up?

"Better Tele-equipment would be helpful, as well as more available units. Begin using iPad''s for ERANGE and HBPC. Working in two time zones there are occasional double books and other scheduling problems."

Increase prescribers (Psychiatrists and NP/PA or PharmD). Improved computers/tele-equipment. Incentives are important in rural settings. Better scheduling packages would help with double booking and other errors.

"Psychiatrists are badly needed (along with NP/PA or PharmD with mental health training), nurses or LVNs as support to the prescribers, nurse case managers would also be very helpful regarding follow-up care and follow-thru on care planning. Good tele-equipment is very important especially in rural settings. Better scheduling systems would potentially decrease scheduling errors especially when dealing with multiple sites and two time zones. In rural settings incentives and other enticements are important given what the provider will give up leaving more urban environments."

"Psychiatrist, and other prescribers are crticial with support needed from nursing, and administration/health techs. Improved tele-mental health equipment is needed especially in rural areas. In a rural setting, incentives and other enticements are important."
"Physicians within the CBOCs are critically important. Support for the physicians in the form of nursing/health tech would support a higher quality of care, along with space to work. Better scheduling system would be helpful along with incentives that would support the move to a rural setting."
"Psychiatrists are critical with nurses/LVNs and other support staff being very important. Better tele-equipment with improved scheduling programs would also be important. Finally, being in a rural region incentives and better access would improve care but there are few providers in some of these rural communities that would allow Veterans to use fee-basis or other forms of care."

"In our clinic, our scheduling options are limited for PTSD services because of stop code requirements. Guidance about setting up clinic profiles to allow for more flexibility would improve access. Now, clinicians are bound to evaluating certain patients within certain stop codes.
Our current assignments include overburdened supervisors, who have to attend to administrative duties rather than being available for clinical supervision - this reduces efficiency in providing care to Veterans suffering from PTSD. Recruiting talented and experienced clinicians (Psychologists for example) with the current benefits structure of only 2 weeks of AL is extremely difficult although other benefits are inviting."
"Once again, we are located in a rural hard to recruit area - improving recruitment incentives such as benefits (specifically AL) would be very helpful to our recruitment efforts. The scheduling system and requirements need to be improved. We work hard to get Veterans timely services, but getting a Veteran seen in consult quickly does not guarantee that follow up is adequate. I personally don''t see contracted care as the solution, as our community does not have staff who are as well-trained and knowledgeable about Veteran care. (Ex: the state of WV does not require doctoral level for psychology licensure, the VA does and we believe this is the best level of educational background to treat Veterans)."
"We have CBOC that are too small to accommodate staff, and more space is needed. Telework options are limited in some rural areas where Veterans do not have access to broadband services (VA equipment availability is actually quite good - but not helpful if you can''t reach a Veteran). Once again, better recruitment incentives are crucial."
"1 of our CBOC''s has NO group room, one has a small and limited space for groups that is shared space with telehealth equipment limiting services and requires extraordinary coordination. More space is needed. Veterans have not, in our experience, enjoyed attempts to participate in groups via telehealth with a group of Veterans at our parent facility (even our staff who use telehealth equipment to be involved in team discussions feel removed and thus it is more difficult to engage). Efforts to recruit staff for weekend services has been extremely challenging and our current availability of weekend services is thus limited - evening services are better but only in the parent hospital."
"Our hospital doe not have a PTSD residential option, thus we refer to other VA''s with delays in admission. Community options are not available."
"We have a plan to build and open a SA residential rehabilitation program that will include programming for dually diagnosed SA/PTSD Veterans. If approved, this will be of benefit. Also, we are attempting to recruit experience personnel to expand our SA/PTSD services. In this area, addiction rates are quite high. We have the required SA/PTSD psychologist but need at the very least one more experienced staff member - Luckily we have an interested candidate."
"A sensitive issue: Staff here are required to continue running support groups that are not effective in promoting recovery, this limits availability to focus on EBT''s. We are attempting to utilize Peer Support Specialists to address this, which is helpful, but previous directives "not to discontinue" these types of

groups is an issue here and I believe, across the VA. Turnover rates in personnel have impacted the balance between providing supervision to trainees and providing clinical services. The impact of productivity standards often limits what some of our professional staff is willing to do to support our training programs. We view training as essential to building a strong, experienced workforce to treat out Veterans - clinicians should not be penalized for providing this type of supervision more intensely with low productivity reports. It would be very helpful to have national guidance on how to address no-show''s more effectively - we need to utilize technology to remind patients of appointments including email and text reminders."

"Need to have staffing which allows for loss of provider without impacting patient care; Currently staffed at bare minimums; need to have a scheduling system which is geared toward mental health and appropriate; need additional, well trained scheduling staff;"
Current staff are insufficient for the demand; Cannot get patients back for weekly psychotherapy when necessary; scheduling system is grossly inappropriate for mental health; Staffing is at bare minimums and loss of a provider would result in compromise of patient care.
"Need to staff for growth. As stated before, our MH system is working but we are seeing increases in demands; pushback from administration about staffing levels; CBOCs are viewed as "primary care" with "mental health as a side show""
Need to have an appropriate scheduling system for mental health; need to have staff with availability in schedule to see patients appropriately; need better clerical support in the CBOCs.
Need better scheduling package for MH needs; Need better clerical-admin support for clinicians; need less reminders and more therapy services;

"Some of our CBOCs have no MH staff available to even partner with, to combine in person and vtel services. Managing MH needs completely by vtel is a huge challenge."
"Our scheduling system is extremely cumbersome. We need a way to be able to assign into appropriate clinics (and stop-codes) after the appointment has been completed, so that we are not limited by having to use certain clinics for certain appointments."
"I would consider implementation of CBOC BHIP teams, including providers from a number of CBOCs and vtel providers from the parent VA."
"This one is tough.....as technology advances, it may be appropriate to do more structured group therapy via vtel, but right now it is a bit iffy..."

"- More clerical staff
- Would help if CO streamlined documentation policies and reduced number of changes per year. Staff spend significant amount of time learning new ways of documenting which change often.
-"
"We have the equipment but the training is very time consuming.
-Personnel - we need a full team of Telemental Health administrative staff."

Increasing space in the CBOCs to use telemental health would increase access. Also streamlining the administrative scheduling process telemental health.
Access to initial evaluations and treatment are negatively impacted by space and staff limitations.
Nurse care managers to assist in contacting and screening self referred patients for the most appropriate services.
Trained staff is very important. Additional support staff is needed along with extended hours. However space is often the limiting factor.

Support staff are necessary to contact patients to schedule for groups. Providers are needed to be trained in evidenced based psychotherapies to provided treatments to reduce symptoms and encourage recovery. Current issues include ineffective treatments or groups designed to hold patients while waiting for an EBP.
"Similar to previous comment increase in trained clinicians and support staff to contact, screen and schedule patients are needed."

"The CBOC''s we work with primarily need more licensed independent providers. However, even more, the staff in the contract CBOC''s need much greater instruction on VA policies especially regarding patient confidentiality and rules around privacy."
"general mental health services providing PTSD care need larger group rooms, more licensed personnel, more scheduling clerks."
CBOC''s need more licensed clinical staff and improved weekend hours.
"In order to provide services via telemental health more effectively, the CBOC''s need more equipment, more licensed clinical staff and expanded weekend hours."
Primarily lack of adequate staffing has made for an unnecessary stress on providers working well under their license ceiling.

We need more office space that will allow for TMH to other CBOCS. We need more administrative support for therapist. Currently there is not a delay in care because staff see patients in their administrative time. The coordinator of PCT uses all of her administrative time for patient care. We do not have the space to add more clinicians
We only have access to 16 hours of Substance Use/PTSD available each week; this is not enough time to take care of all of the Veterans that are presenting for care in PCT. Other clinical staff and the Coordinator are using their administrative time to take care of the request for care. Currently we do not have the space to add more clinicians.
"PCT Clinicians provide all administrative support for themselves. We have 8 hours of administrative support dedicated to PCT. These hours are sometimes used for other departments, attending staff meeting, tracking some data."

"Tele-health clerical staff at one CBOC and LIP''s at multiple CBOC''s - e.g. psychologists, social workers. Organization is already in process of bringing on more LIP clinical staff - e.g. MH staff, especially psychologists, which should help."
Facility in process of bringing additional LIP''s to CBOC''s which should improve this area. Need more available physical space for therapy in CBOC's.

New scheduling system is needed. But our few delay typically stem from administrative processes that we''re working to refine. (Fix already underway.)
Hard-to-fill vacancies for psychiatrists are the challenge; we''re actively recruiting
See previous question.
"Challenge is transfer to other VISN facilities, as we have no RRTP at our site. However, these other sites are short-staffed for providers as well. Administrative processes for intra-facility transfers continue to be challenging"
We''re working to transform "legacy groups" into peer-led (rather than clinician-led) functions.
Scheduling system needs upgrade

staffing resources (LIPs) would be critical (VACO has estimated that we are 10FTEE ''down''. Support staff would also help in streamlining some processes (alllowing to work at top of license

same as comments on prior page

"General outpatient psychiatry medication prescribers or PC MDs are needed to follow PTSD patients on stable treatment regimens. PTSD MDs are overloaded with such cases, making it difficult to meet with more complex cases (e.g., OEF/OIF/OND veterans with acute PTSD, suicidality, aggression related to trauma exposures. Nursing staff could also follow stable patients, freeing up MD, and therapist time for acute needs.
Clerical staff needed to track patient caseloads and manage complex scheduling- the MHTC program has created a level of administrative work for clinicians that does not appear to yield benefits for patient care.
Clinicians are burned out, but must spend large amounts of time on administrative matters. Good administrative support is needed."
Comments for preceeding question apply here
"Space is unavailable for FT providers in MH and in PCMH. There is a general lack of interest in telemental health in the patient population who can travel easily to the medical center. Need for MH support personnel - NP, nurses, admin to manage MD and therapist case load. Evidence-based treatment is available. Older veterans prefer supportive counseling and some state they are entitled to frequent appointments; younger veterans often requuire crisis-management and case management (e.g., housing, safety planning, legal services, employement and educational services) before evidence based treatment can be initiated."
"Evidence-based treatment for PTSD treatment is always available. Older veterans with PTSD prefer supportive counseling and some state they are entitled to frequent appointments; younger veterans often requuire crisis-management and case management (e.g., housing, safety planning, legal services, employement and educational services) before evidence based treatment for PTSD can be initiated."
"No shows are a frequent occurrence and the clinic utilization system is outdated and does not adequately capture a clinician''s workload. The scheduling system is inflexible. The multiple required outreaches for people who consistently no show for appointments could be conducted by admin or bachelor''s level clinical staff, but there is no staffing available for this. Space is unavailable. Training is time consuming, but this is something that providers enjoy doing."

Va needs to provide streamlined access to off-the-shelf psychological testing products and these need to be integrated with CPRS. Right now the security and privacy concerns VA has with computerized testing systems are preventing the utilization of products widely in use in the private sector. This grossly attenuates the utility of testing in the clinical environment of care. This is especially important as we are trying to be accountable for providing evidence based therapies and measurement based care for Veterans.
"It is critically important to provide support staff for clinical care. This goes beyond scheduling to include key supports like care management, communication with patients, follow-up care, etc. we also need to promote an embedded leader in every team...too often in VA teams are accountable to a leader who is completely absent from the environment of care."
Need more MH specific leadership embedded in the teams
"Need a new and functional scheduling package that interacts with other key,critical data such as provider leave,
And that is adaptable to the complexity of mental health"
"There is no space for groups, even individual offices appear to be impossible to get. Uncertainty and variability in the care environment creates problems in Veteran treTment. Unavailability of group spaces leads us to be less productive and offer far less access than we could otherwise. Also, insufficient numbers of support staff are a challenge"

Need a streamlined and simplified scheduling system

psychologists specifically trained in evidence based trauma-related treatments and psychiatrists

"Extend funding period for access to care positiong for mental health programs. One year funding limited local facilities from fully implementing new positions.
Dedicated funding for medical providers to support RRTP screening requirements."
"Equalizing locality pay between the [location redacted] and [location redacted] campus, clinical staff workinig on the [location redacted] campus are paid a lower locality rate despite a high percentage comuting from the [location redacted]area. This causes a higher turnoever rate and difficulty in recruitment."
"Extend access to care fudning for mental health positions, one year funding period limited local facilites from implementing all new positions.
Increase locality pay for [location redacted] based clinicians as lower locality rate negatively impacts retention and recruitment of specialty PTSD providers (PCT located in [location redacted])."
"A large volume of administartive demands coming in the form of site visits, action items, auditing tools and other tasks that are a duplication and not directly linked to patient care take critical time away from providers."

Antiquated scheduling system; high turnover of administrative staff and delays in filling vacancies.

"The scheduling s ystem is often down, is not controlled by clinicians directly, and is difficult to manage. Administrative support (e.g., clerical) is lacking due to understaffing."
"Need more personnel (e.g., staff to triage emergent patients, prescribers, therapists, support staff). The new SAIL metric measuring patients who have had a diagnosis of PTSD and requires two sessions in the specialty clinic will reduce access to EBT for patients who are interested and motivated."
"The current scheduling system creates errors in displaying availability, double bookings, and timely scheduling (as it often crashes) which restricts access. The SAIL metric, which focuses on providing treatment rather than offering treatment, may block access to full, EBT participation in the absence of more staff."
Please see prior comments; all still apply.

The area impacting this issue the most is the limited number of prescribing providers.
"Limited providers in the outpatient clinic has resulted in large panel sizes for providers that limits frequency of sessions. Further, new ideas for groups are often not able to be developed given limited group room space."
"While there are several providers who are certified to offer EBPs for PTSD, large panel sizes due to limited providers has resulted in difficulty offering sessions on a weekly or bi-weekly basis. For many, they are simply unable to offer these treatments with any regularity given lack of staff in the clinic."
"Policy states there must be three attempts to contact veterans following a no-show. This often takes place via phone or mailed letter and can be time consuming. Further, there is no clear policy regarding procedures/guidelines in situations in which a veteran has a pattern of not showing to appointments or canceling without sufficient notice."

Patient flow from PTSD programs needs to be encouraged; tele health technology is a viable way to improve access in underserved areas.

need psychiatrists and therapists

therapists
"changes in scheduling had a big impact negatively both for veterans and staff .
not enough clerical staff to facilitate program management data collection"

"less barriers in making changes overall (e.g., hiring process, clinic profiles, scheduling). Each barrier lends to increased time to make effective change, thus decreasing clinic time available"

"Our delays are relatively modest in terms of % of Vets effected. However, they are tied to staffing in outpatient mental health services, particularly LIP''s."
"As we noted earlier, our delays are relatively modest (2-3% face delays of 30+ days). However, they are tied to staffing in outpatient mental health services, particularly LIP's"
"We have a flow work group that has been addressing these issues for several years, but there is always room to improve."

Space is the number one issue. Second issue staffing timely by Human Resources. Third is less mandates from central office and need more autonomy at service level.
"Space, autonomy service level, Timely and efficient help from human resources for recruitment, less mandates from central office"
"Space, Human Resources support for timely recruitment, autonomy at service level and less mandates from central office"
"Initiative, policies are quite cumbersome and time consuming"

Dedicated BHS clerical staff needed. More therapists and psychiatrists needed. Updated scheduling system needed to facilitate ease of scheduling multiple appointments in a row as required by EBPs.
Increase BHS dedicated clerical staff as well as update scheduling system so that scheduling is not so burdensome in terms of time. Allow providers to schedule their own appointments.
Increase number of therapists and psychiatrists as well as BHS dedicated clerical staff. Update scheduling system so that scheduling is not so burdensome in terms of time. Allow providers to schedule their own appointments.

TRANSPORTATION AT TIMES CAN BE DIFFICULT
Increase PCMHI in OPC with a certain volumn
Ability to recruite non-citizens
"Evening and weekend directive is too prescriptive, the medical centers need to be able to have flexability to meet the needs of the Veterans they treat."

recruitment and retention bonuses and flexible tours/telework etc for greater staff satisfaction
flexible tours/telework. Recruitment and relocation incentives
recruitment/relocation incentives. Flexible tours and telework options

Increase space for providers and increase psychologists and psychiatrists. Also allow these providers to schedule their Veterans to ensure they are put in the system and on correct day and time.
Increase number of psychologists which will require an increase in space. Allow them the option to schedule their own Veterans to ensure correct day and time.
Ensure telehealth equipment is available and there is enough support staff to arrange the sessions and manage paperwork.
Increase psychiatry and nursing staff which will lead to an increase in office space.
Increase all staff in residential programs to increase bed space. At times the wait is 4 to 6 months.

There are a large number of reminders to complete and need to go into more than one system MH Suite and CPRS.

Ability to hire additional staff efficiently is critical. Current HR processes for onboarding and offering incentives are inefficient and untimely. Space for additional staff is critical. Ability to recruit to rural and remote locations (where the community is also lacking resources) needs to be incentivized in VHA. Space and staffing are critical. In smaller health care systems the loss of 1-2 providers in a team results in delays due to lack of ability to cover their caseloads and slowness in the recruitment/hiring process. The current scheduling package is also arcaic and makes it difficult to overlay multiple clinics and schedule correctly.
There is significant need for a user friendly scheduling package.

More technicians on the patient side for telehealth.
"1) Will likely need more clinical social workers and psychologists to keep up with the psychotherapy demand.
2) As clinical staff increase, a proportional increase in support staff is needed.
3) SAIL measures create unnecessary burden by prescribing the number of psychotherapy sessions within artificial time frames.
4) Implementation of DRAGON dictation software would help with documentation of care."
"1) Will likely need more clinical social workers and psychologists to keep up with the psychotherapy demand.
2) As clinical staff increase, a proportional increase in support staff is needed.
3) SAIL measures create unnecessary burden by prescribing the number of psychotherapy sessions within artificial time frames.
4) Implementation of DRAGON dictation software would help with documentation of care."
Staff are slowed down by excessive clinical reminders and inefficient Treatment Plan Suite software.

"LIPs - need competitive salaries for LIPs. Need to be able to hire them in a timely fashion. Need an up to date EHR, not one that is an antique. Need streamlined policies that are collaborative vertically and horizontally."
"Need better more competitive salaries for providers.
Need an EHR that is modern, integrated, and has better scheduling functionality. The "AR"" unsigned notes, and several other problems would simply go away.
Policies really need to be made with better vertical as well as horizontal transmission for optimal understanding of local impact.
Regarding personnel supervision and management: We need to be able to FIRE people who cannot or do not do their jobs. Right now that is nearly impossible."
"See previous reply - same here, with the addition that we do need more after hours capability in the cbocs."
same as previous
same as previous

"Need additional therapists/clinicians (current openings in program); improvements in information technology to assist in looking at openings across a team (not just an individual) and to better gauge openings for EBPs for PTSD (i.e., weekly therapy slots for a provider); personnel/management: clinicians and staff are supervised by individuals not on team at this time, and this at times results in inefficiencies and complications in the process, and there are minimal incentives for the staff how are demonstrating efficiency"

"telemental health is widely used for PTSD assessment, however, the scheduling of providers to match room availability in the CBOC can be challenging; TMH to home could be suggested after the evaluation, but clinically we prefer to assess first within a clinic; there are numerous people involved in the process; the TMH lead is readily available and helpful but remains a more time-involved activity to arrange these assessments and coordinate with the local supports on the patient's end"

"telehealth has been an option to increase service delivery for those clinics with gaps; however, room is needed in both locations; telehealth coordinator has been very available and helpful, but a centralized scheduling strategy to streamline these efforts would be helpful"

"CBOCs are offering evening and weekend hours, but need additional staffing that can work weekly in evenings to permit delivery of EBPs in evenings); CBOC providers also need to cover numerous functions, like PC-MHI in CBOCs based upon central policies; they seem to be divided into too many essesntial and mandatory roles that little time can be left for EBPs"

long waits within the VISN for PTSD beds at several locations; it would be beneficial for more TMH to be utilized for assessments and intakes for programs

"most important issues (order of importance) are
1, HR to increase efficiency of hiring process
2. need to recruit more LIP
3. VA to provide better IT support to build clinics and manage work load"
"1. improve efficiency of HR hiring
2. increase LIPs
3. better techinical and administarative support"
"1. increase speed of HR hiring
2. increase number of LIPs
3. increase administarative and technical support"
"1, increase speed of HR hiring
2. increae number of LIP
3. increase admin and tech support
4. increase salary for physician so VA can be more competitive"
"1. increase speed of HR hiring
2. increase salary for physician
3. increase number of LIPs
increse admin and tech support from VACO"
"1. increase speed of HR hiring
2. increase number of LIPs trained in EBP
3. VACO to help in tracking EBP outcomes"
VACO should be more cooperative and direct in assisting each medical center and write clear policies. Most policies are vague and cause confusion between MCDs and Chiefs

Working to increase the availability of services
Working to increase the availability of services
Working to increase the availability of services
Working to increase the availability of services

"--We need to be able to hire and retain talented clinicians, such as psychiatrists, psychologists, social workers, and nurse case managers with a background in psychiatric care.
--We need the support staff to be able to do less administrative tasks as c"

"--We need to be able to hire and retain talented and trained clinicians. With the disparity in pay between professions (i.e., social work and psychology) that are providing the same trained services (i.e., evidence-based treatments for PTSD), we are seein"

"--Our CBOCs need additional staff in the form of psychiatrists, nurse case managers, psychologists and social workers. However, with space being an issue, the amount of additional staff provided would need to come along with the addition of space.
--Tel"

"with the volumes of Veterans needing services, outpatient mental health needs to be able to hire and retain psychiatrists and/or nurse practitioners to meet the demands for medication management. additional clinical pharmacists would be helpful in reviewing medications for interactions and educating Our Veterans about how to take their medications. nurse case managers would be helpful in assisting to follow up with Veterans in between appointments."

"Adding personnel to the CBOCs is critically important, but space is an issue in that additional space is needed to house any new staff. Increasing the use of telemental health services in critical both for pharmacological interventions as well as therapeutic interventions. However, there needs to be adequate space and technology available to make this happen."

"Space has been a constant worry over the last 15 years. Our facility was built as a hospital and much of the space has been jury rigged to work as outpatient offices. The speed at which space is fully remodeled and repurposed does not keep up with the hiring of staff and expansion of services. We have new ""watched staff"" coming on board with no offices for them to land in, no furniture as of yet as well as other resources. I truly believe the problems don"

"The biggest single challenge for our PTSD care providers has been that the volume of patients seeking care has increased over time and we have needed to grow our clinic which we did with recent access staffing hiring initiative.
   The evidenced based psychotherapies are a tough sell with the veterans as whole. It is not easy to get them engaged in a therapy process that requires more active participation - but this is true in the civilian sector as well. I think the national expectations for the adoption of these therapies and their clinical penetration was unrealistically hopeful."

"CBOC's are contracted space and over time our clinics have become landlocked with no space to grow into.
  Hiring in some of the rural areas has been difficult. The recent pay band changes for Psychiatry have helped and without this we would have even more openings. We may not pay more than the community but at least we are closer to being competitive. Students loan repayment has also been effective in recruiting for some positions. These are welcome additions."

"The hiring of prescribers in more rural areas has benefited from recent pay band changes but there is a nationwide shortage of Psychiatrists. I think advertising loan repayment options in a more obvious way would help - right now they are there but a bit of secret.
   Space and office equipment are challenges that vary over time."

Again staffing in rural areas can be difficult. We seem to be able to find qualified PHD and MSW therapists. Hiring practices are clunky and we could use some support and flexibility with regards to the behind the scenes work that must occur to hire someone.

"All mental health staff have to work together at improving scheduling and access. MH is not staffed nor is it''s space ready to adopt a PACT like model and so more of the day to day task fall onto the clinicians to perform or manage. In tour MH clinic the prescribers do the bulk of the reminders but for our primary care teams the MA's and RN''s do the bulk of the clinical reminders.
  The mental health treatment planning software has added little in the way of value added. Why must we use this if we are the only MH provider seeing a given veteran? Does a team of one need to write

themselves a treatment plan to follow - this is a time waster and feedback on national calls seems overwhelming negative and yet we persist with it."

"Need more beds space (funding) to increase patient flow. Also, will need additional nursing and clerk staff. Also, retaining qualified employees is VERY challenging. Need incentives that are attainable and renewable."

Increase clinical staffing in CBOCs to meet workload demand
Increase CBOC clinical and support staff and office space to suppor them
Increase clinical and support staff in CBOCS and provide the space necessary for increased staffing

"The incredible length of time it takes to hire psychology staff is absolutely an impediment to having services available. Also, staff who are "maxed" out on the GS scale often lack the incentive to be anything other than ordinary in their work performance---needs to change!!"
make the hiring process quicker!!
mandate that providers must be trained in EBT's
"our time is constantly bombarded with e-mails, trainings, surveys,meetings etc."

"PTSD IS a PRIMARY reason MH services in VA exist---yet we are funding more and more general care. Soldiers from OEF-OIF are becoming Veterans, with PTSD as one of their signature injuries, but PTSD programs not gaining staff. The idea apparently is that patients will do BRIEF work in PTSD, then transfer to general care---but most traumatized vets have great difficulty trusting, and transfers of care are problematic.
 scheduling system is a dinosaur (VISTA)
We are CONSTANTLY being pulled away to deal with mandates and measures. The paperwork requirements are overwhelming.
More performance incentives for THERAPISTS (GS 11-13 Psychologists and GS11 SW), not just for Psychiatrists. More ability to promote, and based on merit, not longevity
Fee basis care is expensive and a logistical nightmare, as is the CHOICE act.
Stop throwing quick solutions at the VA without talking to clinicians rather than adminstrators at a high level only."
We need more psychiatrists AND we need HR to make hiring easier and take off restrictions on who we can hire.
"We need more therapists/clinicians in PTSD--primarily either psychologists with real training in EBP's, or experienced social workers"

"Need more providers, particularly psychologists. Need additional space in the CBOCs for tele-mental health. Need more bandwidth."
"As before, space, tele-MH providers, particularly psychologists, more bandwidth."
"Need more space in CBOCs, more providers, more bandwidth. Many community providers don't have the skills needed to treat military related PTSD."
"Same answer, more space in CBOCs, more providers doing tele-MH, more bandwidth."
"Same answer, more space in CBOCs, more providers, more bandwidth."
Mental Health Suite Treatment Planning is cumbersome and doesn't integrate with CPRS well.

"The community lacks the quality of care that the VA demands of us and using FEE or community to service our Vets also makes it difficult to coordinate care. It requires a whole new level of managers to make sure the patients don''t get lost and the quality they are receiving in the community are up to

standards. VA Handbook 1160 is very proscriptive in must do'' for our providers/patients with unreasonable demands given staffing. It requires that Psychiatrists become Case Managers for their patients using Behavioral Health guides (stronger than normal JC guides for mental health). This requires teams with case manager in the team to actually do a "recovery based"" treatment plan. The documentation requirements and paternalistic rules for managing patients are so overwhelming that it over tasks the providers and causes huge morale issues. In addition we have been begging for space for the past 5 years and are yet to see any movement on this. The biggest reason I am told is the Contracting and in this Town where there is a big military presence we have to compete with all the other federal agencies when we need any thing done that involves a contract. We lost a mental health building because it took two years for contracting to offer the owner a bid and then the property had appreciated so much in that time that the owner laughed and turned it down. We find that patients generally do not want late appointments, some will use Saturday but many of the young who have families do not want either. So these clinics are not well utilized. I do not have enough providers to cover both weekends, evenings and day time clinics, as this requires extra support staff and give I also have to cover call this is another morale downer for providers. Central Office now realizes that MH teams need to be exactly that , teams, so we can do all the things the Handbook requires but this also requires hiring more administrative staff and nursing. We have a long way to go to get staffed up to the recommended BHIP size and in addition pair down the recommended panel size per BHIP. This would enable us to better" "Case Manage"; our patients but we cannot do it if I don''t have space in which to place the teams. Finally HR rules are onerous and outdated and interfere with getting well qualified applicants hired timely. The process requires to much level of oversight by the head of HR because of common mistakes made by the HR representatives. In all my years of trying to understand the inefficiencies of HR the only thing I can surmise is that you must have to have a PhD in human resources at the very basic level of helping a service get providers on board because despite all the training they have had the rules keep changing like a moving target so paper work keeps getting returned and in the mean time the provider we are trying to hire takes a job elsewhere and we have to start all over again." Please see my previous comments they apply here as well.

"My comments remain true for every aspect of care. I do want to add that for substance abuse services I need a more beds to be available and a large facility so we can do a better job of offering Intensive Outpatient Services. Currently we are managing but we had to build extra office space on the porches of the existing building. [potentially identifiable comment redacted]

I want to emphasize that the community cannot even take care of the community at large so to use the community to manage our patients is not an option. Also most of the community lacks the skills of evidenced based therapies and hence cannot help our veterans with the same quality that we have trained up to do.

In order to case manage our patients I need more administrative and nursing support."

Please see previous comments.

"Please see previous comments. I would like to add that additional personnel needed are substance abuse counselors and Addictions Psychiatry, especially if Extended Hours, I am currently not adequately manned for extended hours as I do not have enough personnel to offer this service and keep operational during normal duty hours too Immediate (same day) appointments are expected and difficult to accomplish also secondary to manning, but I need space if I am to grow in manning. I do believe that same day appointments are essential in this population because you have to catch them when they are ready. Secondary to the lack of space (see previous comments about our Domiciliary, our outpatient program shares the building) we are at critical mass for being able to expand and offer good coverage of services to this population."

"The mandated use of Mental Health Suite for treatment plans has only added a layer of unnecessary, inefficient, not patient centered and useless paperwork for both the patient and the provider. It

consumes time and does not lend itself to producing a plan that is recovery based or easy to read and understand when printed. It needs to be scratched and un-mandated. We are now starting to use the ”standardized““ templates for EBTs, but I have heard they are in need of ““tweaking““ but this is a welcome over the MHS. Again because of the expectation of case management I need more nurses and lower level (SW or LPCs) to help with coordination of care issues."

"Mental health staffing and space is the biggest issue. The VACO office of mental health operations has outlined staffing models but our facility cannot meet demand and we are not staffed properly. In addition, we are unable to compete for certain disciplines - nurse practitioners in particular-with the local metro market and even the VISN. We have had recruits decline due to pay. Our psychiatrists are at least 20K under the metro. My last three hires -including two from other VAs [location redacted] are taking a paycut to come here -coming for other reasons (spouse job, etc). Equipment needs for MH are related to telehealth infrastructure. VISN [location redacted] is huge geographically - our ability to provide high qulaity care to our rural vets depends on improved infraastructure including expanding innovative modalities - CVT into the home. The inability to lease space, the time it takes for new buildings to get approved for construction,etc are untenable in a 1a facility with a 8% growth rate for the past few years. We have already outgrown some of our blueprints that have yet to be built. Recently VACO OMHO did change access measure for MH to 30 days which is better. Would revisit critically all metrics and compare to what other MH care systems (non-VA) are doing. Staffing models seem to neglect the importance of administrative staff, -MSAs/PSAs, data analysts, etc. The regular occurence of downgrading positions and not classifying positions for folks based on their own expertise and experience also negatively impacts recruitment and retention. the process for fee-basis and contracted care is very cumbersome and not easy to navigate. HR and MPS services are understaffed and take too long to onboard staff -we have lost recruits as a result."

previous comments secction addresses most concerns. VACO OMHO expectations for evidence based psychotherapies (EBP) - metrics are too idealistic and difficult to achieve in a high growth 1a facility. In order to have robust programming of EBPs you need to have adequate staffing models of psychologists and SWs (we do not meet the BHIP staffing model requirements) - our focus is on access -again with the disproportionate growth in unique Veterans vs growth in staffing - making the frequency requirements of these EBPS (X #of sessions in Y #of weeks) difficult. One comment on telehealth capacity within the Portland CBOCs - there is no space-multiple tele services competing for in most places a single tele room. Services that have telehealth as a core mission must have dedicated space in CBOCs. Clinicians are doing admin work -not at top of their license due to shortage of admin staff

evening and weekend clinics would be wonderful but we cannot realistically contemplate here in Portland without staffing increases.

same as previous comments.

with not being able to provide market pay - the education mission is often what appeals to our applicants and why we are able to get high quality staff. THe requirements for three contacts post no-show for all Veterans is burdensome and is in direct conflict with the conceptual model of recovery and ownership of one's own care. Would like to actually see evidence based support for that required policy. This is also not the community standard. Does make sense for oflks with a high risk suicide flag.

Re-designing MH services delivery in alignment with current provider scarcity realities and evidence based medical interventions.

Staff all RRTP beds in the VISN. Make admission process more transparent and efficient. Consider using TeleHealth to screen Veterans

"The number of Veterans seeking services have outgrown the clinical admin infrastructure. No issues with clinical staffing, but most service lines are thin in terms of AO, MSA support. Too many requests coming from VACO for data that require considerable time to collect."

"We are in critical need of additional staff to provide services. Particularly, med providers including psychiatry services. We also need improvement in our electronic medical record. It is difficult to use." Increase the number of providers available to improve veteran care. We do not have enough psychiatrists or other med providers. We also need increased levels of therapist and admin staff.

Some VACO policies make things worse. The MHTC policy has created a tremendous amount of work for clinicians with little to no gain in patient care.
We do not have enough PTSD staff to meet the needs. We need additional clerical support. Some VACO policies (i.e. MHTC) take time away from critical patient care.
CBOC staffing is inadequate for the patient needs.
General mental health does not have enough clinicians to provide psychotherapy; they essentially function as case managers.
"CBOCs do not have enough staff to meet the needs, and also have space issues."
"We do not have enough staff, nor do we have enough space."
"Clinicians spend far too much time on nonclinical duties. We have a ridiculous amount of irrelevant TMS trainings, for instance."

Allow managers to hold employees more accountable and terminate employees who are repeatedly performing poorly. The union interferes with this and perpetuates the problem.

"We need:
- Pharmacists, technicians, psychologists, clerks, SW and supervisors.
-Infrastructure to track Non VA cases at the clinical level."
"We need more technical support and adequate staff to assist the clinician in the scheduling, care management, evaluation of the Veterans in need of the service."
CBOCs lack the staff and supervision to implement our mandates and provide same level of care.

"We are having to pull clinicians away from clinical care to keep up with the growing amount of time devoted to complete administrative requirements, training, completion of reports,etc. The effeciency of providing care is being greatly reduced."

"licensed independent practitioners: psychology, psychiatry, and social work; need more administrative support staff especially at clerk level; IT: scheduling package should allow us to view a single provider's availability at a given time regardless of stop code/ clinic number - an Outlook-type schedule would be helpful; we need to improve the way we deploy all of the staff with an emphasis on providing same day access for new patients, not just patients already enrolled - requires cooperation across all disciplines; some other solutions: creating greater availability of same day access particularly for new patients by making more efficient use of resources, including same-day weekend and evening access"
Need additional psychologists/social workers in PTSD Clinic.
increase number of psychologists and social workers in PTSD Clinic; assign psychiatrists to PTSD Clinic

general mental health is in need of additional LIPs in order to be able to offer weekly or every other week therapy (in order to prepare for or augment PTSD specific treatment) for veterans on a consistent basis. This would also require additional space as our system currently has some MH providers without

a full time dedicated space. We are also in need of additional program support assistants to support the number of clinicians and programs in our system.
All LIPs sharing case management duties rather than consideration of dedicated case managers in system.

"Need new scheduling package
Need to be able to pay and otherwise provide incentives to providers with less restrictions"

"Some CBOC''s are short staffed on both psychiatrists and therapists. This impacts access to care, especially therapists trained in evidence based practices for PTSD. More evening hours for telehealth and couples based treatments are needed at several locations"
See question 2 comments
See answer to queston 2

"We are having difficulty recruiting clinical staff in CBOC''s in rural areas. MD''s, psychologists and LCSW."
Difficulty recruiting med providers
retention-recruitment incentives would help with this.
Increase space for CBOC for groups and for access to Vtel for each provider.

"VISTA scheduling package was designed more than 30 years ago. Creates numerous problems with convenience, access, efficiency, and Veteran satisfaction.
We lead the nation in the use of telemental health and need to expand it further. Is a great thing--rarely done well in the private sector.
Would be helpful for efficiency to have additional TCTs for our clinicians doing telemental health"
Marked N/A for ""fee-basis" question as we only very rarely need to do utilize fee-basis for clinical care
Are hiring new staff and anticipate resolution of minor delays in pharmacotherapy appts for established patients within the next few months.
"See response for previous comments section,
Would also be helpful to have additional CBOC TCTs"

need additional subspeciality licensed independent providers.

"3 psychologists, one nurse practitioner, one nurse supervisor, one clerk"
"two RN, three psychologists, one MD, one NP, one LVN"
"two RN, three psychologists, one MD, one NP, one LVN"
"5 psychologists, one social worker, 1 clerk"
"3 psychologists, one clerk"
"3 psychologists, one clerk"

Limited space beds for inpatient or residential PTSD. Some veterans choose to wait for Northport PTSB bed rather than going to another facility for the program. They are followed by MH.
Could always use more therapists to conduct individual psychotherapy. Have evening and weekend hours currwntly.

Increase efficiency of the consult process

Increase EDRP money available to stations. We cannot offer without money. Need more telehealth equipment and space for providers.

"Provider space, EMS equipment, CPRS training, local PRRTP program"
"Need more provider space; focus on clinical care not political care; eliminate government roadblocks and bureaucracy, eliminate irrelevant and unsuccessful measures unrelated to providing good clinical care, revamp phone and scheduling programs"
See previous comments
"Provide MH-RRTPs locally for each medical center, sending Veterans long distances does not support reintegration and recovery into their local environment, family, friends and/or community"

"More IT support and updated PC''s and printers
Too much time away from clinical work with too many traininjg requirements and burden of the amount of clinical reminders.
Higher grade and pay for secretaries for more effecient and more capable suppoirt staff."
"More IT support and updated PC''s and printers

"Ineffecient secretarial staff.
Burden of surveys, reviews, reminders, training."
'

Changing performace based measures to assess patient outcomes. Majority of focus is on access to care but not quality or evaluating effectivness of interventions. Policies to support the delivery of evidence based treatments over supportive care/case management. Providing incentives to providers who routinely implement and provide evidence based treatments.

"Most of the delays in Veterans receiving services are in general mental health, not in the specialty clinics (like, PCT, MST, PRRC, etc.). Access to speciality clinics is great. I think that Salisbury has been slow to implement BHIP teams, and this is just starting now, which will help access in general mental health. Also, our leadership in mental health is not very supportive or respectful of its staff, so staff morale can be low, which inevitably affects patient care, timeliness, etc."

We are out of space and we need to add additional providers to meet the need. We have a large volume of referrals to contracted providers (about 20%) but many Vets insist on being seen at the VA.

Improve amount of TMH and greater case management and administrative support.
Adding personnel at CBOCs is critical.
Use of consults has added significantly to the administrative burden.

[Location redacted] has submitted expansion plan to VACO for additional Residential Rehabilitation Treatment Program beds (2015)

"addition of case manager/nursing personnel to help coordinate care, complete clinical reminders and administer symptom rating scales would be beneficial, have adequate number of LIP positions but several vacancies and filing vacant positions is a lengthy process. addition of TMH services would help access and requires equipment, staff and space"
"Not enough TMH access at busiest CBOC-adding service requires space, staff and equipment"
"Program has adequate positions approved but several open vacancies and lengthy process to fill, having case management/nursing staff to help with care coordination and paperwork would be helpful,

expanding TMH would require new equipment as well as staff at the remote site and program being fully staffed with providers trained in EBTs"

"increased availability of TMH services at CBOC would decrease delays in service, increasing TMH requires equipment, space and staff at both locations- fully staffed with providers trained in EBTs in order to provide services"

"increased availability of TMH services at busiest CBOCs requires space, equipment and support staff to make service run smoothly at remote location and requires PTSD program being fully staffed, being able to refer those out who can not be served in a timely manner is essential"

"increased access through greater availability of TMH especially at heavily utilized CBOCs, offering extended wkends and evening hours, fully staff and addition of staff to support LIPs, ability to refer to community providers when necessary"

"LIPs spend time making no show phone calls, entering symptom rating scales that could be done by staff with less training, we have good administrative support but when that person is out often have no coverage, patients call central scheduling to cancel but clinic is not notified, computer often is slow impacting workflow"

"- need for additional psychologists and prescribers (psychiatrists and/or NPs), as well as nursing support - antiquated VISTA scheduling system and clinic grids do not allow for sufficient flexibility in scheduling to better meet veteran needs"

"A major impediment to utilizing more telehealth for provision of psychopharmacology is difficulty accessing telehealth clinic slots at the CBOCs. To some extent this is due to limited space (only a single telehealth room to be used for all specialties across the Atlanta VAMC system and limited coverage with TCTs if on leave). Bigger issue is related to scheduling. It would be very helpful to have an active calendar that demonstrates all clinic slots available for telehealth so that any available slot can be booked if it matches the psychiatrist and patient schedule. Currently, different programs typically have specifically assigned slots (i.e. Thursday from 2-3 pm) that may not match pt scheduling needs and therefore may be going unutilized but could be used to provide clinical care for other services who might be able to utilize that slot. In addition, telehealth requires separate clinics in CPRS, which does not allow for psychiatrists to flexibly utilize any clinic slot they have available to see a telehealth patient, but again locks them into more''rigid'' slots that may not meet patient needs or CBOC telehealth availability."

"Very similar issues to previous question. One of the main issues impeding provision of these services by telehealth is availability of accessing telehealth clinic slots at the CBOC. To some extent, this is related to limited space (one single room utilized for all telehealth services provided by the Atlanta VA system) or limited personnel (providing backup for TCTs when on leave or pending hiring/backfill). Bigger issues relate to lack of flexibility in scheduling. Rather than having a ''real time'' calendar that demonstrates all clinic slots available for booking, in general there are specific slots assigned to a given program (i.e. Thursdays from 2-3 pm). If that slot does not work for the patient(s) then it may go un-utilized, whereas other services may be able to utilize that slot. Similarly, the requirement for separate telehealth clinics locks therapists into specific clinic slots for provision of telehealth (which may or may not meet patient needs) rather than allowing them to flexibly utilize any of their clinic slots to see patients via telehealth."

"There is not a PTSD RRTP associated with the [location redacted] VAMC despite a very large population of veterans diagnosed with PTSD and a large Trauma Recovery Program with clinicians with significant expertise in the treatment of PTSD. The primary barriers are physical and staffing - building space and residence space are needed to create a PTSD RRTP associated with the [location redacted] VAMC and staff are needed to provide care (psychiatry, psychology, social work, nursing, peer support, residence

staff) during days, evenings and weekends. Currently, veterans often need to wait for extended periods of time to be accepted into and enrolled in PTSD RRTPs outside the VISN."

"1) No show rates are at approximately 15%. As no show reminder calls are not made in a sufficiently reliable manner, we are beginning a pilot of ''robo calls'' to provide reminders

2) due to limited administrative support, much clinician time is devoted to consult management, data tracking (i.e. treatment plan completion, medical record review, etc.), and scheduling outreach."

- **SUD**

"Space needs include additional access to group spaces at main campus, and space for individual and group sessions at all CBOC"

Space is a critical need at all CBOC

"Similar responses to previous questions. Group space is important for ability to do additional group therapies, as are additional substance abuse counselors (more than one dedicated outpatient counselor for facility and CBOC''s). Adding additional supervisors and/or management ""bandwidth" would be helpful, as would fee basis. Evening hours helpful only if additional staff."

Simply need additional psychiatrists; numbers are critically low with two suboxone-qualified outpatient psychiatrists on deployment or indefinite leave.

Need more psychiatric providers. Additional education and support for prescribing in this area from general psychiatric providers could be useful as well.

"Need more psychiatrists. In addition to vacancies, currently two outpatient suboxone-qualified psychiatrists are away on leave or mobilization."

Same answers for section 1 detailing challenges with outpatient SUD services.

Same comments as section 1 detailing SUD services

"At many CBOC sites, CPRS bandwidth is severely limited and very slow computer responsiveness. If all required activities were actually completed (reminders, treatment plan in MHS by all disciplines, note, encounter, med reconciliation, safety plans and risk assessments), outpatient time on charting per encounter is significant, with most of this done by provider rather than medical assistant. A primary care provider will appropriately have three support staff, a cardiologist or specialist will have a nurse. A psychiatrist is expected to work with a fraction of a nurse and a fraction of a scheduler."

Support SuD Business Plan to have veterans seen on more odd tours of duty and SUD focuse teams for weekend clinics duty.Expand MAT TX in CBOC s.

Community Fee-Base programs feels that VAs are not paying enough vs medicaid rates.

Veterans wanting the improvement to occur in VA and not contracted to some programs that have poor enviorment for recovery.

Continue to improve SUD Quality of care.

"1. Technology: telehealth from home would improve pt access and outcomes but VA would need to supply ipad and needed equipment. Standardized biofeedback equipment such as apps and finder monitors which are used on personal cell phones be funded and made available to veterans for mood regulation.

2. CO policies: maintain centralized SUD services for uniformity; establish earmarked funds for SUD rather than fund through general mental health dollars; continue trend to monitor by effective, outcome-based bench-marking.

3. Personnel: recommend all BHIP teams have designated SUD specialist for identifying SUD issues, provide Brief Intervention, case management. Recommend the acute phase of treatment each SUD sub-speciality have MD specializing in addictions, a nurse practitioner, social worker or psychologist, addiction therapist, and peer support, Specify staffing models for different levels of care based on ASAM criteria to include designated staffing for ancillary/support services such as gym, recreation therapy, occupational therapy, vocational rehab. Ancillary services are critical to reconditional the limbic system/ leisure time activity and reduce relapse risks. Such changes provide uniformity and consistency among all VHA.

4. Recommend all sites have ability to use dip sticks for immeidate/ on-site urine drug screens"

"VHA standardized bed board and intrafacility consult process for referrals outlining best practice for points of contacts and referral authoriztion to reduce bottle neck when sending to another facility. Also, travel pay guidleines needed so monies are available to transport veterann to and from out of catchment area facility"

"1. Technology: telehealth from home would improve pt access and outcomes but VA would need to supply ipad and needed equipment. Standardized biofeedback equipment such as apps and finder monitors which are used on personal cell phones be funded and made available to veterans for mood regulation.

2. CO policies: maintain centralized SUD services for uniformity; establish earmarked funds for SUD rather than fund through general mental health dollars; continue trend to monitor by effective, outcome-based bench-marking.

3. Personnel: recommend all BHIP teams have designated SUD specialist for identifying SUD issues, provide Brief Intervention, case management. Ancillary services are critical to reconditional the limbic system/ leisure time activity and reduce relapse risks. Such changes provide uniformity and consistency among all VHA.

4. Recommend all sites have ability to use dip sticks for immeidate/ on-site urine drug screens

5. More clinicians with certifications in SUD. Currently, SUD certifications are not reimbursed and pay scales to not reflect if paid out-of-pocket by provider. Addiction therapsits need to be Level I and Level II independent providers within the VHA system to practice their full capability and reduce clinical supervision requirements."

"1. Technology: telehealth from home would improve pt access and outcomes but VA would need to supply ipad and needed equipment. Standardized biofeedback equipment such as apps and finder monitors which are used on personal cell phones be funded and made available to veterans for mood regulation.

2. CO policies: maintain centralized SUD services for uniformity; establish earmarked funds for SUD rather than fund through general mental health dollars; continue trend to monitor by effective, outcome-based bench-marking."

"Frontline clinical prescribers needed with specialty in SUD with devoted labor-mapping to SUD clients solely so emphasis, time/ attention is provided.to this difficult, complex, veteran population"

"See question 3 for suggestions.

1. Personnel: increase SUD specialization/ knowledge through incentivizing SUD certification as associated costs of obtaining SUD certification is not currently reimbursed by VA and does not increase staff pay if such costs are paid out-of-pocket.

2. Also, revised personnel standards/ qualifications to allow for addiction therapists to be AT 1 for entry level and AT 2 for advanced level providing a licensed independent provider status to those with a master''s degree."

Limited physician time limits how many admissions we can schedule. WOuld help if we broadened the time period for completion of admission process for them and allowed for more activities to be done by other providers.

incentives needed to take referrals at other sites when we send them

Preparing copies for group sessions could be done by admin staff.

Would require an added addiction psychiatrist and another nurse practitioner who could do the physical screening so that the person cold be staffed and inducted.

"1. Rules about how quickly veteran services need to be scheduled in the community are not dependent on VA referral agents. Rather, it is dependent on the outside agencies. This puts heavy pressure on VA staff who cannot control the speed in which the No-VA Care agency gets the veteran in for services.

2. VA needs to market and recruit more Non-VA Care agencies in some areas (e.g. Methadone/Suboxone) as there is far more need and not enough services available."

"1. Increase in number of residential beds, especially "dedicated residential beds", would reduce need for Non-VA Care referrals.

2. Increase in residential staff, along with unit nursing staff, to accompany the increase in number of beds, would also reduce need for Non-VA Care referrals.

3. Increase in marketing and recruitment of Non-VA Care agencies that provide residential services in areas that are geographically far from Cleveland, yet fall in our VISN."

"1. Need added office space for new staff (see below).

2. New addiction psychiatrist to see added Suboxone patients.

3. New nurse practitioner to complete necessary physical exams and screen new patients for Suboxone induction."

Work on marketing and recruiting added Non-VA Care agencies that are accredited and can provide Suboxone services to veterans in more geographically remote areas.

"1. Need added office space for new staff (see below).

2. New addiction psychiatrist to see added Methadone patients.

3. New nurse practitioner to complete necessary physical exams and screen new patients for Methadone induction."

"1. Increase number of residential beds.

2. Increase number of Dedicated SUD Beds

3. Increase number of Providers and Clinical Staff

4. Increase number of nursing staff on the unit"

"1. Add more residential beds

2. Add more dedicated beds for addiction (e.g. SUD) treatment

3. Hire more Providers and Clinical Staff

4. Hire more nursing staff to run the new/expanded unit"

"1. Add more residential beds

2. Add more dedicated beds for addiction (e.g. SUD) treatment

3. Hire more Providers and Clinical Staff

4. Hire more nursing staff to run the new/expanded unit"

"1. Clinical staff do perform a lot of administrative duties - CPRS documentation and other paperwork is cumbersome

2. CPRS problems result in Open Encounters - glitches in system are known but local says national CPRS will not (cannot?) fix them

3. Program did not have enough administrative support for number of months, recently rectified

4. Problems with scheduling, do not preschedule residential appointments due to vets having other appointments - avoid missed opportunities

5. MHTC Coordinator assignments do not make sense for a Specialty MH service"

"Methadone Maintenance not available in the ECHCS aside from fee-basis to community providers. There are 2 vendors in the [location redacted], both with wait times. Individuals who live in more remote areas often cannot travel to clinics daily for dosing, as is required in the early stages of

treatment. Fee-basis approval can be a slow process as there is limited staff to process consults and limited programs in the community that offer this service"

"There are not currently fee-basis relationships with any treatment providers in the community. Would suggest increasing access to community SUD treatment providers, to include detox services. Currently there are no options to refer veterans to services in the community. Transportation makes it difficult for veterans to attend the level of treatment needed for SUD services. Would like to see Choice Act and/or fee-basis include community providers to allow patients better access to services in their community."

"There is no available VA residential care for SUD in [location redacted]. We must refer to [location redacted] for services. Often there are lengthy application processes and complicated travel arrangements for treatment. There is also not a centralized way to know about waittimes. It would be beneficial to have residential services available in Colorado, be able to reimburse for payment in the community and/or streamline the process for referral/admission for residential programs in other states."

"Alcohol withdrawal is managed by inpatient medicine. There are not currently options for outpatient detox, nor preventative medical detox. Services are only available for individuals who are in acute medical crisis due to withdrawal. Would recommend increasing services for this population, to include reimbursement for community detox facilities."

Opioid Withdrawal Management is not a service provided by ECHCS unless there are complicating medical factors. This is a high request area with little resource to address it. Would recommend increasing availability for this service and/or providing reimbursement for these services to be provided in the community.

"SUD services are not offered in all CBOCs, despite identified needs. Would recommend ensuring all CBOCs offer sufficient services for SUD, or providing reimbursement for community providers in areas where services are not available."

"increasing staffing and room availability would allow for shorter wait times. In addition, more resources in the community would likely increase access to services, esp for people living outside the Denver metro area."

no residential services offered in [location redacted]. Must coordinate with surrounding states.

"increasing staffing and space would allow for expedited access, as would more available community services."

"High rate of no-shows, not enough support staff to make reminder calls. Need additional staffing for urinalysis, breathalyzers, etc. No peer support available."

Limited number of SUD beds for rehab (five beds) leads to gap in time between inpatient care (detox often) and beginning rehabilitation. Need space and funding to increase SUD rehab beds. Need nurses and rehab techs to accomodat patient load.

"Again, bottleneck is seen with small number of SUD beds in rehabilitation program."

need more physician assistant support for assessments

Need SUD residential care which does not require homelessness as part of eligibility.

"decrease ratio of supervisory staff to clinicians in general mental health clinic. Consider adding psychiatrists and allied health staff to SUD program for direct admission capability and team based care within SUD. Increase support for mental health from human resources, particularly in terms of managing employee accountability and hiring."

"1. increase HR speed of hiring
2. increase number of LIPs

3. increase admin and tech support from CO"
"1. increase speed of HR hiring
2. increase # of LIPs
3. increase salaries
4. inform MCD of importance of MH staff and not to hold off hiring in MH becasue of percieved low producitivity"
improve communication to residential facilities.
"train more providers in suboxone
pay suboxone providers more"
improve communication between medical centers and residential facilities
lack of suboxone providers in the community who can take on more patients
increase residential beds and improve communication to residential facilities
lack of beds in residential facilities
lack of beds in residential treatment facilities
"too much admin requirements from VACO, OMHO, VISN and others"

"WE DON''T HAVE A METHADONE CLINIC OR ANY OPIOID SUBSTITUTION CLINIC HERE, NEED TO DEVELOP ONE."
"GIVEN WAIT-TIMES AT ANY AND ALL MHRRTPs, I''D SUGGEST CREATING MORE MHRRTP BEDS NATION WIDE"
ANY QUESTIONS PERTAINING TO DELAYS IN RESIDENTIAL CARE AT THIS FACILITY REVOLVE AROUND HAVING AN INSUFFICIENT NUMBER OF RESIDENTIAL BEDS
"ALOS IN OUR RRTP IS, IN MY ESTIMATION, ENTIRELY TOO LONG"

"Increase psychiatrists, psychologists and SW with SUD training. May need to employ incentives to entice trained and experienced professionals to a rural area. Nurses with specialty training could be very helpful."
"Could use incentives, bring in specialists to CBOCs (psychiatrists, psychologists, social workers, trained in SUD work), there are few fee-based providers in rural areas."
"Hard to get qualified and experienced SUD providers within rural regions, let alone para-professionals able to provide support. Incentives would be helpful but there are few local/fee based providers in rural regions."
Would help to hire professionals by offering incentives and providing support.
Its difficult to comment on local resources in a rural community where there isn''t enough of many resources let alone specialized care for substance withdrawal. Incentives would likely help but they would likely be more than the VA is willing to consider.
"Psychiatrists and support staff would be helpful but also lab equipment that would allow for testing/screening, etc..."
"Psychiatrist/psychologists, social workers, with incentives for moving to a rural area."
"Would cost way too much to build, hire (provide incentive) and support the specialty providers needed for SUD Residential Treatment Program in this rural setting."

"Need new scheduling package
Need to be able to pay and otherwise provide incentives to providers with less restrictions"

"Space, Human Resources support for timely recruitment, autonomy at service level and less mandates from central office"

"Space, Human Resources support for timely recruitment, autonomy at service level and less mandates from central office. Make a policy for MH providers to work from home (telework) if space is issue."
"Space, Human Resources support for timely recruitment, autonomy at service level and less mandates from central office. Approve telework (working from home) for MH providers."

"Hire additional Personnel - psychiatrists, social workers, psychologists, nurses
Improve access within the system rather than improving access to non-VA fee basis or contracted care
Allow trainees to be certified to do telehealth
Patients who decline appointment must have one scheduled when discharged from inpatient which leads to high no show rates and missed opportunities to fill appointments for veterans interested in care"
"Rather than improving referral to non-VA care the best solution to this problem is to improve access within the VA by increasing staff, space, and other support to accomplish this"

Limited suboxone providers in community and on staff at this time.
Provider availability is limited in the community and delays are longer than any delays we have in house.
"We are hiring more MDs who can provide this service, This is the only solution I can see to help improve access to opiate replacement tx."
"Some patients complete detox but they choose to delay entry into residential or opt SUD for variious personal reasons. This may appear like a delay, but it is patient driven."

RRTP requirements change often and take time to implement and track new requirements.

"1. The shortage of office space to see patients at [location redacted] Clinic and [location redacted] is a rate-limiting step in increasing access. There are additional well-qualified clinical trainees who could expand our clinical capacity whom we cannot accept for lack of space. Further, we have no space for any growth in permanent staffing.
2. The parent site and CBOCs will each need an additional MD with buprenorphine waiver to accommodate the expanding demand for office-based buprenorphine treatment.
3. We need additional RN staffing. Currently there is no nursing coverage when our sole outpatient SUD is on SL, AL, or attending meetings or training. Such coverage is essential for providing high quality SUD/MH medical management.
3. Our main use of fee-basis or contracted care is for methadone treatment for opioid dependence. We have tremendous difficulty with these referrals because local providers find the VA payment systems overly cumbersome and slow, such that most will not accept our referrals.
4. There is an acute need for increased physical space and staffing to provide appropriately supervised specimen collection for urine drug testing. The current, inadequately supervised process allows tremendous room for invalid test results.
5. IT: The current "clinic profile"" and scheduling software is overly rigid and restricts flexibility in meeting patient needs. As an attending psychiatrist, it is appropriate for me to see, within the same clinic half-day, both patients enrolled in SUD treatment and those receiving MH care but not active SUD treatment. It should be possible to have a single clinic profile and to designate the stop code (SUD vs. MH) when completing the encounter form rather than limiting any given scheduled clinic to one or the other. This may seem trivial, but it really restricts flexibility in meeting patient needs. It is an example of the over-segmented structure of MH care.
6. We need higher-paid, better-trained and more thoroughly supervised administrative support staff to provide excellent service in as complicated system as ours.

7. The current "matrix management" system is highly problematic. As an SUD program director, I lead a team composed of clinicians from multiple clinical services (psychology, social work, nursing, psychiatry, chaplains). The ability to define staff roles and responsibilities and provide meaningful supervision is grossly impaired by the cumbersome "matrix"" in which these clinicians' supervisors tend to have limited interest in my input our program''s needs and their employees'' performance in the actual care setting.

8. Given our heavy reliance on CPRS, we need much faster and more reliable computer performance. Significant time is lost every day to computer hang-ups, freezes, etc.

9. The process of referring to SUD residential care at other facilities remains problematic. Each of the RRTP''s has an entirely different referral mechanism and documentation requirements, which makes the process extremely cumbersome and inefficient. The basic referral/application process should be standardized across RRTP''s. Admission criteria need to be explicit and consistently applied.

10. I need increased administrative support as an SUD program leader, to be able to access, search and organize existing computer data about our patients and services. I know that a tremendous amount of potentially useful data is being stored, but it feels like a black box in terms of useful access.

11. In all honesty, there are too many top-down external mandates and measures. The effect is to stifle local initiative and creativity when the overwhelming emphasis in on meeting externally defined criteria. I recognize that some of these measures are valid and meaningful, but a more appropriate balance is needed, respecting the intelligence, initiative and professionalism of "the field"""

We need more inpatient beds.

There is a need for more residential treatment beds in VISN [location redacted].

Need more residential beds.

"Pschologist, Psychiatrists, SW, Clerical, Nurses"

"Psychologists, SW, Psychiatrists, Nurses, Clerical staff.

Use of the MH Ste.

Central office policies are sometimes difficult to meet given many factors including local veteran culture, rurality, etc."

"Need for additional MH Prescribers, space and a process which to streamline access"

"Need for additional MH Prescribers,

Need for additional Nursing support, space, Need for streamlined access to clinical care"

"MH Prescribers, Support staff, space for providers"

Multiple and sometimes conflicting requirments and clinical staff required to complete administrative tasks.

[Location redacted] has a dely in residential treatment due to Supply vs. demand. We have 20 beds with a wait list that flucuates between 2 to 3 months. We need to increase beds and staff in order to eliminate this wait.

We need an increase in beds and staff for SATP Residential and or contracts in the community to provide residential SATP in order to eliminate the wait for SATP residential treatment.

Increase beds and staff to make this service available or create community contracts with providers in the local community for this service.

Either increase beds and staff at the main [location redacted] facility to decrease wait and or create contracts in local communities around the CBOC tro provide this service.

Training opportunities within the VHA system has been down to almost zero. We need continuous training to opportunities to keep providers thinking about the most up to date treatment practices.

Availability of contract methadone clinics in [location redacted]

Ease of getting contracts and maintaining with supervision of contracts - staff availability to monitor. Ability to do telehealth with contracted services.
Ease flow with simplified and expedited administrative and transfer request forms(electronic).
Ease of ability of admit for detox of opiates in medicine and psychiatry service
Availability of local fee basis for methadone.
"Availability of LIPs to help refer and ease of referring to community methadone clinics, e.g. contract and simplified fee basis."
"Additional fee basis care available for residential treatment. Additional staff(counseling, social work, nursing, therapy assistant) for monitoring and documentation."
"Additional homeless housing for SUD patients associated with IOP, additional counseling and social work staff for treatment. Additional contract/fee basis for referral for residential."
"Additional homeless housing for SUD patients associated with IOP, additional counseling and social work staff for treatment. Additional contract/fee basis for referral for residential. Weekend or evening services not avail at CBOCs."
"Lack of clerical support staff for patient visits, groups, meeting minutes. Social worker and doctor/NP calling patients for missed appts. Mult new requirements and standards. Need to cancel missed group therapy appointments. Admin done by MDs, counselors, etc."

"b. Buprenorphine providers, LIPs specializing in addiction
c. Addiction treatment presence in CBOCs
d. SmartBoard, TV, DVD, Projector, education materials, reliable stat lab testing
f. computers need to be able to play DVDs remotely; telehealth scheduling is cumbersome; IT separation from VHA is problematic; national helpline is not effective; telehealth training process changes too frequently and communication is poor.
g. Too many inspections, surveys, and suspenses, for example, this survey took 6 hours of staff time (12 patients could have been seen in this time!)
h. Staff are tired of "over-measurement""; more flexibility with small time off awards."

"1. Renumeration for care by community based providers, who provide Medication Assisted Treatment-Methadone, Buprenorphine, Naltrexone injectable should be competitive to encourage them to sign up and provider services when travel and distance makes it difficult for SARP to deliver the care. Most community base providers shierk from medicare reimbursement rate.
2. DEA to increase the number of pts community based providers can treat in Office Based Buprenorphine. Currently there is a ceiling of 100 pt. per provider. This severely restrict access to treatment."
"1. Increase the pt ceiling (presently 100) that community based, office based Buprenorphine providers can treatment."
"1. [Location redacted] VAMC need a Domicilary program that will provide residential SUD care for pt who need a higher level of care. Our Domicilary program has been in gestation nearly 10 years.
2. Contract with community based residential SUD programs to meet this need."
please response for mental health to residential SUD care
"1. Program could benefit from a Health Technician on team who will assist in collecting urine toxicology screen and sent to Core Lab for processing.
2. Program support specialist to help in gathering data, tracking and trending to help improve quality of care."

Our data suggest 2-3% of Vets are delayed 30+ days. Staffing and staff management seem to be the most critical factors.

"again, staffing and enhanced flow strategies seem to be the most likely areas to furhter improve delays. We have been working at this for several years, but still have room to improve."
Telehealth is popular and so flow through these services can create occasional delays. This is related to staffing and to management of flow.
"We have modest delays in this, which are mostly related to capacity and flow. We are actively managing this but have further room to improve."
"We have excellant services in this area, but still have modest delays in this, which are mostly related to capacity and flow. We are actively managing this but have further room to improve."
"This effects relatively few Vets, but is most closely tied to resources and management of flow. We have been working on this for several years, but still have room to improve."

"Beds are full on a consistent basis, requiring a wait time of 2 weeks for patients vulnerable to relapse."
"Delay in telemed based on high demand within the CBOC's. Need for telemed machines, rooms, etc."
"Increase CBOC provider''s willingness to work with SUD Specialty and pharmacy to offer alcohol dependence medication. Typically is ""turfed"" to SATP to handle, when the primary care provider should work with SATP. Providers appear scared or uncomfortable with addiction and treatment."
"Need more inpatient beds in [location redacted], or create inpatient level of care in [location redacted]."
No healthy environment during 2-week wait time to residential.

"Simplifying adminstrative processes would be a benefit to the Veterans.
More space and more qualified clinical personnel would allow for a slight increase the in the number of Cohort groups in simultaneous operation."
Many of these stem from having a system for capturing workload which allows for some required entries to remain blank - allowing for loss of workload unless fixed within 7 days.

"We are told there "isn''t enough bandwith" to increase telehealth services. I do not understand what this means, but we are often not able to provide the amount of SUD services needed because of this reason."
"I do not have enough SUD specialty staff to keep up with the number of Veterans who are recommended to outpatient treatment. I need at least one additional clinician, but I am told this is not an option."
There are significant waiting lists for other residential programs in the VISN. It is difficult to refer people for care as a result.
"We are in need of at least one additional staff member due to a waiting list for outpatient services. We have enough evening hours and telehealth equipment, but not enough providers to take an individual caseload and facilitate groups"
See previous comments. We are in need of additional staff and telehealth availability to increase services that are needed
See previous comments. We are in need of at least one additional staff member and more telehealth bandwith to provide more services
We are in need of additional SUD speciality staff to meet the demands of the services requested.
We are in need of additional SUD specialty staff and offices to meet the demands for SUD services
We use fee basis detox. We are in need of more services for this and more beds.

More expedient referral process to Parent Facilities with residential programs
"Better incentives for Psychiatrist, more clinical staff in parent residential facilities and/or increase funding for more local contracted residential programs"

More expedient process to referr to parent larger VISN facilities residential programs
better pay for Psychiatrist
Very poor patient motivation to enter rehabilitation program

There are not any inpatient detox services within this healthcare system. We are dependent on the providers at the joint venture. They are sometimes reluctant to provide detox to repeat patients. We would need 24/7 detox capabilities within this HS in order to provide consistent services.

It takes an extraordinary amount of time to get administrative tasks done to make improvements to the system. This needs to be streamlined or simplified. It takes months to hire a new staff leaving services shorthanded. It takes months to hold ineffective staff accountable. We have to weigh whether we should get rid of incompetent staff against how long we will go without staff at all. This impacts patient care on many levels. Maybe we need to outsource HR with incentives to get things done in a timely manner.
It just takes a long time for approval for fee-based services and then to set them up. Also it is difficult to find providers due to them not being reimbursed in a timely manner. Many providers simply refuse to serve VA patients.
Often patients are denied entry to inpatient treatment at other VA locations due to their need to serve their patient population first. We also struggle with timing for patients to come from out of town to detox at our hospital then to be able to go directly to out of town inpatient care. Our facility refuses to lodge them for a day or two and it puts them at risk to have to go home and wait for a bed. The other VAs often refuse to set a date for them unless they detox first. It makes the timing difficult and puts the patients at risk of relapse.
We do not have adequate program support. Our PSA has been moved away from the clinic and is working in another building. Clinical staff are now having to do many tasks that are administrative and not clinical at all in nature. This is a waste of highly qualified and paid clinical employees. This occurs in multiple programs in behavioral health. The administrative supervisor has complete control of this situation and moved all PSAs close to her and away from their clinic staff and patients.

"Understaffing is the biggest problem, particularly in CBOCs. Difficulty recruiting when positions are open is also a problem. Office space becomes a factor if more staff are hired."
Recruiting to CBOCs is particularly challenging. Syracuse is understaffed to offer enough telehealth to CBOCs. Non VA Care works and we use it a lot.
"Our experience in referring to residential care is that they all have policies that Veterans must try outpatient first, before being admitted to residential. This is rigid and does not allow for the outpatient provider''s assessment of a Veterans needs related to severity of substance use, available resources, living conditions, ability to travel for appointments etc."
"I cannot speak to staffing at residential facilities, but the policy of insisting on outpatient first is a problem."
"Again, staffing at CBOCS is particularly problematic and understaffing at the main facility makes increasing telehealth services impossible. Space needs are also a big issue in CBOCs"
"Again, cannot speak to why there are problems in residential sud care. My impression is Central Office policies re mandating outpatient first is an issue that leads to delays"
Allow outpatient SUD providers to determine need for residential treatment rather than mandating outpatient first.
"Not enough admin staff, nobody focused on SUD Clinic, SUD Clinician handles scheduling. team lead is split with .5 SUD, .5 PTSD and the team lead also trying to do PTSD clinical work. Staffing money saved, but reduces functioning of the STS Clinic."

Currently all physicians in the program are exceeding expectations for RVUs. In order to expand services will need more prescribers. We have very poor support for appointment creation and our HAS clerks are consistently short staffed. We need both licensed providers and administrative support staff increases to improve performance of our clinic.

"Long waits for transfer for veterans who would like care at another facility exist throughout our area. Our program is not residential and when we try to assist our patients to get into residential care, we have long waits and sometimes are told that our veterans can''t access the desired program because they have too long of a waiting time for their own residents."

We have not had a substance abuse counselor in the primary care clinic for several months due to slow hiring at our facility. We have just hired one and expect to have this issue resolved. Slow hiring is a problem at our facility.

We do not have a residential program. Referrals out can take months for admission.

"While we are meeting our performance measure for bringing a patient in to the program, we would like better case management from the ER to facilitate patient''s transition to care in the interim."

We have poor administrative support in my clinic and we have not been assigned a permanent program support individual. It is extremely difficult to have appointments scheduled due to very poor HAS support.

"We have a facility in which the majority of SUD services are given. This facility is a rented building that has been maxed out in terms of space. We have created offices on what used to be porch space just to make room for more providers. We are in dire need of a new building so we can offer more beds for Residential treatment of substance abuse. We need more space so we can adequately perform outpatient detox, we also need more technicians and clinical staff so we can provide extended hours clinics. We were on the Skip plan for 2017 to get a new building but I am expecting a delay in this because we also have competing space needs for General Outpatient Clinic for Primary Care and Mental Health and this will take precedence over any new plans for space for substance abuse because Government Contracting is notoriously slow and must prioritize all the projects they have. So far we have not offered substance abuse services as FEE base or contractual secondary to the basic needs of this population along with multiple psychosocial issues that only the VA is geared to manage. This include homelessness, getting engaged in primary care, helping with getting the veteran back to work once they obtain sobriety. WE do have Grant Programs in the community as well as HUDVASH vouchers which help transition for our patients. We offer Buprenorphine but do not as yet offer Methadone. This will be costly once the new handbook is published which apparently has the requirement to offer both forms of treatment. When this happens Methadone will have to be FEE to the community as we do not have the resources to provide this. I understand of all the Methadone clinics in this area there is one that meets SAMSHA requirements. Our substance abuse patients are the most difficult to treat. We have had several process improvement and currently I have an ongoing project to try to find ways of managing this population so that the revolving door stops. This is project is ongoing and we are trying to tackle several issues to include making the services quickly available and also using motivational techniques and case management, finding ways to communicate with these veterans (they usually don't have phones or addresses), and making sure their transportation needs are met. This all takes manpower and hence space. The desire is to engage these veterans in this health care system to minimize the morbidity and mortality that this difficult population succumbs to. Feeing them out will only cause more of the revolving door and will increase the likely hood that they will get lost to follow-up."

Please see previous comments. More beds for Substance abuse will improve access to treatment for residential. This would require an increase in Substance abuse counselors. Enhancement of our

outpatient and extended hours services also would be benefited by increase of substance abuse counselors as currently I do not have enough providers to offer this service without fatiguing my existing providers. This again requires more space for providers as well as patients. Using Fee-basis is not an option per previous comments. As you add providers there is need for more computers. With more providers we can offer more vtel to more distant CBOCs but they too must have space available for the patient to be received.

"Delay comes when CBOC provider places a consult for patient to receive substance abuse services and the patient is not yet ready and refuses or no shows the consult or does not respond to efforts to schedule an appointment. There is an ongoing initiative to start anti-craving medications in the Primary Care through the SUD Queri initiative and this is a current research project ongoing at this time. In addition Behavior Health Psychology, which is embedded in Primary Care works with the patient to get them motivated for change. Both these programs need to be enhanced and when growing Primary Care Clinics special attention needs to be emphasized to not forget space for PCMHI is also needed to support primary care CBOCs. Finally Contract CBOCS which are generally Large CBOCS or Less in size do not have PCMHI so either the contracts need to be changed to have MH embedded in Primary CAre in the contract CBOCs or space considerations need to be taken into account when the Mental health needs/Behavioral Health needs of a primary care patient in the Contract CBOC needs attention. because the PCMHI provider is providing services to those contract clinics as well but when adding contract clinics there is no additional space provided for PCMHI. A perfect example is [location redacted] that only has space for 2 full time mental health people but the need is great for more. We have utilized every square inch providing Vtel in space that is not utilized when not seeing patients and also sending MH providers to [location redacted] to see patients in office space that is Vacant because primary care provider is on leave that day. This takes a great deal of coordination of schedules and choreography to make sure we are utilizing space to the maximum but also making sure our providers are also being fully utilized."

"Please see previous comments. Delays from outpatient to SUD treatment are usually secondary to the patient not responding to efforts to schedule the consult or No showing to the scheduled appointment. Anti-craving medications can be started and ongoing conversations are necessary to motivate patients for treatment. Patients that engage with their MH provider have an increased likely hood of following up with this treatment over time. This is another reason that Fee Basis does not work as we do not have time or personnel to manage the care of patients that are sent to the community for services.

I have sent many FEE services out and have been disappointed with the quality of care in the community yet I am responsible for the quality and have to ensure the patient is continued for care if they need treatment. By doing a FEE contract I believe I have delayed the necessary care for the patients. At issue is that I, the Chief of Mental Health, am the one person that has to review these FEE contracts for quality and necessity for continued care as I do not have the clinical staff to do this as they are all trying hard to see the patients that come into the system. This is bad for my morale and is taxing when especially we strive hard to give good quality care and are expected to manage our patients above and beyond personal responsibility of the patient. For instance if a patient misses his mental health appointment the provider has to make three attempts to contact the patient and get them rescheduled. If a patient is High Risk for suicide they must have weekly appointments, have meds controlled (cant be done if sent to the community) and be monitored closely for risk assessments and suicide safety plans. ALL MH patients are required to have a RECOVERY BASED treatment plan using MH SUITE. This software does not lend itself to recovery based treatment plans and is not standardizable and only serves as one more documentation requirement that wastes the providers'' time and the patients'' time. We created template based treatment plans that were felt to be outstanding by JC and CARF and The VACO SITE visitors told us in no uncertain terms we had to use MH SUITE for our treatment plans. TOO much money was spent on this software as it does not help the provider and produces a document that is

miles long and not understandable from the perspective of the patient. The mandated use of MH suite is another paper pushing exercise that makes the provider glue to the computer and spend actual less time face to face with the patient. Also its mandated use requires additional admin time for documentation which the provider has to take out of hide because we have to have them seeing patients. It is not patient centric and destroys morale of the providers.

I would challenge the community to be able to meet all the mandated requirements of the MH Handbook/ I do believe the handbook to be full of wonderful quality initiatives but I also feel the people who created it had no idea of the resources required to meet the mandates in the handbook and are still lacking the basic understanding of what more we need to meet the true intent of the handbook and the costs associated with that. In addition because of the lack of resources for case management (the part that currently my most expensive providers are expected to do) this causes a huge moral issues among these providers and causes them to burn out and leave."

Please see previous responses

"I have already discussed the MH handbook and how it is a wonderful Quality Initiative. However it takes much more administrative resources and support services than we currently have in place to be able to have true quality and intent of the handbook. Mental Health Treatment coordinators are exactly that. Treatment coordinators and currently 90 % of my MHTCs are psychiatrists, who do not have time to coordinate care for their patients. The New BHIP model is designed as a solution for this but it will take me years to reorganize my clinics to get the BHIP model fully staffed and incorporated. And without space I cannot do it at all."

Providers frequently are not willing to prescribe pharmacotherapy for alcohol use disorder. More incentives and education are needed.

More providers need certification for buprenorphine. Very few exist in the local community.

There is only 1 community methadone site in the state. we need more community resources.

Need more residential beds and staffing to have shorter wait times. Contracts with community are used extensively.

Need more staff and residential beds

Need more beds and staff

A barrier to obtaining timely access to care for fee-basis community providers is the difficulty with the VA paying community providers for their services in a timely manner.

VA needs to pay community fee-basis buprenorphine providers in a timely manner so that they will continue to accept Veterans for treatment.

We are desperately in need of more mental health/SUD clinicians (CBOC''s in particular are understaffed).

"We have no SUD specialists at the CBOC''s and limited specialty telehealth. We need support staff to reduce wait times for some services (e.g. more nursing staff in CBOCs would allow them to do Suboxone inductions, thus relieving the wait time for that service, currently only offered at the main hospital."

Create expedited process to get medical clearance for people in need of rehab. The rest of the delays occur at the residential facility and we cannot control that.

We need more therapists and support staff in the CBOCs!!

We need more nursing staff at CBOC''s in order to make it possible for them to do buprenorphine inductions. We may need more psychiatrists to manage increased workload of new patients with weekly appointments.

Veterans need to be sent promptly to local hospitals when they need detox. We have had times in the past where we had to wait for beds or services to be declined from another VAMC and the patient walked out of the ER.
Mental Health Suite is cumbersome.

need a psychiatric/medical provider with SUD experience with time dedicated to outpatient MH SUD services. Management needs to assure those with time intended to be dedicated to SUD services are providing those services in an efficient and effective manner (psychiatry/medical). improved communication and processes between the emergency department and inpatient withdrawal management to understand services and criterion for admission (hospital - non MH).
assign a prescribing provider with SUD experience time dedicated to SUD outpatient services.
management to assure that psychiatry providers engage effectively with SUD outpatient service clinical providers.

we do not have residential treatment at our facility and the demand for this type of service is so high in our VISN that we are unable to get veterans into the treatment facility within our VISN. we are not having to refer outside of our VISN for this type of care
"we need additional resourses for residential treatment. i think there needs to be additional beds and programs opened up and that all 1a, 1b and 1c facilities should have these on campus"
we do not have residential beds and the ones within our VISN are always full and there is a long delay
"we do not have residential beds, there are non in the community and the VISN residential program is always full. recommend that all 1a, 1b and 1c level facilities have residnetial beds"

Need more support staff for scheduling and administrative support for practitioners
"There are not enough residential treatment resources in our area. We have too few beds to support our number of veterans. We cannot rely on other proximal systems, they are also full. We end up utilizing private care, but often this care is below va standards and does not provide the care a veteran prefers."
Need more SUD detox beds
"We need more treatment space, especially space to do private, individual care"
Need to find ways to support outpatient detox in CBOCs
Need more beds...
We need more inpatient beds for detox...veterans prefer treatment in VA...also need streamlined approach to de-escalate inpatient detox to outpatient detox and community beds to support this
"We have delays in our availability of residential treat,net beds mainly for lack of space"

Referrals across parents to other institutions are case-by-case.
Make referral conductable electronically
"Not enough health tech time. No health techs for evening hours.
CPRS has flaws."

"We need more psychologists. We also need more administrative support in the clinics. Scheduling is extremely difficult - we need a centralized, user-friendly scheduling system that tracks both appointments and room availability, because telehealth is shared by multiple providers. We could use more telehealth rooms to increase scheduling flexibility and we could also use more evening and Saturday hours."
"See the previous question, most apply here. We need more psychologists and masters level clinicians - the psychologists to provider oversight and program development for SUD in the outpatient clinics."

"Please see previous 2 questions. In addition, our SUD program at the main campus is sorely understaffed. We need more psychologists and masters level clinicians to meet the need. The scheduling system needs updating, but is not as critical as it is for telemental health. And they literally have NO administrative support, which impacts care as well."
Additional staff devoted to screenings would reduce time from referral to admission.

"Space is at a premium , so having more office space would afford privacy of care to veterans. Increase number of psychiatrists to manage this complex group of patients , to continue to provide ambulatory detox safely . also need nursing support as well as addiction therapists to be able to provide MI and support , to engage patients in treatment even as they are undergoing detox."

"Our contracted residential facilities have very restrictive criteria. Services in the community do not seem to exist with the same emphasis as VA services (e.g., evidence supported use of suboxone and methadone)."
This facility has approved key personnel to improve in this area. We are not yet able to fully make the improvement due to HR related delays in start dates and posting necessary positions.
"A residential sud program for this facility has been approved and positions are being filled. this inhouse capacity will likely address only 1/3 of the demand. approval for more dom sa/sarrtp beds for this facility would be ideal. we''d also need the space and staff, etc for this expansion."
"this facility has already approved staff changes to improve this problem, but in the past year since approved we have not yet been able to have new ftee EOD. this will improve once staff are on board and new structure implemented."

More efficient and timely processes to enroll veterans in RRTPs.
Open and staff all RRTP beds in the VISN. Make standardized screening processes.
Open and staff all RRTP beds. Transparent and efficient screening processes.
Open and staff all RRTP beds. Transparent and efficient screening processes. Could screen by TeleHealth
"As the number of Veterans/Services have increased, we have outgrown the clinical administrative structure. Too much admin burden and "due todays" are coming from CO."

"We could use more Psychiatrists, social workers, and admin support staff. Better incentives and salaries for MDs will help"
Would need additional case managers.

"More addicition trained staff - all levels but especially addiction physicians
Improve drugs of abuse testing capabilities to allow for adequate chain of custody and confirmatory toxicology at each main facility.
Modernize the archaic VISTA scheduling
 system.
"Horinzontal"" alignment and integration at the top (Centraol Office) to be maintained as policies work their way down for Front Line implementation.
The biggest supervisory challenge is not allowing CLINICAL staff sufficient time to perform supervisory responsibilites."
Increasing non-VA care without corresponding CLEAR processes for COORDINATED and INTEGRATED care carries the risk of Veterans suffering from lack of coordinated care.
"Insufficient number of beds for a region. Matter is critical in parent facilities that are mostly rural. Thus, non-VA facilities with required service also likely NOT to be available or existing. Veterans and families

are not well supported (and are often unable) to travel sometimes litreally across the country to where services may be available."

"We are sending out Veterans for care that could (and should) be provided inhouse. It is cumbersome to obtain necessary administrative changes: for example, change designated beds thatwould reduce delay and keep care in VHA."

"We are sending out Veterans for care that could (and should) be provided in house. It is cumbersome to obtain necessary administrative changes: for example, change designated beds that would reduce delay and keep care in VHA."

There is just not enough staff or space for example to properly and safely perform ambulatory detox.

The facility needs to do better in facilitating the use of EB pharmacotherapies that do not require SUD specialty level of expertise.

Residential care is extended length care. Thus there is likely to be delays whether within VHA or outside VHA.

Limited number of facilities providing this care in the community coupled with the limits within VHA make delays inevitable.

Help clinicians be involved in administrative and management by providing adequate non-clinical support.

"Answers to questions about another administrative parent''s programs are estimates. Difficult to say what staffing or equipment needs another site may have.

Typically what we hear is delays are due to lack of space and/or ability to accept referral sooner (possibly related to staffing).

IT system is cumbersome; this likely could improve efficiencies in transferring Veterans to another site for care.

At times arranging transportation is a factor in delays experienced."

Referral system is cumbersome; approval system also. Access to community resources could be improved.

In order to facilitate residential SUD care additional options for referral when facility''s program is full would be helpful.

".Have concerns about standard of care at local methadone clinics. Some ambiguity about how responsible VA staff are for care at outsourced private clinic. The VA system responds fairly quickly to consults.

We just lost an excellent social work SUD counselor to Homeless program because she was able to get GS 12 promotion. Specialized staff should have same opportunity for promotion.

Need build out for a more private space to conduct observed urine toxicology screens."

"We need our own residential treatment program. Our patients have to wait 2-5 weeks to get into residential facility at another site.

Difficult to detox severely alcoholic patients in outpatient setting as this is a rural community and many live too far to come to daily outpatient treatment. Need our own residential program and more support for inpatient detoxification."

There are delays in private residential programs as well do to over flow. Again we cannot guaranty quality care.

Patients with significantly elevated BAL are admitted to medicine overnight and kept if they have co-morbid acute medical conditions. CIWA is instituted while inpatient but often they are immediately discharged often with benzodiazepine prescription. We are a rural community and so many patients live too far to attend IOP. If they live close enough and can be safely detoxed we can do that on outpatient

basis. If we had a residential program we could slow down the revolving door and offer more outpatient detox to those who live too far to come to clinic daily.
WE do not have staff with substance abuse expertise in CBOCS and so CBOCs send them to main hospital. CBOCS are over crowded with no additional space to house new mental health staff.
We do not have inpatient detox capability unless medicine will admit for co-morbid acute medical.
We do not have residential on -site and there is a wait list for other facilities.
We need a build out for residential. Proposal is has already been submitted.

"e. There have been significant problems in establishing telehealth SUD services in [location redacted] CBOC due to space, bandwith, equipment, staff support problems. Not so much the other CBOC"
Same comments as questions number 3.

We are in pro cess of hiring additional Medical staff which will eliminate delays.
Increase available beds for inpatient and residential placement for patients who are not benefitting from outpatient treatment.
Increase supply to meet demand.
Currently hiring so we should be eliminiting any delays in the coming months.
Currently hiring additional staff (Addiction Psychiatrist) which should resolve any delays.
More beds are necessary in the network to allow for timely referral.
Clarify admission criteria and coordinate continuuim of care so that there is no delay between detox/stabilization and start of inpatient rehab or other inpatient care.

"Front line admin. staff are needed to process consultation referrals after triage. There are providers with open slots in their schedules and a backlog of patient who have been accepted for the service but are waiting to be scheduled.
Space and equipment is needed in order to provide our Vets with all ASAM levels of alcohol detox. care.
The appropriate compliment of staff e.g. prescribers, RN, health techs, clerks.
In order for policies to be useful, staff need the required resources to do what is indicated in the policy."
Need to be able to more easily fee-base services immediately un-available at this facility
Need an alcohol detox. program that can treat all ASAM levels of detox.
Need a free-standing SUD treatment center that can provide in-pt. treatment for substance detox. otherwise allow for fee-base treatrment
see previous comment
Need to either provide services within the VA system or allow for fee-based care
need a formal detox. center with immediate transition to residential care
Need to be able to access fee-based care especially in remote areas.

Need more psychologists for assessment of SUD; need more psychiatrists or APRNs for medication management; need more testing materials to properly assess SUD; overworked staff lack any incentives to improve productivity or morale.
"The [location redacted]VA does not have it's own residential SUD unit. The [location redacted] VA is contracted with one agency [location redacted], and beds are frequently difficult to obtain, as the agency serves the [location redacted], etc. The SATP team at the [location redacted] has been ;largely unsuccessful in sending veterans to other VAs for residential SUD care. The ""denial"" of our veterans by other VAs is perceived to be a lack of space/providers, as the reason given is that the VA is already full with patients from their own catchment area."
The [location redacted]VA currently does not have a clinic to address acute alcohol withdrawal. Veterans in withdrawal are sent to the TAMC ER.

The [location redacted]VAs delays in opioid withdrawal has been impacted by staffing issues. This is expected to be resolved within the next 2-3 months by recruitment and hiring of appropriate personnel. The [location redacted]VAs delays in buprenorphine management maintenance has been impacted by staffing issues. This is expected to be resolved within the next 2-3 months by recruitment and hiring of appropriate personnel.

"The [location redacted]VAs CBOCs are [location redacted], varying from [locations redacted]. Delays are typically due to travel and housing arrangements, and are not due to appointment availability in the outpatient treatment facility. Delays in residential treatment are also impacted for the CBOS by travel and housing arrangements, and by available space at the contracted agency. An increased number of contracted residential providers would be helpful in decreasing wait times."

need a functioning fax machine in our building
"once pts are assessed and seen as appropriate for referral to non-VA methadone care, the primary delay in care is getting MH Administration approval for the fee-basis referral."

"Also need second dosing window and dosing nurse for that window, as well as confidential space for dosing line."
"We have no clearly defined admin person in the CVAMC trained, time alotted, and clearly advertised as the ""go-to"" person to send our fee-basis referrals to. As well, our payment rate is low to these fee basis providers such that they are not eager for our business."
"We need to hire 6-7 more therapists, who need offices too. We also need to streamline the fee basis process."
"We need to hire more therapists, give them offices, move our dosing area to a confidential location near our addiction specialty providers, add another doing window. We also need to streamline the fee basis process."
"Our residential unit in small in capacity, relatively speaking. We need to be able to increase our census as we have a typical wait time of 10 days - wherein patients relapse, have complications, or worse. We may consider fee basing some of this volume out."

"We need a more automated system to reduce no shows. We also need tech support staff to collect urine specimens, administer breathalyzers, etc."

We have availability at our facility without delays so we to not need to use contract or fee for service outside providers. We also have more qualified providers at our facility than the providers in the community
We have the above listed treatment options at our facility and there is no need to use outside services
we have no delays in providing SUD treatment at our facility so we have no need to use outside services
Using clinicians to address administrative requirements and reports which removes them from clinical activities - ineffecient care

We need more community detox programs in our rural areas/areas far from medical center.

Space constraints at CBOC can limit access. Adding LIPs would improve access. VistA scheduling package is outdated and does not meet organizational needs. Administrative burdens affect clinical efficiency.
Addiction psychiatry vacancies has affected operations.

"More clinicians who have training or direct experience in dual diagnosis treatment to work in all settings -- inpatient, outpatient, residential. More staff to call pts to remind them of appts or when they are expected to attend groups."

Group space and office space is at a premium at our facility. Groups frequently cannot be conducted at the times we would like to have them because group space is already reserved. We also need more office space for trainees to see patients. Our float office space is not adequate.

The psychiatrists need staff who can take care of simple refill orders rather than the MD/Psychiatric NP having to take care of every request. We also need more staff who can take a phone call to an MD/asking when their next appt is. No shows leave clinicians with unscheduled hours for pts on one day and overbooked hours on other days to accomodate the rescheduled no shows.

"We do have some rural patients who participate in buprenorphine, but there is the expense of time and travel to get to the main medical center. They must travel to the medical center because there are not enough of them to offer psychosocial group treatment via telehealth. If there were more rural community providers of buprenorphine, we could refer rural patients to them and these patients would be able to obtain services more conveniently."

"The problem here is that our VA does not offer methadone therefore if a patient wants that they have to be referred to the community where there are significant delays getting into an approved program. We do not have high numbers of patients requesting or appropriate for methadone at this time, however when we do, it is a long and difficult process. My perception is that there are not enough methadone programs in the community and they have long waiting lists. The other alternative would be to apply through VA channels to have a methadone program here at our VA. However, there are not enough patients requesting the service to support a methadone program."

"We are in critical need of Psychiatrists/NP, RN and LVN in outpatient SUD. In the last year we have lost/will be losing in next 30 days approximately 1.7FTEE MD time, .4 FTEE is TMH SUD, .5 CBOC. It is critically important we are able to fill these positions. We are also in need of RN/LVN assistance in ADTP-OP to fill the need to assist with SUD-OP medical treatment needs (detox/pharmacotherapy). A FT pharmacists in SUD-OP and our SARRTP. A fee basis need is community based detox. Equipment-bed bug oven, breathalyzers, wheel chairs, and vital sign machines with pulse ox. A treatment planning tab in CPRS."

The main needs are to fill recently departed MDs and to hire RN/LVN to support op alcohol withdrawal.
The main needs are to fill recently departed MDs and to hire RN/LVN to support op opioid withdrawal.
The main needs are to fill recently departed MDs and to hire RN/LVN to support pharmacotherapy for opioid use disorder.
There is brief number of delays in detox bed availability.

need more SUD providers and space at CBOC''s.
could use more trained SUD staff
most residential programs have some of the same issues with demand and we probbaly need more of these programs throughout the country
need more incentives to recruit Suboxone certified providers.
if we had more beds i''m sure we could fill them.
we could use suoxone certified providers and it's difficult to recruit them.
screening process and sometimes pts do not want to come in immediately to a residential program
screening process and residential requires committment from pt

"We provide SUD care in our CBOC''s but finding staff with specific SUD experience in large metro area is a challenge and even more so in more rural areas. Psychiatrists with a sub-specialization in addiction medicine are rare, their salaries are rising and many of them have an academic bent which are factors against hiring them in CBOC''s. Then there are space and support challenges that we exp. in general that add to the mix."

We have a very good carf accredited methadone clinic near our main facility that we are lucky enough to contract with. They do an excellent job and I believe they can provide methadone treatment more efficiently than we would be able to. At our CBOC''s the contracting out for methadone is more hit and miss. Suboxone is a wonderful treatment but takes a lot of appointment slots to manage and we don''t have much at all in terms of nursing support in the CBOC''s to help case manage the patients. So if we only have so much in the way of prescriber time do we spend it doing pharmacotherapy for 3 patients with PTSD and Depression whom we see every 3 months or do we see 1 patient on suboxone for the 12 monthly appointments? In this case it has made sense to look to the community to help provide suboxone treatment.

Providers who want to work with veterans who have SUD''s are harder to find than a generalist OP Psychiatrist. We aren'' built to run a SUD clinic at the CBOC''s as we are at the main facility and aren''t staffed with RN''s to case manage the patients.

We had 2.6 FTEE Psychiatrists sub specialty boarded in addiction medicine. One moved to another VA. Our .6 is retiring and we cannot staff our fellowship. Ads have been out for over a year and we have tried co- recruiting with our affiliated medical school and have no applicants as of this writing. Pay does matter but the VA might want to think of sponsoring Psychiatrists who enter this field or be more open and generous with tuition reimbursement. There is a difference between having staff who can treat a problem if they have too and staff who chose to specialize in treating a given problem.

"A PACT model would work great for our SUD clinics. We have tried to emulate this but a national effort to boost staffing of RN''s, MA''s and MSA''s would help. We were fortunate to have a skip plan approved to remodel space which will be primarily for SUD care and purpose built for that population. This is the result of a decades worth of planning and work to get to this point. We hope to have the project start early next FY."

Increasing access to SUD care in CBOCs is critical.
Having personnel in the CBOCs is critical.
More programs are needed.
More staff are needed to offer these services.
More staff are needed in the CBOCs due to increasing demand for these services.
More providers needed to deliver TMH.
More clinicians are needed.
The administrative burden has been steadily increasing. The number of tasks have been increasing and take up significant time to manage.

Working to improve access to care

Working to increase the availability of services

"We need more space and prescribers and psychologists in the CBOCs.   It would likely be good to offer financial incentives to support staff for efficiency, and to have more scheduling staff."
The most important factor is bed availability. Interfacility consults could be more user-friendly.
Increased scheduling staff and increased pharmacy involvement would be helpful. At times more beds would be helpful and at other times there is no delay in getting into our residential program

Having more sud prescribing providers in the CBOCs and offering POC drug screening would be helpful. At times the SARRTP is full and there is a short wait.

scheduling software is not helpful and outdated.

Need to have better scheduling package; need clerical support; need to recognize issues of rural level 3 care facilities when it comes to providing any service; staff need more praise and gratitude from upper management
Need better scheduling tools for MH; need clerical staff for SUD; Need to recognize challenges of level 3 care facilities; Need less staff in VISN and VACO and more in facilities... especially clinicians.
Need to have easier fee out processes for some of the medication management related to SUD; Need specific addictions psychiatrist position within MH if these demands are expected to be met
"Need to have specialized programs at different facilities. For instance, a small rural site should be able to refer to a larger facility for specialty SUD care in some instances. Small sites cannot afford a full time, dedicated SUD psychiatrist when our outpatient clinic in general MH is barely staffed appropriately"
"Need to review the literature to have a system with requirements which are logical, empirically based, and supported by administration; need more admin staff to support clinical functions; need nursing cooperation"

"Space and personnel seem to be the two biggest issues in access. We also need to find ways of decreasing waits for inpatient SUD services, particulalry because we don''t offer them at our Ambulatory Care Center."
Increase in the number of inpatient beds along with sufficient staff to manage the workload would go a long way in improving access to inpatient SUD treatment.

"Space for provision of care is critical as is allowing for overhires in order to maintain access when providers are lost. An improved, user friendly scheduling package is needed. Opportunities for career progression are important to retention."
Same comments as in prior section.
Our Veterans recieve residential treatment in other health care systems due to lack of residential services in our own. The addition of fee based residential care could assist as would adding resources to residential programs in our sister systems.
All our residential care is provided in other VA systems.
Need an improved scheduling package.

"Efficient and timely referrals, acceptance, and transfer to SARRTPs"
SUD intake and evaluation is fast but methadone clinics have delays to their own assessment and lose patients during this interval
"Referral, evaluation, acceptance and transfer takes too long"
Provide local SARRTP
Provide more CBOC personnel to provide more timely SUD treatment
"Delay from ADTP intake to initial referral assessment with fee basis provider, non-VA vendor does initial intakes on one day per week during a limited and specific time, lose Veterans in the meantime"
"Transfer to other VA SARRTPs takes too long, transfer to a local fee-basis vendor is denied many times"
"Not enough inpatient beds are available, refer these to fee-basis when inpatient full"
"Open up local SARRTP, Veterans have to travel far, time to referral, acceptance and transfer takes longer than neccessary"

"Difficult to estimate physical limitations at other facilities.
Autonomy in triaging in selecting appropriate candidates is questionable."
Increasing # of beds.

"ancient and arduous scheduling system creates too many errors, to include process of adjusting clinical profiles to improve access"
none additional
"moving patients from acute detox to inpatient or residential care is the weak link in the treatment chain. Currently, patients are receiving inpatient acute detox, discharged with "regular"" outpatient care wherein they''re very likely to "use"" again and by the time their name comes up for inpatient care, they''re not willing/able to make the decision to engage in care. Its a terrible cycle."
"our hospitalists express lack of competency around inpatient detox services for opiate withdrawal. So much so that some patients are turned away from this care, depending on which physician is working that shift."
DEA restrictions require no more than 100 patients of suboxone patients per provider. which presents a real limitation.

more recently we tried to refer Veterans requiring Methadone treatment into community which is very complex. Hiring should be easier and should be able to hire staff with skill set for a particular job.
[Location redacted]needs residential SUD facilty
[Location redacted]needs a residential SUD program .
we do not have SUD Residential facility.
we do not have personnel to implement SUD Telehealth services but plan to start when vacant positions are filled.
plan to implement Telehealth services in CBOC once vacant positions filled.
we need SUD Residential facility or easier process to refer pts out to the community.
we need Residential SUD facility
needs SUD Residential facility

There is a need for increased clerical staffing through MH Service. We would like to increase psychiatrists for Telepsychiatry but it is difficult to get new psychiatrists as they do not appear to pursue work in this area.
We need more psychiatrists to increase our Telepsychiatrist program. We also need more clerical staff.
"We need more psychiatrists, especially an addictionologist but they are difficult to recruit in this area. We need more clerical staff."
We would like to hire more psychiatrists to increase our Telepsychiatry services. We also need more clerical staff.
We need more psychiatrist to increase Telepsychiatry services. We need more clerical staff.
There are too many MH Initiatives that somewhat overlap making it difficult to give your full attention to the core group of initiatives.

Only reason for delay was transfer of our one-of-one addiction therapist to another positions. Personnel policies and resource limitations lead to delays (can''t backfill before incumbent leaves; can''t recruit without lengthy resource approval process)
"Transfers between facilities for residential SUD care has been a long-standing challenge in our VISN. Not sure what the problem is, or the solution"
"Fix transfer challenges between VISN facilities. Not sure what the obstacles are on their end, but I believe the VISN leadership is working on this"

There''s no community program to which to refer
Fix problems with transfer to VISN partner for RRTP. Not sure what the obstacle is on their end
Same as previously comments

Approving officials increase efficiency in providing approval/disapproval.

"There need to be more beds at he VISN level for residential treatment. VISN beds are always full, and run over capacity. As there is not an RRTP at our facility, I can only estimate what needs there would be at another facility if they were to add beds. Contract beds may be part of a solution to this concern."
See previous comments regarding access to residential care.
See previous comments

We have no Residential Program in [location redacted].
No PRRC in the [location redacted].
No Residential Program in the [location redacted].
We have no Residential SUD care.
We have no Residential SUD care in [location redacted].

need more bandwidth
"most veterans are started on medication assisted therapies for ETOH within SUD services, this could be done in outpt mh as well"
same as answer to previous question
"CPRS and AMS (methadone software) don''t communicate, clinical reminders are repetitive when veterans are seen daily"

VISTA scheduling package hopelessly antiquated.

The views, opinions, and/or findings contained in this report are those of RAND Corporation and should not be construed as an official government position, policy, or decision.

I-246

- **TBI**

"Appt. booking times do not always work for patients. Often they are involved in school, work or inpatient program activities and cannot make an 8:30am appt or 3pm appt."
We do not offer MRIs on site and have to send pt. to another facility to have this done. This can create a delay in services.
"Currently, the Provider performing the TBI is not allowed to submit a consult for Optometry and must request that this be submitted by patient''s PCP, which lead to a delay in care. The TBI providers need to be able to submit the consult for this service which will decrease wait times and booking for this evaluation."
Audiology services are not currently available on site so patient''s have to be referred out to another VA facility. This contributes to a delay in scheduling and evaluations.
To have more access for TBI evaluations through the development of a full time TBI clinic where patients can be seen and evaluated quickly.
Currently we do not have an active pain management department and staffing. Need to send patients out to another VA for these services.
The completion of the secondary level evaluation and the resulting consults submission is time consuming for the practitioners. More help in this regard would help to streamline the appt. scheduling.

"If there is delay in providing the Second Level Evaluation it is often not because of the scheduling practices of our fcility. It is often times the Veteran''s schedule or other psycho-social barriers that create delays. Veterans frequently cancel or no-show and when the appointments are are re-scheduled per the Veterans request it often gives the appearance of delay on the part of the facility. The facility makes every attempt to schedule within the required time frames, however, we have to take into account when the Veteran is available for that appointment.
In rare instances a technical glitch in the CPRS system may prevent a TBI consult from being generated to notify the appropriate clinicians, however, that too is unique."
The lack of medical records from DoD does not delay or providing the Second Level TBI Evaluation. We always provide the evaluation regardless of records from DoD.
The questions relative to Pain and Sleep Clinics are out of our scope of practice.
Veteran no-shows and missed opportunities are a major issue. The facility is often pernalized for the Veterans missed opportunity. The system could have an improved communication system for centralized scheduling. There are far too many templates in CPRS that ask the same questions in a different way.

"most of the resources were allocated to mental health, however they are not the best ones to evaluate patients for TBI"
"I do not know the delay in this institution, later on they send me consultation requests to evaluate patients for TBI, eventhough this may had happened many years back"
"Here they need more people that are competent enough to evaluate these patients, this does not happens here they limits themselves to fill up templates or just click a filled template already, Quality of the ancillary service is poor, quality of the MRI is terrible and they sent patient have this done outside they do not do the appropriate sequences on MRI, they need here is a 3-5 tesla MRI to obtain better quality images. This service should be and must be available here 24/7. So far as far as have seen this is just virtual reality medicine"
"both do not apply here. The whole place is not equipe and have the qualified personal to do this task.,"

Recently added additional neuropsychologist and technician for test administration. May need to add additional staff if back log not resolved. Fee basis for this testing is difficult in local community as not many skilled providers available in the community.

"Have had difficulty replacing open position, finding psychologist interested in this role at our VA. Currently have candidate who has been offered position, plan to start in august."

"TBI clinic provides numerous processes for reminders to vets regarding appointments, but still clinic has large no show rate. appointments are offered per vet''s preference, letters are sent, reminder calls x 2 are provided. Vet still no show. Vet's offer that they no show for clinic due to forgot, car wouldn''t start, bad weather, have headache, too anxious to leave house on appointment date, etc., despite a phone conversation of day before that they plan to attend."

"For Comprehensive TBI Evaluations, many private sector providers are not as knowledgeable in military expsores to provide a thorough and understanding evaluation."

"My local health care system has a Polytrauma Support Clinic Team. Majority of patients we see are able to be managed as an outpatient. When necessary, referrals are made to our Polytrauma Network Site."

Delays often caused by Veterans having multiple evaluations scheduled after no-showing. Limited slots are available due to staffing in CBOCs as CBOC visit is done by primary care specialist.

"For Veterans with TBI who do not want to seek primary care within VA, they are unable to see metnal health. In some CBOC''s mental health appointments are booked out. If >30 days Veteran may be able to use choice but it is not typically clinically appropriate to switch counselors or mental health providers. Continuity is very important in ongoing mental health counseling."

Very limited options for pain management outside of primary care are available.

Implement team supervision vs. having each team member reporting to different service lines/supervisor.

"[Location redacted] is has limited access to both VA and non-VA comprehensive sleep evaluations, especially as the local private market is already saturated."

Unsure

"Increased access to VA and non-VA resources for comprehensive sleep studies. However, current VA and non-VA markets are saturated."

Need physical and occupational therapists. Need space to conduct therapies and need to streamline ability to provide care for patients. Also need to breakdown barriers and allow people to just get work done rather than constantly responding to NATs

"we have a shortage of space, therapists, equipment and schedulers. With issues at the VA being so compartmentalized when there is a problem at any point along the deliver chain we are unable to properly care for patients."

"Again, not enough therapists, problems with space, scheduling, human resources in terms of bring people on board, lack of computers and equipment."

rehab clinic but evaluations completed by primary care and mental health staff

"Facility is without Neuropsychiatry.

Remote CBOC''s depend on Telemedicine and fee basis to serve Veterans"

"Facilty is without Neuropsych provider, fee basis providers utilized."

Facilty had only very limited case management services. Facilty has since hired 2 case managers and administrative support. Space for these providers is limited. Case Managers and other staff do work evenings to accomodate Veterans.

Typical delay is in obtaining mental health records.

We need to proceed with our space project that has not begun yet to separate TBI to it''s own clinical space. We need to backfill vacancies in OT.
We only have neuro psychologist as part of team. We send referrals to mental health for all other services.
We need approval to backfill the vacant 0.5 FTE Occupational Therapist vacant since beginning FY2015. Approval on hold.

"Demand for sleep studies is such that NVCC & Choice must be used, but administrative policies & practices for use of both NVCC and Choice are challenging."
"See previous response re: NVCC, Choice for sleep studies."
"See previous response re: NVCC, Choice for sleep studies."

Our facility receives approximately 100 consults a months with only 1.5 FTE provider(s) to see those requiring a CTBIE.
"The requirement of how many time to reach a patient to schedule them for an appointment is time consuming and wasteful. We still have a 25% no-show despite these efforts. With the outreach being greater in the outlying areas it is difficult to meat the mandate of completing the CTBIE with no change in staffing for the last 10 years. It makes telehealth efforts harder because one provider is being as decrease in person clinic availability to tele-health. Why do we have to contact the veteran for the an appointment? The veteran should have some empowerment to call and make their own appointments. I know consult have to be tracked, but maybe have veteran know that they have 10 business days to make the appointment or the consult is voided. The veteran often get irritated with us chasing them down for an appointment in order to meet a mandate and at the same fighting a loosing battle in missed opportunity rates. I have found in other clinic where the patient makes there own appointment, they are more likely to show up and most of the time call in a timely manner to cancel if unable to make it. If the process doesn''t change then more FTE is needed to complete the CTBIE in the 30 day mandate. Additionally, what I find problematic is when the veteran transfers to another VA the TBI screen comes up again when patient already had one at a previous VA. Isn't there a way for the screen to auto-populate with last time one was done and ask if there has been new deployment since there last screen?"
Performance CTBIE is heavily dependent on scheduling and re-scheduling particularly no-shows as they are clogging up available slots for new consults and not necessarily delivering quality care.

improve access to sleep speciality assessment
increase clinical staffing and provide the space for them to provide services
increase clinical staffing and provide the necessary space for services
increase clinical staffing and space
Increase clinical staff and space

"In addition to evaluation neuropsychology, treatment psychology services would be advantageous"
"Audiology services are delayed. If C&P audiology could be outsourced, this would help."
Do not recall requesting DoD records
Delays in neuropsych assessment sometimes as long as 4 months.
"the intake packet, paper questionaires, is often lost by patients, Without a completed packet the patient cannot get to their first appointment. Couldn''t this be electronic?"
Newly hired Pain Management specialist having trouble getting started due to lack of clinic space.

"the pain management, audiology, and neuropsych issues."

"These cases are triaged so I am reasonably confident that there are no adverse outcomes, only failure to meet guidelines"
"1. Central Office loves to increase administration and all positions which do not provide direct care, and never adds providers, or people who word directly under the supervision of providers. "Clip board nurses" who provide no patient care are the plague!
2. A national electronic record so that all information is readily available is essential to efficiency and good care."
"The VA is run, to quote a director, so as" "to control the doctors" You cannot run a health care system against the doctors. All the problems mentioned above derive fundamentally from the desire to by CO to control the system not let professionals do their job."
""""""

DOD is uncooperative and condescending.
""""""""""

"we just need more staff in the therapy sections for the outpatient services. Vision for tBI, vestibular and OT staff for the mTBI"
need another OT vision therapists and a full time OT
we have s system in place but one record system would be best
we have some gaps in personnel because of our large inpatient workload
vision rehab done by OT for TBI
make the physicians the highest costs FTE in the VA the most efficient FTE...give them the tools and staff to make them efficient and not to administrators who are not involved in patient care

Timely submission of consults. Providers available at remote sites. Reminder phone calls. Improved NVCC services.
Support clerical staff needed. NVCC services.

Other mental health therapy
"Web-based templates for CTBIE, Mayo Portland and IRCK has been inoperable intermittently and not user-friendly"

Need to decrease clerical staff turn over in dealing with the TBI CTBIE''s. Many rules to be adhered to and takes a long time to train new staff members. This creates the possibility of delays and missed scheduling of veterans.

"Interdisciplinary Team Evaluation, patient not physically present."
This is due to provider shortage and rescheduling. Travel distance is a significant impediment to obtaining timely evaluations. This is a rural/frontier state.
"We are dealing with a shortage of providers, both physicians and mid level providers. There is a shortage of nursing personnel, both RN and LPN. We have a critical shortage of physical space, not enough exam rooms to the point of inhibiting productivity. Telemedicine has increased our ability to reach rural areas, and this should be expanded. Providers other than neurologists and physiatrists are capable of performing the CTBIE. We are currently doing this, otherwise we would not be capable of keeping up with the demand."
"We have a significant shortage of licensed neuropsychologists. Each neuropsychologist needs to have trained technician support. We do not have a Physiatrist, no neuro-ophthalmology capability, no vestibular specialist. Audiology access is limited."

"We have a significant shortage of independent licensed professionals, especially psychiatrists, to provide the care. This impacts available timely appointments, both face to face as well as telehealth."

"VA providers need ready access to DoD health records via electronic medical record systems. There is significant delay in accessing the hard copy records. Additionally, the DoD EMR is cumbersome and not easy to read."

"The PNS is overwhelmed and as a PSCT, we have developed alternative capabilities.."

"As noted previously, most issues are due to shortages of professional staff. Once staff is acquired, the necessary support personnel needs to be hired. We do not have specialists in Physical Medicine or a Pain Management specialist."

"Again, the issue is a shortage of trained personnel."

"We do not have a pain specialist on staff. Availability in the local communities is limited. Again, it is a shortage of personnel."

The problem with scheduling relates to decreased availability of appointment slots due to lack of specialty trained personnel. Space is also limited.

"This is awkward in that I am answering proposed solutions about another department, yet I am not privy to what their specific challenges. I am guessing at my answers here."

"Again, I am not privy to the challenges of another department, so I cannot legitimately propose their unique solutions. However, we have a system wherein Mental Health allows walk-ins only rather than allows for physician to physician referrals to psychiatry. I believe strongly that a TBI Physiatrist should be able to make a referral to a Psychiatrist colleague."

"We can do this here in SPRS, however we need the appropriate personnel. I am not sure whether or not this has been identified as a priority by the supervision in SPRS."

This is my favorite question so far and directly speaks to our inefficiencies. We have a doctor and nurse doing a great deal of clerical work and much of the documentation requirements do not feel meaningful to the actual care of the patient.

Weekend clinics and extended hours have been developed in the MRI section
Extended hours on the weekend

[potentially identifiable comments redacted]

"The time between the consult and the expectation of when the patient will be seen is unrealistic for Veterans many of whom were injured years before being screened. The TBI clinics are designed to be one deep, and that puts an unrealistic demand upon staff to treat as an emergency a condition that is not a recent injury when that one deep provider is expected to perform other duties. The EPRP pulls continue to drive and are used to measure the TBI clinic, and might be the best measure, but all of the other focus has shifted to using SAIL as the most important metric for evaluating clinic efficiency. It seems as if all the resources and hires are primarily based on SAIL data, yet most of the criticism and pressure on clinic performance continues to come through EPRP. It feels like metric mismatch. One hears about SAIL constantly, but all the heat comes from the EPRP pulls. It would be nice to only have to worry about a single metric."

"This is a trick question. Remote data allows you to access DoD records from CPRS. However, those records are rarely relevant to the evaluation. They are often VA records that have been transferred into the DoD database, and almost never contain information about injures that happened in theatre or that involved medical care while on Active Duty that is associated with the reported TBI."

"We are exploring starting a Pain Clinic. Fellowship trained pain specialists need to be hired. You have to determine what expertise they are brining to the facility to determine if additional equipment, like a C-arm, is necessary. But many providers won't come to a place that is not set up to allow them to practice.

We at present have some of the components to manage pain patients, but without the Pain clinic leadership we are still working through issues. We are going to be recruiting a Pain Doctor this year, we hope."
"We lost a provider, lost our social worker and our clinic nurse over the last year. We are just now beginning to fill those positions, but we are still struggling to recruit another TBI physician."

"headed by trained NP,OT, as available neuro/forensic psych"
we meet goal of < 30 days
"planning on second LIP to cover PRN
Vaco actions- MUST have easy way to correct record if pt screens + in error and or end s up on tracking application in error"
"Access to BHS critical, we have lost our dedictaed psych on team with littlehopeof replacement in near future.Our neuro psych was murdered in VA clinic."
for us to be fully functioning team need access to bhs same day as TBI eval done as has been case almost always in past 7 years
I have been granted full access to DoD EMR
I have access to virtually any aspect of TBI care needed in house or fee based to ELP
"I provide on going care if needed, PCP manage vast majority of care"
I need a neuro psych or a trained psych on embedded team
"I do not have a SLP, I have to refer all to community this is vital to have on my team"

radiology

the facility has a poly trauma consult used for referral.
"1 Optomologist in recruitment
2 Opthopic tehnicians currently in recruitment
Program currently triages level of urgency for patient access."
Extend funding for acces to care mental health positions.

Polytrauma Network Site
"1. Delay in PCP or OEF/OIF provider placing consult.
2. Reduced FTE in PNS clinic.
3. Patient''s no showing or cancelling appts."
"1. Increase FTE for PM&R physicians with TBI specialization, potential increase FTE in nurse practitioners with TBI training, increase FTE with nurse case managers and clerks.
2. Improved access/speed of the CTBIE web application.
3. Dueling policies for CTBIE completion and EPRP. If a patient doesn''t qualify for CTBIE, they may qualify for EPRP reporting and this is a waste of resources. Also, CTBIE countdown starts from the moment the primary screen is completed as positive, but TBI clinic has no ability to affect when a provider places a consult or if the Vet chooses to return the call/make an appointment.
4. It would be inappropriate to use contracted care for this patient population as it take as long time to create a rapport with patients with TBI such that they will be forthcoming with information, also, VA providers know the DoD system much better than civilian providers, so can empathize with Vets."
We use at times Janus Joint Legacy Viewer and DoD data is difficult to come by.
"Currently, Vocational Services are provided by Vocational Specialists through the Compensated Work Therapy program. This program severely limits the distance a patient can live (25 miles) from the facility. Anyone further is not allowed to enroll. Also, the program will not allow "underemployed" Veterans to enroll as they currently have a job. One other issue is that the program does not support Vets returning

to school. Vocational Rehabilitation Counselor using a supported employment model with distance restrictions or underemployment restrictions will be ideal."

problems with providers for the service being addressed
lack needed providers and techs

"best guess, veterans no show or cancel appt's"

"This clinic is always staffed by a NP, a psychologist, and a case manager (nurse and social work CM alternate)"
"We get veterans scheduled within the 30 day period, unless requested to do otherwise by veterans."
"As for MRI here in Memphis, we have generally one person who reads them and the facility joke is that one must have a 5 cm or greater hole in the head for it to be read as anything beyond normal for stated age. Personnel is vital, but really here an MRI is only meant to r/o organic change other than TBI, as anyone who has read the literature knows that MRI is not close to sensitive enough for TBI. DTI, SPECT, etc. are better techniques for imaging with better relations with treatment, diagnosis, etc."
"First of all, when related to PT, driving 2-3 hours to go to a PT appointment (especially for back or LE) is a farce. One does more damage driving here than can be repaired while here. Home telehealth could be a strong option if equipment is mobile. Additionally, it should be known that providers understand that central office requirements are often ignored so that a facility can "rob Peter to pay Paul." Finally, providers have some good incentives, depending on how well written evaluations are within a particular service or facility. However, our greatest problem are the clerical staff. They have no incentives to do anything. I would never request them to schedule, as they care far less than I do about our veterans as whole. As such, when one does not have intrinsic motivation, then extrinsic motivation can be of assistance."
"Delay is less important at this level of care than the idea that there was little care within DoD, and the plan was to separate the servicemember to receive care in the VA. Sometimes that delay is more dfficult for the veteran and decreases investment and trust."
"At this juncture, this level 1A hospital has two 0.5 psychologists who treat PTSD. This is far less than prior to 911. This is beyond unacceptable. Consults are resolved through a one-time group setting, the wait for evaluation can be several months, and then most people who are given a dx of PTSD are shuffled to a group, with a trauma-focused treatment that may not be best for them. Anyone with subclinical PTSD is sent back to the mental health clinic, where their needs are not really met. A true trauma-focused clinic where subclinical PTSD is treated would be best. It is important to state that this clinic actually does a very good job with the few providers it has. However, we are losing one provider and will be down to one 1/2 time psychologist. Backfills do not seem to happen in Mental Health, but because of the immense strain on providers, people are leaving in droves."
"Sleep medicine has made great strides and are very receptive and the nurse practitioner in charge is a wonderful addition. However, there are problems with providers and clerical staff. Veteran miss appointments, and often the appointments are made without the agreement of the veteran, which would never be acceptable for any of us were we to be the patients. As such, people are not properly informed of their appointments or they are not scheduled at great times. Again, the clinic is doing a very good job communicating with the TBI team and working with our veterans. We also are piloting a CPAP adherence group which assists with that relationship."
"Again, with such a wide catchment area, fee basis seems to be a far more intelligent idea that asking veterans to drive four hours for physical therapy. For those who can do home exercises, telehealth to home may be a great option to keep veterans on track and to examine their efficacy at home."

"Our greatest problem is provider staffing, specifically with mental health. Next,relationship with neurology is not strong. As such, we are creating an Interdisciplinary Headache Clinic within Polytrauma to better meet the needs of our veterans. No show rates, clerical staff, and the ridiculous CPRS/VISTA interface are interconnected problems. Our veterans are younger, do not listen to messages, and only receive texts. Recent research has demonstrated that no show rates decrease with text reminders (Schnur, P. et al. 2015). MHV can be an excellent way to get in touch with veterans as well, which I use personally in my clinics.

Finally, according to OIG from 2010 visit, Polytrauma was doing quite well and received recommendations on care. However, we did not have a physiatrist associated with our team. At this point, the physiatrist at the medical center does sign off on notes, but does not assist with needs. For example, he has yet to countersign our sole medical provider (NP) on her ability to prescribe narcotics (which she rarely does but should have the ability to do). We will also need the physiatrist's or someone''s support in the continued development of our headache clinic."

 Study ID fagUsw

Often a neurology consult is generated as well as a mental health consult as TBI and PTSD often occur together. Usually an EYE consult and possibly an Audiology consult as well.

"Delays can come from logistical challenges, e.g. patients can not make designated appointment dates due to problems getting gas money to come to [location redacted] or cannot get off from work. Other challenges are ensuring that the right address and phone # are correct and that the patient''s cell phone and voice mail are working."

"1) scheduling so that a patient can be seen at multiple clinics in one day is quite labor intensive and it''s challenging to make work. Usually this requires assigning an administrative person to coordinate the scheduling.

2) More telehealth availability is helpful/important for f/u for patients

3) fee basis consults are still quite delayed for some specialties, although this is improving. Fee basis consults can be lost or delayed for months in some circumstances. The critical consults for TBI are sleep and eye."

"MRI availability is a problem, although capacity expansion is starting to catch up. In the mean time, we have a patchwork of fee basis consults that result in a report. Fee basis takes the report and considers the consult closed. However the referring physician (often me) has to call the MRI center doing the study and get the CD and then have it loaded into the iSite system. Not very efficient and with all these handoffs, things fall through the cracks. A better solution would be for fee-basis to take ownership of the entire process. Another option would be some sort of electronic transfer of the DICOM files to the VA and supervised upload of the files to the iSite system for visualization."

"We currently use a mixture of in-house and fee basis sleep studies. The combination of "sleep study in a box" where the instrumentation is mailed to the patient, the patient hooks up the instrumentation and then mails it back is helpful for a crude first pass, ideally we would have this as an internal capability for integrated scheduling and flexibility. We are also capacity constrained for full in-house sleep studies and have to rely on external labs also. Part of this is due to the distances involved, but we have been short of capacity for about 3-4 years. **Our internal measurements of performance seem to have not resulted in change until about the last year, even though sleep disturbances are highly correlated with TBI (there are a number of studies now showing this, which is consistent with my clinical experience)."

"I''m not sure what I would do differently. We cannot put physical therapy in all facilities, but the driving distances are such that any benefit from the physical therapy can be offset by the driving"

"I can''t even answer this question as I never see medical records from DoD assessments for TBI unless I go looking for them in the CPRS Remote system or in the new JLV system (not rolled out nationally yet, but I have access). I never see the inpatient records from Walter Reed, Landstuhl or Iraq or Afghanistan. I sometimes see the outpatient records from remote facilities in Iraq or Afghanistan, but they are few

and far between. I *never* have access to things like sleep studies or the images from studies such as CT or MRI and usually have to re-image anything that I want to look at. I do not have access to MEB''s or PEB''s. Patients routinely arrive in my clinic room saying "I gave the VA all my records" and I have no idea who has them or where I could look for them. Occasionally I find records in IMaging. I have treated a Coast Guard patient and none of her records are in the system as the Coast Guard seems to have their own EHR, not accessible to me."

"Most of the severe TBI goes to [location redacted] and maybe then comes back to the [location redacted] system. 8-90% of TBI is mild TBI, which we handle in GNV as well as stable moderate to severe TBI."

"We are capacity constrained in mental health due to the number of providers we have and the demands for services. We can see patients quickly, but then they may have a long wait to be seen again. We are might be able to be more effective if we see the same patient more often, but that results in delays in seeing others, As delay is what is being measured, not effectiveness (a tough measure), we end up with many patients being seen, but not very effectively."

"The interventional pain management service''s requirement of the area have an MRI before they will do an intervention is reasonable, but this then pushes the patient into the currently quite long MRI queue. So more MRI scanners might help reduce the delay in being seen by pain management."

"Noted previously, availability of sleep study lab slots and f/u on CPAP fittings or re-fittings and SD card downloads is limited. People, space and hardware are needed. I can''t fix PTSD or even sometimes have clear diagnoses of seizure before I get the sleep understood, if not straightened out."

"My administrative support is limited to someone doing my scheduling for me and taking messages. I end up chasing down MRI CD''s to review as well as returning routine phone calls.
Not having MRI scanner capacity directly impacts ability to sent people for interventional pain consults as well as slows down my workup."

some occur at CBOCs via Telemedicine led by Interdisciplinary TBI team
"we are able to offer visits in timely fashion, patients often opt for later times or no show which impacts care"
improved communication of DoD or civilian sleep study results into the VA record would help to expedite this process

Working on increasing the availability of services

"Access is not the issue, many times Veterans prefer a date outside the 30 day requirement, and that negatively impacts the data. Also high rate of no shows in this population causes the same problem."

Change Central office policies: When we have our EPRP the denomintor is very low and this does not represent our TBI services.
Neuropsych is very important Needed for treatment.
"delays also involve contacting the Veteran.
No-shows are very high with this population.
Should maybe not see until the SC is determined."

". There are absolutely no delays stemming from our PM&R TBI providers or staff. Any delays are the result of a veteran who cancels or no shows his appointment, or cannot be reached despite multiple phone calls and certified letters."
"1.)The process of cajoling the reticent or unwilling veterans who have a positive primary TBI screen into making and keeping an appointment for a secondary screen is inefficient and disproportionate to the

number of veterans served by this endeavor. It ties up staff who could be doing other productive things. Some of our veterans have alluded to the process as approaching harassment in a lighthearted way.
2.) ''No-show' rates contribute to delays in many areas of veteran care, to include those related to TBI.As long as ''no-show'' rates remain high--usually 20-30%--there will be unnecessary delays. Patients who do not really want to come in, despite our best efforts to reach and educate them as to the reason, will tend to ''no-show''.
3.) Eliminate the requirement that the TBI provider fill out a registry tool. It is redundant and adds zero value to the clinical encounter (although I would assume it has statistic, research value for someone.)"
"1.)We have workload analyses demonstrating with near mathematical certainty that our number of PT staff is insufficient to handle the number of referrals in timely fashion. We simply need more PT FTEEs.
2.) The hiring process is fraught with delays and inefficiency. Some is bureaucratic and some is related to poorly performing HR staff.
3.) We are not allowed to use wireless technology that would allow PT (and other) staff to use tablets to document bedside or at the point of care as is becoming common in the private sector. This creates inefficiency and space problems as all of the PTs converge on one area to document on desktops."
Sometimes it is available on ''remote data/Vista' and sometimes it is not.
This is a redundant section. These questions were already answered in a prior section.

"primarily d/t failed attempts at contacting pt; they do not call back or respond to certified letter. Also, once the appt is made, there is a high no-show rate (traditionally almost 50%, improved to 33% d/t overbooks, not because patients are showing up more frequently!!)"
current central office directives are put too much onus on the healthcare system rather than the individual patient.
"cannot comment, as I have no knowledge of TBI assessements in DoD"

PM& R in the Post Deployment Integrated Clinic

The Interdisciplinary TBI clinic is within the PM&R department.
Need more providers and have a reasonable expectation of the length of time it takes to accomplish visits for the VA staff and the community. A better scheduling system is needed with schedulers who work with the clinic to keep it filled not just follow protocols.

"The scheduling system is very antiquated and does not allow for the flexibility that is required in the clinic setting. It is also hard to accommodate individual needs because the performance measures group people. This causes people with low medical priority but high connectability, i.e. OEF/OIF/OND to receive priority care. Triaging of care should be based on medical necessity. Needs to be less layers of supervision and more clinical or patient direct care providers hired."
"The supply versus demand for physical therapy has traditionally been inadequate. The current space has been maximized for treatment. Access is very important but many variables confound the situation, i.e. having a seperate service schedule consults, performance measures that make patients priority which competes needlessly for medical needs. Fee Basis is difficult as it is hard to oversee care and determine necessity without notes and notification. It would better serve our veterans to receive services here for continuity of care"
Our availability of providers and treatment area is adequate. Our difficulty arises in scheduling services. This is a seperate service in our facility which makes it hard to oversee. Would like to see scheduling come back under the services for outpatient to have more oversight. New scheduling program for flexibility and efficiency would be appreciated

WE make DOD patients a high priority for TBI and all related treatment options. Have been highly successful in the past

Part of the delay in care was that we were down a 0.6 FTE in NP. Now that we have the 1.0 FTE we have been able to meet the Veteran''s need in a more timely manner. We have tried pilots of scheduling on weekends which have not been successful with high missed opportunities.

Mental health has the best staffing and office space in the facility. The barrier becomes that competing performance measures that makes triaging/access more diffficult. Improving communication with services is helping facilitate scheduling based on medical necessity.

Some questions have already been answered. The high demand of this service makes it difficult to schedule patients with competing priorities. All of the same suggestions made earlier apply

We''ve had difficulty with the second level evaluation template which has not been functioning this year. this requires extra work in the provider filling out a hard copy and scanning into CPRS.

Barriers can results from layers of bureaucracy at times that distract from true patient care.

Loss of staff created delay in referral. Space and other issues as noted unchanged.

short time without trained staff resulting in patients being referred and delay. Now hired staff and no delays.

Designated "TBI/SCI Clinic""

"If neuropsych is requested as part of comprehensive work up, NP clinic is significantly delayed in scheduling evals."

"Staff need time to refine/update specialty skills, coordinate with TBI/polytrauma staff at VISN level, coordinate with other PCP providers. Need clerical/SW/NP staff to keep program definition sharp vs "any PCP"" can address TBI/SCI issues mentality. Even mTBI pts create a more intensive case load."

Wait list is into NOVEMBER (6mos) due to only on NP on staff. Speech therapy staff pressured to perform outside scope of practice due to shortage which puts pts at risk. Field is moving towards remote administration but we''re not there yet; NPs are hard to come by so fee basing service is unrealistic. Late in day/early evening appts already in place.

"No NP therapy allowed/possible given only one provider on site to meet entire assessment needs of hospital (TBI AND all other consult requests). Again, difficult to fee base due to scarcity of providers. Evening feedback sessions now offered."

"Pain, depression are crucial aspects of many polytrauma veterans. With current Opiate Initiative, adequate staff to treat pain in other ways is crucial (BH chronic pain mgmt./Biofeedback/SCS and other pain strategies)."

High volume demand service and not available in house. Should be considered vs fee basis. Ongoing need for TBI pts with increased comorbid OSA but also need for BH and PC pts.

"Primarily related to delay in scheduling per HAS, not due to clinic availiability"

"There are available providers/appointments however there is delay in getting those appointments scheduled. Additional issue is when primary care, MHC providers or others incorrectly fill out initial screening, when second level is not indicated. This may be a central office issue to figure out how to correct these reports, thus not have that information "counted" as pending appointments when second level screening is not indicated."

"We have only one MRI scanner and I do not know staffing or hours of operation of this service. Additional scanner may be useful, but would require more space, staff and support staff. Currently fee basis is utilized. Also, process of scheuduling not always clear and if order cancelled for any reason,

there is no record of it ever having been ordered in CPRS. (Unlike a consult that still lists as discontinued)."

"The VA of southern nevada has had a lot of turn over in neuropsych. Perhaps looking at compensation or staffing (support staffing/scheduling) may be issue. Currently, new providers coming on board, and flow may improve. Fee basis referrals have been done on occasion."

"Currently there is no ""consult"" that can be placed for MHC services, even when Veteran requests it. The ability to request a consult could improve, because this population of patients not always great about follow through (some memory issues common). Also, in near future, a psychologist will work part time with TBI team, to hopefully provide some MHC support at time of initial TBI appointment as needed."

"There is often difficulty obtaining the DoD data from Vista Web. I have inconsistently had benefit of using Joint Legacy Viewer, and recently have stopped trying to utilze it during clinic, because it is not easily accessible (like VIsta WEb is from CPRS) and if ever the PIV card is not inserted prior to starting to see a patient, then program will not even load."

There can be delay in follow up appoitnments due to scheduling issues.

The main delay with pain management clinic is the scheduling of the initial consult.

"Appropriate staff should be hired and retained (recently no one in pulmonary sleep clinic, as provider left VA.)"

"There have been delays in the past for sleep studies and for neuropsychological testing. I have not seen adverse outcomes for veterans and there is always high quality care when delivered. In fact, I highly prefer our internal consultants over outside providers. These are just two services that seem to take longer to complete relative to others. Perhaps more neuropsychologists or techs are needed. That said, if I ever call and request more clinically urgent services, I am always accommodated especially for neuropsychology as they are active members of our TBI interdisciplinary team."

please see detailed response on previous question

Many DOD records available in Vista Web. I am also a participant in a pilot for the new JLV (Joint Legacy Viewer) EMR that pulls records from DoD and VA health systems into a user friendly interface.

Have never referred to regional PNS. Have referred severe TBI/ABI patients to PRC sites.

see previous comments regarding neuropsychological services.

"I am not familiar with the needs and staffing of the sleep clinic. This service has improved in the last 1-2 years, but anecdotally, does tend to take longer to complete relative to other utilized services. That said, if I feel services are urgently needed, I will call directly for accommodation or pursue non-va referral for which I am always supported."

"The required time to open and fully complete the extensive CTBIE template is inefficient. It is a good system but utilization adds several minutes to the encounter, multiplied by ever encounter and it adds up. Also prone to technical failure but VACO remedies quickly and with good communication. Scheduling/rescheduling requirements add to recurrent no-show rates and take slots that first time appointments could have."

"I think there is much consensus that screening for a condition (mtbi) that is expected to recover in days or weeks for the vast majority is a waste of resources. If this must be done, then requiring 3 no shows before a consult can be closed restricts access. There should be a VA uniform no-show policy for all Veterans. Regarding staffing, we were without a dedicated physiatrist position for over a year which delayed timeliness of CTBIE evaluation."

More neuropsychologists would make for better access.

"I am currently split (SW) 50/50 with SCI, a very needy population of which I have 230 patients to case manage. This leaves little to no time for Polytrauma case management."

"PT has been understaffed, as has administrative support."
I know have access to JLV which is great.
"Again, requiring 3 no shows before completing is excessive and restricts access. More support staff might allow designation of scheduling/tracking functions and free up clinical time for case management."

"Sometimes requesting providers do not enter the consult request, in spite of prompts. Some enter the wrong clinic consult."
"Having a dedicated scheduler to monitor positive 1st-level TBI screens would help tremendously or having that info readily available in real-time; educating PCP's to enter Polytrauma consult has been tried, but should have helped; having faculty who are available on weekends could help;"
I have no idea. Not familiar enough with their administrative policies.
Essentially all sleep studies have to be performed through NVCC -- and these have to be approved by a cascade of people -- incredible delays.
"In all cases, DoD records are unavailable."

nearly half of patients requiring speech therapy services live a long distance from VA and many also have jobs/school which impact ability to schedule. With limited speech staff it becomes difficult to arrange appointments that meet the needs of the Veteran in a timely manner. Having easy access to care in the local community would alleviate these issues.
"The TBI second level screening tool in CPRS is difficult to use, frequently does not work and is very slow. While it may allow VACO to collect data, it adds nothing to clinical care for the Veteran."

previously worked in PM&R clinic in [location redacted] VA
pending filling of several positions: 1) MSA 2) PSA 3) SW and 4) Psychologist. pending new telehealth program.
not fully aware of all of the challenges. service has new space and staff.
center of excellence is being developed. support staff is needed.
need more providers for vets
"flow of info has improved with JLV, but it is not always accessible. would love improved access to records"
difficulty with getting testing completed in a timely fashion.
stringent requirements for scheduling tbi pts (central office mandates). just moved to new clinic space and have added new providers this year.

"VHA needs to move forward with non traditional hours, clinics open until 7PM and on Saturdays. Tele-heath capabilities expanded for secondary evaluations at all sites."
This is a service best delivered by the VHA and is central to the core mission of the VHA

Week end & evening availability of services have been implemented lately. Fee base NVCC consult has to be simplified especially for reporting back MRI results.
Increase sleep eval. through Neurology service other than the Pulmonary service providing the testing. This will enhance collaborative management of sleep dysfunction throughout the healthcare system. .
"There's a need for dedicated optometrist/ neuro opthalmologist for TBI patients due to the specific visual problems. Currently, there''s a short staff in Eye clinic at [location redacted] VAHCS."
The mental health eval. & documents are not readily available through the DoD portal.
Improve patient flow in existing pain clinic. This is already being addressed. New pain clinic areas will soon be activated within the next 4 weeks.

Very tedious scheduling & EPRP process. Patient No show rate remains at about 20-22% due to patient NOT engaging.

Veterans received from DoDO facility usually include medical records in the referral packet.

Polytrauma Clinic
"Clinic access to contract clinics and CBOCs for all mental health services including STS, increase availability of walk-in assessment and medication evaluation, access to acute detox programs, access to Anger Management programs."
"telehealth assessment for medication management in outlining clinic areas, more access to interventional pain management services. Improved communication with DoD regarding pain services received in military."
CO requirement for certified letters for scheduling purposes?

"In order to improve services to Veteran and remain compliant with the timeliness of the CTBIE''s, the Wilmington VAMC needs a dedicated provider who is flexible and able to see patients at their convenience. Veterans are often inconvenienced by having to return to the WVAMC to complete their CTBIE. This provider should be under the PM&R service line."
"For the [location redacted] VAMC, the [location redacted]VAMc was initially doing their Neuropsychological evaluations. This process stopped in December 2014. Now that our providers are responsible for completing them, we do not have enough staff to administer them in a timely manner. Two of our Psychologists are trying to incorporate the NeuroPsych evals into their schedules. It is very difficult to accommodate Veterans who require a Neuropsych eval due to the already overwhelming caseload that the providers have. It is vital that the [location redacted]VAMC have the ability to hire one or two professionals who are capable of providing Neuropsych evaluations in a timely manner."
"This writer, who is responsible for all of the case management services for the Polytrauma/TBI Veterans, has been detailed to other clinics within this hospital over the past year. It has been difficult to maintain timely access and case management services for Veteran when more immediate concerns are present. This writer has begun the discussion of Telehealth implementation with the necessary personnel at this facility."
The majority of Veteran that are seen in the Polytrauma/TBI clinic are already affiliated with BHS. Some of them are already being seen by providers and other are being referred to the intake evaluation after completing the CTBIE. The [location redacted] VAMC could always use additional MH providers to provide specific treatments for our Veterans.
The [location redacted] VAMC no longer has a Speech and Language Pathologist. We have been down to one SLP for the past year. She recently resigned and we are now sending our SLP patients to Perry Point VAMC for evaluation. [Location redacted]only has a few openings for our patients that they are trying to fit in.
"There is no dedicated MSA for the Polytrauma/TBI program. Most of the Administrative paperwork, scheduling and telephone calls are completed by the Polytrauma/TBI Coordinator."

This is not due to access to the TBI clinic however due to Veteran forgetting/re-scheduling clinic multiple times therefore prolonging time from positive screen till TBI eval or the Veterans'' preference on being seen in a certain location. Also at sites where we use telemedicine there has been technical difficulties with the equipment. At [location redacted] we are able to see the patient typically with in 5-10 days.
"It would be helpful to offer one Saturday a month for therapy and CTBIE time slots, and perhaps two evenings a month."
Upgrade their current facility.

C.O. needs to formalize what they define as Pain management. This system would be more holistic and involve not only medical management but also inclusive of C.A.M.

Reduce time from consult for sleep study to actual getting the appointment scheduled in the community

"We need more providers to be able to complete the 2nd level evals in the 30 days. Also need more streamlined scheduling, currently only billing office can do and they do not understand our schedule needs. Working on getting texting available to veterans."
The city only has 1 neurooptometrist. The VA does not have one. Not sure how enthused the Opthamology staff is to send patients out for testing.
A lot of our veterans live over an hour from the hospital. They don''t qualify for fee services but can''t travel for therapy that far. We do have some CBOC services but could use more locations for PT.
"Same as PT. Need to fee more out, too far for a lot of the patients to drive for services. We do not have OT services out in the CBOCs."
We currently do not have a pain provider. It takes a long time to get the services feed out to the community.
"The providers have to put in our own orders, make phone calls, run state drug screens, etc. No nurse to do that for us. The Case Managers do not have time to do it either."

Use of technology to improve or circumvent no show rates such as texting patients or using telehealth. Very limited reception of VA cell phones in our facility makes it difficult to use this mode.

"1) IT - CPRS scheduling is inflexible and is hard to allow admitting patients off regular hours.
2) Change "central office policies"" (a) the filling out of the template is very time consuming; in addition it prevents optimal eye contact with the patient, hence effective communication; (b) the rush to admit patients on time (even when the injuries occured years ago) adversely effects the quality of the time spent seeing new patients
3) ""Increase weekend and evening availability of services" - if the numbers of critical staff can''t be increased, then increasing the hours of the clinic is needed, but difficult yo implement due to staffing inssues
4) "Some other solution(s)"" - Allowing for time of the MD to review new patinets with the LCSW and RN (since the see the vet 1st) would help improve initial insight - but this is not possible since there is a ruch to get patients in and seen"

"which includes PM&R TBI specialist physician, PT, OT SLP, Psychology and Nursing"
"central office policies"" 30 day policy - the community does not have 30 day routine access. CHOICE does not have anything close to 30 day routine access, nor does pc3. PERSONNEL: need more sleep techs who are paid well. VHA pay lags the community significantly. VHA HR PROCESSES ARE ANTITHETICAL TO THE PROVISION OF TIMELY QUALITY CARE."
"""""
personnel actions remain constipated in HR processes that are outdated, too narrowly interpreted and with multiple layers of narrow interpretation (local HR ass't, local HR specialist, local asst chief of HR, local HRO, VISN CCU, VISN HRO, CO HRO). Perfectly designed to avoid onboarding quality personnel in a timely fashion."

"It would be helpful to be able to better utilize technology (text messages, email, etc) to help with scheduling of these young veterans."
currently feeing out some neuropsych evals

---

currently feeing out large number of ophthalmology services all all neuro-opthal.
DOD and VA do not have nation-wide systems to share medical recors. This hascontributed to delays in ontaining old medical records.
TBI interface crashes often.

"Delay due to staffing, this has since been corrected."
"Increase LIPs, nursing, and SW. It would be beneficial to have text messaging of reminders for upcoming appointments. Tele-health - provides prefer face-to-face for initial appointment."
Have medical records "talk"" to one another. Our Audiology group expanded weekend hours to accommodate Veterans. Continued efforts to reduce waits for Sleep studies using nonVA care or Choice.
"Audiology noted delays, other services report no problems."

Difficult to recruit area due to rural frontier arena
Non-VA care has limited access capacity in the State.
See previous comment

"NP's or physicians as well as LPN/MSA, improvement in speed/processing of required templates would improve efficiency, scheduling software (VISTA) is incredibly inefficient and cumbersome, our Vets have been surveyed and do not desire evening/weekend appointments"
"Difficult to assess services provided by different departments.
Scheduling package makes scheduling and monitoring difficult across services"
Unable to speak directly to the needs for the service providing MH
Difficult to speak for another service/discipline
Difficult to speak to the needs of another service

cumbersome templates

Our process that led to delay involved lack of speicalty trained provider onsite to complete the CTBIE. We are in process of modifying this to have a PCP trained onsite to complete.

PSCT (Polytrauma Support Clinic Team)
"no delays resulted in adverse effects - however, with only one provider performing CTBIE(and all other assessments regarding TBI) there are inevitable delays and the metric does not reflect the true number of referrals."
"more space is always needed
back up to solo provider for CTBIE
allow use of up to date technology such as text to remind Veterans of appointments
Use Fee basis back up for CTBIE"
We are a Polytrauma Support Clinic Team (part of the Polytrauma System of Care)
see previous comments
I am not conversant with the reasons for any delays in Mental Health
"across the board increase in funding, space and clinical and support personnel needed"
there is too much redundancy in the reporting required by VACO for TBI the CTBIE report is of little clinical value and the use of the Mayo Portland is not appropriate for many settings.

"1) We need for more staff trained in diagnosis and management of TBI.

2) However, there are a number of patients that repeatedly miss appointments, and thus extend the wait time for everybody."
we need more openings in neuropsychology
there are no fee-basis services that are really applicable to these patients

"Timely receipt of referral for Comprehensive TBI Evaluation to PM&R from Primary Care or Mental Health, following TBI Screening, has caused delays in CTBIE"
Providing Medical Supports Assistants(Clerks) to scheduled patients in the required CTBIE time frames is very important
"Increased Sleep Lab Rooms, Technicians would greatly improve Sleep Assessments"
"Increased Mental Health Professionals, and Telehealth would greatly improve Mental Health services to Veterans."
Increased Neuro-Ophthalmologist would greatly improve eye care.
Patients are often received from distant DOD medical facilities with limited medical records.
Increased Pain Specialist would improve care.

Post Deployment Polytrauma clinic

Lots of funding for Polytrauma site- those funds need shared with Polytrauma Support Clinic Sites as that is where the bulk of follow up and long term care resides.

"MRI's main challenge is space. [Location redacted] VAMC needs an additional MRI for a rapidly growing veteran population, but we must build additional space to house the MRI."
[location redacted]VAMC is critically short on exam room space.
"Audiology''s main challenge is a shortage of hearing booths for a rapidly growing veteran population. We can acquire the booths, but need space to place them. We also experience a large Comp & Pen demand for audiology booth time. Perhaps we can relax the VA policies on hearing test requirements in comp & pen."
We must have seamless bi-directional interface between DoD and VA electronic medical records.
Space in PM& R for TBI counseling is our main challenge.
Neuropsychologists are extremely difficult to recruit.
"Pain Management clinic must meet the space requirement for CARF accreditation, which is extremely challenging given our growing veteran population. Psychologists and OIPP Directors are extremely difficult to recruit."
Same comments as in primary care. CPRS inflexibility is a huge issue.

"currently no delays, did have space restraints. Also, training provided to schedulers."
"Expanded hours in optometry. Recently hired additional Ophthalmolist. Currentlyno wait time issues. We have a Center of Balance, with designated team that is able to adress many clincal assessments in one visit."
We have a designated Polytrauma Team working out of the PM& R section that follows patients closely and offer a wide range of services and adaptive devices.

Currently meeting need No show is biggest problem
Vist is 4 hrs and no show biggest problem
Vision therapy not eval feed out
almost impossible to get
more staff

TCM Team

Additional neuropsychology services have been added during the past year. There is no longer a delay.
Problem of delays was addressed during the past year
The TBI screening program is flawed and has resulted in too many veterans being diagnosed with TBI based on limited info. The need to complete Mayo-Portland evaluations for mild TBI patients is not helpful.

Need more MAS for scheduling. Need to improve phone system for faster and more efficient communication for patients. Reminders by text.
see initial comments

Availability of MRI is limited at facility. Fee Basis care is often utilized but the process often gets in the way of timeliness. Our facility needs more equipment to perform MRIs or the process for Fee Basis care should be simplified to provide access to these services more quickly.
"There are no sleep lab services available at present at facility, however, a sleep lab is in development which will improve access to this service. Fee Basis is the current way to access sleep studies and the process gets in the way of timely studies. Fee Basis process should be streamlined."
Facility needs a full time Neurologist to evaluate and treat Veterans. Fee Basis process is utilized but takes time to get approval and an appointment scheduled in the community.
"Sleep studies are not available at facility but are arranged per Fee Basis in community, however, the process takes too long. Sleep study lab is being implemented now which will open access to care once completed. Fee Basis process needs to be streamlined."
CTBIE template is not user-friendly and is periodically updated resulting in errors that lead to inefficient use of provider time as the provider must enter clinical information several times before server will save data. Policy Documentation requirements overlap and result in redundancy in documentation for example: TBI Second Level Evaluation has a plan of care and yet a Rehabilitation and Reintegration Plan of Care is required which has same information noted.

"There is a need for Vestibular Rehab -- combination of MDs, PT and Audiology. Collaborative efforts among these specialists will help in the well-being of our Veterans. Resources are available within the VISN."
"More space need to be allocated for the Audiology section. In 1 campus, the space allocated need to be reassessed for increased efficiency. Additionally, staff coaching can also be instrumental in increasing the efficiency of this section."
Staff training/coaching on gaining balance and vestibular rehab.
Individuals trained in the cognitive and physical aspects of TBI with regard to schooling and employment.
"Reasons for Patients No Show include transportation, clerical and constant reminders."

Greater clarity in national recommendations

"Patients are sent to Physical Medicine and Rehab clinic; however, there is no dedicated provider in this clinic to timely respond to completion of 2nd level TBI evaluation."
Delay due to staffing issue and lack of leadership support to address this issue in hiring appropriate personnel.
"1. Dedicated physician to complete evaluation.

2. Training of primary provider and other disciplines in completion of the initial TBI screen.
3. Backfill TBI Coordinator''s (Social Work) position to manage the process, respond to consults, complete treatment plan, and coordinate appropriate clinical interventions."
Dedicated Neuropsych provider for OEF/OIF/OND Veterans to assist with evaluation and clinical interventions.
"1. Backfilling TBI Coordinator (Social Worker) position to provide adequate case management services.
2. Dedicated schedule to contact patients.
3. Training"
Hire dedicated trained mental health provider in providing care to TBI patients.
"1. Hiring dedicated TBI Coordinator and physician.
2. Hire Nurse to support team and managing care.
3. Hire admin support staff to support scheduling of the clinic."

"PM&R TBI/Polytrauma Clinic includes physiatrists, neuropsychologist, and RN case manager."
"Delays only occur when the person performing the TBI clinical reminder screen fails to send the consult for a CTBIE, which is automatically opened by a positive screen."
"Space and clinical staffing are adequate. Telehealth equipment is available but remote site staffing is not. Current clinic scheduling package is woefully inadequate. Efficient scheduling is difficult when physicians see patients in multiple clinics having different stop codes (e.g., TBI, amputee, EMG, physiatry, and pain), with each stop code requiring a separate clinic profile. Technical definitions for compliance monitors need to change to remove patients who screen positive in error from analysis(e.g., LVN enters positive screen then PACT MD deletes CTBIE consult after determining patient did not understand screening questions and had no exposure). Adding resources should only be considered after the extremely poor selectivity of the TBI clinical reminder screening tool has been addressed. The false positive rate is unacceptable. Section 4 should be reworded to clarify any current symptoms must have started and continued from the time of the exposure, not have developed de novo."
Need another MRI scanner.
One of 3 pain physician slots and a pain PA slot have been vacant > 1yr. New pain physician scheduled to start next month. PA candidate declined due to salary. See previous comment regarding scheduling software.
"Mandatory training, often on material covered multiple times in the past, cuts into clinical time and reduces workload credit. Staff physicians have little administrative/secretarial support. Medical record entries must be typed by the providers. Lack of dictation services (a few providers have Dragon software)."

Need addition of ILP (physiatrist and psychologist) to increase capacity. Central office policies need to be adjusted to allow for repeated no-shows/cancellations with these referrals. Number of Veterans disengage from the process after referral and cannot be contacted for scheduling.
DoD records were not requested on any referrals in the past year.

We generally don''t see acute or subacute TBI

Change the timeframe metric/requirement for Veterans who no-show/repeatedly no-show

Information technology - a better way to track who has received a positive TBI reminder but that a consult may not have been placed.
In the past we have not received any records from DoD assessments. With the roll out of JLV we now have some access to these.

TBI Clinic is held in the PM& R Department with an interdisciplinary team.
Evaluations are generally available in remote data.
Regional polytrauma referrals are made with initial moderate to severe injury and are made on an as needed basis for chronic symptoms less frequently.

"New psychologist was selected and currently ungoing HR processing.
No adverse events occured as pateints were offered appropiate MH treament."
"To prevent delays, if DoD information is not readily available we contact DoD Practioners"

Focus should be on symptoms management and not ''TBI'; mild concussion. I think we do more ''damage control'; with that label . Also manage symptoms in context of psychosocial issues. cannot use a traditional medical model to treat these Veterans with Combat Stress issues. Eliminate Level II TBI evals - essentially useless - uses up valuable time away from symptoms and psychosocial management. Focue on rehab and job school success rather than treat ''TBI symptoms'; Very unproductive and improvements not long lasting until overall psychosocial issues addressee with at least equal importance "The whole Level II TBi evaluation process with perfomrance measures are too cumbersome. Penalized in performance measures if you are ''tenacious'' and able to schedule patients beyond the required three phone calls, certified later. - Median days to level Ii TBi eval is longer despite following ''leave no vet behind''/"

Add addtional in-house MRI capability.
add in-house capacity for main hospital and CBOCS for MH services.
Recruit neuro-opthalmology resource to add to neuro-ophthalmology/Neurology resource already available.
"make the DOD and VA electronic record sharing more robust and comprehensive,this will take the burden away from case managers who have to get paper records.Also,DOD should improve scanning the outside care documents into their electronic records."
Add more in-house MH capacity

Provider covering TBI clinic changed so there was a time when no one was covering TBI clinic.

Speech therapist are vital in the role of moderate and severe outpatient TBI treatment. The use of NVCC is vital for those that live a great distance. Many CO directives do not address the real need of having the ability to schedule and contact Veterans more efficiently. Wait times are arbitrary and rarely reflect clinical need or community standards.
Many Veterans that are screened for TBI are many years past the initial incident. It is important to address their clinical needs but the required templates are not necessary for many of the evaluations. The scheduling system is often down and does not provide an easy scheduling process. The documentation often requires providers to complete encounter information that is purely administrative and adds to documentation time.

- **ACS**

"Because of affiliations with teaching institutions, we need to have more house-staff in ED, Internal Medicine, Cardiology, CT surgery, etc. in addition to professional staff (physicians, mid-level providers, nurses, techs, PSAs, etc.) in well-equipped chest pain units with user-friendly ACS pathways and protocols."

To have ambulances at site 24/7 for possible transfer to non-VA facilities where there is no cath lab available on evenings and weekends.

"To provide funding to make current cath labs 24/7 operations with space, including separate CCU and step-down units, and adequate staffing."

We need 24/7 on-site CT surgery with adequate staffing of a SICU geared towards cardiovascular diseases and postoperative care.

"We were on diversion and no beds were available in the ICUs, telemetry or general wards."

"We need to make our current observation unit to a well-equipped and adequately staffed cardiovascular observation unit with 24/7 operations. Most importantly, we need our own CCU as a separate space with adequate equipment and staffing at all levels."

"Last minute requests (like this survey) detract from patient care time. So do long training modules, and associated interruptions in provider computer access."

"Retention allowances were delayed or eliminated, and consequently sonographers lost."

Need more beds.

Survey is becoming duplicative and tedious. Information from this point on is of dubious reliability.

education that PCI and thorombolytics are equally effective in some patients.

Often we hear "no beds available" for admission of ACS patients -- not so much because of inadequate physical beds -- but because of delays in discharges or transfers out and inadequate nursing staff to open all potential beds.

See preceding comments about inadequate nursing staff to open all potential beds to accept transfers in.

"We have enough medical provider staff- we could use a LMSW to help us move people more quickly out of the UCC so we can can for our ACS and other urgent patients more quicly. We areflexing scedules to better serve during peak hours. We have antiquated space/layout that is in the plan for renovation. We will be working on a method to simplify transfers and may need additinal support assistance after duty hours.Beacuse we are an UCC with an inhouse telemetry unit, admissions or transfers are a hot priority here. We get immediate approval for transfers, delay is on the receiving end.or transportation. Overuse of UCC for primary care continues to plague us as well as the rest of the nation.We need pharmacy support afterhours to improve our flow and service but that generally does not impact ACS. We have routine orders , as soon as they are ruled in or out, they are transferred. If unstable chestpain-immediate transfer. Cut and dried."

Straemline CPRS.

Cardiology services here available M-F 8-1630

"Our hospital is a level 3 facility no invasive cardiology services. We are too far from the nearest VA hospital to offer VA emergent cardiac invasive procedures- all are done locally. Usually the next facility does not have bed availability for emergent cardiac services, if it can wait ."

"Cardiologist is alotted a fair amount of time to review echoes, stress testing. Fee based provider on boarding to increase volume.

UCC poroviders have a fair amount of administrative work- cardiologist 95 &+ clinical."

[Location redacted]does NOT have inpatient medical beds
[Location redacted]does not have cardiac specialty or inpatient medical beds.

"Having more exam rooms, so patients are not waiting and ability to independantly manage patients will help expedite the entire process."
This is not a significant problem for our va.
"documentation, cart notes and imed consent is cumersome. efforts to do urgent cases locally are already in place so we can avoid delay in care."
This is not a significant problem for our va. Delays are rare.
More beds necessary at the accepting VA transfer site ([location redacted]) reason for delay for the most part is no available beds.
"This is not a significant problem for our va, transferring patients to local hospital for urgent care. Delays are quite rare. If a procedure is emergent, every effort is made by both parties to transfer pt for prompt care to non va facility."
"Busy schedules at the accepting VA facility I think cause the delay in care. Lack of spots for surgery, cause delays."
Ability to do echo''s and nuclear stress tests during the weekend can expedite the process.
"Not enough clinic slots, limited providers,
inability for primary care to take care of patients independantly"
"This is a rare problem, our accepting VA makes every effort to accomodate"
lack of beds to accept transfer is the main issue

We would benefit from more Interventional Cardiology FTE and from increasing Cardiology salaries to be competitive with local non-VA salaries.
Increase Interventional Cardiology FTE and salaries
"Our VA referral site for CABG is 4-5 hours away. This is too far for patients to travel and makes appropriate follow care difficult. In addition, the VA we refer to has a very large catchment area for referrals and cannot reliably handle the load."
It would be in the veterans' best interest to be able to undego CABG locally.
"Our facility has too few inpatient beds for busy months of the year, e.g., flu season"
It would improve referral times if we could use local non-VA surgery practices.

Follow-up appointment as outpatient after ACS is too long due to lack of clinic availability.
Access post ACS in timely fashion to outpatient clinic is main bottle neck.
Post ACS access to clinics after hospital Discharge is the key SHORTAGE in ACS.

More provider (physician/NP/PA) coverage may be helpful. Additional tele beds and nursing would be helpful. Reducing paperwork for transferring STEMI and Imed delays would be helpful.
Admitting mid-level support for the teams may be useful on Saturday/sunday and additional provisions for admitting patients during busy times. More nursing for more inpatient beds would also help.
Redirect patients with STEMI and likely higher risk NSTEMI when w/in system cath is not available.
Echo on weekends would be helpful at times. That would require echo techs/cross trained radiology techs and either remote reading or in house reading.
"More nuclear stress testing capacity, both on weekends and perhaps even after hours would be very helpful in risk stratification."

"We find that it is very difficult to transfer patients to other VA facilities for coronary angiography. Building and staffing a cath lab in Boise would help, as would more use of fee-basis service and medically re-directing when in-system resources are not available."

"We usually get our STEMIs out in time and there are no issues with local acceptance. Rarely ED crowding issues might delay STEMI care, but this would be quite rare. When we have had delays, it is purely systems issues like using non-emergent ambulance."

More capacity to do coronary interventions within the VA is essential. We frequently have trouble transferring patients for coronary interventions and wind up using local non-VA care.

"We can usually get non-VA CABG done, but within the VA system getting CABG done can be delayed by bed availability in our tertiary centers."

"On occasion we cannot accept a patient in transfer because of bed availability, but in general we can accept patients if they are appropriate (however we do not have a cath lab)."

"Getting a cath lab here would help a lot, as would additional inpatient telemetry/icu beds."

"More capacity (fee-basis, after hours, etc) for nuclear stress testing would be nice."

More capacity for CABG in our tertiary referral centers and more CCU/telemetry beds would expedite elective CABG.

"Increased cath lab availability and the attendant staffing would improve our access to PCI, either at our facility (none now) or our referral centers."

"We have resolved our situation with the delays in echocardiography scheduling now, but about 3-4 months ago, there were significant issues. This is related to some of the regulatory rules about when we can advertise for new personnel. Specifically, we knew several months ago about the retirement of one of our echo sonographers. However, we were not allowed to post for their position until the person actually left. This left us in an impossible situation where we did not have enough sonographers to cover the entire number of people referred. It took several months before we could hire and bring in a new person. All this could potentially have been avoided if we could post for positions sooner, especially when we have advanced notice about an employees' departure.

The vast majority of Veterans do not want to take advanatage of fee-basis opportunities or the Veterans Choice Act. If the services can be offered at the VA, they seem committed to staying within the VA. So, it would be helpful to provide the infrastructure to help them do so."

"Some ER physicians rotate through the ER on a fee-basis and so they are not as aware of the protocols in place to evaluate ACS patients, particularly the STEMI patients who require rapid evaluation.

Easier and more efficient methods to transimt ECGs to cardiologists to evaluate would be helpful especially during "off-hours." When there are ECGs that raise concern amongst ER physicians, they often would like a cardiologist to quickly read, and facilitating this could improve Veteran care."

"The transfer of patients within the VA happens quite well. However, we do notice that at some VA facilities, there are Veterans who could have been transferred to our VA in [location redacted], but the patients somehow end up going to a local non-VA facility. If this was patient-driven, it may be okay, but our perception is that often times, it is a decision driven by a fee-basis physician working at the outside VA facility."

"The scheduling of preoperative testing does results in some delay in the scheduling of procedures, such as CABG."

"One of our cath labs requires an upgrade, and the time for upgrading it seems quite long due to lack of funds and the number of approvals required. This particular lab does repeatedly break down requiring additional servicing. Fortunately, it has not led to a significant patient-care issue or delay in therapy as yet.

There is occasionally issues with bed availability restricting our ability to quickly turnover patients, though this rare.

The no-show rate is somewhat problematic in the outpatient setting and prevents us from seeing the maximum number of patients possible."

We have physical beds but not enough nurses to take care of patients; hence the wait time for inpatient beds. We cannot transfer ACS patients (to our VA for cardiac cath) easily from outside hospitals or other VAs because of the ''bed situation''
Lack of nursing staff despite adequate physical beds and space. There are plenty of doctors and cardiologists who are happy to care for these ACS patients who are turned down due to low bed availability
No delay for any urgent or emergent cardiac cath or echo services. Occasionally stable patient Echo may be done the next day if schedule is too full.
"Need more OR space and time for CT surgery
Need an additional CT surgeon for CABG"
"CT surgeons may need another day of OR time and space on Sat to manage the workload.
Also easier fee basis transfer to affiliated Univ hospital could be expedited to help manage the workload"
"No physical beds
Poor communication between bed control and AOD
Too much of paperwork/computer work"
"Need better functioning over weekend to enable transfers
Better communication with Bed control and AOD
More weekend personnel to facilitate transfer and care
NEED MOR BED CAPACITY"
"Need more CT surgeons
Need more OR space and time for CABG
Need additional Nurse Practitioner / PA to help manage the CT surgery work load
Better fee basis to Univ for elective cases which could be delayed"
Not a big issue or delay with this aspect
"Need more CT surgeons
Need more OR time and space"
If we have more staffed physical beds and some more personnel we can easily take care of 50% more volume happily

Remains critical to foster community relationships as we rely on community resources to rapidly accept our referrals
Again continuing to foster/nurture relationships with community resources as we fee out all acute coronary care
Currently our only available risk stratification is ETT with or without sestamibi. This is reasonably available (same or next day) M-F. Other modalities (dobutamine echo or stress echo) are done by fee. Improving timeliness of these approvals/referrals would be helpful.
Beds on the receiving end (in a tertiary center) always seem to limit availability to refer within the VA. Our access (via phone or tele ICU) with tertiary facilities is good.
again fostering good community relationships is key to access local care quickly as these are all referred locally within the community.
Still all about local facilities willingness to accept our referrals.
Beds in referral facilities is the key rate limiting aspect of these referrals.
"Stable ACS patient" is an oxymoron. As we don''t cath patients at this facility we don''t generally accept chest pain referrals.

"Don''t think it is reasonable to anticipate the workload for more than a M-F service. In our small facility there is 1 ekg tech and 1 nuc med tech, and their absence (for sickness, leave) derails our ability to obtain ETT with sestamibi, our only modality. Dobutamine echo as an option would require substantial investment in personnel and space, and so long as these are available timely by fee I don''t think it is worthwhile for us to do these."

"Again, as we don''t cath patients most of our process is assessment and referral by fee for care locally either as an inpatient or electively."

"Patient load in ED has increased tremendouslywithout corresponding increase in room, support staff, facilities, medical staff, administrative staff. We've noted the ED has a crisis limit where even a few patients over that limit causes major slowdown in patient care. All services (Hospitalists, Psychiatry, Surgery) affect the flow of ED and are out of control of the ED. Further, a non-urgent acute care department needs to be associated with every ED in order to better serve the patients with serious illness."

"The ED needs to be at least twice as large as it is currently to serve the Veterans. Needs to be staffed with more full time ED docs, nurses, NP/PA, admins, phlebotimists, transport, pharmacists. VA needs a functional schedule system and health record that is based on modern technology-a commercial software used by other hospitals should be fine. Radiology should be available 24/7. Full time psychiatry support in ED is critical as SI/HI patients often require tremendous personnel support and rooms, slowing down ED care."

"Currently remodeling 4th floor which should increase number of tele beds assuming more units will be used once the extra beds are open. Sometimes have to put patients in ICU when tele/SDU beds are full. I think the delays are usually attributable in small parts to several services which add up. Busy MDs need time to eval in ER and write admission orders, busy nurses need time to take report and admit new patient, bed turnover from the last patient takes time."

Our Medical ICU has 6 beds and usually has to use SICU beds for spillover. Being at 2 different ends of the hospital it is inefficient but works for the most part. If MICU expanded nursing staff would have to be increased. Keeping up with monthly data about timeliness would keep it in the forefront of the minds of LIP/nursing/ancillary staff.

"We currently need more echo techs because their schedule is full. If one tech is out the other has a double load. Also, inpatients wait until afternoon behind outpatients to get their echo which can delay discharge. No echo available on weekends so some requiring holding until Monday afternoon to be evaluated."

We would like to hire another cardiologist which would give more flexibility to our current staff. Patient''s with intermediate risk factors admitted over a weekend have to stay until Monday to get their stress test. Don''t think our institution is big enough to justify 7days/week availability.

Currently our cath lab is only used for scheduled cases and emergencies during regular work hours. We are trying to increase cardiology staffing which might allow for more availability in some situations.

"If we have an STEMI after hours it will require transfer from VA to university which will take a minimum of one hour, usually more, to work out. We cannot staff a cath lab 24h, 7d a week."

"Having 24h, 7d/week cath availability here is not feasible. It is a long tedious process to send an inpatient to another facility after hours. Not sure what parts could be simplified or eliminated."

Transferring a Veteran to a larger VA offering CABG services is slow and usually requires keeping the patient on our inpatient service for days until (1) Cardiothoracic surgeon reviews films and agrees to do it (2) picks a day they want him to arrive and (3) travel can be arranged. The answer is to stop requiring us to send people so far from their home and family to get life-altering surgery.

"Transferring someone anywhere from inpatient service requires so much administrative work, however, I''m not sure any of it can be eliminated. Per my last patient transfer--there just weren't any obvious short cuts."

"VA should conduct a yearly market salary analysis for all providers to maintain competitiveness with community standards. We should also be flexible in allowing for incentive pay for physicians based on RVUs or productivity. Regarding recruitment and hiring processes--HR should be able to have a provider start date of 30 days or less. Current practice is 4-6 months before EOD date is given to selected employee. Regarding Contracting issues in relations to equipment purchases, simplify process to allow acquisition of equipment in a timely manner (60 days or less)."

Optimal availability of resources
The cardiac cath lab must be optimally equipped.

"Facility volume in general and the ED''s in particular has greatly increased and without a corresponding increase in resources. We need additional ED exam rooms and the staff to service them including Physicians, Nurses, LPN''s, and techs.
There are an insufficient number of Tele and ICU beds for our population. These areas are often filled to capacity requiring our patients to be transferred out. Additional rooms and appropriate staff, eg; ICU RN''s and so forth are needed.
Everything needs an increase on the order of 50%, and this is simply to catch up to present demand. This does not allow for future growth in our population base, which is clearly going to occur.
We need an X-ray suite within the ED,
Radiology needs additional personnel for staffing on nights and weekends when there is often only one X-ray tech for the entire building and services the ED, ICU and OR simultaneously.
All departments involved in the care of the cardiac patient need improved and increased administrative support at all levels.
Central office rules on Physician scheduling are too restrictive and need to allow for working more than 80 hours in one pay period either with compensation for overtime pay or additional leave days, or by allowing fewer hours to be worked in other pay periods.
An in-house transport service to move patients to and from X-ray and to inpatient beds from the ED would speed flow. This is at present a volunteer staff and at that is inadequate in number for present needs."

All departments involved in the care of the cardiac patient need improved and increased administrative support at all levels.

Central office rules on Physician scheduling are too restrictive and need to allow for working more than 80 hours in one pay period either with compensation for overtime pay or additional leave days, or by allowing fewer hours to be worked in other pay periods.

An in-house transport service to move patients to and from X-ray and to inpatient beds from the ED would speed flow. This is at present a volunteer staff and at that is inadequate in number for present needs."

"Ratings apply to patient care in general, as it is difficult to isolate care of ACS patients from the general population in these aspects."

"Employ well trained ED phyusicians. Not newly graduates. Provide ongoing training, feedback, case discussion and follow-up for ED physicians."

I recommend immediate cardioogy consult in the ED for every patient being considered for ACS admission. As done in the private sector.

"Delays may be improved by pre-procedure screening and adhering to ACC/AHA appropriated use criteria. By reducing unnecessary tests, delay would be reduced."

"Staff training, mock drills, in-service for new health care provider, physician feedback"

"Having the PCI team memebers living wihthin 30 min to the hospital makes it easier to achieve 90 min D2B time. Otherwise, the team have to make up time in other process areas."

"dealy due to
1. lack of beds
2. lack of nursing staff
3. inefficient discharge process that ties up beds"

"Blocking patient transfer UNTIL a bed is physically empty. Bed control is unwilling to "anticpate" upcoming discharges and patietn transfer time. i.e. if one knows a bed will be available in two hours, then one should accept pt for transfer that has a transfer time > 2hrs."

The surgical service admits patient 3-4 days for pre-CABG evaluation. An inefficient use to time and beds.

Too MANY nurse administrators (chiefs)monitoring and not doing actual patient care work. Too many repetative documentations set up by administrators to meet JACHO requirement. Too many hospital wide balnket policies that should be taylored to departmental needs.

"All delays have to do with transportation, not the personnel at either facility; and certainly not due to delay of care. I would recommend improving the contracts with services that transport our patients, OR to have our own transport immediately available (although I am aware that this is a very costly service to maintain).
I recall cases (not so much names unfortunately) where there was a 2-3 hour wait for STEMI or NSTEMI - because the ambulance couldn't get there in a timely manner, for a 10 minute drive to the nearest hospital that could perform PCI. Fortunately in all cases the patient had already begun to stabilize clinically, but I wouldn't prefer to rely on luck alone."
"All delays are related to transportation time and availability. I would recommend improving the contracts with services that transport our patients, OR to have our own transport immediately available."

Establish better memoranda of agreement.
Increased bed availability of beds at the receiving hospital.
Bed availability is the primary issue

[Location redacted] VA does not have a cath lab. and it doesn''t make a true business case to have one.
Transfer of patients to other VA is delayed by distances not used in cases of ACS
Delay is lack of bed in different hospital.
Primary PCI in STEMI not usually done at another VA due to distance traveled.
Stable ACS transfer for possible PCI would like to have further testing over the weekend prior to transfer accepting provider from outside hospital doesn''t want to take a patient earlier.

"VA is not competitive (salary) in hiring echo technicians. This results in delays in getting inpatient echocardiograms. Also numan resources process is extremely slow, hiring process takes 6 months or more. An alternate short term solution was suggested at this VA (hire contract echo techs on an as needed basis; it turns out that drawing up a contract for this is also very slow). VA has become increasingly bureaucratic and inefficient in terms of hiring, this is affecting patient safety and care, and is also very expensive as increasing numbers of patients are sent out to community."
"Generally inpatient response is reasonable, problem mostly on outpatient side. Weekend coverage would clearly shorten hospital length of stay for patients arriving on Friday or Saturday. ."
Currently ED is staffed nights and weekends by moonlighting University fellows many of whom are not expert in rapid diagnosis of STEMI. Hiring ER trained and certified staff 24/7 is only way to fix the problem.
The delays in primary PCI are related to delays in diagnosis in the ED (see question 8). There have not been problems with timely arrival of cath lab staff once the STEMI team is activated.
"Our VA needs to recruit and hire additional cardiovascular surgeons, it is currently routine for non-urgent surgeries to be delayed a week or more, and for urgent surgeries to be sent out. Patients with unstable angina are typically sent home to come back for surgery later. Most of this is related currently to shortage of surgeons, in past when more surgeons were available a problem was availability of the OR only 3 days/week (due to lack of CV anesthesia support and OR staff and space). Anesthesia staff resistant to doing more than 1 case/day, need incentives to improve efficiency or hire contract staff to allow a second CV case. Finally night and weekend coverage is non-existent, those cases are routinely

sent out to non-VA facilities. Need night and weekend coverage by qualified CV anesthesia staff (either VA call-back system, or contract call from non VA facility)."

"Delays are common. Mostly this results in extra expense to the VA as patient is treated at a non-VA facility. Reason for delay is shortage of inpatient beds, and no ability of CCU to restrict CCU beds to cardiology patients."

"Main problem is insufficient inpatient beds. At times in past nursing shortages have also been an issue, resulting in not all beds being open; this hasn';t been an issue in past 90 days. There is no consistent effort to prioritize transfers based on acuity of their illness.

Supervision and incentives: Unlike the private sector there is not a "service mentality" in the transfer office. The transfer process is "unfriendly"" to referring hospitals, typically they have to leave a message and get a call back, rather than having a transfer clerk consistently available to answer the phone directly. This is a problem both for referring physicians and in-house physicians trying to get a patient admitted."

"Recently hired CRNPs should help with delays in clinic appointments, especially hospital discharge patients. However, currently no morning clinic space (despite long backlog in patients). We could see more patients if we had more space, would also require some additional physician FTE. Also there are many issues in the clinic that make it inefficient, slowing patient flow:

1) Lack of adequate support staff (certified techs) to do things like medicine reconciliation. Latter currently not happening in any real sense unless the physician does it, which is VERY inefficient use of resources

2) The subspecialty clinics have no control over the support staff to enforce things like med reconciliation (the staff report to nursing service, which is not very responsive to request for change).

3) The electronic medical record is no longer state of the art, and is not well connected to scheduling system, which contributes to inefficiencies in both scheduling and patient thru-put."

More nuclear techs and equipment. Weekend coverage would less hospital length of stay.

"Need more CV surgeons.

Anesthesia is inefficient, difficulty staffing more than 1 CV case per day. Lack of qualified CV anesthesia coverage at night and on weekends. Need fee basis coverage from non-VA facilities for night and weekend anesthesia coverage, and also for second cases during the day. Need additional trained CV nursing staff, need to increase caseload to make job attractive (or hire fee basis contract CV nurses from non-VA facility as needed)"

"Administrative and lack of support staff mostly in outpatient area. Rare delay in inpatient studies due to one of the two cath labs suboptimal for complex procedures, competition for time with EP procedures in same space; replacement lab for older cath lab scheduled to be on-line in next 6 months to address this."

Recedntly opened new cath lab.

"Our single biggest deficiency is in availability of inpatient beds. Most often, but not always, the actual shortfall is in bed staffing (i.e. nursing) and not in physical beds. This results in delays in transfer of patients from the ED to the floor, and creates further bottlenecks for the procedure areas. For example, in the Cardiac Cath lab patients often must be held in the Recovery area for additional hours due to lack of available telemetry beds, which pulls cath lab staff from other duties and affects procedure throughput.

In Cardiology we have a shortfall in technologist positions -- primarily cath lab techs and echo techs. Technologist pay scales fall far below market in high cost of living areas, and we have continual problems attracting and retaining these critical personnel."

"Similar to last question.

Our single biggest deficiency is in availability of inpatient beds. Most often, but not always, the actual shortfall is in bed staffing (i.e. nursing) and not in physical beds. This results in delays in transfer of patients from the ED to the floor, and creates further bottlenecks for the procedure areas. For example, in the Cardiac Cath lab patients often must be held in the Recovery area for additional hours due to lack of available telemetry beds, which pulls cath lab staff from other duties and affects procedure throughput.

In Cardiology we have a shortfall in technologist positions -- primarily cath lab techs and echo techs. Technologist pay scales fall far below market in high cost of living areas, and we have continual problems attracting and retaining these critical personnel."

"The echo lab relies heavily on contractors to fill sonographer positions, due to the large gap between VA and community payscales for the technologists who perform echo procedures. This leads to inefficiencies and to some degree of uncertainty with regard to echo lab staffing. Physician staffing is not the issue.

Overall, equipment is very good. However, the VISN recently imposed a change in PACS systems that was un-asked for at the local level. The new system has been inadequately supported at the IT level, such that technical problems in transferring clinical reports from the reading system to CPRS/Vista have led to delays in having these reports available for patient care for hundreds of patients."

"I am told that it is sometimes difficult to add on inpatient nuclear stress tests in an expedient manner - e.g., can''t get a slot for stress testing for a patient who comes in through the ED the afternoon or evening prior."

"Our VA medical center does not have a true page operator who can facilitate simultaneous and efficient contacting of the STEMI team to ensure that everyone is notified in a timely manner for this time-sensitive function. We rely on the nursing supervisor to play the role of page operator, which is an imperfect solution."

"CT surgery at SFVA has difficulty ramping up for urgent inpatient procedures. In general they perform a single operation most weekdays with the exception of Thursdays, when they have clinic. The CT surgery chief has pushed very hard to be able to perform two procedures per day when there are urgent inpatients, so that these patients may be accomodated without necessarily moving or cancelling the scheduled outpatients. Gaining support for this from OR and anesthesia staff has been challenging."

"The issue with accepting transfers generally involves bed availability, and at SFVA the issue limiting beds is more often than not RN availability for staffing those beds. In general, patients with ACS should not wait very long, so when we do not have bed availability, those patients are transferred to other cardiac centers so as not to impact care. The cath lab nearly always has capacity to add on urgent inpatient transfers."

"CT surgery can generally get patients in to clinic within a reasonable amount of time. Like many clinics at SFVAMC, they suffer from a shortage of clinic space, which impacts efficiency and numbers of patients seen. Tele-health can be applicable for some patients. The case manager role is essential for organizing these complex patients."

"Carotid ultrasound can generally be acquired quickly.

Full PFTs (CT surgery generally requests full PFTs, as opposed to bedside spirometry) generally take quite some time (on the order of 2 months, according to the TAVR coordinator) to obtain."

"Insufficient administrative support is a chronic issue.

The number of staffed inpatient beds has long been an issue, which impacts our ability to get patients out of the ED, to bring in urgent transfers for advanced care, and to move patients from the procedure areas to the floor.

Cath lab equipment is overall excellent. The physical space is inadequate for all needs, however -- sterile storage is in several rooms that are physically separate from the cath lab area. This suboptimal situation

was created when the hybrid cath lab/OR was built (which took some space that was previously used for storage), and has not been remedied."

"Need licensed emergency medicine physicians instead of mid-level providers in the ER, more technicians, pharmacists and nursing staff."

"We need more echotechnicians, weekend echo availability, more licensed physicians instead of NP''s in the ER, more bed availability in other VA facilities to which patients are transfered to for coronary angiography, provide an in-house coronary intervention capability so patients don't have their care delayed due to waiting for transfers to other VA or non-VA facilities."

"Our patients are transfered to VAAA for angioplasty and there is invariably a delay secondary to lack of beds at the accepting facility, lack of physicians available to perform procedures on weekends."

We need to have our own ambulance service available at our disposal. We need better clerical staff that can expedite transfer. We need user friendly steps that IT can help us with. We need central office to recognize that we have had approval to increase the complexity of care here in our facility to do high risk coronary angiography and interventions and help us gain support form our local VISN.

"We need to have licensed emergency physicians instead of NP''s and/or moonlighters of other medical fields in the ER to help better recognize ST elevation on EKG. We need the central office to support us in having the ability to have an on-site interventional lab so we depend less on transfers outside the hospital for acute care, where time is money."

"We need the central office to support us in having the ability to have an on-site interventional lab so we depend less on transfers outside the hospital for acute care, where time is money."

"Most of our delays to another VA facility for PCI is lack of beds. In addition there are no physicians available outside work hours and weekends which delays things significantly. Wait for CABG is significantly long in the accepting VA facility. We need central office to support us in having the ability to have an on-site interventional lab so we depend less on transfers outside the hospital for acute care, where time is money."

"Most of our delays to another VA facility for PCI is lack of beds. In addition there are no physicians available outside work hours and weekends which delays things significantly. Wait for CABG is significantly long in the accepting VA facility. We need central office to support us in having the ability to have an on-site interventional lab so we depend less on transfers outside the hospital for acute care, where time is money."

We need support to increase complexity of surgical procedures done in our own institution so there is less dependency on outside VA or non-VA facilities so we can better serve our veterans with ACS in a timely fashion.

The delays are usually because of lack of beds. If beds are available there is no other key step that is a limiting factor.

More providers should be hired to improve access. Weekend availability of services including tests would also help. More OR''s and OR equipments would also help improve access.

Availability of tests over the weekend and more equipments and tech availability to help improve access.

"All our inpatient CABG delays are due to lack of beds in the accepting VA facility (VA [location redacted]). Outpatient CABG delays are related to restricted OR time for CABG, eithe rdue to limited availability of CT surgery in the respective VA."

We need more licensed physicians in the emergency room instead of nurse practitioners. We need to have the ability to do on-site coronary interventions. We have been approved for it by central office but not by our local VISN due to local politics which is not acceptable.

"Severe space limitations in ED; delays also due to limited ICU, ward beds

Variable, but ED Clinical staff not infrequently overwhelmed by large patient volume

Need simplified/expedited processes for transfer of care for STEMI patients (we do not have staff to offer PCI 24/7). Collaboating with community to establish better direct routine of STEMI patients to PCI centers without adminitrative delays"

Limited telemetry bed availability impacts delays both directly and indirectly (slows bed transfers from ICU and therefore bed availability there).

Limited number of ICU beds (shared med-surg-cardiac) in consistenly very high demand. Secondary impact from limited ward and telemetry beds to which ICU patients can be transferred.

"Weekend/night coverage only by physician/Fellow performance as emergency. technician staffing currently satisfactory, but chronic problem in recruitment due to grossly noncompetitive salary structure"

"Staffed only with one part-time physician; when on leave, no nuclear cardiology capability and must fee-base out. If services expanded may need more technical personnel support"

This facility provides primary PCI only during business hours if (single) cath lab is available. Delays in intrahospital transfer night/weekends related to recognition and facile activation of STEMI system for transfer or throbolytics+ transfer. Need to work with community to permit transmission of first-contact ECGs and administrative authority to directly route patient to closest PCI center for optimal STEMI care without cost to patient

"Limited bed availability at receiving hospitals can delay care. Referral to other centers would be greattly facilitated by establishing transfer coordinators and centers at each site to coordinate practical aspects of arrangements. High bandwidth data access between sites (including across VISN lines) to facilitate image transmission and discussion (cath films, echo studies, etc)."

Limitation is timely transfer of patients to non-va facilities when needed--ambulance transfer even short distance often delayed. Would be desirable to establish authorization to direct acute STEMI patients to outside PCI facility without having to come to ER when apprpriate

See previous comments. Need more expeditious transfer capabilites as transport is most common source for delay

"Biggest limitations are bed availability and limited surgical staffing at recieving facilities, long distance to referral sites. Limited capabilities to take high risk patients (surgical depth, LVAD access, etc)."

Administrative authorization and cost sensitivies are most common reasons for delays

Ability to transfer here from other facilities limited primarily to access due to limited number of ICU and other beds

"Outpatient clinical facilities, staffing already beyond capacity. Difficult to meet various time metrics given these limitations. Very limited clerical/administrative support for specialty care. More fee-basis access to specialty care for patients at long distances from central facility would be better for patients"

"Need more depth in nuclar medicine staffing, particularly physician staffing."

Limited CT surigical staffing/capacity at referral centers. Arcane and inappropriate travel restrictions for outpatient transfers for appointmens

"1]Install state of the art computer system. CPRS is outdated and full of "patches" which slow it tremendously.. Look at the systems currently used by private sector.

2]Our CPRS is run by 11 years old processors !!! Get new processors.

3] the ER should be staffed by ER trained physicians -not by Primary care and internists physicians."

"1]This facility cardiac nuclear services are run by an employee of the Radiology department who is not capable of doing the job and creates major obstacles .

2] Cardiac nuclear studies should be offered along the weekend."

"1] retire cardiac surgeons who are no longer able to provide state of the art operations and real oncall coverage

2] create maximal cooperation/integration with the private secotr's cardiac surgery program and surgeons[[location redacted]Hospital]"

"1]Cardiac nuclear studies must be done expeditiously

2] CT surgery must employ fully competent,eager to work and energetic surgeons."

"The department of CT surgery requires a substential overall. Employ energetic,eager to work and most importantly-competent cardiac surgerons."

see previous comments concerning the functionality of CT surgery

"Personnel management - when hiring new staff for technical positions, such as echocardiography technician, it is important to test the technical skills of the people applying. With current HR rules, it is difficult to do (if there are no local veterans applying, then you have to consider veteran applicants from across the country but nobody pays them to fly out for an in-person interview)."

"Transfer from ER when patients present with STEMI, is not a problem. The only delay that happens in our hospital when patients have STEMI, is when the patient is already hospitalized (so transfer now has to be inpatient-to-inpatient), especially when STEMI is diagnosed in "off-hours" (nights or weekends) . The issues are following: 1) no available beds in the surrounding community hospitals who accept STEMI, 2) our transfer center is closed on nights and weekends and the Administrative Officer on Duty has trouble coordinating the transfer, 3) STEMI from inpatient requires ACLS transport, and in our locality this may take up to 40 minutes to arrive. RECOMMENDATIONS: 1) local transfer center with ACLS transport on-call 24/7, or contract with ambulance services to provide ACLS transport in a timely manner, 2) better supervision of various AOD and NODs who are on call at night/weekends"

"Significant amount of patients who are stable enough to be transferred to another VA facility for CABG, experience delays due to 1) lack of beds in the referral VA - [location redacted], 2) delay in accepting the patients by the surgeons due to busy OR schedule or the surgeon simply not being available (there have been significant staffing changes and turnover in CT surgery in VISN[location redacted]). For us, it would be better to use contract surgery in the affiliated University hospital where the surgeon (who has an intermittent appointment at the VA) could come over and see the patient for a consult, and the patient can then get the surgery in the affiliated University hospital by contract. This happens now with patients who are not stable for transfer to another VA, with very good outcomes. Using similar process for patients with ACS who require inpatient CABG but are still stable to transfer, would improve quality of care (surgeon would consult the patient before the transfer), timeliness of care, and patient satisfaction."

"In few patients, there can be a short delay in transferring to the non-VA university referral hospital for urgent CABG due to lack of bed in the accepting hospital, or due to their busy OR schedule. This delay has been minor compared to the delays we experience transferring patients to another VA."

lack of ICU/telemetry beds in our hospital

Most of the delay in transferring patients from outside hospital to our VA occurs due to lack of beds. Some of it has to do with lack of nursing personnel though it has been addressed now.

"Patients who are discharged from the hospital after ACS and are referred for outpatient CABG, should get their CT surgery appointment in 2 weeks. [location redacted]VA accommodates this, [location redacted]does not - however, they do see patients in 30 days. I do not know what solutions should be in place for them to see patient quicker."

"Delays in getting outpatient CABG for patients after ACS happen often, partially because the referral center surgeons insist on multiple consults by other services before seeing the patients. Also, I assume because of lack of OR. Often patients wait for months to get outpatient CABG in the referral VA. Better communication between cardiologists at our VA and surgeons in referral VAs may help, and we can work on this on our own. VISN level cardiovascular meetings where the Chiefs of Cardiology or even all cardiologists/CT surgeons get together to discuss pressing issues, would help A LOT."

"There is no "cardiovascular conference" where we could discuss patients with the referring cardiologist (at our VA), the referral cardiologist (at referral VA where they do complex PCI), and the referral CT surgeon could all get together and discuss what to do with the patient. A great solution would be weekly teleconference between 2 VAs where both sides would have access to patient record and medical images, and management decisions for complex patients could be made with all parties participating. Currently the referring cardiologist talks to the referral interventional cardiologist and then has to talk to the CT surgeon separately."

"Our ED is being expanded this summer.
Our hospital is being expanded within the next two years. This should help."
"We need more beds. This is a process, which is ongoing.
We are interviewing for two Cardiology provider positions.
Equipment is sufficient."
"Once we have more beds available, patients will not need to be transfered out anymore, except the few who might need urgent/immediate cardiac catheterization."
On-call Cardiologist must be available by phone within 5 minutes and can direct care even when off-site. There is good communication with the ED physicians.
"The approval of our PCI business plan is overdue. Once approved, we can do PCI here at our facility."
Transfer process works OK for us
We have had a very good relationship with [location redacted]hospital in [location redacted]and all of our urgent open heart surgery patients have gone their quickly and efficiently.
Patients have to travel out of state for cardiac surgery at other VAs. Would be nice to routinely have this done in Las Vegas at a contract hospital.
Would be nice to have CABG surgery done locally rather than traveling to another state to get to a VA offering this service
We need more beds in the [location redacted] hospital to accomodate the increasing number of patients. This is in the planning stage. Any "increase in speed" regarding this process would be beneficial to patient care.
"VA purchasing system is very cumbersome.
Whenever something is being requested, this should start with "Email 1" and be dated and followed at close intervals, with someone being responsible for progress."

"We don''t do ACS evals, since we do not have a cath lab"

Increase awareness of "time is myocardium" for after-hours and weekends to the ED medical staff.
Same as before. Increase awareness of "time is myocardium".
Timely call for STEMI is needed. I am referring to one case in particular.
We need more surgeons and telemetry beds along with Mid-level providers for both CT surgery and Cardiology.
No beds available.
We need more telemetry beds cared by an Attending with mid-level providers. These are stable patients and residents get a max patients they can cover.
We need to increase availability for XR/US studies
We are short on CT surgeons.
Physicians are now asked to be "administrative personnel" and perform multiple tasks for which we have not being trained nor studied for.

"if inpatient beds increased, would likely need more inpatient attendings/hospitalists to staff these patients"

"Our options for ACS are to transfer patients locally (we have a local contract with a community medical center) or to send ~200 miles to [location redacted]or [location redacted]. The patients have to wait on average 2-3 days or longer for beds at those outside facilities. The VA ''preference'; is that we send within the VA rather than the community for financial reasons. however, it is inappropriate for ACS patients (even stable patients, cp free, with mild or no troponins) to wait > 48 hrs. So, either bed capacity, cath lab capacity with staff at those facilities need to increase, or we need to make a permanent contract locally to avoid these delays. We are also working on starting our own catheterization lab as well"

"we don''t currently have a cath lab, so we don''t run into this situation"

"People can typically be seen within a 1 week of hospitalization or certainly within 30 days. However, delay occurs when patient needs a week follow up from an outside community hospital, and that consult request isn''t forwarded to us in good time. Better communication needs to happen between the outside facility and the VA schedulers"

"Typically, if patient getting a CABG for ACS at an outside VA ([location redacted]), they might do it the same admission. If the patient is more stable, they would set that up as an outpatient. At both outlying facilities, it usually is more than a 30 day wait for elective visits with CT surgeon or the surgery itself. I don''t know why the delay is, but assuming they are fully scheduled, they may need more CT surgeons. Again, these facilities are 200 miles away, we need local contracts to take care of this in Fresno. Local surgeons would see these patients within 7 days and get the surgeries scheduled soon thereafter"

"due to old systems, doctors are retranscribing echo reports and holter reports and stress test reports from one electronic system into cprs. secretaries were doing this in the past but there was too much delay and/or errors made, so now physicians do directly but it wastes their time. This applies to all cardiology patients as well as ACS. we are working for upgrades to our systems as well as obtaining the clinical procedures cprs module which is suppposed to help avoid this"

"Hospital needs more beds/space. Often it is difficult to find appropriate type of bed for ACS patients. The number of independent licensed practitioner''s is too small to take care of current patient volume. There is no weekend availability of tests like in house echocardiogram caths
cath lab supplies/ disposables needs to available in timely fashion"

Important that there are adequate personnel that can do the procedures and that are available to communicate easily with physicians and ancillary staff from the referring center. The line of communication must be wide open throughout the entire process so that the referring center is always aware as to the status of their patients.

"In general, there has to be easy access to communicate with the personnel at the VA that is performing the procedure. There have to be an adequate number of surgeons to perform these procedures at this center or additional VAs must be added to the system so that these procedures are done in a timely manner."

"As mentioned before, there have to be an adequate number of surgeons at the VA to perform CABGs. There also has to be an adequate line of communication so that the personnel at referring VA know at all times exactly what the status of their patient is and the rationale behind decisions made."

Improve contracting process at the VACO to make cardiac catheterization laboratory supplies be available in a timely manner

"1)Ability to transmit EKG images immediately to STEMI providers via cell phone /wife fax is not feasible due to privacy concerns

2)Ability to upload the EKG in VISTA immediately is not feasible due to EKG machines not having wifi capacity

3) There is no incentive or on-call pay for physicians on STEMI call - which can be every other day or every third day

4) Process for hiring of staff is too prolonged due to VA regulations

5) Pay for interventional or other cardiologists are much lower than market pay ranges"

"Our cardiologists and CT surgeons are excellence and available 24/7, but nursing staff shortage , availability of operating rooms and perfusionists coverage can be a limiting factor."

"This is a critical issue. Due to central office contracting magnates, we cannot receive cath lab supplies in a timely manner.

Similarly, we cannot get cath labs remodeled or upgraded in a timely manner, having to compete at the VISN level for equipment purchases for CT , PET scan etc."

Need space for a well-staffed chest pain unit with fixed equipment .

Critical need for additional patient''s rooms including telemetry beds. Nursing staff

Need for additional well staffed CCU beds

"Additional well-staffed operation rooms dedicated to CT surgery.

More operating time for CT surgery under current space conditions."

Non VA facilities have limited capacity

"We need more patient beds, telemetry, intermediate and intensive care."

Need more inpatient beds and a more efficient transfer center

More patient beds and more operating rooms.

Procurement issues are serious and affect patient care

Need to expand technology to allow more telemetry beds available at facility and increase number of nursing staff so sufficient should there be a call off due to illness. Some of CO policies do not effectively translate to facility needs or cause unintended consequences such as delays related to obtaining services/personal i.e. contracting procedures.

See previous comments.

Transport to non-VA PCI facility has inherent risks of delays due to traffic patterns and area emergencies. Continue working with local ambulance and EMS systems to assure transport accomplished in a timely manner.

"We need more cardiologists on-site, and more nurse practitioners"

"We need better accountability from our cardiac surgeons, expanded OR time and better scheduling in order to improve through-put, and accountability of the OR team when things don't go as planned."

We need MORE BEDS to accept transfer patients!

"More inpatient beds, nurses to staff those beds, and nurse executives who are invested in success rather than in preserving the (inefficient) status quo."

"We critically need more cardiologists, cardiology nurse practitioners, and bigger outpatient clinic facilities."

Need more CT surgeons!

The OR needs to expand its hours so that more than 1 case per day can be done.

Far too much TMS activity. Too many superfluous E-mails. Leadership sometimes out of sync with clinical realities. Too much top down direction. Not enough input into clinical direction of programs. Residency time requirements have reach levels of intolerance.

Need of an additional CT surgeon
Need of additional CT surgeon
Need for more Internal Medicine Beds

"Maintaining EMS and support staff very difficulty due to low pay, low staffing, difficulty getting staff hired due to HR processes/limitations.
Equipment: very difficult getting new and replacement equipment needed for room turnover and patient care due to obstacles in contracting."
"Cath lab does not have adequate recovery space, especially after hours/weekends.
Inadequate turnover/transport/support staff also concern."
Bed lock.

Improve local ambulance response time to transfer patients in a timely manner
Ensure that local ambulance arrives in a timely manner for transfer
Timely transfer via ambulance
Timely transfer via local ambulance
timely transfer via ambulance

"b. Physicians
c. Nurses
g. resources to reward staff"
More funding for providers and support staff and for imaging equipment.
c. x-ray technician
c. x-ray tech

We do not have a nuclear medicine service hence need to transfer patients fo area facilities causing a delay in this urgent but not emergent testing
Our affiliated referral VA's for cardiac care are sometimes short of beds leading to delays in transfers for higher level care
Increased bed availability at our referal VA's
Planned CABG procedures are done within the VA system if possilbe. NonVA surgeries are often outgrowth of earlier transfer to NonVA care settings with ACS
good relationship with private area hospital
Additional on-site Cardiology FTEE
CT surgery not available at facility. Use either referral VAs or community partners and when elective can be delayed (somewhat)
overall the ACS patient group care model works fairly well

Need access to more tele-beds/obs and same day stress tests if appicable.
need more tele-obs beds and same day stress tests
need to save a few slots each day in nuclear stress test schedule for quick rule -outs
"13. No beds were available to transfer
Valve replacements patients have 10% delay because CABG gets priority."

"- Cardiology clinic needs more suport staff. There is one receptionist who is the "secretary" for all the providers.
-Consider additional session for fellows or support staff, NP RN for fellows. Fellows are only in clinic one day per week, so "

"Stress lab needs more supervision. Scheduling is very disorganized, disjointed.
Flow throughout the nuclear department could be improved and made more efficient, by using a "flow coordinator"."

NEED TO STREAMLINE PROVIDER PROCESSING THROUGH HR AND REDUCE TIME SPENY ON NON CLINICAL ACTIVITIES. TMS IS A WASTE OF TIME
NEED TO MAKE TRANBSFER A PRIORITY
USUALLY A STAFFING ISSUE
NEED ADDITIONAL PROVIDERS
CURENT AREA CLOSED DUE TO CONSTRUCTION
NOT AN ISSUE
ALL PATIENTS ARE TRANSFERRED
PATIENTS ARETRANSFERRED
TRANSFER PROCESS IS IN PLACE
NEED MORE STAFF
NEED COMPLETION OF CONSTRUCTION

Without means to take pt to cath lab at our facility we would not accept ACS; ''stable'' and ''acute'' are not compatable terms.
"need to add an additional nucleay camera with all the support personnel that involves, at a new HCC. Need addition of 2 onsite cath labs. at medical center."

"1- Chest pain unit with protocols based on new high sensitive troponin I; patients could be triaged in 2 hours. (Send home or admitted to CP unit to complete rule out or further testing in house vs out-patients).
2-Increase hospital bed capabilities, including unit beds or better step down units uniquely to cardiology (4 beds for one RN ratio with Tele).
3-A dedicated transport person to Cardiology (Cath lab, Non invasive lab and PM examining Rm)
4-Increase Echo lab personnel 3.5 positions, with increasing VA patient population for Echo cardiograms, Stress test.
5-Ciritcally important now is to increase the Cath lab tech and RN. We are the busiest VA cath lab in the nation for interventions with a skeleton of personnel al least 3 more people to avoid burn out fatigue and mistakes. Currently overtime pay estimates we could hire two extra people, but that''s not enough for our current conditions.
6-New cath lab with EP/Pacemaker implant capabilities with assigned personnel.
7-Hospice beds for terminal heart failure patients (is not available in our institution) and or in outpatient based palliative care.
8-Allow patient who have critical conditions, potentially could be treated with procedure not offered in our intuition, but are offered in local community. (i.e. LVAD''s, cardiothoracic in high risk pts)
9- Extra corporal counterpulsation therapy for angina patients not amenable to coronary interventions or CABG."
"1- Chest pain unit with protocols based on new high sensitive troponin I; patients could be triaged in 2 hours. (Send home or admitted to CP unit to complete rule out or further testing in house vs out-patients).
2-Increase hospital bed capabilities, including unit beds or better step down units uniquely to cardiology (4 beds for one RN ratio with Tele).
3-A dedicated transport person to Cardiology (Cath lab, Non invasive lab and PM examining Rm)

4-Increase Echo lab personnel 3.5 positions, with increasing VA patient population for Echo cardiograms, Stress test.

5-Ciritcally important now is to increase the Cath lab tech and RN. We are the busiest VA cath lab in the nation for interventions with a skeleton of personnel al least 3 more people to avoid burn out fatigue and mistakes. Currently overtime pay estimates we could hire two extra people, but that''s not enough for our current conditions.

6-New cath lab with EP/Pacemaker implant capabilities with assigned personnel.

7-Hospice beds for terminal heart failure patients (is not available in our institution) and or in outpatient based palliative care.

8-Allow patient who have critical conditions, potentially could be treated with procedure not offered in our intuition, but are offered in local community. (i.e. LVAD''s, cardiothoracic in high risk pts)

9- Extra corporal counterpulsation therapy for angina patients not amenable to coronary interventions or CABG."

"We could do all the work locally with the appropriate support (personnel equipment and space, currently lacking)"

"Hire more cardiothoracic surgeons to help out with the number of complex cases at least two...and ancillary staff, a surgical SICU person while they are operating to cover 24hrs/7d)"

"the process is done in cumbersome way, cost saving is the goal, not providing the best care possible, in services we cannot provide here but available in local hospitals.

Other VA are in the same circumstances and cannot absorb our volume for complex pts since Nov last year.

Expert in the decision making is lacking."

due to proper bed allocation when small VA health care faciliites

Not enough surgeons for the volume complexity of the cases with support for in house SICU team post CABG while surgeons is operating. 24hrs/7 d coverage

"Too many administrative personnel related to non patient care and too many regulators not dedicated to patient care, too many rules and unnecessary documentation double documentation making the system very inefficient.

Mandates for "Lean projects"" and other charter projects lined to salary incentives which take time away for patient care.

i.e. Lean project take extra times hours per week, making some teams in cardiology stay overtime that had to be paid, and delaying the procedures for pts and discharge.

Is well know in the literature that Pay-Performance doe snot work for improving care, but still embedded in the culture of administration.

Lean projects then have to presented like in " high school" diverting MD from patient care. and not enough people to support them."

"unable to get rid of unproductive or problematic employees
HR is rarely helpful"

"[Location redacted]uses the CCU ICU beds as a holding area for all general ward admissions when the wards are full. These patients, who do not need internsive care stay in the CCU for days and fill up the beds and delaying care for paitnet who need CCU ICU"

the number of STEMIs are small in the VA since ambulance will take these patients to nearest ER.

contract withcommunity hospitals more efficient than developing a STEMI program in the VA

VA refuses to allow physicians to reivew echo images from home during nights and weekends due to "information secutiry reasons" One option is t have "night hawk" readuers similar to Radiology

In most VAs number of STEMI is smal ldue to ambulances taking the patients to nearest ER and not to the VA. A quick transfer to the nearest tertiary center is likely more cost effective

To transfer a STEMI to a non-VA facility three different forms need to be filled out by the physician and records copied ....there may or may not be a clerk in the ER

usual reason for delay is lackk of monitored beds

We have a single cardiac surgery team with limited OR time - resulting in delyas during busey times

"Cardiology has no secretary and the physicians do clerical work and MAS work (e.g., cancelling no-show consults). this is waste of physician time"

"Biggest delay incurred is when wanting to transfer semi urgent cases to tertiary center such as [location redacted], either directly from ED or inpatient. Delays are incurred in requesting interfacility transfer and often require Non Va care due to lack of "bed availability" at tertiary centers."

"Inpatient volume unpredictable, have to balance protected time for inpateients with maximizing outpatient scheduling"

nuclear stress testing requires appropriate nuclear medicine tech staffing

Tertiary referral centers should be adequately staffed/supported with beds to reasonably accomomdate stable Veterans for transfer to avoid Non VA/fee basis transfer.

As before need adequate beds/supp[ort at other facilities ([location redacted])

bed availability/support

"Stress tests are treated as consults and tracked that way, as opposed to a diagnostic test like radiology. For someone who the primary provider wants to have there CAD followed up with an otherwise "routine stress test" should not be given the same priority as a more concerning indication. Once a consult is received, it is scheduled in next available slot. Cancellation slots are used to fill unpredicatable urgent consults, or known urgent consults. Limited overbook abilty on short notice due to need for adequate time to schedule on nuclear camera and obtain nuclear isotope"

Need more nurses who can take care of critical patients and CARDIAC CARE beds

Critical care nurse staffing as well as space and proper financial incentive for the doctors.

Nuclear cardiology should be part of Cardiology and not radiology

Need on call nursing/ Tech. team and need to simplify the regulation from pharmacy.

Need ICU/CCU bed managed by efficient cardiac nurses.

Increase nurses and incentive for the physician.

"Need Left ventricular assist device, CSI atherectomy and critical care beds."

Need contract with accepting Hospital.

The other VA is 120 miles away and they do not take any Veteran who Is not a good candidate. Need local CV surgery program.

Need to let Cardiology MD to decide transfer and VA need to pay its bill on timely basis and not delay due to poor office staff.

Bed shortage .

Need bed staffed by critical care nurses and flexible staff to accommodate pt. needs.

Need local CT surgery program and need accountability from existing CT surgery program.

Need technician and need for radiology to interpret locally.

Pt. should be able to go to local hospital or VA should have its own program.

Need to have nursing and tech. support to help in documentation/ clerical work.

Working to increase the avialability of services

"Many VA employees are not hindered by a lack of supervision or incentives. Their satisfaction comes from helping Vet's. If their ability to help Vet''s is blocked at any level for any reason it creates an environment of consternation. Among the greatest road-blocks are access, double-standard care system(on-tour/off-tour), professional collegiality."
If this VA has available beds and the patient is stable there is no delay in transferring the patient.

Simplify HR and Contracting Process
"Reliability of Pager system notification
Maintaining IT support for notification system
Maintaining ER staff knowledge
Enhancing acute ECG evaluation skills"
"OR time
Midlevel support for CT surgery
Recovery/SICU space"
Very limited bed availability for ACS
"HR process delays
Nursing staffing model problems, VA different from all other hospitals"
"Exam room scheduling flexability needed
Midlevel support for Cardiology
Nursing, tech, Clerical support for clinic
Data entry support for documentation"
"OR Time
Midlevel support for CT surgery
SICU postop care space and staff"
"Contracting limitations (supplies)
Number of inpatient beds"

.[potentially identifiable comment redacted] Acute coronary syndrome patients either present to our urgent care unit or are transferred there from other departments in the facility. Once the decision is made that the patient has an acute coronary syndrome, they need to be transferred by
ambulance to an inpatient facility. Depending on the urgency of the situation as determined by the Urgent Care physician, the patient is transferred to a local
non VA facility or (if very stable) to a VA hospital which is 90 to 120 miles away. Because the VA must pay Medicare rates if
admitted to a non VA facility, there is emphasis on trying to admit to a VA facility
if deemed safe. If our clinic could work out a
financial arrangement with a local inpatient
facility, it would alleviate the need to transport long distances
patients with potential unstable cardiac conditions."
"All of our STEMI patients are sent by squadto local non VA facilities. We generally notify the receiving emergency room that a STEMI
is coming, so they can start preparing"

"ours is urgent care , we do not have ER
we should reduce the time taken to transfer to local Hospital. we should try to reduce the forms we have to fill"
"simplify administrative processes for approval and transfer, we need good echo machine"

The other VA [location redacted]is 2 hrs away hence not applicable. we have to transfer to Local hospitals. the processes takes long time . we have to simply and physicians and nurses need practice .
"we have to increase physicians and nurses in UC or ER or CBOC
administrative processes have to be simplified"
as above simplify the administrative processes
"telehealth for CBOC is imp.
increase qualified physicians and nurses"
"this is same as ACS, simplify administrative processes, telehealth for CBOC"
"increase physicians and nurses , Nurses should help getting local non- va cardiologist and NVCC nurses and other concerned persons on line to physicians who is transferring the veteran"
same more physicians and nurses. good administration

"We need to have more providers at the front lines. Adding adminstrative processes tends to slow the process of taking care of patients. The addition of physician extenders has shown in the private sector to be useful, freeing up the physcians to concentrate on more urgent or complicated patients and issues"

increase in the number of CT Surgeons at our Institution
increase in number of tech''s for non invasive procedures
Our delays for c. cath is due to no weekend coverage
improve night and weekend services
improve weekend and night sevices
improve access to services on Weekends and nights
increase personell and more procedure rooms
increase personel

Need to expedite infrastructure renovations and space
Need to expedite completion of current renovations and acquire additional space for personnel and patients
Need to improve prompt transfer of coronary angiograms from referring site

Nursing shortages/understaffing at VA facilities often result in inability to transfer within VA. Lack of operating room time/surgeons at heart surgery centers result in ability to refer within VA from this facility for heart procedures.
Delays can be result of availability of ambulance service for transfer to PCI capable facility within the community; there is rarely a circumstance for delays due to accepting facility capacity.
Bed availability based on understaffing is the main reason for delays to VA facilities for PCI. As a result almost all ACS patients are referred to the community with little if any delay of transfer.
"rarely, there are delays to community, often related to transfer issues with ambulance service; rarely due to bed availability at the receiving facility."
"Referral to VA facilities from this site is almost nonexistent due to lack of availability for heart surgery procedures within a timely manner. [location redacted], the VISN hub NEVER accepts our patients due to availability or operating times and I cannot recall in my 8+ years at this facility ever having a [location redacted] patient have heart surgery at that center. The other center which has taken [location redacted] patients ([location redacted]VA) now also states no operating times within an acceptable time."
delays may be due to lack of records from referring facility to determine appropriateness of transfer.
True ACS patients who need PCI are not transferred to this hospital as not PCI onsite in [location redacted].

Rarely is a transfer delayed due to bed availability at [location redacted]. Most often these patients require transfer to a PCI capable facility which is often in the community and not VA.

[Location redacted]has been understaffed in Cardiology for 9 years. We are on the cusp of having enough physicians with the recent hiring of a 4th FTEE cardiologist; our other critical limiting factor is physical space in the clinic (exam rooms) to see patients; this is at crisis proportion and creates havoc when multiple specialists are competing for very limited exam room space; often I have cardiology staff to see patient and no rooms to actually see patients.

"Inadequate support staff - providers have to request records;

Inadequate primary care providers - cardiology providers required to complete primary care clinical reminders/teaching/etc during appointments.

Lack of adherence by primary care to existing service agreements for referral to cardilogy that if followed would help facilitate and not hinder delivery of cardiology care.

Chronically overbooked clinics often as much as 200% imposing restrictions for limited time per patient for cardiology evaluation

I cannot emphasize enough the negative impact that these local policies, procedures and deficiencies have on the provision of cardiology care at this facility."

"1. Cath lab RN, (supervisor), cath and EP lab RN as cath lab RN have to cover EP lab, Cath lab Tech

2. 1 Cardiology attending and 2 mid-level (PA/NP) to provide dedicated ER consults and ER advised stress testing for rapid triage of ER patients"

Define time to consult for in- and out-patients clearly in policy documents

"We have been waiting for requested echo tech. echo lab RN, dedicated clerk and MD position for the echo lab. We desperately need more space for the main campus echo lab."

We have been waiting over 4 years to replace frequently damaged cath lab equipment that breaks down along with cath lab RN and tech positions. We have 2 interventionalists taking q24 hours call for over 10 years and need additional FTE.

Multiple Cardiology request for on-site VA based primary CVTS CABG services have been made. Our facility will significantly benefit from VA based dedicated cardiac surgery service.

Need VA based dedicated CVTS surgeons or fee-basis during the transition period working together with university affiliated cardiac surgery team

VISN wide connectivity with interconnected Cardiology PACS is critical in eliminating wait times between VA facilities. Also more specialized fee-basis physicians should be approved and allowed for services that can be provided within existing facilities but are not available just for lack of a specific specialist.

No open beds at our facility to receive patients.

Need more space and providers for timeliness of care. Bed control should be open and available for all to see.

Current clinics are full to capacity without any reserves. More clinic space and mid-level providers are needed. Administrative support is also essential. Need assessments should not be done based on FTEs only but also on what kinds of FTEs are needed and where.

"VAs that we refer to should be electronically linked via intranet so that PACS are accessible to physicians at accepting facilities. This is the number one hold-up and delay causing issue.

Need more availability of fee-basis physicians until VAs are linked and they can see patients referred to them by tele health."

None. Just link the VAs

Contracting and Prosthetics should be on-board

"We are land locked with patient beds. Most delays would be corrected with bed availablity.

We often need to switch patients to make room for another patient from the ED. Many of these patients are identified early in the ED and sent to the community for cardiac catherizations."

We have many ED providers that are not employees. Supervising and setting benchmarks for them is difficult. Hiring a full staff would be what is needed.

"TEchnology has been difficult in getting the interpretations returned. Equipment "matching"" with older versions Windows, XP cause delays in the "handshake" between programs. Very difficult to work with."

It is critical that we have a tiertiary hospital that is responsive to us as a level 1 recently 2 system. When we need to send a critically ill patient we are often waiting 4-6-8 hours for responses. It is critical to have a referral system that works. Incentivize or evaluate the services these hospitals give to us. It is often "near"" less than standard conditions that hold us hostage.

Our ER physicians complete evaluations and assements but often battle with who will accept the patients from our facility.

"If central office could incentivize our teirtiary hospitals to take our patients, incorporate customer service reviews perhaps this could change. Our community hospitals are more accepting and easier to deal with. We have many frustrating calls to make with unorganized responses."

Timeliness is key. We are able to give thrombolytics. When we recognize that a patient needs to go out for higher level of care we often are not able to send to VA facilities.

We do not perform these.

We send out these patients with ease and effeciency.

If these delays occur it is usually a room availablity or nurse staffing issue

Room or space is an issue.

We currently have practitioners without essential support staff. They are performing clerical duties. Maximizing their patient time and adding another provider are necessary.

"Limits exist in sharing a nuclear room in radiology. This is a "growing Pains" situation.
Access would be improved with more scheduled time in radiology."

We run with little to no support for our cardiologists and specialists. The facility is behind the times in structure and function.

"Bed availability is often an issue. The ED services are currently contracted out. While some providers are good, many do not have the basic ability to identify serious cases, or to identify patients in whome a strict time bound protocol needs to be followed. Telehealth need not be a priority, and I am not sure why resources are being diverted to this modality at the expense of the needs of real, tangible ER and workspaces."

"We need more secreterial staff. There is one secretary in all of cardiology. The supervision of services is haphazard. Echo is supervised under respiratory therapy. We would expand clinics, but there are no clinic rooms available. Most patients want to see their provider and are willing to drive long distances. Resources need to be diverted to clinical and support staff rather than to telehealth or multitude of administrators doing little productive work."

Reports do not get transferred to CPRS. We still need to cut and paste it. Unions have undue say in workflow. This should be a clinical decision. Equipment requests are not transparent.

"Cardiology physicians are board certified and willing and eager to read nuclear stress tests, but are not allowed. Need more mid level providers, so that they have defined roles rather than being shunt to areas of greatest need."

There should be ability to read off site EKGs from mobile platforms. Cath lab nurses are nearing retirement. Recruitment and retention is a problem due to poor pay compared to community.

The service chiefs should be involved with personnel decisions. There have been changes in support staff that were not communicated to service chief. This is not an isolated incident.

Bed should be available. All other systems work well.

"Need more inpatient beds, more staffing of nurses. Incentives of management and staff need to be focused on improving throughput. Decreased protections for underperforming employees/dead weight on system."

"We need more night/weekend availability of services, or to make easier the transfer of patients out as needed. Staffing is again a major issue. Management incentives are not sufficiently aligned to provide more services, rather they appear to be to just do as little as the budget allows."

"For coronary angiography, we have minimal delays, but do not have 24/7 hours, and only one shift of two nurses. This is inadequate for the need, and we have to transfer patients out frequently. Need to have several shifts of teams and possibly a second cath lab."

"Need to allow for easier contracting with outside facilities, and easier transfer out for patient care needs."

"Transfers again need to be made easier, contracting process simplified. We need to make 4 calls to transfer someone at this time, and it takes an inordinate amount of time for an acute patient."

"Incentives for VA surgeons are misaligned, to be overly conservative compared with private practice physicians. They should be incentivized to not delay care by asking for more testing. Having alternatives like Fee-Basis has been the only option for some of our patients."

"Need to facilitate payments to outside providers, and expedite transfers."

"Our receiving site cannot see our films or patient records even though they are part of our system. Getting them access to our films/records can be a large source of delay, as the administrative structures/people for this are only there Mon-Fri, and don't respond quickly to requests."

"We have plenty of surgeons on staff at our receiving facility - they are just not incentivized to do more surgeries, and are punished for poor outcomes, so they are very very conservative and this slows patient care."

It would be reasonable to have a MOU of certain cardiology groups in the locality where our clinic is located.

"The voucher process for outpatient care needs to be improved; this is critical, there should be no delays in scheduling patients for cardiac studies/consultations"

We need to be able to offer nuclear stress imaging at our facility; and improve feeing out for studies. Scheduling outpatient cardiac stress tests and consultations needs to be streamlined and much more timely and efficient

"1. Fully implement matrix organization
2. Have a more responsive HR system as the delay in hiring new employees severely hampers our ability to meet the health care needs of our veterans"

1. The critical problem in the ED is the lack of qualified physicians/nurses so that cardiology is notified when an ACS presents

1. The main reason for a delay in the activation of STEMI is the lack of appropriate expertise in the ED physician/nursing staff such that ECGs are often misinterpreted and/or cardiology is not notified in a timely manner.

1. Unfortunately and unacceptably large number of our veterans who need CABG experience delays due to the lack of responsiveness of Columbia where we are obligated to send many of our patients during the ramp-up phase of our cardiac surgery program in St. Louis. We are now sending more patients to non-VA facilities to lower the latency from consult to surgery in these critically-ill patients.

The major source of delay is the availability of beds at [location redacted]VAMC.

The delays in providing care for ACS patients needing to be transferred to JC VAMC from non-VA facilities would be significantly reduced with (1) more available beds; and a better strategy for "turning-over" our existing beds including stream lining discharge policies/procedures.

"Personnel needs; There should be no delay in hiring echocardiographers
Equipment needs: 1) Echo machines, 2) treadmill machines, 3) echo reading stations
Information technology: Biomed and IT are constantly blaming each other when equipment fails, there should be a clearcut policy and physicians should be not asked to figure out their issues
Central office policies: 1) Tests such as echos, treadmills etc should be ordered as tests and not as consults"
Need for second cardiac cathlab and need to develop overtime options for nurses and techs and hire enough staffing
Communication between non VA facility and VA is sometimes the cause of delay
