"Physicians should be given incentives for starting new programs.
Development of a second cardiac cath lab and more lab time for cardiology section is paramount in developing the program and preventing delay in PCI"
Cathlab equipment maintenance should be done after hours. Here the cathlab is routinely requested to stop functioning to do maintenance work or to fix something on regular days rather than weekend or after hours as in private sector

EDIS is still glitch. Improvement there would help flow management. Would be helpful to have more discretion and funds to reward and retain high performers.
"Improve EDIS board functioning, reliability, ease of use."
"Need more funds to recruit, reward, retain key personnel - techs and MDs."
"We need another cath lab and more dollars to recruit, reward, and retain cardiologists, cath lab nurses, X-ray techs"

Only reason for delay is no available bed at our facility.

follow recommendations of specialists for referral
same as prior question
robust transfer process and agreements
case management and coordination of care processes.

Decrease dependency on fee-basis ED physicians and move toward ED certified physicians
Need additional sonographer and upgrade equipment
Need more ED certified physicians (less dependence on fee basis
Having dedicated cardiology beds (CCU or cardiac unit)
Need dedicated CCU beds with appropriate staffing
Would like on-site CT surgery program
More assistance from health tech on hospital wards

better scheduling

"Independent practioners-Physicians
Other personneol-Nursing
Information technology- Allow CPRS to implement changs recommended by clinicians that improve pt care

Improve personnel supervison in ER- need better RN, MD supervison of triage staff. This can be an important point of delay when pts symptoms , especially chest pain,
are under-appreciated."
"More physicians in ER to identify the ACS pt with atypical symptoms that a triage RN might miss
More RN staff to focus on the CAS pt
The problem with CPRS is that there are so many mandatory templates that the critical H&P information seems to be under-appreciated
Central office policies need to focus on the promt recognition and triage of ACS pts in the ER. It sometimes seems like once the troponin level is drawn less attention is paid until the troponin comes back elevated.
Need better supervison of triage RN"
"More ER physicians
More ER RN''s
Better supervison of ER traige personnel"
"More echo exam rooms
More echo techs
Scheduling system for oupt Echos is cumbersome this indirectly slows down the accessibility for inpt Echos
Need adequate support personnel for scheduling Echos
Administrative processes for fee basis and contracted care desperately need simplification. There seems to be no coherent central VA policy on regionalizing
acute ACS care"
"Adequate salary competitive with private practice interventionalists and on-call compensation
Need more cath lab RN''s
Simplify administrative processes
Need funding to allow for acth lab RN and technicians to be on call for emergency cases on nights and weekends"
Cardiology APRN''s play a critical role in in expediting pts urgently./emergently needing transfer to non-VA facility for PCI
On-site availability of cath lab on nights and weekends is most imporatant factor id reducing delys in primary PCI for STEMI
"Need appropriate incentives for VA funded interventional cardiologists to be vaailable for emergency PCI on nights and weekends
Initiate on-site cardiac surgery at our VA
Have to have RNs and cath lab technicians availble on nights and weekends"
Need faster contracted amulance resonse
Adequate cath lab RN and technician staffing
Have had problems at times with copying coronary angiography cine done on-site to non-VA interventional cardiologists
Need to havd availability for immediate copying th coronary angiography done on-sit to receiving non-VA CV surgeons
"Need more outpt clinic space for cardiology outpts post ACS to be seen
Need mor cardiologists and carddiac APRN''s
 Having the business office responsible for scheduling outpt cardiology clinic appointments rather than employees of the department of medicine is unacceptable as it is currently organized
" Central office should abandon the use of the business office employees for scheduling cardiology clinic appointments"

"Pt transportation to another VA for elective CABG is currently a major problem. There is currenlty no regularly scheduled transportation transportation for our elective CAG pts to VA hospitals in our VISN who accept our pts for surgery
There should be uniformity among all VA hospitals on which elective CABG pt can be fee based to a local non-va facility (including university hospitals connected by a walk-way) versus having to travel many hours and miles. Also there seems to be no incentive for a VA to accept elective CABG pts from another VA. Our experience is that the cardiologists and surgeons are happy to take our pts but medical center administraors say no. There needs to be a cntral VA policy."

a modest increase (5-10%) in the number of telemetry beds and additional staff to observe patients in a step down unit may alleviate the ocasional shortage of telemetry beds
Timely PCI for STEMI during WHEN hours for thrombolytic ineligible patients would require a plan for transfer from ED to a 24/7 STEMI center
Lack of CCU beds and reluctance to transfer patients on weekends due to concern over LOS leads to some delay
Opening up step down beds and making cath/PCI available on weekends for stable ACS patients would decrease these delays
"minor inefficiencies in the system have little impact on ACS care, but patient difficulties woth travel to our facility lead to a significant no sahow rate for clinic appointments and procedures (10-15%)"

"More nursing staff needed. Increase the number of technicians to support after-hours/weekend non-invasive imaging, with increase in specialty staff needed to handle higher volume. Support upgrading of existing digital imaging infrastructure. MORE BIOMED AND INFO-TECH(IT) STAFF NEEDED FOR ASSISTANCE WITH COMPUTERIZED MED. DEVICES & INFRASTRUCTURE (more incentive pay to retain staff). Increase the number of beds that can be opened in the facility; policy change."
"More nursing staff needed. Increase the number of technicians to support after-hours/weekend non-invasive imaging, with increase in specialty staff needed to handle higher volume. Support upgrading of existing digital imaging infrastructure. MORE BIOMED AND INFO-TECH(IT) STAFF NEEDED FOR ASSISTANCE WITH COMPUTERIZED MED. DEVICES & INFRASTRUCTURE (more incentive pay to retain staff). Increase the number of beds that can be opened in the facility; policy change."
"Increase the number of echo technicians, and Echo Lab Attending''s needed to handle higher volume. MUST have more space available for performing exams, currently no additional rooms availability in the facility. Support upgrading of existing digital imaging infrastructure. MORE BIOMED AND INFO-TECH(IT) STAFF NEEDED FOR ASSISTANCE WITH COMPUTERIZED MED. DEVICES & INFRASTRUCTURE (more incentive pay to retain staff)."
"Comments are only applicable for after-hours/weekend coverage. Cath Lab Attending, Nursing and tech staffing locations/housing do not allow for efficient after hour/weekend coverage of ACS/acute MI interventions. In general the close proximity of a non-VA facility with in-house call of cath lab personnel, allows for <=90min door to cath/balloon time for ACS/MI patients. The limiting factor is transportation service."
Improvement in efficiency and staffing of outside transfer service used.
"Delays can occur due to co-morbidities of patients, often requiring an optimization of medical management before surgery. Medical support services are available to address these issues. Increase in Anesthesia staffing and supporting service is needed."
"Increased social worker or AOD coverage for negotiating the transfer process. On weekends and after-hours an AOD covers for the social worker, in addition their standard duties."

"Lack of available beds lead to placement of facility on temporary bypass status, at times delaying transfers. Opening more beds for use (policy issue), would be important, as is increasing number of nurses, specialty staff and ancillary staff. Resolution of some staffing issues are in progress."
"The progressive increase in patient volumes has not been previously matched with the need for an increase in specialty staff, clerical staff, nursing staff and exam room availability. The Cardiology Service Line Agreement needs to be followed by practitioners, to reduce the number of inappropriate consults and to increase the efficiency of handling clinic requests. The current clinic model in undergoing a Systems Re-design. However the concerns of specialty staff, clerical staff and nursing staff needs a better way of being address by administrative personnel."

"1. Need more space in the ED - always cramped/ on internal diversion
2. Need more hospital beds to transfer patients out of the ED"
need more beds in the hospital to decompress the ER. We are always on internal diversion.
Never happens - we are ALWAYS full

The two main factors that contribute to delays in Veterans obtaining echos as our facility are personnel and equipment. We need to hire a cardiology tech and we need another standard echo machine.
"We need to hire a cardiology tech. If we have this person in place, we could begin nuclear stress testing at one of our CBOCs."
We do not manage ACS patients here at this facility. We have an agreement with the local Air Force Hospital that accepts all of our ACS patients that present to the ED or that need transferring from the inpatient units. To my knowledge there have been no delays in getting these Veterans transferred from our facility to the Air Force Hospital for ACS management.
We need additional nursing support in our Cardiology clinics. Providers spent many hours taking vitals and calling patients with lab and diagnostic test results.

Surge staffing for nursing when inpatients are being held in the ED. Develop alternative temporary bed location for inpatient admission holds. Could agency nursing staff be utilized during periods of high bed occupance. Specific discharge directive specifying early discharges and rules to expedite discharge planning. Increase nuclear med ECHO and stress testing on weekends and holidays.

Need more RNs on telemetry-capable units to fully staff all available beds. Lack of nursing staff delays throughput of patients.
Lack of appropriately skilled nursing staff limits the number of truly available beds on telemetry floors - this is vital. Also needed - more beds in progressive care unit for ACS patients.
Need incentives for leadership that are based on number of veterans being sent to outside hospitals due to unavailable beds due to lack of skilled RNs. Need more RNs to fully staff beds.
Need LIPs to conduct nuclear stress testing
"Need 1) Early recognition of STEMI by ED clinicians and 2) consistent, effective activation of Cath Lab by administrative staff without delay"
Need administrative staff to be adequately incentivized (and supervised) to activate Cath Lab in a timely manner when STEMI patient presents to ED
Need additional cardiologists and nurses to staff additional clinic sessions
Need additional LIP and technician staff to increase availability of nuclear stress testing
Too much administrative burden on physicians including mandatory training that reduces availability for patient care.

"Patients with chest pain should be evaluated in local ER and service should be provided (paid for) by the VA. If patient requires admission, cath, etc stabilize and transfer to the VA. Currently services outside the VA are not paid for unless patient is service connected. This means many patients attempted to drive long distances (hours) to a VAMC for ACS. The result is substantial delay in treatment of ACS"
Out of date equipment (nuclear camera) unnecessary danger in some areas
Need new nuclear cameras to facilitate evaluation of patients. New cameras use less radiation for each test and require less acquisition time.

- **Colon Cancer**

national clinical reminder
our nurses double check the labs

"Electronic Reminders-Pop Ups
However if patient is not seen it may go unrecognized."
We are not offering screening colonoscopies for Average risk patients.
"b-More Endo-Teams needed
c-more schedulers needed
d- more scopes needed
g-consent and starting iv's
k-talk to people involved in these procedures"

clinic reminders to all PCC''s for pt's 50 and older for screening colonoscopy

clinical reminders in primary care
less than 30 days
less than 30 days
as early as indicated
more providers with support staff and better workflow solutions

A GI case manager is in charge of this process
A FOBT positive is picked up by the case mannager
"Better salaries for GI physicians, to recruit to VA."

"In the past 6 months , a process of electronic referral and call back for repeat colonoscopy
(?surveillance colonoscopy?)after colonoscopy, done at this VA, is + for colon adenoma or colorectal
cancer, has been reestablished here by the Chief of Medicine in conjunction with his GI providers and
support staff ."
"All + FOBT areidentified /captured by the lab and routed to the GI providers by secure e-mail weekly, in
addition to the automatic alert which is generated and sent to the ordering provider (usually PCM)
though CPRS."
Wait time for routine screening or surveillance colonosocpy is 42 days (6 weeks).
up to 42 days for asymptomatic patients
FOBT + wait time is 30 days or less.
Depends upon acuity of labs results and associated signs and /or symptoms. Can be as little as 1 day
and as long and 42 days.
1-42 days. Patients are triaged according to clincal assessment of severity of disease. Can be as quickly
as 1 day (inpatient) or as great as 42 days.

yearly fobt
lab contacts provider for every positive fobt

Clinical Reminders section of Med Record

"Need more nursing support, technician support, anesthesia services. Additional physician positions in
addition to the nursing and technician support would enable a greater number of procedures to be

done. We would also need a manager that reports to the physician endoscopy unit manager to facilitate patient flow and to oversee patient scheduling and coordination of services with patient transportation or housing in order to recover those patients that receive sedation."

Reminders are implemented in the Clinical reminder pane. They are initiated by age (automatically at age 50) or by procedure as clinically appropriate.
Dependent on the symptoms/ indications. Urgent cases may be completed in less than 2 days.
"Increasing personnel: physicians/LIP, nurses & techs. Availability of equipment: colonscopes, vital sign monitors. Ensure guidelines/timeframes from Central Office are supported by best available medical evidence."

"I only see pt. w/ Dx colon cancer , I do not screen them ."
We see both IDA and Colon Ca

"When patient turn 50, at the primary care visit."
Hospital encourage FOBT testing over screening colonoscopy.
"VA need to come up with competitive, less complicated ways to hire gastroenterologist. Our VA is struggling to hire a gastroenterologist replacement for last 2 yrs. Hiring process is very much dependent upon local administration perception of market. There is more top down approach, when it comes to implementing work process in individual department, which leaves staff with a feeling that they do not have much say in the process thus no buy in from stake holder, passive behavior and eventually loss of personal."
Close coordination and follow up of patients who are send out on fee basis

clinical reminders via CPRS to primary care PACT teams
"Desperately needed - GI physicians and endoscopy nursing personnel;
Badly needed - more endoscopy rooms"
"GI physicians doing administrative work, including mandatory training that interferes with clinical availability"

Colon cancer screening reminder triggered at age of 50 and every 10 years. There is also a Repeat Colonoscopy reminder to trigger for interval colonoscopy procedure

Clinical reminders appear in the clinical reminder section of the CPRS coversheet. Templated charting in CPRS drives the reminders.
We currently send average risk patients to the community via NVCC process. I do not have access to those wait times.
Currently use NVCC process.
"At Dorn we are limited by nursing staffing, tech staffing, and number and configuration of procedure rooms. I am TOLD that the NVCC process results in long delays of care. Our equipment is up-to-date. The implementation of the electronic consent probably costs 4 procedures a day. However, administration is actively trying to improve in these areas."

Yearly
All +FOBTs are detected by GI nurse who follows up with PCC providers.
Available on request
Available on request
Nurse hiring and retention problematic due to noncompetetive grades/salaries and long HR delays.

Most fee basis delays are due to inefficiency and incompetence in Business Office.
Administrative delays are common due to poor functioning of Business Office.
Understaffing of VA administration and support personnel is a pervasive and longstanding VA problem.
A particular need is cancer care coordinators/navigators which is cost effective.

"uncertain, this is usually done by primary care. most that I see are done by colonscoopy"
this is usually not triggered via oncology but rather through primary care
"uncertain, this is via gi"
via gi
via primary care
via primary care
via gi
This is not a physician centric institution. the physicians are viewed as the problem and the solution is ancillary personal. this is backwards. The focus needs to be on physicians and patients.
Again we need qualified physicians. Not folks who can write notes that say to see physician. The bottle neck is that the va seems to feel NPs and PAs are equivalent to physicians
"Qualified colo rectal surgeons, not PAs or refer to Huntsman Cancer institute as many of us have dual priveledges"
We have in SLC the resources to dual with most things either at the VA or HCI. referrals out really not the issue
Administrative stuff is unmanageable and out of control. Secretaries are unable to order labs. Everything is delegated to physicians. as a half time physician I have a 20hr/wk tour but 60 hours of annual training

THe physician puts in forthe reminder but I am not sure what happens next.

Reminders in CPRS
"Limited number of endo rooms, lack of nursing support and delays in replacing equipment are major causes for delays."
Very limited number of surgical oncologists with very restricted operating time due to lack of OR rooms

Triggered based upon age and no code for FIT in the last year or colonoscopy in last 10 yrs
Secondary clinical reminder also in place for positive FIT
Screening for Colon Cancer in average risk patients is typically completed via FIT.

usually see the GI attending first for consult and then the colonoscopy scheduled from there.

Recall reminders that pop up when patients are seen in the primary care clinic. Colon cancer screening reminders pop up yearly.
In the surgery clinic we have a mid level provider who gets all FOBT/FIT + results and reminds PCP''s and other providers if no action is taken. This serves as a back up.

"Automatic physician reminder
OncWatch"

The clinical reminder is activated for all patients over age 50. The nurse will distribute the FIT tests to the patients and assist in compliance. There is also a clinician in each PACT who reviews outstanding tests and contacts those patients. If a FIT test is positive there is a nurse practitioner assigned to this

project to make sure the PCP has entered a request for colonoscopy within a 30 day period of receiving the positive FIT.

An abnormal FIT test alerts the PCP. In addition the lab sends the results of all abnormal FIT tests to a GI Nurse Practitioner who job is to monitor these results and alert any PCP who has not placed the approrpiate GI colonoscopy request within the designated time period.

"It is critically important to hire additional physicians (Gastroenterologists) and nurses - cannot perform procedures without either. We also need additional mid-level providers to assess patients prior to scheduling, monitor FIT testing and screen and triage consults.

Gastroenterologists must receive salaries on par with the community in order to recruit and retain endoscopists. Salaries are too low and there are never significant increases or incentives.

The Central Office policies need to be revised because obviously non-clinicians are making decisions as to how quickly patients need to undergo procedures. The doubling time in the colon is ~5 years therefore the average patient does not need to have a procedure performed within 30 days or even 60 days. In the community patients are getting screened and procedures performed on an elective basis and often the wait times are >30 days. If a cancer is found it didn''t ''develop'' within the 30-60 days waiting period - it was there most likely year(s) prior.

If Veterans are to receive the appropriate care and screening for colorectal cancer they need to have the same resources (up to date equipment, ancillary personnel staffing must be adequate, and skilled nurses and physicians be must available)"

Need to increase the number of GI sureons at our facility. Three of four are leaving at the end of this academic year (June 2015) and certainly because of higher salaries elsewhere or the chance to enter into a productive private practice. This is crucial! There is also the need for more spaces in the surgical schedule and more anesthesiologists and nursing personnel.

"The oncology section needs to expand - again! They have outgrown a space designed for them ~10 years ago. There is no space for additional patient treatment rooms, physician offices and nursing stations. They also need to consider weekend infusions."

"Radiation Department needs additional skilled providers physicians and nures that will allow them to provide services on weekends, evening times. In addition need to review their equipemt to assure that it meets current standards, etc."

reminders are for primary care they are turned on for all patients 50-75 years of age they are turned off after a colonoscopy for 10 years. They are not adjusted based on path that is up to the PCP or GI to follow. If FOBT is done it will be turned off for a year

a positive FOBT of any kind generated appropriately or inapropriately generates an automatic consult to Gi

Longest wait times are for those patients that need the procedure with the assiatnace of anesthesia- need MAC not just conscious sedation.

"The problem is the patients desired scheduling date is often out further than the available time slots. If a patient needs to be seen we will get them in.

Longest wait times are for those patients that need the procedure with the assiatnace of anesthesia- need MAC not just conscious sedation.-"

"The problem is the patients desired scheduling date is often out further than the available time slots. If

"provide updated technollogy

increase space increases endo rooms, need preprocedure area.

our patients do not do well when sent on to the outside need to improve our abilities. This requires, increased admin staff and clnical nurse supprt not just in the nedoscopy room but all physicians especially procedureal physicians need nurses to follow up with patietn labs, etc and to remind and

educate patients regarding their upcoming proceudre appointments otherwise we have an increase in no show and cancellation rates.
Increase avaialbeility of out of OR anesthesia"
"improve OR room and nursing, anesthesia availability
Improve contracting out for specialty surgeries"
"We need more OR space, more nurses, more ICU nurses for the beds that we have and often our neighboring hospitals don''t want to take our patients so we need to improve our resources."
Residents take time but they also do a lot of work that would otherwise have to be done by the attending staff and that would hae a great impact on flow. Additonally most good providers would not work for this system without trainees.

We have an RN assigned to also receive the positive FOBT view alerts to assist.
"We do not perform colonoscopys on station, and they have to be sent either to tertiary site or community. The time can vary from 15 days to 45 days."
"We do not perform colonoscopys on station, and they have to be sent either to tertiary site or community. The time can vary from 15 days to 45 days."
"We do not perform colonoscopys on station, and they have to be sent either to tertiary site or community. The positive FOBT are a priotrity and can occur quickly."
"We do not perform colonoscopys on station, and they have to be sent either to tertiary site or community. Patients with iron deficiency anemia are sent to a higher level of care immediately without delay."
"We do not perform colonoscopys on station, and they have to be sent either to tertiary site or community. Patients with symptoms are sent to a higher level of care immediately without delay."

Unaware of CPRS alerts to remind providers of screening and/or surveillance(follow-up) colonoscopy.
This question would be best answered by a primary care provider.
"<30 days, based on best judgement"

Most of the delays in our institute is for patients that need an anesthesiologist for MAC (monitored anesthesia care) since we have only one day a week that MAC procedures are done. Our wait time for these procedures is over 90 days. We are in critical need of an anethesiologist who is dedicated to GI procedures. These patients cannot be outsourced because they are considered high risk by community gastroenterologists and they don''t accept them for outpatient procedures. Lot of our time is also spent in documentation at VA. My choice program for Veterans essentially does not work because it puts the burden on the patient to make the phone call. Triaging our consults also takes a lot of time for PA and physicians -we do need additional Gi rpoviders in our hospital.
Increase the number of surgeons
"A lot of time is spent by providers in administartive work, triaging consults etc. No training is given to provders to capture work load properly, coding etc. Every few days there is some "suspense"' to be answered within few days or some such VA document to be completed. We have to drop everyhting and answer that."

all pts 50 and above have reminder on for fecal testing turned off for 7 years if have colonoscopy
several checks in place to assure all pos occult tests are tracked
biggest problem is no shows and cancelled by patient too late to move someone in

By PCP; on computer

Available at VA Togus
BY the PCP and GI team

A GI staff member reviews all positive fobt results to ensure speedy referral to GI
"Elective screening exams are scheduled per patient preference sometime during the year after turning age 50. There is wide variability when these exams are scheduled- I would estimate most are completed within 3 months, but is entirely based on patient preference."
"Elective screening exams, including those for asymptomatic high risk patients, are scheduled per patient preference sometime during the year after turning age 50. The clinician seeing the patient does encourage the patient to undergo prompt testing and appointment slots within 30 days are offered. There is wide variability when these exams are scheduled- I would estimate most are completed within 3 months, but is entirely based on patient preference."
All positive FIT patients are offered an endoscopy slot within 14 days. However scheduling is based on patient preference
"Like positive FIT tests, patients with red flag symptoms are offered appointment slots within 14 days. Patients with other less urgent symptoms, like bloating, are offered slots within 30-45 days. Scheduling is per patient preference for the exam"

"Colorectal cancer screening reminders are implmented and also serve as surveillance reminders. Age 50-75, no colonoscopy within last 10 years or colonoscopy is said to be due again for follow up, no FIT/FOBT in past year, no flex sig/CT colonography/ACBE in past 5 years."
We are no longer using FOBT. It has been replaced with FIT.
change in prep for colonoscopy.We still use Go lytely

Triggered annually in health summary. Last colonoscopy performed and date done is present on Veteran''s problem list.
"Our facility needs additional endoscopists. We also have a delay in pre-procedure processing. We also are challenged with standardizing provider output, i.e. benchmarking productivity through all positions."
"Facility was not performing colon surgery until March of 2015. After returning to Intermediate surgical complexity status, we have been able to meet our clinical load in surgery."
We do not provide Radiation therapy locally and use fee-basis providers. The NVCC unit seems to be challenged by the load of all types of consults that they must address. I do not see clinically significant delays because of this.

"There is a standard alert system to the PCP''s for routine 10 year screens. they order these.
Those with polyps or other conditions discovered on colonoscopy have f/u exams ordered by the endoscopist and these are entered into an approved recall system."
"If we cannot see them in our [location redacted] office within 30 days or due to distance they are either fee based out or if appropriate given ''choice''", predicated on the patient accepting our offer for appointment. Once they are fee based or use choice we have no knowledge if they are seen within 30 days, 50,60,90 etc. This is not tracked as far as I know."

The extensive documentations and requirement for physicians to write all orders regarding return to clinic slows down the procedures. The scheduling and administrative support personnel and their supervisors need to be significantly strengthened.

clinical reminders seem to be based on review of labs and charts for prior screening. Much/most of past CRC screening was out-sourced and this information is often not available so accuracy of the clinical reminders is often flawed

"Need more endoscopists to perform the work with trained, experienced motivated support staff. Primary Care needs education for indications for colonoscopy. Non-VA information needs to be obtained for accuracy in the medical record. IT/CAC support would be great to develop order sets to streamline patient throughput in the endoscopy unit. VA regulations should be reviewed/re-interpreted to assess their usefulness in timely patient care. If the VA is held to the volume of the community, then the same resources and standards need to be considered. There are often too much regulatory pre- and post-procedure processes that delay efficient patient through put in the endoscopy unit."

Additional surgeons will be starting in the next few months. This facility has suffered from the scarcity of trained colorectal surgeons. There are also not enough surgical providers in the local community so some patients need to be sent to other geographic locations; their wait times are based on the resources at those facilities.

More TRAINED surgeons are critical to proper and timely care of our patients. The support personnel (RNs and techs) need to be trained and committed to efficient competent patient care.

Additional experienced physicians/providers would significantly improve patient care with decreased wait times.

"There are too many mandatory regulatory and administrative processes both local and national. Often redundant and cumbersome, sometimes unnecessary documentation. Support staff should be educated, experienced and engaged in performing high-quality efficient patient care"

"After a colonoscopy is completed, the GI provider re-sets the clinical reminder to indicate when colonoscopy is due, i.e. 10yr repeat colonoscopy for repeat screening after a negative colonoscopy in an average risk patient."

"diagnostic colonoscopy for GI bleeding or sudden change in bowel habits, involuntary wt loss or alarm symptoms"

"Currently we need more clerical staff (MSAs), more nurses, techs, and MDs to be able to have all 6 Endscopy procedure rooms at JP VAMC up and running. The Sat colonoscopy clinic worked well in the past. Scheduling package could be modernized and simplified to make it easier for all who use it."

CPRS produces a view alert when the patient turns 50. This is automatically reset if a FIT result is seen for 1 yr. and automatically reset to 10 years if a colonoscopy cpt code is seen. This is modified by the GI section if the colonoscopy found polyps or if the prep was poor.

Every month the lab runs a list of the FIT positive patients and an administrator notifies all primary care providers of any patients that are FIT positive that have not been acted upon.

Urgency is dependent on the findings. Abnormal CT within 2 weeks for example

"We have been blessed with adequate space, close to adequate nursing and technical support, new equipment should be on contract in the next fiscal year. We are short on independent practitioners. Some policies make for less effeciency and consume patient care providers time."

"We have been blessed with a new endoscopy area, endoscopy program, and we will be getting new rental endoscopes in the next fiscal year. We are very short on independent practitioners and to some extent nursing administrative and technical support specifically to our area. Endoscopist can still get significantly more money outside the VA system."

Many of the scheduling and telephone calls to patients that is currently performed by a physician could be performed by a clinical case manager nurse. We have cross trained a number of people in the area to function outside their core responsibilities which has been a great assistence.

Automatic reminders pop up in record when patient comes to PCP

all of the estimates are until the first scheduled date. patients frequently reschedule or request dates farther in the future

varies 14- 45 days ie decreasing hgb and IDA are done sooner whereas IDA and minimal stable anemia may wait upto 45 days

"wait time depends on clinical urgency ie brb with dropping hgb are done w/in 15- days, brb with stable hgb w.in 30-45 days"

"increased MD,RN, LPN and clerical support are crucial, increased Anesthesia support it is needed, At present space and equipment are adequate, the addition of a clinically indicated date has been a help"

"Under cliinical reminders, triggered by age for screening between age 50-75"

FOBT list is printed and addressed with daily pending consult list by GI NPs

Estimate based on clinical observations

30-60 days depending on the severity and urgency of the individual veteran's situation

It would be helpful to streamline the amount of computer clicks that are needed to process a consult for colonoscoy surveillance/screening. Pharmacist in the GI setting would be helpful. An additional NP to provide increased clinic availability.

A big issue is patient no-shows.

Reminder protocols are based on recorded chart findings using age and past screening results.

Abnormal FOBTs are also built into reminder logic.

<;30 days

"<30 days.

Can be triaged to lower number based on medical need."

"<30 days.

Occult blood testing clinical reminders on CPRS cover sheet

It is easy to overlook abnl lab results if they are mixed in with literally hundreds of other abnormal lab results.

If patient has more than one indicator of colon cancer risk patients can sometimes be overbooked if efforts are made.

Need more endoscopy techs to allow more endoscopies per day. Working on a reduced schedule.

Please contact [name redacted] if you have quesitons about reminders in VISN [location redacted].

"However, a staff member actively follows up on all positve tests to be sure they are acted on"

"It takes longer to do the paper work than perform the procedure and MOST of the paper work is not value added. GI procedures are treated like SURGERIES (e.g. special purpose wrist bands, time outs, "gurney consent" etc) Now we are required to put estimated blood loss in our reports. Leadership should realize that GI procedures should not be considered OPERATIVE procedures and the rules/regs should be reaxed"

"FOBT every year, Colonoscopy every 10 years, flexible sigmoidoscopy avery 5 years. Triggered when no longer applicable."

"Triaged by GI, screening intervals of 10 years"

"Triaged by GI, screening intervals 2- 5 years."

"Triaged by GI, sooner if other symptoms."

Triaged by GI for urgency

Urgency determined by GI provider

"VA target of 85% for CRC screening is much higher than achieved the community. Some FOBT are not indicated for patients with co-morbidities and resources not available for such ambitious program. CPRS and inflexibility of interphase between EMR and non-VA endoscopy report system leads to many inefficiencies such as recall and scheduling."
Cancer coordinator/ navigator will help thorough follow-up.
Cancer coordinator will be of help for follow-up. VA processes are cumbersome.
"VA rules /regulation are cumbersome barriers (e.g. fee service paperwork, consent process, CPRS interphase) that further compound insufficient staff."

Lab completes positive obt provider notice note and adds PCP as additional signer to the note
Vast majority of our diagnostic colonoscopies are referred to Buffalo or Syracuse VA as we do not provide the service on site. [Location redacted]monitor the 30 day mark for completion of the study.
Vast majority of our diagnostic colonoscopies are referred to [location redacted]VA as we do not provide the service on site. [Location redacted] monitor the 30 day mark for completion of the study.
Vast majority of our diagnostic colonoscopies are referred to [location redacted] VA as we do not provide the service on site. [Location redacted] monitor the 30 day mark for completion of the study.
chemo and radiation usually require a regular cycle of treatment - for various reasons it is difficult for patients to attend a treatment center that is far from home.

implemented on all patients yearly as part of the standard clinical reminders process
we currently have an efficient system to route patients through colon cancer screening processes

"In Primary care clinic the reminder is automatically turned on at age 50 to start screening. Once a patient undergoes colonscopy, depending on findings and path a recommendation for surveillance colonoscopy is generated. The remined for f/u colonoscopy is activated in CPRS by the nurse navigator who writes the endoscopy follow up report to the patient. The pateitn is also informed about the recommended f/u."
colonoscopy completed within 60 days of request
within 59 days from the date FOBT was found to be positive
these are reviewed by the physician to see if they have had any w/u in past and if so what would be the next best w/u. If no endscopies have been done in past usual wait time can vary from 2 weeks to one month.
these are reviewed by the physician to see if and what w/u has been done and what would be the next best w/u. If no endscopies have been done in past usual wait time can vary from same week (for eg Hematochezia) to one month (vague abd pain).

This is managed by the primary care providers and not the GI-endoscopy providers
"Again, this would be best answered by PCP, but my answer is my best impression."
consent process could be improved with greater flexibility

Reminder is triggered to the Primary Care Provider for average risk patients with the appropriate age characteristics
"8b:physicians and nurse practitioners
8c: registered nurses and clerical staff
8H: improve pay and incentive"
Unclear what their needs are at other VA health care system

Test handed out at CBOCs - sent to parent for lab there

Reminder used that asks for dates/ results and recommended interval for screening
"We do not have GI onsite
All abnormal labs are a mandatory alert
Clinicians receive many alerts - making it easier to miss something"
Clinicians here can speak with surgeons - only discipline doing scopes - if need to expedite something
"Space is adequate for demand. Have no GI - rural site - surgeons do all scopes.
HR support for prompt hiring would be helpful - fee basis/ hard to find providers -remote location and
VA reimbursement is low and often paid late"
I cannot assess why the larger VA we refer to cannot accommodate referrals
This is a small rural/remote community - limited services
"Chronic issues with outdated VISTA scheduling
CPRS - has resulted in excessive reminder use"

"Reminders are implemented, however, all providers are not consistently utilizing them"
"Timeframe depends on the reason for the visit. If we cannot see patients within guideline timeframes
(ex. BRBPR in 30 days), they are sent via Non VA Care"
"Timeframe is dependent upon whether we can see the patient within timeframe guidelines, or if we
send them to Non VA Care"
"Currently, FOBT positive patients are not automatically referred to GI, unsure of wait time"
"Many of our patients are outsourced due to inability to see patients within prescribed timeframes,
timeframes vary between providers"
"Many of our patients are outsourced due to inability to see patients within prescribed timeframes,
timeframes vary between providers"
"The majority of our patients are sent through Non VA Care, due to low number of providers available,
and not enough nursing staff. Increasing physicians and staff would also generate the need for more
space. Increasing providers, staff and patient load would require an increase in equipment (scopes,
towers, procedure rooms, etc.) Since the majority of our GI patients are sent through Non VA Care,
many have wait times for procedures, which we have no control over. The BIGGEST problem with Non
VA Care is that the facilities that do the procedures typically do not send the patient records back to the
facility as they are supposed to do according to the authorization letter. This is one of the biggest
reasons that we have so many consults that are not complete, even if the procedure has been done.
There is a significant lack of timely document return in the community. Lots of time is spent requesting
and re-requesting patient records. For the patients that are seen at the facility, their appointments are
made promptly and consult processing is very timely."
Increasing the hours that a wide range of radiologic services are provided could be helpful.
"Elective/outpatient surgery is very high volume at this facility. Inpatient beds are limited, esp. ICU
beds. Weekend outpatient surgery might be a viable option."
"Unfortunately, we don't have control over what the Non VA providers do. As long as consults are
submitted and processed by Non VA Care in a timely manner, authorized for payment and scheduled,
that is all we can "control"

CRC screening reminders are managed (turned on and off) through the primary care clinics an
appropriate screening exam has been completed
"MAJOR issue is the volume of consults directed to the GI service by primary care. A large portion of
these consults are incomplete (not enough provided information to triage the consult well), duplicates
(consults for established patients; 2 or more consults entered around the same time for the same issue)
or inaccurate/inappropriate (e.g. colonoscopy requested for a patient who just had a normal
colonoscopy). It still takes man power to review all of these consults and focus our efforts to address

the relevant consults, but need to wade through all of the entered requests to do this. Also, consult to GI for colonoscopy for a positive FIT is often not entered in a timely manner, so time to colonoscopy is delayed."
More reliable scheduling system with reminders and follow up calls to patients would be important.

Clinical reminder triggered yearly
We have had gastroenterology positions posted for 5 years; unable to fill due to inability to match community pay

patient reaches age 50
MORE PROVIDERS

Based on patient demographics or prior endoscopy results.
Rules governing moderate sedation require such extensive documentation and chart auditing that we lose capacity to care for patients.
VA pay tables for oncologists are not competitive with community rates. This makes recruiting staff oncologists a challenge.
We generally send these patients to a tertiary VA or into the community.

"Clinical reminder in place when diagnosis code of colon cancer, colon polyps, or family history of colon cancer are entered into problem list for every five years. Otherwise, a reminder of every ten years."
less than 90 days
30-60 days
30 days or less
30-90 days
less than 60 days
Worling to increase the availability of services

"1) Reminder Cohort: Meets age 50 to 75 without Risk Factors with patients over age 75 being assessed if screening is applicable. If applicable, providers are able to turn the reminders off completely Screening, Diagnostic, and Surveillance "not applicable." Resolution: FOBT (every year), Flexsig (every 5 years), FOBT (every year) and Flexsig (every 5 years), DCBE (every 5 years, prior to 10/1/10), CT Colonography (every 5 years), Colonoscopy (every 10 years)
2) Reminder Cohort: Meets age 40 and older with Risk factors (must meet one of the following): Family history of colon cancer, Family history of familial polyposis coli, History of Ovarian or Uterine Cancer. Diagnostic and Surveillance reminders "not applicable;" Resolution: Colonoscopy (every 5 years)"

"Clinical Reminder, Set Age 50-75, turned off when FIT negative x 1 year, colonoscopy x 3-10 years based on results, flex sig x 5 years, BE x 5 years"
GI follows up any +FIT or FOBT that has not been acted on by the ordering provider w/in 2 weeks of test result
High risk patients are usually scoped w/in 30 days
Patients w/ Iron Defic. Anemia are usually scoped w/in 30 day
"Important to understand the clinical meaningful timing for specific indications and not lump all indications together. National standards should be upheld for high risk patients, recognizing that screening for average low risk patients can safely be delayed many many days."
Ability to start and deliver chemotherapy to outpatients over the weekend. Increase provider FTE when needed both at main facility and referring facilities.

"Colon cancer screening reminder pops up for Veterans age 50 and over per USPSTF guidelines/recommendations for colorectal cancer screening when Veterans see their PACT team. When Veterans complete endoscopic procedures, GI results notes link with future reminders so CPRS users including PACT teamlet are aware when procedure is recommended to be performed again."

40 days average wait time for low or average risk colorectal screening. Sometimes patients have a specific preference for day of week or beginning/end of month when they have driver or can clear their work schedule. When this preference is accommodated sometimes that makes the wait time shorter (i.e. we have had a cancellation that we can schedule them into) or it makes the wait time longer because we are honoring their request.

25 days average wait time for higher risk risk colorectal screening or for patients with IBD. Sometimes patients have a specific preference for day of week or beginning/end of month when they have driver or can clear their work schedule. When this preference is accommodated sometimes that makes the wait time shorter (i.e. we have had a cancellation that we can schedule them into) or it makes the wait time longer because we are honoring their request.

25 days average wait time for +FIT. Per our policy these should have procedure performed within 60 days and we work to schedule them this way. Sometimes patients have a specific preference for day of week or beginning/end of month when they have driver or can clear their work schedule. When this preference is accommodated sometimes that makes the wait time shorter (i.e. we have had a cancellation that we can schedule them into) or it makes the wait time longer because we are honoring their request.

30 days average wait time for patients with IDA as traditionally this requires a double procedure i.e. EGD and colonoscopy. Sometimes patients have a specific preference for day of week or beginning/end of month when they have driver or can clear their work schedule. When this preference is accommodated sometimes that makes the wait time shorter (i.e. we have had a cancellation that we can schedule them into) or it makes the wait time longer because we are honoring their request.

"Scheduling urgency (or not) depends on the patient's symptoms or clinical indication. Some symptoms are more of a red flag which triggers providers to request a procedure in 1 week, 2 weeks, 3 weeks or perhaps routinely with notation that patient can safely wait up to 3 months to complete study."

"More clerical staff are needed now that we have moved to live scheduling or negotiated appts for all consults. This is very time intensive. We also need more nursing staff to answer patient questions pre-procedure since our patients come in on day of study. We need expansion of physical exam to interview patients pre-procedure. We need a 3:1 bed ratio between procedure suites and pre and post-procedure recovery space. This requires more patient monitoring equipment and stretchers, stretchers bays or spaces."

"Solid service-level consult review and management DAILY by either MD''s, PA''s or ARNPs so that urgent consults coming in are seen and triaged immediately. This reviewer would have a good working relationship with clerical or RN navigator staff who could contact pt right away to negotiate appt. This handoff and communication should all be documented in CPRS. More CT scan machines and use of after hours and weekends would reduce wait times for these important staging scans which then assist the specialty care provider on best plan of action. if patient cannot travel here for care, simplified referral process for community based care would be appreciated and have this process be as transparent as possible so all providers know when and where this Veteran was seen and what the plan is."

"Increased CT scanners required more radiology staff to read studies, requires more clerical support to call and schedule patients for studies. Would require more Xray staff to walk patients through the scanning appt. Timely electronic notification to ordering provider requiring electronic signature not just a VA viewer alert would be the best way to communicate results."

The clinic nurses often place the order when alert comes up that patient needs screening. More education needs to take place with the nurses re: when screening is and is not indicated per the standards. This would improve patient's quality of care by not putting them at increased risk such as FIT testing a patient 75-80 or older(not recommended due to increased risk of perforation.

Clinical reminders are used. When they show up PCP and PACT teams give out the FIT test kit with instructions

FOBT results inputted into tracking tool and I call the patient if PCP has not already to initiate the consult to endoscopy clinic. Sometimes the PCP will beat me to it and place the consult at which time the consult is answered by a provider and MAS contacts the patient for earliest possible appt.

We do have a problem with managing medically complicated patients here but non-VA resources are financially limiting and IFC is denied due to work load. Is appropriation of funds directly proportionate to the geographical population of veterans ? Might consider.

More practitioners and support staff as well as resources will improve our ability deliver more efficient services. Right now we are SO low on PCP''s that consults for specialty services are down. Active recruiting/ incentives for good quality staff important. Look at the workload and day to day tasks placed on PCP''s. Limited 30 minute time slot for H&P''s is inadequate for providers to access and manage complicated patients but we have been forced to work at that level to increase access to veterans. More NP are not being hired due to the inability to manage pain with narcotics.

We are not provided any time to do mandatory educational training required by the hospital/VA system.

Provider receives a reminder and responds.

We get in any high risk patient.

We are in critical need of GI physicians. We are in a rural community and salary has been a concern.

"CPRS is difficult, often redundant in tasks.

One or two no show in procedures out 40 cases. Not enough support staff, walking patients takes half of the scheduled appointment time."

CRC clinical reminder is triggered for age >50 once a year if FIT testing only. If colonoscopy is completed it triggers every 10 years.

"To avoid any patients slipping through the cracks, we established an interdisciplinary team GI and Primary care running positive FIT testing report regularly and monitor scheduling proactively of the colonoscopy within 60 days of the positive FIT test result. This team reports quarterly to the ECMS."

Within 60 days of the positive FIT

"We have been successful in decreasing wait times significantly by hiring additional GI physician and APNs, nurse coordinator, as well as more RNs and techs.

The vista scheduling package overall need a major overhaul due to inflexibility and being very cumbersome for the clerks. This also applies to the consult package especially since we use Endoworks for colonoscopy reports which does not automatically close the consult as it creates a report in vista imaging instead.

We have a minor project approved to remodel the GI lab and increase number and size of operational exam rooms and efficient recovery room flow."

"Colorectal Cancer Screening

Cohort: Target Group: All veterans 51 to 75 years of age.

Exclusions""

   Life expectancy <6 months

   Diagnosis of Colorectal cancer

   Total colectomy

"Veterans who only receive Behavioral Health Care in the VHA with
explicit documentation of refusal of VHA Primary Care and that primary
care is received in a non-VHA setting*
*This exclusion is an identified variance from HEDIS."
Indicator Statement: Percentage of patients who have received appropriate
colorectal cancer screening

Numerator: Patients receiving appropriate colorectal cancer screening

Denominator: Patients 51-75 years old at the time of the qualifying visit
Technical Description:
This reminder is triggered annually for all veterans aged 51 to 80 years of
age.

The reminder is satisfied for one year by the Lab Test Occult Blood X3,
which indicates that three FOBT cards have been screened. If less than
three cards are submitted, if one is positive, it is accepted as adequate
for the screen.

The reminder is satisfied for five years by entry of one of the codes
contained in the Taxonomy SIGMOIDOSCOPY; or for ten years by the entry of
one of the codes contained in the Taxonomy COLONOSCOPY; or for one year by
indicating FOBT was done elsewhere; or five years by indicating
sigmoidoscopy was done elsewhere; or for 10 years by indicating colonoscopy
was done elsewhere. Progress note must contain date and results of tests
done at another facility."
We have a PA who tracks with lab all +iFOBTs in the system to ensure completed in 60 days.
Using our MR dashboard for all of the 321 stop code wait time. Unable to drill down past 321 stop code
into procedure types.
"Less than 30 days.

"primary care is very aggressive in obtaining FIT for all veterans, often overly aggressive"
Nurse leader who reviews all positive FIT testing and insures that alerts are followed up for scheduling
"not routinely used, some patients will specifically request screening by colonoscopy and we attempt to
accommodate as soon as openings available"
within that time unless the patient requests another date
variable based on when consult is received and if true iron deficiency is present
"individualized, but usually within 60 days, sometimes slower if special needs exist such as a
requirement for anesthesia to deliver sedation or admission for concurrent medical problems"
"we are in the process of hiring adequate GI MD, endoscopy RNs are very important as are well trained
GI Techs- it could be helpful in retention if they could be recognized for expertise by becoming certified
endoscopy nurses (supported by VA). We are frequently short on schedulers to get patients on the
books. CPRS is slow and it is not efficient to use in endoscopy. The time out procedure is not suitable for
endoscopy- you must enter why you did not SIGN THE OPERATIVE SITE!"
critically short on General and abdominal surgeons and we are losing our best surgeon to another VA
same as prior question- losing our best general surgeon we will be critically short
"Oncology service is good, there are plans for a new oncology infusion suite within the next 3-6 months"
if we could anticipate no shows we could attempt to fill the slots with other patients

These automated reminders are answered by primary care providers.

"Depends on indication. If urgent, a colonoscopy can be performed within days - This is based on the clinical judgement of a physician and not generally limited by resources. If not urgent, then it may be longer."

"Space and personnel are key, but we could do many more procedures with existing structural resources of our processes were more efficient/streamlined. There are major organizational and regulatory (VA-specific) impediments to efficient care. Examples: 1) misaligned incentives between nurses/techs and physicians; 2) High nurse turnover; 3) High regulatory burden (i.e. excessive time out requirements, lack of ability for nonphysician consents, etc) 4) antiquated scheduling system; 5) lack of operational data to guide process improvement. This being said, the patients in the VA are MUCH more complicated then your normal community screening patient, and so non-VA benchmarks don''t apply

Re: equipment - the VA needs a national Endoscopy Report Writer that is standardized across the VA and interfaces seamlessley with CPRS. There is such TREMENDOUS effort spent managing software that it has become a serious burden on our staff and impedes effective care."

"You read my mind; all of these items are critical obstacles to improving access to CRC screening. I would love to see a pilot program within the VA to waive some of these administrative requirements, while assuring patient safety, to improve throughput. Much more could also be done to improve flow of information from primary care to gastroenterology. Some of this is limited by consult system in CPRS."

"Case managers follow on results , once returned to lab"

A GI case manager is in charge of this process

"Increase salaries of GI doctors , so they will come to the VA. They make to much money in the civilian world to work at the VA."

"Again very few radiologist want to work@VA. The radiology dept in my opinion is very inefficient!!!!!"

"More OR space , more good and aggressive
surgeons need it"

"We do not have a RT dept. A facility this size
should consider building one. W/ the money
we pay contract radiation oncologist through the year we could have built one"

"Clinical reminders are implemented by a robust system that alerts primary care that a screening procedure is due. Patients are assigned to be informed of the options by the primary care team or are consulted to the GI department. There, the options are discussed. Appropriate notes are required to be entered documenting these elements. The reminders are turned on or off for varying lengths of time depending on the initial path choosen, IE colonoscopy vs FIT testing. Other options including flexible sigmoidoscopy or CT colonography are rarely choosen but are available."

"As part of the C4 initiative, it was noted that at times positive FOBT tests were not enacted upon in a timely mannor by PCP''s for a variety of reasons. We have for several years now routed all FOBT+ results directly to the GI department, reported on a weekly basis to us. We also directly schedule the patients in the GI department and simultaneously in the endoscopy suite, hopefully within 30 days of the date of positive test. This allows there to be rescheduling still within the 60 day time frame should there be a missed appointment. With this system and very close oversight, we have achieved well over 90% of patients getting colonoscopy within 60 days, including those patients that refuse to have it done in that time frame or refuse completely, taking out the studies that are not done appropriately for screening or if there is a contraindication to the procedure at the time."

"During the past 12 months there has been a large decrease in the wait time. It probably started around 90-120 days to now being 30-45 days. A prior backlog of cases was addressed lasst summer by the access to care initiative, with 900 or so procedures referred out to non-VA care. This, in concert with continued efforts to bolster clinical staff as well as nursing support staff in the endoscopy unit has resulted in the much shorter overall time. In addition, we are seeing patients within the required 30 day interval from time of consult more often. At the present time, we are seeing mocheduling presures as the large access to care has ended. We currently have a policy to treat all patients as FIT + patients and have their procedure within 60 days regardless of the indication. As this is a VA wide standard, it seems to make sense that the 60 day time frame would be appropriate and certainly expedient enough for all patients except those with more sever urgent needs, which would be seen much more emergently (within a day or 2 if needed. This was not present in the years past and we did not have the opportunity to send out patients that we could not see in a timely mannor. In late 2013 I noted on a chart review that patients seen in the clinic in Nov were being scheduled the following April or so. tghis was delt wit hin part as I have describved previously with access to care. In addition, we offered only FIT testing to patients with average risk for a time (as had been discussed with National colorectal program director who approved this based on available rescources), but are now back to offering colonoscopy to everyone that wants it"

"These patients would not be offered fit testing, only colonscopy. Again, the time frame for these patients has improved due to availability. On an individual basis they would be stratified as to the need and required time froam for the procedures. For an example, unless they were a new IBD patient, they would have been actively followed in the clinic and would have been seen well prior to their due date for their procedure, thus insuring that they could be easily scjheduled at the appropriate time."

"While this has probably improved somewhat, these patients for a number of years were always given priority and not placed on access to care as that was actually much slower than having their procedure performed in house"

"This is too diverse a group to give a number as it includes some patients with highly urgent required procedures and others with trivial symtoms that most likley were of benign etiology. The range would be from 1-2days to app 90 days. some of these patients would have been sent to acdess to care and again attempt was made to stratify them as to urgency. However, the fee department was overwhelmed and there was a fair amount of time to get these patients in. Despite attempting to manage and follow these patients, many did not get procedures done on the outside for a variety of reasons and were ultimately brought back to [location redacted] to have them performed . I have not included these patients in my estimate of the scheduling her of 2-60 days. Clearly many of these patients were much longer."

"Many of the items in this area have been addressed in Salisbury over the past several years, and thus the answers reflect where we stand in 2015. For example, renovations have generally been completed to allow for increased space for patient care bot in the clinic and the endoscopy units. There will be 2 CBOCS opening in the next year or so with more than enough capacity space wise to perform endocopies far into the future. The availability of increased staff to perform procedures is, however critical and is an ongoing challange. Since coming to [location redacted] almost 8 years ago, there has been a plan to increase the number of GI physicians to 5. They have been hard to recruit and we have just reached that 5 number within the past 6 months. It is likley that we will lose at least one within the next 3 months. While there are many issues here, the physican that is leaving to go to the private sector notes a general lack of respect for physicians in the VA system, certainly at [location redacted], that she had not noted in the private sector, and I agree with her. In addition, the salary range for GI physicians is still far lower than in the private sector. In addition, despite the increase recently in the salery caps, these increases will only be given to new hires which creates striff within the organization, particularly as I have recently learned that at the 2 year review, it is unlikley that existing staff will be paid at even

the same rate as new staff coming on board. This will mean that the seasoned staff including the department chiefs will be paid less than the ''freshman'' One additional staff member of mine is thinking of leaving if his salary does not get at least raised to the level of the new hires at his 2 years review. Due to all thes factors, I think it is unlikley that the excellent new facilities will be abe to be adequately staffed for some time. There will need to be additional support staff to man the clinics, IE NP/PA. These have traditionally not been as difficult to hire. The scheduling for procedures at Salisbury has long been hampered by a lack of MSA''s dedicated to the GI department. There has been an extreme shortage of all MSA''s here. The ones that have done the GI scheduling have not been assigned exclusively to us, and the result has been that the scheduling had been done very poorly in the past. The current administration has been extremely responsive to the needs of the GI department, the busiest in our VA wit h marked growth, and one of the highest volume endoscopy units in the country. As part of their commitment, a system redesign group was formed. the result was marked increased nursing staff, and the assignment of several dedicated MSA''s to GI. The results have been stageringly sucessful. However, the MSA''s are not assigned to clinc, only to procedures. The providers again all feel that these should be more dedicated functions to specific assigned employees. I believe it would also be helpful if the supervision for these employees came from the medicine department. The consenting of patients for procedures is extremely inefficient due to several factors. First, while there are a number of VA''s that still employ this practice, PA/NP are forbidden from consenting patients here for procedures. This is extremely common practice outside the VA in private sector and as stated in many VA''s This is a result of VA regulations enacted some years ago that stated the practitioner who consented for the procedure needed to be able to perform the procedure. The authors of this policy were queried, and agreed that if the PA''s NP''s assisted with the procedure in some capacity that they would be able to consent for the procedure. Despite the approval for this from the authors of the policy, the General Counsel in this Vison felt that the interpretation did not allow them to consent. The second part of this that has hampered work flow is the requirement that the patient remain in street clothes prior to the consenting process by the clinician. This destroys flow as the patients are not able to be gotten ready for their procedure until the clinician is free from the prior procedure. This policy has been streamlined in various VA's by the sending out of brochures and other educational materilal, and these VA''s have been felt to be abiding by the poicy. However, the interpretation has varied from one region to another and this is not allowed here. This entire clothes on consent requirement has had outcries from multiple GI section chiefs including the national VA GI chairman, who points out that this policy was enacted without representation of GI or any surgical groups that are affected. This policy is supposed to be revamped, but that has been markedly delayed. The curent endoworks system employed for documentation has had a good bit of difficulty interfacing with CPRS. There have been a series of breakdowns, and has largely attributed to server malfunction. Periodically reports would not be available for review in the chart, and clinicians would have to go through a very time consumng process of receiving a list of not crossed over cases, and having the procedures copied and scanned into CPRS. Thes images are far from ideal. The current servers are out of date and is a major reason for this. The buying of new ones has been delayed for some time."
"I have no knowledge of other systems to be able to answer this question, and the prior answer was just a guess."
"The non va care department is overwhelmed by the demand created by the new various programs, As in all cases, every effort should be made to streamline paperwork."
"Coordinating patienet care outside the VA can be difficult particularly for veterans that live a great distance, and may not have easy means to get to facilities. The can be difficult for our facility, but even more so when trying to get a Veteran the care needed at various outside places. We have continued to increase oncology resources here, and this will be the best long term solution"

"I have addressed many of these previously. Having more staff to help with administration woul be beneficial. right now a PA is occupying much of her time doing the complex scheduling for all the providers as there is no one else available. The documentation requirements before procedures are of course necessary as required by JCAH. However, there are multiple nursing notes that depend on doctor notes to complete here. We are working on integrating these better for effficiency. Once IT issues arrise, the time required to fix small issues is often excessive. Again, better support here would be beneficial"

>30
Need more personal/clinics in referral sites
Increase providers at referral sites

"While they are available to all currently, we may not be able to cope because of impending departure of one MD in next few weeks. The vacancy is still open without good chances for filling in near future"
Above won''t apply after July 1st due to impending departure of physician and no hiring or locum tenem is on horizon
"The salaries of gastroenterologists are less than half of those in local community. Even our academic affiliate medical school faculty make more. As such, recruitment and retention is a problem. One person has left and another might be retiring in a year. No new recruits are on horizon since we are not competitive financially."
"Unless the VA is competitive financially in a realistic fashion for hiring, things won''t work. National income surveys may not apply to local areas as in our case. In such cases, veterans in those areas may feel the brunt."
"Too many administrative mandatory trainings, meetings, time bound action items on top of limited staff makes people do more than one thing or one patient at a time creating potential for patient safety."

best determined by Primary Care section
handled through Primary Care section
<30 days

all results reviewed by a Nurse practitioner

Reminder becomes active at age 51 until the patient reaches 75 years old. The reminder is managed by primary care providers. The reminder remains active until a screening test is performed and results are available.
Colorectal cancer case manager tracks abnormal tests and coordinates with PCC for timely GI consults and also coordinates appointments for colonoscopies.
If patients does not want to wait for a screening colonoscopy in house are referred to Non-VA care. Access is the community is limited as well
If patients does not want to wait for a screening colonoscopy in house are referred to Non-VA care. Access is the community is limited as well
"Currently we have 3 procedure rooms partly staffed. Even though we have expanded the operation hours from 7 am through 5:30 PM we are unable to cope with the demand. Turnaround time of the procedure rooms is not efficient enough. Besides expediting the down time of the procedure rooms which is currently < 15-20 minutes, we need to increase the number of procedure rooms in order to be able to increase the number of procedures. Furthermore, by changing the concept from GI physician

The views, opinions, and/or findings contained in this report are those of RAND Corporation and should not be construed as an official government position, policy, or decision.

I-314

directed moderate sedation to an anesthesia administered sedation; we would further increase the number of procedures by just decreasing the amount of time spent by the endoscopist in documentation moderate sedation pre, intra and post anesthesia care. It takes >45 minutes documenting all the required notes (i-Med Consent, H & P, pre anesthesia assessment, airway assessment, ASA, post procedure anesthesia assessment, PACU I, PACUII, Medication reconciliation, procedure note, patient instructions, etc.) while the procedure lasts <30 minutes or less. If the sedation is documented by anesthesia then the endoscopist would dedicate this precious time in doing the procedure and writing just the pertinent documentation associated to it. In summary my recommendation is to standardize how we do GI procedures throughout the nation. My recommendations are to perform these procedures in an ambulatory center where anesthesia is responsible for the sedation. Based on our demands for services we would need twice the procedure rooms (6) in order to have the endoscopist move from one procedure rooms to another and have the appropriate number of recovery beds. Each room would need to be staffed by at least 1 GI technician and an anesthetist to monitor the patient while doing the procedure. At least 2 additional gastroenterologists would be required as well. Clerks and support personnel to help decrease the no-show by routine phone calls reminding appointments would be great.

In terms of information technology, IMed is very slow and prone to down time, intra-procedure recording is also somewhat time consuming as are the thousand and one required notes. Furthermore, procedure documentation software should be developed in order or facilitate documentation, abstraction of quality reports and imaging. Current commercial software (EndoWorks by Olympus) will no longer available which will create additional burden in terms of acquiring quality measures data.

As important to mention is that even though there is a national contract for endoscopes, here at [location redacted] we have been unable to lease scopes due to the fact that we live in [location redacted]. It has taken us 3 years to get included in the lease and now we are in the process of updating all our scopes. We will have to wait to determine if we would finally have the new technology on board.

In terms of incentives, GI physicians remain underpaid and underestimated. It is very difficult to recruit GI physicians using VA pay scales. Private sector is by far more attractive to young graduates.

In terms of Non-VA care; to me this is the worst of all possible solutions. Our experience has been that we end up repeating studies due to poor quality of procedures performed resulting in waste of resources and what is worst delay in diagnosis and treatment. Furthermore, community resources are limited and waiting times are even longer that at the VA. While we devote to high quality procedures; we end up offering substandard care in the community due to lack of capacity to cope with the demand."

"Although there are no major delays in surgery, oncology evaluation and chemotherapy there are severe space and staffing constraints in Oncology. Clinic office spaces, chemotherapy unit and staffing are absent, minimal or insufficient to cope with the demand for services. Furthermore, cancer patients lack social worker, nutritionist, PharmD and psychology support which is extremely important when providing patient centric cancer care. Oncology should be treated as a Specialty PACT team. This population is in extreme need for proper multidisciplinary approach. I understand that VACO should enforce and mandate this multidisciplinary patient-centric approach for cancer care through all VA hospitals. Cancer care is not all about chemotherapy and radiotherapy. We must also care for the mind and soul of those that are in need. Oncologists become the primary providers of cancer patients and should be considered as such when distributing resources. In our station we are in need of additional Oncologist also. Those available are extremely productive and dedicated, but they are not enough."

"Additional space and staffing are required to meet Radiation therapy space and staffing gap. Additional radiation Oncologist and dosimetrist would be required. These positions are very difficult to recruit.

Furthermore additional equipment is required. Penidng purchase of new VarianTrueBeam. Non-VA referral fails to provide timely care. Coordination with few Radiation specialists in the community takes time and there are few providers available."

clinical reminders
we provide procedures on weekends and community providers when available

"How - computer generated
When - no colonoscopy or 10 years or previously determined by provider or FOBT in 12 month and age 50"
Need to be award of provider time/opportunity cost in the mandatory TMS training

This portion (clinical reminders) are managed by Primary Care. The reminders are triggered when a patient visits their PCP.

 Study ID rYEL75
I am not aware if PCP office has a reminder system in place for colonoscopy

The reminder is triggered if there is not an iFOBT within the past year or a colonscopy listed within the past 10 years
increase pesonnel at the hub facilities for these specialties

Alerts section of the cover sheet if over the age of 50
Depends on actual diagnosis/reason for requesting colonoscopy

Reminder activates when patient is due for screening.
Generally within 60 days.
Generally within 30 days upon receipt of consult.
"Physicians are increasingly being asked to do paper work, answering numerous supsension with short turnaround time is one such example. Get rid of some of these hassles and let providers see patients and take care of them. Stop trying to micromanage the providers and tell them what to do. The more you do that, the less enpowered and engaged they will feel. You need to give physicians a chance to do what you hire them to do. Not in front of the computer keep doing" "paper work", filling out documents, attending meetings, developing and revising policy that have no impact on patient care and outcome. I see we are spending time inputing data that are "required" by policy but have absolute no releverance or impact on patient care and outcome. It often left providers wondering who came up with these metrics. Are they evidence based?"

"The reminder is turned on by primary care provider. The reminder is divided in average risk, all patients above 50 years whom there is no contraindication or high risk for example family history or familial cancer syndromes. The positive occult is flagged to ordering providers through view alert H* which means it cannot be turned off by individual providers."
"The occult blood alert goes back to the ordering clinician to order the colonoscopy.
It is H* therefore cannot be turned off."
Some of those were completed by non-VA contract screening colonoscopies (these data was actually collected data from review of 96 reported records.
"Can''t access.
To avoid delays they have been sent out on fee - mostly Atlanta Gastroenterology"

To avoid delays they have been sent out on fee - mostly completed by [location redacted] Gastroenterology"

"Increase number of clinic exam rooms, number of procedure room, incentive pay for full time physicians who agree to work overtime and weekends, improve timeliness of process to classify new employees, post position, obtain certificates and time of hiring for Nurse Practitioners, Physician Assistants. Allow those providers to be trained for procedures and match their salaries with community salaries. Incentive pay to match the salary of gastroenterologist who are procedure oriented to match salary with community (if you wait until they have a formal offer letter for retention bonus, it is too late, they accept the outside job). Fee basis is not ideal. The VA patients are not the private sector highest priority and the results are not available timely on the medical record.

The regular referral pattern change and lend to not ideal continuation of care."

"The system is transferring responsibilities previously performed by MSAs to physicians, ex. enter labs before signature order. The insufficient number of exam rooms and procedure rooms slows down the process of clinic appointments. The entering of time by part time physicians is time consuming, screening and management for minor side effects could be done by trained providers, not necessarily the physicians performing the procedures.

Phone call could be returned by qualified RNs so that the physicians can evaluate more patients in clinics.

MSAs or PSAs can call the patient after they leave messages so that the physicians do not call the patients just to find out that they want to reschedule appointments.

Insufficient staff to call patients. A personal call works much better than any automated system."

Primary care alert
less than 60 days.
less than 30 days.

There is a clinical reminders section which states when a colonoscopy or screening for CRCS is due
Need to have more Gastroenterologists to do the screening colonoscopies for average risk and high risk patients. Also need to have the capacity for more beds to prebed and recover patients thereby avoiding slowing down of entire process due to lack of space
Need to have more OR capacity at our facility and need to have more surgeons to do the required surgeries as they appear to be overwhelmed sometimes as there are not enough surgeons .
We do not have a Oncologist at present and there is need for 2 or more oncologists to handle the chemotherapies needed for the patients.
"We do not have Radiation oncology department at our facility at present. They are sent out. Therefore, it may be critical to get the radiation oncology department at our facility along with the required personnel"

I think. It is in our facility as standard of care. I don''t know about other hospitals in the system.
I believe as part of the Primary Care Physician''s electronic reminder ''package'
Patients who have iron deficiency from a cause other than GI blood loss would not necessarily need a GI workup.
"Our GI group is very attentive and has increased their capacity by holding ''scope sessions' on weekends. Because our hospital is running a budget deficit, these extended services are threatened. The patient load is increasing much more rapidly than the increase in resources - both personnel (physicians and nurses) and instruments."
"The evaluation and initial care of patients with any kind of cancer depends on the availability of physicians/nurse practitioners and clinic space. We in Oncology are hampered by both. We have had

no increase in qualified oncologists in the past 6 years (in fact, we';ve lost 'eighths) while, at the same time, the clinical load increases by 5-10% per year. This is not sustainable. We need more qualified practitioners and more clinic time to see patients with newly diagnosed cancer of any kind, including colon cancer, in a timely fashion."
The patient scheduling system is very inefficient. We also have a heavy teaching load in the clinics. The short answer is that we need more trained (qualified care-givers) to be able to see patients in a timely fashion given the restrictions on clinic sizes (room availability).

Colonoscopy in available at the VAMC. FIT tests can be given at the VAMC and CBOCs.
We do not have a wait time for endoscopy.
"We have expanded our operation to provide more endoscopy to eliminate the number of paitents referred to non VA care, but this has not occured with the necessary increase in space, increase in the necessary clinical staff or reduction clinical duties, such as rounding on inpatient medical service."

Any FIT pos results gets processed by the CRC nurse and tracked to completion
days between GI confirming that request is indeed for average risk screening and colonosocpy
"this category excludes any other high risk, such as listed below."
"includes rectal bleeding, wt loss"

The Clinical reminder is in CPRS. It is reset every time a patient does the FIT test or has a colonoscopy.
The primary care receives a phone call as well from the lab as a critical value.
Our goal is 60 days. Depending of local staffing we have mad this goal 40-50% time.
These are made a priority as well But we do not have the staff or the rooms needed to see patients rapidly in the clinic.
"Need more clinic rooms and gastroenterologists. More rooms for the nurses to do patient teaching and schedule.
We can''t attract GI MD''s at this salary"

'

Need better contracting processes. 24 hour staffing and the amount of providers and clinical staff is important to increase services and decrease wait times. Low staffing is affecting the number of rooms that we can run.
Need more oncologists and oncology nursing staff
Need the ability to provide radiation locally. Currently all of the Veterans need to travel to Philadelphia 1 1/2 hours away

'

by primary care in CPRS template note
"Need more GI physicians who can perform endoscopy, outsource fewer in the community (those are the ones with delays, community is slower), add capacity for high risk patients that need MAC (more anesthesia/critical support available), increase flexibility of nursing staff to be able to assist with multiple patient care tasks & coordination"
"Need surgeons, particularly colorectal trained surgeons.
Shorten/streamline process for pre-op clearance by primary care.
Need OR facilities/inpatient facilities available.
Nursing/clerical support to cut down on clerical work done by providers.
Fee basis in community is often slower than in-house services & there is less communication."
"Need more surgeons, particularly specialty.

Need nursing & clerical staff to be able to assist providers so providers are not spending time on clerical work. Rigid service lines prevent nursing from providing care at their full potential.
Decrease the time from equipment request to obtainment/use."
Create policy to decrease time frame from referral to procedure & require reports be sent back within 14 days instead of 30 or more
There are sometimes adequate numbers of clerical staff but they are not working in a useful capacity. Too much rigidity in service lines & perceived institutional policies & not enough teamwork. Very little support staff that works as team members with providers. Centralized scheduling with very little communication with providers. Large/anonymous system atmosphere. Patient population that tends to have transportation & psychosocial issues.

The CPRS reminders are completed at the PCP appointments.
I'm unsure if the FOBT alert is a "mandatory" alert such as a critical value which can''t be turned off.
We complete the procedure within 60 days of the positive result.
"Variable, each consult is screened by the MD and then the timing is determined by the urgency of the symptoms or findings."
"There is a large disparity between the ratio of the consults received per day to the number of procedures that can be done per day. We have adequate space at this point but we lack the staff to run the rooms--- an additional provider, nursing, and administrative. Consults sent to Fee Basis actually created more work in our area and was extremely disorganized. At this point it is unclear that the results were adequately followed up on as well. In addition many Veterans preferred to stay in the VA system for their procedure and were unhappy about being sent to the private sector. Our scheduling system could also be improved, VISTA as a scheduling system is not user friendly."
I do not work in the area and I''m unclear on the issues present that cause the delay
I am not present in the area and I''m unclear on the issues.
Again I''m not present in the area and I''m unclear on the issues.

"Every PACT visit for all patients 50-75 years of age. It the patient has had positive fecal occult blood testing, colorectal cancer clinical reminder will be turned off for one year. If the patient has had colonoscopy done, CRC reminder will turn off for the length of time as specified by the gastronenterology attending taking into account the procedure findings. This later step is relatively new and representsa very significant improvement to the process that allows the primary provider to fine tune the interval for surveillance or follow up screening colonoscopy."
"FOBT positive tests are considered of high importance and actually generate a call fro the laboratory to the requesting provider with the results, in addition to a CPRS alert. The policy in the ambulatory care area is that no laboratory results should be suppressed by clinicians."
"B- Additional gastroenterology physician (one); Physician extender (one) to take responsibility for non-urgent clinical tasks of division
C- Nursing shortages due to insufficient staffing leads to inefficiency in endoscopy unit functioning and decreased patient volume per day
H- Significant barriers to effective scheduling due to insufficient and unreliable clerical staff"
"1-
Additional surgical and anesthesia staff are necessary. Surgical staff optimally would have expertise in colorectal surgical techniques
2-
Streamine interfacility consult management"
"1- Streamline interfacility consult management.

2- Outreach to community physicians and implementation of policies to allow for fast payment for service without obstructive requirements."
"Unreliable and unmotivated clerical staff lead to difficulties in reliable scheduling. Issues with staff persist despite multiple attempts at reeducation.
Inability to reassign staff or hire reliable staff hinders scheduling."

"reminder shows up on cover sheet as ''due'' when needed. annually for occult acrds, 10 yrs for colonoscopy etc"

"Ability to hire doctors that are not US citizens.
Adequate number of adequately trained Clerical staff."
Typcially no delay in being evaluated by surgeon. Issues with contacting vet and scheduling can occur
Understaffed in Oncology svc
NA to VAPHS
self explanatory

Triggered annual or based on clinical indication after screening.
"Delay in provider availability when general surgeon is performing procedures other than colon cancer screening.
Limited by basic complexity/CRNA service-patients requiring higher levels of care for services, oncology or anesthesia require review and consultation to alternate fee services.
Recruitment for Chief, Surgical services=difficult recruitment."
Consider improving flow administratively for radiation oncology to non-VA care.
Scheduling - difficult to customize scheduling for complex cases or variable appointment lengths.

Yearly reminders in CPRS
"this is after all the factors we have no control of, ie : inability of pt to get a ride, cancelations due to illness, road conditions"
"There are simply not enough people to do the endoscopic exams in [location redacted], both in the private sector and VA, salaries make it difficult for the VA to compete for providers."
There simply are not enough providers and the system is cumbersome in getting things done. Physicians spend to much time doing clerical work
patient guides ie nurse coordination would help patients navigate the system
We need more providers!
system is cumbersome and not enough providers and providers spend a lot on time doing clerical work

"via alerts on the patients electronicmedical records
A GI coordinator oversee the alerts so no patients are missed."
"Our GI Coordinator is alerted, likewise the PMD"
pay physicians especially in the rural settings at the 70-90th percentile range(salary.com).Current Surgeon salary ceiling is below 50th percentile.This is the single most important reason why quality staff recruitment and retention is a chronic VA problem.

These are triggered via automatic alerts in CPRS. They are also being triggered as part of the CONFIRM trial.
Unable to assess - do not have local data
"I can perform colonoscopies every 45 min in my academic practice, and stay on time. If the VA had more efficient pre-procedural policies it would allow for more procedures. The documentation process

takes at a minium 20-30 min prior to each case. In addition, the documentation process after each case is also slow Endoscopy reporting systems should be uniform across the VA. Endoscopists should also be tracked for meeting colonoscopy quality benchmarks."

clinical reminder
an appropriate scheduling system and CONSISTENT guidance from VACO.

Reminders have been in use consistently for 6-7 years. They are mandatory to complete as a part of every screening colonoscopy report and are entered by primary or ordering providers when FIT testing is done. The reminders are triggered to alert 3 months prior to the "due date"" to allow time for renewal of screening tests.
FOBT/FIT positive results are tracked by the lab and routed to endoscopy directly for scheduling. Standard alerts are sent to primaries as noted above.
"We have long struggled with constraints of space and personnel. Currently we have 3 full-time endoscopists. This is inadequate to meet current clinical needs. Hiring a fourth endoscopist (gastroenterologist) is an important step but we need additional clinical space (a third fully developed endoscopy room plumbed for anesthesia services), additional nursing staff to support the room (2 nurses) and additional prep/recovery beds to support the extra room (3 prep/recovery beds for every room). In our current location we SHARE 10 prep/recovery beds with our 3 endo rooms (2 of which we can reliably staff with nurses), cardiac cath, ophthalmology, VIR and our 5 room OR. This is GROSSLY inadequate and huge bottleneck in our process. It might be helpful to offer weekend/evening hours but this would require FLEX TIME or COMPRESSED schedules which administration has resisted. Also helpful might be asking existing providers to work Saturday morning to do endoscopies when on call but absent additional pay for working 6 days a week or FLEX TIME/COMPRESSED schedule arrangements this is unhelpful. Many staff are also resistant to longer hours. Most fruitful then, would be adjusting our physical plant and hiring additional full time staff. We may, in fact, need 5 FTE of endoscopists to fully meet our demand. I made the assumption that VA would like to see procedures done within 30 days in most cases."
Having adequate administrative support for our unit has been absolutely CRITICAL to our achieving the level of success we have managed to date. If we don''t have effective admin support personnel then our nurses take up the slack which hamstrings our clinical activities. We have 1 admin support person to do all our scheduling and could easily use 1-2 more in endo/OR/IR.

Age appropriate but not for followup
Would best be answered by VAPHS Chief of GI
Create a Cancer Service Line for screening through survivorship
"Increase compensation for medical oncology providers to match market pay. This would improve the caliber and intellectual pursuits of applicants and retention of VA oncologists.
Also focus on rebuillding a VA Central Cancer Tumor Registar Team."

triggered annually after age 50 in CPRS via clinical reminder system. provider action closes out if colonoscopy or FIT has been completed
this retrospective average includes many patients who no-show or cancel and reschedule their initially scheduled procedure which was initially targeted to occur within 60 days
Increase efficiency of clinical operations through system redesign and/or fix flow initiatives. Improve VA allowable incentives for tying productivity to market incentives in private sector
Addition of Colon and Rectal trained MD Providers to our facility to avoid need to outsource. Improve numbers and efficiency/productivity of CBO Case Manager staff for non-VA care.

Improve communication and coordination between facilities
based on previously noted need for increased admin support staff

A clinical reminder is set up to remind primary care providers to order FIT testing yearly on patients for colon cancer screening.
"Our full time GI provider does not have a designated office or exam room. We have recruited for a full time GI physician for 8+ years & recently obtained one, but he is currently off on medical leave. If he does not return, it is imperative we recruit & obtain a full-time GI physician. We need a dedicated GI scheduling clerk. Currently we share 3 clerks that schedule for multiple other specialty clinics also. If we are unable to maintain a full time GI physician it would be imperative we have a tele-health GI physican that the two midlevels that work in GI could have available to discuss complex cases and help manage the IBD & cirrhotic patients. We only have 2 part time fee for service GI providers and access to schedule GI procedures timely is very poor. If this pattern continues we need clear guidelines on triaging which patients for GI procedures. We often times lack GI coverage on the weekends if our one local GI fee for service provider is unavailable. Inpatient consults often do not get answered in a timely manner due to this providers limited availability at our facility. We live in a very rural area and in past experience the fee basis referrals are not getting seen any quicker in the community then they are at our facility & communcation is lacking (we often do not get medical records back in a timely fashion if at all). We are limited in how many procedures we can schedule due to issues with anesthesia coverage and the sharing of OR staff between the GI doc and other surgeons that may be doing procedures on the same day. The turn around time between GI patient procedures is very lengthy. There is lots of room for improving the efficiency of our SDS and OR work flow. In the past we have been told to cancel GI procedures if another surgeon was working and anesthesia coverage was inadequate. Our facility has a policy that patients have to be seen within 30 days of their GI procedure date. When access to procedures is so poor, it impacts our clinic access tremendously as we are seeing each of these patients twice and this is taking up access that new consults could be seen in. On the other hand when we continue to see new consults but have no access to schedule them within 30 days for their procedure we need to establish some sort of policy on who refers these for fee basis services (do we cancel the consult and recommend PCP do it, do we see them 1st and the GI provider submits the consult but this does create delays in patients care when they wait to see us on consult first)."
"We need more colorectal surgeons at our tertiary VA centers in order for clinic access to improve. I think establishing tele-health services with the colorectal surgeons at our tertiary VA centers would help. They would be able to review the cases with us and establish what type of pre-surgical work up they need before seeing the patients that we could possibly complete at our facility. This would limit travel and number of patient visits at their facility which in turn would help improve their access. Our current policy is to submit dual consults to two tertiary facilities at the same time and wait and see which facility can see the patient the earliest. However, having a second lingering consult out there creates unecessary work load on the other facility. Often times patients get schedule appointments at both facilities and the patient ends up being a no show at one of the facilities due to keeping the early appointment at the other facility. We do not perform colorectal surgery at our facily so it is imperative we have fee basis options to refer these patients to. But again, we live in a rural community and often times their access in getting the patient in is not timely either. Communication is poor and some of these patients gets lost to follow up. The fee basis department sends fax inquiries to request medical documentation but often times it is not receive timely or at all."
See my comments on prior section.
Please see my comments on prior section.

"Clinical Reminder is turned on for all Vets >50yo. Clinical Reminder logic is turned off for 1 year by a negative FOBT results. For colonoscopy, a letter is generated for all patients post-procedure which triggers the Clinical Reminder to alert the PCP based on guidelines related to the procedure, patient history, and tissue histology."

All screening procedures are Fee Based due to lack of capacity at our facility.

"Our facility currently runs a deficit of 100 procedures every month. We are understaffed with respect to GI providers and nurse/techs to run the rooms. We do not have sufficient Facilitators to schedule procedures, and we do not have enough Nurse Care Coordinators to manage the complex patients we do see."

"The amount of time spent by clinicians to document the pre-procedure and post procedure assessments is 5 times more onerous, tedious, and wasteful than any other endoscopy program in the country."

"Reminders come to PCP in CPRS as pop up. Provider can clear by ordering tests, verifying it was done elsewhere, or stating pt is too sick to merit CRC screening."

We discourage use of FOBT in our system. Colonoscopy is the preferred mode of screening.

We have no wait for colonosocopy. Pts can easily be accommodated w/in 30 days.

as above

"Again, we don''t like FOBT. It''s a poor screening test. We discourage use. BUT, if done and positive, we'll do colonoscopy w/in 30 days"

It will be scheduled w/in 30 days in all cases unless pt desires otherwise.

The key is a charge nurse and physician director who are thoroughly invested - and empowered - to run the unit efficiently.

"Within our local radius, we provide all services at our site w/o delay. For pts living remotely, there simply aren''t sufficient services available to provide high quality chemotherapy or XRT."

"We perform XRT at our University affiliate and get great service. We have no delays in access. For patients who live remotely, we have had problems with VA contracted services with groups/facilities with which we do not feel comfortable, i.e., quality of service is not what we expect. This is an onoging problem for the VA: the quality of care is BETTER at the VA than contracted sites, especially in more rural locations."

"We are suffocating in checklists, tedious consent processes, and documentation requirements. The requirment for a provider to send f/up letters after procedures is incredibly burdensome. It could be automated (as Kaiser does) - but the IT group hasn't deemed that of sufficient importance to move forward. SO, we spend many hours each month sending out individual letters."

activated automatically based on age of patient

Additional space for procedure duties is necessary. Improved scheduling personnel/practices and staff for monitoring of CRC obligations are necessary. Prefer not to fee-base our care as this creates complexities in acquiring results and is unnecessarily costly.

More surgeons needed at our facility.

Available at [location redacted] only

Reminders are used

I do not know about the FOBT triggers or responses

less than 90

"Need additional physicians to perform endoscopy. Need to STOP primary care from performing FOBT tests a year after normal colonoscopy and re-referring the patient for endoscopy. Need to APPLY the guidelines that stop screening at age 75, so that 82 year-olds stop being referred for routine endoscopy

and clogging the system. Need to stop the absurdity of timeline constraints on "open consults""--a patient referred for routine screening colonoscopy because it has been 10 years since his last one should have ONE YEAR--365 days--to get his procedure done sometime in that calendar year.
Need to improve the quality of endoscopy equipment, and make a system where the scope report can be easily moved into CPRS; the electronic health record."
"RESTORE all VA inpatient facilities the RIGHT to perform surgery!!!!!!!!! This, without a doubt, is the biggest stumbling block in the ability to provide care to veterans. The unilateral decision by the NationalSurgeryOffice (NSO) to restrict surgeons from being able to actually perform surgery has crippled the services offered locally to all veterans. In addition, it has made recruitment of physicians very difficult. Why would a surgeon come to my facility only to be told he cannot perform colon resections or other bowel surgery here, and that all these cases must be referred to outside facilities because we do not have a cardiologist or intensivist?? There is not a single medical study which supports this rationale impoised by the NSO. Quite the contrary, studies show that rural surgeons perform just as well as ''centers''. It is not about quantity of work. Plus, the overall hypocrisy of this NSO edict is exposed by the fact that orthopedic surgery IS allowed to continue at these very same facilities which are unable to offer cancer surgeries to our patients. It is pure economics."
"At this facility, to get a colonoscopy:
1.Consult placed for colonoscopy
2.Patient must have 3 appointments:
  **endoscopy nurse
  **anesthesia
  ** surgeon (endoscopist)
3. Await a date from the Endoscopy scheduler
4.Colonoscopy done.
Surgeon must write:
 Brief op note in CPRS
OPERATIVE note
Orders
Endoworks report with pictures for patient--this is done on a completely separate computer, as CPRS does not talk to endoworks, AND at this institution, they are not even allowed to be on the same computer network.
GI follow up letter
Clinical Reminder
Notification of Pathology note.
That''s a lot of steps for a colonoscopy."

"age > 50 annually, FOBT"
"Ex. had pt. identified in CBOC with rectal bleeding and other symptoms last week. That day did telehealth colonoscopy screening with PA at hospital, sched. colonoscopy for this week."

- **Diabetes**

One podiatrist on staff; one APN for foot care/limb preservation. They are available for acute needs but scheduling outpatient tends to be prolonged
All consultants are available for same day consultation in case of urgent intervention. Follow up is good with most. Cardiology does not manage refractory HLD but will offer suggestions to the PCP. Staffing is key in most of the issues related to tx. delays
"Some reminders could be done by staff other than provider. Clinic panels are not well managed eg. providers retired or gone for other reasons with pending follow up needed in panel...and no designated surrogate to follow up. The call back for scheduling system does not work...they are sent a reminder letter to call 30 days in advance to make a call, they call and are told "too early", they call back in 2 weeks and now providers are booked out beyond the 30 days and by that time, patient is out of meds. Even making appointments for 30 days later is a stretch for most of the providers. Patients frequently complain that they want to have an appointment scheduled before they leave the facility". Lots of provider turnover. Long way to go in continuity of care. Long way to go in employee satisfaction. Clerical staff not supportive and numerous complaints re "poor attitudes" and "rudeness" from front desk personnel. Many of these individuals feel protected because they are Veterans. Providers are not given sufficient time to perform exam and "check the boxes" of all the clinical reminders required of them."

"The Medical Center outpatient primary care clinic layout/design does not allow for coordinated, patient-centered care and services. Nursing staff provide basic diabetes self-management education in both the inpatient and outpatient setting but this is ineffective and often leads to delays in follow up communication and care. Multiply factors including space, time constraints, ineffective or poor communication, etc. also contribute to the ineffective delivery of diabetes self-management education and services. Additionally, information technology issues such as, the lack of interface capabilities between diabetes equipment/software and CPRS make the exchange or sharing of information such as blood glucose data cumbersome and inefficient. Use of a diabetes registry would help to improve diabetes care coordination but registries are not available to all facilities. The use of a diabetes registry is frequently limited to very large medical centers or sites who have participated in a pilot study. Incentives should be disbursed among all members of the healthcare team and should be based on the performance rating of the overall team and each individual. Individual and group diabetes education is not offered in the evening or on the weekend. Offering education and classes during non-administrative times is patient-centered and beneficial to those patients who work or have family members or caregivers who work. Telehealth diabetes classes are available from a larger VA facility within the VISN but the class schedule is inflexible. There are 4 classes, one each week, on Tuesday afternoon from at 1 - 2 pm and classes must be completed in consecutive order. Patients must attend all 4 classes and class attendance cannot be tailored to meet specific patient education needs. Additionally, patients are required to wait until the next class series starts before beginning Telehealth diabetes education classes. Within the SVAHCS catchment area, availability of non-VA diabetes education programs and services is limited, thus it is often challenging to provide fee-basis or contracted care services to non-VA diabetes education programs."
"Additional access to tele-endocrinology services could be made possible with the addition of 1-2 tele-endocrinologists, additional Telehealth primary care rooms and Telehealth Clinical Technicians would be needed at each location to facilitate additional appointments. Appointment availability during non-administrative hours would be patient-centered and beneficial to patients who work or those patients who have family members or caregivers who work. The availability of non-VA endocrinology services is limited within the SVAHCS catchment area. Use of fee-basis or contracted care services to non-VA endocrinology providers would be challenging."

"Additional access to dietitians could be made possible with an increase of 1-2 additional dietitians. Specialized nutrition counseling and education related to diabetes self-management is very important because healthy, consistent nutrition is a key aspect of good diabetes self-management and the prevention of long-term complications. Increase use of Telehealth would improve Veteran access to nutrition counseling and education to Veterans who receive care in the CBOCs."

Additional access to optometry and ophthalmology services utilizing Tele-Retinal Exam and fee-basis care would be the best solutions to decrease delays. Additional training Telehealth clinical Technicians (TCTs) and training for TCTs would facilitate increased access to care.

"Additional access to nephrology services utilizing Tele-Primary care and fee-basis care would be a good solution to decrease delayed care. Additional space for Telehealth appointments, additional TCTs, as well as access to nephrology specialists would facilitate improved access to care."

"Additional access to cardiology services utilizing Tele-Primary care would be a good solution to decrease delays in care. Additional space for Telehealth appointments, additional TCTs, as well as increased access to cardiology specialists would facilitate improved access to care."

"We have been challenged with hiring podiatry support personnel, such as nursing. With a growing veteran population, space has become constrained. Central Office must allow for leasing of temporary mobile space to relieve the constraint."

"We can recruit general ophthalmologists, but are challenged with recruiting the ophthalmology subspecialists such as retinal, glaucoma, and oculoplastic sub-specialists. Central office must allow for temporary leasing of mobile space to relieve space constraints."

"We have an under-staffed prosthetics sections because this service line falls under the VISN and not the facility. Prosthetics must come back under the facility. Prosthetics also has an under-performing contractor that has generated a fair amount of patient complaints. Central office must also change the business rules for prosthetics and move towards order sets instead of consults. With a growing veteran population, we have become constrained for space. Central Office must allow for temporary leasing of mobile exam room space."

[Location redacted] VAMC currently has no vascular surgeon. We have been trying over a year to recruit one and have had several declinations in spite of very attractive recruitment / relocation incentives. We are currently pursuing a locums contract.

See previous comments on podiatry. Central Office must allow for leasing of temporary mobile office exam room space.

"Podiatry has been challenged with recruiting adequate support staff, such as nursing. Central Office must allow for temporary leasing of mobile office space for exam rooms."

"Same comments as in "new patients"" in the General Facility Questionnaire [name redacted]. Inflexible CPRS, lack of support personnel, View Alert burden. Space is a constraint and Central Office must allow for leasing of temporary mobile office space for administrative personnel."

Need more nephrologist given increasing demand for these services. Need nephrology nurse specialist. Need more dialysis equipment and space. CPRS needs to be compatible with community standard (Electronic medical record). There is difficulty in coordination of care with NVCC to VA providers.

"Need more nephrologist, nephrology nurses, dialysis equipment and space. CPRS needs to be more compatible with community electronic medical record. Diffculity getting information from NVCC providers on VA patients they treat."

The electronic medical record needs to upgrade and hinders provider''s ability to provide patient care. Providers are given too many clerical dutieis that dedicated personnel could do

"Decisions regarding how soon patients need to be seen by specialists should be made by the specialty clinicians, not administrative non-clinical data analysts."
"This VA had 1 endocrinologist & 2 diabetes nurse specialists 25 years ago. Today, 25 years later, with the incidence of diabetes in veterans now at 25%, we increased to 2 endocrinologists (1 month ago) & 3 diabetes nurse specialists (6 years ago). The [location redacted] VA has 25 certified diabetes educators. There is a critical lack of resources/personnel for the volume of veterans with diabetes at every VA in VISN 15."
Podiatry dept. is grossly understaffed for needs of this facility and throughout VISN [location redacted].
"There are seriously inappropriate behaviors occuring between the nephrologists in the nephrology department. Upper level management needs to step in and take actions to ensure professional communications between these physicians, as it highly impacts patient care."
Administrative changes that dictate how patients must be rescheduled greatly impact efficiency of clinician and patient f/u requirements.

pt. do not keep nutrition appts.

Patient has to be in Move program for 6 months and has to lose certain amount of weight before eligible for surgery. Some patients are not able to lose weight. The policy needs to be changed.

down load of the insulin pump
I tiwould be nice to have a team working together to help manage diabetes which includes dietitian CDE and endocrinologist and NP

"Currently and RN CDE runs our diebetes program. Program includes two dieticians, two part time Pharm Ds. Nutrition appt are back logged."
Limited nephrologist in community. No nephrologist on staff.

"Blanket mandates for timing between consultation request placement and delivery of care cause inefficient utilization of limited resources.
Expanding clinics to non-standard hours is possible but entails simultaneous expansion of ancillary services and clinical personnel expansion.
Patients tend to prefer to be seen at the VAMC rather than the private sector. The private sector does not attend to the combined needs of our veterans as efficiently as a VAMC.
Central Office mandates to manipulate specialty care flow are overly simple and do not acknowledge the complexities of specialty care."
"Expanding podiatry clinics to non-standard hours is possible but entails simultaneous expansion of ancillary services and clinical personnel expansion. Similarly, telehealth podiatry clinics are possible, but require adequate staffing and infrastructure support, which are currently lacking.
The scheduling package available to schedulers is antiquated and inflexible, and produces inefficiencies in access. The facility desperately requires a modernized telephone system that permits monitoring of call volumes, call timing and durations, direction through automated answering trees, lost-call rates, etc.
Patients tend to prefer to be seen at the VAMC rather than the private sector. The private sector does not attend to the combined needs of our veterans as efficiently as a VAMC."
"Screening for diabetic retinopathy is a dual function of primary care access and efficiency. Primary care at this facility is under resourced with respect to both staff and space, leading to excessively large panels, and lack of space within CBOCs for screening equipment and technicians to run them."

"Access to vascular surgery is impaired at many steps, including limited space and personnel to assess peripheral vascular disease, number of vascular surgery providers, space for vascular surgery providers to evaluate and treat patients, and surgical OR time.
Policies that dictate time until evaluation, without consideration of clinical need, exacerbate system inefficiencies."
"Access to nephrology is impaired at many steps, including limited space and personnel to assess renal disease.
Policies that dictate time until evaluation, without consideration of clinical need, exacerbate system inefficiencies.
Expanding weekend services is feasible, only if additional staff were available, and required ancillary services were also available. Outsourcing care to the private sector is possible but undermines attempts to coordinate care across medical disciplines for veterans."
"Delivery of podiatric care is limited primarily by space and staff considerations. Trained technicians, as well as podiatrists are needed, as well as appropriate work spaces. Delivery of care by telehealth would facilitate care, but requires sufficient space, and technician assistance at CBOCs. In addition, telehealth screening modalities typically lead to increased discovery of disease that requires interventions only available at the medical center. Podiatry care is further hampered by limited access to operating room (OR) time by podiatrists. OR efficiency is limited by an antiquated and dysfunctional telephone system that does not permit timely communication with patients with respect to procedure scheduling."

need additional nutritionists
Improve speed with which prosthetic requests are processed and delivered.

we need more endocrinologist or the ability to get people into community clinics faster
we spend too much time on the computer answering clinical reminders that all competent physicians should handle routinely w/o the reminder and most have shown no benefit to the veteran. they are also redundant as these are mostly addredded in the progress note.
we need a cardiac lab and interventionist to use it
we need to find a way to decrease view alerts and just plain make 90% of clinical reminders go away.
clinic cancellation policy is draconian.

Stop code issues with the scheduling system make appropriate appointment making incredibly difficult. Lack of training and high turnover of MSAs makes this problem worse.

"In the pt care are, more full time staff instead of more part time for better continuity of care and coverage"

There is a problem with the culture in Nephrology. They are more invested in the opportunities for education than aligning their resources with care for the entire population of Veterans with renal disease.
The members of PACT beisdes the PCP do not engage in a population management approach to DM nor do they work at the top of their license.

Lack of adequate clinical and clerical support staff limits the efficiency of our services. We have no dedicated nursing staff for the diabetic clinic and physicians must do tasks normally done by nursing support staff. Physicians have even been asked to call patients and schedule their appointments to remedy inefficiencies in the patient appointment scheduling system. Added administrative requirement for the physician to call back or notify patient by personal letter of every lab result ordered by the

physician increases administrative physician time that could be better utilized directly seeing patients. But we do the best we can with our limited clinical support.

"The NVCC process is entirely cumbersome for no reason, simplify the process so care can be delivered more timely"
"the NVCC process is to cumbersome, please simplify so that care can be timely."

"I can truly only comment on what I see in the endocrine division and our associated subspecialty clinics. I cannot comment on the other clinics (primary care, vascular, ophtho, etc) that provide service to our patients."

Planned 6 month appointments with the primary care provider is not adequate for good control of diabetes mellitus. BUT the staffing for specialty care of all diabetics can never be adequate---not enough endocrinologists to do that in the USA or elsewhere. We must have generalists care for many of those patients.
Fee basis podiatry services for nail/foot care for persons with diabetes over age 60 would be VERY helpful
Wound care close to home is important because most are elderly and/or impaired. Increased fee-basis wound care would greatly improve foot care.
"Retinal surgeons are in short supply, so fee-basis services are essential."
Fee-basis services are likely to be needed to get prompt attention to these patients.
Policies are "one size fits all" and patients simply don''t follow those "rules"

"increase the number of support personelle ie clerical, nursing (MA, RN, LPN) as well as assign each group a coordinator whether APN, PharmD, PA etc that works with the providers in the area. Design to be collaborative and to work at top of their training.
Central office policy is understandably changed with new needs. This can at times result in difficulties implementing the mandates without sufficient time to give feed back about the local results - both good and bad.

The VA is easy to have bad PR both from outside as well as inside the VA at times - patients and staff. This helps us do even better but would be nice to have regular focus also on how great the care and services are most of the time."
see question two comments section. Also forgot to answer about improve management etc. Most of us are here because we are proud to serve our Veterans and help with their healthcare needs. Process and meeting the goals of processes has become too large a focus and believe that helping everyone feel the satisfaction of caring for Veterans is very important.
see prior answers also. For retinopathy treatment would also need more providers and technical staff as well as other support people.
"see prior answers also
for these questions, would almost always be taken care of in clinic (theirs or referring) or seen in ER. Those who are missed would relate mostly to process issues that more support staff would be expected to help."
see prior comments. Cardiology needs more space and technical staff. All answers are for new symptoms not refractory hyperlipidemia which is also or primarily done by endocrinology and preventative general medicine.
see prior comments

"Over the past year there were many changes to the scheduling policies that resulted in decreased system efficiency. However, currenlty his is fixed. With less staff, patient flow can decrease efficiency. With better flow, more staffing there would be a likely need for more space. TMS requirments being the same every year and without much if any grace period and similar for all people decreases provider and system efficiency."

More operating room time for surgeons. Additional surgeons experienced in bariatric surgery.
No show or cancelling close to clinic date is significant problem.

Need more primary care providers
Need more nephrology availability with more subspecialists
Need more cardiologists and nurses for improved clinic availability
"Poor patient show rate for DM clinics historically; also - too many administrative duties, including mandatory training interferes with physician availability to patiients"

"Improved and effective Coordination of clinical and administrative services (ie scheduling by business office vs by clinic staff)
May need a designated advanced MSA who can understand the process and the options available for open spots
Also syncing patients preference and clinical priority.
patient accountability for multiple no shows (over 3) .
Having more rooms for multidisciplinary clinics
Telehealth services will certainly improve no show rates and is excellent for diabetes follow up appointments
Availability of sensors for type 1 diabetics(equipment /device)
Diabetes Section providers
We have set up clinics for high risk diabetes patients (ie frequent admissions and ER visits and complications) staffed by our diabetes NP .
we alos have insulin pump clinicstwice a month.
Fee basis may not be a great choice for chronic diseases such as diabetes.
VA has great national guidelines, policies and resources for diabetic patients and we just need to streamline the care from prevention to managing complications."
"RTC notes take time
Can we make it an order instead?
Also it takes time to explain locations of labs, radiology,pharmacy ,prosthetics etc to pt
To improve flow and time ,can we have nursing staff or trained MSA explain disposition details so provider can move on to clinical duties.
Also having a CDE available at all clinics is quite helpful to explain about insulins, review injections and meal plans."
"In my experience veterans who use the VA access VA system prefer to get all their specialty care at the VA for reasons of communication and continuity.Fee basis does not help, since care is fragmented."
as mentioned previously midlevel provider trained in diabetes will be helpful

Have CDE certified nutritionists
Concurrent clinic activity
Enhanced interface of clinical activities

 Study ID EkfhJJ

"These opinions are entirely my own, based only on my perceptions and experience.
RE:Reducing delays in PACTs.
I did a quick survey of random PACT clinics in [location redacted]. Out of 15 clinics seven had an open appointment in 1-4 weeks and in eight clinics the next available appointment was > 1 month away which I consider a ""clinically meaningful delay"" in the treatment of poorly controlled diabetes. Since 50% of the clinics I sampled can't see any patient for > 1month some people would say that''s an indication we need more providers but I disagree and I make my point below.
ADDITIONAL SPACE: Space is a peripheral problem. I worked in our primary care clinics >10 years, during that same time I was also working part-time in a primary care private practice night clinic. The 2 physical and functional models were totally different and definitely had an impact on efficiency. In the private practice I saw 20 patients in 4 hours. In the VA, then and now, I can''t see more than 12 patients in 8 hours. From a quick survey of the PACTs it seems PCPs have from 10-18 slots per day. The model the VA follows does not support the PCP. The PCP is burdened with too many non-medical ancillary tasks that in private practice are done by clerks, MAs and nurses. The PCP spends an inordinate amount of time on non-patient care tasks, as a result the number of patients we see is limited. We don''t need more PCPs. We just need to give the PCPs we have more support. Ordering of tests, looking up results, entering consults, etc should be done before and after the appointment by the ancillary staff. At one time CPRS was helpful but that system is now antiquated, inefficient and simply burdensome.
LIP: As I said above compared to a private practice we have plenty of LIP but they are burdened with too many non-patient care duties DURING CLINIC time that decreases their efficiiency
OTHER PERSONNEL: PharmDs and TMC clinics are a very efficient means of getting pts quick evaluation and tx of diabetes.
YES we need more ancillary staff, MAs, LPNs, and RNs trained to support the
PCP by taking over more of the pre-appointment and post-appointment duties and free the PCPs time to see more patients. The VA needs to more closely follow the private practice model.
EQUIPMENT: Diabetes research has firmly established that good diabetes control depends on frequent home monitoring of blood sugars and patients being knowledgeable in diabetes self-managment. The VA policy that restricts patients not on insulin to 150 strips/year is a direct barrier to helping a patient get faster control of their diabetes and necessitates MORE clinic visits. Since my patients can't test as much as I need them to I have to depend on the A1C which necessitates the patient make more trips for lab and more f/u time in clinic. Medicare-B covers 1 strip/day for pts not on insulin and any number of strips as Rxd for pts on insulin. Many of our patients have Medicare-B and can get strips outside the VA if the provider will write a RX. However the general understanding among PCPs and other providers is that NO outside RXs can be written. This prevents patients from benefitting from their Medicare-B coverage and increases the VA cost because it means ALL strips must be provided by VA. In addition to test strips pts need education on how/when to test and how to use that information. Our pts are not under any obligation to participate in diabetes education and the majority choose NOT to participate in education which results in inefficient use of test strips, poorly controlled diabetes, more diabetes complications, more use of primary care clinic time and all VA resources/equipment. ALL OF THIS RESULTS IN MORE CLINIC VISITS REDUCING THE OVERALL EFFICIENCY OF OUR PRIMARY CARE CLINICS.
TELE-HEALTH SERVICES: We have several diabetes/metabolic telehealth clinics. Yes, tele-health can take the place of some primary care clinic appointments if the patient is comfortable with the technology.
INFORMATION TECHNOLOGY: CPRS is antiquated, slow and inefficient and greatly decreases the efficiency of all providers. It''s also unusual in this day and time that providers can''t access a patients record from home. It''s common practice in private practice to be able to review records from home.
CENTRAL OFFICE POLICIES: If this refers to Performance Measures then YES changes need to be made. Current research supports that PMs do not improve patient care and PMs should be limited in their use.

If you look at the typical PCP note it's full of redundant information and PMs with little pertinent personal information about the patient.

PERSONNEL MANAGEMENT: Business Office personnel and practices are the weakest links in the efficiency of our PCCs.The system needs a new model and new leadership. BO personnel do not preceive themselves as part of the care team. They seem to function as independent entities and do not think of themselves as "support"" staff. In fact some BO clerks resent the title "support staff" because they don''t believe they are here to support anyone but just to do the job they are assigned. I''ve observed some very, very poor customer service from BO staff but even a tactful suggestion on what might be a better approach is resented. Basically BO staff have never been encouraged to be part of the PACT team. BO supervisors and staff do not attend staff meetings so are not part of the conversations on customer service and clinic efficiency. The BO clerks are the face and voice of our clinics. They set the tone for the entire clinic visit but they are often the least polite, least professional and least efficient members of the PCCs.

INCENTIVES: Yes, they work if they are based on significant and objective measures and if they have real value to the employee. Our own surveys have shown that employees place most value on cash awards and PTO. I also personally believe the awards must be given frequently enough for employees to feel they may actually have a chance to be recognized. The reasons an employee is recognized must also be widely and publicly announced so others will know what is necessary to earn an award. I''ve received substantial cash awards for "achievement" that I only knew about because I looked at my LES. The public recogniton and appreciation would have made me feel even better than the cash and would give other's incentive to work towards an award. [location redacted]'s Clinic has been voted "Best Place to Work"" and I''ve recently been a patient for multiple visits at 2 of their locations. The employee spirit and camaradie was noticeable from the minute I walked in the door. The staff was friendly, smiling, polite, professional from the beginning to the end of every one of my visits. Talk to their HR I''m sure they can give you some ideas.

WEEKEND AND EVENING CLINICS; YES!! Providers and patients have been asking for evening clinics for the entire 30 years I''ve been here! Years ago we had semi-annual Diabetes Health Fairs on Saturday mornings. Over 200 patients attended each health fair. One of the survey questions asked if pts preferred Saturday or a weekday for the health fairs. Over 90% responded they preferred Saturdays. We have many vets in blue-collar, labor and part-time jobs that do not offer the luxury of PDO. Vets should not have to sacrifice pay to come to the VA for their health care or be forced to come to the ED. We are doing ourselves and our vets a disservice by not providing evening clinics.

INCREASE FEE-BASIS OR CONTRACT CARE AND SIMPLIFY ADMIN PROCESS: The answer to this question just seems too obvious to answer."

I am familiar with only one patient who has had bariatric surgery and it seemed to me it took her a very long time to go thru the evaluation process.

"The bariatric surgery process is something that could clearly be streamlined. it''s hard to say the delays are clinically significant because the procedure is ultimately elective, but there is a huge burden on referring providers trying to make bariatric surgery referrals

Re: fee basis care, my opinion is that this is a poor solution because of the care discontinuity it creates - e.g., when my patient sees a non-VA eye care provider, I seldom receive the results"

No-shows - I deliberately overbook my endocrinology clinic to 9-10 patients in a half-day expecting that 1-2 will no-show. This takes appts away from other patients - having admin support to improve apt confirmations with pts would be helpful.

'

contract out recruitment process; increase the number of credentialing personnel to facilitate the entry on duty
considering expanding a nurse run foot clinic for nail care; implement point of care scheduling established patients

"Only a small percentage of patients medically eligible for bariatric surgery end up with the procedure. This is true not just at our VA (where bariatric surgery is not performed), but is also true in the private practice setting. This is a bottle neck in our health care system; locally, nationally, private, and government."
"There seems to be an issue with scheduling. Often, when I''m in clinic my panels aren''t full; yet, I keep getting reports about backlogs. Scheduling is moving from a centralized model to a clinic-based model in the next few weeks. Perhaps this will help."

"Staff and Space are always an issue and the lack thereof leads to specialty care of the most complex diabetics being refused or deferred back to PACT where there is less expertise. Specialty care providers lack adequate admin support and nursing support to traffic feedback from patients on glycemic control and to redirect treatment plans and so providers are relying on mailing letters that are often not received or the patients lack sophistication to interpret them or translate them into functional self care plans. Patients have had the most success with high quality RN level care coordination (which is uncommon), especially in groups and 1 on 1 and we have too few nurses to manage the population and they are not well skilled at diabetes management and delegating the varied elements of care to other memebers of the team, so diverting too much of the work of chronic diease management back into the providier visits. They would benefit from more treatment protocols and/or NP/PA extenders to support their efforts. Clerical staff perform poorly in general on all domains and elements of their jobs. This is an opportunity for developing ''specialty'' PACTs for diabetes, coalescing the most complex patients in fewer numbers with more richly staffed and trained teams."
Not sure how this question is any different from the one prior?
"Specialty care such as Podiatry is not held to the same standard for access, efficiency, care coordination, access, etc as Primary Care. Clinics could use total review and redesign for efficiency and ideally Podiatry should have a presence in the PC clinic and not be so remote and inaccessible to the teams. Since so many podiatric needs are acute, with poorly controlled diabetics finding their way to PC clinic with infections and injuries, there needs to be a clinic flow with more carved out urgent drop in capacity"
"Nephrology as a service is poorly reponsive to PACT and veterans, generally declining or deferring care and participating minimally in it. Care coordination is poor at the nursing level especially in dialysis patients and there is much that could be done with virtual care modalities and a more comprehensive and welcoming approach by the specialty especially regarding management of blood pressure, dialysis related medication &nutritional needs, and timely intervention in stage 4 CKD to plan for future dialysis. Ideally Nephrology should have a clinical pharmacist and an NP supporting their efforts."
Podiatry has moved to another building and is very difficult to reach and communicate with. Patients who present with acute foot needs are often delayed while too many staff spin heels trying to get help and often have to defer to ER. Ideally there should be a podiatrist rotating thru primary care and ample capacity set aside in podiatry clinic for acute diiabetic foot disease
"Culturally PACT is failing locally as non-provider staff and services have failed to increase their performance towards top-of-the license care, still walking away from or poorly performing too much work that then ends up on the provider''s plate. Scheduling accuracy is poor and clinic staff have to spend additional time working around scrubbing of bookings to protect access. Nursing often pushes back against patients seeking care and defers them to provider visits, ER, etc. Clinics are too small with

too few rooms, buildings are poorly designed and delapidated and Primary Care areas have received the least and most delayed attention in remodels compared to all specialties. The growing burden of clinical reminders and performance measures that tasks to providers to document for the sake of QM and other admin staff has so strangulated the office visit that it has negatively impacted the care experience and patient satisfaction"

hiring of RNs certified as diabetes educators; the use of diabetes planned visits as a way to efficiently bring togethe the diabetes care team around the patient during one clinic visit; create nurse protocols around insulin titration to ensure appropriate dosing and adminstration of insulin especially for poorly controlled; partner with community based organization to develop relevant self-management educational strategies that involve the patient and family; decrease barriers such as criteria for referral to those specialtly services who address dm complications; increase access to opthalmologic services either by expanding VA staff or partnering with high quality community providers; use telehealth to expand home access to education and acute care services - RN Call Center with Telehealth capabilities; Create templates in CPRS with decision support capabilities and registry access; create policies around care coordination to make transitions of care seamless
"Additional ophthalmology services needed; mechanism by which to easily capture opthalmology services received in community; a look at workflow and use of PACT to optimize patient wait times, communication between providers and creation of multidisciplinary plans of care"
similar to previous question; to prevent treatment delays processes around care coordination that are interdeparmental not just limited to primary care
"Given the prevalence of macrovascular complications is patients with diabetes, access to vascular consultation and on going care is critical. a dedicated wound care center staffed with physician, nurse and physcian extenders would create a team approach to preventing and treating vascular complications."
"Yearly retinopathy screening drives high demand for ophthalmologic services. Therefore, appropriate staffing is required in order for screening practices to be appropriate. Expanding these services with the addition of space and personnel is recommended"
"Expand interventional cardiology services and diagnostic cardiology, to ensure timely access."
"Creating processes that optimize patient flow, work roles and clinic processes so that team members work efficiently and at the top of their licenses. Automate process so that they are less provider driven and more driven by the TEAM and or the clinical guidelines of the patients diagnosis. Example, flow sheets to ensure that recommended testing and DM goals are met"

"For patients with uncontrolled Diabetes, a more focused approach with emphasis on self-management education and support are critical. We are very good at providing medical care and high risk psychiatric care (suicide, PTSD, etc...) But when a moderately depressed patient has no motivation to change behaviors that directly impact his/her chronic conditions (watch TV all day, poor sleep, erratic eating patterns, poor dietary habits, sedentarism), we have very little to offer them. This may be one of the most important interventions and are very limited in most places."
"In our case, we"require"" that patients coming to the diabetes clinic, have previously received "basic diabetes education" in primary care. (We standarized such a process). When consults without such documented education process are received, scheduling of appointments suffer delays."
We have a referral process to the [location redacted] VA which patients are not very keen of.

"Improving and increasing space for Primary Care clinic will allow for additional providers and nursing staff and improve access to care, health behavior teaching and support. This will help improve diabetes management."

"The lack of endocrinologists available for diabetes care of high risk patients has hurt our care of patients with uncontrolled diabetes. There are several additional or newer medications available that could help with diabetes management, but without the endocrinologist eval and approval, Primary Care is unable to prescribe these."

We have a lack of podiatrists available for routine foot care of diabetics including nail care. Part of the criteria to be seen by the Podiatrist is to have an insensate foot however many patients would benefit from more routine evaluation than waiting until advanced diabetic foot care.

We have a backlog of cases that need evaluation and follow up by ophthalmology and many NVCC referrals to the community because of this back up. This is the service most in need of growth at [location redacted].

"We have way too many alerts that are not needed to be reviewed by providers. This leads to rushing and missing important alerts. Many clinical reminders can and should be done by ancillary staff, yet are left to providers to complete and this takes time away from patient care responsibilities."

"Space is very tight here. If we were to grow in-house services, we would need more space to support those programs.

Biggest difficulty is getting Endocrinology/Diabetologist expertise. VA salary ranges are generally below what''s being offered in the community.

Currently most PCP''s just try to manage diabetic control on their own because there isn't endocrine capacity to assist them.

Pharmacist support for poorly controlled diabetics needing insulin titration has been helpful, but is far from comprehensive.

Central office policies and procedures just make care overall more inefficient, decreasing capacity further.

Fee basis and Choice program are too complicated and have too many "rules" that only serve as barriers to care."

"Currently our facility does not offer this service. This service is only available outside our VISN (in another VISN) and they accept very few veterans and have numerous requirements before even considering a referral.

The community has LOTS of resources, but we do not refer patients for this service under Fee or Choice that I know of.

The easiest and most cost effective strategy might be to refer these folks into the local community unless an in-house surgeon with skill/experience could be recruited. In that case, compensation becomes a major issue."

"We only have limited Vascular Surgery support from the community. Most vets who need surgical intervention (e.g. bypass), are referred to VISN tertiary facilities where there are delays. Community providers exist, but in general Fee does not support those referrals unless it''s acute limb threatening ischemia. Again, salary ranges for the VA fall below community compensation, so getting surgeons to join the staff is nearly impossible."

"For many years we were unable to recruit enough opthalmology staff need to meet our demands. Fee basis referrals into the community still occur for people with retinal issues, which can lead to delays and fragmented care. The Eye Clinic as plans to expand. That said, the demand is huge. There needs to more shaping of this demand, since PC staff and patients choose opt for eye care even when there''s no clear need for it. In clinic screening (e.g. visual acuity and glaucoma testing) might be a better way to provide eye care while decreasing demands on Eye Clinic specialty services and providers. Fee basis care in to the community has been good for patients but again only leads to fragmented care."

"Currently we have only limited Nephrology support in the outpatient arena (PA one day a week, MD one half day a week). Inpatient support is available and provided by outside nephrologists who consult

as needed. The clinic often doesn''t have enough space when it runs. Fee basis outpatient consultation is generally not available, so patients wait for in-house consultative support/appointments. Ideally the facility needs at least a half time MD and a full-time NP/PA to allow for more frequent and earlier interventions (hopefully to prevent ESRD events). Dialysis support when it is needed is generally good and provided entirely out in the community which is appropriate."

"One of the biggest barriers to diabetes care in our VA is resources. The primary care providers are overwhelmed with large patient loads and can''t attend education sessions to help them improve their DM care. There is a lack of certified diabetes educators to help with the massive education load. Our patient population is very complex and requires extraordinary amounts of education re: diet, exercise and management of complex medical regimens. If PCP';s could have more time with diabetics (60" vs. 30") or if they had qualified diabetes educators to help it would make a significant difference."
The biggest issue is that we spend a lot of money sending people to the private sector because they can
From the minute the patient is checked in the delays begin. Our LPN''s recheck out of range BP''s multiple times because they are trying to meet a performance measure of BP''s <140/80. This delays patients getting back to a room in time. The provider is given 30"; patient slots so if the vitals are delayed the provider is delayed and forced to provide quick care. This extra documentation is often not necessary because the pt is just hypertensive. We don't have enough staff to do this and it delays pt care.

"Need more providers: endocrinologist, NPs or PAs. Currently only one endocrinologist at [location redacted] VAMC. Need better reminder system for Veteran to keep consultation appointments, because ""No-show"" wastes precious consultation time. It is not necessary to split Diabetes from Endocrine consultation."
"Need more ophthalmologist, and nurses to work at eye clinic.There is only 2 opthamologist in our facility."
"Need more podiatrist. In our facility, currently all podiatry consuiltation was sent out to non-VA provider, since we only have on part-time podiatrist. Cannot give any care if no provider!"
"Need more endocrinologist and NPs or PAs. Frequently we do not have a nurse (RN or LPN) in the diabetes/endocrine clinic; high turn-over rate, no continuity. Paper works (CPRS) took 1/3-1/2 of our clinical time. Need better reminder system to decrease no-shows."

The number of overall clinical reminders are excessive.

"Policies should allow triaging of patients - some don''t need to be seen urgently, others do"
pharmacist would be good

"The main problem is lack of adequate professional personnel to see the patients, and also the need for increased numbers of treatment rooms."
The two biggest problems or lack of adequate professional help from MDs and there'' practitioners and lack of space if and when we can get these practitioners.
"Again, the main problem is lack of adequate Eye doctors to see the patients."

To allow nurse care managers to be nurse care managers. Streamline clinical reminders and consults. Stop providers from being clerks and allow them to be providers. Active recruitment of healthcare professionals instead of passive recruitment.

Some times it is hard to communicate with a veteran before scheduling an appointment. This has cause delay in scheduling even though an appointment is open & available.
At this point we have to call a veteran before scheduling. This policy has cause delay as some times it is not possible to reach a veteran
Schedule a veteran for appointment in case he cannot be reached by 2 telephone call within a week
More ophthalmology staff will be helpful.
You get the job done from Monday to Friday if you have enough staff based on demand
More patients can be seen if progress notes are dictated than typed.

"No case manager for division; only clerk and MDs are available to assist patients. Questions from patients sometimes lost since providers not sure whom to contact. Also, other clerks allowed to schedule into clinic, making clinics sometimes difficult to manage. Would be helpful to have case manager assist with streamlining services."
Same as previous comments.
See previous comments

decrease involvement by CO and distractions related to requirements that do nothing to improve care

"We have 1 endocrinoloigist and several pharm d in DM clinics. PC access is better, still improving. fee base access to community needs improvemnt, elp is a health shortage area and spec are in short supply"
"1 endocrinoligist on staff meaningful changes require more 1deepMD. have several Pharm d but need support staff, rooms,space."
need to be more than 1 deep in MD position.
"we do not have vascular in house all cases go to army/fee base, a smooth process is critical but a shortage of providers exist on outside"
"we have access to limited nephrology care in house, most are fee based to community in an area where there are staff shortages. Pts get care with limited delay"

Increase personnel in spec clinics at ref centers

METER AVAILABILITY

"Currently at the [location redacted] VA there is a critical shortage of available space in the primary care clinic for current staff and thus new staff become a bigger issue for space.
The current consult system is totally ineffecient often requiring 2-3 consult rewrites to obtain timely care. This is further compounded that there are 4 different pathways for our patients and often all 4 are tried causing delays in care. Those are internal, NVCC, IFC, and choice counsults. Patients often spend months in the consult system trying to obtain care. The consult system should have only on consult for all four pathways."
Simply the consult system in "broken" causes significant delays in care.
Again consult system is responsible for almost all delays

"CPRS is an antiquated EHR. It is nearly impossible to identify high risk diabetic patients within CPRS. High risk population mangement only becomes possible by exiting CPRS and creating "work around"" data extration programs i.e. patient registries, that having various level of reliability and validity. We need real time testing, outcomes and consult management programs.

The VA';s scheduling program is archaic and should have been updated years ago. We spend too much time implementing strategies specifically designed to work around the systems limitations in order to become compliant with CO requests.
Gluccometer download software incompatibility and malfunctions is rampant esp at CBOCs"
"High risk diabetic podiatric patients need rapid, multidisciplinary access and intervention in order to optimize outcomes. Care remains disjointed and uncordinated more often than not secondary to limited leadership, antiquated EHR and staffing.
Easy access for patient initiated contact needs improvement"
We have no Bariatric surgeon nor support staff or OR space. The closest facility is greater than 300 miles away. There currently is no fee basis model locally
CPRS does not provide real time updates or scheduling info (i.e. missed appointments) of high risk nephrology patients
Cardiology while providing excellent care in face to face situations is understaffed and thus unorganized and like diabetes is faced with an epedemic of high risk patients
View alerts and Clinical Reminders are without rationale and burdensome

"Primary Care need to take more ownership of the patient. They cannot be a traffic police sending patient to sub-specialties.
Software to download and create useful report from the glucose meters used by patient is critical for appointment at Primary Care and Metabolic Clinic.
Continous Glucose Monitoring equipment is very important to facilitate an efficient evaluation and management of patients."
"Dietitians trained to teach carbohydrate counting is very limited at PACT.
Food model are in great need.
The policy has been that the patient see the dietitian when they come to see the primary care but if the dietitian is busy or not available that date then the patient does not see the dietitian. Schedule appointment are needed for some patients. Open acess does not work for everybody. The patient may be re-evaluated by the PCP in 4-6 months and that is too much time for re-evaluaton with the dietitian if the patient is not in adequate glycemic control."
"We do not do Bariatric Surgery at our Station. There is very limited availability in the community, frequently having to wait 6-8 months. The system requires pre-approval by Chief of Surgery, who requires patient going thru MOVE program. The MOVE program has several months delays. Therefore, is a roadblock after anothter one taking at least 1-2 years before finally getting a patient to realy close to be schedule for bariatric surgery."

"IT: The ability to write to CPRS from the Primary care Almanac to quickly flag patients for rapid follow-up and order needed labs would be of great assistance. Clinical Reminders developed locally are currently used for DM management. They are poorly designed and hinder care.
Policies: Recall policy makes regular follow-up scheduling in Primary care unreliable.
Supervision: Direct supervisors for the PSAs are needed to better train and supervise clerks in scheduling processes."
"Information Technology: New scheduling package
Policies: Providing diabetic foot wear is delayed due to the requirement that patients be evaluated by a podiatrist first.
Personnel: Scheduling clerks"
see my prior comments

"Need more clinical space.

Need another Endocrinologist or dedicated practitioner.
Need a CDE and dedicated nurses.
Need a more facile EHR for diabetes care.
Need a case manager -especially for PC
PCP need to take diabetes more seriously and learn tools to treat"
"It is very difficult to get bariatric surgery approved - it is almost an obstacle course for the patient
There should be a patient navigator
Our program asks that the patient lose 10% weight before consideration - which essentially excludes almost all patients"
Vascular Surgery is very Hands-Off - the surgeon rarely sees the patient - usually it is resident or licensed physician extender
"Need an ophthalmologist - almost all work is contracted out
There are delays in care"
Nephrology is over-burdened
"Endocrinology clinic has been promised more Nursing support through a PACT system - which has not happened due to staffing and space
There is no single number that patients can call for help
Our medical center abandoned ADA recognition many years ago
A diabetes educator is a critical need"

"Allow staff podiatrists in system to be able to provide podiatric care at CBOCs, where podiatrists are contracted."

more LIPs and support staff
need to recruit additional qualified certified diabetic nurse educators and registered dietitians as well as support staff to allow them to function efficiently
"more podiatrists, more administrative and clinical support staff more space"

"CBOC&'s have struggled more with deficits in administrative and support staff; No show rates are moderate, but higher than desired. We have identified issues with patient cancellations."

Primary Care panel sizes are to large. operating at 100% of capacity increases risk of burnout and leads to lapses in care. Therefore more pact teams are needed. Additional resources are also needed to expand clinical pharmacy specialists to support PACT. There needs to be stronger link between what program offices require and the funding to the field. Currently the requirements of program offices are often unfunded mandates. Program offices need to understand that incremental change ultimately requires re-thinking staffing models or the field dies a death of a thousand cuts.In our location night and weekend hours are not desired by our patients and requiring continuing these activities is wasteful. Some of the changes coming in the IT and EHR world like active notes could be game changer. Tele health has been oversold as a potential solution. Smaller panel sizes and more PACT teams imply more space. the current space planning process is so lengthy that space is often too small by the time it is opened.
see responses to the primary care section above.
Bariatric surgery is difficult to obtain within the VA system (limited number sites performing the service and a lot of barriers to utilize it). Need more bariatric surgeons and locations.
more access to cardiology testing and technology. this means both more cardiologists and associated support staff and all that this implies include space.
Need more and better foot care support which is finally on the way here. same issues as related before.

Providers are saddled with to many things to do for each patient and are drowning. mandatory education detracts from patient care and needs to be required more thoughtfully. Need to find ways to augment providers with more support for basic activities.

Need adequate number of rooms for specialty services. Guidelines suggest one room for each provider which is very inefficient.
See previous comments

"Need more providers to see patients more quickly. In our specialty (Endocrinology/Diabetes), long waits for appointments are not uncommon since there are many people with endocrine problems especially diabetes, the kind of advanced diabetes patients we see are those who cannot be discharged from our clinics, and there are not enough endocrinologists. This is not just a problem in VA; it is a problem in private sector as well. Obviously, more providers require more space. As the number of patients is increased, more clerical staff is required not only to help schedule patients, for instance, but also to provide triage for providers. Scheduling is a problem. The recall letter system implemented several years ago has not improved things, simple made them worse, in my opinion. Centralized call in centers tend to be impersonal and might be better replaced by local systems where people answering the phones know the providers. In any case, such clerical personal need better supervision. Central Office has to be more realistic on access times. I now understand that all new consults (non-emergent) must be seen within 30 days of request. That sounds great, but probably is unrealistic. Private sector does not do that, as assessed in my non-scientific survey of many endocrinologists outside VA :). There should be incentives especially for clerical people who are critical to smooth flow of the system. Weekend and evening availability is not critical since many patients are retired and coming during the day is not a problem. If late or weekend services are offered, they need only be limited and all involved should get incentive pay. Fee basis, in my opinion, should be limited to people who are very, very far from VA facilities. There are unanswered questions about fee basis -- how long does it last, who writes the scripts, will VA pay for meds acquired outside VA, how will VA oversee the outcomes?"
"Often, though not always, time spent in calling patients or writing letters about lab results could be done by others. Obviously, there are some sensitive, serious situations in which the provider can/should call. The scheduling system needs to be simplified and upgraded. The patient should have a appointment date for the next clinic given at the clinic visit. The recall letter system wastes time and is inefficient. Unnecessary documentation refers to answering clinical reminders. The reminders are usually helpful and some (but not all) need to be answered. No-show is a chronic problem both here and at our university affiliate. I was on a committee to solve the problem but we could not! Patient flow in clinic needs to be faster. There are too many things that have to be done at each visit. This is where more clinical support is necessary"

"Safe and quality diabetes care CANNOT be delivered to all veterans who need it in the current care delivery paradigm. We have strong data that system based diabetes case management models work well but facilities must provide sufficient qualified personnel (diabetes case managers) AND support medical directors (e.g.MD, DO) to oversee these programs. The type of effort involved in effective/safe diabetes care that is well established to be time-intensive MUST be able to be captured and recognized as effort (beyond current RVU based methods) . the number of Primary care MD''s are also currently insufficient to provide diabetes care to patients who are not high-risk (that diabetes case management and endocrinologist see)."
We have strong bariatric surgery programs regionally.
schduling grid archaic. we need more space to see patients on days with many rotaters

---

Personnell are doing the best they can w/ their resources. Having more PharmDs to help manage diabetics aggressively would help.

we only have one endocrinologist in a state with huge numbers of patients with diabetes. Having additional specialists and pharmDs to aggressively manage patients would help.

same as previous comments.

delays occur due to staffing shortages. fee basis is used but there is delay there too. we do not get reports back from fee basis providers.

cardiologists at our facility do not see patients for lipid issues..this is a primary care providers job. They see acute cardiac issues promptly.

"Providers are taskes with doing everything. Despite PACT, this stil occurs. View alerts keep providers doing admin work. They are not focused on face to face patient care."

"often times directives/madates/policies from central office bring challenges from a clinical standpoint, this makes it difficult to provide care"

we do not have ophthalmology on site so cannot answer for their issues. for retinal attention

would be helpful to have access to contract providers for extended leave issues; and local podiatry access to community is strained

"staff shortages, delay in hiring, Many dm 2 treatments can be nurse protocol which are being developed now"

"We need more endocrinologists at [location redacted] Section of Endocrinologist. Candidates were interviewed however annual salary was not attractive for them to accept the position.

Nursing staff- At this time, we have 3 nurses with 2 full time endocrinologists but when we have a third endocrinologist in the future, nursing support staff is needed. It does not have to be an RN that will be helping the section. A health tech or LPN is enough for nursing support staff."

"We are in need of more endocrinologists.

There were a number of candidates who interviewed however annual salary was not attractive for them to join the VA [location redacted]Section of Endocrinology.

Re:Nursing staff. At this time, nursing service provided a 3rd support staff for 2 full time endo mds but when the third endo md will come in- Nursing support staff will be needed. It does not have to be an RN. LNP or Health tech is good for us."

We need more podiatrists at [location redacted] VA. There were at least 2 podiatrists left and have not been replaced. More technicians are need for toenail trimming. Choice care is being offered as the section can't cope up with the demand

"Section of Nephrology: Inpatient and Dialysis unit were added to the services offered by the section however the number of Nephrologists were even lower. One nephrologist left for almost a year and no new nephrologist came on board. One is leaving in 6 weeks. We are down to 2 nephrologists. Waiting time for a new consult to see them is around 3 mos.

Same holds true with podiatry staff as previously stated."

Having more Foot and Ankle surgeons would decrease the delay of patient care. More Technicians for toenail trimming would decrease the back log .

"Certain Nursing staff unwilling to help out medical provider eg: faxing outside prescriptions or going thru Prior authorization for a certain drug to be approved. Front desk staff takes care of the flow of the patients coming in and checking in and receiving phone messages thus medication related issues should be done by nursing staff.

From 3 full time endocrinologists down to 2 full time providers and absorbing the patient pop'n on top of our patient population, the no-show rate is low. It''s difficult to reschedule because there are no slots available ."

"Additional clerical support needed for scheduling and consult management.
Scheduling software is one of the biggest impediments to patient care. VISTA based package is bulky, not user friendly, and unqueriable in a meaningful fasion.
IT support for glucometer downloads is lacking in terms of manpower and capabilities."
Please refer to clerical support and scheduling software comments from previous section.
Clerical and scheduling issues are same as previously. Additional vascular surgery MD FTEEs required to manage the volume of vascular burden that this facility sees. Unable to recruit fulltime vascular surgery MD staff due to marked discrepancy with community salaries.
"MDs spend inordinate amount of time managing alerts, 50% of which could be handled by lower trained staff. Scheduling package is immensely cumbersome and impedes patient care. Difficult to cancel and reschedule without getting penalized due to performance measure standards relate dto canceled by clinic standards. Space is major impediment to care impacting pt flow on a daily basis. Insufficient exam room space and cumbersome clinic layout not conducive to robust patient flow. Insufficient clerical staff to support the volume of patinets being seen in clinic. CPRS requirements have rendered chart documentation almost useless unless there is free text somewhere within the note. Administartive burden is heavy with documentation requirements, TMS requirements, etc.... that have no bearing on direct patient care."

"The endocrine section at the [location redacted] VAMC lack administrative support staff for diabetes related patient care activities. More administrative support in this area would be greatly appreciated on behalf of the Veterans.
A large amount of administrative requirements such as clinical reminders and view alerts which focus on directives and policies take away the ability to concentrate more on the Veteran''s overall health care."

Hiring additional staff to do nail care for veterans with Diabetes which fortunately is being done now.
"Numerous requirements for bariatric surgery, not all of which are consistently clinically relevant"

working to increase the availability of services

"Scheduling is often not appropriate and there are few dedicated, capable individuals to accomplish this. I have gotten certified to perform scheduling simply because I cannot rely on our system to provide appropriate, adequate scheduling assistance, clearly beneath the scope of my practice as an APRN, CDE specializing in the treatment management of patients with diabetes. We need dedicated clerks and provide incentives to keep them in their positions so they won''t always be seeking more money elsewhere in the system."
"Fee basis is not an option I would consider. I think veterans should be seen within their facility. I think more trained clinicians should be available to see these patients and more support staff to ensure adequate use of the clinician''s time/expertise.
All persons from the top down to the bottom up should be held accountable by ensuring their time is not spent surfing the web, watching movies on their phone, making personal phone calls, or yucking it up."
"This is not available for patients and should be. They must jump through hoops designed by "Dietary?!"" Why not Endocrine of APRN specialists? Absolutely they need to show accountability prior

to surgery, but nutritionists decide whether or not they should be given the go ahead. I think Endocrine of APRN specialists should have this responsibility"

"veterans need to be seen immediately when limb threatening lesions present; they are often sent to ER where trained staff are not available. They will often call for vascular surgery to evaluate, but not always."

"Must merely monitor and manage lipids more rigorously, either by more personnel to see and counsel and treat the patient, or specialty clinics for this."

"Need more podiatrists or foot nurse specialists to see, treat and manage LE wounds, DM problems immediately."

"More nursing would facilitate calls regarding bg management advice

Dopplers at all clinics where I perform telemedicine visits

I just went from 70% to 100% endocrine practice. Not sure yet how good my access will now be. Previously poor

I am also increasing my telemedicine (CVT)availability. Good resources are available.

telehealth (CCHT) is readily available and very helpful.

Out-sourcing endocrine care tends to fragment care, since communication is less good.

Group medical education and group medical visits. We have implemented a multidisciplinary comprehensive diabetes education course. Group medical visits for patients with diabetes are likely to be helpful."

group medical visits

We have urgent care such that urgent issues can be treated. The delays when patients call before they can speak to the call center is a real barrier to their calling when having difficulties. The CCHT nurse will often pick up on problems and notify me.

"Delays in being seen in boston. Challenges in reaching service due to need for more clerical personnel make facilitation difficult. For vascular procedures, due to the cost of eval, outside referral is likely not cost effective"

"We just increased cardiology, which should help

more use of econsults."

"WE need a certified diabetes educator for hospitalized patients. We need at least a second diabetes educator for clinic patients.

We need a behavior health person to help us while we are in clinic

We need a dietician present when we are in clinic.

We need a full time nurse case manager who is a diabetes educator to help manage our patients.

We need our own nurse to room our patients- often the nurses rooming our patients are inadequate.

WE need more SPACE- we need an area designated for classes for our patients,

THe diabetes educators space is abysmal- she is working in a closet.

THe exam rooms are not well stocked- we stock them ourselves.THe exam tables are facing the wrong way.

THe scale and height measuring is inadequate.

WE need to be able to do a point of care a1c.,

WE need new dragon systems in all the exam rooms.

We need a secretary who will have time to help the patients more - who they can call and will be assured the doctors receive their messages.

We need to have bariatric surgery done locally - bariatric surgery cures diabetes, it needs to be an easy process without a lot of hurdles to jump through before the patients can speak with a program."

Patients need to be able to have bariatric procedures easily and locally.

"Patients must be able to call and speak with someone and schedule an appointment to see a primary care physicain within 14 days. From that point the patient can start treatment and be referred to the proper specialist, if needed. Communication between the patient, HAS staff, and primary care must be improved. The number of no show appointments need to be reduced by proper scheduling. They also should have a separate walk in clinic for veterans with urgent needs (not part of primary care) that can triage patients appropriately."

Patients should have access and in some cases same day access to a dietitian which would require an increase in number of staff. Also need to improve scheduling procedures to reduce the number of no show appointments which impact all veterans.

Patients should be scheduled efficiently and expeditiously. The number of no show appointments needs to be reduced. There should be podiatry designated to see scheduled appointments but should also have podiatrists available for same day access.

"Currently, at this VA center we do not have immediate access to surgery on site because there is no inpatient services. All surgery is fee based out to the community. Between the time the consult is placed and the patient is scheduled with outside surgery should be within 14 days, but that does not always happen within that time."

"Our clinics have a 10-15% no show rate which impacts negatively on patient accessibility. We have some nurses who are RNs who do not practice at the level of their training and only check patients BP and weight. We have multiple issues with scheduling with not utilizing all of our clinic availability, not rescheduling patients within a reasonable amount of time."

"There is not adequate space for the increased capacity of patients we should be seeing. It would be ideal to have a check in space, then 2 exams rooms for the providers. This would allow for increased flow and increase the amount of patients we could see. At this time, we only have one endocrinologist and one full time CDE working in the diabetes clinic. This is grossly understaffed for the needs of the facility. At this time the PACT teams have inadequate follow-up for their patients with uncontrolled DM. Better staffing could improve this. Would also like to see closer monitoring to make sure providers are acting within guidelines. Well trained clinical pharmacists to help with patient management would also be useful"

"Need more endocrinologist, psychologist to support the diabetes service, midlevel providers to extend endocrinologist, RN to assist providers, clinical pharmacist, additional health technician for patient check in and support with scheduling. Also need to increase space."

"need increased eye providers to do exams and treat growing population; need techs to support providers and schedule patients. Need full eye lanes to be able to evaluate patients. Clarification regarding the retinal exam policy would be important. If teleretinal imaging could be done as screening every year, it might free up time of the eye providers to see those that truly need an exam"

We do not have our own vascular surgery department. We utilize fee basis to receive care. Delays typically occur when providers don''t refer early enough to vascular surgery

"Space is a significant issue. Lack of space prevents growth of the service. We currently have only one full time cardiologist for the main facility and surrounding CBOC''s. Much care is sent to fee. With additional physicians, additional support staff would be needed."

Staffing and space shortages limit the ability to see more patients. Increased use of telehealth would help to support the CBOCs

Physician and nursing staff shortages have increased patient wait times; hence the above answers
These questions better answered by Medicine service Chief

"dedicated diabetes clinic
support staff (RN/LPN, CDE, Foot Care) for chronic disease management"

"Most services for diabetes care are provided in a timely and effective manner. The one area where delay continues is in opthamology where issues exist due to lack of providers, clinic space, and clinic flor. More assistance is needed to help them organize their current system and expand given the huge patient need."

"Current process to refer to bariatric surgery is cumbersome. Patient must complete a 5 step MOVE! program and often "drop out" of hte program before moving onto steps in pharmacologic treatment, meal replacement, and surgery. Because of this, the number of bariatric surgeries done are incredibly low compared to outside hospitals. Further, no meal replacement program exists- a key step in the process."

Please comments for retinopathy. Same comments exist for opthamology referrals. Too few providers and space given the need. Further organization within clinic is lacking per patient report.

Our endocrine section is small requiring clinicians (MDs and NPs) to take on more administrative responsibility than elsewhere. However; recent changes to admin help in past 6 mos (MSA supervisors and 100% MSA coverage to endocrine) has helped this immensely.

"increase number of pact members-pcp, rn, lpn and msa in some clinics. patient compliance is a primary issue in glycemic control success."

increase endocrinology f2f appts. patient compliance is a primary issue w/glycemic control.

no available routine appts >90 days. need more staff-podiatrist and support staff. not familiar w/space in podiatry but suspect increased staffing needs more space and equipment. patients are being fee based to private sector but many patients are choosing to stay w/the VA-will take next aa.

"need adequate staff including LIP's to do the exams, functional equipment and physicians to read the reports."

need adequate staff and providers to schedule and evaluate the patients

scheduling staff need to be efficient. all trained professionals need to function at their highest level. RN''s could monitor the problematic uncontrolled patients under the guidance of the pcp.

We do not have endocrine onsite - I cannot assess why the larger VA we refer to has delay

Cannot assess why the larger VA we refer to has delays

We are trying to recruit a podiatrist - federal pay scale (podiatry/optometry and chiropractor are on one scale) is ridiculously low. Remote/rural area - fewer options for fee care here. We are also recruiting a nail tech

I cannot assess why the larger VA we refer to has delays on consults from us

"Cannot assess why the larger VA we refer to has delays

Limited care in rural location on fee service"

"We have a 0.2 cardiologist - not adequate for 17k pts

Refer to larger VA- cannot comment on their issues"

Too many measure put in place by CO just distract the frontline provider from actually getting time to see patients.

Too many administrators creating tasks for front line providers that distract from patient care.

More clinical space needed!

Retinal specialists are a highly paid specialty - huge wage disparities significantly hinder ability to hire

Increasing salary and CME training opportunities and reimbursement

"Regarding licensed independent practitioners though not critically important, adding mid-level provider with diabetes management to primary care could improve the patient care and the level of care provided by existing providers
Is even more important than other personnel such individuals greatly increase the tailored individualized pa is even more important than other personnel such individuals greatly increase tailored individualized patient car and increase the knowledge of the PC providers.
A huge concern is the EHR. Our system is not good for efficiently allowing providers to input info and to have point of care decision support. It is too soloed. The customized regional data warehouse reports that have developed across the Enterprise are a testament to how good the integration of info can get but a good EHR would allow that with greater ease and at the point of care. (From what I have seen, the new eHMP does this. PUT ALL POSSIBLE RESOURCES INTO COMPLETING AND RELEASING IT)
Regarding central office policy, let''s use our nationwide innovative resources to recognize our best practices, the facilitate their dissemination. E.g. In 2008 after seeing it demonstrated hands on at a veHu conference, I came back to my site with a proposal to create a process whereby incoming faxes would not be printed, circulated as paper then scanned back in to the EHR. Keeping the documents in electronic format and ""capturing"" them into Vista has so many benefits. Despite receiving a cash award for the idea we have made no change (in 7 years). The stated concerns related to information security and stumbling blocks included purchasing fax/copy machines that were incompatible. It''s being done elsewhere in VA but we languish with an archaic process, a champion who has spent his enthusiasm, and resources wasted on equipment that did not facilitate progress.
I am taking this survey at 6AM on a Sunday. We don''t need more supervision and incentives. Sure I want more money for what I do, a asked for it and got little, but one cannot develop the perfect set of incentives to drive the progress. Just remove some barriers to efficiency, provide the type of support mentioned (space for one on one teaching and for groups, excellent diabetes educators, and a facile EHR) FYI it take roughly 30% of the time allotted for office visit to document,place orders etc. there''s room for improvement when our highest paid personnel are doing this...."

Also, since fm specialty care is not strongly reliant on the physical exam, telehealth is certainly appropriate"
Teleretinal even in clinics co located with an Opthamology service
"Comments regarding CPRS were already made. The scheduling system was developed shortly after the Rosetta Stone was created. Need I say more? Having the space and team let functional support to allow the provider to do, in their time directly with the patient, what only a provider can do is the goal to be sought."

"space is critical to accomodate needed eye techs, pharm D''s and clerks, Endocrinology is a very difficult to recruit specialist in our area, t few local FEE providers accepting veterans due tothe cumbersome process to get authorizations approved and paid, The CPRS system needs a complete revision, the amount of time Providers use on clerical duties and clearing view alerts could be better utilized in direct patient care."
"Additional space needed for more LIP''s and group appointments,use of tablets for nursing will increase the availability of clinical space ,the fee process requires incredible amount of time on the PCP''s for entering information, consult requests create multiple unnecessary alerts and create a bottleneck in providing timely response to the veterans needs/
Nursing needs training on how improve triage skills. and need more diabetic educators."

"We have the resources but have not improve the workload, have room for improvement on supervision and employee training and education"

"Need space for Ophtalmology, need at least 2 ophtalmologist not able to recruit, support personnel is available but retention is poor, perhaps incentives to stay will increase VA committment"

"Providers are tasked with menial clerical duties ,(i.e. manually entering all lab orders because MAS now is not "authorized"" to transcribe orders from a progress note to the orders tab in CPRS) . In our HCS Unscheduled visits are allowed all day long, creating disruption of the PCP''s schedules flow, the fact that we do not have a Hospital or Emergency Room gives the patients the impression that they can come in at anytime for anything urgert or not, perhaps the creation of an Urgent clinic in each of the 3 largest clinic will work , but again we are in a geographical area difficult to recruit and retain Providers.
  The non va care consult system has created an extraordinary amount of clerical/administrative time consuming duties that PCP's devotes less and less time with face to face or direct patient care. decrease job satisfaction and burn out is also more frequesnt now than before non va care was initiated, we need administrative coordinators of these visits."

decreased training requirements and increase provider clinic time
increased provider access in CBOCs
this service is not available at all locations but is a referral
to much mandatory training

"We need more endocrinologists at the VA to take care of our veterans'' needs. More support staff such as nurses, dedicated diabetes educators and pump specialists are needed to help support physicians take care of veterans."

"To help with patient wait times and improve diabetes care, more endocrinologists and support staff such as diabetes educators and nurses are needed."

"As mentioned earlier, with more staff, more veterans can get better quality care."

More nephrologists are needed to take care of more veterans

More staff will help patients be seen sooner.

"With more opthalmologists dedicated to treating diabetic retinopathy, that will help veterans to be seen sooner."

Organization and reporting structure is not aligned ideally to facilitate team function
Availability of vascular surgery providers within facility would aid process
Having additional providers either by telehealth or comunity referals is important to providing timely care
We need access to additional providers to meet targets for timely evaluation
Providers report that 20-40% of time is spent on tasks that can be done

Our local VA is acutely short of specialist Local. Non VA endocrinologist are already overworked
need more endocrinologist in the VA. Local non VA endocrinologists have long wait time

"Question licensed independent practitioners: this refers to physicians, MD
Question personnel supervision, management, or incentives: I think that it should be given emphasis to the fact that VA is a premiere medical institution and the culture should not be "well this is the government" but "this is the best medical provider of the country". In the context of creating a culture of excellence there should be rewards and incentives when established performance measures are reached

Question Increase weekend and evening availability of services: by not restricting our activities strictly Mon Fri 8-4 we will be able to amplify the number of encounters/activities/procedures. Specialists should travel from tertiary centers to community clinic and have weekly clinic.
Generally speaking I do not believe I increasing fee base services. If the mission of serving the veterans is presented in an attractive fashion, VA labor force will develop a loyalty toward the veterans, and services will be of higher level when given in-house rather than by a fee-based facility"
Comments here are the same as in the section of the previous page
[I work at a large VA hospital], and yet it does not have a bariatric program. This is a serious lack, because ~ 40% of our patients are obese and prospective studies have shown that bariatric surgery decreases CV morbidity and overall mortality, and cures diabetes. We refer our patients to a dysfunctional bariatric program in our VISN, which from what I understand (unofficial information) handles 10-20 patients per year. The threshold to send our patients to this center is very high, many are refused after they complete a very large number of tests -some of which invasive-. It is a loosing enterprise and the consequence is suboptimal or no patient care. In my opinion every tertiary VA hospital should be given funds to generate an internal bariatric programs. I do not think fee base initiatives are the answer to this problem."
Patient with acute vascular problems are usually seen right away. Patient with sub-acute problems may experience delays. I have not been able to determine if the changes in personnel promoted by VACAA have implemented changes in this area. No need to increase fee base services in this area if the philosophy of the agency is to generate a culture of loyalty to customers (i.e. veterans).
"A problem is that nephrologist are very well paid in the private sector, and it is difficult to recruit and retain nephrologists at VA hospitals."
Like for nephrologists there are not too many podiatrist working at the VA.
"One of the most frequent comments I hear is that we are spending a lot of time being our own secretaries. Mid levels (PA''s and NP''s) and administrative personnel (PSA''s) are usually doing excellent work. The agency does not do enough to attract PA''s, there should be a well outlined career path for PA''s. The agency has been at the forefront for the use of technology, but has an incredible fear that there will be a leak of private information, and so use of technology some times is delayed. For instance, we do not have wifi."

executives need to be more proactive in access problems solved

we have made efforts to improve flow but space per provider remains rate limiting. Each provider has only one exam room and this limits ability to increase number of patients seen
Actively recruiting for ophthalmologist. New chief has been recruited and will start in 3 weeks. Delays in getting equipment and software. Getting trained Eye tech support challenging from a HR standpoint.

- **Gynecological Surgery**

We are currently trying to hire a part time gynecologist.

OB/GYN services did not participate in teaching training requirement as there was not enough clinical space for the students.

[Location redacted] does not refer any Gynecology patients to other VA facilities. I cannot comment on any Gyn clinic scheduling/access issues another facility may be experiencing
"[Location redacted] refers gynecologic cancer patients to the community, typically to our academic affiliate. Care delays occasionally occur. Typically these originate out of the Fee office e.g. due to delay in authorization, non-receipt of authorization via fax by outside vendor, or delays in scanning outside records in for VA provider review. Solutions include increasing Fee office FTE, streamlining fee processes, and adding RN care manager FTE to ''ride herd'' on critical patients being referred out into the community"
"[Location redacted]has 1.5 FTE Gynecology, which is more than many VA facilities. Gynecology is present at 4 sites including our VAMC, and hopes to expand to 6 sites in FY16. Owing to our geographic reach, occasionally clinically signficiant delays in care occur. The main determinant in delays is Gynecology FTE - a Gynecologist can only be at one site at a time. Additional determinants include lack of a RN care manager for Gynecology, OR access constraints, antequated scheduling software, and burdensome documentation requirements that take time away from direct patient care activities."
"VISN[location redacted] has two robust Gyn surgical programs: [locations redacted]. [Location redacted] closed its Gyn surgical program in 2014 due to a single adverse outcome. [Location redacted] has a non-operating Gyn. [Location redacted] is highly selective in what they do and refer harder cases to [location redacted]. Solutions for delays at other facilities include restoring [location redacted] Gyn surgical program, and increasing Gyn pay to attract high quality surgical Gynecologists that can perform surgeries locally. The number of Gyn FTE in VISN [location redacted] is an issue, but also the quality and capabilities of existing FTE"
"Same comments as for fee appointment access - need to improve Fee office processes, can hire RN care manager FTE to ''ride herd'' on Gyn surgical patients referred out into community"
"Occasionally, [location redacted] women Vets experience clinically significant delays in getting surgery. Any emergent cases are done on a same-day basis. Main determinants of delays include Gyn FTE and OR access. [Location redacted] has a small main OR (4 rooms) and runs at >80% capacity utilization. To improve OR access, would need to add more OR personnel, which would allow us to open up more rooms on Fridays and perhaps do weekend cases"
"Main determinants that adversely impact Gyn clinic and surgical care include Gyn providing care that could/should be provided by others (this clogs up our clinics with routine care items), slow IT systems, documentation requirements, and lack of adequate support staff. In my opinion VA should take the PACT model and apply it to all specialties in a modified format i.e. relax the 1:1 provider to care manager ratio. Administratively, too often we are assigned duties without adequate data reports, and without staff well versed in how to generate that data. So we spend gobs of time figuring out how to get the data we need. IMO every administrative duty assigned should be accompanied by a list of the data reports that will be needed, and a plan to generate any new reports that are needed but do not already exist."

"The reason for delay at our local VA is that I am not approved to do laparoscopy or laparotomy at [location redacted]. I have to take these cases to [locations redacted]. I have to cancel a day of clinic to

go to those locations, so I often will schedule the surgery for 6 wks or more from the time of the consultation. This is to avoid having to reschedule already booked patients in my clinics."

"The biggest improvement could be made by allowing gynecologic laparoscopic procedures (for ovarian cysts, endometriosis, adhesions, etc) and laparotomies (hysterectomies, myomectomies, etc) and vaginal surgery (vaginal hysterectomies, cystocele, rectocele repairs) to be done in the [location redacted] ORs. I could block a 1/2 day/ week for such cases. It would be SO much easier for the patients than driving 1-2 hours further for their procedures, with an additional day to get anesthesia beforehand at [location redacted]. I would not have to cancel as much clinic time. Patient care would be more stream-lined, efficient, and more accessible to the patient.

In response to the first question above, we could use another gynecologic procedure room, so that when both gynecologists are in the clinic at the same time, we can both see patients. Right now there is only one room.

If allowed to perform procedures here, we have most all the equipment initially needed already. Exception is suction D&C equipment, which would need to be acquired.

I need a new exam table. There is no height adjustment, and it needs to be wider to accommodate our bigger patients."

"I start appointments at 740am. If my RN calls in, there is no one in the clinic in the morning to assist me or chaperone.

If iMed consent link with CPRS is not working, it significantly impacts my clinic as many of my appointments involve procedures - all of which require an iMed consent. There have been at 3 occasions that this has occurred in the past year. One of them lasted several days, despite many work order requests. I had to do written consent forms, and this delayed the clinic and increased work burden.

There are many TMS requirements that do not seem effective or useful. They require a great deal of time to complete each year."

"We need another physician, nurse, and medical support personnel"
simplify administrative processes for approval and transfer to care in the community.
Too many administrative requirements

"Typing takes a lot of time that culd be spent with teh patietn, a dictatoin or transcriptoin systme would allow more patients to be seen per hour."
"we need two providers, one a gynecologist wiht each ahving a RN assistant-chaperone
At our facility equipment is not a problem"
The private sector can not see refferals in < 30 so why does the VA system think it can see patients < 30d for appointments
This is a very poor survery. Questions are not specific enough or easy to understand. I feel this is another wate of VA funds that will not benefit the veteran.
"I think this is a very poor survery. The questions are not specific, and many are redundent. Another waste of VA funds that wont change anything to help the veterans"

We are in process of selecting an additional Gynecologist and will add surgical care as a new service line with this provider
Streamlining fee basis care will lessen delay

"A support person is needed. Currently, the coordinator does pre-opt teaching, pre- and post-op calls, triage patients, triage consults, schedule, coordinating with ancillary services, etc. It can sometimes be overwhelming"

"A support person is needed. Currently, the coordinator does pre-opt teaching, pre- and post-op calls, triage patients, triage consults, schedule, coordinating with ancillary services, etc. It can sometimes be overwhelming."
No Gyn on staff.
Additional staff is needed to facilitate the initial approval of fee-based referrals.

"This Facility has a tremendous shortfall in surgical space, resources, & management of such. Consequently, GYN is only afforded ONE DAY PER MONTH of block time in the OR. This allottment is not close to sufficient for the volume needed. Additionally, given the oft requirement for timing surgery with menstrual cycles or simply offering Veteran centric availability for working women & families, this is obviously inadequate. Resultingly, 50-60% of our GYN surgery is done on days other than ""block time"", using other surgical services time who are on leave or are underutilizing there time. This practice is inefficient & demoralizing.
Despite the above circumstances, the GYN service manages to avoid most clinically meaningful delays in surgery by using the strategies outlined above or alternatively, if it is determined that our surgical schedule or lack of resources will not allow care at the local VA Facility, prompt referral of Pts to Fee Basis is done on their initial GYN surgical consult."
"The scheduling packages for both clinic appointments as well as surgery scheduling are in a word, abhorrent. They are inefficient, user unfriendly, & realistically, a decade or more outdated.
Data management is woefully inadequate. We have reams of data but no section or service administrative managers to present meaningful summaries to Section Heads or Service Chiefs that can be used to show what's working & what''s not.
Contracting for purchasing specialty operative equipment is terribly difficult. Often this equipment is ""one of a kind"" & requires sole source justification. That process and methodology appears to be materially flawed. For instance, we purchased a proprietary electrosurgical unit generator (ESU) to do a certain type of endometrial ablations. Sole source justification was performed and approved including full transparency regarding anticipated volume for ongoing use of the proprietary single use disposable handpieces that are used with the ESU. Purchasing these handpieces continues to be an ongoing saga of duplicative futility with contracting requiring repetitive sole source justifcation. I have had to make extraordinary arrangements to get equipment to do timely procedures at the VA that if I were in the Private sector, would never even be an issue.
Support staffing for GYN clinics is way below what''s used in the private sector. We are often operating at a ratio of Nurses/Providers of < 1/1. Considering the following issues: 1. EVERY EXAM requires a chaperone, 2. EVERY PROCEDURE requires a chaperone plus pre & post procedural teaching/monitoring, etc., 3. Checking in Pts, 4. Phone calls, walk ins, and triage..........we do not have required support staff to allow Providers to be efficient."
"The scheduling packages for both clinic appointments as well as surgery scheduling are in a word, abhorrent. They are inefficient, user unfriendly, & realistically, a decade or more outdated.
"Most telephone triage, f/up, call backs, and lab result calls fall on the physicians.
In the private sector, the vast majority would be done by support staff."

"I answered this question based on delays due to gynecology, not delays due to patient's not getting a medical clearance through their PCP"

"I have not seen a significant delay in patient care in our community. The referral process can be approved by not canceling consults that are placed, but instead communicating with the referring provider to correct any problems with the consults. This would decrease delays in care."

It is sometimes difficult to find providers that will accept VA patients in the community because of low reimbursements and delays in reimbursements.

"The VA''s fee basis staff need better training. Some staff workers lack the knowledge to make referrals to appropriate specialties. We have had patients that were sent out for maternity care but instead of being referred to a obstetrical provider they were sent to a perinatologist, who usually don''t provide general obstetrical services. There is also a significant delay from approval to scheduling with community providers. We have had some patient''s with significant menorrhagia that have had long delays to be scheduled to see the community provider in their area. A consult should never be cancelled, but instead the referring provider should be contacted and asked to correct any deficiencies in the referral. In other words instead of canceling the consult it should be ''worked'' by the feed basis personnel to completion. This process would keep physicians from overlooking canceled referrals."

The process would be greatly improved if we could get someone in the Fee service department to answer the phone or return phone calls promptly.

"Definitely could use a Gyne NP to help the gynecologist and also could use a full time gynecologist, only having gyne 1.5 days a week can be somewhat limited, especially if one of those days is a surgery day or a holiday. Also, would be better if the gynecologist was an employee of the VA and not contracted"

Need to have competent employees to help simplify the scheduling system

Our business office can not process our non-VA care requests fast enough and do a miserable job at bill paying. Female vets need to fend off collection agencies and fight damaged credit due to non-payment of maternity care bills.

NON-VA care in our area is saturated. Doing more in-house is the solution

"1)OR time/space, a more welcoming attitude from the established surgical services will be key to getting started.

2)updating the tier pay panel salary max with delay/impede recruiting GYN docs. 250K for a MIGS fellowship trained GYN is insulting and gender biased.

3)Women's health at CO has been very focused and successful at outpatient PC MD/RN training. We need to get our OR nurses and inpatient nurses the same level of nationally uniformed training."

Scheduling for all services is moving to a central location. it''s hard enough for our own clerks to know which provider can place an IUD and which can do a PAP...mischeduled patients is a chore

We do not offer GYN surgery at this facility

We utilize surgical providers at WNY and [location redacted] VAMC sites or refer locally to fee basis providers.

"We do not have a gynocologic surgeon, so all patients are sent out via NVCC/fee-basis."

be able to schedule apptmts with vendors directly by relatively independently functioning PACT teams
This is due to vendor associated lead times for scheduling
Be able to schedule vendor apptmts directly by PACT teams

[potentially identifiable comment redacted] space is already too small to accommodate all of our current providers. In addition, the location which was originally intended for gynecology services is going to be utilized for a different service. Unfortunately, there does not appear to be an alternate area for gynecology services which has the appropriate number of procedure rooms and examination rooms along with appropriately located restrooms.

Number of licensed practitioners: Our greatest impediment to providing prompt gynecologic services is that we do not have an adequate number of well-trained primary care providers"

"If a patient needs gynecologic surgery but has other complicating medical conditions, it is frequently difficult to have those conditions addressed in a timely fashion. For example, preoperative medical clearance for surgery, optimization of management of hypertension, diabetes, hypothyroidism, etc."

"Our biggest problem in providing gynecologic surgery in a timely fashion is having an adequate amount of well trained primary care women''s health providers to identify patients with gynecologic problems and refer them to the gynecology service for further evaluation and treatment. It appears that many women are not being asked if their menses are regular, if they are having pain, if they are having incontinence, etc. In addition, many of our non-women's health primary care providers are ordering mammograms but not performing or referring the patient to a women''s health provider for breast and pelvic exams."

"Our department of surgery has not had a permanent AO (administrative officer) for 2 years. This makes it nearly impossible to get needed equipment, staffing, and resolution of problems.
Our scheduling system is getting worse with numbers of ""no shows" or last minute reschedules. The patients need to be contacted by phone several days in advance so that if a patient cancels her appointment, we still have time to schedule a new patient in that time slot."

Problems with getting another surgeon to assist in major cases. Very limited support from mid levels as well.
Fee basis is the best option for gynecological emergencies. It is important to make it easy and seamless.
"Our biggest problem has been having surgical assistants and OR time for one of the newer providers.
Need MD surgical assist for major cases.
Mid level surgical assistant for both surgeons; adequate block time for both providers in the operating room.
Telehealth hopefully will be utilized in future for consent signing for patients that live far away.
Need provider friendly scheduling system.
Need significant assistance from Department of Surgery and incentives for getting procedures done in a timely fashion (pay for performance measure maybe!).
Need ability to do hysteroscopy and LEEP procedures in the clinic. We have the space but we need more LPN support and ACLS certified RN support to do so.
Need another MSA in clinic to support gynecological services. PACT MSA is supporting gynecological services at present.
It is very difficult to handle gynecological surgery cases in an emergency. Both our gynecologists are part time and do not take call. We need to have a contract with a gynecology group for all these services ideally. That could be our academic affiliate or a private practice group.
Getting equipment is a very tedious process and left up to the gynecologists who do not know the process or do not have the time to do so. We have a Innovations project at present and hopefully learn the process and put it on SharePoint.
We need more training for OR technicians and nursing in post operative period for gynecological cases.
VA should pay the bills in time so that private contracted service providers do not opt out of providing service to our veterans. It is a major problem with our OB patients."
"The process of getting surgery done is long and tedious. We have a 0.2 gynecological surgery coordinator but still there are many barriers to getting surgery done.
Poor support from affiliate for gynecology.

There is a lot of paperwork in the VA that physicians are expected to do as compared to private sector. It is a major barrier for recruitment of quality providers. New providers need a lot of administrative training to function optimally."

Increase communication in electronic consults.
"Improve coordination of fee basis care, getting appointments made, communicating results."
Improve communication.

fee based process is too slow
fee based process takes too long

"increase number of gyns on staff
provide orientation of MODs on womens issues and for new providers as well"
"Having additional gyn md availability.
Being able to schedule an appt after hours
streamline credentialing process
address womens issues at part of MD /provider new orientation process as well as MODs"
"increase number of gyns
 provide training on womens issues to MODs and new providers"
"MD finds paperwork burdensome esp with biopsy and specimen questions that don''t appy to gyn but are required to fill out.
Understaffed due to budget"

"We need more primary care providers, nurses and some specialty care. Once our women get in our system there is no delay in patient care. Getting into the system initially takes too long."

We desparately need more space and more providers. We are being blamed by our congressman for appt delays and they are his fault for not appropriating money to make it possible for us to see more veterans without delay.
[name of contracter] seems to be a borrle neck in approving veterans for non VA care!
[name of contracter] is the bottleneck in getting Veteran care at non VA locations

"Increasing work space would allow the hiring or an additional provider which would decrease patient wait times for an appointment.
Hiring of a part-time Gynecologist would decrease wait time for surgical initial evaluations and wait time for surgical procedures to be performed.
A nurse tech as a chaperone would increase productivity because the nurse would be able to screen the next patients in line for an appointment.
An a electronic tracking system for preventative screening would increase productivity of current staff. Women"
Creation of additional space would allow the hiring of a nurse practicer or gynecologist to be hired to assist with the clinic. The hiring of a nurse tech to chaperone patients during exam instead of nurse so that the next patient may be triaged and checked in. Currently the process through [name of contractor redacted] in Fee-basis and contracted care is causing delays. In addition when [contractor] calls facilities to schedule appointments they have no medical knowledge or ability to look up the answers. This leaves the facility in the dark on exactly what is needed for the appt and whether the appt is considered more urgent than the consult was written for.
Delays due to [contractor]

All Gynecological surgeries are fee-based

"When we do a fee basis consult, we do not get direct immediate feedback as it is being processed because GYN here only 0.15 FTE. The two times there were delays, the patient had to check in with the LPN in the WCCC to assure that the fee basis consult was moving along. It would be helpful to have a nurse care manager assisting with this process."

we have 2 part time GYN Providers and they have been able to manage the workload without delay Women''s Health clinic has a higher no show rate and or patient clinic cancellation rate than any of the primary care clinics. MSA Staff work with patients on appointment dates and a reminder letter is sent to the patient about the appointment date and time about a week ahead of the appointment. We are working with the PACT Teams to establish other ways to decrease the no show or clinic cancellation rate.
"To streamline the Non VA Care for Reproductive Endocrinology, Infertility, Gynecological Oncology and Maternal Fetal Medicine, the Veterans needing these services have been underserved in the past and their care has been delayed. Moving forward, these Veterans should be evaluated with 7 days by VA Point of contact to identify appropriate referral, education of the Vetran and get all the necessary pre-workup in house."
Simplify administrative process by educting providers.

"[Location redacted] VA only has limited GYN resources and have only recenlty reinstated GYN surgeries at the site Wait times for appts are long and not realistic for someone with an urgent need , these veterans are referred to community thru fee basis though now being told should be VA Choice , providers must enroll and this is not a timely process"
[comment redacted because potentially identifiable]

"b: increase # of GYN providers at [location redacted] (Facility that we refer to)
f: need more efficient scheduling system that includes texting capabilities"
scheduling is not efficient for VA nor Non-VA appointment
obtaining records/documents can cause a delay at times
obtaining records and/or documents can cause delays

"We have no in house GYN, getting records back in a meaningful way into our system does not exist."
Need more providers in rural areas lack of providers is worst problem

"We will be required to hire and support FTE in Gynecology. In the interim we need to increase the efficiency and productivity, which may include increasing numbers, of Case Managers while we are exclusively outsourcing. Streamlining records management will certainly help."
W lost our only Gynecologist in 12/14 and we are primarily outsourcing care. We need to continue recruitment efforts and will hire ASAP; and have the equipment and support staff to run the section efficiently if more than one provider is obtained.
"The best way to improve this is to not have to rely on it, in other words to hire and retain our own FTE in Gynecology and support those FTE. In the interim we need to improve the efficiency of the fee process and the efficiency and productivity of case managers involved in that care."
Hire and retain FTE in Gynecology

Create incentives for providers performing more than expected RVUs.
Improved transportation to sister facility VAs for patients traveling for surgery.

Improve electronic communication between non-VA care providers and VA providers to facilitate timely transfer of patient information.
Create incentives for providers who perform more than expected RVUs.

Improve primary care pract. referral process so appropriate cases referred and other abdom pain worked up before assumed to be GYN
acquire more instrument sets for the OR

Having specified NVCC consult services. For example Gen Gyn vs Gyn-Onc or REI. Patient''s often have to go through another generalist on outside to get to specialist they need.
"More streamlined and helpful consult templates.
Holding primary care providers to completing paps so consult spots not clogged."
Limited OR services and days do not allow for many surgical cases. Also OR process inefficient and time consuming for doc and patient.
"Again, more specified fee consult tabs."
"- Less paperwork to schedule.
- Less convoluted scheduling process.
- Better trained OR staff.
- Higher level of OR services to reduce number of fee-based patients"
- Hard to get a return appt for preop planning b/c no return spots left in schedule. Schedule overfilled with new consults. Mays f/u and planning difficult.

'

"Increase the number of other personnel - Fee needs to have more nurse care navigators to coordinate care and ensure resolution.
Improve information technology by allowing the record systems to communicate with one another. If this is not possible then the nurse navigator would be most useful here.
Change ""central office policies"" that affect workflow and efficiency - VA Choice was not rolled out very well. It is not standardize and it is still quite vague."
"Increase the number of other personnel - We need the auxiliary staff to support the providers. We need LPN, RN and a MSA or a chaperone that is separate from the LPN/RN, particularly for this patient population. We are currently functioning with one or the other but not all 3.
Improve information technology - Dhcp is outdated and does not merge well with CPRS.
Change ""central office policies"" that affect workflow and efficiency - The current system for measurement of success does not correspond with Direction or mission of the agency. One example, If we are to fully implementing PACT then the clinic utilization should be low. We continue to stuff successful PACT clinics with more patients to meet access numbers. We implement PACT or missions without the infrastructure to be successful.
Improve personnel supervision, management, or incentives - Our salaries are not competitive to the private sector. Our nurses cannot bonuses or pay for performance which is positive incentive.
Improve access to care by increasing the number of designated women's health providers and ensuring all the clinics are properly supplied. We also need to have access and time to attend regular training. Lastly they need POC pregnancy testing."
"Increase the number of other personnel (e.g., nursing, technicians, pharmacists, clerical staff). - Increase the number of nurse navigators and MSAs for NVCC.
Central office polices as per previous discussion."

"nursing, technicians, pharmacists, clerical staff and a gynecologist"

there is limited resources in the community that accept VA vouchers
"physicians, nurse practitioners, nursing and support staff"

"we have a university and excellent private community however hard to refer because of cumbersome mass fee and one unit refers to private drs through their primary care system
we consult for the current need 2 days per week and prn as needed so servie may change with increased numbers"
"we need uro gynecology services
less hassle with referring infertility patients or referring patients with complex gyn urology needs a limiting factors is rooms, privacy, chaperones and if we get urogyn we need more clinic time ultrasound vaginal series should be available on the clinic we need urogyn equipment for diagnosis in the office we need a microscope for teaching and diagnostic purposes we also need diagnostic hystersocopic equipment and training and we need to be able to perform sonohysterograms for diagnosis rather than needlessly putting all people to sleep"
it snafus are always very common and overburden our efficiency
we do the best we can for the load alwys looking for better ways to offer more on sight services and to avoid delays biggest issue we always need more nursing staff and other support for exams and organizing care
overburden with enormous administrative bureaucratic t time taking away from patient care

It is difficult to say what another VA facility needs to provide more services but the biggest problem to accessing gyn surgical care at another facility from the view of this referring facility is inadequate number of gynecologists that have surgical privileges. One or none at a facility is inadequate. Recruitment would be significantly easier if salary was more in line with the private sector - about 50% more than currently offered.
"Same as previous recommendations, hire more gynecologists at a salary that is competitive with the private sector. If that is not possible use fee basis for care in the private sector. I have no knowledge to comment on what other needs another facility has."
"Other than no-show rate, no problems here. Patients receive appointment letters and automated call and still high no-show/last minute cancellation rate."

"-personnel responsibilty and accountability for specific work loads only.
-avoiding cross coverage of staff for a long period of time, where short term is acceptable.
-pharmacy and drug availability
-supplies availability"

"Access is available within 2 weeks even though our current consultant provider only works 3 days per payperiod. However, some appointments are scheduled greater than 30 days.
We are looking to provide better access by hiring a part-time provider (0.6FTEE) rather than continue with a part-time (0.3FTEE) consultant."
All surgeries are scheduled as needed and always within 30 days unless the patient chooses otherwise.
"Patient no show rates have always been about 50% higher than other surgical specialty clinics despite multiple automated and direct calls to the Veterans.
The consultant is paid as a ”fee for services” provider and we often have to cancel clinics to complete mandatory and other TMS training."

We have one part time GYN physician on staff who does not perform surgery at this facility. We lost one part time Family physician in Women's clinic. We are awaiting one full time GYN physician to come on board in the fall. All GYN surgical procedures (other than minor procedures) are sent out by contract.

"Availability of in-house female provider for women requesting a female physician.
Classification of reports by clinical priority would assist in triage of and timely review of reports by providers"
Availability on in-house female provider for patients requesting a female provider
Additional operating rooms to keep up with surgical demand; additional nursing staff

"The No-show rate, scheduling and administrative questions are regarding gynecology clinic. We do not perform gynecologic surgery at our VA."

"Space is not so much an issue, but increasing funding, staffing and supervision for the fee basis office is of the essence. They are severely understaffed and quite overwhelmed with the increased volume of fee basis appointments. There is also a need to streamline the system and make it less bureaucratic. The latter is a serious flaw and problem in our system. Expectations of many middle managers are completely unrealistic and not aligned with clinical realities."
Delays in surgical scheduling were primarily related to our limited OR time. We have one major surgery day and one minor day. Juggling patients'' and surgeons' schedules around 2 OR days/month can be difficult. Because GYN is a small clinical service competing for OR time with much larger and more politically powerful services this is not always seen as important (though I must add that immediate supervisors and Surgery admin staff are very responsive and try their best).
"In general, scheduling patients for GYN surgery goes smoothly especially since we have excellent support in Anesthesia''s preop testing area. The [location redacted] VA really needs more space (inpatient beds, ORs) and while this is said to be in the works the challenges are significant.
I would like to say that fee basis care is not the solution. Many of our patients use the VA for their health care because it''s their safety net and because of their social and psychiatric problems. Our experience is that many have not done well being seen outside the VA. Also, the fact of the matter is that delays for appointments in the private sector are usually much longer for routine care (the exception is for GYN oncology surgery) than in VA."
"Space is a problem. We are very very limited insofar as rooms, especially procedure rooms."

patients are sent out only for GYN Oncology surgery

Cannot comment on why the larger VA we refer to has delays on consults we send
Remote/ rural area - limited amt of are in community available
limited availability in community - cannot assess the larger VA we also refer to
Cannot assess the larger VA we refer to
cannot assess community issues - remote/rural area with limited amt of providers in community
No gyn surgery at this facility

"We very rarely use outside GYN services. They might include GYN oncology, obstetrics, mammogrma and Ultasound imaging"
"IF a patient is snet out to the community, I personally am uanware of how long it takes as I am not involved in that process"
?
GYN surgeries are limited by lack of adequate equipment and personel avaliable

"Improve OR scheduling package
Improve fee-basis referral system and options and eliminate HealthNet!
Offer in-vitro fertilization when appropriate
Increase funding for gyn surgical equipment"
too much mandatory training

Additional OR space and support staff to run additional rooms. Streamline HR hiring process and incentives to hiring WH designated providers. Over hire when know staff leaving to avoid access issues when staff turnover. Incentive need to be in place for sterile supply staff and surgical techs as with out them can not run. Need to look at the pay scale for the staff including program assistants who schedule our appts. We currently cover 24/7 for GYN via call and Womens clinic offers weekend primary care appts at our main facility. Streamline process for equipment purchasing for clinics and OR. Even the few patients we have placed on Veterans Choice list had appts with GYN sooner than outside providers.
"We have been able to get appts very quickly with outside providers when specialty care- ONC, REI, ob. Sometimes wait time for non specialist is the same as here and patient wants appointment sooner but it is not clinically indicated. Travel to specialist is issue but there are limited GYN ONC specialists and we have a large physical area in our system"
"More OR time allocated to GYN is needed at main facility for major procedures. Or space/allotment is related to support staff- Nurses, anesthesiology and sterile supply staff.
Turn over in staff in CBOC''s and Women''s Clinics and lack of designated WH providers primary care can delay patients getting to GYN or referred appropriately out of system for services not provided in house(GYN ONC and Reproductive endocrine) We do currently have a good referral process to non va care for Onc, OB and REI. Delays in ability to order equipment and that new equipment requests go through long approval process and are done centrally delays getting new technology in OR as well as getting outpatient or sites up and running. Need additional support staff. No clinical coordinator. Delays in HR in hiring when staff turnover whether MD or Midlevels. Phone system and accessing care for veteran can be difficult."
Delays have been for elective surgery but has never put patient at risk If suspect malignancy sent out side VA for care via non VA care. Only delay I am aware of is a delay in diagnosis that was not recognized as soon as came to attention to GYN provider addressed and appropriate care.
"GYN's do not need to be doing routine annual exams they can be done by Designated WH provider. To much time spent on admin tasks as very little clerical and admin support. RN do not order tests and consults so lots of ordering. Redundant documentation also on admission and preop paper work. High no show rate and if occurs at last minute difficult to fill slot.
Hard to reach patients by phone. Providers spent lots of time with patient result letters, coordinating care and redundant documentation. Also have to order equipment and deal with deadlines placed by administration for items. (survey's, action items etc) These take away from patient direct care."

Nights and weekend coverage for ob/gyn in the ED is currently being addressed. We plan to contract to [outside institution redacted] Gynecology for this service.

we try to avoid sending pts outside our institution as it is not necessary in the vast majority of cases
"Again we try to avoid sending patients out as we have the capacity from provider standpoint to take care of nearly all gyn issues. The problems are the few patients we want to send out, for example for pelvic physical therapy, the fee basis process is so onerous and time consuming they often do not get the therapy at all or not in conjunction with appropriate additional therapy"

"having policies such as if a surgical date is more than 30 days out that they HAVE to be put on a list is ridiculous, especially for elective procedures. Prioritizing patients is important, so making policies that ALL pts have to be seen within a certain time period precludes thoughtful triaging. Admin staff and scheduling staff can help with no shows, we need to be able to provide incentive to the staff, the physicians should not be held accountable for things outside their control when it comes to their incentive (eg no shows).

We should consider instituting a no show fee to improve utilization. We need more space, an outpt surgerical center would be best"

"our no show rate is a significant impediment to good clinic utilization. Additionally, there needs to be a centralized process for alerting patients to normal lab or pathology results as we have significant amount of these. Additionally, fact that there is only one person that can create appointments is ludicrous. Each section should designate a person that can help with scheduling so that full utilization of the provider and clinic time and space is possible."

"We need adequate trained nursing support staff, enough exam rooms for providers, proper equipment for in-office procedures."

"We need enough trained support staff, enough exam rooms for providers, enough equipment for in-office procedures."

Fee-based care would take care of waiting/backlog

"C& P could be fee-based out, thus freeing up the only gynecologist in the [location redacted] region."

"At our facility, there were plans when our Women''s Clinic was being designed to include a treatment room for procedures such as LEEP. However, a female administrator at the time changed the plan to a conference room without notifying the medical staff. We have been unable to do these planned procedures since that time 7 years ago."

[potentially identifiable comment redacted] There is no delay, if Veteran needs a service not available in [location redacted], they are sent to another VA, usually [location redacted]or through Non-VA Care. There is no delay in sending patients where they need to go to receive care."

"[Location redacted]has a space issue due to adding more staff in anticpation of the hopsital which is necessary. This cause some problems on all medical services, but staff worked together. [Location redacted] Medical Director handled most administrative tasks for the Gyneologist so they were not tied up in these things."

"As we rebuild our program it will be important to have some general gynecology on staff and then add fee basis or NVCC/contracts for specialized care in the community. As volume, predicted to grow increases, will be able to justify expanding in house services. As in house services expand will likely need additional clinic and OR equipment and support personnel."

We have a low number of female Veterans accessing GYN services. Over the past year had only office based GYN and utilized NVCC for operations. Working with affiliate now to establish more robust GYN program. Difficult secondary to volume. If we build it correctly (space/clinics/staffing) I suspect the program will grow.

Our facility is not currently performing GYN surgery on site. Fee basis GYN services are utilized and provided in a timely manner.

"There are occasional challenges with nonva providers who do not have access to CPRS and exchange of information. This includes timeliness of lab results, ability to contact staff by phone.

We do not have a Gynecologist on staff. We are a smaller facility with a broad geographical catchment area."

Increasing the number of providers and exam space will correct our issues with access. Extending hours has not been beneficial in this speciality
We would prefer to keep our patient's in-house.
"VAGINAL ULTRA SOUND EQUIPEMNT(PROBES) - NEED MORE.
Increase accuracy of coding of surgical procedures so that work load can be better measured."
Mandated TMS is 290+ hrs for a gynecologist - that plus vacation takes up 2 months a year.

Preface

Congress enacted and President Obama signed into law the Veterans Access, Choice, and Accountability Act of 2014 (Public Law 113-146) ("Veterans Choice Act"), as amended by the Department of Veterans Affairs (VA) Expiring Authorities Act of 2014 (Public Law 113-175), to improve access to timely, high-quality health care for Veterans. Under "Title II – Health Care Administrative Matters," Section 201 calls for an Independent Assessment of 12 areas of VA's health care delivery systems and management processes.

VA engaged the Institute of Medicine of the National Academies to prepare an assessment of access standards and engaged the Centers for Medicare & Medicaid Services (CMS) Alliance to Modernize Healthcare (CAMH)[1] to serve as the program integrator and as primary developer of the remaining 11 Veterans Choice Act independent assessments. CAMH subcontracted with Grant Thornton, McKinsey & Company, and the RAND Corporation to conduct 10 independent assessments as specified in Section 201, with MITRE conducting the 11th assessment. Drawing on the results of the 12 assessments, CAMH also produced the Integrated Report in this volume, which contains key findings and recommendations. CAMH is furnishing the complete set of reports to the Secretary of Veterans Affairs, the Committee on Veterans' Affairs of the Senate, the Committee on Veterans' Affairs of the House of Representatives, and the Commission on Care.

The research addressed in this report was conducted by the RAND Corporation, under a subcontract with The MITRE Corporation.

Executive Summary

One of the core responsibilities of the Department of Veterans Affairs (VA) involves providing health care services to eligible Veterans. Although VA has traditionally carried out its health care role primarily by operating a national network of hospitals and other facilities, the agency also administers a purchased care function through which it pays for health care services from outside providers. VA's purchased care function has evolved primarily to address situations in which VA's direct-care resources are unable to offer needed services to Veterans. Moreover, the function is bounded by the fiscal context of a discretionary VA health benefit funded by a limited annual budget appropriation.[2] Although purchased care has accounted for only a small fraction of VA's health care budget over the past decade, that fraction is growing. In the wake of the recent crisis in access to care through VA facilities, stakeholders and policy-makers are revisiting the role and performance of VA purchased care. Specifically, they are considering whether modifications to VA's purchased care approach might be desirable, given broader goals of expanding access to care, enhancing trusted partnerships, and improving VA operations to deliver seamless and integrated support for the health of Veterans.

The Veterans Choice Act and the assessment mandate for this report were passed into law in the summer of 2014. Broadly, the act represented a congressional response to an acute access crisis in Phoenix and other parts of the country. In some important respects, the Veterans Choice Act spotlighted purchased care both as a device for ensuring Veterans' access to services and as a focal point for policy-makers' attention moving forward.

The assessment mandate for this report was established specifically by Section 201(a)(1)(C) of the Veterans Choice Act. That mandate called for a study to address "[t]he authorities and mechanisms under which the Secretary may furnish hospital care, medical services, and other health care at non-Department facilities, including whether the Secretary should have the authority to furnish such care and services at such facilities through the completion of episodes of care."

Purpose and Methods

The purpose of this report is to respond to the assessment questions posed by Section 201(a)(1)(C) of the Veterans Choice Act. In particular, we describe the legal authorities and operating mechanisms by which VA carries out its purchased care activity, related challenges and opportunities for VA, and insights regarding the question of whether the Secretary should have more, less, or different authority for purchased care than he or she currently has today. In addition, given the explicit language of the assessment mandate, we also evaluated VA's authority to purchase episodes of care and the relevance of "episodes" in VA's approach to the outsourcing of health care services.

---

[2] As we discuss in the body of this report, the fiscal context for VA purchased care changed somewhat with the implementation of the Veterans Choice Act, particularly given the $10B appropriation for the Choice program that was made under the act.

Our research methods included a review and analysis of statutory, regulatory, and legislative history materials, as well as VA policy materials and related commentaries and guidance documents; a review of relevant secondary literature, commentary, and prior studies pertaining to VA's purchased care activity; consultation and interviews with expert stakeholders within VA and in relevant outside organizations and agencies; a forward-looking analysis of potential changes to VA authority; a survey of VA health care facilities; and the solicitation and analysis of local-level VA policy documents.

Findings

VA Has a Complex Set of Authorities to Purchase Care, Reflecting Tension Among Implicit Aims

Prior to the passage of the Veterans Choice Act in 2014, the Secretary of VA held long-standing authority to purchase care, scattered across many statutory and regulatory provisions. Although the basic grant of authorities to the Secretary is expansive in some respects, it is not unlimited. It involves significant controls on when, how, and for whom medical care may be purchased. These controls implicitly reflect several competing aims beyond simply making outside care available, including restricting costs and maintaining a balance between VA's provider and payer functions. In sum, not only are VA's authorities for furnishing purchased care complex and scattered, but they also embody more than one aim, and those aims operate in tension with each other.

In a related vein, the answer to whether the Secretary should have more or different authorities for purchased care is, it depends. More explicitly, it depends on what policy-makers most want to accomplish through purchased care in the future. Different objectives for purchased care reform could easily lead to different conclusions about the need for revision to existing authorities.

The Episode of Care Defines the "Unit" of VA Authorization and May Help Shape Purchased Care in Practice

In Section 201(a)(1)(c) of the Veterans Choice Act, Congress posed the question of whether the Secretary should have the authority to furnish care at non-VA facilities through the completion of "episodes of care." The authorities for purchasing care tie into episodes primarily through program requirements for authorization (for example, as specified under the Veterans Choice Act). However, in principle, an episode conceptually bounds a clinical problem for which a Veteran might require outside services, so it might therefore make sense to outsource care as a coherent "unit." Future refinements in defining episodes of care, and an authority framework that allows the Secretary to adopt such refinements, may be critical to supporting VA's adoption of bundled payment and value-based purchasing mechanisms in the future.

The Purchased Care Landscape Is in the Midst of Transformation

As of this writing (in summer 2015), numerous changes to VA's authorities and mechanisms for purchasing care were being proposed, planned, or implemented. These developments included new administrative pilots for administering the Choice and Patient-Centered Community Care (PC3) initiatives, modifications to the eligibility criteria under Choice, revisions to VA's procurement authority for purchased care, the extension of the Choice program and reallocation of funding, and the consolidation of existing purchased care mechanisms and initiatives under a unified programmatic umbrella. With these facets of purchased care authorities and practice in flux, the full landscape of VA purchase care is not just complicated, but dynamically so. Moreover, while the proposed policy changes seek to address many different problems and issues, their sheer multiplicity suggests the drawbacks of a piecemeal approach and the lack of guiding orientation and strategy for VA's purchased care enterprise as a whole.

Recommendations for Purchased Care

Overall Strategy

Define a Strategy for Purchased Care. Policy-makers and VA should articulate a clear strategy and set of goals for how purchased care should be used and how it fits into VA's broader health care mission. The strategy should also establish benchmarks for success in VA's adoption of purchased care reforms. Specifically, the strategy should provide a foundation and structure for purchased care authorities and procedures, as well as flexibility to support surge needs and Veteran-centered care.

Address Cost Control More Explicitly and Systematically. Existing purchased care authorities have established a set of indirect cost controls through eligibility requirements and other stipulations that limit the use of the discretionary health benefits. VA and policy-makers should address cost control in purchased care explicitly and directly through a more rigorous performance evaluation of existing purchased care contracts, better and more systematic data collection on purchased care costs, and stronger cost-control mechanisms, such as co-pays, deductibles, and utilization review.

Collect Better Data to Accurately Estimate the Demand for and Use of Purchased Care. In addition to strengthening its data collection on purchased care costs, VA should also strengthen its data collection on other aspects of purchased care processes and outcomes. At present, VA lacks systematic data on these various facets of purchased care, particularly at the local facility level. A stronger base of data and analysis could help VA to improve its monitoring of purchased care processes and improve outcomes for Veterans.

Management Structure and Processes

Develop a Stronger Management Structure for Purchased Care and Allocate Responsibility and Authority to the Most Appropriate Levels. VA purchased care activities require improved program management, with responsibilities assigned to organizations at the appropriate level

of VA's administrative hierarchy. For example, referrals should be managed locally, while large contracts (such as those under Choice and PC3) should be managed centrally. VA leadership should issue clear policy and procedural requirements while facilitating appropriate flexibility in the field at the local level.

Evaluate the Third-Party Contractors Administering PC3 and Choice. As the PC3 and Choice programs are fully implemented and continue to grow, VA should establish an ongoing process for evaluating third-party administrator (TPA) performance. VA should also assess the adequacy of the provider networks, the efficiency of claims and other processes, and Veteran experiences with the programs.

Develop Clear and Consistent Guidance and Training on VA's Authority to Purchase Care. Existing VA guidance pertaining to purchased care is scattered, sometimes outdated, and inconsistent in setting clear standards, leaving local facilities to develop their own policies and procedures. VA should create a consolidated manual on purchased care, together with associated training and external messaging that explains VA's authority to purchase care, and that clarifies eligibility standards and processes to both inside and outside audiences.

Ensure That Purchased Care Contracts Include Requirements for Data Sharing, Quality Monitoring, and Care Coordination. VA has limited visibility into the quality of services that it purchases, and related standards and processes for coordinating care between VA and outside providers are inconsistent. To provide better oversight and ensure the high quality of purchased care services, both new and existing purchased care contracts with outside providers and third-party administrators should include appropriate requirements for data sharing, quality-of-care reporting, and care coordination.

Consider Adopting Innovative (but Tested) Ways to Purchase Care. TRICARE and Medicare offer useful lessons in how to purchase care efficiently. VA should consider incorporating some of these strategies, including outsourcing administrative functions and offering performance incentives to contractors.

Authorities and Mechanisms

Eliminate Inconsistencies in Current Authorities and Provide Flexibility for VA to Implement a Purchased Care Strategy. Policy-makers and VA should address and resolve specific points of tension and ambiguity in existing purchased care authorities, such as inconsistent standards for defining an episode of care, the subjective nature of some elements of 38 U.S.C. 1703 (the core statutory authority for VA purchased care), differences in definitions of geographic inaccessibility and wait time, and the conflict between the language and intent of what constitutes a "medical facility" for applying the 40-mile rule under Choice. Congress and VA should also consider the more ambitious step of simplifying purchased care authorities and mechanisms generally, such as by seeking to consolidate and harmonize them. At least in principle, such a step could help reduce the complexity and ambiguity now associated with purchased care authorities and mechanisms.

Revise How Episodes of Care Are Defined to Better Accommodate Veterans' Needs. Under the Veterans Choice Act, VA is obligated to allow Veterans who use the Choice program to seek

outside services through the completion of an episode of care, "but for a period not in excess of 60 days." The legal requirement for a fixed-term reauthorization of an episode runs contrary to evolving clinical practices and standards in the broader health care community. A revision of this authority could help improve the monitoring and coordination of episodes of care while reducing the administrative burden on VA staff and Veterans.

Adopt a Consistent Strategy for Reimbursement Rates Across Purchased Care Initiatives. Building VA purchased care networks in certain regions of the country may be difficult because some providers may not accept reimbursement rates at or below the rates set by Medicare. Current authorities generally set upper bounds on provider reimbursement rates but do not establish a floor. To address these types of reimbursement problems, we recommend that VA and policy-makers adopt a coherent strategy for setting reimbursement rates across VA purchased care initiatives, balancing cost and access considerations. In setting reimbursement rates, VA mechanisms and contracts for purchasing care should reflect the reality of local competitive market conditions.

PART I: Introduction and Methods

This report is divided into three main parts. Each part is composed of several sections, which together address a common topic.

Broadly, this report summarizes the findings of a congressionally mandated study of U.S. Department of Veterans Affairs (VA) purchased care, responding specifically to three basic questions posed by Congress:

- What authorities and mechanisms does VA have to purchase care?
- Does VA have the appropriate authorities and mechanisms to purchase care?
- Should VA have the authority to purchase care through the completion of episodes of care?

In answering these research questions, we undertook an extensive investigation of VA's current authorities and mechanisms for purchasing care, as well as of potential changes and alternative models that stakeholders and policy-makers might consider in the future. Parts II and III of this report deal with the current landscape and future possibilities for VA purchased care, respectively.

Part I of this report offers an introduction to our assessment task and to our methods of research and analysis in carrying out this study. We provide here an overview of the broader context of our research and mandate, including how purchased care fits into the larger health care mission, organization, and recent history of VA. We also discuss the message, audience, and purpose of this report.

This page intentionally left blank.

1 Introduction

One of VA's core functions involves providing health care services to eligible Veterans. Although VA has traditionally carried out this role primarily by operating a national network of hospitals and other facilities, the agency also administers a purchased care function, through which it pays for health care services from outside providers. VA purchased care evolved primarily to address situations in which VA's direct-care resources were unable to offer needed services. Although purchased care has accounted for only a small fraction of VA's health care budget over the past decade, that fraction is growing. In the wake of the recent crisis in access to care at VA facilities, stakeholders and policy-makers are now revisiting the role and performance of VA purchased care. Specifically, they are considering whether modifications to VA's purchased care approach might be desirable, given broader goals of expanding access to care, enhancing trusted partnerships, and improving VA operations to deliver seamless and integrated support.

The Veterans Choice Act and the assessment mandate for this report were passed into law in the summer of 2014. According to some commentators, the act was a congressional response to misconduct and mismanagement in the VA health care system, in which delayed access to services was allegedly associated with the deaths of dozens of Veterans and falsified wait-time data collected at the VA medical center (VAMC) in Phoenix, Arizona.

The access crisis in Phoenix and other parts of the country led Congress to require a series of corrective actions under the Veterans Choice Act. Perhaps most notably, the legislation established the new Choice program, an initiative to increase access to purchased care for eligible Veterans who met new enrollment, wait-time, and driving-distance criteria. Another major provision of the Veterans Choice Act served to reorganize payment authority and budgeting for purchased care, shifting responsibility from VAMCs to the Veterans Health Administration's (VHA's) Chief Business Office. Both measures under the act reflect policy-makers' view of purchased care as an important tool for ensuring comprehensive access to medical services by Veterans.

1.1 Objective of This Report

Pursuant to Section 201(a)(1)(C) of the Veterans Access, Choice, and Accountability Act of 2014, Congress mandated an independent assessment of VA, specifically to address "[t]he authorities and mechanisms under which the Secretary may furnish hospital care, medical services, and other health care at non-Department facilities, including whether the Secretary should have the authority to furnish such care and services at such facilities through the completion of episodes of care."

The first clause of the assessment mandate broadly addresses the legal and policy contours under which VA is empowered to provide health care services at non-VA facilities. We interpreted the phrase *health care at non-Department facilities* as synonymous with *purchased care*—or actions taken by VA to pay for outside medical services for Veteran beneficiaries, rather than providing service directly through VA-employed or VA-contracted providers and at

VA-owned or VA-contracted facilities.[3] Although the language of the Veterans Choice Act mandate could be interpreted more broadly to encompass other aspects of VA practice related to the delivery of health care services, such as facility leasing, the primary focus of this assessment is on purchasing health care for Veterans from non-VA sources and on the authorities and mechanisms that support this practice.

The second clause of the assessment mandate asks whether the VA Secretary should have the authority to furnish health care services at non-VA facilities through the completion of episodes of care. At present, VA has established a patchwork of policies, programs, and mechanisms to furnish health care at non-VA facilities. Thus, for this assessment, we were asked to assess the various elements of the purchased care system and to envision what the array of laws, programs, and policies might look like in the future. The language of the Veterans Choice Act mandate asks a forward-looking, normative question about VA authority and implicitly invites comment on an array of potential policy changes to the VA purchased care landscape. The mandate also invites specific comment on *episodes of care* and their relationship to other aspects of VA authority and purchased care in practice.

One additional aspect of the assessment mandate deserves particular note: the focus on authorities and mechanisms. We interpret *authorities* to refer to the statutory and regulatory framework that empowers VA to purchase care, while we interpret *mechanisms* to refer to uncodified VA policies and to the actual practice by which VA carries out its purchased care activity. In essence, the mandate involves addressing several basic research questions about purchased care:

1. What authorities and mechanisms does VA have to purchase care?

2. Does the Secretary have the appropriate authorities and mechanisms to purchase care?

3. Should the Secretary have the authority to purchase care through the completion of episodes of care?

1.2 Historical Evolution of VA Purchased Care

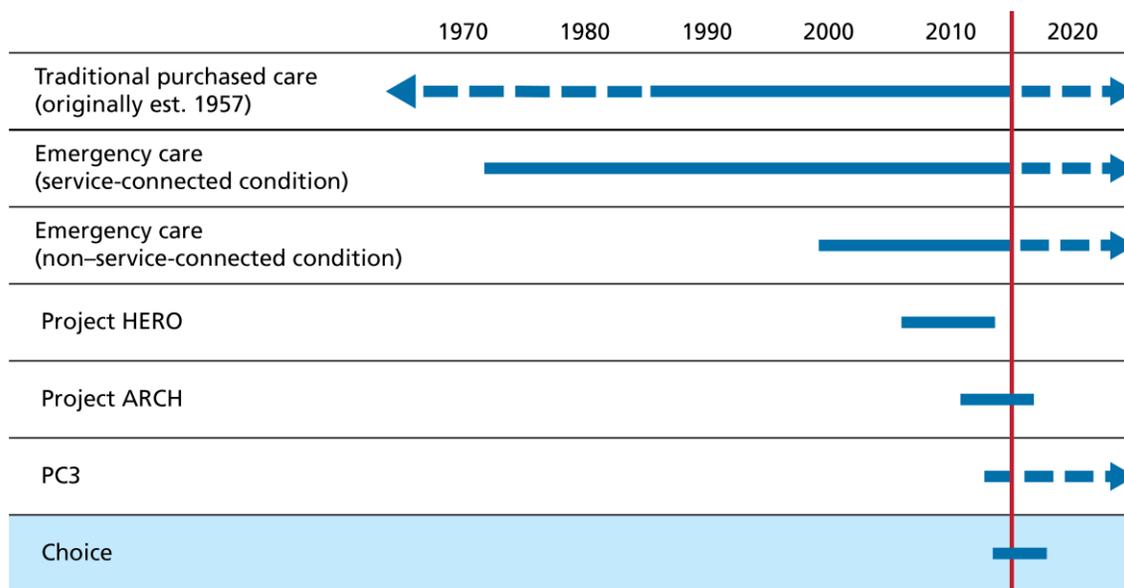
The landscape of VA purchased care authorities is complex, largely because the act of purchasing medical services is inherently complicated. Purchasing care minimally involves screening Veterans to determine when outside referrals for services may be appropriate, initiating those referrals, and establishing contractual relationships with outside providers. It also involves defining the scope of authorization for outside care in specific situations, monitoring the services provided, sharing records appropriately and coordinating care with non-VA providers, and paying claims for outside services. VA purchased care does not involve

---

[3] Note that *purchased care*, as we define it here, may also include actions taken by VA to obtain services from outside care providers at non-VA facilities without directly paying for them, as through strategic resource-sharing arrangements between VA and the U.S. Department of Defense (DoD). With this being said, much of our focus is specifically on VA's role and authority as a payer for outside services. Hence, we use *purchased care* as an umbrella term in describing the scope of this assessment.

just a single function and mechanism, but rather a whole series of interlocking ones. For the system to operate effectively, all the parts must work together efficiently and consistently.

As shown in Figure 1-1, VA has had the core statutory authority to purchase care for decades. We characterize this authority, originally established by what is currently 38 U.S.C. 1703 and programs enacted thereunder, as *traditional purchased care*. Over the years, VA has purchased inpatient and outpatient services through a mix of individual authorizations and contracts with outside providers at external facilities. As with health care services provided through VA directly, purchased care has evolved to cover both service-connected conditions and non–service-connected conditions. There was a similar expansion in coverage with regard to the purchase of or reimbursement for emergency care services. In part as a response to the recent conflicts in Iraq and Afghanistan, VA has been compelled to apply and refine its purchased care tools to meet increased demand. For example, in 2001, Project HERO (Healthcare Effectiveness through Resource Optimization) was instituted as a pilot program designed to enhance the coordination of care delivered by both VA and external providers. Project ARCH (Access Received Closer to Home) was originally fielded as a pilot program to increase the coordination and cost-effectiveness of care provided to rural Veterans, and the pilot was continued under the Veterans Choice Act. PC3 (Patient-Centered Community Care, sometimes referred to as PCCC) was subsequently created to further expand access and was based on lessons learned from the prior pilot programs.

Figure 1-1. Timeline of VA Purchased Care Mechanism Development


NOTE: Dashed arrows indicate mechanisms established prior to the start of the figure's timeline or anticipated to continue indefinitely. The vertical red line indicates when this analysis took place (2015).

Each of the multiple VA purchased care programs and initiatives that exist today has different criteria for Veteran and provider eligibility, different guidelines for VA discretion to furnish

care,[4] and different rules governing payment. Table 1-1 compares four primary mechanisms involved in providing purchased care.

Table 1-1. VA Purchased Care Rules for Eligibility, VA Discretion, Providers, and Payment

Feature	Traditional VA Purchased Care	ARCH	PC3	Choice
Eligibility	VA not able to furnish necessary care (per 38 U.S.C. 1703)	Driving time to VA facilities (pilot sites only)	VA not able to furnish necessary care	Wait time, geographic distance to VA facilities
Does corresponding authority *permit* or *compel* VA to furnish care at non-VA facilities?	"may"	"shall"	"may"	"shall"
Providers	Contract/ agreement	Network	Network	Medicare-eligible[a]
Typical Reimburse-ment rate	VA fee schedule, Medicare rate, or contracted rate	% of or full Medicare rate	% of Medicare rate	% of Medicare rate

[a] Health care providers from DoD, the Indian Health Service (IHS), and federally qualified health centers (FQHCs) would also be qualified under Choice.

Unsurprisingly, the multiplicity of mechanisms and programs in purchased care has sometimes created confusion and inefficiency. Although a single purchased care provider might deliver care through more than one of these mechanisms, the corresponding reimbursement rates, requirements for record sharing, and other conditions of participation vary by mechanism.

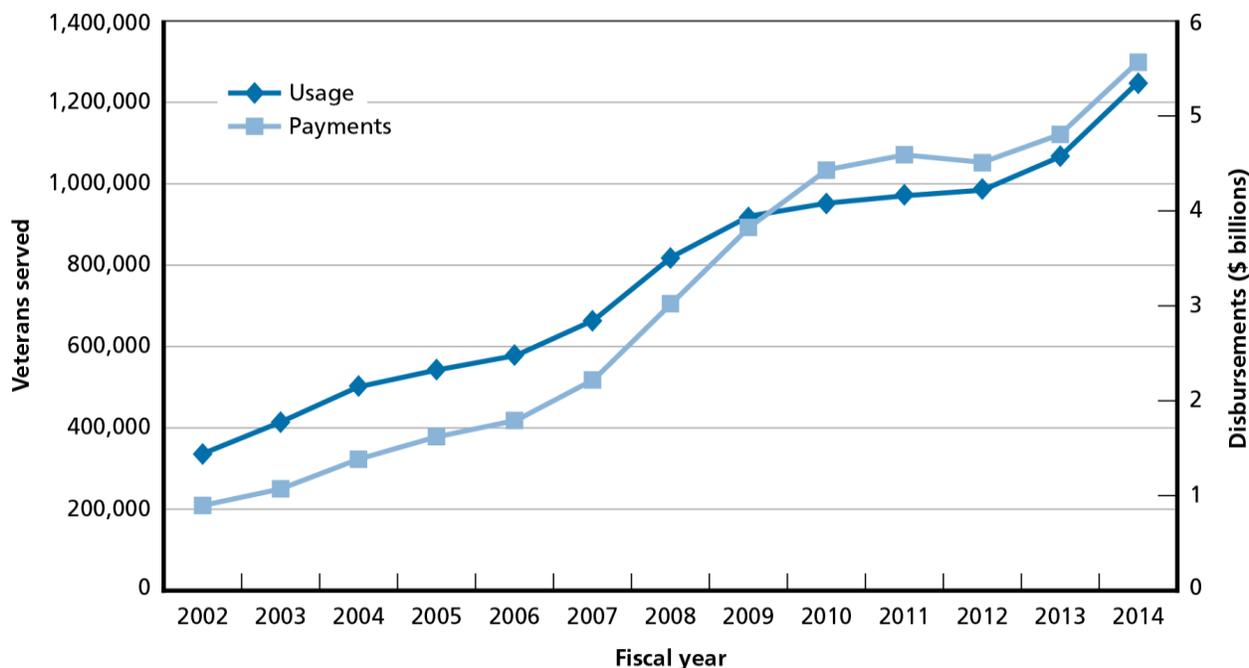
---

[4] Some VA authorities specify that VA *shall* furnish care, while others specify that VA *may* furnish care. In this context, *shall* represents VA authority and a congressional mandate to provide or pay for the care required, as long as the eligibility criteria are met. *May* implies greater discretion on VA's part, in that VA has the authority to furnish the necessary care but not a specific mandate to do so.

Individual Veterans may be eligible to receive purchased care through multiple mechanisms. For Veterans and VA staff, determining the appropriate route to access purchased care is sometimes difficult. Referring VAMCs must select from among these options according to one or more goals, including optimizing ease of access, lowering costs, leveraging preexisting contractual relationships with providers, and optimizing Veteran choice.

1.2.1 Purchased Care Continues to Evolve

As of this writing (in summer 2015), about 10 percent of VA's annual health care budget went to purchased care. VHA's Chief Business Office estimated that purchased care costs in fiscal year (FY) 2014 totaled $5.6 billion, after steady and significant increases year after year (Figure 1-2; VA, 2014c). Other VA sources have provided different estimates of purchased care expenditures during this time frame, with VA Deputy Secretary Sloan Gibson testifying before the Senate Veterans' Affairs Committee on May 12, 2015, that VA had spent more than $8.5 billion on purchased care in FY 2014 (Exploring the Implementation and Future of the Veterans Choice Program, 2015). The difference in these estimates is likely because Deputy Secretary Gibson included Civilian Health and Medical Program of Veterans Affairs costs in his totals. Using another metric of purchased care utilization, Deputy Secretary Gibson noted that Veterans completed 55.04 million appointments at VA facilities and 16.2 million appointments in the community (through purchased care) in FY 2014 (Exploring the Implementation and Future of the Veterans Choice Program, 2015).

Figure 1-2. Growth in VA Purchased Care, FYs 2002–2014


SOURCE: Data obtained through a request to the VHA Chief Business Office, May 12, 2015, and originally derived from VA Central Office fee payment files.

Rising expenditures over the past decade reflect only one of the ways in which purchased care has evolved. The research for this assessment began in November 2014. Since that time, there have been major changes to VA's authorities and mechanisms for purchasing care. For example, as required by the Veterans Choice Act, VA mailed "Choice Cards" to Veterans to seek care in the community, reorganized the VHA Chief Business Office, and consolidated the purchased care budget. In addition, in April 2015, VA promulgated a revised regulation that changed its interpretation of the access standard used to determine Veterans' eligibility for the Choice program from a geodesic line to driving distance using the fastest route (VA, 2015d).[5] This roughly doubled the number of Veterans eligible to receive care in the community under the Choice program (Exploring the Implementation and Future of the Veterans Choice Program, 2015).

This assessment represents the status of VA purchased care as of early in 2015. There were many changes to the purchased care landscape that were implemented, planned, or proposed while we were writing this report. The changes to the Veterans Choice Act mentioned above were just a few examples. Throughout this report, we have attempted to incorporate and address the most recent developments in purchased care authority and mechanisms as of May 2015.

1.3 Overview of VA Purchased Care Funding

Beyond the programs and mechanisms of VA purchased care, it is also helpful to recognize that purchased care is bounded by some basic features of VA's structure as an agency. Perhaps most important, VA health benefits are notably *not* a legal entitlement or a benefit to which Veterans are automatically entitled and for which the government must pay. Rather, Veterans may obtain VA health care services according to a priority scheme for eligibility established by Congress.[6] In addition, VA's capacity to provide health care benefits is limited by its annual appropriations allocated by Congress.[7] As such, VA's health care mission involves not only providing health care services with "integrity, commitment, advocacy, respect, and excellence"[8] but also doing so while simultaneously keeping expenditures under a restrictive resource ceiling.

This basic funding reality for VA's health care operations is central to understanding purchased care. One historical implication is that dollars spent on purchased care by local VA facilities have sometimes been viewed as a direct offset to funding available for other local health care purposes. From this perspective, purchased care may sometimes involve a resourcing trade-off against strengthening the capacity of VA's own provider facilities. While this is beyond the focus

---

[5] We discuss this change in more detail in Section 3 of this report.

[6] We describe the priority scheme for enrollment for health care benefits in Appendix E of this report.

[7] As we discuss in Section 3, funding for purchased care in particular shifted somewhat with the Veterans Choice Act, which established a specific reserve of $10 billion to cover costs associated with the Choice program established by the act.

[8] These are the five core values articulated by VA as an implicit part of its mission statement (VA, 2014b).

---

of this report to address in depth,[9] for stakeholders concerned with VA health care more broadly, the potential for a resourcing trade-off between VA direct care and purchased care is an important consideration for the future.

Another implication of VA's funding constraint is that some of the basic features of purchased care are implicitly tied to limiting spending. Such features include eligibility and authorization requirements for purchased care, Veteran co-pays, requirements for outside provider reimbursement rates, and restrictions on who can participate as an outside provider.[10] Collectively, these have the effect of giving VA more control and influence in restricting purchased care expenditures. Achieving an optimal balance between access and quality on one hand and cost control on the other presents a fundamental challenge for VA in purchased care.

The discretion to purchase care has traditionally resided with VA rather than Veterans. This has changed somewhat under the new Choice program, which confers more power on eligible Veterans to elect to pursue purchased care, as well as a direct mandate for VA to pay for that care when wait-time or driving-distance criteria are met. Together, these features of the Choice program are likely to enhance access, but with the implicit trade-off of reducing VA control over related expenditures.[11] Here again, purchased care involves striking a balance between the competing aims of enhancing Veteran choice and access and containing related costs.

All of these considerations spotlight the importance of VA's funding context in shaping the operation of purchased care. Purchased care fulfills a limited function within VA's health care mission, and it does so primarily through discretionary funding from Congress. Recent changes to purchased care under the Veterans Choice Act invite some reflection on this context, and on how changes to the context might influence the balance between access, choice, and cost containment in the future.

1.4 Scope of This Report

The contents of this report adhere closely to the assessment mandate posed by Congress in Section 201(a)(1)(C) of the Veterans Choice Act. To address components of that mandate, we undertook a broad investigation of VA purchased care authorities, policies, and mechanisms.

Authorities and *mechanisms* are terms drawn directly from the assessment mandate in Section 201(a)(1)(C) of the Veterans Choice Act. We interpret each of these terms in accordance with its plain meaning and in view of the act's objectives. Here again, a*uthorities* refers broadly to federal law, the powers and responsibilities delegated by Congress to the Secretary, and formal rule-making undertaken by the Secretary, consistent therewith. *Mechanisms*, by contrast, is a

---

[9] Note that a separately mandated assessment under the Veterans Choice Act is addressing issues of VA health care capacity, and focuses more directly on this particular issue.

[10] We discuss these features in more detail in Sections 3, 4, and 7 of this report.

[11] Regarding the latter point, it is noteworthy that the Veterans Choice Act established a $10 billion funding pool for benefits under the Choice program. Thus, although the congressional mandate for Choice program benefits has the effect of reducing VA's control over costs, the budget mechanism and additional resourcing serve to balance that.

less formal term. We construe mechanisms to include (uncodified) VA programs and initiatives, VA guidance documents and policies, and VA operating practices for furnishing purchased care. Generally speaking, mechanisms are not formally codified by law and regulation, but they nevertheless reflect VA practice and VA's efforts to furnish purchased care consistent with the framework established by formal authorities. Both concepts are central to understanding the landscape of VA purchased care.

Although we describe laws and regulations pertaining to VA purchased care in detail in Sections 3 and 4 of this report, it is important to emphasize that this report is not intended to offer an academic review of the law or a legal treatise.[12] Rather, this report was written for a broader policy audience (including Congress and VA, as well as other interested stakeholder groups) and in direct response to the assessment mandate in Section 201(a)(1)(C) of the Veterans Choice Act. VA purchased care is a complicated topic, and a discussion of the statutory and policy issues surrounding VA purchased care requires an understanding of the legal framework that defines it. However, the law also reflects an underlying set of policy objectives and economic relationships that are the substance of purchased care, both as it exists today and as policy-makers might choose to refashion it in the future. This report aims to speak to this broader policy context, not just the legal aspects of it.

It is equally important to highlight what is beyond the scope of this report. As we noted earlier, the assessment mandate of Section 201(a)(1)(C) refers to the phrase "care at non-Department facilities." For the purposes of this report, we interpret this phrase as being largely synonymous with purchased care. However, the same phrase could be interpreted in other ways. VA facility leasing, for example, involves "care at non-Department facilities."[13] Likewise, it could also include VA's long-standing collaborative relationship with DoD to provide health care services to Veterans. Although we do touch on the latter topic in some parts of this report, we do not address it at length. VA and DoD have a unique, long-standing collaborative relationship that has been the subject of intense scrutiny and comment elsewhere (see, for example, Military Compensation and Retirement Modernization Commission, 2015).

More generally, VA purchased care authorities and policy are closely tied to many other aspects of VA's health care mission, structure, and operations. For example, the types of health care services purchased by VA are implicitly determined by the contours of the agency's health care benefit, since the latter defines the services that Veterans may be eligible to receive. Likewise, Veterans' ability to obtain purchased care services is contingent on initial eligibility to receive VHA benefits. Other examples of collateral features that have some relevance to purchased care include the anatomy of VA's national infrastructure of health care facilities, the structural and command relationship between VA's local facilities and its regional and national

---

[12] It is also important to underline that this report does not offer formal legal advice to VA or to Congress. Formal legal advice can only be given by licensed attorneys operating within the scope of their professional practice in response to legal consultation sought by a client. The RAND Corporation is not a law firm and is unable to give formal legal advice. If the sponsors of this report would like to receive legal advice, they would need to consult internally with their own counsels or seek assistance from an independent law firm.

[13] VA facility leasing is a focus of other assessment mandates in the Veterans Choice Act in Section 201(a)(1)(K) and (a)(2)(B).

administrative offices, and the composition and evolution of VA's internal provider capabilities. We do not address these ancillary aspects of VA in much detail in this report, though they do shape the VA purchased care landscape in various ways. Some of these topics are addressed by other mandated assessments under the Veterans Choice Act.

One additional scoping note deserves particular mention here. Veterans' eligibility for health benefits, broadly construed, is outside the scope this report to address. However, VA's purchased care authority does involve an important interaction with Veteran eligibility: the Secretary's discretion to purchase services when VA facilities are unable to provide those services directly versus the Secretary's obligation to provide care to specific categories of Veterans as designated by statute.[14] In Section 3 of this report, we discuss the tension between these two basic authority provisions and the implications for actual practice in VA purchased care.

1.5 Organization of This Report

This report is organized into three parts. Part I includes this introductory section and an overview of our study methods (Section 2). Part II focuses broadly on authorities and mechanisms for VA purchased care and includes sections on these authorities and mechanisms prior to and since the passage of the Veterans Choice Act (Section 3) and in practice (Section 4), along with a discussion of procurement and episodes of care (Section 5) to help frame a strategy for VA purchased care going forward. The report concludes with Part III, which examines potential reforms to VA purchased care practice (Section 6) and alternative government payer models (Section 7); it also presents our overall conclusions and recommendations (Section 8). This report includes five technical appendixes providing additional background and detail on rates of VA purchased care utilization and authorizations (Appendix A); statutory and regulatory authorities for the provision of VA purchased care (Appendix B); characteristics of the policy documents received through our request for data on VA purchased care in practice at the local level (Appendix C); pertinent questions included in the 2015 Survey of VA Capabilities and Resources that was fielded to all VAMCs, as well as data on responses to those questions (Appendix D); and VA health benefits and priority groups, to provide a fuller picture of the context in which VA purchased care mechanisms operate (Appendix E).

---

[14] We refer here to 38 U.S.C. 1703 and 1710, respectively. See the discussion in Section 3 of this report.

This page intentionally left blank.

2   Methods

Consistent with the assessment questions posed by Congress, our research methods included statutory, regulatory, and legislative history research and analysis. We supplemented this analysis with a review of the published literature, including commentary and prior studies of VA's purchased care activity, consultations and interviews with expert stakeholders representing VA and other agencies and organizations, a review of local-level VA policy and procedural documents, and a survey of VA facilities. Section 2 reviews each of these approaches in more detail.

2.1   Statutory, Regulatory, and Legislative History Research and Analysis

The primary research methodology involved cataloging and analyzing statutes and regulations related to VA purchased care, along with associated legal commentary and cross-references from those materials. Much of the authority for VA purchased care appears in various provisions in Title 38 of the U.S. Code, while corresponding regulations appear in Title 38 of the Code of Federal Regulations. We conducted an initial review of these primary legal sources to identify the provisions that were relevant to this assessment; we then used the themes drawn from these provisions to structure our analysis of VA purchased care authorities in Section 3. We also reviewed and analyzed the relevant provisions under the Veterans Choice Act. Where appropriate, we consulted legislative history materials to better understand the interpretation and intentions of Congress with regard to the Veterans Choice Act and relevant pieces of legislation affecting how VA furnishes purchased care. We also searched and reviewed relevant case law.

2.2   Review of Relevant Published Literature

Beyond our direct research on statutes and regulations, we also reviewed the published literature on VA's purchased care authorities and programs. Specifically, we searched for pertinent reports published by the U.S. Government Accountability Office (GAO), the Congressional Budget Office, and the Congressional Research Service; by previous independent commissions and panels that have studied or commented on VA purchased care practices; and by entities within VA, including the central offices, VHA, and the Office of Inspector General. We also sought to identify, retrieve, and review copies of all publicly available VA policy documents pertaining to purchased care, including directives, manuals, and guidance documents. Finally, our review considered findings published in scholarly papers and commentaries, which we accessed through several databases, including PubMed and the Index to Legal Periodicals.

2.3   Interviews with Expert Stakeholders

To construct a more complete picture of VA policies and mechanisms pertaining to purchased care in practice, we conducted a series of interviews and background discussions with a range of VA personnel and representatives from other stakeholder groups. Interviews were formal

meetings during which we asked questions informed by prior background discussions with other stakeholders. These meetings were guided by research protocols and formal consent documents. Interviewees were informed that their responses would not be attributed to them in any way. Interview questions probed stakeholders' professional experiences with and perspectives on VA purchased care authorities and mechanisms. Background discussions were informal meetings and were not guided by research protocols. These discussions, which focused on basic facts and the structure of VA purchased care authorities and mechanisms, were used to inform the development of research protocols for the formal interviews.

Interviewees included VA officials and administrators spanning a variety of offices at VA headquarters, as well as senior officials at VAMCs and Veterans Integrated Service Networks (VISNs). Outside of VA, we spoke with representatives from seven Veterans Service Organizations (VSOs); officials with the third-party administrators (TPAs) responsible for administering the PC3 and Choice programs; subject-matter experts from the Congressional Budget Office, the Congressional Research Service, GAO, and other organizations; and congressional staff of several committees with responsibility for Veterans' affairs. Within these varied categories, we selected interviewees who had considerable familiarity with and expertise on the issues surrounding VA purchased care, drawing on our own prior knowledge and familiarity with these stakeholders and on the recommendations of the respondent organizations and interviewees themselves. Although we make no claims about the representativeness of the opinions proffered by our interviewees, we made a concerted effort to talk to a diverse selection of individuals with expertise on the issues pertaining to this study and ensured that we spoke to individuals who would have differing perspectives and opinions.

Over the course of several months, we conducted a total of 41 conversations with both individual stakeholders and small groups. These interviews were both telephonic and in person. The majority of interviews were one hour in length, though a small number were conducted in conjunction with Assessment B (Health Care Capabilities) and thus were slightly longer. Of those, 11 were background discussions with subject-matter experts and VA officials that served to increase our knowledge of the subject material and help refine our formal interview protocols. The remaining 30 were formal interviews.[15] Because many of these conversations were with small groups of interviewees, we ultimately collected input and insights from more than 50 individuals. Recognizing the methodological risks of overreliance on a relatively small sample of qualitative interviews, we bolstered our utilization of these data through triangulation with a variety of other qualitative and quantitative methods, as described elsewhere in Section 2.

2.4 Review of the Secretary's Authorities

To investigate the authority implications associated with a range of different possible future changes to purchased care, we employed a method derived from scenario analysis. Starting from a set of potential objectives that VA and Congress might bring to changing purchased care, we defined a series of illustrative *implementing steps* that they might choose to pursue, which

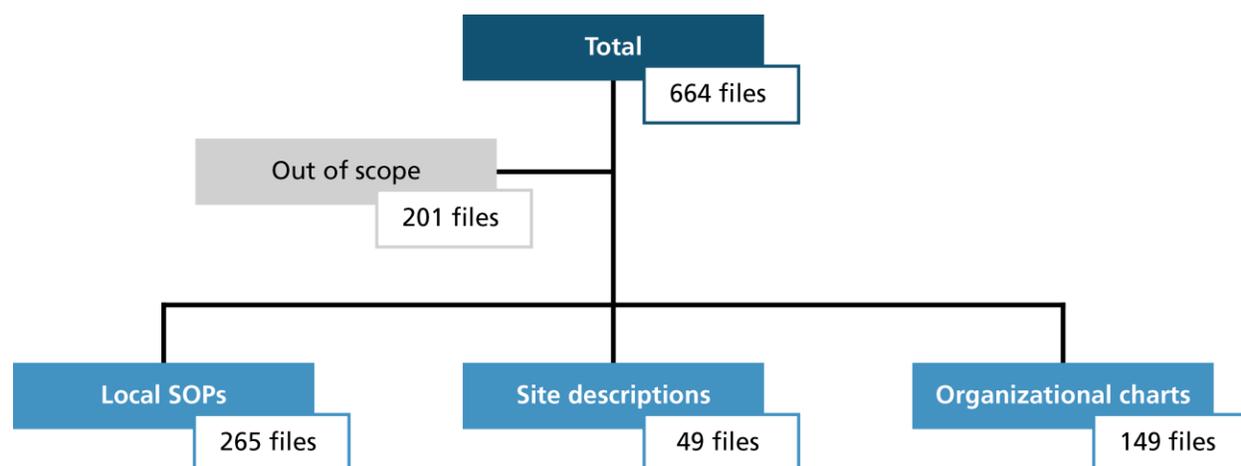
---

[15] RAND's Human Subjects Protection Committee approved this research.

are broadly responsive to one or more of these objectives. We then analyze the implications for authority—specifically, the need for legislative action, formal rule-making by VA, or revisions to VA guidance or policy documents—for each potential implementing step. The objectives and implementing steps were developed through discussions with a panel of experts, as well as through a review of the literature and from interviews with stakeholders.

2.5 Review of Local VA Policy Documents

As described in Assessment B (Health Care Capabilities), VA health care facilities are overseen by overlapping management structures. At the basic level, VA's 21 VISNs manage all resources within their service areas. On top of that, "administrative parents" oversee clusters of health care facilities. We requested policy documents related to purchased care from all of VA's 141 administrative parents, a management mechanism responsible for care in a group of health care facilities.[16] We specifically requested written documentation (i.e., policies or guidance) on when, how, and for whom VA purchased care is contracted at the local, facility level (as distinct from national-level policies). We clarified that the purpose of the request was to understand local variation in the implementation of national policy. In response to our solicitation, we received a total of 664 files from 78 VAMCs and one VISN (see Figure 2-1).

Figure 2-1. Local Purchased Care Policy Documents Received


NOTE: SOP = standard operating procedure.

We reviewed and categorized the documents we received into three categories: (1) descriptions of SOPs related to purchased care (n = 265), (2) detailed VAMC site descriptions (n = 49), and (3) organizational charts (n = 149). We did not receive any policy documents from

---

[16] According to VHA Handbook 1006.02, *VHA Site Classifications and Definitions*, an administrative parent is defined as a collection of all the points of service that a leadership group (medical facility director, deputy medical facility director, chief of staff, associate or assistant director, and nurse executive) manages. The points of service can include any institution where health care is delivered. All the data originating from these points of service roll up to a single station number representing the administrative parent for management and programmatic activities (VA, 2013b).

22 of the VA administrative parent organizations to which the data request was issued. The overall response rate to the request was 86 percent. We calculated response rates for each of the document categories, with 49 percent for SOPs, 30 percent for site descriptions, and 67 percent for organizational charts.

Not all of the policy documents were dated, but among those that were (205 of the 664 total documents), the vast majority predated the August 2014 passage of the Veterans Choice Act and the November 2014 establishment of the Choice program. Those dates ranged from January 2008 to April 2015, with the majority issued in 2012 and 2013. Moreover, the bulk of the documents issued after the establishment of the Choice program were quite short and less useful for describing variations in key policies, processes, and SOPs pertaining to purchased care. For instance, many were simply one-page documents containing screenshots showing how to enter a purchased care consult request into various computing systems, with little or no accompanying text.

To assess the local policy documents, we coded the SOPs received by the following criteria: date; their level of detail in describing VA purchased care policies and procedures; number of pages; terminology used to refer to a non-VA care provider; authorities cited; level of detail; whether they encouraged the use of VA purchased care, or, alternatively, staying within the VA system; which VA staff were listed as responsible for various steps in the VA purchased care referral and authorization processes; and whether and to what extent they discussed "episodes of care." We then used the themes extracted through this coding exercise to draw preliminary conclusions about how purchased care decisions are made at the local level. Additional detail on our request for data and our assessment of the documents received is provided in both Section 4 and Appendix C of this report.

2.6 Survey of VA Capabilities and Resources

The 2015 Survey of VA Capabilities and Resources was fielded as part of RAND's assessment in response to the mandate in Section 201(a)(1)(B) of the Veterans Choice Act (Assessment B, Health Care Capabilities). The survey was designed to identify clinically meaningful delays in care for seven illustrative clinical populations and for primary care more generally. The survey's sample frame was all of VA's 141 administrative parents (again, local health care systems with at least one hospital and its affiliate clinics), and the field period for the survey was two and a half weeks (May 7–26, 2015).

Assessment C included seven questions in the survey. Three of these questions concerned referrals for VA purchased care, two asked about how episodes of care are defined in practice, and two asked about various internal processes and practices at the VAMC level (including data collection) and the use of the Non-VA Care Coordination (NVCC) program. Response options varied, with two yes/no questions, two questions asking about the frequency of various practices, one question asking respondents to rank the options by importance, and two questions asking the respondent to select the best answer among several provided responses. Each question also included a small comment box in which the respondent could elaborate on his or her answer. Additional details of the survey's fielding, full text of the survey questions pertaining to purchased care, and response data are presented in Appendix D of this report.

We received survey responses from 117 out of 141 administrative parents—an 83-percent overall response rate.[17] However, several respondents chose to exit the survey before answering every question, leaving 111 respondents answering those questions pertaining specifically to Assessment C (a 79-percent response rate). In analyzing survey responses, we explored respondents' estimates of the frequency of referrals to purchased care, as well as the reasons for these referrals. We also assessed respondents' feedback about their knowledge of and experiences with episodes of care and electronic record sharing.

---

[17] VHA Handbook 1006.02 defines an administrative parent as "collection of all the points of service that a leadership group (Medical Facility Director, Deputy Medical Facility Director, Chief of Staff, Associate or Assistant Director, and Nurse Executive) manages. The points of service can include any institution where health care is delivered. All of the data that originate from these points of service roll up to a single station number representing the administrative parent for management and programmatic activities" (VA, 2013b, p. 1).

PART II: Current Authorities, Mechanisms, and Framework for VHA Purchased Care

This part covers three sections: 3. Authorities and Mechanisms for Purchased Care, 4. VA Purchased Care Authorities and Mechanisms in Practice, and 5. Procurement and Episodes of Care. These sections describe the current landscape of purchased care authorities and mechanisms.

These three sections describe the range of authorities and mechanisms for VA purchased care, as well as the strengths and challenges of implementation on the ground. The first section in this part (Section 3) examines features of the laws governing purchased care and the evolution of the various purchased care mechanisms. Its purpose is to offer policymakers a detailed view of the inner workings of VA's purchased care authorities to facilitate understanding of the existing laws. Those descriptions lay the foundation for Part III, in which we discuss possible future authorities and mechanisms for VA's purchased care. Existing authorities were developed over time in piecemeal fashion. Future changes to purchased care authorities should consider the potential detriment of further incremental development without the guidance of a centralized strategy or supporting mechanisms. Section 4 provides a detailed discussion of purchased care mechanisms in practice, derived from analysis of multiple primary data sources collected specifically for this study. The section describes the strengths and shortfalls of purchased care mechanisms and offers findings and recommendations aimed at VHA management and reform. Section 5 concludes with framing material that describes some of the critical elements underlying VA's purchased care authority and mechanisms, including procurement policies, definitions of episodes of care, and the health benefits structure.

This page intentionally left blank.

3 Authorities and Mechanisms for Purchased Care

Overview of Methods and Data for Authorities and Mechanisms for Purchased Care

- We traced the history of authorities and mechanisms for VA purchased care through a review of relevant statutes, regulations, VA policies, and associated guidance documents.
- Supporting the legal analysis, we reviewed in detail the provisions of Title 38 of the U.S. Code, and of legislative initiatives governing VA purchased care prior to the Veterans Choice Act. We also reviewed data on purchased care programs implemented prior to the passage of the Veterans Choice Act, including key features of those programs and VA's role thereunder.
- We examined changes to VA purchased care implemented by, and under, the Veterans Choice Act.

Although the Veterans Choice program received considerable attention in 2014 and was considered a novel mechanism for using non-VA facilities and providers to meet Veterans' medical needs, similar authority had already been in place for nearly six decades.[18] Such explicit authority was necessary for acquiring medical services from external providers because VA operates within considerable statutory and regulatory limits. Given that this underlying authority is based on myriad legislative initiatives, each addressing different concerns for different Veteran populations at different times and under different conditions, understanding what is and is not permitted under current law can be a daunting task.

The mandate for this study (Section 201 of the Veterans Choice Act) called for an examination of the "authorities and mechanisms under which the Secretary may furnish hospital care, medical services, and other health care at non-Department facilities." For our purposes, *authority* can be understood partly as the set of statutes passed by Congress, which define, guide and constrain VA purchased care activity.[19] In addition, *authority* also includes regulations promulgated by VA, consistent with its authorizing statutes, which also operate with the force of law. Relevant regulations and rules can also be promulgated by other federal agencies.

---

[18] The key legislative foundations for purchased care prior to the Veterans Choice Act are as follows: Veterans' Benefits Act of 1957 (Pub. L. 85-56, Sec. 501); the Veterans Health Care Expansion Act of 1973 (Pub. L. 93–82, Sec. 106); Consolidated Omnibus Budget Reconciliation Act of 1985 (Pub. L. 99–272, Sec. 19012, 1986); the Veterans' Health Care Eligibility Reform Act of 1996 (Pub. L. 104-262); and the Veterans Millennium Health Care and Benefits Act (Pub. L. 106-117, 1999). The use of non-VA facilities and providers actually dates back prior to the original establishment of the agency.

[19] Federal statutes sometimes involve direct mandates to executive branch agencies, and also sometimes involve a delegation of power and discretion to agencies. As we describe in this section, some of the core statutory authorities for VA purchased care involve considerable discretion for the Secretary in determining when and how to apply them. Note that pursuant to *Chevron v. National Resources Defense Council* (467 U.S. 837, 1984) and as a general matter of administrative law, the courts typically defer to a federal agency in the interpretation of its own empowering statutes, so long as the agency interpretation is not unreasonable.

Together, statutes and regulations establish the legal framework within which VA carries out its purchased care functions.

Another important focus of our analysis involves examining the *mechanisms* by which VA carries out its activities in practice. Beyond the formal legal authority embodied in statutes and regulations, VA and other executive branch agencies also exercise considerable interpretive discretion in carrying out their functions on a day-to-day basis. A *mechanism* refers to the specific means by which an agency acts, or intends to act, within the bounds of its authority. For example, a mechanism might involve a program that is created with government facilities, personnel, and funding, such as for the provision of basic medical services through VHA facilities. Some aspects of VA's operating policies and practices are recorded in internal guidance documents, handbooks, or directives that provide direction for staff when carrying out VA business. Other aspects of VA's operating practices may not be written down at all, or may be described through a range of other types of documents of narrowly focused-application, such as a contract entered into by VA with an outside health care provider.

In Section 3, we describe the authorities and mechanisms that have been available to the Secretary for furnishing medical care to Veterans in non-VA facilities and from non-VA providers. We first review those that were in in place prior to the passage and implementation of the Veterans Choice Act. We provide an overview of programs developed in light of such authority, such as the *traditional* approach utilized by VA under 38 U.S.C. 1703 for preauthorized inpatient and outpatient services, reimbursement for *emergency* care provided to Veterans by non-VA resources, certain types of *contracting authorities* that provide VA with the ability to establish formal relationships with certain entities for sharing or purchasing health care resources, the acquisition of *specialized* services or the provision of purchased care to specialized Veteran populations, and four *key initiatives* that have helped shape delivery in the current environment. We then address the Veterans Choice Act*,* attendant changes to VA's authority in this area, and the features of the *Choice Program*. This section concludes by comparing the authority and mechanisms of all of these programs, both before and after the Veterans Choice Act. Additional detail on the legal and regulatory provisions relating to VA purchased care can be found in Appendix B.

We note that over the years, externally provided medical care has been referred to in a number of ways by Congress, VA, and others, under such labels as "Non-VA Outpatient Fee Care," "Non-VA Care Coordination," "Fee Care," "Fee Basis Care," "Purchased Care," "Non-Department Care," "Fee Program," "Preauthorized Care," "Non-VA Care," and "Non-VA Medical Care" (see, for example, VHA Directive 1601, 2013a, p. 1). In this report, we generally refer to externally-provided medical care simply as *purchased care* in the broadest sense to characterize health care professionals and facilities that are not part of VA and the care they provide, regardless of the underlying authority, purpose, or circumstances of such utilization.

3.1 Pre–Veterans Choice Act Authority and Mechanisms

While what constitutes purchased care may seem relatively straightforward, the concept covers a wide-ranging set of circumstances with different goals, mechanisms, and target Veteran populations. For the purposes of this discussion, purchased care available just prior to the

passage of the Veterans Choice Act can be divided into two categories. The first is *broad-based external services*. This type of care is generally available to any eligible Veteran, covers the widest variety of medical and dental services, and can involve treatment in inpatient, outpatient, and emergency settings (though we describe it more fully elsewhere in this Section 3, the Veterans Choice Act's Choice Program is intended to deliver broad-based external services as well). The second category is *specialized external services*. These services involve the use of purchased care resources to address the needs of specific subsets of Veterans, sometimes to provide specialized services available only from selected types of health care providers. While specialized external services can address critical aspects of an individual Veteran's health needs, broad-based external services are most relevant to a discussion of authorities and mechanisms for furnishing care at non-VA facilities if the underlying goal is to increase access for Veterans generally. The following sections provide a brief overview of the authorities for both broad-based and specialized external services, though we generally focuses on the former.[20]

3.1.1 Broad-Based External Services

3.1.1.1 Traditional Authority Under 38 U.S.C. 1703

The core statutory authorities for broad-based external services can be found in the U.S. Code at Title 38, Section 1703, as implemented by VA regulations set forth in the Code of Federal Regulations (C.F.R.) at Title 38, Sections 17.52–17.56. We characterize this authority as that for "traditional purchased care" because it has been the primary means of utilizing non-VA facilities and providers since the late 1950s. VA is authorized under 38 U.S.C. 1703 to contract for medical and dental care when VA facilities are "not capable of furnishing economical hospital care or medical services because of geographical inaccessibility" *or* when VA facilities "are not capable of furnishing the care or services required." If either condition is met, the types of care that can be authorized include the following:

- Hospital care or medical services for the treatment of a service-connected disability, a disability that led to a discharge or release from service, or any disability of a Veteran who has a total and permanent service-connected disability (38 U.S.C. 1703(a)(1))
- Medical services for the treatment of a Veteran with a service-connected disability rated at 50 percent or more, a Veteran who has already received medical care for a disability but requires additional medical services to complete treatment, or certain types of

---

[20] It should be noted that we do not treat community-based outpatient clinics as specific providers of non-VA medical care for Veterans. Though such clinics may be owned and staffed by VA or may lease space that is also staffed by VA, some do include contracted facilities and personnel, often provided through a health care management organization. Nevertheless, there are no fundamental restrictions on Veterans obtaining health care services through a community-based outpatient clinic. The Veteran does not have to seek prior authorization nor make any upfront payment of out-of-pocket expenses (at least not for services similar to those received at a traditional VAMC), and all such clinics are affiliated with a specific VAMC in terms of administrative responsibility. As such, we characterize community-based outpatient clinics in the same manner as any other VA medical facility.

Veterans whose medical condition precludes appropriate treatment in VA facilities (38 U.S.C. 1703(a)(2))

- Emergency hospital care or medical services in situations that pose a serious threat to the life or health of a Veteran who is already receiving nursing home care in a non-VA facility or already receiving medical services in a VA facility (38 U.S.C. 1703(a)(3))

- Hospital care for female Veterans (38 U.S.C. 1703(a)(4))

- Hospital care, or medical services in place of hospital care, for Veterans outside of the contiguous 48 states (38 U.S.C. 1703(a)(5))

- Diagnostic services needed to determine eligibility or appropriate course of treatment at an outpatient clinic for medical services in place of hospital care (38 U.S.C. 1703(a)(6))

- Outpatient dental services, treatment, and appliances for former prisoners of war (38 U.S.C. 1703(a)(7))

- Diagnostic services for determining eligibility for a VA benefit or service (38 U.S.C. 1703(a)(8)).

The legislative grant of power to VA to contract with outside providers is broader than it might appear from the granulated categories in the statute. A key provision in the enabling statute is the one that addresses medical services for the treatment of any disability of a Veteran who has already received VA medical care but nevertheless requires additional medical services to complete treatment (38 U.S.C. 1703(a)(2)(B)). What widens the reach of Section 1703 is that the terms *disability* and *medical services* have expansive meanings under Title 38 of the U.S. Code. Under 38 U.S.C. 1701(1), a disability is defined as any "disease, injury, or other physical or mental defect" (rather than the more common conceptualization of an impairment that limits one or more major life activity); thus any Veteran who is already receiving VA medical services for nearly any type of medical condition would clear at least one statutory threshold for external health care provision. Moreover, 38 U.S.C. 1701(6) defines medical services in a very broad way, going beyond examination, treatment, and rehabilitation to include surgical services, dental services and appliances, optometric and podiatric services, preventive health services, and non-institutional extended care services. The language of 38 U.S.C. 1703 allows the use of external services for *any* Veteran if (1) he or she has already been seen by VHA providers and (2) it can be determined that non-VA resources are required to address the Veteran's medical needs in some way (assuming that there is a lack of capacity on VA's part to furnish the care at all or to do so economically as a result of geographic inaccessibility). Table 3-1 describes key aspects of the authorities and mechanisms related to the traditional authority under 38 U.S.C. 1703 for purchasing care.[21]

---

[21] We refer to the purchased care authorities granted by 38 U.S.C. 1703 and programs established thereunder as *traditional purchased care.*

Table 3-1. Key Features of Traditional Purchased Care

Feature	Description
Situational eligibility	VA not capable of furnishing . . . (1) *economical* care/services because of "geographical inaccessibility" **or** (2) *required* care/services
Status eligibility	Many conditions and situations qualify, but two may be most commonly utilized: (1) treatment of any service-connected disability/condition; **or** (2) treatment of any disability if (a) Veteran previously seen by VHA providers **and** (b) non-VA resources are required to complete treatment
VA discretion to utilize or pay for non-VA care	VA **may** employ if eligibility criteria are met
Provider qualifications or requirements	None, as long as (a) existing contract is in place, **or** (b) individual authorization is granted in instances where need is infrequent
Veteran input into provider choice	None specifically authorized
Additional requirements for inpatient treatment	VA or other federal facility must not be " feasibly available," defined as when (1) "urgency" of condition, (2) "relative distance," **or** (3) treatment required make use of external resource is "necessary or economically advisable." Stay limited to time needed to stabilize/improve condition
Additional requirements for outpatient treatment	None

Feature	Description
Payments	If *inpatient*, "prospective payment system similar to that used in the Medicare program"; in practice this means (1) The non-VA hospital rate (2) The VA cost-to-charge rate If *outpatient*, (1) the amount described on any contract or negotiated agreement, **_or_** (2) if no contract or agreement exists but there is an applicable "Medicare rate", the lower of (a) the "Medicare rate", (b) the "repricer" rate, **_or_** (c) amount the provider bills general public; (3) If no contract or agreement exists and there is no applicable "Medicare rate", the lower of (a) the local VA Fee Schedule;, (b) the "repricer" rate, **_or_** (c) amount the provider bills general public
Direct payer of provider	VA
Medical record sharing requirements	Implemented programmatically
Coverage	National
First year implemented or authorized	1957, though authority most similar to current form was enacted in 1986
Status	Active
Key statutes or laws	38 U.S.C. 1703
Key regulations	38 C.F.R. 17.52–17.56

38 U.S.C. 1703 states only that the VA Secretary "may contract" with external providers, not that the Secretary must. As such, VA has considerable discretion to define the circumstances under which it will pay for such services, and it can place additional conditions on external provider utilization if it so desires (and it has done so in the past).

VA-promulgated regulations implementing 38 U.S.C. 1703 are found at 38 C.F.R. 17.52–17.56, "Use of Public or Private Hospitals." These regulations impose additional requirements on Veteran eligibility and describe the circumstances under which the use of non-VA resources would be appropriate. Notably, 38 C.F.R. 17.52 states that any such exercise of authority under

38 U.S.C. 1703 would be possible only through contracts with non-VA facilities or, when "demand is only for infrequent use," the use of "individual authorizations."[22] In other words, VA must have a contract in place before an external resource can be used, or, in the absence of such an existing relationship, it must issue an explicit authorization for an individual Veteran for a particular course of treatment. Furthermore, 38 C.F.R. 17.53 restricts inpatient treatment by external providers to instances in which any VAMC or other federal facility where the Veteran could conceivably be seen is "not feasibly available," in other words, when the (1) "urgency of the applicant's medical condition," (2) "the relative distance of the travel involved," or (3) "the nature of the treatment required" make the use of an external provider rather than a VA resource "necessary or economically advisable." In addition, the authorization is limited to the "period of time required to stabilize or improve the patient's condition to the extent that further care is no longer required to satisfy the purpose for which it was initiated."

3.1.1.2 Emergency Services

Services under 38 U.S.C. 1703 are often referred to as "preauthorized care" because the Veteran must receive explicit permission from VA prior to visiting external health care professionals or facilities or else risk being personally liable for the costs of services rendered. In a crisis situation, however, obtaining appropriate VA approval prior to arriving at a hospital's emergency department or calling for paramedics may be impractical or put the Veteran's life or health at risk. Two key statutes provide the legislative authority for VA payment of external emergency care without prior approval, differing by whether or not the event was related to a service-connected condition.[23]

The first of these statutes is 38 U.S.C. 1728, under which VA will reimburse a Veteran for the costs of emergency treatment (or pay the provider directly) as long as the event was related to a service-connected disability (either directly or indirectly) or the Veteran had a service-connected total disability. While the statute does say that the VA Secretary "shall" reimburse, any reimbursement will be "under such regulations as the Secretary prescribes."[24] Such regulations can be found at 38 C.F.R. 17.120–17.121, with Section 17.120 limiting 38 U.S.C.

---

[22] We have been informed that VA is moving away from the use of term *individual authorizations*; instead, VA will refer to these as *other forms of agreements*.

[23] There is also additional authority in the U.S. Code for utilizing non-VA emergency care. First, 38 U.S.C. 1703 (a)(3) authorizes the use of non-VA resources in emergencies posing a serious threat to the life and health of Veterans in nursing homes or while receiving treatment at VA facilities. In addition, Section 1703(a)(2)(B) and its associated regulations address situations in which VA can preauthorize the use of external emergency resources and when the emergency involves treatment already being received by the Veteran. Second, 38 U.S.C. 1728(a)(4), which covers emergency services provided to Veterans participating in a vocational rehabilitation program. Our discussion in this section focuses on the perhaps more common circumstances constituting an emergency—one in which prior approval would not be practical, involving a condition not previously treated by VA, and the Veteran is not in a nursing home, participating in a vocational rehabilitation program, or at a VA health care facility at the time of emergency.

[24] The original version of this statute, the Veterans Health Care Expansion Act of 1973 (Pub. L. 93-82), Section 106(a), indicated only that VA may reimburse.

1728 reimbursement to claims "timely filed" by Veterans. Furthermore, the emergency must be one in which "a prudent layperson would have reasonably expected that delay in seeking immediate medical attention would have been hazardous to life or health," thus "placing the health of the individual in serious jeopardy, serious impairment to bodily functions, or serious dysfunction of any bodily organ or part." Moreover, any VA or other federal facilities providing health care to Veterans that could have theoretically provided emergency services must not have been "feasibly available," and any attempts to use them would "not have been reasonable, sound, wise, or practicable" or the treatment authorization "had been or would have been refused."

The other main avenue to reimbursed external emergency care is 38 U.S.C. 1725, which does not require a Veteran to have a service-connected disability. The enabling statute, created as part of the Veterans Millennium Health Care and Benefits Act (which is why payments for non–service-connected emergency services under this provision are popularly known as "Mill Bill" reimbursements), does have some important restrictions, however.[25] The Veteran must be enrolled and have received some type of VA health care in the previous two years (though not necessarily related to the conditions that led to the emergency) and be otherwise "personally liable" for the charges. The personal liability requirement means that the Veteran has (1) no entitlement to any health care plan or contract (such as private health insurance, Medicare or Medicaid benefits, or workers' compensation benefits) that might cover some part of the charges and (2) no recourse against any "third party" (such as an automobile liability carrier following a motor vehicle collision, an employer or an employer's insurance carrier) that could pay the entire bill for services. Put another way, VA must essentially be the resource of last resort to cover the costs of the emergency care.[26] The statute's provisions are clarified by 38 C.F.R. 17.1000–17.1008. Section 17.1002 generally mirrors the language in 38 C.F.R. 17.120 for assessing the reasonableness of service-connected emergency claims. It also contains a version of the "feasibly available" and "prudent layperson" standards described earlier with regard to defining a true emergency and whether a VA facility should have been used instead.

Appendix E includes a more complete overview of the key features of these two types of emergency care authorities for purchased care.

3.1.1.3 Related Contracting Authorities

External services provided to Veterans under 38 U.S.C. 1703, 1725, and 1728 are often acquired on an ad hoc basis; in other words, a Veteran has a medical issue that requires only one or perhaps just a handful of contacts with specific non-VA health care professionals or facilities, and the Veteran may be the only patient (or one of just a handful of patients) treated by the

---

[25] Pub. L. 106-117 (1999). This original enabling statute was later amended by Pub. L. 110-387 (2008) and Pub. L. 111-137 (2010), with both amendments easing the requirements somewhat for reimbursing emergency care.

[26] When a third party is responsible for paying part of emergency services (such when a Veteran is 50 percent responsible for a motor vehicle accident), VA will act as a secondary payer and cover only the Veteran's share of the expense (38 U.S.C. 1725(c)).

---

professional or facility whose services would ultimately be paid for or reimbursed by VHA. In such instances, VHA receives a statement from the provider or a request for reimbursement from the Veteran that itemizes the costs of each service delivered and indicates whether the circumstances and the services rendered are appropriate uses of non-VA care according to statutes and regulations. If so, VHA pays the bill.[27] Increasingly, however, VA appears to be moving away from such a "fee-for-service" model requiring individual authorizations toward one in which external care is delivered by health care providers who have an existing and ongoing relationship with the agency and the costs of services delivered are determined in advance. The three main vehicles for establishing such relationships beyond the traditional fee-for-service approach—purchased care contracts, sharing agreements with DoD, and sharing agreements with VA's "academic affiliates"—are described in the following sections. It should be kept in mind, however, that these three contracting vehicles do not constitute an expansion of basic VA authority to purchase care for Veterans, beyond that in 38 U.S.C. 1703, 1725, and 1728.

3.1.1.3.1 Purchased Care Contracts

The "sharing of medical facilities, equipment, and information" by VA is addressed by 38 U.S.C. 8151–8158. The key statute of interest here in terms of purchased care is 38 U.S.C. 8153, which allows VA—when it determines that it is "in the best interest of the prevailing standards of the Department medical care program"—to "make arrangements, by contract or other form of agreement for the mutual use, or exchange of use, of health-care resources between Department health-care facilities and any health-care provider, or other entity or individual." Although this language may seem to imply a reciprocal agreement in which VA offers its services in exchange for those provided by others, in actuality, the statute is commonly used as the basis for *directly* purchasing services and supplies from a wide range of health care providers.[28] Examples include contracting for dialysis services, organ transplants, anesthesia services, diagnostic radiology, and psychiatric care.

Section 8153(a)(3)(B) allows VA to enter into such commercial medical care contracts, which may involve services delivered over a relatively long period of time and for considerable sums of money, through the use of certain "simplified" contracting rules "without regard to any law or regulation that would otherwise require the use of competitive procedures for procuring the resource" (48 C.F.R. 873.101–873.118). 38 U.S.C. 8153 plays a key role in recent initiatives that VA has rolled out to deliver purchased care, with third parties essentially administering all aspects of the referral, including choosing the providers, scheduling appointments, processing claims, and coordinating care. The language of the statute permits VA wide latitude to contract

---

[27] When there is no existing contract or agreement in effect (as might be the case when external health care is sought only on an occasional fee-for-service basis), 48 C.F.R. 801.670-3 (part of the set of VA Acquisition Regulations, or VAAR) allows certain officials at VA medical facilities to order medical, dental, and ancillary services when the amount authorized is less than $10,000. In such situations, 48 C.F.R. 813.307(c) and 48 C.F.R. 853.213 describe the forms that must be executed when ordering the services under the simplified procedures for VA acquisition set forth in 48 C.F.R. 873.101–873.118.

[28] As described later, VA often enters such reciprocal agreements with DoD and certain academic institutions.

with managed care organizations and other entities that oversee (or directly employ) entire networks of providers.

VA contracting for outside health services under Section 8153 implicates the area of law pertaining to government procurement activities more generally. In Section 5 of this report, we discuss VA contracting for purchased care generally, and related authorities, in much greater detail.

3.1.1.3.2 DoD Sharing Arrangements

Another statute concerning the acquisition of external services is 38 U.S.C. 8111, under which VA and DoD can enter into arrangements for utilizing each other's medical care facilities and providers: "The Secretary of Veterans Affairs and the Secretary of Defense shall enter into agreements and contracts for the mutually beneficial coordination, use, or exchange of use of the health care resources of [their respective Departments.]" Unlike 38 U.S.C. 8153, which can be used with any public or private provider, Section 8111 focuses exclusively on DoD as VA's intended partner. Moreover, the flow of services and products under Section 8111 has been in both directions, with VA "selling" (i.e., treating DoD patients and seeking reimbursement later) and "buying" (i.e., sending VA patients to DoD). Nevertheless, compared with other means of acquiring external health care, VA's use of existing DoD facilities and personnel is a minor contributor to the overall cost of addressing the medical needs of Veterans at slightly more than $100 million per year.[29] Issues related to the physical distribution of such facilities (which may not be located near population centers) and potential interruptions due to security concerns or DoD priorities may limit the utility of these arrangements for VA (see GAO, 2008).

3.1.1.3.3 Academic Affiliate Sharing Arrangements

The authorization under 38 U.S.C. 8153 to establish sharing agreements and other relationships with external entities offers minimal guidance on which entities should be prioritized. That said, 38 U.S.C. 7302 separately mandates VA to "carry out a program of education and training of health personnel" in cooperation with schools of "medicine, osteopathy, dentistry, nursing, pharmacy, optometry, podiatry, public health, or allied health professions." Section 8153(a)(3)(A) reflects that policy by allowing the use of noncompetitive sharing agreements (in other words, sole-source contracts) with affiliated academic institutions, such as medical schools, teaching hospitals, and associated clinical practices. The enhanced ability to enter into sole-source contracts without competitive bidding, in combination with VA's underlying mission to "assist in providing an adequate supply of health personnel to the Nation" (38 U.S.C. 7302(a)), has been an important factor in the growth of arrangements with academic affiliates. While the program is primarily one where non-VA health care professionals (such as medical school residents) receive training at VA facilities, VA purchases more than $1 billion dollars in

---

[29] In FY 2013, for example, DoD purchased $152 million in services and goods from VA; in turn, DoD provided $119 million in medical resources to VA (VA, 2015b, p. 200). To put these numbers into perspective, VHA's Chief Business Office's estimate of total spending in FY 2014 for all purchased care was $5.6 billion (VA, 2014c).

services each year from their academic affiliates (for example, a VA patient may be sent to a medical school for certain radiological services).

3.1.2 Specialized External Services and Specialized Veteran Populations

There are many other programs that could be characterized as VA purchased care, since they also rely on external providers and resources to deliver health care to Veterans. However, their utility as a means of expanding a wide range of health care services to Veterans generally is limited. These programs include, for example, agreements to reimburse IHS and Tribal Health Program health facilities for services provided to American Indian and Alaskan Native Veterans;[30] the authority under 38 U.S.C. 7409 to enter into contracts with medical and nursing schools, "clinics," or "any other group or individual" for the provision of "scarce medical specialist services"; and the Foreign Medical Program under 38 U.S.C. 1724, which is used to reimburse medical expenses incurred by Veterans with service-connected disabilities who require treatment while residing or traveling abroad. Appendix E includes a comprehensive list of these programs.

3.1.3 Pre–Veterans Choice Act Initiatives

VA has implemented a series of programmatic mechanisms in recent years with various goals, such as better utilizing purchased care resources, containing costs, enhancing the coordination of care, and addressing the needs of underserved Veterans. These programs' origins range from congressional mandates to internally developed VA initiatives. Some seem to have been specifically directed at various concerns that have been raised regarding purchased care generally, while others were intended to be the primary templates for VA's purchased care activities in the future.

The following discussion addresses four such programs: a pilot to explore using provider networks for purchased care in certain VISNs (Project HERO), expanded eligibility rules for certain rural Veterans in selected locations to also employ provider networks (Project ARCH), a nationwide rollout of a provider network approach (Patient-Centered Community Care, or PC3), and a more centralized approach to administering purchased care (Non-VA Care Coordination Program, or NVCC).[31]

---

[30] IHS, part of the U.S. Department of Health and Human Services, provides health services to members of federally recognized American Indian and Alaska Native tribes. VA reimburses IHS and the Tribal Health Program for care provided to Veterans through reimbursement agreements authorized under 38 U.S.C. 8153.

[31] Not included in the discussion in this section are demonstration projects for expanding access for rural Veterans authorized by Section 307 of the Caregivers and Veterans Omnibus Health Services Act of 2010 (Pub. L. 111-163). Among the projects contemplated by Congress were partnerships between VA and the IHS, U.S. Department of Health and Human Services, and CMS, among other agencies, for non-VA facilities and providers. That said, it appears that the primary vehicle for expanding access for this Veteran population has been the use of grants to fund enhanced transportation to both VA and non-VA medical facilities for highly rural Veterans, as described in 38 C.F.R. 17.700–17.730. Because these grants simply facilitate rather than authorize or direct the use of non-VA providers, we do not include them here as a relevant recent initiative.

In the discussion below, we use some key terminology in explaining these purchased care initiatives. By *provider*, we mean any health care professional or facility that might render medical services to Veterans in connection with one of the programs described in Section 3. By *network*, we mean a group of providers who have executed agreements with the same organization to deliver medical care under predetermined rules and conditions. Such an organization is a *network administrator* and may be a preferred provider organization, insurer, employer, third-party administrator (TPA), health maintenance organization, or health plan. A provider who agrees to join the network is said to be "participating" as an "in-network provider." A provider who does not join the network but nevertheless is utilized for purchased care services is said to be an "out-of-network provider." Generally, network administrators and the providers within that network are independent of each another and not agents (or principals), employers (or employees), or other legal representatives. The predominate type of network administrator in VA's current purchased care programs is a TPA.

We also use the term *contractor* for any organization or individual under contract with VA to deliver some type of medical service. For example, in some of the programs described in this section, a network administrator makes its network of providers available to VA under contract to supply medical services. Thus, a network administrator can be characterized as a type of contractor.[32] The term *contractor* can also be applied to a medical facility that delivers contracted medical services to VA, typically using its own employees. Individual providers can also contract with VA (and, as such, can be contractors). Still another type of contractor would be any organization that has contracted with VA to provide administrative services for VA purchased care, such as claims administration.

3.1.3.1 Project HERO

Project HERO (*Healthcare Effectiveness Through Resource Optimization*) was created in response to a House Conference Committee report issued in connection with the 2006 Military Quality of Life and Veterans Affairs Appropriations Act (Pub. L. 109-114). While Project HERO is no longer an active initiative, we describe it here because many of its features were subsequently used as a model for later programs, in particular PC3 (Jones, 2012). The committee report urged VA to explore new medical case management strategies, though what VA ultimately implemented was less an exercise in fully managed care than a means of enhancing the existing purchased care program (House Report 109-305, 2005, pp. 43–44; Panangala, 2010, p. 4). The pilot program went live in January 2007 and was tested in VISNs 8, 16, 20, and 23. It employed provider networks under contract to VA for supplemental referrals when similar care was not available at local VAMCs or VA clinics. The goal, according to one observer, was to make "contracted providers virtual, high-quality extensions of VHA" (American Legion, n.d.). VA contracted with Humana Military Healthcare Services, Inc. (for medical services) and Delta Dental (for dental services) to operate as network administrators. These contracts terminated in September 2012 and March 2013, respectively. Table 3-2 describes Project HERO's features.

---

[32] We have been informed that VA's currently preferred term for a TPA is *contractor*.

Table 3-2. Key Features of Project HERO

Feature	Description
Situational eligibility	Same as for traditional purchased care
Status eligibility	Same as for traditional purchased care, though specialty required must also be one offered by a HERO contracted provider
VA discretion to utilize or pay for non-VA care	Same as for traditional purchased care
Provider qualifications or requirements	(1) Provider must be part of the HERO network (which may impose additional credentialing requirements); **_and_** (2) Provider is located within a "reasonable distance" from the Veteran
Veteran input into provider choice	Presumably limited; HERO contractor sets up appointment with provider within network
Additional requirements for inpatient treatment	Same as for traditional purchased care
Additional requirements for outpatient treatment	Same as for traditional purchased care
Payments	Presumably at or below the amounts allowed for traditional purchased care; reportedly a negotiated percentage of local Medicare rates
Direct payer of provider	HERO contractor
Medical record sharing requirements	Contractually required
Coverage	VISNs 8, 16, 20, and 23
First year implemented or authorized	2007
Status	Final contracts expired March 2013
Key statutes or laws	Same as for traditional purchased care
Key regulations	Same as for traditional purchased care

VA fee staff (in consultation with the contractor) would determine whether referral to Project HERO was appropriate, assuming all other criteria for purchased care were satisfied. That

determination would be driven by (1) whether the specialty required was one offered by the HERO contractor and (2) whether the HERO provider selected by the contractor was located within a "reasonable distance" of the Veteran.[33] If both criteria were met, the contractor would be responsible for contacting the Veteran to set up an appointment. The contractor would also act as the conduit for exchanging clinical information between VA and the provider, both before and after the service was provided.[34] Payments to providers were simplified, coming from the contractor rather than the U.S. Department of the Treasury.[35] Presumably, such payments would not exceed those allowed under existing statutory and regulatory authority for purchased care. Reportedly, however, providers were paid a "negotiated percentage" of CMS rates, according to "local market rates where the services are provided" (Panangala, 2010, p. 12). As compensation for managing the provider network and administering the payment and information exchange, the contractor was paid a value-added fee equivalent to just under 8 percent of total billings in FY 2009 (Panangala, 2010, p. 13, Table 2).

3.1.3.2 Project ARCH

Project ARCH (*Access Received Closer to Home*) is an effort to explore a more patient-centered approach to the use of purchased care in a coordinated, cost-effective manner. ARCH is the result of Section 403 of the Veterans' Mental Health and Other Care Improvements Act of 2008 (Pub. L. 110-387), which required VA to test the subsidization of health care costs for rural Veterans in locations other than those testing Project HERO.[36] The pilot program was first fielded in 2011 as a three-year test in rural VAMCs and focused on selected medical services.[37] The services would be provided "through contracts," presumably in contrast with individual payments to external providers for fee-based care. VA selected the Cary Medical Center (in Maine) and Humana Veterans Health Services (all other sites) to act as the initial network administrators. The pool of providers available under ARCH was limited to those who had executed agreements with the network administrators (VHA Chief Business Office, 2014). The

---

[33] While a reasonable distance standard was not specifically defined, as a matter of practice, the contractor would inform VA staff whether the available network provider was more than 50 miles from the Veteran's residence. If so, VA staff would have the option of canceling the HERO referral and using another means to supply the required care. The distance standard appears to be the result of an internal VA business practice rather than a formal feature of Project HERO (Panangala, 2010, p. 11).

[34] As a contractual requirement, the network administrator sent the medical record of the treatment back to the originating VAMC (Panangala, 2010, p. 7).

[35] The contractor would seek reimbursement from VA at a later point.

[36] Authority for the pilot program was later amended by Section 308 of the Caregivers and Veterans Omnibus Health Services Act of 2010 (Pub. L. 111-163).

[37] The program was officially called the Pilot Program of Enhanced Contract Care Authority for Health Care Needs of Veterans in Highly Rural Areas. The pilot was implemented in VISNs 1, 6, 15, 18, and 19 (Caribou, Maine; Farmville, Virginia; Pratt, Kansas; Flagstaff, Arizona; and Billings, Montana). Under the Veterans' Mental Health and Other Care Improvements Act of 2008, VA had the discretion to include other VISNs in the program, but it appears not to have done so.

Veterans Choice Act extended ARCH an additional two years, and it now has a termination date of August 2016.[38]

The Congressional mandate included a clear expansion of the eligibility rules set forth for traditional purchased care, albeit only for a geographically-defined set of Veterans (Table 3-3). A Veteran living in one of the pilot sites would be eligible for ARCH under one of the following conditions: (1) the Veteran's home was more than 60 minutes driving time from the nearest VA primary health care service facility (if the Veteran was seeking primary care); (2) the Veteran lived more than 120 minutes driving time from the nearest VA facility offering acute hospital care (if acute medical care were sought); or (3) the Veteran lived more than 240 minutes driving time from the nearest tertiary care VA health care facility (if tertiary care were sought). The original enabling statute determined eligibility based on distance rather than time, so the maximum travel criteria to the three facility types were 60 miles, 120 miles, and 240 miles, respectively. That language was subsequently changed by Section 308 of the Caregivers and Veterans Omnibus Health Services Act of 2010 (Pub. L. 111-163).[39] The original statute also included language that would have expanded the pilot program to Veterans who lived within the driving limits but who nevertheless faced "such hardship or other difficulties in travel to the nearest appropriate Department health care facility that such travel is not in the best interest of the veteran, as determined by the Secretary pursuant to regulations prescribed for purposes of this subsection." The subsequent revision dropped that alternative eligibility definition (Pub. L. 111-163).

Table 3-3. Key Features of Project ARCH

Feature	Description
Situational eligibility	(1) If seeking primary care, Veteran must reside more than 60 min. driving time to nearest VA primary health care facility; _**or**_ (2) If seeking acute hospital care, must reside more than 120 min. driving time to nearest VA acute hospital care facility; _**or**_ (3) If seeking tertiary care, must reside more than 240 min. driving time to nearest VA tertiary care facility.
Status eligibility	Veteran must be (1) Residing in a pilot site; _**and**_ (2) Currently enrolled for VA health care Services required must be offered by an ARCH contracted provider

---

[38] The extension gives VA the ability to rely on existing ARCH contracts or to enter into new ones, presumably including those now utilized for the Choice program.

[39] Nevertheless, the language in the current version of the statute continues to use the phrase _driving distance_ rather than _driving time_, even though eligibility is based on minutes of driving.

Feature	Description
VA discretion to utilize or pay for non-VA care	VA **_shall_** provide covered health services to eligible Veterans (if electing) through ARCH provider contracts (assuming qualified providers are available)
Provider qualifications or requirements	Provider must be part of an ARCH network or facility VA determines whether provider is "qualified"
Veteran input into provider choice	Presumably limited to providers within ARCH network
Additional requirements for inpatient treatment	Presumably none if Veteran is otherwise eligible
Additional requirements for outpatient treatment	Presumably none if Veteran is otherwise eligible
Payments	Reportedly a negotiated percentage of local Medicare rates for four sites managed by a vendor, while full Medicare rates for the site directly contracting with VA
Direct payer of provider	ARCH contractor
Medical record sharing requirements	Mandated by statute
Coverage	Certain rural VAMCs in VISNs 1, 6, 15, 18, and 19
First year implemented or authorized	2011
Status	Now scheduled to terminate in August 2016 as a result of a Veterans Choice Act extension
Key statutes or laws	Pub. L. 110-387, Sec. 403; Pub. L. 111-163, Sec. 308; Pub. L. 113-146, Sec. 104; Pub. L. 113-175, Sec. 409
Key regulations	None that can be identified

Eligibility is based primarily on the patient's status as a "highly rural" Veteran, determined by a simple drive-time test related to the specific medical need rather than "geographic inaccessibility" or other Section 1703 criterion. VA calculated drive times for every Veteran in each of the pilot sites, so eligibility had essentially been determined before the program was

under way.[40] That said, the Veteran's VA provider would still need determine that a service available under ARCH was needed, even if the Veteran met one of the drive time criteria. In addition, Veteran participation is voluntary and could be withdrawn if other types of purchased care were preferred or if the Veteran were willing to tolerate drive times exceeding the ARCH-qualifying standards.

Besides simply offering purchased care to Veterans with geographical access limitations, ARCH mandates that the care be provided on a timely basis. Section 104 of the Veterans Choice Act requires that medical appointments under ARCH be "scheduled not later than 5 days after the date on which the appointment is requested" and "occur not later than 30 days after such date." It is not clear what the consequences might be if an appointment is not delivered within these limitations, however.

One important aspect of ARCH is that it was funded by VA's Office of Rural Health rather than the VAMC where the consults originated.[41] In FY 2012, for example, the office allocated $35 million for ARCH-related needs (Veterans' Rural Health Advisory Committee, 2012, p. 3). In FY 2015, funding for ARCH, like for all VA purchased care, was moved to the VHA Chief Business Office budget.[42] Thus, referrals to purchased care throughout the ARCH experience would have had a minimal direct impact on a VAMC's budget, essentially eliminating any significant financial disincentive at the local level to use non-VA providers. In contrast, funds expended for purchased care as part of Project HERO were sourced from the VISNs where the pilot programs operated.[43] Another important aspect involves provider reimbursement rates. In four of the five ARCH sites, the managing organization made arrangements with its network providers to pay, as was true under Project HERO, negotiated percentages of Medicare rates (Tester, 2014). But because Cary Medical Center in Maine directly contracted with VA as a provider, 100 percent of applicable Medicare rates were paid (Dickson, 2014b; Non-VA Care: An Integrated Solution for Veteran Access, 2014).

3.1.3.3 PC3

PC3 (Patient-Centered Community Care, sometimes referred to as PCCC) was created by VA in 2013 based on what was learned from Project HERO and other pilot/demonstration programs. The first contracts with regional health care networks TriWest Healthcare Alliance and Health Net Federal Services were awarded in September 2013 for the delivery of external health care in a manner similar to a private employer's TPA for managing health care benefits. This particular initiative was being fully rolled out when the Veterans Choice Act was passed.

---

[40] The Veteran would nevertheless have to "submit to [VA] an application . . . containing such information as [VA] shall specify for purposes of the pilot program" (Project ARCH, n.d.).

[41] While management of ARCH originated in VHA's Chief Business Office, the Office of Rural Health reportedly assumed operational oversight in October 2011 (Veterans' Rural Health Advisory Committee, 2012, p. 3).

[42] See Section 106(b) of the Choice Act.

[43] In FY 2009, for example, Project HERO payments were 0.43 percent of total budgets for the relevant VISNs.

A key point to keep in mind is that PC3 (like Project HERO) does not provide any expanded authority for VA to utilize non-VA resources (see Table 3-4).[44] It simply addresses administrative aspects of existing authority, such as that available under 38 U.S.C. 1703 related to geographical inaccessibility or when VA facilities are incapable of furnishing the care that the Veteran requires. VA medical center staff determine whether PC3 resources are appropriate.

Table 3-4. Key Features of PC3

Feature	Description
Situational eligibility	Same as for traditional purchased care
Status eligibility	Same as for traditional purchased care, though specialty required must also be one offered by a PC3 contracted provider
VA discretion to utilize or pay for non-VA care	Same as for traditional purchased care
Provider qualifications or requirements	(1) Provider must be part of the PC3 network; **_and_** (2) Provider is located within a "reasonable distance" from the Veteran.
Veteran input into provider choice	Presumably limited; PC3 contractor sets up appointment with provider within network
Additional requirements for inpatient treatment	Same as for traditional purchased care
Additional requirements for outpatient treatment	Same as for traditional purchased care
Payments	Presumably at or below the amounts allowed for traditional purchased care; reportedly a negotiated percentage of local Medicare rates
Direct payer of provider	PC3 contractor
Medical record sharing requirements	Contractually required
Coverage	National
First year implemented or authorized	2013

---

[44] In contrast, Project ARCH had a congressional mandate expanding Veteran eligibility beyond that set forth in 38 U.S.C. 1703, 1725, and 1728.

Feature	Description
Status	Active
Key statutes or laws	Same as for traditional purchased care
Key regulations	Same as for traditional purchased care

The initial focus was on medical and surgical services other than primary care, dialysis, and mental health, but the program has been expanded over time to include inpatient specialty care, outpatient specialty care (such as home infusion therapy), certain types of emergency care, and some care for newborns of enrolled female Veterans. In August 2014, the program was expanded considerably, at least in terms of potential scope, when primary care was added (see VA Office of Public and Intergovernmental Affairs, 2014). That said, PC3 remains a program in the early stages of implementation, and, while the country has already been divided across two administrators (TriWest and Health Net), provider networks are still being developed.

One characteristic that distinguishes PC3 from purchased care (at least before the advent of the relatively recent Non-VA Care Coordination Program discussed subsequently) is its concerted effort to provide current clinical information about a patient to the health care provider at the time of service, regardless of whether the Veteran is treated by a VA or external provider. In addition, PC3 providers are required to schedule an appointment within five days of initial contact and hold the appointment within 30 days of receiving authorization, with the patient being seen within 20 minutes of arrival. There are also contractually imposed requirements regarding turnaround times for returning medical documentation (14 days for outpatient and 30 days for inpatient). Like the practice adopted during Project HERO, the health care professional or facility must be located within a "reasonable distance" of the Veteran (Health Net, n.d.-a).

As discussed in greater detail in Section 4, TriWest and Health Net act as TPAs of provider networks. Individual health care professionals and entities register with the TPAs to become preferred in-network providers.[45] When VA staff decide that referral to a PC3 provider is warranted, a request is sent to the appropriate TPA which, in turn, sends an authorization to a network provider (TriWest, n.d.). After treating the Veteran, the provider sends a claim to the TPA (or, in some instances, the claims processing vendor appointed by the TPA). As required in the network provider agreement, to be paid, the claim must be accompanied by the medical record of the treatment (see, for example, TriWest, 2015c, p. 15). If the provider believes that additional or different treatment is needed, it must contact the TPA for a supplemental authorization. Ultimately, the TPA seeks bulk reimbursement from VA for all PC3 payments it has made.

Another important aspect that differs from traditional purchased care is that providers in the TPA networks (outside of Alaska) receive amounts that are, on average, less than the full Medicare reimbursement rates—reportedly 94.5–97.5 percent for medical and surgical services

---

[45] Assessment I's report details the responsibilities of PC3 providers.

and 92–97 percent for skilled home health (Robinson, 2014; VA OIG, 2015, pp. 11–12). The rate is contractually set, and some providers have agreed to even lower levels of reimbursement.[46]

PC3 is VA's preferred mechanism for external medical services, though actual utilization (as far as we could determine) is far smaller than other paths to VA purchased care. VA materials suggest that in cases of geographical inaccessibility or a lack of availability of services through VHA, a PC3 authorization should be used unless direct contracting with providers is a "definitively" better method:

> Local contracts may be used on an exception basis. The intent is to purchase all services included in PC3 through the resultant contracts. However, a local VAMC may contract directly if needed services are not covered by PC3 or if the local contract can *definitively provide benefits above and beyond* those offered by PC3. (VHA Chief Business Office, 2014b, emphasis added)

3.1.3.4 NVCC

NVCC (*Non-VA Care Coordination Program*), the current administrative mechanism for many aspects of VA purchased care, was first rolled out as a pilot program in VISNs 11, 16, and 18 and later system-wide. Again, we note that NVCC is not an expansion of VA's ability to use non-VA medical care resources. Rather, it can be viewed as a change in internal business processes, especially with regard to standardizing referrals to external providers. Some aspects of NVCC administration now apply to all VA purchased care delivery, including PC3, Project ARCH, and the Choice Program, but the program's primarily role at the outset was to standardize procedures related to external medical care under 38 U.S.C. 1703, 1725, and 1728.

Again, it is challenging to characterize the process by which purchased care is provided under NVCC because policies, guidance, and lines of authority have changed frequently. One key difference from past practices is that VA Central Office staff now play a larger role in coordinating the delivery of external services to the Veteran: Not only does VHA make the referral, but it also sets up the appointment (see Chapter 4 for a more detailed discussion). As of January 2014, the process for obtaining an authorization for external care appeared to begin with the submission of a non-VA care consult, presumably by a VA health care professional who has been working with the Veteran.[47] That consult was then reviewed for the Veteran's administratively eligibility for external health care and whether the proposed services were medically necessary. If approved, NVCC staff would determine which purchased care option would be most appropriate (e.g., individual authorization or referral to the PC3 network), an authorization was issued and sent to the Veteran, while a separate authorization was sent to

---

[46] For example, the EmpowerChiro preferred provider application states, "Provider agrees to accept a percentage discount off the current applicable Medicare Fee Schedule, as updated from time to time, as follows: 85% of Medicare" (EmpowerChiro, 2014, Exhibit 1).

[47] This description draws heavily on VA Form 10-7078/10-7079 (VA, 2014a). Presumably, the VA health care professional has been designated by the facility's chief of staff and by VHA's Chief Business Office as an official authorized to approve purchased care consults. See VHA (2013b, 2013c).

the provider along with information about the services being authorized, the time frame for the services, and other guidance.

NVCC also marked a fundamental change how provider claims are processed. Previously, responsibility for reviewing claim eligibility and moving the paperwork was at the local level, with "fee staff" (personnel charged with claims processing and other purchased care duties) based at each VAMC. The VHA Chief Business Office is now in the process of consolidating these tasks so that only a small number of sites will be used to handle purchased care paperwork (though fee staff at individual VAMCs will continue to perform this function for the foreseeable future). When there was no preexisting contract or negotiated agreement with the provider, claims are paid in accordance with 38 C.F.R. 17.55 and 17.56, which closely follow Medicare guidelines.[48] With a preexisting arrangement, the reimbursement would be at the negotiated rate.

There has also been a focused effort under NVCC to track the flow of clinical documentation from external providers and add it to the Veteran's electronic medical record.[49] Finally, there is more standardized guidance to field the inevitable requests for appeal and to ensure compliance with statutory and regulatory requirements for the provision of external care.

NVCC continues to be VA's primary avenue for managing external care, at least in the near future. Indeed, the Veterans Choice Act clearly anticipates that the NVCC process will provide the administrative structure for the Choice option: "The Secretary shall coordinate, through the Non-VA Care Coordination Program of the Department of Veterans Affairs, the furnishing of care and services under this section to eligible veterans." As a result, NVCC staff will determine whether a Veteran would be best served by the Choice Program, PC3, fee-for-service preauthorized medical services, or another option.

3.1.4 Available Guidance for VA Purchased Care Prior to the Veterans Choice Act

The bulk of broad-based external services prior to the Veterans Choice Act were the result of decisions made at the VAMC level to authorize a Veteran to go outside of VA for nonemergency medical or dental care. It is difficult to describe the decision-making process because the guidance available to VAMC staff evolved over time and was not always consistent or up-to-date. Although the identification of controlling statutes and regulations is straightforward, internal VHA policies and procedures that define the day-to-day applications of the VA purchased care program appear to have developed piecemeal over time. In theory, staff should have been able to turn to VHA's main operation manual (Manual M-1, "Operations, Part I, Medical Administration Activities)—specifically, Chapter 18 ("Outpatient Care-Fee") and Chapter 21 ("Authorized Non-VA Hospitalization in the United States"). They would also be able

---

[48] If not applicable, the 75th percentile methodology described earlier would be used.

[49] Authorizations under NVCC put the provider on notice that submission of the medical record would be a prerequisite for payment. See VA Form 10-1079 (VA, 2014a).

to draw guidance from VHA Directive 1601 (VHA, 2013a). However, as VA's Office of the Inspector General noted in 2009,

> VHA does not have a centralized source of comprehensive, clearly written, current policies and procedures for the Fee Program. Instead, fee supervisors and staff rely on an assortment of resources including the CFR, Manual M-1, other VHA directives, procedure guides that contain some policy, technical guides for the VistA Fee system, training materials, and informal guidance, such as conference call minutes. (VA, Office of the Inspector General, 2009, p. 10)

Our own summary review of publicly available VA guidance materials describing purchased care mechanisms is broadly consistent with the foregoing observation. The last published update to Chapters 18 and 21 in Manual M-1 appears to have occurred in 1995. Although much has changed in VA purchased care, and in the broader U.S. health care landscape, in the last 20 years, each of these legacy chapters offers guidance to VHA staff on when, how, and under what terms they may seek to purchase outside health care services. While VHA Directive 1601 (" Non-VA Medical Care Program") dates from 2013, its short summary of the rules for Veteran eligibility for purchased care services lack the level of detail needed for assuring consistency in practices across VISNs and VAMCs. VA Directive 1663 ("Health Care Resources Contracting—Buying") does provide guidance on contracting practices in purchased care, and describes the roles and responsibilities of various local and regional officials in carrying out such contracting, but it has not been updated in nine years.

The shortcomings here are obvious. Despite the fact that there has been significant development in VA purchased care authority and mechanisms since these documents were published, important aspects of VA purchased care practice in 2015, are simply not included in these documents. Consequently, local VA officials seeking relevant purchased care guidance would need to look in more than one place to find it, and some aspects of current VA practice may not be captured in published guidance at all. Moreover, the content of the chapters in Manual M-1 in particular is simultaneously noteworthy for being detailed and fairly technical in some respects (e.g., concerning "Invoice Processing" under the "Fee-Basis System"), while leaving considerable discretion to local officials in other respects (e.g., concerning "When to Make Contracts" with non-federal hospitals).

Taken together and in context, even these limited materials suggest that relevant VA guidance pertaining to purchased care is scattered, outdated in parts, and inconsistent in setting clear standards for local VA officials to follow. Our subsequent findings in Section 4 suggest that local VAMCs have indeed struggled with ambiguity, in seeking to develop their own local policies and procedures for purchased care.

3.2 Veterans Choice Act Authorities and Mechanisms

With broad bipartisan support, Congress passed the Veterans Choice Act in August 2014 in part to address widely reported issues related to wait times at VA facilities. The Act covered many areas related to Veterans' medical care, along with such topics as housing loans, awards and bonuses available to VA employees, educational benefits, medical facility leases, and the removal of certain VA senior executives. The key centerpiece of the Act, however, are the

provisions that concern the delivery of medical services to Veterans through the use of non-VA entities, a topic primarily covered by Section 101 and implemented through what is popularly known as the Choice program. As its title implies, the Act was intended to give Veterans additional options when confronted by lengthy delays in obtaining appointments with VA health care providers or challenged by difficulties in traveling to VA facilities. Reports often portrayed the new Act as providing Veterans with markedly expanded discretion to select a local doctor or other caregiver, free from the bureaucratic constraints that had led to a headline-grabbing scandal earlier in the year [50]

In the sections that follow we highlight the key changes to VA purchased care triggered by the legislation. We conclude our review of authorities and mechanisms by drawing comparisons across the purchased care initiatives previously discussed and the Choice program. Additional detail on the legal and regulatory provisions relating to non-VA care can be found in Appendix B of this report.

Amendments to the Veterans Choice Act were made by Section 409 of the Department of Veterans Affairs Expiring Authorities Act of 2014 (Pub. L. 113-175), Section 242 of the 2015 Consolidated and Further Continuing Appropriations Act (Pub. L. 113-235), and Section 3 of the 2015 Construction Authorization and Choice Improvement Act (Pub. L. 114-19). Unless noted, these amendments did not significantly change the language or meaning of any of the Veterans Choice Act sections cited here.

Also of interest for this discussion are certain regulations promulgated by VA in response to the Veterans Choice Act's mandate that interim final rules implementing Section 101 be published within 90 days of enactment (Sec. 101(n)). On November 5, 2014, such rules were indeed published in the *Federal Register*, creating nine new sections in Title 38 of the Code of Federal Regulations specifically addressing the Choice program.[51] We reference the regulations in the November 2014 interim final rule here only when they differ in some meaningful fashion from the language used in the Veterans Choice Act.

3.2.1 Basic Eligibility

Under the Veterans Choice Act, a Veteran's eligibility for the Choice program is a function of both the Veteran's status and his or her personal situation (Table 3-5). The status component can be satisfied if the Veteran was already enrolled in VA's patient enrollment system as of

---

[50] For example, Representative Bradley Byrne of Alabama said in a blog post, "[U]nder most circumstances, our local veterans can now choose to visit a specialist or hospital of their choosing close to home. I cannot overstate how much this freedom of choice will mean to our veterans" (Byrne, 2014).

According to Representative Tim Huelskamp of Kansas, "Thousands of Kansas Veterans who live further than 40 miles from a VA facility— or those who have to wait more than 30 days for care—will soon be able to call their local doctor and get their healthcare needs met" (Huelskamp: Kansas Vets to Receive Their Choice Card Soon, 2014).

[51] This refers to Expanded Access to Non-VA Care Through the Veterans Choice Program, 79 Fed. Reg. 65571-01, November 5, 2014, amending 38 C.F.R., Part 17. Section 101 in the Veterans Choice Act is addressed primarily in 38 C.F.R. 17.1500–17.1540.

August 1, 2014, or if he or she is a recently discharged combat Veteran under certain circumstances (Sec. 101(b)(1)).[52] The situational component under the act as originally adopted required that the Veteran meet one of the following requirements:

4. The Veteran was unable to schedule an appointment with VA for hospital care or medical services within VHA's "wait-time goals."

5. The Veteran resides more than 40 miles from any VA medical facility.

6. The Veteran resides more than 20 miles from any VA medical facility if his or her state of residency lacks a VA medical facility providing hospital care, emergency services, or inpatient surgical care.

7. The Veteran resides 40 miles or less from any VA medical facility but either is required to travel by air or water or is faced by an "unusual or excessive burden" in accessing those facilities due to "geographic challenges" as defined by VA (Sec. 101(b)(2)).[53]

Some of the conditions attached to situational eligibility have important implications for the size of the eligible Veteran population. Sec. 101(s)(1) of the Veterans Choice Act provides a default definition for VHA's wait-time goal: not more than 30 days from the date a Veteran requests hospital care or medical services from VA.[54] However, the law also provided an option for VA to use a different standard if it submitted a report to Congress setting forth different wait-time goals within 60 days of the act's passage (Sec. 101(s)(2)). Such a report was submitted on October 3, 2014, establishing a standard that, while nominally holding to the default 30-day period, markedly changed the points at which the clock may start to tick:

> Unless changed by further notice in the Federal Register, the term 'wait-time goals of the Veterans Health Administration' means not more than 30 days from either the date that an appointment is deemed clinically appropriate by a VA health care provider, or if no such clinical determination has been made, the date a Veteran prefers to be seen for hospital care or medical services. In the event a VA health care provider identifies a time range when care must be provided (e.g., within the next 2 months), VA will use the last clinically appropriate date for determining whether or not such care is timely. The Department anticipates that the Under Secretary for Health periodically will consider changes to the wait-time goals of the Veterans Health Administration as appropriate. (VA, 2014c; see also 79 Fed. Reg. 62519–62520)

As such, the standard for situational eligibility under the Veterans Choice Act, if based solely on delay, would first depend on whether a VA provider had made a clinical determination of when necessary medical services or hospitalizations would be appropriate. If no such determination

---

[52] A recently discharged combat Veteran presumably would have to sign up for the patient enrollment system before participating in the Choice program.

[53] Eligibility based on non-road travel or geographic challenges does not apply to Veterans residing in Guam, American Samoa, or the Philippines.

[54] Under VA's interim final rule, the request for care or services from which the 30 days is measured must be affirmatively communicated to a VA employee who is responsible for scheduling appointments or to a VA health care provider (38 C.F.R. 17.1505).

---

has been made, the clock starts on the Veteran's preferred date of service.[55] When the determination involves a specific date, the period begins on that date. When the determination involves a range, the period begins on the last day of the range. Under the revised time goals, the original default standard described in the act would be in effect only when there was no clinical determination of time frame and the Veteran requested that the appointment be scheduled for the same day VA was contacted.

Table 3-5. Key Features of the Veterans Choice Program

Feature	Description
Situational eligibility	The Veteran . . . (a) was unable to schedule appointment within "wait-time goals"; (b) resides more than 40 miles from any VA medical facility; (c) resides more than 20 miles from any VA medical facility if state lacks a VA "standard" level inpatient facility; (d) is required to travel by air or water to all VA medical facilities within the 40 mile limit; **_or_** (e) has "unusual or excessive burden" due to "geographic challenges," "environmental factors," medical conditions, or other VA-defined factors
Status eligibility	Veteran must be (1) Already enrolled in VA's patient enrollment system as of Aug. 1, 2014; **_or_** (2) a recently discharged combat Veteran under specific circumstances
VA discretion to utilize or pay for non-VA care	Hospital care and medical services **_shall_** be furnished to an eligible Veteran at the election of such Veteran
Provider qualifications or requirements	Provider must . . . (1) Participate in Medicare;[a] (2) Meets or exceed the credentials and licenses required of those within VA; (3) Submit verification of credentials and licenses annually; (4) Have entered into agreements with VA or third-party administrators of program; **_and_** (5) Be "accessible" to the Veteran

---

[55] A threshold issue here would be VA's interpretation of the phrase "the date a Veteran prefers to be seen" as used in the interim rule. It is not clear whether such a preference is completely up to the Veteran's discretion (e.g., any day and time that is convenient for the Veteran) or whether it is constrained by the dates and times eligible providers are actually available.

Feature	Description
Veteran input into provider choice	Presumably limited to providers who have previously entered into agreements with VA or third party administrators of program ***and*** who VA judges to be "accessible" to the Veteran
Additional Requirements for Inpatient Treatment	Presumably none if Veteran is otherwise eligible
Additional Requirements for Outpatient Treatment	Presumably none if Veteran is otherwise eligible
Payments	Rates are to be negotiated, but may not be more than (a) Medicare Fee Schedule rates; (b) A negotiated rate greater than Medicare rates but only for Veterans residing in a "highly rural area"; (c) The rates available under the NVCC formula but only if the Medicare Fee Schedule is not applicable; ***or*** (d) An alternative set of rates in certain locations
Direct payer of provider	Choice contractor
Medical record sharing requirements	Mandated by statute
Coverage	National
First year implemented or authorized	2014
Status	Scheduled to terminate in August 2017
Key statutes or laws	Pub. L. 113-146, Sec. 101; Pub. L. 113-175, Sec. 409; Pub. L. 113-235, Sec. 242; Pub. L. 114-19, Sec. 3
Key regulations	38 C.F.R. 17.1500–17.1540.
[a] Health care providers from DoD, IHS, and FQHCs would also be qualified under the Choice program.	

Another important question regarding the potential Veteran uptake in the Choice program involves what constitutes a VA medical facility for the purposes of calculating the distance standard. According to the Veterans Choice Act, the "term 'facility of the Department' has the meaning given the term 'facilities of the Department' in section 1701 of title 38, United States Code" (Sec. 2(1)). The statute defines *facilities* as "(A) facilities over which the Secretary has

direct jurisdiction; (B) Government facilities for which the Secretary contracts; and (C) public or private facilities at which the Secretary provides recreational activities for patients receiving care under section 1710 of this title" (38 U.S.C. 1701(4)). Conceivably, this definition could include a parking lot operated by VA, though the Veterans Choice Act narrows the application to "medical facility of the Department." Thus, the VA facility providing medical services or products closest to the Veteran would be the end point in the distance assessment. The key issue here is that the Veterans Choice Act does not distinguish between medical facilities that meet a Veteran's specific needs (in other words, the reason for requesting the appointment) and medical facilities that do not provide the necessary care.[56] For example, the Veterans Choice Act specifically mentions "a community-based outpatient clinic" as one type of medical facility considered for the 40-mile test. A Veteran who needs hospitalization and inpatient surgery could fail to meet the distance test set forth in Section 101(b)(2)(B) if such a clinic were within 40 miles of his or her residence, even though the closest VA hospital where the surgery could be performed was 100 miles away.

Notably, the July 28, 2014, conference report accompanying H.R. 3230 (the bill that was eventually enacted as the Veterans Choice Act) and jointly issued by the bill's managers in the House and Senate assumed that VA would not use technical proximity to block access to the Choice program if the facility did not provide the necessary services: "The Conferees do not intend the 40-mile eligibility criteria included in this section to preclude veterans who reside less than 40 miles from a VA facility from accessing care through non-VA providers, particularly if the VA facility the veteran resides near provides limited services" (House Report 113-564, 2014, p. 55). Nevertheless, VA has stated that it lacked options under the Veterans Choice Act on the issue of *any facility* versus *a facility that provides the actual care required*: "Absent a statutory change, VA does not believe that it has the flexibility to adopt an alternative approach" (VA, 2014c, p. 2).

It should be noted that VA's final interim rule does narrow the definition of medical facility from the potentially broader usage found in the Veterans Choice Act. Currently, 38 C.F.R. 17.1505 states, "VA medical facility means a VA hospital, a VA community-based outpatient clinic, or a VA health care center. A Vet Center, or Readjustment Counseling Service Center, is not a VA medical facility." The comments to the final interim rule noted, "We have included these types of VA facilities because they provide medical care or hospital services that may be provided as part of the Program." However, VA documents routinely refer to a fourth category of medical facility beyond hospitals, community-based outpatient clinics, and health care centers: outpatient clinics that are not community based (for example, the Sierra Foothills Outpatient Clinic in Auburn, California, the Johnson County/Radiation Oncology VA Clinic in

---

[56] In contrast, the corresponding criterion for Veteran eligibility under Project ARCH is the distance from the type of medical facility from which the patient is seeking services.

Overland Park, Kansas, and the Zachary and Elizabeth Fisher Medical and Dental Clinic in Great Lakes, Michigan).[57] It is unclear how these facilities would factor into the distance calculations.

At least for calculating distances, *medical facility* is defined more narrowly in the special case where a Veteran's state of residence does not have a VA medical facility capable of providing hospital care, emergency care, and inpatient surgical services rated by VA as "standard" in complexity. In such cases, a 20-mile criterion is used, and the facility must meet the hospital/emergency/standard surgical competence test. However, the Veteran's specific need is not a consideration here with regard to facility type, and, moreover, the 20-mile rule is likely to affect only a small percentage of the Veteran population.[58]

How the distance between residence and facility is measured is also critical to the size of the eligible Veteran pool.[59] The Veterans Choice Act did not describe how to calculate mileage from a Veteran's residence for the purpose of determining Choice eligibility, only that the test involves varying criteria, such as "more than 40 miles," "more than 20 miles," or "40 miles or less." The July 28, 2014 conference report for H.R. 3230 stated that it was "the Conferees' expectation that VA will use geodesic distance, or the shortest distance between two points" (House Report 113-564, 2014, p. 55). VA's interim final rule met that expectation by promulgating regulations related to the Veterans Choice Act using straight-line distance (i.e., "as the crow flies") (38 C.F.R. 17.1510(e)). Such an interpretation might have meant that a Veteran who lived 70 miles driving distance from a VA medical facility would not satisfy the test if the facility was 30 miles away by helicopter.[60] Reacting to criticisms from multiple quarters, VA announced on March 24, 2015 that it intended to issue an interim rule so that "this criterion will change to the driving distance calculation between the Veteran's home and the nearest VA medical facility," adding, "VA believes that revising the calculation will still be in the spirit of the law and allow improved access for Veterans" (VA, 2015c). It did so a month later, announcing that it would use driving distance to determine eligibility for the Choice program (VA, 2015d). In May 2015, Congress eliminated any remaining uncertainty about this aspect of the 40-mile rule

---

[57] In California, for example, there are nine VAMCs, one VA health care system, 36 community-based outpatient clinics, and 24 facilities characterized simply as "outpatient clinics." Of the latter group, only one is clearly a health care center. Presumably, the outpatient clinic group excluding any health care centers would not qualify as "a VA hospital, a VA community-based outpatient clinic, or a VA health care center." See VA (2010).

[58] Only Alaska, Hawaii, and New Hampshire are currently without any VA inpatient surgical facilities rated at standard complexity (VHA, 2014a).

[59] A threshold issue here is what constitutes a Veteran's "residence." Although the Veterans Choice Act does not address this issue, VA's interim final rules define it the legal residence or personal domicile at the time the Veteran is seeking external medical care through the Choice program (38 C.F.R. 17.1505).

[60] The commentary in the supplementary information section of the interim final rule indicated that there was "strong support for this interpretation" because the conference report accompanying the Veterans Choice Act noted that in "calculating the distance from a nearest VA medical facility, it is the Conferees' expectation that VA will use geodesic distance, or the shortest distance between two points" (79 Fed. Reg. 65577, citing House Report 113-564, 2014, p. 55).

---

calculation with an amendment to the Choice Act calculating the mileage "based on distance traveled" (Pub. L. 114-19, Sec. 3(a)(1)).

Finally, VA was originally given considerable discretion in how it would define "geographic challenges" with regard to Veteran eligibility based on "unusual or excessive burden" in accessing medical facilities 40 miles or less from a Veteran's residence.[61] The interim final rule essentially equated "geographic" with geological or topological, specifically, "a body of water (including moving water and still water) or a geologic formation that cannot be crossed by road" (38 C.F.R. 17.1510(b)(4)). The May 2015 congressional amendment to the Choice Act retained the geographical challenge test for eligibility based on burden, but it also expanded the potential factors to include environmental ones ("such as roads that are not accessible to the general public, traffic, or hazardous weather"), a medical condition ("that impacts the ability to travel"), and any "other factors, as determined by the Secretary" (Pub. L. 114-19, Sec. 3). The change broadened the range of possible interpretations available to VA, and, conceivably the time needed to travel to VA facilities on clogged urban highways or by public transit could be taken into account.[62]

3.2.2 Elections and Providers

The Veterans Choice Act intends that when a recently separated combat Veteran signs up for the patient enrollment system, when a Veteran is unable to schedule an appointment within the wait-time goal maximum, or when a Veteran becomes eligible under criteria related to travel, he or she be provided with information about the availability of Choice-related care (Sec. 101(g)). Once eligible, a Veteran, at his or her election, can receive the types of hospital care and medical services that would normally be furnished by VA via health care providers participating in the Medicare program, any FQHC (for example, a nonprofit community health center), DoD, or IHS (Sec. 101(a)(1)).[63] As indicated previously, the process would be managed through VA's existing NVCC program, and VA is charged with ensuring that the Veteran's appointment with the external provider occurs within VA's wait-time goals (Sec. 101(a)(3)).

Under the original language of the Veterans Choice Act, Veterans who are unable to obtain a timely appointment with a VA provider have the following options: (1) keep the appointment despite the delay, (2) be placed on a prioritized waiting list for available VA services, or (3) elect to use external providers and obtain an authorization to receive care for "for a period of time specified" by VA (Sec. 101(c)(1), as modified by Pub. L. 113-175, Section 409(a)(1)(A)). If the eligible Veteran chooses the external provider option, he or she also has the ability, at least in theory, to select a specific provider (Sec. 101(a)(2)). The Veterans Choice Act's original language

---

[61] "[A]s determined by the Secretary," per Section 101(b)(2)(D).

[62] The Assessment B report examines many elements related to Veterans' geographic access to care, and how various alternative standards affect determinations of access.

[63] FQHCs are facilities that qualify for enhanced reimbursement and other benefits under Medicare and Medicaid. They must meet several service and quality criteria, including offering a sliding fee scale, engaging in continuous quality assurance, and providing services to underserved populations (Health Resources and Services Administration, n.d.).

---

did not grant this option to Veterans who are eligible for external care solely on the basis of distance and other travel challenges. VA's final interim rule was intended to fill "this gap in the law by providing these Veterans the same opportunity to select a particular provider as Veterans eligible based upon the wait-time standard. Eligible Veterans may nevertheless choose not to make such a selection, and in such a situation, those Veterans will be referred to an eligible entity or provider identified by VA." Accordingly, 38 C.F.R 17.1515(a) makes no distinction between time- and travel-based Veterans when it comes to available elections.

While the Veterans Choice Act (as interpreted by the interim final rule) appears to suggest that the specific choice of provider is essentially up to the Veteran as long as the provider falls under one of the four allowed categories, in actuality, a much narrower set of external health care resources is available.[64] Focusing here on private providers and FQHCs (rather than DoD or IHS providers), participation in Medicare is an initial requirement. Another requirement is that the provider must meet or exceed the credentials and licenses of VA providers and submit verification of these qualifications annually (Sec. 101(i)).

The provider pool is even more limited than the set of health care professionals who accept Medicare and who possess the necessary qualifications. An important characteristic of the Veterans Choice Act is the existence of "agreements" between VA and providers, suggesting that some preexisting legal relationship must be in place before a provider can render services to an eligible Veteran and expect reimbursement (Sec. 101(d)(1)).[65] Such an agreement anticipates that the provider would be willing to accept no more than standard Medicare program reimbursement rates for Choice-related services, except in situations involving Veterans residing in counties with a population density under seven persons per square mile (Sec. 101(d)(2)(B)). The technical amendments to the Veterans Choice Act through the Department of Veterans Affairs Expiring Authorities Act of 2014 added to Section 101(d)(1)(A) an explicit preference for using existing agreements with providers before entering into new ones:

> Before entering into an agreement pursuant to this subparagraph, the Secretary shall, to the maximum extent practicable and consistent with the requirements of this section, furnish such care and services to such veterans under this section with such entities pursuant to sharing agreements, existing contracts entered into by the Secretary, or other processes available at medical facilities of the Department. (Pub. L. 113-175, Sec. 409(a)(2))

Given that VA already had extensive contracts with TriWest and Health Net for PC3, the amended language opened the door to having these two TPAs effectively become the functional administrators of the Choice program.[66] If a health care provider wishes to be

---

[64] VA's interim final rule states that while an eligible Veteran may specify a desired non-VA entity or provider for Choice services, in actuality, the entity or provider must meet certain requirements set forth in the regulations to be eligible to participate in the program (38 C.F.R. 17.1515(b)). If the Veteran does not specify an eligible provider or entity, VA will make the decision.

[65] Indeed, the title of Section 101 describes its purpose as "Expanded availability of hospital care and medical services for veterans through the use of agreements with non-Department of Veterans Affairs entities."

[66] Every state and the District of Columbia is already assigned to either TriWest or Health Net.

classified as Choice-eligible, it would have to either join an existing TriWest or Health Net network or enter into a special provider agreement with a Choice TPA. At least for the short run, a Veteran's ability to select a specific provider would, as a practical matter, be limited to those already a part of one of the existing networks.

The interim final rule addressed another aspect to Choice program provider eligibility not discussed at length in the Veterans Choice Act: accessibility from the perspective of the Veteran (38 C.F.R. 1530(c)). The Veterans Choice Act indicated only that Veterans eligible due to appointments exceeding wait-time goals "may select a provider . . . from among the entities . . . that are accessible to the veteran," without actually defining what accessibility involved (Sec. 101(a)(2)). Besides expanding the scope for this section to include Veterans eligible due to distance, the interim final rule noted that the amount of time the Veteran would have to wait for an appointment with a provider, the provider's qualifications, and the distance from the Veteran's residence to the provider's facilities would all be taken into account in VA's unilateral decision about whether a provider is appropriately accessible to the Veteran. The interim final rule does not specify the exact criteria for making such assessments, though the comments to the rule indicate that "VA will consider these factors together," balancing competing interests and "the preference of the veteran," and make "accessibility determinations on a case-by-case basis" (79 Fed. Reg. 65580).

Prior to receiving any external care, the Veteran must inform VA of any other medical benefit plans, contracts, or agreements (other than through Medicare, Medicaid, or TRICARE) that might provide coverage (Sec. 101(e)(1), (4)). VA, in turn, discloses these details to the external provider, along with information about any non–service-connected disability that could result in payments or benefits from collateral sources (such as workers' compensation, insurance recoveries related to motor vehicle accidents, victim compensation funds, or health care plans) (Sec. 101(e)(2), (3)(C)). Such information is required because the external provider is responsible for first seeking reimbursement from collateral sources or health plans, and the Choice program is secondarily responsible to the extent that the rate does not exceed the allowable amounts (Sec. 101(e)(3)(A), (B)). The act does not address the issue of primary or secondary responsibility when the payments or benefits are related to a service-connected disability, but the interim final rule states that VA is solely responsible for covering hospital care or medical services for a service-connected disability (38 C.F.R. 17.1535(b)(2)).

The final interim rule also aligned the Veterans Choice Act's provisions with VA's existing but informal policy of not requiring co-pays from a Veteran at time or point of service but, rather, only after VA has processed provider billings and determined the net amount owed (38 C.F.R. 17.108(b), (c); 38 C.F.R. 17.110(b)(4), (b)(3)).

3.2.3 Scope of Care

A Choice authorization to receive care at non-VA facilities can cover more than just a single visit to an external doctor or hospital. The Veterans Choice Act requires VA to allow a Veteran to obtain "hospital care and medical services from [the non-VA] health care provider through the completion of the episode of care," which includes "all specialty and ancillary services deemed necessary as part of the treatment recommended in the course of such hospital care or medical

services" (Sec. 101(h)). The Veterans Choice Act does not define *episode of care*, though it does limit the provision of care from any health care provider under a single Choice authorization to a maximum of 60 days (Sec. 101(h)). Thus, whatever the Veterans Choice Act considered an episode of care to be, Choice would only cover the first 60 days thereof without follow-up authorizations. See Section 5 for a more detailed discussion of the legal contours of episodes of care as currently defined by VA authority. See also Section 4 for a discussion of how this concept is applied locally, and its practical implications for purchased care administration.

3.2.4 Program Application

Choice is a very recent initiative. Despite a clear congressional desire to roll out the program as a fully featured option for Veterans within a few months of the act's passage, key rules and agency practices are still evolving and undoubtedly will continue to do so for the foreseeable future. The April 2015 decision to measure the distance between a Veteran's residence and a VA medical facility according to highway mileage provides an excellent example of the dynamic nature of the program's implementation. Materials describing how Choice works in practice may be out of date as soon as they are made available, and the specific policies and procedures used by one VA location may differ from those used by another as the system moves toward a unified, stable approach. That said, we can nevertheless describe in broad terms our interpretation of how the Choice program operates.

The process begins with a VA health care provider deciding that a course of treatment or a particular service is needed. A Veteran who wishes to take advantage of the Choice program initially calls a hotline that connects him or her with a representative of either TriWest or Health Net (depending on the location). At that point, the representative will confirm basic eligibility according to distance, appointment delay, or other criteria.[67] If eligibility is confirmed, the types of services available depend on the *type* of eligibility. Veterans who meet only the wait-time criteria can use Choice solely for the service that could not be scheduled within the time standard. Veterans who meet distance or other residence-based criteria can use Choice providers for any services that are "clinically necessary" (VA, 2014d). The TPA determines clinical necessity (VHA, 2015a, p. 9). The Veteran is then asked for the name and address of his or her preferred non-VA provider (if one is preferred), though, ultimately, that choice is limited to participating providers. The TPA representative then formally authorizes the referral and schedules the appointment with a Choice provider.

Providers who are interested in becoming eligible for Choice are informed that "VA has expanded its Patient-Centered Community Care (PC3) contracts with Health Net Federal and TriWest Healthcare Alliance to include implementing the Choice Program," noting that Choice "supplements PC3 and allows coverage for more services for eligible Veterans and provides Veterans more flexibility in their choice to receive care in the community or through VA" (VA, 2014e). They are told that existing members of either PC3 network are already eligible to participate in Choice. Moreover, if a provider is interested in joining a PC3 network (and thus becoming automatically eligible for Choice participation), they must execute a contract with

---

[67] Some of the information used by TPAs to confirm Veteran eligibility is periodically received from VHA.

TriWest or Health Net. If they would prefer to remain independent from a PC3 network, they must nevertheless execute an out-of-network provider agreement with one of the two TPAs. Such agreements require the provider to meet Medicare conditions for participation and coverage, accept Medicare rates, and submit a copy of the Veteran's medical record to the TPA after services are rendered.

Review of the Health Net and TriWest web portals for provider inquiries suggests that there is little pressure to choose a PC3 contract rather than a Choice provider agreement and that the process for executing a provider agreement is not particularly onerous.[68] That said, the selected path to provider eligibility (via a PC3 network agreement or an out-of-network provider agreement with a TPA) does have important economic implications. Recall that PC3 network providers are paid about 3–8 percent less than full Medicare reimbursement rates. Presumably, those operating independently under a Choice out-of-network provider agreement (assuming less-than-Medicare reimbursement rates were not required to enter into the agreement) would incur no such loss.[69] It should be noted that the rules for calculating rates under Choice vary depending on whether a contract or provider agreement is in effect, the location of the services provided, and a number of other factors. For example, there is a specific authorization for the use of "the Alaska Fee Schedule of the Department of Veterans Affairs" for the Choice Program in Alaska, and in states like Maryland where an all-payer model agreement between the state and the Centers for Medicaid and Medicare is in place, the reimbursement rates are those in effect under the agreement.[70]

Not surprisingly, given its connection to PC3 administration, the Choice process from the provider's perspective is similar to that under PC3. An eligible provider (either selected by the Veteran or assigned by the TPA) receives the care authorization from the TPA (TriWest, n.d.). When the authorization is based on excessive wait times, it is accompanied by clinical/consultation information provided by VA; when patient eligibility is based on distance, supplementary information is included. Unlike PC3 and other VA purchased care programs, the provider is responsible for initially billing any health plan or other collateral source for initial reimbursement. Any residual claim (and any claim without another payment source that could be considered primary) would be then presented to the TPA or the TPA's payment processing vendor. The Veterans Choice Act specifically requires providers to supply VA with electronic medical records describing the treatments rendered (Sec. 101(l)). In addition, provider agreements with the network contractor are likely to require the submission of medical records prior to payment for services rendered.[71]

---

[68] For Health Net's portals, see Health Net Federal Services, n.d.-b, n.d.-c, & n.d.-d. For TriWest's, see TriWest Health Alliance, 2014, 2015a, & 2015b.

[69] A sample Health Net Choice program provider agreement—presumably one that would not be required for health care professionals and facilities already associated with Health Net through the PC3 program—indicates that the default rate of reimbursement would be "Rate Agreed Upon: 100% of Medicare rates," and, when there is no published Medicare rate, it would be "Rate Agreed Upon: 100% of the VA fee schedule rate" (Health Net, 2014).

[70] See, for example, Pub. L. 113-235, Sec. 242.

[71] See, for example, Section 9 in Health Net's participation agreement (Health Net, 2014).

It is important to remember that the Choice program is a stopgap approach taken to address the circumstances that led to the passage of the Veterans Choice Act. In the words of VA Secretary Robert A. McDonald, "The Choice Program is a new, temporary benefit allowing some Veterans to receive health care in their communities rather than waiting for a VA appointment or traveling to a VA facility" (McDonald, 2014b). Moreover, it is a supplement to existing VA purchased care authorities and not a replacement. As the commentary to VA's regulations implementing the Veterans Choice Act specifically noted,

> Nothing in this rulemaking modifies VA's existing authority to furnish non-VA care, such as under 38 U.S.C. 1703, 1725, 1728, 8111, or 8153. The requirements of those statutes and their implementing regulations continue to apply, and VA will use those authorities when appropriate. Any veteran currently receiving non-VA care who is eligible for the Program will be provided the opportunity to elect to participate in the Program or to continue being provided care under VA's other authorities. (79 Fed. Reg. 65571)

3.2.5 Other Changes to VA Purchased Care Triggered by the Veterans Choice Act

3.2.5.1 Lines of Authority

The Veterans Choice Act addressed a number of areas that relate to the use of external medical care providers and facilities not necessarily tied to the Choice program. One involves the lines of authority for all VA purchased care. Traditionally, VHA's Chief Business Office had nominal control over all aspects of care provided externally, while VISNs maintained operational authority and responsibility. Nevertheless, it was the VAMCs that handled the day-to-day administration of purchased care, with staff at each center essentially having an independent hand when authorizing, managing, and paying for such care. The arrangement was said to provide "flexibility to meet local needs," though some have commented that the "decentralized nature of this program produces inefficiency" (AMVETS, Disabled American Veterans, Paralyzed Veterans of America, & VFW, 2013, p. 168). Some critics were more direct in their assessments of the existing arrangement, noting that this "highly decentralized mode of operation across VA hospitals and networks is a primary factor in the [VA purchased care] program's inefficient operations and high payment error rates," which was marked by significant variation in "organizational alignment, staffing, grade profiles, education, training, proficiency certification, performance standards and performance expectations" (National Academy of Public Administration, 2011). In addition, because payments to non-VA providers came out of VAMC budgets, the conference report accompanying the Veterans Choice Act noted that there were built-in disincentives when authorizing the use of external care, a situation that "in some cases has led to the determination of eligibility as subject to facility budget considerations rather than to the determination of what is best for the veteran" (House Report 113-564, p. 60).

Section 106 of the Veterans Choice Act was an attempt to address these concerns. Within a few months of the act's passage, VA was required to transfer all authority to pay for externally provided care from the VISNs and VAMCs to VHA's Chief Business Office (Sec. 106(a)(1)). VISN and VAMC employees who were tasked with claims processing, appeals, clinical reviews, and other functions associated with VA purchased care programs would be transferred (at least on

paper) to an independent division of VHA's Chief Business Office known as "Chief Business Office Purchased Care."[72] To reduce direct financial disincentives for VAMC provider staff when making external referrals, Section 106(b) provided that all funding for VA purchased care would be handled by the Chief Business Office rather than the VISNs and VAMCs where the services would actually be obtained.

3.2.5.2 Prompt Payment

Some criticisms lodged against VA purchased care programs prior to the passage of the Veterans Choice Act related to delays in processing claims and reimbursing external providers. Congress moved to address these criticisms through the Act.

In theory and more broadly, the Prompt Payment Act (codified at 31 U.S.C. 3901–3907) is designed to discourage federal agencies from such tardiness when they owe monies under federal contracts. The Prompt Payment Act requires the government to pay valid invoices on commercial obligations that are properly submitted within specific time frames; if the agency fails to do so, it must pay interest to the contractor and, in some instances, penalties.[73]

While some federal agencies fall outside of these requirements, VA does not. Internal guidance acknowledges VA's responsibilities under the act: "VA will follow the Prompt Payment Act for accepting goods, establishing the payment due date, and calculating any applicable discounts or interest required for procurement contracts, vendor payments, and utility payments per 5 C.F.R. Part 1315 and other regulatory guidance" (VA, 2013, p. 2). However, VA has traditionally interpreted the applicable statutes and regulations as exempting purchased care invoices from interest and penalties when payment is delayed. VA's position was that the Prompt Payment Act "applies to payments incurred as the result of a procurement contract," which means "any enforceable agreement, rental and lease agreement, purchase order, delivery order, requirements-type (open-ended) service contract, or blanket purchase agreement between VA and a vendor" (VA, 2013, p. 19). While the definition of a *procurement contract* is broad and would presumably cover instances in which VA purchased care is acquired through competitive bids for long-term services (such as contracting for establishing one of the PC3 networks), VA nevertheless asserted that payments "for medical and dental services which fall under non-VA care and are not covered in a contract or sharing agreement" are specifically exempt from these protections (VA, 2013, p. 20). Under this view, an individual authorization for purchased care under 38 U.S.C. 1703 (and the subsequent invoice VA would receive from the non-VA provider or facility) would not trigger Prompt Payment Act requirements.

The Veterans Choice Act took steps to clearly tie Prompt Payment Act requirements to VA purchased care invoicing. Section 105(a) states that it is the "sense of Congress" that VA comply with the prompt payment regulations set forth at 5 C.F.R. 1315 et seq., though it continued to

---

[72] It appears that some NVCC care coordination functions will remain at local VAMCs and other VHA facilities.

[73] Regulations implementing the act are found at 5 C.F.R. 1315.1–1315.20. Assessment I's report details the issues surrounding these interest penalty payments.

---

characterize the underlying relationship as contractual.[74] Moreover, Section 106(a) required VA (presumably VHA's Chief Business Office) to establish "a system to process and pay claims" from non-VA providers and mandated that the claims system be compliant with the Prompt Payment Act statutes.

3.3 Key Themes in Pre- and Post-Choice Purchased Care

In this section, we examine the four current methods for acquiring external health care for Veterans outside of emergency settings: three programs that rely primarily on established provider networks (Project ARCH, PC3, and the Choice program) and one "fee-for-service" mechanisms that can essentially utilize any eligible health care professional or facility (traditional purchased care). Note that the descriptions of these programs reflect our best assessment of how they work in practice, not simply what has been legally mandated by applicable statutes and regulations. The descriptions focus on services provided by physicians and inpatient facilities, as other types of services and products—such as clinical laboratory work, ambulances, dialysis, outpatient facilities, anesthesia, dental, pharmaceuticals, and ambulatory surgical centers—may operate under special rules for calculating payments and other criteria that would significantly increase the complexity of any cross-program comparison.

The basic statutory requirement for providing hospital, nursing, and domiciliary care for Veterans at VA facilities can be found in 38 U.S.C. 1710. That statute directs the VA Secretary to furnish certain types of care to specific classes of eligible Veterans (e.g., those with service-connected disabilities), and grants discretionary authority to the Secretary for providing medical care contingent on the availability of resources and facilities.[75]

With this mandate to provide care at VA facilities as background, the traditional authority for going outside VA—38 U.S.C. 1703—establishes the authority by which the Secretary "may contract with non-Department facilities" to furnish certain types of medical care and services (Table 3-6). The interplay of the two statutes—one mandating care at VA facilities for some groups of Veterans, and one permitting contractual arrangements to provide care at non-VA facilities—is the foundation for VA's current and historical programs for externally provided care.

A key point on the interaction between 38 U.S.C. 1703 and 1710 is important to recognize. Section 1710 includes a mandate that "the Secretary *shall* furnish hospital care and medical services which the Secretary determines to be needed," particularly to Veterans in specified groups. One question that arises is, how does the statutory mandate for VA to provide care

---

[74] Prompt Payment Act regulations would come into play only with regard to "health care pursuant to contracts entered into with non-Department of Veterans Affairs providers."

[75] Specifically, the statute requires the Secretary to "furnish hospital care and medical services which the Secretary determines to be needed to any veteran for a service-connected disability; and to any veteran who has a service-connected disability rated at 50 percent or more" (38 U.S.C. 1710(a)(1)(A and B)). In addition, "the Secretary may, to the extent resources and facilities are available, . . . furnish hospital care, medical services, and nursing home care which the Secretary determines to be needed" (38 U.S.C. 1710(a)(3)).

under Section 1710 interact with the Secretary's discretion to purchase services under Section 1703? The answer is complicated. When read together, these two statutory provisions imply that for Veterans entitled to receive care under Section 1710, the Secretary has an obligation to provide that care, and if unable to do so through VA, the Secretary would then presumably have an obligation to exercise his discretion to purchase care from the outside. However, the wording of both statutes gives the discretion of the Secretary in making threshold judgments, including the determination of need for care under Section 1710, and VA's inability to provide care directly under 1703. Whether in practice VA has fully met this obligation in the way that it historically carried out purchased care, however, is open to debate.[76]

Table 3-6. VA Discretion in Key Purchased Care Programs

Program	Rules
Traditional purchased care	VA ***may*** employ if eligibility criteria are met
ARCH	VA ***shall*** provide covered health services to eligible Veterans (if electing) through ARCH provider contracts (assuming qualified providers are available)
PC3	Same as for traditional purchased care
Choice	Hospital care and medical services ***shall*** be furnished to an eligible Veteran at the election of such Veteran

Choice moves the pointer ever further, with a clear mandate upon VA to utilize non-VA resources when certain conditions are met. However, as our earlier description of the regulatory environment in which Choice operates suggested, that "shall" comes with important modifiers in terms of who can be used as providers and the circumstances in which the external care will be provided. Note that Choice was not groundbreaking in regards to providing the Secretary with an unambiguous charge to utilize purchased care under specific conditions; the Congressional authority establishing Project ARCH contained equally strong language, albeit applicable only for a fraction of the Veteran population.

As Table 3-7 suggests, the rules for Veteran eligibility across all four programs are a complicated mix of distance, time, medical conditions, travel challenges, issues related to local internal VA capabilities, issues related to statewide VA facility types, and Veteran residency. Navigating this jigsaw puzzle of rules would be difficult enough for administrative law attorneys, but for a Veteran whose primary concern is receiving adequate care on a timely basis, and not legal scholarship, the challenges would be formidable. Project ARCH has the least ambiguous (from the perspective of the Veteran) definition of what constitutes eligibility (requiring a certain amount of driving time depending on the facility desired), and traditional purchased care under

---

[76] As we noted in the introduction to this report, the lead-up to the passage of the Veterans Choice Act in 2014 involved a crisis in access to services through some VA facilities. Presumably, some or all of the Veterans denied timely access to care ought to have been given access to purchased care as an alternative, based on a superficial reading of Sections 38 U.S.C. 1703 and 1710.

Section 1703 is the most (requiring knowledge of VA's internal ability to furnish economical car). Some of Choice's rules regarding eligibility are straightforward, but given the current debate over what constitutes a "medical facility" for the purpose of measuring distance, there is still some confusion even among well-informed stakeholders.

Table 3-7. Eligibility in Key Purchased Care Programs

Program	Situational Eligibility Rules	Status Eligibility Rules
Traditional purchased care	VA not capable of furnishing . . . (1) economical care/services because of "geographical inaccessibility" or (2) required care/services	Many conditions and situations qualify, but two may be most commonly utilized: (1) treatment of any service-connected disability/condition; or (2) treatment of any disability if (a) Veteran previously seen by VHA providers and (b) non-VA resources are required to complete treatment
ARCH	(1) If seeking primary care, must reside more than 60 min. driving time to nearest VA primary health care facility; (2) If seeking acute hospital care, must reside more than 120 min. driving time to nearest VA acute hospital care facility; or (3) If seeking tertiary care, must reside more than 240 min. driving time to nearest VA tertiary care facility.	Veteran must be (1) Residing in a pilot site; and (2) Currently enrolled for VA health care. Services required must be offered by an ARCH contracted provider
PC3	Same as for traditional purchased care	Same as for traditional purchased care, though specialty required must also be one offered by a PC3 contracted provider

Program	Situational Eligibility Rules	Status Eligibility Rules
Choice	The Veteran . . . (a) was unable to schedule appointment within "wait-time goals"; (b) resides more than 40 miles from any VA medical facility; (c) resides more than 20 miles from any VA medical facility if state lacks a VA "standard" level inpatient facility (d) is required to travel by air or water to all VA medical facilities within the 40 mile limit; or (e) has "unusual or excessive burden" due to "geographic challenges," "environmental factors," medical conditions, or other VA-defined factors	Veteran must be (1) Already enrolled in VA's patient enrollment system as of Aug. 1, 2014; or (2) a recently discharged combat Veteran under specific circumstances

Veterans are clearly provided with greater discretion to choose a provider under the Choice program than under the other three purchased care programs (Table 3-8), but given that the provider pool is essentially restricted to those with preexisting relationships with the TPAs administering Choice, assertions made at the time of the act's passage that eligible Veterans can go to any doctor of their choosing markedly overstate the actual situation. This condition could change with the continued rollout of Choice, though the VA-defined requirement of "accessibility" could further narrow Veteran discretion.

Table 3-8. Veteran Input into Provider Choice in Key Purchased Care Programs

Program	Rules
Traditional purchased care	None specifically authorized
ARCH	Presumably limited to providers within ARCH network
PC3	Presumably limited; PC3 contractor sets up appointment with provider within network
Choice	Presumably limited to providers who have previously entered into agreements with VA or third party administrators of program ***and*** who VA judges to be "accessible" to the Veteran

These programs also differ dramatically in regards to what providers might receive for treating Veterans (Table 3-9). As discussed in Section 4, these differences may play a significant role in program uptake, if indeed the payment rules reduce the pool of available providers and services in a region. There does appear, however, to be some flexibility built into the rules, and ultimately provider reimbursement levels may be driven more by market forces than statutory and regulatory mandates.

Table 3-9. Payments and Payers in Key Purchased Care Programs

Program	Payment Rules	Payer Rules
Traditional purchased care	If inpatient, "prospective payment system similar to that used in the Medicare program"; in practice this means (1) The Non-VA hospital price rate (2) The VA cost-to-charge rate. If outpatient, (1) the amount described on any contract or negotiated agreement, or (2) if no contract or agreement exists but there is an applicable "Medicare rate," the lower of (a) the "Medicare rate," (b) the "repricer" rate, or (c) amount the provider bills general public; (3) If no contract or agreement exists and there is no applicable "Medicare rate," the lower of (a) the local VA Fee Schedule; (b) the "repricer" rate, or (c) amount the provider bills general public	VA
ARCH	Reportedly a negotiated percentage of local Medicare rates for four sites managed by a vendor; full Medicare rates for the site directly contracting with VA	ARCH contractor or facility
PC3	Presumably at or below the amounts allowed for traditional purchased care; reportedly a negotiated percentage of local Medicare rates	PC3 contractor

Program	Payment Rules	Payer Rules
Choice	Rates are to be negotiated, but may not be more than . . . (a) Medicare Fee Schedule rates; (b) A negotiated rate greater than Medicare rates but only for Veterans residing in a "highly rural area"; (c) The rates available under the traditional purchased care formula but only if the Medicare Fee Schedule is not applicable; or (d) An alternative set of rates in certain locations	Choice contractor

The statutory and regulatory references described here suggest several potential reasons for allowing Veterans to obtain care outside of VA (Table 3-10). In some cases, the underlying objective originates with VA, such as when it considers the use of outside providers to be in its economic self-interest or a way to avoid having to develop a capacity that may have little ongoing utility. In other cases, it is the Veteran's preferences or interests that are at stake, such as the inconvenience or expense of accessing medical care in highly rural areas. The line between the two sets of interests is not a bright one, and even when an authority allows the Veteran to see a much closer non-VA physician, VA's interests are nevertheless in play, because VA would ultimately be responsible for covering the costs of traveling to a VA facility.

Table 3-10. Objectives For Utilizing Purchased Care

Area of Concern	Congressional Approach	Authority Provided
VA does not have expertise or facilities to provide needed care.	Provide VA with limited discretion to determine whether it has the capacity to deliver needed services.	Authorizations issued under 38 U.S.C. 1703
VA has expertise or facilities required, but external provision would be economically advantageous to VA.	Provide VA with limited discretion to determine whether it has the capacity to deliver needed services economically.	Authorizations issued under 38 U.S.C. 1703
VA has expertise or facilities required, but wait time for Veteran would be excessive.	Allow Veteran to use non-VA resources if an appointment cannot be scheduled within wait-time standards.	Eligibility for Choice program based on whether appointment can be scheduled within VA-defined time standards

Area of Concern	Congressional Approach	Authority Provided
VA has expertise or facilities required, but Veteran's life or heath requires immediate delivery of services.	Allow Veteran to use non-VA resources in emergency situations.	Reimbursements under 38 U.S.C. 1725 and 1728
VA has expertise or facilities required, but travel time or effort for Veteran to access care would be excessive.	Allow Veteran to use non-VA resources when he or she meets objective distance, time, or geographic criteria.	Qualification under Project ARCH for residing more than 120 minutes driving time from needed acute care facility
VA has expertise or facilities required, but Veteran would prefer alternative provider.	Allow Veteran option of using VA providers or going outside VA, but only if certain conditions are met; offer limited pool from which providers can be chosen.	Optional use of Choice program providers under Veterans Choice Act
VA has expertise or facilities required to some degree, but demand for specific services exceeds supply.	Allow contracting to augment available pool of providers.	Agreements under 38 U.S.C. 7409 to purchase services from local medical schools
Use of collaborative arrangement for sharing resources is believed to further VA mission.	Permit the use of reciprocal agreements allowing VA to treat other entities' patients and vice versa.	Sharing agreements with DoD under 38 U.S.C. 8111
Development of sustainable/widely available expertise or facilities believed to be a less-than-optimal use of VA resources.	Carve out specific conditions or treatments for facilitated access to external resources.	Treatment of children with spina bifida under 38 U.S.C. 1813(b)

What is clear from Table 3-10 is that VA has never been given *unfettered* discretion by Congress to purchase external health care. In every instance, the authority to do so is limited in some way, sometimes by objective criteria (such as minimum distance from the closest VA medical facility) and sometimes by narrowing the pool of potential patients (such as Veterans with service-connected disabilities). There are likely many reasons for these legislative constraints, such as controlling costs, discouraging VA from shifting from its traditional role as a specialized health care provider into a health care payer, or ensuring that resources for purchased care are targeted towards specific goals. Whatever the reason, Congress has repeatedly declined to grant VA with unrestricted ability to spend Department funds in this area as it sees fit.

Additional layers of constraint upon purchase care use are essentially self-imposed by VA. Regulations it has promulgated often serve to more narrowly define the circumstances in which

Veterans are eligible to receive care from external sources than what the underlying statutory authority required. Regulations also have been used to place additional restrictions upon the qualifications of providers who might be eligible to deliver such services, and to limit the scope and duration of any treatment given during the course of a referral. Ultimately such regulations provide VA with powerful tools to control when, where, and how it utilizes outside medical services.

Given that they have been developed over many decades, it is not surprising that these authorities are marked by an array of eligibility requirements and, sometimes, idiosyncrasies.[77] Over the years, revisions to the basic authority for purchased care provided by 38 U.S.C. 1703, as well as the expansion of permissible uses of external resources brought about by Project ARCH and the Veterans Choice Act, have created a complex structure for service delivery. Table 3-7 provides a hint of this intricate maze of statute and regulation that has developed over time at least with regard to situational and status eligibility requirements. Navigating that maze is not only a challenge for Veterans, it can also be a challenge for VA staff, especially given that key sources for guidance do not always reflect the most current legal framework for purchased care.

This overview of purchased care authorities and mechanisms before and after Choice program implementation demonstrates that existing statutes do provide the Secretary with authority to use a multitude of purchased care options to accomplish the mission of serving Veterans. However, various restrictions on the use of these resources create a convoluted pool of criteria that can limit how external providers are used if VA so chooses. Statutory limitations and VA's interpretive rulemaking could both benefit from clarification to facilitate the more effective and efficient use of VA purchased care.

---

[77] One example is a specific provision in 38 U.S.C. 1703 allowing VA to use non-department facilities when a female Veteran is in need of hospital care. The authorization appears to date back to the 1950s. No similar authority exists for male Veterans.

4   VA Purchased Care Authorities and Mechanisms in Practice

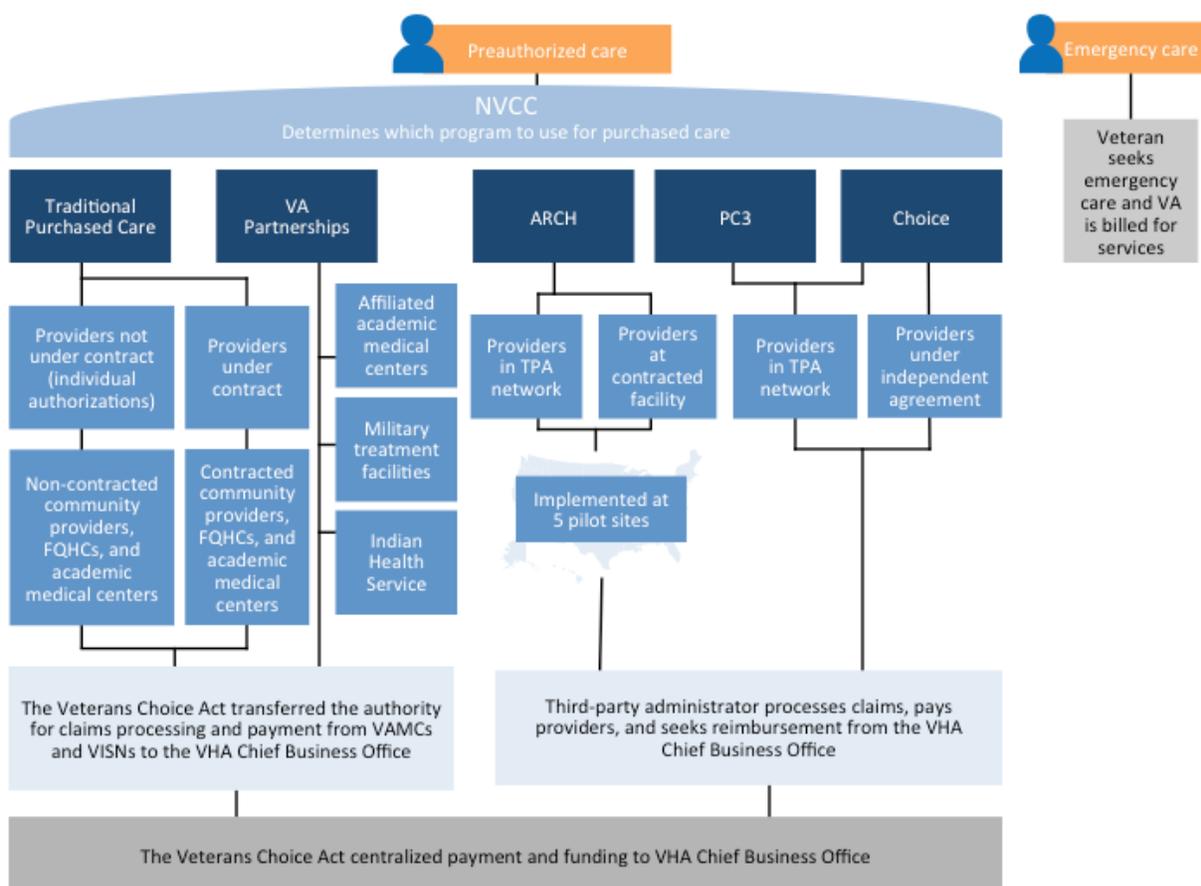
Overview of Methods and Data for Authorities and Mechanisms for Purchased Care in Practice

We assessed barriers and challenges to purchased care in practice by:

- Reviewing documentation from 79 VA facilities, describing their purchased care policies and processes at the local level
- Reviewing relevant VA policy documents and guidance at the national level, as well as related secondary literature
- Conducting and analyzing data from stakeholder interviews
- Analyzing relevant data from the Survey of VA Capabilities and Resources.

As discussed in Section 3, VA can purchase care through a series of different mechanisms. Figure 4-1 illustrates the array of purchased care mechanisms in use as of the writing of this report. In Section 3, we explained how differences in purchased care programs' key elements create inherent challenges to implementation by VA. Section 4 discusses VA purchased care authorities and mechanisms in practice and how the multiple programs for purchasing care may contribute to confusion and inefficiency within VA.

Whereas Section 3 primarily addressed the federal authorities and mechanisms by which VA purchases care, in this section, we focus on challenges in the implementation of purchased care and on the experiences of local VA facilities and personnel in striving to overcome them. We drew on our review of the relevant literature, as well as original data gleaned from stakeholder interviews and the Survey of VA Capabilities and Resources. We also examined the balance between standardization and flexibility in local VAMC and VISN purchased care policies, procedures, and training, drawing on original source materials we received from VA and the Survey of VA Capabilities and Resources. In the process, we identified models that could inform revisions to various local policies in purchased care. Section 4 highlights leverage points for policymakers to consider that would help to streamline the administration and practice of purchased care in the future.

Figure 4-1. Purchased Care Mechanisms in Practice


4.1 Practical Challenges in the Administration of Purchased Care

Several reports have highlighted serious problems with the administration of the traditional VA purchased care programs, including improper payment of fee claims, administrative inefficiencies, and inconsistent procedures (see, e.g., VA Office of the Inspector General, 2009, 2010, and 2012). Another criticism leveled was the lack of coordination or care management with regard to Veterans' use of fee care services, potentially leading to inappropriate follow-up care, medication errors, and readmissions (Jones, 2012).

To assess the barriers and challenges to purchased care in practice, we reviewed documentation from 79 VA facilities describing their purchased care policies and processes at the local level. We also reviewed relevant data from the 2015 Survey of VA Capabilities and Resources, which assessed clinically meaningful delays in care for the seven illustrative clinical populations chosen for Assessment B (Health Care Capabilities) and for primary care.[78] In addition, we conducted stakeholder interviews and reviewed related literature on local

---

[78] See Section 2 and Appendix D for additional detail on the survey's administration and the questions about purchased care.

implementation and federal oversight of VA purchased care. Our assessment of purchased care program administration examines eligibility criteria, reimbursement and billing, quality of care, issues with TPAs and provider networks, coordination of care, and centralization and oversight versus local discretion and flexibility.

4.1.1 Eligibility Criteria and the Hierarchy of Purchasing and Referral Options

As shown in Figure 4-1, VA obtains (preauthorized) outside care through several channels, including the traditional VA purchased care mechanism, VA partner agencies, Project ARCH, PC3, and Choice. Eligibility for purchased care varies across these pathways. Through NVCC, local medical facilities determine which mechanism to use to purchase care for each patient referred. That determination is based primarily on the Veteran's eligibility for each of the purchased care programs. Table 4-1 summarizes the eligibility criteria for the four main purchased care programs; these criteria are discussed in greater detail in Section 3 of this report.

Table 4-1. Comparison of Purchased Care Eligibility Across Four Main Programs

Feature	ARCH	PC3	Traditional Purchased Care	Choice
Eligibility	Driving time to VA facilities (pilot sites only)	VA not able to furnish necessary care	VA not able to furnish necessary care	Wait time, geographic distance to VA facilities

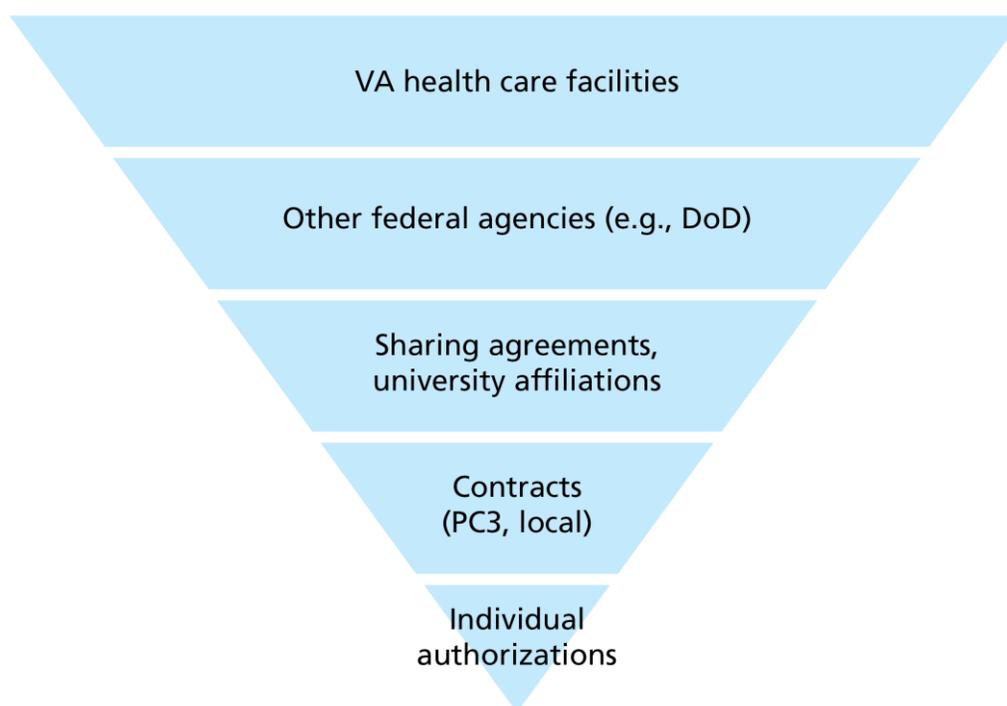
As discussed in Section 3, Project ARCH is a pilot program offered only in rural VAMCs in VISNs 1, 6, 15, 18, and 19. The pilot is set to end in August 2016. Thus, for most VISNs, both currently and in the long term, ARCH eligibility is not a relevant consideration. However, at present, for Veterans living in the five VISNs participating in the pilot, driving time criteria for participating in ARCH is an additional consideration.

The other purchased care mechanisms have overlapping distance and access eligibility requirements. Under Choice, Veterans who are eligible based on 40-mile access criteria may request purchased care.

As shown in Figure 4-2, there is also a specified hierarchy intended to determine VA health care referrals. Direct VA health care is broadly the option that VHA prefers Veterans to utilize first. Current guidance then directs purchased care referrals first to other federal agencies,[79] then to affiliated academic medical centers, then to contracts (including PC3 and Choice), and then to individual authorizations.

---

[79] As we discussed earlier in Section 3.1.1.3.2 of this report, VA has specific authority to enter into collaborative agreements with DoD for the sharing of medical facilities and providers. In addition, VA also has the authority to collaborate and/or contract with other several other federal agencies to obtain outside services, notably including the IHS and FQHCs. Sections 101 and 102 of the Veterans Choice Act address both of these outside agencies, and Section 101 explicitly identifies them as being eligible to receive Choice referrals.

Figure 4-2. Hierarchy for VA Care Referrals


SOURCE: Robinson (2014).

Notwithstanding this programmatic hierarchy for outside referrals, complex judgments by VA administrators may still be involved in deciding which purchasing mechanism to use, given the context of care for a specific Veteran. As noted in Section 3, the various programmatic options differ not only with regard to basic eligibility criteria but also along other parameters, including payment levels, provider qualifications, and additional, situational eligibility requirements. Taken collectively, and given the likelihood that access to willing outside providers may be more readily available under some pathways than others, the selection of the "correct" purchasing pathway may not be reducible to a simple algorithm. As one VA official we interviewed said, "It isn't that VA staff aren't familiar [with the various purchased care programs], it's that they don't know which program to use first."

As of this writing, purchased care eligibility criteria and the referral hierarchy did not appear to be getting simpler, though VHA's Chief Business Office was strengthening its guidance for navigating program eligibility.[80] In 2015, stakeholders were actively discussing a range of possible changes to the hierarchy for purchased care. According to one senior VA stakeholder interviewed, the hierarchy is intended to shift in June 2015, based on new VA guidance that will assert that no new individual provider agreements should be made. By implication, referrals would go to academic affiliates first, then to PC3, and then to existing contracts with providers, while individual authorizations would disappear from the hierarchy as a purchasing option. In contrast, recent congressional testimony by a different VA official described new legislation

---

[80] According to one interviewee.

being proposed by VA, specifically intended to protect individual authorizations as a procurement practice for purchased care (Murray, 2015). Yet another recent testimony before the Senate Veterans' Affairs Committee suggested a different possible shift to the purchased care referral hierarchy, under which Choice would become the default option for purchased care going forward (Exploring the Implementation and Future of the Veterans Choice Program, 2015).

At present, it seems fair to conclude that the future direction of these policies is unclear. In the meantime, purchased care referrals under the existing framework involve navigating a complex set of eligibility criteria, with significant ambiguity for VA officials in determining the appropriate pathway for purchasing care and referring Veterans in specific cases.

4.1.1.1 The Role of NVCC in Navigating Eligibility Criteria

We heard somewhat conflicting views about NVCC in stakeholder interviews. Several VAMC and VISN officials provided positive feedback on the program, praising NVCC as a critical mechanism for routing Veterans to the appropriate care and navigating the complex maze of eligibility criteria. One VAMC interviewee noted Veterans' appreciation of the fact that, under NVCC, VA is responsible for coordinating all steps of the patient's medical treatment or services, from scheduling the appointment through completion of care. Similarly, some believed that NVCC had standardized the referral process for purchased care. As one VISN interviewee put it, "The loop is phenomenally tight." Others cited the standardization brought about by NVCC as being useful in aiding the VAMCs and VISNs and in monitoring problems in the referral process.

Still other stakeholders critiqued what they perceived as an overriding of the successful NVCC process by new purchased care mechanisms, such as PC3 and Choice. VA interviewees stated that the standardization in referral processes established through NVCC did not extend to PC3 or Choice. As one VISN interviewee noted, "NVCC is a great program. It provides great care, and serves Veterans well. It's timely, and provides continuity of care. PC3 has done nothing but fracture the NVCC process."

However, other interviewees spoke of challenges they perceived to be associated with NVCC. One senior VA official with significant expertise in NVCC processes spoke of the complexities surrounding NVCC, specifically the backlog of cases resulting from understaffing and high workloads. This official reported an average monthly workload of 1,600 appointments. Compounding this problem are apparent communication and information-sharing challenges that NVCC personnel encounter as they attempt to interact with VA personnel and external medical providers of purchased care; each office or entity may have a distinct information-technology structure of its own. The same senior VA official commented that already overburdened NVCC personnel must rely on fax machines to transmit the majority of documentation between different providers' offices and spend a significant amount of time resending documents and calling providers to track down documentation that was, in many cases, already sent. This official also noted that while NVCC personnel receive official VA training on scheduling, standardized guidance on NVCC-specific training is lacking. As a result, staff training in NVCC-specific processes tends to be "locally developed, like a lot of VA [practices]."

The literature points to other potential problems with NVCC. An inspection of one VAMC by the VA Office of the Inspector General's Office of Healthcare Inspections found improper "batch closings" of more than 1,500 NVCC requests for external clinical care in April 2014, done solely to meet a May 1, 2014 administrative deadline. Moreover, the inspection found that the same facility had problems scheduling timely appointments under NVCC, missing VHA's 90-day goal every month for five months (VA Office of the Inspector General, 2014a).

4.1.2 Reimbursement Rates and Claims Processing Issues

Variability in reimbursement rates to providers under different purchased care mechanisms has also hampered implementation. A criticism frequently levied against PC3 is that provider reimbursement rates, which, in some areas, are lower than those under Medicare, might discourage participation (Dickson, 2014b). Indeed, concerns about low PC3 reimbursement rates and their effect on provider participation led Congress to mandate an explicit extension of Project ARCH so that care for Veterans already in the system would not be disrupted when PC3 was launched at the ARCH sites.

These concerns were supported by a March 2015 letter to Secretary Robert McDonald from the American College of Physicians, which noted that negotiated reimbursement levels in both PC3 and the Choice program operated as a disincentive to provider participation. "In order to encourage participation by non-VHA physicians and other healthcare professionals in the [Veterans Choice Act] Program," the American College of Physicians recommended, "payment rates should be no lower than those provided under the Medicare program" (American College of Physicians, 2015). Moreover, the National Association of Community Health Centers (2015) has argued that reimbursement rates under Choice should not be calculated on the basis of what was available under PC3, which it asserted was wrongfully being used as the default standard if a provider participated in both programs.

These concerns were echoed in the interviews conducted for this assessment. The Veterans Choice Act states that, except in certain specified situations, the rates shall be no higher than those paid to providers under Medicare for similar services, but there is no similar language that prevents a provider from being offered less than full Medicare rates as part of network participation negotiations. Some interviewees were concerned that health care providers had little financial incentive to sign on to VA purchased care networks, especially in affluent regions and in areas where "concierge medicine" (as one VAMC director phrased it) is on the rise.[81] Indeed, in such areas, even Medicare rates are substantially lower than the market rates that a provider can command, adding an extra challenge to efforts to expand purchased care. The same VAMC director who mentioned concierge medicine explained that there is "variance between what is reimbursable and what [some outside providers] can command in their individual markets. It's quite a variance, and, in some cases, it's . . . hard to reconcile." It is important to note that these are individual perceptions. An evaluation of VA's purchased care

---

[81] *Concierge medicine* refers to primary care practices in which patients pay annual retainers to receive enhanced, more customer-oriented care.

networks, once they are fully established under PC3 and Choice, will be needed to determine their adequacy and the trade-offs between negotiated payment rates and access to providers.

Several past reports have indicated the pervasiveness of improper claims payments and their potential impact on non-VA providers' willingness to continue serving Veterans.[82] A 2009 study conducted by VA's Office of the Inspector General determined that the outpatient component of the traditional purchased care program improperly paid 37 percent of outpatient fee claims by making duplicate payments, paying incorrect rates, and making other, less frequent payment errors, such as paying for the wrong quantity of services (VA Office of the Inspector General, 2009, p. 4). It also found that, for 80 percent of outpatient fee claims, VAMCs did not follow requirements for justifying and authorizing fee services. A subsequent study by the same office in 2010 found that VHA improperly paid 28 percent of preauthorized inpatient fee claims. It also found that VAMC staff did not properly authorize inpatient fee care because VHA policies did not provide adequate guidance for determining eligibility or because fee staff did not understand the guidance that was available (VA Office of the Inspector General, 2010, p. 3).[83] Others have criticized the lack of updated automated processes for claims handling by VA under the traditional purchased care program, noting that the primary application being used to handle claims from non-VA providers is more than two decades old (AMVETS, Disabled American Veterans, Paralyzed Veterans of America, & VFW, 2013, p. 167). The problems noted go beyond mere inefficiencies in handling paperwork, some stakeholders argue; there have been "serious concerns about past due claims payments from VA and the economic realities that will force community providers to stop serving Veterans without timely payments" (Jones, 2012). Indeed, a March 2014 GAO report indicated that delays in claim processing under the traditional purchased care program were a major issue for some non-VA hospitals. According to the report, staff at one VA facility believed that these delays had lasted years in some cases.[84] To our knowledge, as of this writing, VA had not performed any systematic evaluations of the timeliness and quality of contractor claims processing for the relatively new PC3 and Choice programs. Assessment I's (Business Process) report, however, provides an evaluation of these issues.

To the extent that Medicare rates (or sub-Medicare rates) and delayed claims payments are unattractive to outside providers, purchased care mechanisms that otherwise seek to address internal VA capacity shortfalls may be unsuccessful in building a robust outside provider capacity. The TRICARE program, the health benefit plan for active-duty and retired military personnel and their dependents, also maintains a national network of civilian providers who are paid largely at Medicare rates. At the end of FY 2014, the TRICARE network totaled 434,300 physicians and other providers, and beneficiary access to community care was similar to or

---

[82] According to Assessment I (Business Process), the most significant barrier to timely and accurate payments of claims is technological. Non-VA providers submit relatively few electronic claims, negatively affecting accuracy and timeliness.

[83] Two years later, similar issues were still in play. See VA Office of Inspector General (2012).

[84] This GAO report was about Millennium Act claims, in particular, but echoes statements made more generally (GAO, 2014d).

---

higher than in private sector plans (Defense Health Agency, 2015, p. 62). As of June 2015, both TriWest and Health Net were still building their networks. Once this initial effort is complete, VA can evaluate network adequacy as TRICARE does.

Reacting to claims processing challenges and backlogs, Section 106 of the Veterans Choice Act directed a reorganization of claims processing to consolidate this function under the management of VHA's Chief Business Office, as discussed in detail below. The success of that reorganization and its ultimate impact on claims processing speed remain to be seen.[85] Policy-makers might at least consider whether similar direct legislative intervention could be helpful in improving any aspect of reimbursement, including both claims processing and purchased care provider rates. For example, current VA purchased care law generally sets upper bounds on provider reimbursement rates but establishes no floor.[86] When ensuring an adequate pool of participating providers is perceived to be an important component of a policy to address a particular problem (such as lengthy wait times), Congress could discourage the use of VA initiatives that result in reimbursements smaller than what the Medicare fee schedule allows. The broader policy issue to consider is the resulting trade-off: Authorities and policies that reduce purchased care expenditures may be desirable for controlling cost, but they sometimes may be undesirable when they make participating in purchased care less attractive to outside providers. Future policy discussions will need to determine the appropriate trade-offs.

Although provider reimbursement rates and procedures are a key component of VA purchased care provision, most SOPs we reviewed did not discuss this issue. Instead, they focused on authorization, referral, and appointment management. Given the recent shift and the lack of guidance of budgetary authority from VAMCs to VHA's Chief Business Office, VAMC personnel could be confused, at least in the near term, about responsibilities and procedures for provider reimbursement. Assessment I's report echoes this sentiment, noting that Non-VA care procedures for processing claims are complex and confusing, and claims clerks must execute a number of complicated processes and tasks on a daily basis.

4.1.2.1 Reimbursement for Emergency Services

Most of the time when medical care is provided outside of VA, the patient may be unaware of issues related to invoicing, claim verification, and provider payment. That is not the case for emergency services, for which a Veteran is unlikely to have obtained an official authorization from VA, prior to seeking emergency help at a local hospital or clinic. The latter situation puts the onus on the Veteran to pay the bill and seek reimbursement from VA for his or her

---

[85] Assessment I (Business Process) notes that this is a step in the right direction, and recommends complete centralization and standardization of the claims processing function.

[86] Under Section 101(d)(2)(B) of the Veterans Choice Act, for example, provider reimbursement rates generally cannot be higher than the Medicare Fee Schedule rates (unless the care involves Veterans residing in counties with population densities of less than seven persons per square mile). In the context of outpatient services under Section 1703 purchased care, however, reimbursements can be based on the terms of any existing contract or agreement between the provider and VA. If no such contract or agreement exists, it would be the lower of the Medicare rate, the rate available through re-pricing (where contractors give VA discounted health care through a network of providers), or the amount the provider bills the general public for similar services.

---

emergency care (or to seek an assurance that VA will take care of the bills as they are received). Commenting on the complexities of complying with the conditions set forth in 38 U.S.C. 1725 and 1728 to avoid significant financial responsibility, one group of Veterans Service Organizations has asserted that the "laws prescribing VA coverage of non-VA emergency care services places an extraordinary burden on Veterans, requiring that they be educated on convoluted and burdensome administrative criteria not typically found in private health-insurance plans" (AMVETS, Disabled American Veterans, Paralyzed Veterans of America, & VFW, 2013, p. 67).

4.1.2.2 Financing and Payment

Section 106 of the Veterans Choice Act consolidates purchased care financing in VHA's Chief Business Office rather than at the local level. Congress included this provision in the act in an effort to shift financial decision-making for outsourcing care from the local facilities to the central administration and encourage the use of non-VA care mechanisms. Although referrals still must be made at the local level, this was seen as one lever available to Congress to help increase the utilization of purchased care. As one senior VA official put it, "Choice was a reaction to us not using our mechanisms as often as we should." A congressional official confirmed this sentiment: "We know that VA has the authority to provide non-VA care, but they don't use it. We want to know how to get the VA to use non-VA care authorities."

However, this initiative has met with varying levels of support across different stakeholder groups. Of the nine VISN/VAMC interviews conducted, seven interviewees commented on the centralization of purchased care funding, and all had negative impressions of the change. One VISN director articulated that it caused payments to be late, which, in turn, affected relations with community providers. The interviewee's VISN reportedly had a 95-percent payment rate within 30 days prior to the policy change; after financing was centralized at VHA's Chief Business Office, according to the interviewee, the payment rate dipped to 80 percent. That said, a congressional official was optimistic and suggested that the reshuffle would ultimately help improve the timeliness of claims processing and reimbursements across the VHA enterprise.

Another concern among local and regional VA officials was that the centralization of financing would over-incentivize the use of purchased care. Previously, when local officials managed their purchased care budgets, there was an incentive to bring services back in house to sustain internal workloads. According to one high-level VA Central Office official, "The centers were used to knowing how much money they had, to constrain how many patients they sent out. Now, we are finding that they are sending people out because they aren't under budget constraints." Other local officials worried that the new process would hamper their budget planning. One VISN examined historical care provisions to determine how much purchased care a VAMC was likely to need in the coming year, said the director of a facility in that VISN. Having a clear expectation of the extent to which purchased care might be required helped the VISN to build a smarter budget. Steps are reportedly being taken to carry out this function in collaboration with the relevant VA central offices, the contractors, and the VISNs/VAMCs, but it is too early to determine how widespread or effective this approach has been.

On the other hand, several VSO representatives interviewed for this study supported the shift in budget authority and heralded the consolidated financing as a much-needed change. In the words of one VSO official, "Before, the facilities could decide [how much to spend on non-VA care]. Now, the reliance on non-VA care does not have financial impact on their ability to provide capacity because it's coming from Chief Business Office. It's a step forward and removes a barrier for access to non-VA care."

4.1.3 Quality of Care Concerns

The quality of the care provided by VA is often raised as a major reason for Veterans to stay within the system. Assessment B's review of the evidence on VA quality of care showed that VA health care quality was good overall on many measures and domains compared to non-VA comparators. Studies have found that a key aspect of VA's quality of care is the cultural competency of its providers. For example, a RAND report on the cultural competency of non-VA mental health providers found that only 13 percent were equipped to serve a Veteran population (Tanielian et al., 2014, p. 18).[87] Assessment B's report details the ways in which VA's culture is well suited to providing care to Veterans.[88] In addition to a better understanding of military culture, VA providers understand the specific health needs of Veterans. Illnesses and injuries, such as traumatic brain injury, polytrauma, exposure to hazardous materials, and chronic pain, are more common among Veterans than in the general population (Johnson et al., 2013). Because VA screens Iraq and Afghanistan Veterans for traumatic brain injury, a VA practitioner might be better equipped than a physician at a non-VA facility to identify the symptoms of the condition. Assessment A (Demographics) describes the unique health care challenges facing Veterans and notes that VA providers treat a sicker population than civilian providers.

Several interviewees expressed concerns tied to inconsistent oversight and quality of care across purchased care providers. Some stakeholders indicated a need for performance metrics and data collection so that VA could track community providers' performance. For instance, one VISN director suggested that VA loses control over quality when Veterans seek health care in the community. An official working for another government health program took a similar stance, noting that VA would have to decide whether assessing the quality of care provided to Veterans by non-VA providers is part of its business model. While interviewees tended not to raise quality of care concerns with regard to traditional purchased care, several stakeholders interviewed, including both VISN and VSO officials, expressed concern about the potential dilution of quality standards due to VA's limited oversight when it relies on contractors under PC3 and Choice. One VISN official noted that quality of care concerns were more prevalent with programs like PC3 than with NVCC: "NVCC is a great program, provides great care, and serves

---

[87] While not all the factors examined in the report are relevant to providers of medical care, aspects such as "knowledge, attitudes, and behaviors with respect to military and veteran culture" (Tanielian et al., 2014, p. 20) speak to cultural competency beyond the mental health profession.

[88] The report also notes that VA culture may result in discrimination toward and uneven utilization by certain subgroups.

Vets well. It's timely, and provides continuity of care. PC3 has done nothing but fracture the NVCC process." Meanwhile, a VSO official acknowledged, "I don't know how in-depth [VA] can go in vetting those providers who want to sign on. If they vet them fairly well and they get top-notch service, fine. If they just sign them up to get numbers, that could be a problem." A VISN official acknowledged that a theoretical benefit of PC3 is that the provider networks are supposed to maintain certain levels of quality that are in line with VA standards. However, he felt that his VISN did not receive adequate data or reporting on quality of care under PC3. Overall, this official was skeptical about the extent of oversight of quality of care in PC3-affiliated clinics. Other interviewees explained that the goal should be to give Veterans the same quality of care outside the VA system through purchased care mechanisms as they are guaranteed within it.

Similarly, interview participants discussed the importance of the *quality* of choices, as opposed to just their quantity. One VSO official said, "It's less about having choice, and more about 'what are the choices?' If the choice is between two bad choices, then having a choice doesn't make a difference." Put another way, "Should a Veteran be able to make a bad choice?" Other interviewees, conversely, argued that quality of care is not as important as access to care, which is what the Veterans Choice Act aims to address.

4.1.4 Issues with the Use of Third-Party Administrators and Implementing Provider Networks

There have been concerns about how VA coordinates with the TPAs to determine Veteran eligibility under both PC3 and the Choice program. Reportedly, there is lag time between when a Veteran attempts to make an appointment with VA but is unable to do so within the required time frame and when VA provides that information to the TPA. As a result, if a Veteran attempts to contact the TPA to set up a new appointment with an external provider, he or she may be told that the TPA has not yet received authorization to schedule the appointment, even though the Veteran is already eligible under wait-time requirements (VFW, 2015a, p. 4).

As we discussed earlier, another concern is that some clinicians may be unwilling to accept Choice patients at Medicare reimbursement rates. One requirement described as problematic stipulates that providers submit a report on the care provided within 14 days of the date of service. We were told that the industry norm is 30 days, though we could not confirm this. The Prompt Payment Act, with which the Veterans Choice Act requires VAMCs to comply, has hamstrung VA's abilities to recover medical documentation from non-VA providers in a timely fashion. As VAMC directors explained it, the act does not allow VA to withhold payment pending receipt of the report on care, and, therefore, it disincentivizes providers from sending back the documentation. However, other interviewees noted that providers are not paid until medical documentation is returned and accepted by VA, which frequently rejects such documentation, thus delaying payment to providers. This discrepancy in reported experiences is notable and worthy of further investigation. Furthermore, VA's reliance on networks of eligible providers for PC3 and, where possible, Choice, has been called into question. Veterans who are eligible for the Choice program can acquire purchased care only from non-VA providers who are in the PC3 networks or willing to sign an agreement to provide the care outside the

network. Both TPAs indicated that they will try to enter into agreements with providers Veterans prefer to see, but this is not always possible. Asserting that the Veterans Choice Act "makes clear that veterans may choose from any eligible entity, not merely from those with whom VA happens to contract," some lawmakers have argued that a "limited list of non-VA providers makes the provision of care at VA's choice, not the veteran's" (McDermott, 2014).

One media account reported that Veterans attempting to use their Choice card at a public regional health center were being turned away. The health center had been told that it would take the TPA 90 days to review and approve the health center's application, submitted in mid-January 2015 (Kidston, 2015). Veterans cannot seek service from a civilian provider using their Choice cards as proof of coverage; they must have a referral for the service and the provider must sign an agreement. We heard repeatedly that many Veterans have not understood how to use their Choice cards. Following an inquiry from the senator representing the state in the case in question, the health center's application was approved a week later. Other potential providers have noted that "hospitals have experienced difficulties getting in touch with [the Choice TPAs], receiving answers to their questions about the program, and interpreting communications, particularly pre-authorizations," arguing that a better approach would be to allow "VA to consider allowing hospitals to contract directly with their local VA facilities," rather than requiring "all non-VA medical care provided under the program to be implemented through contracts with either Health Net Federal or TriWest Healthcare Alliance" (American Hospital Association, 2015). It is unclear whether these problems reflect the unusually short implementation period in the Veterans Choice Act or a longer-term issue related to contracting out network development.

VAMC and VISN officials cite these challenges as one underlying reason for low utilization of the Choice program. Eight of the nine senior VAMC and VISN officials interviewed noted that use of the Choice program had been minimal so far.[89] According to these interviewees, the prevailing perception at the VAMC/VISN director level was that the low utilization of the Choice program thus far was primarily due to serious lack of development in the provider networks formed by Health Net and TriWest. We note, however, that the Veterans Choice Act prioritizes the Veteran's provider of choice and does not require use of a network provider. Although some aspects of the low utilization problem are not necessarily something for which VA can reasonably be held responsible—for example, the overall lack of health care providers in rural areas and the statutory caps on reimbursement rates—VAMC and VISN interviewees believed that two elements of the Choice program contributed to the current situation: negotiated rates that drop below the Medicare schedule (or below existing market rates, in affluent areas where those rates are substantially higher than Medicare rates) and the requirements associated with joining the provider networks. In contrast, a Health Net official noted, "There has never been support for PC3. . . . The volume has not materialized under PC3 because there has not been accountability" for adhering to VA guidance on using PC3 and Choice before the traditional

---

[89] The issue was not directly addressed in the ninth interview. Utilization data on the Choice program to date are presented later in Section 4.

program. This view is supported by recent testimony of Deputy Secretary of Veterans Affairs Sloan Gibson before the House Veterans' Affairs Committee:

> PC3 . . . [is] still a new program and it's still a very small percentage. . . . [A]s I mentioned in my statement we've been referring veterans for care in the community for years. Folks are used to doing that a certain way, there are providers that are used to referring their patients to [outside providers] on a routine kind of basis and so that's what's being over-utilized. . . . Choice was designed to help accelerate access to care to make care in the community more available to veterans. That is precisely what we've been trying to do. We've just been using traditional channels to accomplish that as opposed to being able to get all the system and veterans and providers in place to do it through Choice. (Gibson, 2015)

The Health Net official also cited the requirements associated with the Choice program, reporting that providers state, "If you are going to pay us low, that's okay, as long as you don't require all this extra stuff. You can't have it all."

In addition, interviewees pointed out that joining the network does not guarantee availability for VA referrals. Doctors may agree to join the network, but some may have limited or no availability to see Veterans. One VAMC director told us, "A number of specialists that have signed up have very little capacity. It's an important component, especially in rural areas." Moreover, according to the same interviewee, some of the specialists who signed up to serve Veterans are geographically inaccessible. Choice (and PC3) are still being implemented, but when the programs stabilize, VA will need to evaluate where and for what services purchased care will be effective in augmenting VA's in-house capacity to supply timely, high-quality care to Veterans.

Although the majority of VAMC and VISN interviewees felt that the provider networks were too small, one VISN director and one VAMC director expressed optimism that the networks would grow over time, through cooperation with the TPAs and outreach in the community. Moreover, three VAMC directors and one VISN director noted that their relationships with the TPAs had been generally positive. The TPAs indicated that their networks are expanding quickly and they are working with VA central offices, VISNs, and VAMCs in their areas to shape the networks according to local needs and to improve communication and ensure clarity on the documentation required to make referrals. Ultimately, the interviews point to the need to evaluate the TPAs and the provider networks in a systematic and comprehensive manner. Because the interviewees with both negative and positive views emphasized that the networks were very new and still being built, ongoing evaluation and analysis would prove extremely beneficial.

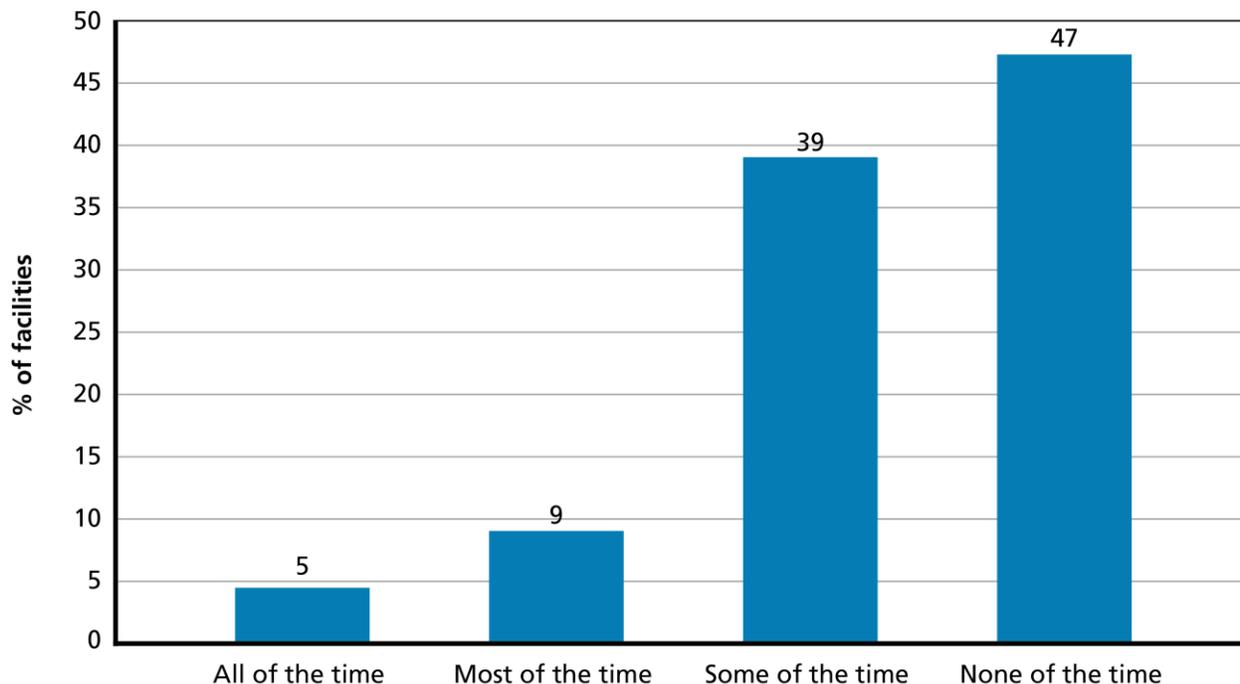
4.1.5 Challenges in Coordinating Care

The literature on purchased care cites the lack of coordination or care management for Veterans who use purchased care services as being sufficiently problematic as to potentially lead to inappropriate follow-up care, medication errors, and readmissions (Jones, 2012). Coordinated care management has been raised as a concern under multiple non-VA care programs. For instance, analysts have criticized PC3 in the past as creating "a national contract

---

for a network of providers to deliver medical and surgical services without critical care coordination elements" such as those found in the discontinued Project HERO, making the program "nothing more than a discounted fee network, with no added benefits for Veterans" (Jones, 2012).

One seemingly critical step in coordinating Veteran care across VA and non-VA providers is ensuring the seamless transfer of Veteran health information from VA facilities to local health care providers in electronic format. As described in the Assessment B (Health Care Capabilities) report, VA has actively pursued electronic health information exchange through its Veteran Lifetime Electronic Record initiative but faces a complex set of technical and other challenges that plague health information exchange more generally (Hosek & Straus, 2013). VA has gradually increased the number of civilian providers who participate in Veteran Lifetime Electronic Record initiative, but the technical requirements and level of effort required to meet federal standards for secure exchange of health information pose significant barriers to participation for most providers. The facility survey included a question on this issue, asking VAMC chiefs of staff, "How often does your local health care system share records with non-VA health care providers in electronic format?" The survey specified that respondents should use their best judgment to answer this question, and they were not required to pull data from their administrative parent records to answer. Response options included "all of the time," "most of the time," "some of the time," and "none of the time." As expected, electronic record sharing with non-VA providers is fairly rare, with nearly half of respondents answering "none of the time," 40 percent responding "some of the time," and only small fractions responding "most of the time" or "all of the time" (see Figure 4-3).

Figure 4-3. Facility Survey Data on Frequency of Electronic Record Sharing with Non-VA Providers


Stakeholder interviews further illuminated views on coordinated care management under purchased care. For instance, a VSO official asked how VA will address cases where a Veteran receives all his or her care outside VA: "How can VA do case management on those folks? Will there be health case managers? Will it be part of the job of primary care? I don't know what mechanism they have in place for patients who may be seen entirely outside VA, that's a new paradigm. . . . The last thing we need is poor care coordination that leads to long-term declines." Such care coordination is the responsibility of VHA, not of the Veteran; however, the unintended consequence of poor care coordination is that Veterans must either take it upon themselves to coordinate their own care, or suffer from a lack of care coordination. Other VSO officials have made public statements to this effect, noting that the Veterans themselves are "assumed to lead the sharing of information and communication between private providers and VA when receiving VA-purchased care, particularly through Fee [traditional purchased] Care" and arguing, "VA has the obligation to lift the burden from veteran patients who are bridging the fragmented and disconnected care the Department buys from the private sector" (AMVETS, Disabled American Veterans, Paralyzed Veterans of America, & VFW, 2013, p. 166). Ideally, there would be a "single care/case manager responsible for assisting and coordinating the veteran and his or her care purchased or provided directly by VA." The need for coordinated care was said to be "especially critical for chronically ill and complex patients, such as those with cancer, diabetes, chronic obstructive pulmonary disease, and end-stage renal disease," as these were the types of patients who have multiple comorbid conditions in addition to the one that led to the consultation. In the future, VA may be able to adopt care management approaches that have been shown to be effective in Medicare or employer health plans, or develop its own approaches.[90] The Section 5 further discusses this issue in the context of episodes of care.

One factor indelibly related to coordination of care and electronic transfer of records to non-VA providers is the communication of information – both to patients, and between providers. In many of the SOPs we reviewed, the delegation of responsibility for communicating information to both the Veteran and the non-VA provider is unclear. One VAMC's SOP for the NVCC program, for example, simply says that an NVCC administrative team member will contact the Veteran and the non-VA provider, but does not say which staff member, or provide guidance for employees to make this determination. Furthermore, the SOP says that the Veteran will be contacted by telephone but does not explain what the conversation should entail. At the other end of the spectrum, several VAMCs have promulgated—either as separate SOPs or as appendices—scripts for staff to follow when calling Veterans to guarantee satisfactory interaction between the Veteran and VAMC staff.

4.1.6 Centralization and Flexibility in Purchased Care Administration

The balance between flexibility and standardization at the VISN and VAMC levels was a key issue that received considerable attention in our interviews. A VAMC director suggested that,

---

[90] Note that there are weaknesses in the Medicare model. One interviewee explained that care coordination has long been problematic under Medicare. VA must keep these drawbacks in mind.

from the outset, those who wrote the Veterans Choice Act recognized that there would not be complete standardization and consistency in its implementation across VA: "It's hard to write one global directive that can be universally implemented. . . . There was general guidance on implementation, and each VISN would implement practices that would most efficiently implement the law."

Other interviewees spoke of the benefits and costs of both flexibility and standardization. Several local VA officials echoed the phrase, "If you've seen one VA facility, then you've seen one VA facility." The lack of standardization across VAMCs is a point of pride for some VA officials; for others, it is a point of great concern.

Although a frequently stated objective is to maintain an appropriate level of standardization and centralization across VAMCs and VISNs, there is a recognized need for flexibility in (and localization of) certain decision processes. For instance, one VISN director expressed the hope that the claims process would be standardized across facilities and across VISNs but assumed that there was not much variation currently. This interviewee also indicated that standardization should be the priority for this function. Flexibility may be acceptable when it comes to contacting the patient, but "the majority of the time, we strive to be standardized." Another VAMC director commented on the benefits of standards and accountability mechanisms in the Federal Acquisition Regulation (FAR) that are available under traditional purchased care, but "I'd like to have a little bit more freedom locally to be able to reach out and implement some of those arrangements . . . in an efficient, legal, and effective way."

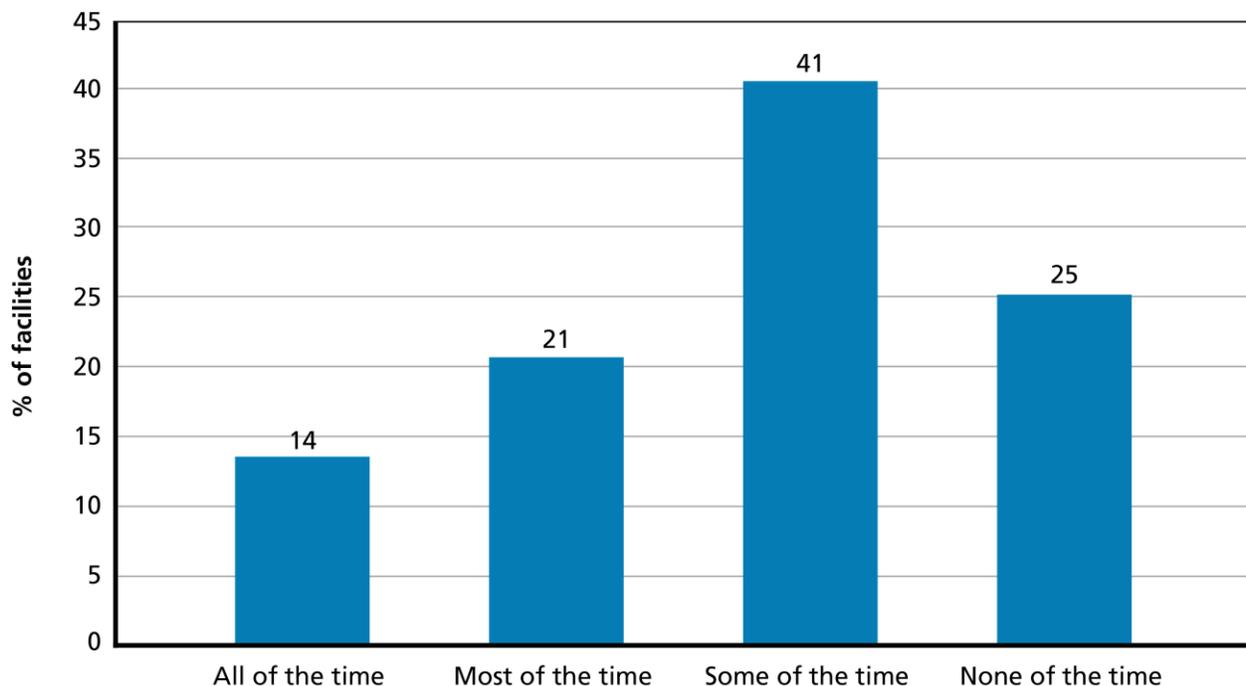
Interviewees highlighted the benefits of the greater standardization provided by the Veterans Choice Act. When asked about the act's strengths, one senior VA official responded that it establishes uniformity for interpreting authorities and implementation. This interviewee felt that the way purchased care was approached prior to the Veterans Choice Act did not give Veterans enough input or choice when using purchased care, and rules regarding who referred for outside care were not consistently applied. For example, one VISN might have required a Veteran to drive 100 miles to receive care. Another VISN might have required the Veteran to seek care closer to home. VSO representatives also appreciated the greater standardization that the Veterans Choice Act provides. They felt that the thresholds for waiting "too long" or being "too far" were no longer nebulous. Instead, the distance and access metrics are written into statute, and Veterans can better understand purchased care offerings. That said, Choice is currently a temporary program with a capped budget, and not all Veterans are eligible. Criteria for referring patients for purchased care through other mechanisms are still at the discretion of local VA officials.

4.1.6.1 Need for Better Data Collection

A review of the facility survey findings speaks to another administrative shortcoming indicating that VA could benefit from further attention to collecting critical data at the local level. The survey included a question asking VAMC chiefs of staff, "How often does your local health care system collect data about how long Veterans wait for appointments with non-VA health care providers?" Interestingly, one in four respondents answered that they never collect these data, and only one in seven reported collecting these data routinely. Most respondents answered

that they collect data on wait times outside VA some or most of the time (see Figure 4-4). Given the focus on minimizing Veteran wait times *within* VA in an attempt to ensure overall quality of care, it seems reasonable to expect that VA would similarly track the wait times for Veterans who are referred out to non-VA providers for various reasons. However, it appears that there is no such systematic tracking.

A study conducted by the National Academy of Public Administration in 2011 provides support for the finding that VA's data collection efforts are minimal, observing that VHA had a "limited understanding of the services" it was paying for under the program as well as the costs to purchase external care (National Academy of Public Administration, 2011, p. 6).

Figure 4-4. Facility Survey Statistics on Frequency of Data Collection Regarding Veteran Wait Times at Non-VA Facilities


More recent GAO reports also highlight a need for improved data collection on purchased care for the dual purposes of oversight and cost-effectiveness analysis. As discussed in detail in Section 5, there are various concerns with data collection mechanisms supporting identification of episodes of care. GAO found that, consequently, VA cannot compare the cost-effectiveness of purchasing care to direct care for episodes of care (GAO, 2013a). However, as discussed in the Assessment B (Health Care Capabilities) report, data are inadequate for estimating the costs of providing either individual services or episodes of care in VA facilities and, further, there are significant methodological challenges involved in comparing VA and private-sector costs. GAO has also noted that the deficiency of purchased-care data systems hinders both the accuracy of reimbursement and the ability to audit those payments, at least in the traditional program (Williamson, 2015). VA reported that, in FY 2016, it would analyze the costs of purchased care by episode of care after the overhaul of data systems is finished (Williamson, 2015).

These assessments by the National Academy of Public Administration and GAO align with our conclusion that more systematic data collection ought to be embedded in purchased care processes and both VA and their contractors should have the capability to analyze these data as needed to plan for and operate the purchased care program cost-effectively. A strong base of data and analysis will allow for ongoing monitoring of purchased care outcomes (access, quality, coordination, cost) over time and target improvements to enhance outcomes.

4.1.6.2 The Veterans Choice Act and VA's Role Going Forward

In November 2014, VA anticipated that 440,794 eligible Veterans would seek authorization for non-VA medical care under the Veterans Choice Act annually and that, in response, 187,000 eligible entities and health care providers would furnish hospital care and medical services.[91] By mid-March 2015, four months after Choice program implementation, VA reported that 45,990 Veterans had requested Veterans Choice Act authorizations, resulting in some 45,000 appointments scheduled under the program (VA, 2015b). Another report estimated that about 27,000 Veterans *received* an appointment (rather than simply requesting one) over roughly the same period (Hegseth, 2015). Although actual uptake was significantly lower than originally predicted, with about 11,500 Veterans per month making requests in the four months after the interim final rule's publication, compared with an anticipated average of 37,000 per month over the course of the year, it should be remembered that the Veterans Choice Act benefit card distribution was staggered, with many—perhaps most—Veterans not receiving cards until January 2015.

In May 2015 testimony before the Senate Veterans' Affairs Committee, an official from Health Net—one of the two third-party administrators responsible for implementing the Veterans Choice Act program—cited slightly different utilization rates for the Choice program:

> Since the inception of the Choice program in November through the beginning of May, 2015, we have answered about 550,000 calls, with the vast majority of these calls coming from Veterans seeking information on Choice or requesting an authorization for care. About 30,000 Veterans have opted-in to the Choice Program with almost two-thirds eligible based on wait time. About 16,500 authorizations have been made for wait list eligible Veterans and nearly 10,000 authorizations have been issued for mileage-eligible Veterans. With the recent change in eligibility criteria based on driving distance, we expect a significant increase in demand for care for mileage eligible Veterans. (Hoffmeier, 2015, p. 6)

When interpreting these data, it is important to keep in mind that Health Net serves only a portion of the Veteran population eligible under the Veterans Choice Act, with TriWest acting as the TPA for the remainder of eligible Veterans. For TriWest's part, president and CEO David J. McIntyre, Jr., noted in May 2015 testimony before the Senate Veterans' Affairs Committee,

> In the six months the [Veterans Choice] program has been operational, TriWest has processed over 40,000 authorizations for care. And we have seen growth in the use of

---

[91] VA's interim final rule submission in response to the Paperwork Reduction Act of 1995 (79 Fed. Reg. 65582–65583), November 2014.

the program every month with the exception of a slight drop between January and February of this year. In November 2014, we processed approximately 2,600 authorizations (more than the first month of operation under PC3). By April 2015, the number was 10,600; growth of nearly 400%. (McIntyre, 2015, p. 7)

Perhaps the most controversial aspect of the program has been a February 2, 2015, request in the White House's FY 2016 budget to reallocate some of the $10 billion in funds earmarked by Congress for the Choice program to other needs within VA (Kime, 2015). At the time, a VA spokesperson argued that the lack of uptake was "a strong indication that [Choice] is not the veteran's preferred choice" and that Veterans "would prefer to remain in the VA" for health care services (Kime, 2015). It was also argued that VA has "no ability to shift resources between Choice Programs and VA-provided care" to provide timely health care to all Veterans, especially in light of "anecdotal indications from veterans and their representatives that they would prefer to get their care in VA facilities from the medical professionals they have" (Kime, 2015). In contrast, others have argued that any underutilization was the result of how the program was rolled out and the "confusion" that accompanied its implementation (Kime, 2015). In response to the request to move funds out of the Choice program if any surplus remains, the primary sponsor of the Veterans Choice Act said that the plan is a "complete non-starter, which I will not support" (O'Harrow, 2015).

Ultimately, given that the Veterans Choice Act has been in effect for only a short period and uptake has been slower than expected, it is difficult to predict the full effects of the Choice program and the long-term implications for VA's role as a health care provider and for Veterans' experiences in seeking care.

One overarching theme in our interviews was that the Veterans Choice Act might be an opportunity for VA to determine how it defines its broader role in directly providing care going forward. Unprompted, several VSO officials, as well as at least one senior VA official and one TPA official, discussed the degree to which the Veterans Choice Act represents the first step on a "slippery slope"[92] toward more purchased care. However, other interviewees had both positive and negative reactions to this idea.

Many interviewees expressed concern that the Veterans Choice Act and a potential increase in purchased care use could "lead to a dilution of quality of care in the VA health care system and could fail to leverage key strengths of the VHA."[93] The primary concern among these interviewees was that the Veterans Choice Act could signal the beginning of more outsourcing of care that will replace direct VA care offerings. While some believed that purchasing care was a good approach, others had reservations. They spoke of a cultural shift in moving from VA/military to private medical providers and were concerned that non-VA providers were not well informed about the medical consequences of military service and lacked the cultural competency to care for Veterans. Furthermore, these interviewees felt that the cost of training

---

[92] In this case, the "slippery slope" refers to a vast increase in the use of purchased care over time that will follow after the Veterans Choice Act and its resulting surge in purchased care.

[93] Beyond RAND's interviews for the purposes of this study, this idea has been discussed in outside reports and literature. See, for example, Panangala (2010).

non-VA providers on these issues outweighed the financial and logistical benefits of referring Veterans out for care. One VSO official who supported the Veterans Choice Act also expressed concerns about the second- and third-order effects of the Choice program associated with an ever-increasing amount of care being provided outside of VA. His view was that Veterans have unique care needs due to service-connected injuries and therefore rely heavily on VA care. Several interviewees discussed VA's duty to provide care. According to one senior VA official, "VA still owns that care in the community. There is connection and importance there. There is a distinction that we are responsible in a global sense. . . . When you contract, some of that responsibility may be severed."

Several interviewees noted that Veterans consistently expressed a preference for VA care, with this preference being especially strong among those who were already in the system. One VSO official stated, "The majority of Veterans we hear from are happy with their care. Once they can get into the VA, they get top-notch care. It's an issue of getting into the VA." More than one VSO official told us that Veterans "feel comfortable with their VA doctor, they feel safe, they feel understood there." Reasons cited included the quality of care, providers' familiarity with the distinct and complex needs of Veterans, and a sense of camaraderie.

The attraction of the VA system extends beyond issues of quality, familiarity with Veterans' specialized needs, and camaraderie, however. Several interviewees raised the point that Veterans may choose to remain within the VA system because it is familiar and known to them. One VSO official noted that Congress may have overestimated the number of Veterans who will choose purchased care. The VSO official said, "Particularly the older guys who've been going to the VA for 20 years, they don't want to go anyplace else. . . . Better the devil you know than the devil you don't know." A VISN director concurred with this point, stating, "We haven't seen the [Veterans] Choice Act be successful. Most Vets want to stay within our system of care. We don't see Vets elect to go into the community when offered." Building on this reasoning, a VAMC director suggested that Veterans might prefer VA over outside providers because they are confused about the Veterans Choice Act and its offerings:

> They are happy with the services that are provided in our telehealth clinics and in our facility, so, for us, that's a great compliment to the services that we provide. So, as far as Choice goes, the premise is great. It works in our areas for our Veterans that are able to utilize it effectively, but for the majority of our folks, it can be confusing and frustrating for them to access that care.

The preference of Veterans for VA care is somewhat supported by recent data. Two recent surveys compiled by the VFW show that just under half of the Veterans surveyed reported that when they were offered the choice to use purchased care, they nevertheless elected to stay in the VA system (VFW, 2015b, p. 3).

4.1.7 Overcoming the Practical Challenges in Purchased Care

In sum, the day-to-day administration of purchased care presents a series of challenges for VA officials. Resolving those challenges will be pivotal to the future success of purchased care, and ought to be a high priority for VA to undertake. More specifically, a robust purchased care program will require adequate reimbursement rates to ensure provider participation, avoiding

delays in processing claims submitted by outside providers, ensuring sufficient network depth and administrative coordination with the TPAs, consistent oversight of quality in outside services purchased, coordination of care and communication of information to and between patients and providers, and data collection efforts in support of these various aims.

Building on these granular steps, VA could strengthen its purchased care operations by developing a strategic plan, by implementing stronger training for its personnel, and by systematically collecting data on various aspects of purchased care operations in order to carefully monitor performance. In principle, these tools could help to articulate clear policy and procedural requirements for VA personnel to follow, while clarifying performance expectations and oversight in purchased care, as well as applicable sanctions for local non-compliance with standards.

At the end of Section 4, we summarize our empirical findings on facility-level implementation of purchased care, how this is currently organized, and the balance of power that it represents between local and centralized authority within VA.

4.2 Implementation of Purchased Care at the Facility Level Is Inconsistent

4.2.1 Organization of Purchased Care within VAMCs

Not only do VA facilities' non-VA care policies and procedures vary, but their categorization and placement of purchased care administration within their organizational structures also differ. As noted above, RAND received 253 organizational charts from VAMCs and VISNs across the country as part of our request for purchased care policies. Of these 253 organizational charts, just 12 organizations identified a separate purchased care function or office on their organizational chart. One of them was at the VISN level, while 11 were from facilities. The dates of these 12 charts varied widely, from January 2012 to February 2015. Nine predated the implementation of the Veterans Choice Act in November 2014; three were dated after implementation. Offices relevant to purchased care at these organizations also went by a variety of names.

In the 12 organizations examined, purchased care offices reported through a variety of management channels. Two offices reported to the VAMC associate director for patient care services; three to the VAMC associate director; one to the VAMC assistant director of facility support; two to the VAMC chief of staff; and one to the VISN deputy network director. Little standardization appeared to exist in purchased care reporting chains within the organizations examined.

To gain a better understanding of where purchased care offices are located within the organizations, we recorded the degrees of separation between the office and the VAMC for the ten charts with this information. For example, if the purchased office reported to the associate director who reported to the VAMC director, we counted two degrees of separation. If the office reported to a manager who reported to the associate director, who then reported to the VAMC director, RAND counted three degrees of separation. On average, we found 2.5 degrees

---

of separation between the facility director and the purchased care office across those 12 organizations listing a separate non-VA care function or office on their organizational chart.

4.2.2 Variation in Length, Terminology, and Tone in Local and Regional Policy Guidance and Standard Operating Procedures

Documents received through our request for data indicated a lack of standardization in purchased care referral and authorization processes and procedures across facilities. Of the 240 SOPs, 57 SOPs were highly detailed, 86 SOPs were moderately detailed, and 94 SOPs were minimally detailed.

Moreover, there was little consistency in the terminology used to describe purchased care across these SOPs: some were specific to particular purchased care mechanisms (such as either the Veterans Choice Act program or PC3), while others referred to "non-VA care," "purchased care," "fee basis," "fee authority," "community based services," or "non-VA fee consults." Still others referred to specific services, such as dialysis, home health services, mammograms, and physical therapy. These service-specific SOPs are discussed in greater detail below. Most SOPs contained a section delineating responsibilities for particular staff members to fulfill in the purchased care referral and authorization process, but they varied widely both in terms of the staff positions listed and the responsibilities of each staff member.

Variations in the permissiveness and tone of purchased care SOPs across the VAMCs provide another working hypothesis to explain the wide variation in utilization described in Appendix A, though such local-level policies may have ultimately been shaped by the knowledge of overarching budgetary constraints in a given region. We coded all SOPs received through the request for their apparent focus/tone pertaining to utilizing internal VA care if at all possible, as opposed to being permissive regarding utilization of purchased care. The results were strikingly varied, with 70 SOPs containing language focused on keeping Veterans within the VA system and utilizing purchased care only as a temporary, last-resort option. Meanwhile, 102 SOPs were much more permissive in tone regarding the utilization of purchased care. Although these 102 SOPs still tended to note that purchased care was to serve only as a temporary solution, they were set up to facilitate the ease of use of the purchased care mechanism(s) in question. The remaining SOPs were deemed to be too neutral in tone to code either way. Nonetheless, the variation in tone across VAMCs regarding how permissive to be when authorizing purchased care services provides one possible explanation for the variation in the actual use of purchased care mechanisms across sites and among local SOPs.

4.2.2.1 Variation in Purchased Care Procedures Across Medical Services

A review of the SOPs received through our request also revealed the existence of a number of stand-alone policies for authorizing purchased care for certain medical services. Stand-alone policies were discovered for dialysis, physical therapy, home health services, and mammograms. A follow-up interview with a senior VA official clarified that each of these services has unique exterior requirements that necessitate more explicit guidance on procedures. For dialysis, there is a national contract for purchasing care that applies not only to VA but other national level care providers such as Medicare and Medicaid. Stand-alone policies

are most likely developed in an effort to ensure that VA is following procedures and is in compliance with this contract. Home health, on the other hand, is ordered differently from typical purchased care. Therefore, the methodology is separate. For mammograms, there are specific timeframe guidelines for reporting cancer-screening results. Because many VA facilities lack mammography machines, it appears that separate protocols are drafted to ensure compatibility with these strict timeline requirements. From our discussions with VA officials, it appears that separate stand-alone policies are required when specific care anomalies are known. However, due to the lack of standardization even in these stand-alone policies across different facilities and regions, it would be worthwhile for VA Central Office officials to explore whether efficiencies might be gained by promulgating a single, national stand-alone policy for each of the services in question and mandating that all local facilities adopt these as their own.

4.2.2.2 Potential Models for Improving Local-Level Standard Operating Procedures for Purchased Care

Many of the SOPs received through the request for data described highly specific processes and specialties, were lacking in detail, or—conversely—were overwhelmed by minutiae. A good number of SOPs provided a modicum of detail about staff responsibilities and the procedure, but not enough to serve as a useful reference for employees. Approximately 57 of the 240 SOPs were coded as having a high level of detail. Out of those, around 15 VAMCs have promulgated SOPs that, in our judgment, may serve as models for replication.

We used several primary criteria in judging the quality of purchased care SOPs:

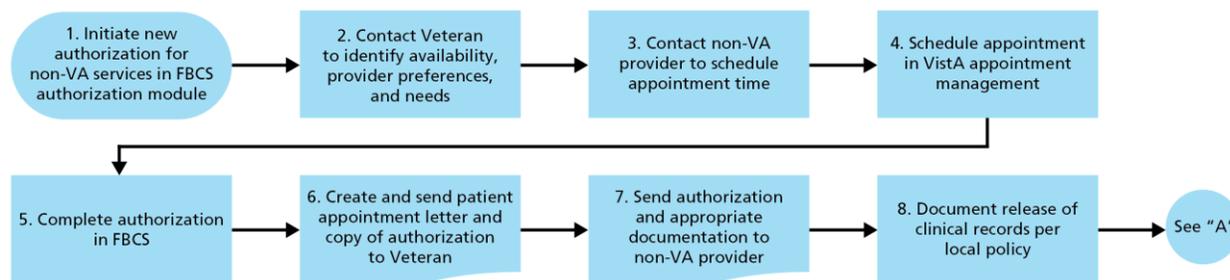
- Clarity and logical organization, judging that only those SOPs that clearly delineate staff responsibilities are likely to be used by employees in the field.
- Effect use of visual and graphic features as an aid and illustration to accompany the text.
- Applicability to a broad range of services.
- Adherence to national guidance and use of valuable features from national manuals, handbooks, and directives.
- References to the authorities, regulations and manuals, along with explanations of why certain policies and practices are in place and how the various programs fit together and better serve Veterans.

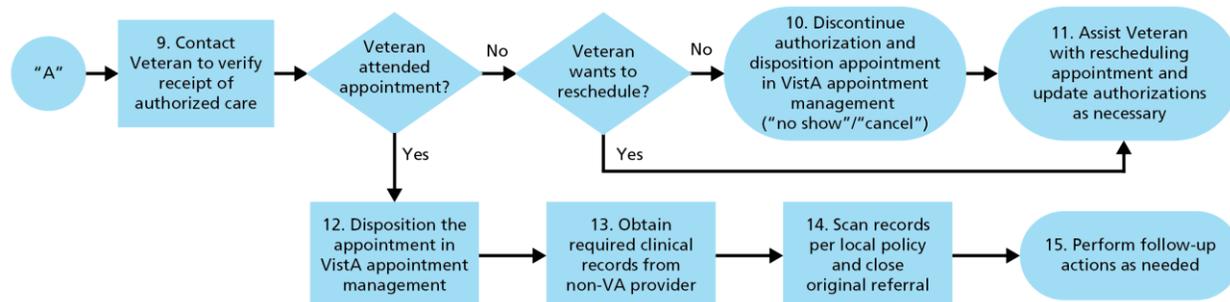
Many of the best SOPs share several features and are organized in the same way, with the following sections: purpose, policy, definitions, responsibilities, procedures, and references. Having headings of any sort is useful in breaking up dense text, and simplifying the reader's task. An employee can skip right to the "Procedure" section when determining what action to take. The presence of similar section headings across the SOPs increases internal coherence across the various programs as well as the different VAMCs. Many of the inferior SOPs are also organized this way, but lack the substance and detail of the better documents. Several of the best SOPs also contain attachments and appendices, such as flowcharts and screenshots.

The best SOPs cover the full range of purchased care operations, so that staffers are not required to refer to different documents for each service and specialty. For example, one VAMC's SOP from May 2012 applied to "outpatient/inpatient non-VA services." Following a

brief statement of purpose, and in some, definitions of key terms, these SOPs lay out the responsibilities of relevant staffers. Although some SOPs use full sentences, the SOPs that use bulleted lists were easier to follow (VA Central Western Massachusetts Health Care System, 2012a). In the best SOPs, the guidance in the Procedures section is presented in the form of bulleted step-by-step instructions that clearly indicate which staffer is responsible for the task. Some SOPs combine responsibilities and procedure into one section. If clearly done, this can be a good approach. Many well-written SOPs do not indicate who is responsible for the task at hand, thus diminishing their utility. The strong SOPs also include references to various authorities, including statutes, regulations, Chief Business Office directives, VHA handbooks, and various VHA guides and webpages.

Some of the best SOPs include useful appendices and attachments. One VAMC's 2015 SOP for non-VA purchased care consultations includes a number of helpful flowcharts describing the following: referral review, appointment management, hospital notification, clinical review for emergency claims, and administrative appeals (see example in Figure 4-5). Staffers can use these for quick and easy reference.

Figure 4-5. Appointment Management Process Flowchart from One VAMC's SOP (April 2015)




NOTE: FBCS = Fee Basis Claims System.

Another useful appendix was included in another VAMC's purchased care SOP, showing a table of the responsible approval officer, by title, for each purchased care service. Rather than creating different SOPs for multiple specialties, this VAMC created one comprehensive document, and indicated the areas of minor distinction. Some SOPs attach additional relevant

SOPs so that all the information is one place. For example, one VAMC's SOP for consult management also includes the procedure for consult *tracking*.

The SOP shown in Figure 4-6 also includes computer instructions, sample patient letters, and various other useful attachments.

Figure 4-6. Veterans Choice Notification Processing from One VAMC's SOP on the Veterans Choice Act Program (February 2015)

Another element that is included in some, but not all, of the best SOPs is an acknowledgement of the need for Veteran-centered, high-quality care. Although this is presumably an implied goal of the VAMCs, it can be beneficial for the SOP to state this somewhere. Often, it is mentioned only in passing. One VAMC's SOP, for example, mentioned that NVCC is an "initiative to create a more Veteran-centered environment." It would likely improve the quality of all SOPs to include a short statement, perhaps in the "Policy" or "Purpose" section.

To summarize, the best SOPs apply to all purchased care procedures. While the best SOPs' main guidance is broadly written, the documents offer references to direction for specific care and services that deviate from the general guidance. Including references to more information about process steps and concrete examples of work procedures and work products, like computer instructions and sample patient letters, are very helpful. Other best practices include step-by-step design, effective use of flow-charts and graphics, and bulleted lists that connect relevant staffers to associated responsibilities.

4.2.2.3 Integration of VHA Chief Business Office SOPs Into Local Procedures

Some of the SOPs that may serve as models share similarities with SOPs created by VHA's Chief Business Office. For example, the Chief Business Office wrote a process guide to help VAMCs

with "Appointment and Clinical Documentation Management" (VHA Chief Business Office, 2013a). It contains a useful flowchart illustrating the appointment management procedure, which is also included in one VAMC's SOP. Other SOPs have "Procedure" sections that are very similar to the Chief Business Office documents.

Although the strong SOPs do share similarities with those from the VHA Chief Business Office and often borrow language, content, and graphics, there are also many areas in which the local documents diverge. As noted above, SOPs received through the request for data varied widely by VAMC or VISN, and very few cite or mirror national guidance. Statutory authority for purchased care is often cited, but the implementation of such authority varies widely by SOP. Sometimes, this is because local documents include more detail, describe the same action items differently, or address multiple procedures in one document. The result is a confusing landscape that lacks clarity.

The several SOPs that do cite VA Chief Business Office guidance could serve as exemplars for local facilities' potential to usefully integrate national guidance into their own local-level SOPs. Several VAMCs apparently utilize SOPs for NVCC appeals that very closely mirror the systematic Chief Business Office guidance on the subject and encourages readers to use a National Fee Program Office appeals management web tool for the process. One such VAMC also cited these materials in its SOP on hospital notification and instructed readers to use both Computerized Patient Records System and Fee Basis Claim System software. This guidance appears to be quite detailed, but National Fee Program Office materials were not available for comparison. This VAMC also has a very detailed, nationally influenced SOP on the purchased care referral review process.

Similarly, one VAMC uses an SOP for appointment management that very closely mirrors Chief Business Office guidance, including instructions to use national Fee Basis Claim System and VistA software. This VAMC also cites Chief Business Office guidance in several other SOPs, including those concerning appeals management and pre-/post-appointment phone calls. Another VAMC's guidance on fee-basis care also cites Chief Business Office material, and directs readers to a Computerized Patient Records System template for fee-basis consults. Unfortunately, the cited Chief Business Office document, "Series 1601F: Fee Service" was not provided in response to the request for data, so we cannot analyze further similarities between it and the VAMC SOP in question.

The above SOPs not only cite national guidance, but they are also clearly influenced by it. Many follow national SOP steps closely, if not exactly. These exemplar local SOPs use nationally created software and this ensures that their processes and the outputs and data from such processes are standardized. Given the apparent benefit of standardization and the high quality of the Chief Business Office documents, it would be worthwhile for VA to consider mandating their adoption by local VAMCs.

4.2.3 Referral and Authorization Processes

The following sections describe the referral and authorization processes in theory and in practice. The referral and authorization processes are difficult to implement given the number of different purchased care programs, the variations in Veteran eligibility for each, and the

different prescribed methods and individuals involved in referrals for each programs. We find that the referral and authorization processes differ in theory and in practice. Based on our research, on the ground practices reflect greater consideration of availability of clinical services than consideration of Veterans' driving times and geographic access.

4.2.3.1 The Referral Process in Theory

In theory, the referral process for purchased care ought to be clear and easily understandable, based on eligibility factors and availability of services offered through the purchased care mechanisms.

For traditional purchased care,[94] this process would begin with a VAMC clinician requesting an authorization (or "consult") for outside services for a patient. The clinician would include a justification for the request, based on either the VAMC's inability to furnish the care, or its inability do so economically or due to geographic inaccessibility. The VAMC chief of staff, or a designee, would then review the request, and authorize it if appropriate. "Fee staff," those employees at the VISN or VAMC level who are tasked with administering the program, would review the request. After this review, the fee staff would notify the Veteran that the request has been authorized. At this point, the Veteran would be able to select a provider, assuming one was not already designated in the authorization. Assuming the provider agrees to provide the services at the reimbursement rate offered, then fee staff would schedule the appointment, and the Veteran would then go to that appointment and receive the outside care.

The referral process is slightly different under Project ARCH (Altarum Institute, 2015, Exhibit 12-27), which involves a TPA contractor (Humana). According to ARCH procedures, the VA medical provider acts as a gatekeeper to the program. The medical staff treating the Veteran is notified of basic drive-time eligibility, and they then assess whether referral to a network provider is appropriate. If so, the next step is to determine whether the Veteran is interested in participating. If the Veteran is indeed interested, then an authorization is sent to Humana's local ARCH network manager, who sets up the appointment with a participating provider.

Under PC3, a referral is to be made in instances of geographical inaccessibility or a lack of availability of services within VHA, unless inter-agency sharing agreements or direct contracting would be definitively superior. Where fee staff determine that a referral through PC3 is appropriate, a request is then sent through VHA's Chief Business Office to the appropriate TPA, which then sends the authorization and confirmation of eligibility to a network provider or, if a network provider isn't available, arranges for the care with a non-network provider (TriWest Healthcare Alliance, 2015c). The PC3 contractor is responsible for scheduling the appointment with the Veteran.

---

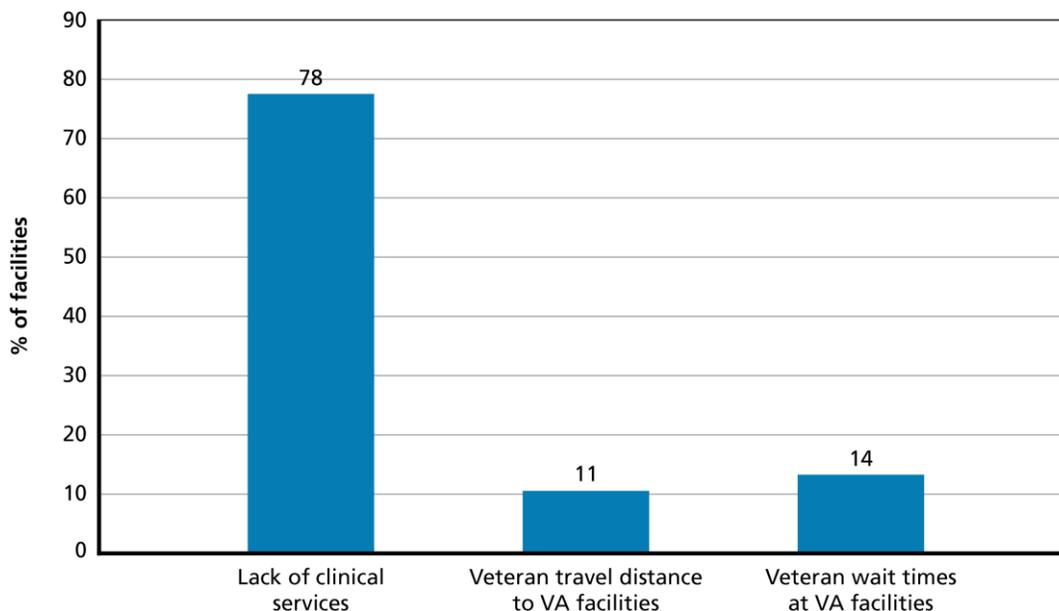
[94] The process description is adopted from Appendix A in VA Office of the Inspector General (2009), as well as the transcript from a hearing before the House Veterans' Affairs Committee, Subcommittee on Health, "VA Fee Basis Care: Examining Solutions to a Flawed System" (2012).

Under the Choice program, selected Veterans may be eligible based on either wait time or travel distance criteria (Sec. 101(g)). VA then provides eligible Veterans with information about the Choice program, and available providers thereunder.[95] If the Veteran elects to receive external care, an authorization is sent to the PC3 TPA for his or her area, who generally follows the same process as under PC3 for referral to a network or non-network provider. The law specifies that, under the Choice program, the Veteran may select a provider of his choosing,[96] and the TPA arranges for the care with that provider if possible.

4.2.3.2 How and Why Referrals Are Made in Practice

When we examined the purchased care referral process in practice at the facility level, we found variation in how and why referrals were made and significant variation in the processes that were used to make referrals.

The Choice program legislation focuses on Veterans' geographic accessibility and distance to care and appointment availability in determining eligibility for purchased care. In our survey of VA facilities VAMC Chiefs of Staff reported that most referral decisions were made based on availability of clinical services altogether at the facility (Figure 4-7). Approximately three-quarters of respondents ranked "lack of clinical services available at VA facilities" as the most important reason for referral to purchased care.

Figure 4-7. Reasons for Referral to Purchased Care


We also found variability in the processes for authorizing purchased care referrals. As we described in the previous section, our review of VA facilities' SOPs revealed substantial

---

[95]Per our discussion in Section 3, eligible providers under the Choice program include those participating in Medicare, any FQHC, DoD, or IHS (Veterans Choice Act, Sec. 101(a)(1)).

[96] Subject to fairly extensive limitations and restrictions, as we describe at greater length in Section 3.

variation in management structure, policies and procedures, adherence to national SOPs, level of detail, and format.

Another issue raised in the literature and illustrated in our data analysis is that purchased care referral and authorization processes tend to be complicated and entail delays (Altarum Institute, 2015, p. 3). In light of the differences revealed in our review of the SOPs, it is possible that delays could occur due to confusion regarding various staff members' responsibilities with regard to ensuring timely authorizations, and/or due to the complexities of the procedures themselves and the number of staff members who are required to sign off on a single authorization. For instance, in one facility, the Community Care Consult Unit is responsible for ensuring requested clinical services are received in a timely manner. In theory, this means that they should be responsible for the timeliness of authorizations as well, but the SOP document does not explicitly state this. Meanwhile, in another facility, the SOP outlines a specific set of steps to be followed by officials responsible for purchased care authorizations—including the chief of the service requesting the referral, the Fee Basis section, and the Chief, Business Service – and states, "Procedures are to be established to assure processing of applications for fee-basis care does not exceed 10 days." Yet, the fact that Veterans may have to wait ten days simply to be authorized to utilize purchased care *despite* the specificity of this policy highlights the problem of authorization delays.

The American College of Physicians, reacting to the Veterans Choice Act, argued that multiple cycles of authorizations for purchased care constitute a process that "can easily become a burden to the treating clinician and their staff, as well as the veteran," recommending that VA "consider reducing or eliminating authorization for treatment provided to eligible veterans from approved non-VHA clinicians who have established a record of effective and efficient care" (American College of Physicians, 2015). Eliminating the authorization step altogether may not be possible but involvement of multiple levels of VA management along with the TPA may not add value, especially if it can be monitored effectively.

4.2.4 Lack of Standardization in Staff Training

Another key area in which standardization appears to be lacking in spite of a need for it is in the training of VA staff in purchased care processes. The Veterans Choice Act required that VA implement the program unusually quickly; VA awarded the TPA contracts just two months before the program start date. VA staff, who had only just been introduced to the PC3 and NVCC programs, had to quickly familiarize themselves with Choice. Interviewees pointed out that the Choice program is complicated and confusing, and in the wake of the Choice Card mailings, VA personnel had to deal with many calls and inquiries from confused Veterans. VA did not have time to institute a standardized formal training program before implementation and to our knowledge one has yet to be developed. One VAMC director described the situation as "a good example of rolling something out without doing the appropriate training." Among the VAMC directors we asked about training, some were unsure what, if any, training was provided. One director with some knowledge about training stated that explanatory documents were created at the national and regional level to familiarize staff with the Veterans Choice Act, and designated "Choice Champions" visited at least some clinics to offer assistance and knowledge.

Of the materials received through our request for data, supplemented by a number of training materials that we downloaded from the VA Intranet, only a handful appear to be part of a formal training program. In fact, of the 62 documents to which we had access that were at least tangentially related to training, only three are components of any formal purchased-care training. Two are national in scope and are training presentations, virtually identical in content, created by the National Non-VA Care Program Office, VHA's Chief Business Office, and the Clinical Business System Office, about the NVCC model and processes. These lengthy and comprehensive presentations are useful with regards to the referral review, appointment management, and hospital notification processes, containing templates, screenshots and detailed instructions. A third document is the only document from a local VAMC in the materials, and is a slideshow presentation from a kickoff briefing introducing the NVCC program.

We received a number of Chief Business Office process guides covering various elements of the NVCC program, such as appointment management, referral review, hospital notification, and administrative appeals. As process guides, these documents are all formatted the same way, with information about key individuals involved, a high-level process overview, a step-by-step procedure, and appendices. Another useful national document that was may have been used locally is the NVCC Manager's Guide, which contains an overview of processes, templates (and when to use certain templates, which is lacking in other guides), tools, and information about managing the program and Computerized Patient Records System setup.

We also received 10 fact sheets published by various VA Central Office departments, including VHA's Chief Business Office, Health Information Management (HIM), and the National Non-VA Medical Care Program Office. Some are useful introductions to new programs, such as NVCC; helpful explanations of complicated issues, such as "episodes of care"; and guides about how to fill out certain forms. Although these fact sheets do not appear to be part of a training program, they can help convey new and important information to staff. However, the extent to which these VHA Central Office documents are circulated to relevant staff at the local level is unclear.

Many of the other materials to which we had access are more straightforward policy documents: VHA directives, memos, and handbooks. Based on the materials analyzed, it appears that training is not provided at the local level nor mandated by the VHA Central Office, and is therefore not standardized at VA facilities across the country.

In addition to paucity of formal training provided to VA staff, some interviewees noted that employees at TriWest or Health Net call centers also lacked training, often providing incorrect or misleading information to Veterans, leading to further confusion. One VAMC director explained that "there have been some issues as far as a Veteran would call [the TPA] one time they'd get one piece of information and if they'd call another time, they might have something different said." This interviewee also noted, however, that such issues were more common at the beginning of the Veterans Choice Act, and that the TPAs have been providing more reliable information to Veterans more recently.

This impression is supported by the May 2015 testimony of David J. McIntyre, Jr., president and CEO of TriWest, before the Senate Veterans' Affairs Committee, in which he noted that lack of

time to properly train TriWest staff in Veteran call centers was a major shortcoming of the rollout of the Choice program:

> First and foremost, we suffered from a lack of training time. We had less than two weeks to hire and train hundreds of people just to answer phone calls from Veterans and describe or explain a complex new program. It is no understatement to say that most who worked to get [the Veterans Choice Program (VCP)] up and operational worked 100-hour weeks during that 30-day period . . . in order to understand what was envisioned by the law and then design the approach and stand-up operations. Given the brief amount of time to do all that was required, one of the greatest challenges was to gain a solid base of understanding of this valuable new benefit, and get the operation design set so that we could sufficiently explain both to others. And, we were not alone in that challenge. Among those most impacted, beyond the Veterans we were all aiming to serve, were the new staff in [our] call centers, as they had only five to seven days in which to grasp the information versus the typical two to three week period one ought to provide. I am sure others, including VA, struggled with the same.

> Obviously, the lack of training led to less than optimal customer experiences. Information provided to Veterans was at times inaccurate or confusing. And some Veterans were left frustrated. I want to apologize for that. But, in apologizing, I also want to reassure this Committee that we did everything in our power to train and educate this new team in the very short period of time we were allotted. In the end, it was simply not enough time. And, we are doing our best to stay on top of making sure that our staff has the right knowledge base of the program in order to provide solid customer service . . . even as this program continues to be refined, creating a need for re-training. (McIntyre, 2015)

The need for improved training and SOPs extends into the traditional purchased care program contracting, insofar as the program continues to be important for purchased care. In recent congressional testimony, GAO echoed VA's need for improved training among contract administrators and recommended that VA revise training for contracting officers' representatives to include developing and overseeing service contracts (Williamson, 2015). Furthermore, GAO called for VA to revamp SOPs for contracting officers' representatives to ensure that they have the appropriate workload based on their availability, qualifications, and training. It also recommended that VA increase oversight of contracting officers and their representatives (Williamson, 2015).

4.3 Discussion

In Section 4, we sought to investigate and analyze a series of implementation barriers to VA purchased care, in large part through the experience of local VA facilities and personnel in striving to overcome them. Drawing on our findings from stakeholder interviews, a request for local purchased care policy documents from VA facilities, and a facility survey that included seven questions pertaining to local purchased care practice, we identified a series of related challenges for VA and its personnel. These challenges range from difficulties in claims processing and reimbursement, to concerns about the oversight of quality in purchased care services, to the fundamental tension between central control and local flexibility in carrying out purchased care policies and operations. Our findings reflect an important set of potential

leverage points for policy-makers to consider using in seeking to streamline and improve the administration of VA purchased care in the future.

Our findings speak to the considerable variability in local practices for purchased care, and the difficulty that VAMCs and VISNs have faced in developing their own policies for carrying out purchased care activities. More specifically, we found that the organization of local purchased care operations is highly varied, and that local SOPs for purchased care, when available at all, are considerably diverse in their content and level of detail. We also found that authorization and referral practices, coordination of care through electronic record sharing, and staff training efforts represent three specific areas in which variability of practices and/or lack of standardization may be detracting from the efficiency and effectiveness of purchased care operations. Moreover, we found a lack of systematic data collection and performance monitoring at the local level, an issue which could—if remedied—help to ameliorate the potentially negative effects of the lack of standardization in local practices.

The findings in this section highlight some important opportunities to improve VA purchased care by effectively implementing procedures to ensure that local facilities and personnel understand and can effectively carry out their purchased care tasks. In Section 5, we examine the broader strategy for VA purchased care and some of the key leverage points for VA purchased care at the national level going forward.

This page intentionally left blank.

5   Procurement and Episodes of Care

> **Overview of Methods and Data for Procurement and Episodes of Care**
>
> - We examined the key statutory provisions governing VA's procurement of purchased care, including applicable sections of the U.S. Code, the Federal Acquisition Regulation, and supplemental acquisition regulations, including the Veterans Affairs Acquisition Regulation.
> - We separately traced VA procurement strategy for different types of service purchases (small, individual purchases and large, bundled purchases) to illustrate how the regulations are applied, and their implications for different strategies.
> - We examined how episodes of care are used to define clinical courses of treatment, in part through a review of the literature from the wider health care sector.

VA purchased care is complex and multifaceted. As we discuss elsewhere in this report, policy-makers might reasonably consider many different aspects of purchased care as possible targets for future revision.[97] Nonetheless, it is important to acknowledge that the basic parameters for VA purchased care are tightly bound to several other aspects of VA's institutional mission, operations, and authority. For example, it is difficult to imagine a discussion of purchased care that does not acknowledge the intimate link between VA's health care benefit structure and VA's activities as a purchaser.[98] The scope and structure of the health benefit serves to define *what* VA can purchase, and for whom. Although it is beyond the scope of this report to address in detail, many plausible future revisions to VA purchased care might go hand in hand with future revisions to the health benefit package for Veterans.

Two other key elements of VA authority and policy are similarly foundational to the operation of purchased care. These include VA procurement rules, which influence the way that contracting is carried out, and the definition of episodes of care, which could have far-reaching ramifications both for contracting and for units of purchase. Each of these elements helps to set the stage for purchased care activity and to bound VA's purchased care operations. Moreover, each of these elements is potentially transformational. Shifting them could deeply change *what* VA would be purchasing, as well as the terms on which any such purchase transactions might take place.

In the future, VA procurement of outside health care services based on bundled payment and revised episode of care standards could look very different from current practice, with an emphasis on new types of aggregated purchasing arrangements, performance-based contracting, and risk-shifting between VA and outside providers. These kinds of changes could become pivotal to VA's health care operations, especially if policy-makers decide to strengthen VA's emphasis on serving as a payer, rather than as a direct provider, of medical services.

---

[97] On this point, see particularly Section 6 for an assessment of a wide range of future possible policy changes that might be undertaken in VA purchased care.

[98] See Appendix E for a brief summary of the major structural features of the VA health benefit.

Analyzing the implications and possibilities requires a more conceptual discussion than that undertaken in Section 3.

For VA stakeholders and policy-makers, these elements present a unique challenge and opportunity, which goes beyond a basic analysis of authority. Much of our discussion of VA purchased care so far has focused on questions of *what* and *how*: What has VA been authorized to do, and how has VA carried out its mandate? Section 5 touches on *why* foundational changes to procurement and to episode-of-care standards might be useful strategic pathways for VA to explore. Our discussion focuses on corresponding possibilities for purchased care strategy in the future and the reasons why stakeholders might choose to transform the landscape of VA purchased care along these lines.

In the sections that follow, we describe and explain VA procurement authority, episode-of-care standards, and how these elements contribute to VA's broader purchasing policy. We conclude with some observations regarding that strategy, and considerations that stakeholders should bear in mind, in any future reforms that touch on procurement and episodes of care.

5.1 VA Procurement in Purchased Care: Understanding the Framework Established by FAR and VAAR

5.1.1 An Introduction to VA Contracting Authority

One of the key mechanisms for VA in carrying out any purchased care activity is *contracting*, or the process for entering into an agreement with a TPA or, in the traditional VA purchased care program, an outside provider entity for delivering health care services in exchange for payment from VA. As we discussed in Section 3, core provisions of authority establish that VA may purchase services for Veterans once a series of designated eligibility criteria are met. VA has established mechanisms under NVCC to carry out the front-end processes of purchased care, particularly around local referrals and authorizations for outside services. Collectively, these mechanisms and authorities establish *when* VA may purchase care (and when Veterans receive it) and *how* the front end of this process is carried out by VA. An equally important piece involves the contractual relationship between VA and the outside providers from whom it purchases care. Without payment and contracting, there can be no access for Veterans to outside providers or services, regardless of whether VA theoretically has the power to act as a payer or whether Veterans have the right to access care at non-VA facilities. Statutes, regulations, and policies may create the overall framework for VA to act as a payer, but government contracts provide the actual mechanism by which care is purchased for Veterans. When it comes to contracting with outside providers, and actually purchasing service from them, what kinds of authorities and restrictions govern VA practice?

In Section 3, we described the key statutory provision for VA purchased care contracting under 38 U.S.C. 8153. This provision gives the Secretary the power to engage in contracting to purchase health care services from outside providers, when he or she determines this to be appropriate. Section 8153 also states that VA is explicitly required to conduct its purchase of health care services and resources "in accordance with all [federal] procurement laws and

regulations."[99] Notably, however, when VA seeks to purchase medical services from a formally affiliated institution (like an academic medical center), it may do so without regard to any requirements for competitive procedures (or bidding) that would otherwise apply under federal law (per 38 USC 8153(a)(3)). Also, VA may purchase services from nonaffiliated entities under simplified procurement procedures, the latter to be formally promulgated and published by VA (also per 38 USC 8153(a)(3)).

Federal laws and regulations on procurement, including but not limited to Title 41, U.S. Code (Public Contracts), code sections applicable to each agency within their own titles of the U.S. Code, the Federal Acquisition Regulation (FAR), and agency supplemental acquisition regulations, provide additional detailed guidance on contracting and procurement. FAR is codified in Title 48 of the Code of Federal Regulations, and it involves a set of rules designed to establish "uniform policies and procedures for acquisition by all executive agencies" (FAR 1.101). In turn, VA (like many other executive branch agencies) has published its own supplementary set of rules on acquisition, which elaborate on FAR. VA's rules are called the Veterans Affairs Acquisition Regulation (VAAR) and are also codified in Title 48 of the Code of Federal Regulations. Taken together, FAR and VAAR establish an elaborate set of definitions, policies, processes, and technical standards that regulate many different aspects of VA contracting practice. These include descriptions of different types of contracts (such as cost-type and fixed-price contracts), requirements for competitive bidding,[100] definitions and standards for contractor qualifications, rules for contract financing and guidelines for contractor cost accounting, guidelines for government review of contractors' pricing, guidelines for the selection and appointment of government contracting officers, and processes for termination and settlement of contracts. Many of the detailed requirements of FAR and VAAR are complex and are beyond the scope of this report. Despite this complexity, the basic intent behind FAR and VAAR is simple: "The vision for the Federal Acquisition System is to deliver on a timely basis the best value product or service to the [government] customer, while maintaining the public's trust and fulfilling public policy objectives" (FAR 1.102(a)).

A few basic features of the acquisition rules in FAR and VAAR are important to note, particularly with regard to VA purchased care. First, the requirements for fixed-price contracting under FAR depend on the size (or dollar value) of the contract. Part 13 of FAR establishes a set of simplified acquisition procedures that apply to contracts for amounts under the simplified acquisition threshold, which is defined at $150,000 (per FAR 2.101).[101] Contracts falling under the simplified acquisition procedures are exempt from a series of federal laws that would

---

[99] See particularly 38 U.S.C. 8153 at subsections (a)(3)(A), (B) and (C).

[100] The FAR and VAAR requirements for competitive contracting flow from statute, including the Competition in Contracting Act of 1984, which is codified in relevant part at 41 U.S.C. 253.

[101] In addition to the standard simplified acquisition threshold, federal law allows simplified acquisition procedures for higher-priced contracts when in support of contingency operations (as that term is defined by DoD) or for procurements related to defense against (or recovery from) nuclear, chemical, biological, or radiological attack. See 41 U.S.C. 1903. For these types of urgent procurements, FAR sets a simplified acquisition threshold of $300,000 for domestic procurements and $1 million for overseas procurements. See FAR 2.101 (Definitions); see also FAR Subpart 18.2 (Emergency Acquisition Flexibilities).

---

otherwise apply and are subject to streamlined standards for solicitation and competitive bidding (as described under FAR Subpart 13.1). For VA, simplified acquisition procedures for health care resources are elaborated under the VAAR at 48 C.F.R. Part 873. Particularly noteworthy is VAAR Section 873.104, which establishes that contracts for services with provider institutions that are formally affiliated with VA (for example, academic medical centers) may be entered into on a sole-source basis and without publication and written justification requirements, notwithstanding contrary provisions that would otherwise apply under FAR and VAAR. This is consistent with VA's statutory authority under 38 U.S.C. 8153(a)(3)(A) to pursue such sole-source contracts with affiliated health providers.

Beyond the simplified acquisition procedures described above, another important set of contracting rules in FAR pertains to purchases that fall below the micro-purchase threshold, which is defined as $3,000 (FAR 2.101).[102] For these purchases, an even more simplified and streamlined set of contracting requirements applies (under FAR Subpart 13.2). In essence, those requirements allow for purchasing without competitive bidding, and with only limited additional requirements for documentation and verification of price reasonableness (FAR 13.203). Contracting for services under the micro-purchase threshold can be carried out through any of several different purchase methods, including (fixed-price) purchase orders and commercial purchase cards (per FAR Subpart 13.3).

When VA acts to purchase medical services from the private sector, it must work within the framework set forth by federal statute and regulation, including FAR and VAAR. Within this framework, there are many taxonomies for organizing contracts, such as cost-type versus fixed-price contracts,[103] commercial items versus noncommercial items, and goods versus services. However, to understand VA's authorities to purchase medical care, the most important parameter is the size of a contract, which under federal law and regulation dictates the level of formal process necessary to enter into, administer, and terminate such a contract. Large, high-value contracts involve extensive and formal requirements under FAR and VAAR. Smaller contracts, falling under the simplified acquisition threshold, are subject to a somewhat streamlined process and fewer requirements.[104] In some cases, such as when VA is purchasing

---

[102] As with simplified acquisitions generally, there exists a set of urgent authorities for use in making micro-purchases when the head of an agency determines that a micro-purchase is to be used in support of a contingency operation or relates to defense or recovery from nuclear, chemical, biological, or radiological attack. Upon such a determination by the head of an agency (in this case, the Secretary of Veterans Affairs), FAR raises the micro-purchase threshold to $15,000 for domestic purchases and to $30,000 for overseas purchases. See FAR 13.201; FAR 2.101.

[103] See FAR Part 16 (Types of Contracts), for a taxonomy of government contracts based primarily on the cost basis of the agreement, i.e. whether fixed-price or cost-reimbursable. Even within these types there are many sub-types, such as the differences between cost-plus-fixed-fee and cost-plus-award-fee contracts. Depending on the type of contract, a government contract may have different terms and conditions.

[104] Another important type of contract involves those awarded to special disadvantaged businesses, including Veteran-owned small businesses and service-disabled Veteran-owned small businesses. These contracts can be issued for range of purposes and for goods or services. However, an agency may set aside contracts during the procurement process specifically for bids by these types of businesses. See FAR Subpart 19.5 (Set-Asides for

---

services from a small disadvantaged business or medical services from an affiliated institution, VA may leverage additional flexible authorities to set aside contracts for a limited range of bidders or use contracting procedures that involve less than full and open competition. For the smallest contracts, those falling below the micro-purchase threshold, there are even fewer formal requirements and more flexibility on the part of VA and its contracting officers in carrying out those arrangements.

5.1.2 Procurement and Contracting Strategy for Purchased Care

In practice, VA contracting for purchased care can take several different forms, consistent with the federal procurement framework established under FAR and VAAR. For example, the PC3 relationships with Health Net and TriWest represent one form of such contracting: large-scale, cost-type contracts with government contractor TPAs to purchase an indefinite amount of care for many Veterans on an indefinite delivery schedule over a period of years. However, the TPAs can use agreements instead of formal contracts with providers who are willing to join the network or provide care on a case-by-case basis. Alternatively, a local VA medical center might purchase a specific medical service for a specific Veteran at a local non-VA facility via a purchase order under the FAR micro-purchase threshold, with very streamlined requirements for making that purchase under FAR. Both of these forms of contracting related to purchased care occur within VA, but each has different contracting and purchasing processes. The different tiers of contracting authority and the multiplicity of contracting options may reflect the fact that it can sometimes be advantageous to local VA facilities to have a very simple process for entering into small purchase contracts in the field, while VHA Central Office is simultaneously working to strengthen a much broader contractual framework for purchasing care on a regional and national basis. This is particularly true if there is no appropriate network provider; this discussion focuses on situations in which the network is not a preferred solution.

These contracting alternatives highlight the fact that VA procurement for purchased care is complex. Beyond the technical requirements of FAR and VAAR that contribute to the complexity of purchased care, the multiplicity of VA contractual alternatives add to the complication. In addition, VA must decide how to define the units of service being purchased and, consequently, the most appropriate way to structure contracts for carrying out those purchases. For example, to the extent that large amounts of outside health care service are being procured in small increments, less than $3,000 each, as through purchase orders under the micro-purchase threshold, that might well represent one expedient way for VA to purchase care. Could a series of similar purchases from the same outside provider be lumped together

---

Small Business) and FAR Subpart 6.2 (Full and Open Competition After Exclusion of Sources). In addition, an agency may award a sole-source contract to a Veteran-owned or special disadvantaged business. Within this category, there are specific statutory and regulatory authorities enabling (or, in some cases, requiring) VA to set aside contracts or make sole-source awards available to such businesses. See FAR 19.1405 (Service-Disabled Veteran-Owned Small Business Set-Aside Procedures) and FAR 19.1406 (Sole-Source Awards to Service-Disabled Veteran-Owned Small Business Concerns); see also Sec. 308, Veterans Benefits Act of 2003, Pub. L. 108-183 (December 16, 2003).

---

contractually into a larger, more strategic procurement, in a manner that would surpass the micro-purchase threshold, and thereby require a more rigorous and demanding contractual process under FAR and VAAR? Likewise, could one envision an even more aggregated, macro-level contracting framework for purchased care, under which VA would move away from purchasing individual services locally on a fixed-price basis, and instead toward bundled purchasing of services in large quantities from networks of private providers, using contract types (such as cost plus award fee or cost plus incentive fee) that appropriately incentivize performance?[105] Or could VA innovate even further in its contracting and procure aggregated bundles of medical service under an indefinite quantity contract where the basis of payment is the outcome achieved, rather than the services acquired, similar to what CMS and private health providers have begun to adopt?[106] The answer to all of these questions is, perhaps.

Ultimately, one of the tensions of VA contracting for purchased care involves the level of formality that ought to apply under FAR and VAAR. The full requirements of FAR and VAAR are intended to ensure rigor in the contracting process, as through competitive bidding, tight management controls, and appropriate standards for notice, evaluating bids, qualifying contractors, and other factors. To the extent that concerns have arisen about waste, inefficiency, or unresponsiveness in VA purchased care contracting, or about local contract terms that are insufficient to ensure the quality of care being purchased, then in principle tighter requirements under FAR and VAAR might be helpful to address these problems. On the other hand, the downside to full formality under the FAR and VAAR is that contracts carried out thereunder become more burdensome for outside providers to enter into, and potentially less attractive to participate in, at least on a local basis and for small quantities of service. Where VA has a legitimate reason and need to purchase small quantities of service locally for individual Veterans and there is no network provider who can provide timely care, it may be considerably easier to do so through the streamlined rules under the micro-purchase threshold. Outside providers may be more open to direct contracting, which can involve terms more similar to the terms they would encounter in the commercial market for health care services. Put another way, VA may obtain the benefit of competitive rigor (and whatever price or quality advantages that this confers) when it structures large purchased care contracts under the full weight of FAR and VAAR, while obtaining the alternative benefits of flexibility and greater attractiveness to local providers when using purchase orders for small quantities of service.

In Volume I of VA's FY 2016 Budget Submission to Congress, VA included a specific legislative proposal to update its purchased care authority, particularly with regard to provider agreements and contracting (VA Office of Budget, 2015). Citing outdated and scattered authorities which "in some cases have created confusion and uncertainty," VA proposed a legislative update that would "streamline and speed the process for purchasing care for an

---

[105] Note that FAR Subpart 16.4 deals at length with "Incentive Contracts," and introduces these as an alternative to fixed-price contracts when "required supplies or services can be acquired at lower costs and, in certain instances, with improved delivery or technical performance, by relating the amount of profit or fee payable under the contract to the contractor's performance."

[106] Regarding performance-based, bundled payment contracting innovations being explored by CMS and others, see, for example, Shelton, Ondra, & Levin (2015) and McKesson Health Solutions (2014).

individual Veteran that is not easily accomplished through a more complex contract with a private provider." Full language of the proposal was not available as of this writing, but VA described its intent as "preserving key protections that would be found in full FAR-based contracting, while providing the benefits of a more streamlined and less complex practice that is more likely to appeal to solo practitioners or small healthcare providers." Taken at face value, it appears that the VA proposal seeks to protect and enhance flexibility in purchased care contracting for some services at the local level, where the Secretary believes that there are meaningful advantages to this practice.

In contrast to this proposal are some of the future possibilities for VA contracting, particularly in a world where VA becomes much more active as a purchaser and more innovative in shifting toward payment models based on bundled purchasing. As we discuss later in Section 5, new definitions of "episodes of care" are now being developed outside of VA, and various outside payer and provider organizations are actively working to build new contracting models that leverage these definitions to support bundled purchasing and related forms of risk shifting between payers and providers. It seems entirely plausible that VA in the future might want to experiment with similar contractual approaches, based on advanced definitions of episodes of care, and the aggregation of its relationships with outside providers into large contracts that (presumably) would be subject to the full weight of FAR and VAAR formal review and procedures. There is not a single "right" approach to federal contracting for VA purchased care, or to the procurement rules under FAR and VAAR. Rather, VA might obtain different advantages when it pursues different approaches to contracting, such as economies of scale, or more sophisticated approaches that enable VA to pay for Veteran outcomes (instead of quantity of services). Ultimately, policy-makers may need to reflect on the overall strategy behind purchased care contracting practice, and what VA purchased care is intended to achieve, to select and refine an optimal path for the "units of purchase" and, consequently, the appropriate treatment of any such contracts under FAR and VAAR. Figure 5.1 illustrates the strategic trade-off between two different approaches to purchased care contracting, under FAR and VAAR.

Figure 5-1. Alternative Approaches to Purchased Care Strategy for Procurement

VA strategy for buying services	Many small, individual purchases of services	or	Fewer purchases of large bundles of services

Feeds into VA procurement authorities	38 U.S.C. 8153	FAR	VAAR

Leading to FAR implications for strategy	Purchases fall under FAR micropurchasing threshold; few contracting requirements apply		Larger purchases involve more FAR contracting requirements, depending on detailed terms

Resulting in advantages for VA	Local flexibility in purchasing; lower burden for contractors; (possibly) more attractive rates		More rigor in contracting process under FAR and VAAR; consistent purchasing terms regionally and nationally; potential to enter into large, innovative risk-shifting and payment arrangements

In May, 2015, a senior VA procurement official came forward with allegations of widespread misconduct and violations of procurement rules under the FAR and VAAR, particularly regarding the purchase of outside medical services under the Fee-Based Care program (the latter being another name for traditional purchased care; see Frye, 2015). It is beyond the scope of this report to review those allegations in detail.[107] Nevertheless, the allegations reflect a similar duality in VA contracting practice to what we have described here, as well as considerable disagreement within VA about how best to work within the FAR and VAAR acquisition framework to appropriately purchase care for Veterans. At present, VA has some authority to engage in local-level contracting for purchased care, for services of small value, under streamlined FAR requirements, and carries out significant activity under this authority. Meanwhile, VA is also involved in pursuing much larger purchased care contracts, subject to the full requirements of FAR and VAAR. It remains for policy-makers to determine whether the benefits of less formal contracting for local, small-value purchases of care are worth preserving (or even extending), and, if so, how this will fit with the future trajectory of VA purchased care contracting writ large.

---

[107] See Assessment J report for a more lengthy discussion of the allegations contained in the Frye memo, and the implications both for contracting and senior management within VA.

5.1.3 Why Is Procurement Important to Purchased Care Strategy?

Ultimately, purchased care involves VA in contracting with outside providers, and exchanging payment for medical services received. Assuming that VA has good reason to engage in purchased care in the first place, procurement rules and strategy help to determine *what* VA is buying, and both the terms and processes that are involved in buying it. For stakeholders, some basic questions about procurement approaches follow. Is the primary aim to maximize efficiency in VA purchasing, or rigor in competitive bidding, through the use of large-scale, aggregated contracting approaches? Is the aim to preserve VA flexibility in contracting for individual services to Veterans on a local basis? Or is the aim to encourage innovation in VA contracting, and to shift the units of purchase and the terms of payment in ways that might enhance both quality and efficiency down the line? Different answers to these questions might lead to very different approaches to VA purchased care, and to different proposals for modifying procurement processes and authority.

5.2 VA's Approach to "Episodes of Care"

The Veterans Choice Act mandate for Section 201, Assessment C, includes the task of addressing "the authorities and mechanisms under which the Secretary may furnish hospital care, medical services, and other health care at non-Department facilities, including whether the Secretary should have the authority to furnish such care and services at such facilities through the *completion of episodes of care*" [emphasis added]. *Episode of care* is a key term in this mandate, and also a key term in any discussion about VA purchased care policy.

5.2.1 Defining the Episode under the Veterans Choice Act

As we first explained in Section 3, the Veterans Choice Act requires VA to allow a Veteran to obtain "hospital care and medical services from [the non-VA] health care provider through the completion of the episode of care," which includes "all specialty and ancillary services deemed necessary as part of the treatment recommended in the course of such hospital care or medical services" (Sec. 101(h)). The Veterans Choice Act does not define *episode of care*, though it does limit the provision of care from any health care provider under a single Choice authorization to a maximum of 60 days (Sec. 101(h)). Thus, whatever the Veterans Choice Act considered an episode of care to be, Choice would only cover the first 60 days thereof without follow-up authorizations.

Although the meaning of *episode of care* might not be clear from the act's language, its use within VA predates the Veterans Choice Act. Almost three decades ago, for example, it was simply the "period of consecutive days . . . beginning with the first day on which a veteran is furnished hospital or nursing home care; and . . . ending on the day of the veteran's discharge from the hospital or nursing home facility, as the case may be" (Pub. L. 99–272, Sec. 19011(f)(2)(C), 1986). A later regulation, related to VA's provision of temporary lodging rather than non-VA care, defined the term as "a course of outpatient treatment, or a period of hospitalization, during which a veteran receives health care under 38 U.S.C. chapter 17, or 38 U.S.C. 8111 or 8153." It included a list of examples, such as "[e]xtended outpatient treatment, such as treatment associated with organ transplant, chemotherapy, or radiation" (38 C.F.R.

60.2). A 2012 internal directive stated that *episode of care* "as it pertains to VHA Non-VA programs refers to a set of clinically related healthcare services for a specific unique illness or condition (diagnosis and/or procedure) provided by an authorized non-VA provider during a defined authorized period of time" (VHA Chief Business Office, 2012).

In its November 2014 final interim rule, VA defined *episode of care* as "a necessary course of treatment, including follow-up appointments and ancillary and specialty services, which lasts no longer than 60 days from the date of the first appointment with a non-VA health care provider" (38 C.F.R. 17.1505). While the regulation appears to track the language in Section 101(h) of the Veterans Choice Act, there are some important differences. Prior VA use of *episode of care* simply described what can be characterized as a set of related services ("a course of outpatient treatment, or a period of hospitalization," "a set of clinically related healthcare services for a specific unique illness or condition"), and the interim final rule *does* incorporate "course of treatment" into the new definition. However, VA's final interim rule also included the modifier "necessary," suggesting that not all potential courses of treatment for a condition could be regarded as an episode of care. The comments to the interim final rule indicate that VA gave significant weight to the language in Section 101(h) of the Veterans Choice Act, which provides guidance on the types of services that might be provided in an episode of care:

> [T]he Secretary shall ensure that . . . the veteran receives such hospital care and medical services from such health care provider through the completion of the episode of care (but for a period not exceeding 60 days), *including all specialty and ancillary services deemed necessary as part of the treatment recommended in the course of such hospital care or medical services*. [Emphasis added.]

One plausible interpretation for this passage is that Congress was calling on VA to ensure that a Veteran eligible for Choice due to distance or time in fact received whatever treatment was recommended by the non-VA provider, including any specialty and ancillary services that the *non-VA provider* deemed necessary. In other words, Section 101(h) can be seen as conferring a heightened level of discretion to non-VA health care providers to manage the course of treatment once the referral was made.[108] Under VA's interpretation, however, it would be VA alone that would determine what types of services are necessary for a Veteran's care under the Choice program.[109] As the comments to the interim final rule indicated, "We believe that the language 'deemed necessary' authorizes VA to make such determinations" (79 Fed. Reg. 65571). In arguing for the need for VA determinations of medical necessity in all instances, the comments to the interim final rule cite a passage from the Conference Report:

> When coordinating care for eligible veterans through the Non-VA Care Coordination program, the Department should attempt to ensure when an appointment is

---

[108] This interpretation is supported by the title of Section 101(h), "Follow-Up Care," which suggests that the original congressional intention was to address medical care and services subsequent to the initial contact with a non-VA provider. Put another way, Section 101(h) requires VA to ensure that non-VA providers are given the opportunity to control the delivery of care and services after the initial contact.

[109] VA's interpretation may also trace back to the language of 38 USC 1703(a), which empowers the Secretary to purchase care when VA facilities are "not capable of furnishing the care or services [that are] *required*" [emphasis added].

---

authorized, the eligible veteran receives care within an appropriate time period, as defined by medical necessity as determined by the referring physician, or a mandatory time period established by the Secretary when the request for care is not initiated by a physician, that all medical fees are appropriately paid and health care records are returned to the Department within the prescribed time. (H.R. Rpt. 113-564, 2014, p. 56)

Given that the passage appears to speak almost exclusively to the issue of time rather than types of services, one interpretation of the conferees' original intent was that VA should ensure that a Veteran's care is delivered within a *time period* that is based on "medical necessity as determined by the referring physician" or within a mandatory time period as established by VA.

Regardless of how an episode of care is defined, the Veterans Choice Act is clear that VA must specifically authorize, at least initially, the provision of hospital care or medical services by non-VA providers or facilities as part of the Choice program.[110] The interim final rule underscores this requirement by stating that VA will only pay for an episode of care that it has specifically authorized (38 C.F.R. 17.1535(c)). The comments to the interim final rule characterize the permission being requested as an authorization from VA to *schedule* an appointment with a non-VA provider.[111] The need for prior authorization is one reason why VA specifically excluded emergency room visits and unscheduled visits to a clinic from the type of "authorized and scheduled encounter with a health care provider" that would take place under the Choice program (38 C.F.R. 17.1505).[112] Moreover the rule puts the onus on the provider to contact VA for additional permission to provide care or services that go beyond the scope of the initial authorization. Given that a covered episode of care is limited in duration to 60 days, authorization must again be issued should the Veteran need continuing treatment beyond the two-month ceiling. Thus, it is certainly conceivable that a six-month course of treatment provided by a non-VA health care professional might involve multiple instances where VA would need to revisit the authorization decision.

5.2.2 What Are Episodes, and Why Does the Definition Matter for Purchased Care?

In the section above, we briefly discussed the legal contours of episodes of care as VA authority currently defines these episodes. However, the legal discussion sidesteps a more basic, conceptual explanation of what an episode of care actually is. Put simply, an "episode" involves a coherent and clinically meaningful trajectory of care, tied to an underlying medical condition for which treatment is sought. Moreover, definition of the episode is also administratively important. Among other things, the boundaries of the "episode" determine how many services can be considered under a single referral and authorization for outside care. A broader

---

[110] For example, Section 101(c)(1)(B) indicates that one of the options available to an eligible Veteran is to have VA authorize Choice care and services.

[111] "In short, if a veteran visits a non-VA health care provider without seeking authorization from VA to schedule such an appointment, VA cannot use Program funds to pay for the services delivered and cannot provide reimbursement after the fact" (79 Fed. Reg. 65574).

[112] As the commentary to the interim final rule indicates, such events "are not scheduled encounters and cannot be authorized in advance" (79 Fed. Reg. 65574).

definition for the episode would make it easier for a Veteran to obtain more services outside of VA, once having obtained an authorization for that episode, and in that sense might be viewed as widening the aperture for purchased care (with the potential trade-offs in utilization and cost). A narrower definition for the episode (say, limited to a single outpatient appointment) is inherently more restrictive, in the sense that it imposes a greater limit on how much outside service can be obtained under a single referral and authorization. By corollary, a narrower definition of the episode may give VA more granular control over the purchase of outside services, and more operating responsibility for monitoring and approving such services.

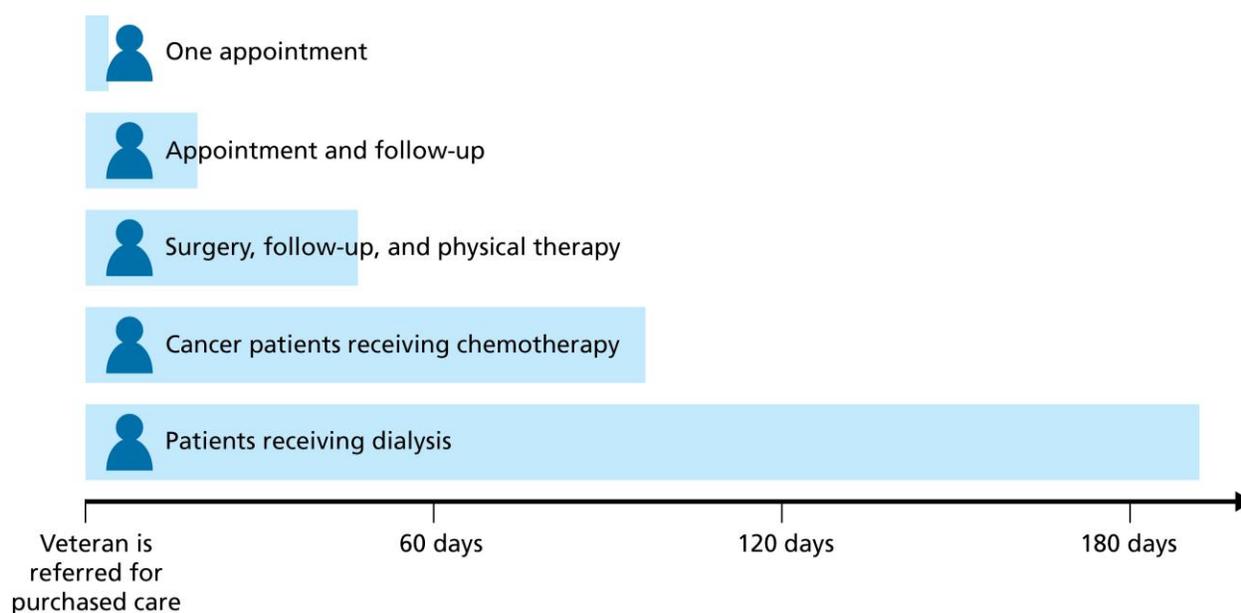
VA has used the phrase *episode of care* in various contexts, often to place an outer boundary on the length of time for which a Veteran can receive a particular benefit or type of care. In the context of purchased care, an episode is defined by VHA as "a set of clinically related healthcare services for a specific unique illness or condition (diagnosis and/or procedure) provided by an authorized non-VA provider during a defined authorized period of time." (VHA Chief Business Office, 2012). Section 101(h) of the Veterans Choice Act states that VA will not pay for external medical services for an "episode of care" if it [the episode] extends beyond 60 days without reauthorization. Subsequent regulations adopted by VA under 38 C.F.R. 17.1505 provided the following definition for episode of care: "a necessary course of treatment, including follow-up appointments and ancillary and specialty services, which lasts no longer than 60 days from the date of the first appointment with a non-VA health care provider."

There is an inborn tension between quality control and oversight in the authority to purchase episodes of care. The 60-day threshold mandated in Choice is used to ensure that the authorized care is the necessary course of treatment. If an episode of care lasts longer than 60 days, then the Veteran must be reauthorized to receive treatment and services, either within VA or through a non-VA provider. Since VA is responsible for ensuring both that Veterans receive high-quality care and that the Department delivers care efficiently and effectively, the 60-day bookend allows VA to assess patients' status and match their needs with the best available resources. While the reauthorization process is an additional step, which may be inherently inefficient, its overarching purpose is to embed consideration of cost and oversight of quality of care into purchased care authorization. Medicare provides an example of a slightly different approach to the role of a payer vis-à-vis quality control and oversight. It is increasingly monitoring provider performance and monetarily rewarding or punishing providers based on the quality of care provided.

In practice, episodes may be constructed in narrow or increasingly broad ways with respect to providers, settings, and time period. A narrow construction might involve services offered by one provider in one setting, such as the provider and hospital services for a specified inpatient course of treatment. An intermediate construction could include all providers in one setting, such as all necessary provider and hospital services for an inpatient stay. A broader episode construction could also include all providers for an inpatient post-acute stay. While episodes of acute care typically begin and end at discrete times (for example, the day of a procedure or last follow-up visit), episodes for chronic events typically capture all treatment over an established time period, perhaps ranging from 60 days to as long as 12 months.

How an episode of care is defined is critical to how VA purchased care operates in practice today. For example, in our interviews, some local VA hospital personnel stated that ambiguity and inconsistency in defining episodes of care presents a significant challenge for the system. One VISN director noted that the definition of "episode of care" under the Veterans Choice Act is confusing for serious ailments that require treatments like chemotherapy, and for which it is clear from the outset that treatment will last longer than 60 days and will necessitate new authorizations. In a related vein, a senior VA official brought up continuity of care issues, pointing out that the definition of "episode of care" under the Veterans Choice Act "has a potential to undermine the Veteran's comfort with the care they are receiving."

Figure 5-2 illustrates the time frames for five different episodes of care. As the figure shows, episodes of care may vary greatly in duration. Depending on the nature of treatment sought, an episode may be much shorter or longer than the 60-day reauthorization period used in the Choice program.

Figure 5-2. Episode of Care Duration for Various Types of Care


Lack of clarity in how to define "episodes" appears to have led some VAMCs to adopt narrower policies than others, in terms of the breadth of their referrals and authorizations for outside care, and in the amounts of outside service that a Veteran can access in connection with a single referral. Presumably, this is a challenge that affects both ease of access to care outside VA and related costs.

Apart from current VA practice, the definition of *episode of care* is also intimately tied a new and emerging set of payment reforms in the United States more broadly. These reforms involve bundled payment and performance metrics based on clinical episodes, rather than traditional fee-for-service practice. In the future, new definitions of *episode of care* might become the basis for a new generation of payer-provider relationships and contracts in the broader U.S.

health care market. With regard to VA, redefining the *episode of care* in line with broader market trends could have a major impact on what VA purchases, the terms on which it does so, and related efforts connected with monitoring the quality of care. It seems likely that VA purchased care practice may need to evolve over time to keep up with the outside state of the art in defining what constitutes an episode of care.

5.2.3 External Models for Episodes of Care

Episode of care is a commonly used concept in health care. One of the earliest definitions was offered by Hornbrook and colleagues (1985, p. 171) to define the boundaries around medical care for purposes of economic analysis: *"A series of temporally contiguous healthcare services related to the treatment of a given spell of illness or provided in response to a specific request by the patient or other relevant entity."* The authors aptly point out that episodes can be viewed from the perspective of the patient ("spell of illness"), the provider ("course of disease"), or the payer ("bundle of service").

A series of tools have been used to operationalize episodes of care in the private sector. Episode "groupers," such as the OptumInsight Symmetry Episode Treatment Groups product, the 3M Patient Focused Episode grouper, the Truven Medstat Medical Episode Grouper, the Health Care Incentives Institute's Prometheus, and the Cave grouper are software tools that create condition-specific episodes from administrative claims data. These products use different methodologies to group and analyze services delivered by providers into "episodes" over a defined period of time and for specific clinical conditions. They have been used by commercial insurers and managed care organizations, health systems, and other payers, in various ways connected to purchasing arrangements, coordination of care, and quality measurement.

The use of episodes of care (and corresponding tools and definitions for the "episode") has been motivated by the desire to improve provider performance and care coordination, while better controlling health care costs. A 2007 Institute of Medicine report, *Provider Performance: Aligning Incentives in Medicare*, laid the groundwork, recommending that "CMS . . . build towards an ultimate vision of aggregating funds for rewards into one integrated pool that would accommodate shared accountability and encourage coordination of care" and that the current measure sets "should evolve over time to provide more comprehensive and longitudinal assessments of provider and system performance." One important step toward achieving these goals involves the refinement of new performance measurement capabilities that are congruent with the episode of care (however defined). Another step involves linking payments directly to the episode, rather than to a fee-for-service invoice of all the services delivered within the episode. Both of these innovations depend on the deployment of valid, useful standards for bounding the episode of care, as a basis for subsequent optimization both of performance measurement and of payment.

Since the IOM recommendations, numerous reports have advocated for the adoption of episodes as the basis of performance measurement and/or payment (Medicare Payment Advisory Commission, 2008; Miller, 2010; Schoen, Guterman, Zezza, & Abrams, 2013,). The Affordable Care Act has also spurred experimentation with related alternative payment models,

including bundled payment. We offer a brief summary below, describing the application of episodes of care in both the performance measurement and payment contexts.

5.2.4 Applications of Episodes of Care

5.2.4.1 Performance Measurement

It is widely accepted that performance measurement is a key strategy for efforts to improve the quality and value of health care, and several public and private payers have adopted an episode-based approach to performance measurement and quality improvement. As an example, both Medicare and commercial health plans are profiling physicians on measures of health care cost and quality and feeding that information back to the physicians to encourage improvements in the quality of care. Medicare's reporting efforts in this vein are illustrative, particularly regarding the tie between performance measurement and the episode of care. Medicare's Supplemental Quality and Resource Use Reports involve "confidential feedback reports provided to medical group practices with payment-standardized, risk-adjusted cost information on the management of their Medicare fee-for-service patients based on episodes of care" (CMS, 2015b). Although there is some concern that current point-in-time quality measures that apply to discrete clinical settings and a single condition rather than multiple co-morbid conditions, may be insufficient for episode-based measurement, efforts are actively underway to fill the measurement gaps (Damberg et al., 2009).

Public reporting of quality and cost information offers another lever to improve the value of health care, and some organizations are notably employing episode-based measurement in their public reporting of resource use. Several regional health care alliances with large claims databases have been experimenting with reporting episode-based measures across providers for comparison purposes. As an example, the Wisconsin Collaborative for Healthcare Quality (2011) has reported variations in resource use for episodes of care for asthma, diabetes, hypertension, and pregnancy with delivery. Additionally, the Health Care Cost Institute has recently introduced a new consumer-focused website called Guroo (n.d.), which reports average costs for 70 "care bundles" or episodes. These reporting efforts are using episodes as a common unit of measurement to inform consumer and payer decision-making.

GAO has suggested that VA use episodes of care as the basis to monitor the cost of purchased care. In a 2013 report, it made the following recommendation:

> VA can also improve its capability to more effectively monitor the fee basis care program. VA Central Office's monitoring efforts are limited by the inability to analyze fee basis care data by episode of care. Because information that would allow VA to pull together all services with a single office visit or inpatient stay is not available, VA Central Office cannot effectively monitor the payments made by fee basis care units or ensure that fee basis providers are billing VA appropriately for care. (GAO, 2013a, p. 33)

In 2014, VA officials responded to the 2013 GAO report, and indicated that they are making improvements to their data systems to allow for analysis of purchased care claims based on episodes of care, but they did not provide a time frame for completion of this initiative (Williamson, 2014).

Taken in sum, recent experience and practice outside VA has involved the development of new performance measurement techniques, based on sophisticated episode of care definitions, and the application of those techniques by payers to quality improvement and value monitoring among providers. In principle, VA could adopt a similar approach to its own purchased care practice in the future, potentially by building on episode of care definitions and related innovations developed independently and outside of VA.

5.2.4.2 Bundled and Performance-Based Payment Approaches

Episode-based or "bundled" payment is another strategy that is being implemented by both public and private payers to improve the value of care by creating a financial incentive for providers to eliminate services that are clinically ineffective or duplicative (Miller, 2009) and to encourage effective coordination of care among providers. One study estimated that widespread implementation of bundled payments could save Medicare $3 billion to $15 billion per year (Cutler & Gosh, 2012). Although the term *bundled payment* is relatively new, the first actual use of bundles involved the Diagnosis Related Groups adopted by CMS over 30 years ago, in connection with a new Inpatient Prospective Payment System mandated by Congress to control hospital costs. Prior to that time, providers retrospectively billed Medicare for all of their à la carte service costs connected to an episode of care. By contrast, Diagnosis Related Groups "bundle" the services that are typically needed to treat a patient with a particular condition, and CMS sets the corresponding rates based on its own analysis of the average costs associated with such care.

More recently, public and private payers and some self-insured employers have been experimenting with bundled payments to providers, on the basis of anticipated costs for clinically defined episodes. In theory, the payment for an "episode" may cover multiple provider types, settings, and services; but in practice, the pilots have used fairly limited episode constructions to date. Although there has been some experimentation with bundled payments for chronic care, most of the experiments to date have been focused on acute care, and particularly on joint replacement, for which there are easily identifiable start and end dates to the episode. While many programs aspire to prospective payment, most of the models now in place are still using retrospective payment at this point (Bailit & Houy, 2014). These payment arrangements are typically accompanied by quality measures that may be specific to the episode (e.g., C-section rates for pregnancy episodes) or more generally applicable to acute-care episodes in hospitals (e.g., readmissions, avoidable complications, patient education). For some bundled payment programs, the providers must meet some minimum standards on quality measures to participate. In other programs, provider "bonuses" are contingent on achieving predetermined levels on the quality measures. Quality measurement in these programs may also serve as an important deterrent to the under-provision of care.

Commercial health plans' use of bundled payment arrangements has been increasing but is still quite limited, and was estimated to represent only 0.1 percent of commercial health plan payments as of September 30, 2014 (Catalyst for Payment Reform, 2014). However, there are some notable examples of successful implementation of bundled payment in the commercial sector. Geisinger Health Systems' "ProvenCare" model was originally developed to bundle payment for coronary artery bypass graft surgery in 2006. The model succeeded in achieving a 10-percent reduction in readmissions, shortening the average length of stay, and reducing hospital charges (Casale, et al., 2007), and subsequently led Geisinger to develop bundled payment for elective coronary angioplasty, bariatric surgery, perinatal care, and treatment of some chronic conditions. United Healthcare ran a bundled payment pilot for oncology care between 2009 and 2012 that involved five sites and reportedly achieved a 34-percent cost savings without a negative impact on quality (Newcomer et al., 2014).

In a somewhat different approach in recent years, several health plans adopted the Prometheus[113] model to implement bundled payment programs. The model assigns evidence-based case reimbursement rates to common conditions and procedures, with a single rate covering all inpatient and outpatient care associated with a given condition or procedure. The reimbursement rate is adjusted for the severity and complexity of each patient's condition. Starting as a pilot program in four sites, the Prometheus model has been adopted by other payers and plans, where it is in various stages of implementation. Blue Cross Blue Shield of North Carolina and Horizon Healthcare Services, Inc. have both moved from pilots to permanent reimbursement for hip and knee surgery. An evaluation of Prometheus at three pilot sites documented a series of challenges to the successful implementation of the bundled payment model. The challenges included defining the bundles,[114] defining the payment method, implementing quality measurement procedures, allocating payments among providers, and redesigning delivery (Hussey, Ridgely, & Rosenthal, 2011).

Several common barriers to bundled payment implementation, and some unique ones related to California regulation of hospitals and health plans, arose in the Integrated Healthcare Association's Bundled Episode Payment and Gainsharing Demonstration. This project brought together a group of providers, health plans, and vendors to develop and implement a bundled payment program for orthopedic surgery in California, starting in 2010. Despite initial enthusiasm among all parties, three of six health plans dropped out of the project, and only two of eight hospitals signed contracts with the participating health plans (Ridgely, de Vries, Bozic, & Hussey, 2014).[115] Delays in implementation, the drop-off in providers and payers, and the resulting small number of procedures completed under the new contracts prevented an evaluation of the impact of the payment model on quality and cost. An important lesson from these pilots is the need for

---

[113] Prometheus Payment Inc. is a nonprofit initiative of Health Care Incentives Institute.

[114] This would include defining episodes of care to which the bundles correspond.

[115] Two ambulatory surgery centers also executed contracts with one health plan.

---

a sufficient volume of episodes to justify the investment of resources required for implementation of bundled payment.

CMS has also been experimenting with episode-based payment, coupled with performance measurement, on an increasingly larger and broader scale. The first CMS foray into bundled payment was the Medicare Participating Heart Bypass Demonstration that took place between 1991 and 1996 and involved bundling physician and hospital payment for coronary artery bypass graft surgery at seven hospitals.[116] It was estimated that Medicare realized savings of about 10 percent through the Demonstration, with no negative impact on quality of care (Cromwell et al., 1998).

Medicare's next experiment with bundled payment was the Acute Care Episode Demonstration, which was implemented at five sites over three years and covered five acute care episode types. In addition to the new payment mechanism, the pilot emphasized enhanced coordination of care, cost-control incentives, adoption of standardized clinical protocols, and quality improvement activities (IMPAQ, 2013). Cost savings for Medicare Parts A and B were estimated at $7.3 million ($585 per episode) across sites, though there was significant variation in cost savings across the types of episodes and the sites, as well as some increases in post-acute care spending that reduced the net Medicare savings per episode to $319. There were no significant changes in quality under the Demonstration, however.

In 2013, CMS introduced a new demonstration, Bundled Payment for Care Improvement,[117] which provides an opportunity to test bundled payment across 48 potential episode types. All four payment models offered to providers are triggered by an acute care stay, but the services and providers included and the payment type (retrospective or prospective) vary (CMS, n.d.). Nearly 6,500 providers entered an exploratory stage of the program, but it is not clear how many will move to the next stage of implementation. In interviews with organizations that have withdrawn from the program, providers indicated that the potential costs outweighed the potential benefits (Koenig et al., 2015). Finally, in February 2015, CMS introduced its first bundled payment model for specialty care, the Oncology Care Model. CMS has offered to enter into new payment agreements with physician practices administering chemotherapy to cancer patients with the goal of providing higher-quality, more coordinated cancer care at a lower cost to Medicare (CMS, n.d.). This is Medicare's first bundled payment program for non-acute care.

Several state Medicaid programs have also been experimenting with bundled payment. The Arkansas Medicaid program, together with two commercial payers, is implementing episode-based payment for 15 acute and chronic episodes, including some conditions that are new for this payment model, such as attention deficit hyperactivity disorder and

---

[116] The demonstration began with four hospitals in 1991, and three hospitals were added in 1993.

[117] For additional details, see the program overview on the CMS website (CMS, n.d.-b).

---

asthma. It is the first mandatory multipayer demonstration model of bundled payment in the country, and the Ohio and Tennessee Medicaid programs are in the early stages of implementing similar programs (Golden, et al., 2015).

Finally, a handful of large self-insured employers[118] are utilizing bundled payment as part of centers of excellence programs for employee medical care. In this model, the employer negotiates a fixed price (bundled payment) for a procedure (i.e., an acute care hospital episode based on a major clinical intervention) with one or several centers of excellence. The bundled payment, in this model, covers the entire cost of the employee's care as well as travel and lodging for the employee and a caregiver. Procedures covered by the programs include cardiac care, spine surgery, and transplants. The goal for employers is higher quality care, quicker employee returns to work, lower costs due to lower complication rates, and greater predictability of costs. The motivation for health system participation is the potential for new, non-local sources of patients.

Several employer coalitions are also coordinating centers of excellence programs that utilize bundled payment. A group of large companies (including Lowe's and Walmart) is collaborating with the Pacific Business Group on Health to form the Employers Centers of Excellence Network to offer knee and hip replacement and spinal surgeries at no cost to employees if they receive care through one of four designated health systems, starting January 2014 (Pacific Business Group on Health, 2014). Under this program, the network qualifies both the hospitals and individual surgeons based on volume, complication rates, training and experience, and patient satisfaction. Additionally, centers of excellence must report to a joint replacement registry and incorporate shared decision making with patients. These employer models are voluntary such that employees may choose to receive care from local providers and incur routine costs. Travel and care management are handled by Health Design Plus, a health care management company. Centers of excellence also provide a health care navigator who works with the patient's home physician on evaluation prior to surgery and follow-up post-surgery. The Employers Health Coalition, a group of 300 small employers, also established a travel surgery program in 2014.

Studies of the results of employer-based COE programs utilizing bundled payment are not yet available. However, The Cleveland Clinic reported performing about 200 cardiac surgeries over the first three years of the Lowe's program, with 3 to 4 percent of patients readmitted to any hospital compared to a rate of 9 to 13 percent for heart surgeries nationally (Chen, 2014). Walmart reported that savings from its spine surgery program have mainly come in the form of avoiding surgeries that physicians at the COEs have determined to be inappropriate (Gawande, 2015)

In sum, although there has been a great deal of enthusiasm for the adoption of bundled payment reforms, experimentation to date has been limited in scope, and there is little evidence about the impact on the cost and quality of care. Additionally, there are significant issues that may act as barriers to effective bundled payment arrangements. Hussey and colleagues (2009) describe several, including threshold decisions about the design of the

---

[118] Lowe's, Walmart, PepsiCo, Boeing, and Kroger have each established COE programs.

episode (e.g., number of settings, number of conditions, and variation within episode types) and regarding the attribution of responsibility and distribution of payment to multiple providers involved in an episode. Beyond the challenges in bundled payment design, even highly experienced payers and providers have encountered difficulties in implementation. In recent interviews with seven commercial and state payers involved in bundled payment arrangements, the payers interviewed described a series of challenges related to implementing bundled payment. These included finding providers who were willing to participate; covering the time and resources required for reconciliation of claims against a prospective budget (in the case of retrospective payment arrangements); and covering the staffing required for provider education, reporting, and quality improvement in bundled payment (Bailit & Houy, 2014).

5.2.5 How Might VA Use a Revised Approach to "Episodes of Care" in the Future?

Given all of the ongoing developments around episodes of care in the U.S. health care system more broadly, VA has the potential to undertake a range of similar innovations going forward. We briefly reflect on some of the possibilities below.

5.2.5.1 To Modify the Time Window that Bounds VA Authorizations

VA may continue to define and use episodes of care as it does today with the intent of bounding the amount of time or the scope of services for which a Veteran is eligible to use outside providers, without compelling a reauthorization. Alternately, VA might seek to adopt a more sophisticated and clinically based set of standards to define what constitutes an episode. In principle, VA could either develop such standards on its own, or else adopt from the emerging state of the art, drawing on the work of CMS, the Arkansas Medicaid program, and private-sector payers. Any such adoption by VA would likely involve moving away from a very simple formulation of the episode of care, such as the 60-day time window imposed under the Veterans Choice Act.

On a practical level, improved standards for episodes of care could help local VA administrators to address some of the confusion in how to define and apply episodes, as we described earlier in Section 5.

5.2.5.2 As a Basis for Performance Measurement

As we described above, GAO recommended (and VA agreed) that VA should develop a claims-based analytic capability for performance measurement, drawing on appropriate episode of care standards, as applied to purchased care claims data. In principle, such a capability would enable better monitoring of cost and quality of purchased care, and ideally might support performance comparisons across VA purchased care, care directly delivered by VA, and care in other delivery systems unrelated to VA. VA's ability to adopt appropriate episode-based performance measurement may be constrained by the extent to which measurement frameworks that take into account the existence of multiple chronic conditions are developed externally or internally. Any future version of performance measurement that VA might adopt

will likely be sensitive to its initial choices in implementing more advanced and nuanced standards for the episode of care.

5.2.5.3 As a Basis for New Approaches to Purchasing and Payment

Assuming that VA first implements more advanced, clinically based standards for an episode of care, it could, in theory, move toward adopting new innovations in value-based payment by purchasing care from non-VA providers on the basis of the quality and cost of episodes, rather than on a traditional fee-for-service basis. Future revisions to VA purchased care along these lines could benefit from the experimentation currently under way in Medicare, Medicaid, and the commercial market. Particularly if emerging models for episode-based payment outside of VA prove to favorably impact the quality and cost of care, VA may wish to pursue a similar path for its own purchased care operations, at least in a limited way. As Figure 5-3 shows, designing an episode-based payment system would require VA to address a series of strategic questions, beyond the definition of episodes, to make a future payment system work. Among the threshold issues that would need to be addressed include the selection of procedures and conditions for episode-based payment; selection of outside providers appropriate and willing to participate; and selection of an appropriate payment mechanism (e.g., prospective versus retrospective).

In the future, rather than attempting to negotiate complex episode-based payment contracts with numerous providers across the country, VA might plausibly consider establishing several regional centers of excellence for selected conditions or procedures, or else joining an established, episode-based payment network such as the Employers Centers of Excellence Network. Joining an existing network would have the advantage of tapping a pool of experienced providers who have already been screened for high performance, and who have worked through many of the implementation challenges to episode-based payment, as described earlier.

Figure 5-3. Design Considerations for VA in Developing Episode-Based Payment Mechanisms

| Selection of procedures or conditions | Are there common/costly conditions/procedures for which episodes have been well defined? | Payers/providers have focused on high-volume/costly conditions to justify investments in bundled payment programs. |
| | How many providers and settings should be involved in the bundle? | Fewer providers and settings simplify implementation but also limit the potential value of greater coordination of care. |

Selection of provider partners	Are there interested providers who have experience with bundled payment?
	Have the providers demonstrated high performance for the procedure/condition?
	Are the providers geographically accessible to VA patients?

| Payment mechanism | Will payment be made prospectively or retrospectively? | Many providers are not comfortable entering into prospective arrangements, but this may change with experience. |
| | If payment is retrospective, does VA have the resources to reconcile claims against the budget? | Automated solutions are available, but some payers believe they will take time to implement. |

5.3 Discussion

In sum, both VA's procurement policies and its standards for episodes of care are key to how the VA purchased care system actually operates. For VA to purchase outside services, it has to enter into some kind of contractual relationship with an outside provider, in which money is exchanged in return for services rendered. Any such contractual relationship, in turn, requires some foundational agreement over what the "standard units" being purchased actually are. In the future, new standards for the episode of care could be applied to VA contracting, in ways that might radically shift the units of purchase, with a cascade of downstream implications for payment and risk-sharing, efficiency, performance measurement, quality assurance, and procurement practice.

For procurement, a key consideration for VA involves the link between rigorous, FAR-based contracting requirements that tend to apply to large contracts, as opposed to the much more streamlined contracting requirements that apply to micropurchases of service under FAR. Advocates of rigor in contracting may favor the formal approach, and by implication, higher-value umbrella contracts that cover networks of providers and large amounts of service on a regional or national basis. By contrast, advocates for local flexibility in contracting may favor the opposite approach. Setting aside the details of the federal procurement laws, VA must decide on a strategy for purchased care, and how much emphasis ought to be placed on large contractual vehicles that draw on regional or national networks to provide outside services to large numbers of Veterans. The choice of strategic approach might be influenced by advantages of ensuring that the full

requirements of the FAR apply. Alternately, the strategy might be more heavily influenced by other considerations, such as ensuring access and/or efficiency through an appropriate approach to contracting.

The evolution of new standards for episodes of care could become another important, strategic consideration for VA in its approach to purchased care contracting. In the future and outside of VA, it seems likely that sophisticated standards for the episode of care could become a new platform for anchoring many payer-provider relationships. By corollary, bundled payment arrangements based on episodes would modify the units of purchase in health care, with corresponding risk-shifting between payers and providers, as through payment incentives to improve quality and the coordination of care and to control costs over the course of an "episode." Current state of the art in defining clinically meaningful episodes, and building performance measures and bundled payment contracts based on those definitions, is still in early in its development. However, as we have suggested here, intensive efforts are underway in Medicare and the private sector, to try to scale up bundled payment arrangements and performance measurement, based on expanded and refined definitions of the episode of care.

In the future, VA should consider adopting similar innovations in bundled payment and performance measurement, based on more sophisticated and clinically nuanced standards for episodes of care. Plausibly, VA could develop such standards in-house or else adopt them from work being done by other federal payers (e.g., CMS) or in the private sector. Regardless, new and expanded definitions for the episode of care could offer a platform for a new VA contracting approach to purchased care, such that the units of purchase would shift toward episodes and toward value-based payment, and away from a more traditional fee-for-service framework. Here again, it seems likely that any such shift would move VA toward consolidating much of its purchase activity under larger, aggregate contractual vehicles that would cover many outside providers and large quantities of service. Strategically, that might be an attractive thing for VA to do, if episode-based purchasing can be shown to fulfill the promises of improving efficiency and quality in the procurement of outside services. Further evidence and experience with episode-based purchasing will need to accumulate, before the merits of this approach for VA will become fully clear.

In the meantime, it is also important to note that a shift toward episode-based purchasing by VA might be undertaken as a stand-alone reform, or, alternately, as a complement to an increased emphasis on purchased care by VA as a basic part of VA's health care mission. Other commentators on VA purchased care have offered opinions regarding what the balance should be between VA's provider and payer functions, and whether VA should move more heavily in the direction of serving as payer in the future (e.g., Concerned Veterans for America, 2015). Without weighing in on the merit of this argument, it seems likely that an expanded emphasis on purchasing care might very well build on episode-based payment in the future, and on the latest standards for defining episodes. Once again, these possibilities for the future invoke deep strategic considerations about what VA purchased care is for, and how it ought to fit into VA's broader health care mission.

With all of this being said, what advice and insights can we offer to policy-makers about procurement and episodes of care? First, federal procurement rules are complex, but designed to ensure rigorous contracting processes and competitive bidding in purchasing. These are desirable things to achieve in the context of VA purchased care, but they are not the only strategic consideration for how to structure contracts to purchase services. Policy-makers may need to weigh other factors in determining an optimal strategy, including providers' willingness to contract with VA under more formal and burdensome requirements, and the competing merits of local flexibility versus large-scale national contracting. Second, emerging standards for episodes of care may play directly into VA's contracting approach and strategy in the future, by shifting the units of purchase, and consequently, the ways that VA might pursue quality and efficiency when purchasing outside care in the future.

Rather than approaching these issues as narrowly technical problems in existing authority, policy-makers instead will need to consider them in a broader, more forward-looking way, in developing a coherent strategy for purchased care in the future. We will return to this point, and implications for VA policy, in Section 8 of this report.

PART III: Considerations for Future VA Purchased Care Authorities and Mechanisms

This part examines future VA purchased care authorities and mechanisms and covers three sections: 6. A Review of Whether Secretary Needs New Authorities for Purchased Care, 7. Alternative Government Health Care Payer Models, and 8. Conclusions and Recommendations. In Section 6, we discuss the objectives that influence potential changes in purchased care, the steps used to implement those changes, and the extent to which revisions would be needed in the Secretary's authorities. This analysis forms the basis for an integral theme of the report, which is the necessity of defining a purchased care strategy and objectives. In Section 7, we explore how Medicare and the Military Health System can serve as potential models for purchasing care. This comparison offers lessons learned for policymakers and VA concerning the mechanisms that support purchased care. Based on the culmination of our analysis in Parts I, II, and III, we respond to the assessment questions formally posed by Congress under Section 201(a)(1)(C) of the Veterans Choice Act and synthesize findings to support our assertions about purchased care and recommended changes to authorities and mechanisms.

This page intentionally left blank.

6 A Review of Whether the Secretary Needs New Authorities for Purchased Care

---

Overview of Methods and Data for Analysis of Secretary's Need for New Purchased Care Authorities

- We drew on input from subject-matter experts and discussions with VA stakeholders to derive a series of potential objectives for policy changes to VA purchased care, and to define illustrative implementing steps broadly responsive to these objectives.
- We then examined the authority implications of each of the implementing steps, building on existing VA legal authorities, policies, and guidance.
- We relied particularly on the existing language in applicable statutes and regulations, when examining the authority implications of each implementing step.

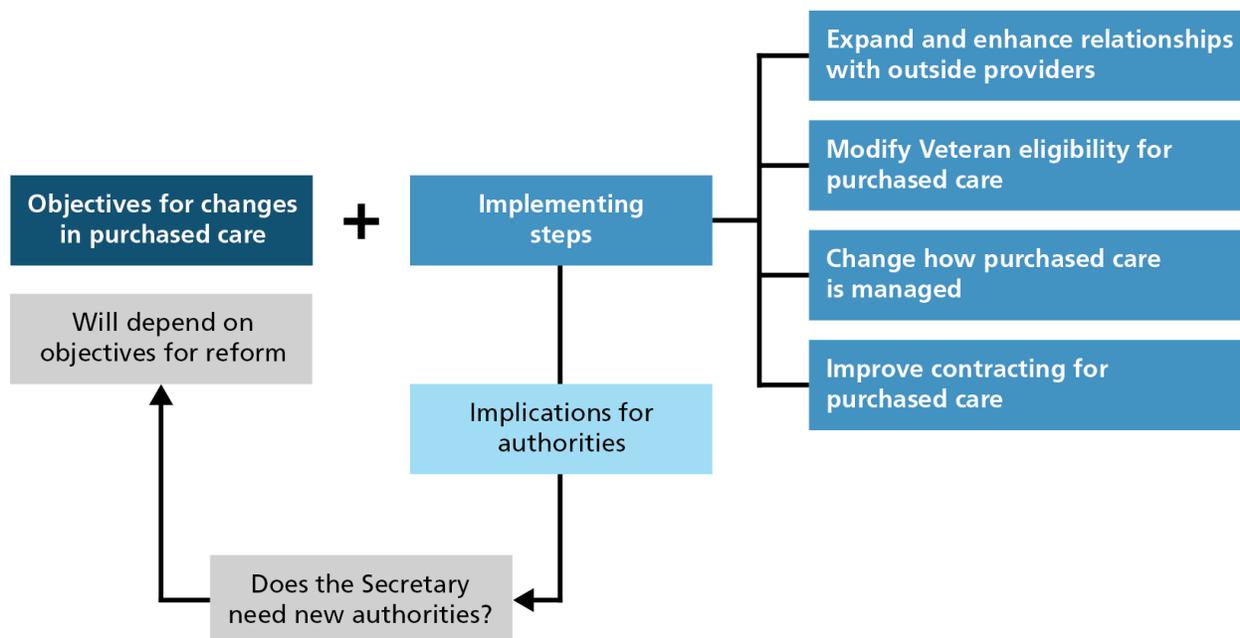
Under Section 201(a)(1)(C), the statutory text of the Veterans Choice Act defines the focus of this assessment to include "The authorities and mechanisms under which the Secretary may furnish hospital care, medical services, and other health care at non-Department facilities, *including whether the Secretary should have the authority to furnish such care and services at such facilities through the completion of episodes of care*" [emphasis added]. The latter part of the assessment mandate poses a normative question: Broadly speaking, Congress has asked whether the Secretary *should* have more or less authority to furnish health care services at non-VA facilities than he has today, through the completion of "episodes of care."[119] This normative question focuses on the desirability of a future change in the status quo of practice and authority and is *inclusive*, rather than *exhaustive*, i.e., it invites comment on a somewhat broader array of potential policy changes.

The simple answer to this normative question depends, at least in part, on what the Congress and VA most want to accomplish through purchased care practice. Determining whether it is a good idea to modify VA legal authority, or VA procedures that derive from that authority, requires identifying what policy-makers hope to achieve with respect to purchased care, and their underlying assumptions, recognizing that those objectives might lead them to choose different targets for future policy changes.

To investigate the authority implications associated with a range of different possible policy changes to purchased care, we employed a method derived from *scenario analysis*. See Figure 6.1.

---

[119] See Sections 3 and 4 for a detailed discussion of the meaning of *episode of care*.

Figure 6-1. Objectives, Implementing Steps, and Implications for the Secretary's Authorities


Starting from the set of objectives that VA or Congress might bring to changing purchased care, we define a series of illustrative *implementing steps* that they might choose to pursue and that are broadly responsive to one or more of these objectives. For the purposes of this discussion, we group these implementing steps according to different aspects of purchased care (e.g., changes in the way that purchased care is managed). We then examine the implications for the Secretary's authorities (specifically, the need for legislative action, formal rule-making by VA, or revisions to VA guidance or policy documents) in connection with each of the potential implementing steps. The objectives and steps comprise the elements for building many different potential scenarios for reforming purchased care. Our goal in Section 6 is to offer insights into the revisions required in the Secretary's authorities by potential changes in purchased care. Therefore, we define the illustrative implementing steps rather than the scenarios themselves.

6.1 Objectives for Policy Changes in Purchased Care

We recognize that there could be a broad set of potential objectives for modifying the purchased care landscape, and so we define some that are currently being raised in the debate over VHA's future. We drew on a variety of sources for these objectives: Congressional testimonies and hearings, articles and commission reports on the future of VA, and on our interviews with purchased care stakeholders.[120] We also discussed potential objectives with an

---

[120] For some of the ideas in the debate on the future of purchased care, see Miller, 2014; Carrato, 2014; Michael O'Hanlon, 2014; Weeks, Wallace, Wallace, and Gottlieb, 2009; Concerned Veterans for America, 2016; Doug Bandow, 2014; Frist and Marshall, 2015; and Concerned Veterans for America, 2015.

internal RAND advisory panel, which included individuals with substantive knowledge in the areas of health care policy, health care financing, and Veterans' policy issues, as well as subject-matter expertise concerning VA as an institution.[121]

Table 6-1 captures a range of these potential objectives, which could lead to different choices for policy change and different implications for VA purchased care authority. It is important to note that these are not the only potential objectives for policy changes and they are not mutually exclusive.

Table 6-1. Objectives for Policy Changes in Purchased Care

Objective	Description
Address short-term gaps in VA health care capacity through a temporary surge in purchased care	"Short-term gaps" could be those that exist today (i.e., in the timeliness of appointments), or they could involve a future mismatch between VA resources and demand for specialty care.
Address long-term gaps in VA health care capacity through the use of purchased care permanently	Gaps could arise in any aspect of VA health care service capacity that cannot be filled feasibly or efficiently by VA capacity development.
Improve value of health care for Veterans through purchased care	From the perspective of government, purchased care could be provided where doing so would lead to improvements in such areas as clinical quality of care or cost-effectiveness.
Expand or enhance purchased care to increase Veterans' choices	Veterans could be offered more choice to seek coverage and care outside of the traditional VHA system (e.g., via private providers or other government facilities, such as those run by DoD).
Redefine the concept of VA health care by aggressively outsourcing VA care	The nature of VA health care activities could be transformed by making purchased care much more focal as a primary mechanism for delivering specific health care services to Veterans or for delivering health care services to specific groups of Veterans.

The objective for the first policy change would involve addressing a short-term mismatch between VA provider capacity and the demand for services by expanding purchased care initiatives, or by increasing Veteran access to existing initiatives, as a way to bridge the "gap." In

---

[121] Two members of the panel previously held senior executive service–level appointments as VA officials; a third is well known as an independent (non-RAND) expert in the area of VA health care policy; a fourth is an expert on Veteran mental health policy and was the co-lead on RAND's seminal study *Invisible Wounds of War: Psychological and Cognitive Injuries, Their Consequences, and Services to Assist Recovery*; and a fifth served on multiple presidential commissions and task forces on VA health care issues.

principle, a future short-term "gap" could look similar, in some important respects, to the problems in access to care that prompted the passage of the Veterans Choice Act in 2014 (e.g., acute problems in the timeliness of scheduling appointments in particular locations, associated with underlying gaps in VA staff capacity or facilities). Alternatively, such a gap could involve another type of transient mismatch between the provider resources available within VA and demand for corresponding services (e.g., a shift in demand for specialty care in particular regions, together with an associated time lag in VA's ability to respond with new staffing or facilities). An important feature of short-term gaps is that they might appear with little warning, requiring VA to have an agile and flexible response capability. Given any short-term gap in the future, VA capacity could, in principle, be temporarily "patched" with purchased care until VA is able to address the gap by modifying its in-house provider resources and capabilities.

A second objective for policy change in purchased care could be to respond to a long-term mismatch between VA provider capacity and demand for services by Veterans. This objective differs from the first in that the hypothetical gaps would be structural in nature, and remedying them would involve long-term investments and enduring changes to VA practice. Purchased care would be undertaken to fill such a gap permanently. In principle, such gaps could arise in many different aspects of VA health care services and, depending on the particular nature of such a shortfall in resources, might reasonably be filled permanently by purchased care as an alternative to expanding VA's internal provider capabilities.

A third objective for policy change could involve seeking to improve the *value* of health care services delivered to Veterans via purchased care. Value (or cost-effectiveness), from VA's perspective, may involve a balanced consideration of several factors, including clinical quality of care, efficiency in service delivery, and timeliness of Veteran access. Broadly speaking, policy changes that might improve purchased care performance according to all these criteria—or according to one criterion without eroding performance in the other areas—could plausibly fit into this objective.

A fourth objective for policy change in purchased care would be involve seeking to expand Veterans' choices to seek coverage and care outside the traditional VHA system. This could be achieved via private providers or other government facilities, such as those run by DoD, with the goal of enhancing Veteran satisfaction, access, or quality of care through the expansion of VA purchased care activities.

A fifth objective for policy change in purchased care could involve redefining the concept of VA health care, and the social contract between Veterans and VA, around more aggressive outsourcing of VA care. Reasons could include a desire to reduce government involvement in the direct provision of health care service. The result would be that purchased care would become much more focal as a primary mechanism for delivering specific types of services to Veterans or delivering services to specific groups of Veterans.

6.2 Steps to Implement Policy Changes and Implications for Authorities

Our goal is to offer insights into the revisions required in the Secretary's authorities (legislation, regulations, and internal VA policies) by potential changes in purchased care. We went beyond our list of objectives and defined a series of implementing steps involving concrete policy changes in purchased care.[122] While these steps do not line up one-to-one with the objectives, they are broadly responsive to the objectives, and are independent of each other. The steps address different aspects of purchased care; for ease of presentation, we grouped them into the following four categories:

- Expand and enhance relationships with providers outside VA.
- Modify Veterans' eligibility for purchased care.
- Change the way that purchased care is managed.
- Improve contracting for purchased care.

We are not recommending these implementing steps nor did we assess their feasibility. We defined them to assess the implications for authorities. How policy-makers in VA or the Congress might translate their objectives for changing purchased care into a package of specific implementing steps may or may not be straightforward, but it would likely involve difficult choices and judgments.

We then analyzed each implementing step, determining how much formal intervention by either the Congress or VA might be needed to carry it out. Some of the implementing steps would require new legislative action or a change to federal law by Congress. These sorts of changes could reflect a significant departure from the authority that the VA Secretary has today, or even a basic redesign of some of the structural features of VA and its purchased care programs. Some implementing steps may not require legislative change but might involve the Secretary modifying formal VA regulations. Finally, some other implementing steps might not require either new legislation or modified regulations. VA could execute those steps within the contours of existing authority simply by shifting its operating practice or modifying its internal guidance documents to reflect the changes.

In general, it is likely that any legislative change made to VA purchased care would also require a downstream amendment to current VA regulations or the promulgation of new ones to conform formal administrative authority to congressional mandates. In turn, it is also likely that any revision made to formal VA regulations would trigger corresponding changes downstream in VA internal policies and practices as well.[123] In all the summary tables and discussions of

---

[122] In defining our implementing steps, we once again drew on input from our internal advisory panel, the literature reviews, and our qualitative interviews with VA officials, both locally (e.g., at VAMCs across the country) and nationally (e.g., at VHA's Chief Business Office), as well as VSOs, outside provider groups that contract with VA, officials from other federal health programs, officials involved with TRICARE, and independent subject-matter experts.

[123] This assumes that any new or modified regulations do not simply mirror existing VA policies or practices.

authority in this section, we characterize an implementing step as requiring a change in current regulations only if the step could be achieved to some degree by regulatory amendment alone; if the change need not be preceded by either congressional action or a formal VA regulatory amendment, we characterize the implementing step as requiring a change to current internal VA policies.

In addition, our assessment here is based solely on the existing language in applicable sources of authority and assumes that all relevant stakeholders are of one mind when it comes to putting each implementing step into play. For example, assume that a particular step could be achieved solely by changing a VA regulation, without any need to address the matter through legislation. The summary tables below would reflect that assessment: legislation = no, regulation = yes.

This analysis of authorities draws heavily on our findings from Sections 3–5 of this report, on our literature review and legal analysis concerning the contours of VA's authority for purchased care initiatives, and on our qualitative interviews and investigation of local-level purchased care policies within VA.

6.2.1 Implementing Steps: Expand and Enhance Relationships with Private Providers

In this section, we describe implementing steps to expand and enhance relationships with private providers and, for each, the implications for authorities. Table 6-2 summarizes the steps and implications.

Table 6-2. Implementing Steps: Expand and Enhance Partnerships with Private Providers

Steps	Legislation Needed?	Change in Regulations Needed?	Change in Internal VA Policies Needed?
Build new relationships with private-sector providers for specific types of care (e.g., specialty, primary)	No	No	Yes
Expand and enhance the national network of outside providers for purchased care	No	No	Yes
Improve medical record and information sharing across VA and non-VA organizations, and include effective channels for feedback	No	No	Yes

NOTE: Asterisks in the table indicate where changes in authority would likely occur but would cascade from a preceding change at a higher level of authority. Thus, a change in legislation (marked "yes") might also lead to a downstream change in corresponding regulation (marked with an asterisk).

6.2.1.1 Build New Relationships with Private-Sector Providers for Specific Types of Care

In essence, this step envisions that VA would enter into new or revised contractual relationships to build or expand outside (i.e., nongovernment) preferred provider networks on a regional or national basis, with a particular focus on expanding clinically defined health care services for which VA wants to address a capacity gap. One of the implications of building these sorts of non-VA "clinical relationships" is that VA would wind up outsourcing more services—and a greater proportion of Veterans' demand for services—in at least some clinically specified domains. This kind of outsourcing could take on more than one form in the future. The simplest version of this step would essentially leave intact the current purchased care mechanisms for referring Veterans out of the system. It would merely facilitate such referrals by making available new (or newly expanded), domain-specific provider networks while strengthening the contractual foundation for the referrals. More ambitious versions of this step could also involve (1) shifting internal resourcing within VA to deemphasize the direct provision of related clinical services, (2) enhancing Veteran access to the outside networks for these service lines by streamlining or reducing current administrative requirements to obtain referrals from VA, (3) adopting an innovative contractual approach to purchasing related services and moving toward a bundled payment or capitated payment relationship between VA and its outside providers, or (4) more fully integrating purchased care providers into the VA system (such as by linking electronic health records) to facilitate smoother movement by Veterans between VA and non-VA providers and facilities.

6.2.1.1.1 Implications for Authorities

This implementation step can be understood to have an impact on two types of "authority." First, it involves creating new or revised contractual networks with outside service providers. Second, it involves supporting modifications to the administration of purchased care or to clinical service resourcing within VA itself. For the simplest version of this step, our analysis suggests that there are no fundamental legislative barriers to VA moving in this contractual direction, and, indeed, building public-private partnerships is already authorized by statute. The need for a regulatory amendment to build new, specialized provider networks is likely to be minimal as well. There are no current regulations, for example, that specifically control the administration of the PC3 program and its use of provider networks. As such, this appears to be an area in which VA could modify its practice in a relatively straightforward manner through internal policy changes. Note that a more ambitious version of the step—particularly one involving the streamlining of administrative requirements for purchased care or radically adjusting the resourcing for direct clinical services—would be much more likely to trigger a need for regulatory or statutory changes as well.

6.2.1.2 Expand and Enhance the National Network of Outside Providers for Purchased Care

VA has already taken steps to expand and enhance its national network of outside care providers through PC3 and its contractor relationships with Health Net and TriWest thereunder. In principle, each of the PC3 contractors is responsible for establishing a broad provider network covering a large part of the United States, in support of VA purchased care activity. In practice, however, the PC3 contractors have had only limited time in which to build their networks; participating provider coverage is reportedly spotty in some parts of the country; and the terms of network participation may not be attractive to some providers. This step would involve VA (possibly through TPAs) establishing a stronger, deeper national provider network (similar in breadth to that which currently exists under the Defense Department's TRICARE system), which would become the default mechanism for all purchased care activity, absent compelling reason for using some other contractual route to purchase care in a specific instance. Likely elements of this step would involve enhancing the attractiveness of provider participation in the network, in part by accelerating claims processing activity and by making the rates paid to providers competitive and attractive. The step might also involve enhancing ongoing VA efforts and incentives to compel local VA officials to use the national network mechanism for purchasing care, rather than other contractual mechanisms, whenever possible.

6.2.1.2.1 Implications for Authorities

Only VA internal policies and practices would need to change. Existing statutory and regulatory authority would not bar VA from strengthening its networks of providers under the PC3 mechanism, or from creating new network mechanisms, as long as the criteria for provider participation do not contradict what is already required in VA's enabling statutes.

6.2.1.3 Improve Medical Record and Information Sharing Across VA and Non-VA Organizations, and Include Effective Channels for Feedback

The focal point for this step involves strengthening the coordination and oversight of care through the sharing of medical records back to VA, during and following a referral of a Veteran out through any mechanism for purchased care. At present, consistent with the industry norm, record-sharing requirements under some existing VA purchased care contracts (including the PC3 mechanism) are relatively unsophisticated, and in many instances may involve faxing of paper records back to VA following an outside treatment episode.

Given the status quo, there are multiple reasons why improved record sharing could be beneficial to VA and to the Veterans that it serves. Improved access to outside records could facilitate VA in coordinating care across multiple outside providers, and between VA and non-VA providers. Through its Virtual Lifetime Electronic Record initiative, VA has pursued electronic health information exchange with community providers. In the future, as more community providers develop the capability to share information electronically, VA may want to direct its referrals to these providers, and incorporate incentives in its contracting mechanisms for prompt exchange of electronic information through the Veteran Lifetime Electronic Record. In the meantime, receiving records describing care provided in the community, in forms that are

both readable by VA and easy for outside providers to comply with, is a high priority. The latter point is notably important in this context, so as not add to the burdens of outside providers in purchased care, hence reducing their potential for dissatisfaction with participating in VA purchase care mechanisms.

6.2.1.3.1 Implications for Authorities

Setting aside broader federal restrictions that apply to the exchange of identifiable health records under HIPAA, putting this step into place would likely only require changes in VA internal policies and practices to standardize and facilitate the sharing of medical records by outside providers. While some VA statutes already mandate the return of the medical record to VA by the external provider once the treatment has completed,[124] these would not conflict with what is being proposed here. As a matter of VA practice, medical record–sharing provisions have already become a standard, contractually based requirement for providers seeking to join PC3 networks, even in the absence of explicit statutory or regulatory mandates. Carrying out this step in practice would likely depend more on improved contractual provisions, and on investment and infrastructure support to outside providers that want to participate in the Veteran Lifetime Electronic Record, than it would on changes to legislation or formal VA regulations.

6.2.2 Implementing Steps: Modify Veterans' Eligibility for Purchased Care

In this section, we describe implementing steps to modify the eligibility of Veterans for purchased care and, for each, the implications for authorities. Table 6-3 summarizes the steps and implications.

Table 6-3. Implementing Steps: Modify Veterans' Eligibility for Purchased Care

Steps	Legislation Needed?	Change in Regulations Needed?	Change in Internal VA Policies Needed?
Enhance access to purchased care by renewing or extending the Veterans Choice Act	Yes	*	*
Use priority groups to help determine the allocation of purchased care and the scheduling and authorization of purchased care appointments	Yes	*	*

---

[124] See, for example, Section 101(l) of the Veterans Choice Act.

Steps	Legislation Needed?	Change in Regulations Needed?	Change in Internal VA Policies Needed?
Expand the availability of purchased care to Veterans when purchased care is more cost-effective	No	No	Yes
Create a VA subsidy for Veterans to obtain health insurance coverage through ACA exchanges or other sources	Yes	*	*
NOTE: Asterisks in the table indicate where changes in authority would likely occur but would cascade from a preceding change at a higher level of authority. Thus, a change in legislation (marked "yes") might also lead to a downstream change in corresponding regulation (marked with an asterisk).			

6.2.2.1 Enhance Access to Purchased Care by Renewing or Extending the Veterans Choice Act

This step would seek to enhance access to non-VA providers in a targeted way, in situations where VA's internal providers cannot deliver timely or economical service, moving beyond the contours of any of VA's existing, permanent initiatives for purchased care. Beyond simply removing or modifying Choice's current termination triggers, different versions of this step could involve funding the renewed program either as a part of VA's budget or separately and as either a discretionary or mandatory program. The results of a simple version of this step might look very similar to the 2014 incarnation of the Veterans Choice Act. Alternately, a more complicated version of this step might be tailored differently, as by making access to outside providers easier to obtain or more widely available to Veterans,[125] or by targeting the step to expand access only to those medical specialties or services which comprise a future capacity gap.

6.2.2.1.1 Implications for Authorities

Congressional action would be needed to extend Choice beyond the current legislative cutoff points (i.e., either an exhaustion of the Veterans Choice Fund or three years following the

---

[125] There are many hypothetical ways that Veteran access to non-VA providers could be expanded in the future. One simple example would involve replacing the "30-day/40-mile" rule with a "21-day/30-mile" rule. The consistent implication of such reforms is that they would presumably increase both the utilization and cost of outsourced health care services for VA, all other factors being held equal.

enactment of the Veterans Choice Act). Legislation would also be needed if the criteria for Veteran eligibility, provider qualifications, the mandatory or discretionary nature of the program, or other key aspects of Choice were changed in any material way from the language in the 2014 act. However, some functional expansion of Choice eligibility and other features as currently implemented by VA might be realized though the promulgation of new or modified regulations.[126] VA would always have the capability to change its current internal policies in connection with the Choice program—for example, to expand the pool of eligible providers.[127]

6.2.2.2 Use Priority Groups to Help Determine the Allocation of Purchased Care and the Scheduling and Authorization of Purchased Care Appointments

Access to VA facilities and direct providers might be treated as a scarce resource by VA, either globally or with regard to specific clinical capabilities and lines of service. One way to prioritize access to purchased care plausibly could involve making purchased care resources more readily available as a choice to Veterans in lower or higher-priority groups, with the aim of easing demand on VA's direct-care system, and thereby increasing the availability of direct care resources for others. Different versions of this step could involve different adjustments to the rules for purchased care access to make purchased care more readily available to Veterans or more attractive to them as an option. For example, access to purchased care might be made a default assumption for access to selected services by selected groups of Veterans, in much the same way that wait time and driving distance are default criteria for access under the Choice program. Regardless, any version of this step would involve tying the priority group scheme to purchased care so that Veterans in the highest priority groups would have enhanced access to outside services.

6.2.2.2.1 Implications for Authorities

While there is existing authority for VA to prioritize the provision of medical care to certain classes of Veterans, a shift in approach of this magnitude would clearly require Congressional action (see 38 U.S.C. 1710). No current authority allows access to purchased care solely on the basis of a Veteran characteristic unrelated to medical need or issues regarding access to VA medical facilities. This implementing step would also create a need to promulgate modified regulations, given that existing administrative guidance addresses the prioritization of scheduling appointments, rather than prioritization of external care referrals (see 38 C.F.R. 17.49).

---

[126] The recent regulatory change from geodesic distance to driving distance as VA's yardstick for measuring distance from a Veteran's residence to a VA medical facility is one example of such a process.

[127] For example, VA could move toward a policy in which the maximum payment for services allowable by statute is the default standard used for compensating providers, rather than pushing for negotiated percentages of Medicare rates.

6.2.2.3 Expand the Availability of Purchased Care to Veterans When Purchased Care Is More Cost-Effective

Under the existing core authority for purchased care (at 38 U.S.C. 1703), the Secretary may contract to purchase care when "Department facilities are not capable of furnishing economical hospital care or medical services because of geographical inaccessibility or are not capable of furnishing the care or services required." In principle, this provision leaves discretion to the Secretary, in deciding when VA facilities are either "not capable" of furnishing service, or not capable of doing so "economically" because of geographic inaccessibility. In practice under the traditional purchased care program, much of the discretion gets carried out locally and at the front-line of VA encounters with Veterans, with VA clinicians and administrators determining the appropriateness of purchased care referrals on a case-by-case basis. This step would involve VA in issuing centralized guidance and directives about lines of VA health care service which would broadly be deemed "non-economical" or capacity-limited, and for which purchased care access might therefore be granted to Veterans on an expedited basis by local VA officials. More ambitious versions of this step might be combined with shifting VA's internal provider resources to focus on areas of specialization and strength, while channeling some other types of demand for services broadly toward purchased care.

6.2.2.3.1 Implications for Authorities

At least for the simple version of this step, only internal VA policies and practices would need to change. Existing statutory and regulatory authority would not bar VA from centralizing and clarifying guidance to designate some lines of service as being "uneconomical" or capacity-limited on a regional or national basis and, hence, appropriate for expedited access to purchased care.

6.2.2.4 Create a VA Subsidy for Veterans to Obtain Health Insurance Coverage Through ACA Exchanges or Other Sources

The idea here would be to shift some Veteran demand for VA health care services into outside facilities and alternative payer mechanisms. Rather than directly providing or paying for care, VA under this step would pay a subsidy directly to Veterans, who would then use the money to purchase health insurance coverage, either through the health care exchanges established by the Affordable Care Act, or through traditional private health coverage, or through other insurance mechanisms (including Medicare). The details of exactly what the subsidy program would look like might be complex. Presumably, selected groups of Veterans would either be encouraged or mandated to participate, and the result would be to shift at least some Veterans out of VA care entirely. If the aim were to make the subsidy program both cost-neutral and benefit neutral (that is, no incremental cost to government above status quo, and no shift in the health benefits that a Veteran would otherwise be entitled to at status quo), then significant VA controls would need to be imposed on who could obtain the subsidy, what kinds of insurance plans they could buy with it, and what they would be giving up in return for the subsidy. Regardless, any version of this step would involve VA in operating a subsidy program that is entirely outside its current scope of operation, and plausibly could involve a change in

the Department's structure, to facilitate such a change in mission. There would be significant cultural challenges in undertaking such subsidies, because any version of the step would involve shifting some Veterans away from VA, both in its capacity as a direct provider of, and as a direct payer for, medical services.

6.2.2.4.1 Implications for Authorities

There is some precedent within VA in facilitating the acquisition of private health-related insurance by Veterans. For example, section 510 of the Caregivers and Veterans Omnibus Health Services Act of 2010 (Pub. L. 111-163, May 5, 2010) established a pilot program where VA would contract with private dental insurance carriers that in turn would offer coverage to eligible Veterans. While no direct subsidy is involved, it was VA's expectation that since "a large number of enrollees can assist with keeping premiums, copayments, and other administrative costs low," VA would "conduct the Federal contracting process anticipating this large number of expected enrollees and attempt to secure reasonable premium and copayment pricing" (78 Fed. Reg. 32128). Similar legislative authorization would be needed to move towards the goal described in this implementing step, though the scope of such statutory change would be increased markedly if participation were mandatory for Veterans in priority groups based on the most extensive service-connected disabilities. Regulatory change or modification of existing VA internal policies and procedures, by itself, would not provide sufficient authority for carrying out the kind of subsidy program that is envisioned by this step. In addition, such a step would require coordination outside of VA with CMS, the Department of Health and Human Services, and the Internal Revenue Service.

6.2.3 Implementing Steps: Change the Way Purchased Care Is Managed

In this section, we describe implementing steps to change the way purchased care is managed and, for each, the implications for authorities. Table 6-4 summarizes the steps and implications.

Table 6-4. Implementing Steps: Change the Way Purchased Care Is Managed

Steps	Legislation Needed?	Change in Regulations Needed?	Change in Internal VA Policies Needed?
Improve resourcing and management decision-making through better data collection and new analytic models	No	No	Yes
Remove or modify "to be seen first" practice under purchased care	Maybe	Maybe	Yes

Steps	Legislation Needed?	Change in Regulations Needed?	Change in Internal VA Policies Needed?
Incorporate all VA purchased care activities into a single program within VA	Maybe	Yes	*
Remove or modify specific VA purchased care requirements that impede access to outside providers	Yes	*	*
Separate VA's payer and provider functions into discrete organizations	Yes	*	*
Standardize and strengthen front-end VA processes for purchased care	No	Yes	*
NOTE: Asterisks in the table indicate where changes in authority would likely occur but would cascade from a preceding change at a higher level of authority. Thus, a change in legislation (marked "yes") might also lead to a downstream change in corresponding regulation (marked with an asterisk).			

6.2.3.1 Improve Resourcing and Management Decision-Making Through Better Data Collection and New Analytic Models

This step would involve an improved data collection effort that builds on VA's existing purchased care ecosystem, by aggregating claims and payment data across all of the various contractual and programmatic mechanisms by which VA outsources care. This step would seek to fill gaps in current data and recordkeeping, with the aim of giving decision-makers much better visibility into purchased care use and expenditures, as a foundation for achieving new efficiencies and for better allocating scare purchased care resources to meet demand. More ambitious versions of this step might also seek to design new VA analytic models on resourcing for purchased care, so as to be able to estimate utilization and resource needs in the future, as a basis for budget planning. As a longer-term goal, such models and data could be used in conjunction with the information that is already available in VA health care records to inform strategic decisions as to when to provide health care inside or outside VA.

6.2.3.1.1 Implications for Authorities

Because improving data collection practices in purchased care lies well within VA's existing authorities to operate generally, it is highly unlikely that VA would require new statutory or regulatory authority to undertake this step. Likewise, modifying VA's approach to resource decision-making through analytic modeling for purchased care seems unlikely to transgress any specific, existing VA statutes or regulations, or to require new authorities to undertake. On its

face, implementing this step (i.e., collecting better data and/or implementing new resourcing models in purchased care) would only require changes to internal VA policies and practices, and not changes in legislation or formal VA regulations.

6.2.3.2 Remove or Modify the "To Be Seen First" Practice under Purchased Care

Currently, a Veteran typically first receives an appointment within VA for treatment, prior to receiving a referral and authorization for specialized purchased care out of the system.[128] Although the core authority for purchased care per 38 U.S.C. 1703 does not explicitly mandate an initial appointment within VA as a requirement for all Veterans prior to their referral out of the system, in practice, the determination that a needed service cannot feasibly be provided within the system has typically involved decisions made by local VA providers and administrators, based on an initial clinical contact with a Veteran within VA's direct care system. Moreover, for at least some Veterans who fall into a narrow, statutory category established by 38 U.S.C. 1703(a)(2), VA's authority to purchase care is tied to the Veteran having already received related care or medical services through VA.

Under some circumstances, the practice of requiring an initial medical appointment within VA has reportedly resulted in catch-22 situations, such that a Veteran who cannot obtain a threshold appointment within VA for treatment for a specific problem also cannot receive a referral out for purchased care, for lack of the initial work-up that would specify and justify the referral. In practice, this implementing step would institute a broad fix within purchased care, to ensure that access to outside providers cannot be bottled up indefinitely based on lack of timely access to a gateway appointment within VA's direct provider system.

6.2.3.2.1 Implications for Authorities

For many Veterans, only VA internal policies and practices would need to change to address this problem. For this group, existing statutory and regulatory authority would not bar VA from eliminating the need to be seen by a VA doctor prior to scheduling an outside, purchased care appointment. A more ambitious fix for the "to be seen first" problem might also revise the statutory category established under 38 U.S.C. 1703(a)(2), which restricts VA's authority to purchase care for a defined subset of Veterans, based on their already having received medical treatment through VA. The latter fix would require legislative intervention by Congress.

6.2.3.3 Incorporate All VA Purchased Care Initiatives into a Single Program Within VA

The simplest version of the step would keep intact the defining contours of the various existing VA initiatives for purchased care (e.g., the 30-day/40-mile rule for VA Choice), and would retain local control over the front-end processes associated with purchased care, but would combine all of the existing programs and initiatives for purchased care under a single VA administrative umbrella, with manualized standards and improved guidance for VA personnel in how to carry

---

[128] Note however that under the 40-mile provision under Choice, a Veteran who lives in an isolated geographic locale removed from any VA facilities might qualify automatically to obtain services through purchased care, without the need for any initial screening appointment within VA.

out purchased care activities. More ambitious versions of this step could involve refining and harmonizing the current portfolio of VA purchased care initiatives to reduce their complexity, or to craft a unified VA approach to purchased care while optimizing administrative processes and oversight. In principle, combining programs for purchased care could help foster greater efficiency in the administration of purchased care and improve understanding among VA staff of the availability of existing purchased care resources (i.e., available outside providers and alternative contracting vehicles).

To implement this step, the Chief Business Office could be elevated within VHA and explicitly given these responsibilities, or a new program office for purchased care could be established. The office would be responsible for capturing best practices in the different programs, organizing standardized training programs and combined processes for implementing various aspects of purchased care, and finding ways to foster innovation in purchased care, perhaps through the use of new standards for episodes of care.

6.2.3.3.1 Implications for Authorities

The extent to which this implementing step attempts to bring the many different types of purchased care programs under one programmatic "roof" will drive the manner in which appropriate authority would be made available. Much could be accomplished through changes in regulations and internal policies, if the goal was limited to unifying the command structure for overall administration of purchased care. Streamlining or standardizing procedures for requesting external care or compensating providers are also likely to be tasks within VA's sole discretion. However, matters related to consolidating or simplifying eligibility requirements for purchased care, or shifting the existing responsibilities of the Chief Business Office or the NVCC unit would likely require congressional action, particularly to the extent that those issues are currently addressed by statute. The Veterans Choice Act, for example, specifically requires VA to coordinate the furnishing of care and services under Choice through the NVCC unit. Unless the implementing step is accomplished by moving all management authority for all programs under NVCC, the act would have to be amended. A similar need would flow from any attempt to change the source of payment for care furnished by non-VA providers away from the Chief Business Office, because the Veterans Choice Act specifically assigns that responsibility to the Chief Business Office.

6.2.3.4 Remove or Modify Specific VA Purchased Care Requirements That Impede Access to Outside Providers

For purposes of illustration, we focus here on several examples of VA requirements that sometimes operate as impediments to Veteran access to purchased care. One such impediment involves the "60 day window" for an episode of care under the Choice program, pursuant to which a referral and authorization for purchased care services cannot last for more than 60 days, without reauthorization by VA. For many acute health care problems, a 60-day limit on the episode of care may be more than sufficient to carry out treatment and to resolve the problem. For more chronic conditions or primary care for Veterans not served by a VA facility, a 60-day episode of care may not correspond well to the nature of services being provided, or the conditions being treated. In some instances, an arbitrary time limit placed on the episode of

care may hamper coordination of care efforts that might otherwise take place among outside providers, and may make it more difficult for Veterans to obtain the services they need in a timely and coherent way. This step would involve doing away with the 60-day window as a defining feature for an episode of care in favor of authorizing the Secretary to establish a more elastic set of episode guidelines for all purchased care to accommodate appropriate treatment trajectories and purchased care practices for a range of clinical conditions.

Another illustrative impediment involves the language in Section 101(b) of the Veterans Choice Act, which establishes that a Veteran may be eligible for service under the Choice program if he or she "resides more than 40 miles from the medical facility of the Department, including a community-based outpatient clinic, that is closest to the residence of the veteran." In instances where a Veteran requires specialized services that are not available through the VA facility nearest his or her residence, the eligibility language of the 40-mile rule may not be responsive to the reality that the Veteran lives more than 40 miles away from the nearest VA facility with the ability to meet his or her specific treatment needs. In this instance, the implementing step would involve modifying the 40-mile rule to calculate the distance based on the nearest VA medical facility that offers the services required by the Veteran.[129]

A third illustrative impediment is the purchased care access filter that is imposed by 38 C.F.R. 17.53, which further restricts the broad eligibility afforded by 38 U.S.C. 1703 to utilize purchased care inpatient services when needed. The regulation restricts inpatient treatment by external providers to instances where VA facilities are "not feasibly available." This step would apply a more liberal interpretation of 38 U.S.C. 1703 that would place the emphasis on the Veteran's best interests.

6.2.3.4.1 Implications for Authorities

The exact nature of what changes in authority might be needed would depend on what specific impediments in VA purchased care are chosen as the object of reform. Given the three illustrative examples we spotlight above, however, it is likely that a combination of revisions to the Veterans Choice Act, to regulations, and to VA internal policies would be required.[130]

6.2.3.5 Separate VA's Payer and Provider Functions into Discrete Organizations

The idea here is to reorganize the way that VA manages Veteran health care risk and pays for medical services, by standing up within VA a new, dedicated payer organization, which would become responsible for all health care funding and contracting/payment activity for VA. At the same time, VA's direct-provider network would be separated out as its own distinct organization, removed from the payer function, and solely dedicated to operating hospitals and

---

[129] Note that a very recent Senate bill has proposed instituting a very similar change to the Choice program. See S. 1463, Access to Community Care Act for Veterans, passed by the Senate on May 22, 2015.

[130] Table 6-4 suggests that legislative change would be needed to implement this step, based specifically on implementing the identified fixes to the 60-day window and 40-mile rule under Section 101 of the Veterans Choice Act.

---

providing medical services to Veterans. In principle, such a reorganization might mean that the new VA payer entity would contract with the VA provider entity, with the latter becoming the primary provider network for delivering benefits. Meanwhile, the VA payer entity would presumably also engage in contracts with other, outside provider networks, and would make decisions about how to allocate resources and pay providers to best implement VA health benefits.[131] In some ways, this step might logically complement a shift in the balance between payer and provider functions within VA, such that VA would put a much stronger emphasis on purchasing care, and VA provider facilities might be shifted to specialized aspects of clinical service where they have greatest comparative advantage and value. However, any version of this step would ramp up VA's payer expertise and capabilities, and would manage VA health care funding in a manner similar to a traditional insurance entity.

6.2.3.5.1 Implications for Authorities

It is difficult to imagine undertaking such a deep shift in VA's mission and operations without making extensive amendments to Chapter 17, Title 38, of the U.S. Code. More specifically, if Congress authorized VA to form a new and distinct payer entity, it could also provide the Secretary with a detailed statutory blueprint for how that payer entity would be organized, exactly what functions it would perform, how it would receive funding from Congress and pay for outside health care services, how it would interact with VA's provider side, and how the new payer entity would fit into a broader strategy for VA purchased care. Related changes would almost certainly be required to VA regulations and internal policy directives as well.

6.2.3.6 Standardize and Strengthen the Front-End VA Processes for Purchased Care

Section 106 of Veterans Choice Act is noteworthy for having consolidated the *back-end* administrative processes (particularly, claims processing) associated with purchased care, by shifting those processes (and the personnel associated with them) to control by VHA's Chief Business Office, and away from the control of the local VAMCs that had previously been responsible for them. Loosely speaking, the logic behind this centralization was to enhance administrative efficiency, to make VA patients more attractive to outside providers, and thereby to enhance Veteran access. In principle, an additional step could be undertaken to enhance the *front-end* processes associated with purchased care (particularly referral and authorization), and streamlining and enhancing the consistency of these processes across VAMCs through revised directives and guidance, together with stronger oversight from VHA's Chief Business Office (and more specifically, the NVCC unit and/or the purchased care offices thereunder). In principle, such a step would aim to make local VA staff more agile, effective, and consistent in their referral and authorization practices.

---

[131] Splitting VA's payer and provider functions is not a new idea and has been proposed elsewhere (see, for example, Concerned Veterans for America, 2014). See Hosek & Cecchine (2001) for a systematic analysis of the organizational implications of splitting the payer and provider functions in the Military Health System. That report addresses the underlying rationale and advantages to such a policy step in more detail.

6.2.3.6.1 Implications for Authorities

Administrative aspects of modifying the front-end of the purchased care process can largely be addressed through regulatory rulemaking and internal policy-making. To some extent, the current NVCC initiative attempts to accomplish some of these same goals, and much of that effort has moved forward solely through internal VA policy changes. Presumably, an expanded and enhanced effort along these lines could proceed by similar means. With this being said a more ambitious version of this step that shifts the standardization of front-end processes away from the NVCC unit, and to some other programmatic office within VA, might require some technical statutory changes to implement as well.[132]

6.2.4 Implementing Steps: Improve Contracting for Purchased Care

In this section, we describe implementing steps to improve contracting for purchased care and, for each, the implications for authorities. Table 6-5 summarizes the steps and implications.

Table 6-5. Implementing Steps: Improve Contracting for Purchased Care

Steps	Legislation Needed?	Change in Regulations Needed?	Change in Internal VA Policies Needed?
Use revised definitions for episodes of care as a basis for improved purchased care contracting	No	Maybe	Yes
Change the requirements imposed on VA by the FAR to improve VA's ability to contract for purchased care	No	Yes	*

---

[132] See immediately preceding footnote, and the example of the Veterans Choice Act and its mandate to have the NVCC unit act as the coordinator for furnishing care outside of VA.

Institute long-term, Veteran-level contracts for purchased care, particularly for long-term service-connected conditions	No	No	Yes
Use revised definitions for episodes of care as a basis for improving purchased care coordination	Yes	*	*
NOTE: Asterisks in the table indicate where changes in authority would likely occur but would cascade from a preceding change at a higher level of authority. Thus, a change in legislation (marked "yes") might also lead to a downstream change in corresponding regulation (marked with an asterisk).			

6.2.4.1 Use Revised Definitions for Episodes of Care as a Basis for Improved Purchased Care Contracting

In this step, the idea would be to build new or revised contractual relationships with outside provider networks, based on bundled payment innovations and sophisticated definitions of episodes of care. Such innovations could help both to improve the quality of care for Veterans, while helping to control related costs to VA. By extension, the bundled payment arrangements envisioned by this step would become the fulcrum for an expanded emphasis on purchased care by VA. What would make such arrangements unique, by contrast with current VA practice, is that they would involve shifting financial risk from VA to outside providers, in connection with the delivery of coordinated packages of service. In practice, actually implementing bundled payment in purchased care contracting would be very complex and would depend on the implementation of clinically meaningful standards for episodes of care and for the bundling of services. These standards are not currently well developed, nor does the infrastructure exist to support the bundling of services.

6.2.4.1.1 Implications for Authorities

Changing the current definition of episode of care as found in the Veterans Choice Act would require legislative action. However, the language in the Act is broad, and VA's regulations implementing the Act give the department considerable latitude in shaping the specific details of the term. Episodes of care for other VA purchased care initiatives are not defined by statutory law, and VA could clarify the term simply by modifying its internal policies and the way that it purchases episodes of care. This would provide a more stable foundation for moving forward with this kind of shift. In a similar vein, VA could undertake bundled payment

contracting simply by modifying its internal policies and without recourse to legislative or formal regulatory changes.

6.2.4.2 Change the Requirements Imposed on VA by the FAR to Improve VA's Ability to Contract for Purchased Care

Current VA contracting with outside providers for purchased care, particularly on a local basis, may at times be impeded by some of the technical requirements for procurement and contracting that are embedded in the FAR. A related theme was notably raised in some of our qualitative interviews with VA officials, and was also addressed in a recent VA budget proposal to Congress, which sought to revise VA authorities to "streamline and speed the business process for purchasing care for an individual Veteran that is not easily accomplished through a more complex contract with a private provider" (VA, Office of Budget, 2015, p. 14).

In line with these observations and the current VA procurement approach to purchased care, the most basic version of this step would affirm and strengthen the validity of local VA practices in the micro-purchase of medical services using purchase orders, consonant with the streamlined FAR requirements that apply under the micro-purchase threshold. More ambitious versions of this step might seek to clarify, or to expand on, the kinds of medical service that are appropriate for VA to outsource by using the micro-purchase mechanism, or alternately, the simplified acquisition procedures that apply under FAR's simplified acquisition threshold. The most extreme version of this step could involve crafting a new exception to the application of the FAR to VA purchased care to enhance VA's ability to enter into related contracts without the formality of full FAR-based procurement processes. Any version of this step would protect or enhance VA's ability to engage in local-level contracting for medical services on a patient-by-patient basis, in part by streamlining FAR requirements that might otherwise apply (e.g., with regard to competitive bidding) and in part by making the prospect of contracting less onerous and more appealing to local providers.

6.2.4.2.1 Implications for Authorities

This implementing step contemplates modifying, or at least clarifying the application of, federal procurement laws to VA purchased care practice. The relevant procurement laws include the FAR and VAAR (which interpret and expand on the FAR). Both sets of rules appear in Title 48 of the Code of Federal Regulations.

The most basic versions of this implementing step might not change any of the current FAR or VAAR rules, but would simply clarify through guidance that the rules are consistent with the current VA procurement practice of local purchasing for individual services for Veterans, under the FAR micro-purchase thresholds. Presumably the latter could be accomplished simply as a matter of internal VA policy. A more aggressive version of this step might involve amending some of the formally promulgated acquisition rules—particularly the simplified acquisition procedures under Part 813 of the VAAR—to clarify the appropriateness of flexible VA purchased care practices under the simplified acquisition procedures or the micropurchase threshold. Any such changes would likely implicate a formal regulatory process, however, which would be more burdensome for VA to undertake. The most extreme version of this step would

involve Congress undertaking a statutory modification to 38 U.S.C. 8153 to explicitly exempt some aspects of VA purchased care contracting from FAR and VAAR coverage. For our purposes, the middle-ground approach of modifying the federal procurement regulations would likely be sufficient to protect current VA contracting practices in purchased care, particularly the use of small, local contracts for services to an individual Veteran under the FAR micropurchase threshold.[133]

6.2.4.3 Institute Long-Term, Veteran-Level Contracts for Purchased Care, Particularly for the Treatment of Long-Term Service-Connected Conditions

The concept here would be to structure some VA purchased-care contracts around specified clinical conditions, such that the entire episode of care could be outsourced to an external care provider or network selected for quality and cost. Presumably, the Secretary would undertake any such purchased-care contracting in clinical service lines for which direct provision of services by VA is deemed uneconomical or where VA capabilities are limited. In principle, this implementing step could be built on advanced definitions for episodes of care for clinically specific conditions, and could further use those definitions to implement bundled payment innovations, such that the contractual providers would be paid by the episode rather for individual services, and with a corresponding shifting of risk from VA to the contractual provider. This kind of contracting could also build in advanced performance metrics and incentives, again based on contractually defined episodes of care. These sorts of innovations might build on the growing experience of recent bundled-payment demonstrations, including those sponsored by Medicare and private-sector payers.

6.2.4.3.1 Implications for Authorities

Authority already exists for moving forward with long-term contracts on either an individual Veteran basis and/or for specific conditions. Developing such contracts would involve a refocusing of internal VA policies and purchasing strategy to some extent, but no regulatory or legislative action would be needed to enter into such contracts *per se*.

6.2.4.4 Use Revised Definitions for Episodes of Care as a Basis for Improving Purchased Care Coordination

The premise here is to shift the way that VA defines episodes of care in practice to make episodes better correspond to clinically meaningful baskets and trajectories of connected health care services, which can usefully be lumped as a group when VA purchases services from outside. In principle, better-defined episodes could be helpful in improving the coordination of care with outside providers, since such episodes could facilitate the "bundling" of a package of relevant services to an outside provider, without the need to split some aspects of the episode between VA and that provider, and without the need to seek repeated authorization from VA for episodes with durations longer than 60 days. In practice, the advantages in coordination

---

[133] Table 6-5 reflects this "middle-ground" assumption, suggesting that the authority change needed for this step would involve modifying VA regulations.

that might accrue with revised standards for episodes of care would likely depend on the details of the new standards, the ease with which VA can apply them, and the impact of those standards on the front-end referral and authorization processes for purchased care.

6.2.4.4.1 Implications for Authorities

Changing the definition of *episode of care* as articulated in the Veterans Choice Act would require legislative action. However, the language in the act is broad, and regulations implementing the act give VA considerable latitude in defining an episode, within the constraint of the 60-day window. Episodes of care for other purchased care programs are not defined by statutory law, and VA could clarify the term simply by modifying its internal policies.

6.3 Discussion

In the Veterans Choice Act, Congress posed the question of "whether the Secretary should have the authority to furnish [health] care and services at [non-Department] facilities through the completion of episodes of care." The answer to this question is, at least in part, that it depends. If the aim is to maintain or expand VA purchased care, then clearly this kind of authority (which the Secretary already has) is needed, and may indeed need to be expanded in specific ways. If the aim is to move VA in the direction of new contracting approaches for episodes of care and bundled payment arrangements, so as to mirror innovations in payment in other parts of the U.S. health care system, then again, this kind of authority is needed, and the authority may need to be modified or expanded in specific ways.

On the other hand, if the primary aim is to address short-term gaps in VA capacity, or to protect and enhance VA's internal provider network and capability, then that could easily lead to the conclusion that the Secretary does not need more authority than he has today, with regard to "providing service at non-Department facilities through the completion of episodes of care." Ultimately, the normative question here depends on a strategic vision of what purchased care is for, how it fits into the larger VA mission, and how the Secretary can best accomplish those ends.

Given the many possible objectives for the future of purchased care, VA and Congress could find themselves considering a range of changes to purchased care. These changes could include enhancing relationships with private providers, making modifications in the eligibility of Veterans for purchased care, changing how purchased care is managed, or improving contracting for purchased care.

Our analyses incorporated these objectives and potential changes in purchased care in different ways. Our aim is not to urge VA or Congress to adopt any of these changes but to offer insights into what would be required in terms of the Secretary's authorities to implement potential policy changes (i.e., in legislation, regulations, or internal VA policies). Not surprisingly, the types of changes in the Secretary's authorities would depend on the specific characteristics of the policies themselves. Nevertheless, we offer some basic observations drawn from the analyses presented in here and elsewhere in this report:

- The Secretary has considerable statutory flexibility and discretion under Title 38 for purchasing care outside of VA, consistent with the traditional goal of responding to future short-term gaps in capacity. It bears repeating that the Secretary already has, and has had for some time, basic statutory authority to engage in purchased care activity, particularly where VA facilities are not capable of furnishing the care required. Some important aspects of purchased care, such as the strategy for contracting and building outside networks of providers or enhancing quality in the care that is purchased, lie largely within the discretion of the Secretary, and are unlikely to require formal legislative or regulatory revisions to carry out. As such, improvements in the Secretary's tools for managing and resourcing purchased care would also not require legislative or regulatory revisions.

- The Secretary would likely need new authority through legislation for policy reforms that involve new types of funding for VA purchased care; or basic changes in VA's mission pertaining to purchased care (e.g., in redefining VA's role as a payer versus provider); or changes in the fundamental eligibility requirements for Veteran health benefits; or reforms that would alter the Veterans Choice Act. Because any of these modifications would touch directly on existing statutory authority for VA, and/or on the role of Congress in how it chooses to fund VA, these are aspects of the purchased care landscape where revision would require additional legislative involvement by, and input from, Congress.

- Some specific impediments to VA purchased care access would require legislative interventions to fix. Specific examples discussed in Section 6 include revisions to the 40-mile rule, and to the 60-day window, under the Veterans Choice Act. Not all such impediments, however, involve statutes. For example, the need for Veterans "to be seen first" by a VA provider prior to a purchased care appointment does not (in all instances) flow directly from VA's statute, and could be at least partly addressed by the Secretary without regard to legislative change or formal regulatory reform.

- Modifying the way that VA purchases "episodes of care" in the future may require new legislation (particularly in connection with the Veterans Choice Act), but more importantly will require internal VA policy changes to be made by the Secretary. Future reforms around "episodes of care" will likely involve the development of a new VA strategy for adopting bundled payment practices, based on emerging standards and definitions for episodes of care from outside sources. The Secretary already has discretion to move in this direction under current statutes and regulations, but VA internal policies and guidance would need to change in support of such movement, as would existing purchased care contracts.

- Some plausible policy changes that policy-makers might consider would involve very significant, sweeping statutory changes—for example, if VA or Congress were to undertake radical changes to VA's mission or function in connection with purchased care. Such changes might also require involvement by Congress in new legislation to establish the blueprint for change. Some examples along these lines could include a shift to greatly expand VA's role as payer organization; or to move significant numbers of Veterans into purchased care and out of direct care through VA; or to make VA the operator of a subsidy program for outside health insurance, as an alternative to obtaining other sorts of health benefits through VA.

---

7 Alternative Government Health Care Payer Models

> **Overview of Methods and Data for Alternative Health Care Payer Models**
>
> - We drew on the experiences of other large government health care payers to derive lessons for VA purchased care. The analysis of program structure, claims processing, contracting procedures, and other characteristics draws on a review of current and historical program documentation, GAO reports, and other literature.
> - We compared and contrasted VA and two large programs (TRICARE and Medicare) along several dimensions, an analysis supported by a review of each program's structure and governing statutes.

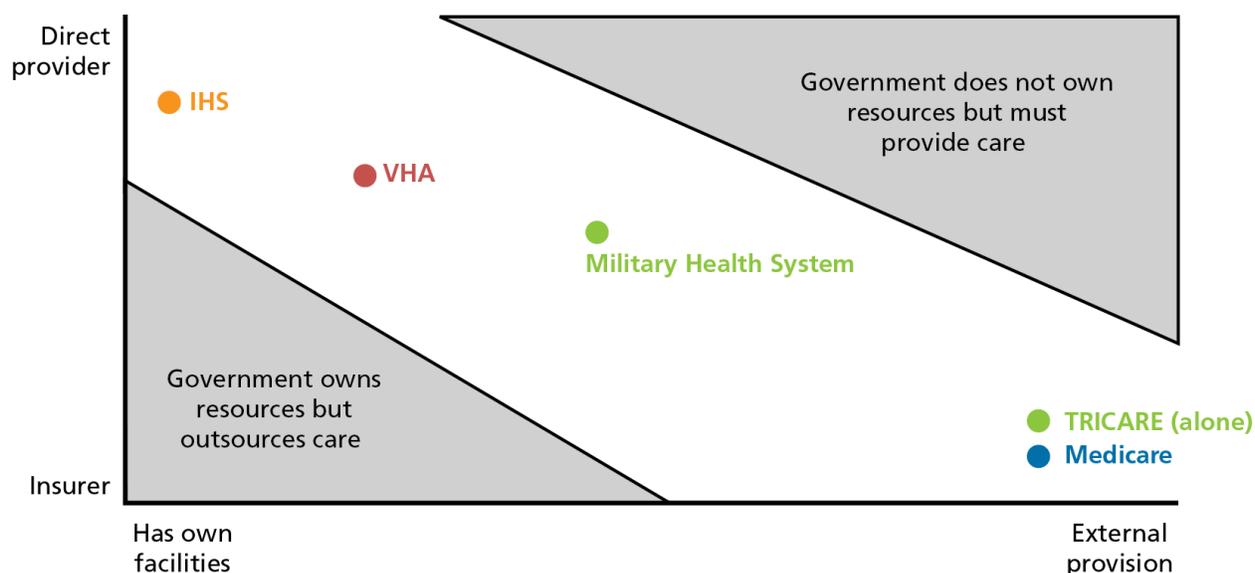
As described in Section 3, VA currently has authority to purchase care, but within a limited scope and, secondary to its primary function as a provider. As a result, there are both structural and financial limitations on VA's ability to marginally expand its role as payer. VA also lacks any clear direction for what or how much care to purchase, beyond seeking to remedy those situations where it cannot provide needed care directly.

An avenue for reflecting on possible reforms to VA purchased care involves considering the experience of other, large government health care payers, and in particular, the Military Health System and Medicare. In theory, both of these government payers represent potential models that VA could follow or learn from, in regard to various aspects of acting as a payer for outside health care services.

While VA purchases care in specific situations and for specific Veterans, Medicare and the Military Health System (through TRICARE) either purchase large quantities of care, or all care, for the populations they serve. As Figure 7-1 shows, these (and other) government payers vary in the degree to which they serve as direct providers of care, versus paying for outside health care services. For example, Medicare does not provide any health care services directly, while IHS provides nearly all care from in-house providers.[134]

---

[134] IHS is an agency within the U.S. Department of Health and Human Services that is responsible for providing federal health services to roughly 2 million American Indians and Alaskan Natives who are members of 566 federally recognized tribes. While IHS serves as a notable benchmark on the continuum of care that is purchased or directly provided, the agency is very different from VA in size and scope, and is thus not discussed further in this comparison of alternative government health care payer models.

Figure 7-1. Spectrum of Provide-Versus-Purchase Care


TRICARE shares some important similarities with VA, in the sense that TRICARE involves the direct provision of care through military treatment facilities (MTFs) and purchased care services when necessary. Medicare, unambiguously and by contrast, involves a very large government health insurance program. Table 7-1 details the basic benefit structure of the main TRICARE and Medicare variants, compared to VA. The fundamental purpose of TRICARE and Medicare, and their corresponding mechanisms and characteristics, distinguish them from VA and VA purchased care, and highlight that there may be some limitations in looking to these other organizations as models for VA.

Table 7-1. Basic Program Structure for TRICARE, Medicare, and VA

Feature	TRICARE Prime[a]	TRICARE Standard/ Extra	Traditional Medicare (A & B)	Medicare Advantage	VA
Type of plan	Health maintenance organization (HMO)	Preferred provider organization (PPO)	Fee for service	HMO or PPO	Staff model HMO
Monthly premium (individual)	Retirees: $23.17 Active duty: None	None	$104.90[b]	Average $135–$168	None

Feature	TRICARE Prime[a]	TRICARE Standard/ Extra	Traditional Medicare (A & B)	Medicare Advantage	VA
Deductible (individual)	Yes for retirees	$50/$150 (varies by rank and beneficiary group)	Part B: $147/year Part A: $1,260 per benefit period	Varies by plan	None
Direct care	Active duty: Use of MTFs mandatory Others: May be assigned to MTFs for primary care	Yes, but only if space available at MTFs	No	No[c]	Yes
Purchased care network	Yes	Yes	No	Yes	Yes
Cost sharing	Yes for retirees	Yes	Yes	Varies by plan	Yes, some priority groups
Referral authorization required	Yes for specialty care	No, some prior authorization	No	Yes	Yes
Access standards in purchased care	Yes, time and distance	No	N/A	Yes, time and distance	Yes, time and distance

[a]For simplicity and ease of comparison, the table does not list fees for family members. TRICARE Standard and Extra are essentially one option with different cost sharing for in- and out-of-network providers.

[b]High-income beneficiaries pay higher premiums, up to $335.70 per month (Medicare.gov, n.d.).

[c]Some Medicare Advantage plans are staff model HMOs and would therefore provide direct care, but Medicare itself is not. Medicare Advantage plans combine services for Parts A, B, and (often) D.

Section 7 reflects on the similarities and differences between TRICARE, Medicare, and VA as

government payers, and seeks to draw some useful lessons for VA in regard to purchasing care. In support of these aims, we draw on a combination of document review supplemented with interviews from a variety of stakeholders involved in VA purchased care, TRICARE, and Medicare.

7.1 Key Similarities Across VA, TRICARE, and Medicare

Broadly speaking, VA operates as both a direct provider of health care services, and as a payer for outside services. As we describe in Section 3, VA engages in purchased care under an elaborate set of authorities, programs, and mechanisms. Three related observations are worth repeating here. First, the core authority for VA purchased care, under 38 U.S.C. 1703, establishes that the Secretary *may* purchase outside medical care when VA is unable to provide the same service and when certain other criteria are met. Second, the Veterans Choice Act *compels* access for eligible Veterans to purchased care when wait-time or driving distance criteria are met. Third, all VA purchased care authorities and operations fall under VA's primary health care function, which involves operating a national network of provider facilities and delivering medical services directly to Veterans.

As such, health care for TRICARE beneficiaries living near MTFs offers a natural comparison for VA, since the military, like VA, is involved both in the direct provision of health care services and the purchase of health care services in the private sector. TRICARE's experience in arranging for care for beneficiaries not living near a military facility may have parallels to care for Veterans in remote areas. DoD established TRICARE to control cost increases and improve access to health care (GAO, 1998). Also, like VA, TRICARE uses purchased care to fill gaps in its direct care system.[135] In several ways, VA has followed a similar trajectory to TRICARE in its development of purchased care. Similar to VA, in implementing TRICARE, DoD faced challenges with establishing provider networks, provider payment backlog, and balancing direct and purchased care in different regions of the country to fulfill the need for care.[136]

DoD's direct care system has never been sized to serve all military health beneficiaries, so its purchased care program is long standing and large. The program has also grown incrementally over the years. DoD's first purchased care program was established in 1956 when Congress passed the Dependents Medical Care Act (Pub. L. 84-569). The legislation formalized rules allowing active duty dependents, retirees, and dependents of retirees to receive medical care at MTFs and authorized DoD to purchase civilian health care services for active-duty dependents for the first time (Jansen, 2014). This legislation was followed by the Military Medical Benefits Amendments in 1966, which authorized DoD to extend outpatient care to certain dependents and retirees by contracting with civilian health care providers. These amendments authorized the establishment of the Civilian Health and Medical Program of the Uniformed Services (CHAMPUS) as a supplement to direct care in MTFs (TRICARE, 2009). TRICARE, the health plan

---

[135] According to stakeholder interviews.

[136] According to stakeholder interviews.

for DoD beneficiaries, replaced CHAMPUS in 1994; unlike CHAMPUS, TRICARE includes both direct care and purchased care.

There are several key parallels in the development of VA purchased care and TRICARE. Both VA purchased care and TRICARE carried out congressionally mandated pilot programs to assess alternative methods for purchased care (GAO, 1998). TRICARE was preceded by two managed care pilot programs, the CHAMPUS Reform Initiative and the Catchment Area Management Program, in the late 1980s. The CHAMPUS Reform Initiative, launched in California and Hawaii in 1988 (Hosek, 1993), contracted out administrative functions and offered beneficiaries a choice of two options: (1) a new HMO, CHAMPUS Prime or (2) the existing fee-for-service CHAMPUS Standard program, which was converted to a PPO with a new CHAMPUS Extra option. In 1994, Congress expanded the initiative and made it permanent by transforming CHAMPUS into TRICARE.[137] TRICARE was again expanded in 2001 to include supplemental Medicare insurance and, in 2005, to make coverage available to eligible deactivated reservists (Rhem, 2001; TRICARE, 2005).

Today, TRICARE is administered through four regional contractors in four regions: domestically, in the North, South, and West, and Overseas. These contractors work under the supervision of TRICARE regional offices to manage purchased care and to coordinate care between the direct and purchased arms of the TRICARE system. The current regional contractors have been in place since 2013, and most are incumbent contractors (GAO, 2014d). While VA and TRICARE are similar in several key ways, the funding structures of the two entities are notably different, particularly regarding entitlement status An entitlement program, in contrast to a discretionary program, creates a right to the benefit, in this case, medical care—a right that obligates the federal government to pay related costs. VA's health care benefits, and particularly those involving purchased care, have not traditionally been regarded as an entitlement. By contrast, the authorizing statute for TRICARE, under 10 U.S.C. 1074, establishes that "a member of a uniformed service . . . is *entitled* to medical and dental care in any facility of any uniformed service" (italics added). The unified medical budget (of which TRICARE is part) is prepared annually and includes resources for all non-deployment-related medical expenses under DoD's control (Jansen, 2014). The funding for this is appropriated through several sources, including annual defense appropriations bills (Jansen, 2014).[138] While defense health programs essentially have a discretionary budget, the DoD is obligated to pay for the health services, making it similar to an entitlement program. In sum, DoD's funding streams for TRICARE may

---

[137] 32 C.F.R. 199.17 sets forth the regulations governing the TRICARE program itself.

[138] The complete list of sections are as follows: (1) a defense appropriations bill section "Defense Health Program" provides operation and maintenance, procurement, and research, development, test, and evaluation funding; (2) a defense appropriations bill section on "military personnel" provides funding for military medical personnel (doctors, corpsmen, and other health care providers) and TRICARE for Life accrual payments; (3) the military construction and VA appropriations bill provides funding for medical military construction; (4) the Medicare supplemental plan is funded through an accrual charge levied on active-duty military personnel; and (5) third-party collections are authorized by 10 U.S.C.1097b(b) and a number of other reimbursable program and transfer authorities.

---

offer both solutions and challenges not present with more simply structured, fixed-budget discretionary programs, such as VA's health care function.

Medicare differs from both TRICARE and VA in that it is exclusively a payer for, and not a provider of, health care services. In fact, Medicare has never been a direct provider of services, and from its earliest days, used outside contractors to administer some aspects of the program. Like TRICARE (but unlike VA), Medicare is also a federal entitlement program. Medicare was enacted in 1965, as Title XVIII of the Social Security Act (Pub.L. 89–97), which simultaneously created the Medicaid program.[139] Section 426 of Title 42 specifically establishes the hospital insurance benefits under Medicare as an entitlement program. Because the spending formula and beneficiary eligibility are defined in law, Medicare spending is considered mandatory and not discretionary (Costantino & Schwabish, 2014). As such, all those eligible to participate in a federal program funded by mandatory spending will receive payment or services with no cap on related spending by the government. This statutory authority does give entitlement programs some nimbleness: Medicare can be efficient programmatically, yet surge to meet patient demand, because it is not tied to an annual budget appropriation. In this respect, Medicare is very different from VA's health care operations, for which spending is tied to an annual budget appropriation by Congress.

To some extent, TRICARE and (by extension) the Military Health System, VA, and Medicare serve overlapping populations at different points in their lives. TRICARE and VA are specifically focused on offering care for military populations of service members and Veterans respectively. The Military Health System serves a large population of military retirees and family members, but, at age 65, these beneficiaries transition to Medicare (with supplemental coverage from DoD).

7.2 Lessons for VA from TRICARE and Medicare

TRICARE and Medicare each bring decades of experience to the table, in refining and carrying out purchased care functions and operations within their respective domains. TRICARE's TPAs (or managed care support contractors) have built a national network of outside providers, and the contractual framework to support them, to augment DoD's longstanding role in providing direct care to beneficiaries. Medicare, by contrast, has been deeply involved in refining and experimenting with methods for managed utilization and cost reduction.

Drawing broadly on the experience of both TRICARE and Medicare, we believe that the most obvious lessons for VA fall into three categories:

- Outsourcing administrative functions
- Instituting contractor incentives
- Managing utilization.

We address each of these points in the sections that follow.

---

[139] See 42 U.S.C. 1395 et seq. for the current statutory basis for Medicare.

7.2.1 Outsourcing Administrative Functions

Over time, major government payers outside of VA have outsourced a variety of administrative functions to private contractors, often with performance incentives attached. Important functions that have been outsourced have included provider network maintenance, claims processing, and call center or other support for enrollees.

TRICARE acquires health care services through Managed Care Support Contracts in three domestic regions. Contractor functions include establishing and maintaining provider networks, third-party billing, claims processing, specialty care referrals, and enrollment (GAO, 2014a). The contractors for the three regions, UnitedHealth, Humana Military, and Health Net, also conduct medical management, customer service activities, and data collection. One interview respondent described TRICARE's relationship with its contractors as a way to increase the efficiency of the system: "We don't contract directly with providers. We use Humana, Health Net, and United to build networks and . . . [to operate as] fiscal intermediaries to pay claims—all the mechanics that go with it, enrollment, referrals, all that. We contract with United, they get paid an administrative fee and make a profit, and they go build a network with providers." For the military, the contracting arrangements under TRICARE mean they do not have to have staff internally to find providers or manage billing. As another interview respondent said, "I don't know how we would have enough people to go to every zip code in America. These companies already have networks; I don't know how we would have the expertise or people to do that . . . [or why we would want to] . . . when they already have that expertise."

Like TRICARE, CMS makes extensive use of outside contractors in administering the Medicare program. From 1966 until the Medicare Prescription Drug Improvement and Modernization Act of 2003, Part A fiscal intermediaries and Part B carriers were the primary administrative processing intermediaries between CMS and providers (CMS, 2015c). The legislation led to a series of contracting reforms, most notably by creating the Medicare Administrative Contractors system, which is the central point for much of Medicare's operational functions (e.g., processing claims and applications, hearing appeals, providing call centers, and supporting educational efforts; see CMS, 2015a and CMS, n.d.). Beyond these core functions, CMS contracts out other aspects of its operations, including Beneficiary Contact Centers, Enterprise Data Centers, Healthcare Integrated General Ledger and Account Systems, Medicare Secondary Payer Recovery Contractors, Zone Program Integrity Contractors, Qualified Independent Contractors, Quality Improvement Organizations, and Recovery Auditors (CMS, n.d.). Under the Medicare Administrative Contractors system, the contractors are responsible for providing services to their assigned geographic area (CMS, 2015a).

By contrast with both TRICARE and Medicare, VA purchases a limited volume of care and employs a different approach, at least in some of its programs. VA uses two contractors to develop and maintain the provider networks for PC3 and Choice (analogous to the provider networks for TRICARE). VA TPAs, Health Net and TriWest, manage provider networks for Veterans to access primary care, inpatient specialty care, outpatient specialty care, mental health care, limited emergency care, and limited newborn care for enrolled female Veterans following birth of a child at non-VA providers (VHA Chief Business Office Purchased Care, 2015). However, the TPAs for VA handle only the administrative functions that the contractors for

---

TRICARE and Medicare handle for the PC3 and Choice programs. For the larger volume of care currently purchased through the traditional VA purchased care program, authorizations and claims payments are handled largely in-house at VA. By contrast, both TRICARE and Medicare use contractors to perform these functions for all purchased care. In the future, if VA enforces its policy to rely more on PC3 and Choice, its TPAs will bear more of the administrative responsibility, particularly for such functions as authorization and claims payments, in line with TRICARE and Medicare.

7.2.1.1 Claims Processing

One of the major administrative functions for Medicare and TRICARE contractors is claims processing, which enables DoD and Medicare to put into place financial incentives for quicker turnarounds and systems for curbing improper or fraudulent claims. VA is less experienced in its outsourcing of the claims processing functions under PC3.

As of fall 2013, TRICARE processed about 4.6 million claims every week (TRICARE, 2013). The contractors who carry out the work do not publicly report claims processing costs separately from the provider costs. However, the contractors report that about 75 percent of the claims processing is fully automated, that is, not requiring human intervention. The contractors also reported to the study team a processing cost per claim of $2.25–$2.50 for electronic claims and $3.50 for paper-based claims. Presumably, automation of claims processing through outside contractors is one of the areas where VA might usefully emulate the practice of TRICARE in pursuit of greater efficiency.

Meanwhile, program integrity officials within TRICARE are charged with oversight of improper payments. Over time, TRICARE has had to build a fraud and abuse system to combat improper payments. A 1999 GAO report found that DoD was not very good at identifying fraud (GAO, 1999). DoD subsequently built in incentive payments for contractors to identify fraudulent billing practices. TRICARE has tried to create contracts that push some "program risks" to the contractors and has created a robust Program Integrity Office with clearly defined criteria and staff consisting of lawyers, statisticians, physicians and nurses (RNs). This office directs contractors in identifying and limiting fraud and abuse throughout the program. The fraud office also deals with improperly paid claims. As a result, TRICARE reportedly now has a very low payment error rate (<0.5 percent for billed charges, and ~1–2 percent of actual amounts paid) (National Academy of Public Administration, 2011; Jones, 2012). However, a 2015 GAO report found that the improper payment rate was likely higher than reported; it recommended that TRICARE adopt Medicare's system of analyzing the underlying medical record for a sample of claims to determine whether services were properly coded (GAO, 2015).

The claims processing contracts include financial penalties or incentives to encourage payment accuracy. Overpayments identified during the Managed Care Support Contracts' annual health care cost compliance review audit are extrapolated to the audit universe and the contractors are liable for the entire extrapolated overpayment error amount, providing a built-in incentive for contractors to continually monitor and improve their claims processing. Meanwhile some contracts also allow the contractor to earn financial incentives for exceeding the contractual performance baseline on over-payments. To minimize improper payments, both pre- and post-

payment controls, including claims auditing software, documentation policies, and audits, are built into both contract requirements and contractors' claims processing systems (Defense Health Agency, n.d.). Here again, VA could in principle seek to model TRICARE in its approaches to using outside contractors to reduce erroneous overpayment and fraud in claims processing.

As with TRICARE, Medicare's claims processing is also completely outsourced, as are many of its other administrative support functions. Historically, provider groups nominated "fiscal intermediaries" in a non-competitive bidding process. In 2003, CMS was granted the ability to use competitive bidding to award outside contracts for a variety of services, including claims processing (GAO, 2014b). Under this set of reforms, CMS also instituted cost-plus-fee payment arrangements, which allow contractors to win incentive payments for meeting performance metrics. Over time, CMS contractors have been slowly improving their performance, but they still do not yet meet all performance targets (GAO, 2010). Notably, there are still problems in ensuring that claims are paid correctly the first time (GAO, 2014f). Just over 10 percent of Medicare's fee-for-service claims were improperly paid in 2013 (GAO, 2015). Medicare's fraud and abuse system uses a different set of contractors to police claims, the Zone Program Integrity Contractors. Medicare also uses models with algorithms to identify potentially fraudulent claims (GAO, 2012). A 2012 GAO study found the system had the ability to curb fraudulent billing from providers and to save money by identifying fraudulent practices before claims were actually paid. However, the report noted that Medicare's contractors had not yet implemented the system consistently (GAO, 2012).

In contrast to TRICARE and Medicare, VA still processes a significant portion of its purchased care claims in-house, rather than through outside contractors (in connection with claims that arise under traditional purchased care, and outside of the PC3 and Choice mechanisms). Under the traditional VA purchased care program, the processing of claims by VA is handled at the VAMC or VISN level, which has contributed to a lack of standardization in processes across facilities/VISNs. The Veterans Choice Act notably imposed a mandate on VA to create a new system to pay these claims, and to centralize funding VHA's Chief Business Office. Previously, internal guidance for processing claims through the NVCC had been passed down by VA, but one official interviewed for this study noted, "We know from audits that not everyone implements [this in] the same way."

Moreover, as we noted in Section 4, VA has continued to experience some problems in carrying out its claims payment function, including improperly paid claims, authorizations for patients to access purchased care that are not justified or properly authorized, and lack of data for calculating the cost of the services in an episode of care. Again and in principle, shifting the claims payment function more fully to outside contractors, while ensuring appropriate automation and implementing incentive payments tied to reducing improper payments and other outcomes, could offer some advantages for VA to pursue, in seeking to draw useful lessons from the experience of TRICARE and Medicare.

7.2.2 Instituting Contractor Incentives

Financial incentives built into contracting arrangements can encourage adherence to various quality, efficiency, or processing standards, beyond their use in claims processing. Over their

evolution, both Medicare and TRICARE have developed incentive payments to align quality and cost savings measures between the programs and the contractors, though the process has not always worked perfectly. VA requires non-VA providers to return medical record information before payment can be issued. Although this is not an incentive in the usual sense, it can be a lesson for the other payers.

Under current TRICARE contract provisions, contractor performance is encouraged through semiannual award fee and performance guarantees (GAO, 2014e). There are also several other financial incentives built into TRICARE contracts for controlling the level of ancillary services use. Managed care support contracts receive 10 percent of provider discount savings above a government-set threshold, encouraging them to steer beneficiaries to in-network providers who should be more efficient. There are penalties if the network share of Prime claims falls below the government-specified standards. In addition, costs for Prime beneficiaries who have civilian primary care providers (as opposed to those assigned for primary care to the MTF) are compared to the per capita trend reported in National Health Expenditures accounts; the contractor is responsible for 30 percent of the differential if the Managed Care Support Contracts' cost trend is higher (DoD, 2014).

As part of the previously mentioned Medicare Modernization Act, the contractors administering fee-for-service Medicare now have incentive payments for high quality work beyond their contractual obligations. The award fee system allows contractors to earn bonus payments for performances metrics including beneficiary service, overall performance on the contract and appeals processing (CMS, 2014b).

VA has very few pay-for-performance incentives for its contractors. In the Project HERO pilot, the contractors were paid a "value reimbursement" for coordinating appointments and returning clinical information to VA after a private-sector appointment in a fixed-fee-per-service arrangement (Panagala, 2010). According to our interviewees, the process for obtaining information from network providers is still undergoing standardization at the VA facility level. One contractor said that returning the records could be a challenge when VA facilities have different standards: "What is 'complete' varies from facility to facility. Sometimes, it [the record] is not legible. This is particularly problematic for optometry. They have their own symbols that they use, and a VA nurse who is not an optometrist may not understand it."

In the future, VA might consider instituting additional performance incentives into its contracting framework for purchased care, similar to those under TRICARE and Medicare. Presumably, steps along these lines might make particular sense if VA expands its outsourcing of administrative functions in the future, and likewise if VA shifts more of its purchased care activity to TPA arrangements, as under PC3 and Choice.

7.2.3 Managing Utilization and Controlling Costs

At present VA has only limited traditional features (e.g., authorization requirements and processes) to reduce unnecessary utilization and costs. By contrast, Medicare and TRICARE have followed somewhat different pathways in the attempt to control costs and utilization when purchasing care. VA could add some additional mechanisms for managing utilization for Veterans receiving care in the community.

TRICARE was originally developed in response to increasing cost pressures and concerns over access in CHAMPUS, the program's predecessor (GAO, 1998). While the original intent was to impose more control on utilization for the dependents and retirees not receiving care in the MTFs, recent studies have shown that TRICARE does not take advantage of techniques such as financial incentives or reimbursement systems based on value. In constant 2013 dollars, while the typical private health insurance premium increased by 76 percent between 2002 and 2013, the TRICARE premium for retirees actually declined by 10 percent (DHA, 2014). Recently, the Military Compensation and Retirement Modernization Commission cited significantly higher use of health care services, both inpatient and outpatient, by TRICARE beneficiaries compared to those in civilian HMOs, due to a lack of incentives such as cost sharing that would deter utilization (Military Compensation and Retirement Modernization Commission, 2015).

Unlike TRICARE or VA, Medicare is not a direct provider of services. Medicare is an insurance program that pays providers for the care delivered to Medicare beneficiaries (CMS, 2014a).[140] Traditional Medicare has no formal provider networks, and any willing provider can apply to join. With Medicare, a beneficiary can receive care from any health care provider that accepts the insurance. With this structure, in the past there was traditionally only limited utilization control in traditional Medicare, save through copayments to deter overutilization (Medicare.gov, n.d.). The cost sharing in Medicare is quite high for some services, so a market for plans that cover just the cost sharing in Medicare developed (called Medigap plans). These plans distort the financial incentives that would otherwise control utilization. In sum, this system is very different from the VA purchased care context.

Medicare employs some mechanisms for enhancing quality and controlling costs in its fee-for-service side and is piloting other innovative approaches that VA could potentially include in its purchasing arrangements. Originally, Medicare paid only "reasonable costs" to hospitals or "usual, customary, and reasonable charges" to doctors and other medical providers (Davis et al., 2013). However, after costs exceeded projections, Medicare replaced its "reasonable costs" and "usual, customary, and responsible charges" standard with a predetermined fee for service model during reforms during the 1980s and 1990s (Davis et al., 2013). Under the Diagnostic Related Group (DRG) system, hospitals were given a lump sum for a given episode of care, instead of allowing the hospitals to individually charge for every service performed during the patient's stay. More recently, the Affordable Care Act funded demonstration projects for a variety of payment and care delivery changes in the fee-for-service Medicare environment, with the express purpose of better aligning incentives to control utilization and spending. These alternative payment models, like bundled payments and accountable care organizations, are set up to pay for "value" instead of for "volume" as in the traditional fee-for-service model (U.S. Department of Health and Human Services, 2015).

As we discussed in more detail in Section 4, bundled-payment arrangements based on episodes of care offer an important avenue for potential reform by VA, and a way in which payment

---

[140] Funding for Medicare hospital insurance comes through payroll taxes, paid by both employers and employees, per 26 U.S.C. 3101 and 3102. Regulations governing Medicare are contained in Title 42 of the Code of Federal Regulations, Chapter IV, Parts 405–600.

innovations now being tested by Medicare might be useful as a model to VA in the future. TRICARE initially relied on utilization review for cost containment, an approach that was employed in the private sector at the time but has not proved to be effective. VA could institute a variety of these mechanisms to manage utilization and coordinate the purchased care for Veterans.

7.3 Experience with Third-Party Contracting for Purchased Care Administration

Many of the lessons learned in the previous sections have focused primarily on the outsourcing of various functions to the private sector. However, it should be noted that heavy reliance on contractors for managing purchased care is not without drawbacks, which can range from losing oversight on day-to-day administrative functions to problems associated with the competitive bidding process itself. Both TRICARE and Medicare have had issues with their bidding processes. For its part, VA has also had issues with its contracting processes for support services.

During the most recent process to award TRICARE Managed Care Support Contracts for the three domestic regions, all three contract awards were protested by unsuccessful bidders (as were some earlier awards).[141] Ultimately new award decisions were made in all three regions, which triggered further, though unsuccessful, protests. This protracted process delayed initiation of the new contracts, misaligned the performance periods of the finalized Managed Care Support Contracts, and is expected to lead to increased costs (GAO, 2014a). In addition, the transition to a new contractor in the West region led to physician reports of delays in the processing of authorizations and referral requests; long hold times for telephone queries and support; website problems; and other deficiencies in support. Many commentators indicated that these problems had a negative impact on patient care (California Medical Association, 2013). DoD ultimately held the incoming contractor accountable for not meeting some requirements, through corrective action requests and financial penalties. However, GAO also found that DoD lacked a process for holding its contractors accountable, and that inadequate guidance and insufficient oversight contributed to problems with health care delivery (GAO, 2014e). These concerns, along with complaints about inadequate access to care and limited choice, led the Military Compensation and Retirement Reform Commission to recommend eliminating TRICARE entirely, and replacing it with a program offering beneficiaries a selection of commercial insurance plans administered through OPM and paid for by a nontaxable allowance (Military Compensation and Retirement Modernization Commission, 2015).

Medicare's durable medical equipment contracts have recently suffered similar concerns over the transparency of the process. Medicare was required to start bidding out contracts to provide durable medical equipment such as prosthetics or oxygen supplies (CMS, 2015b). The program has been widely criticized by patient advocates as disruptive, if a new company in a

---

[141] A former Administrator of the Office of Federal Procurement Policy has argued that, across the federal government, protests yield benefits that outweigh the costs they impose (Gordon, 2013).

given region wins the new contract, thus changing procedures or even types of equipment offered (Japsen, 2013). GAO reported in 2014 that the process led to savings and that the process did not adversely affect beneficiaries, contrary to media reports (GAO, 2014c). The report also recommended ongoing monitoring of the process.

VA also has a contracting process in place, for services other than the major contracts to provide health services. VA's Office of the Inspector General monitors and audits the contracting process for all VA agencies (VA Office of the Inspector General, 2014c, 2013). In one audit for VHA support services in 2014, the VA Office of the Inspector General found that VA lacked a rigorous internal process for the entire spectrum of contract lifespan from developing and awarding a contract to monitoring performance post-award (VA Office of the Inspector General, 2014d).

In summary, all three organizations have had issues with bidding out contracts to the private sector for various services. Any competitive bidding and appeals process for these functions would need to be managed carefully and thoughtfully, so as to minimize the risk of any interruption to ongoing operations.

7.4 Discussion

TRICARE and Medicare can both offer some lessons on how to efficiently purchase care from outside contractors. Perhaps most notable in this regard, TRICARE and Medicare outsource many of the administrative functions in paying for care, such as claims processing and fraud tracking, and they often do so with structured performance incentives for the outside contractors. In principle, policy makers could draw on these lessons in strengthening VA's approach to purchased care contracting in the future—either in the context of expanding VA's emphasis on purchased care or in the context of improving efficiency and quality within VA's current approach to purchased care. Regardless, policy-makers would be well served by developing a clear strategy for VA purchased care as an antecedent to improving related processes and standards for outsourcing.

More broadly, the relevance of TRICARE and MEDICARE as models for VA depends in part on whether policy makers agree on a clear strategy for VA purchased care programs, and particularly so if an ambitious path to reform was undertaken, by refashioning VA's function and mission to look much more like that of TRICARE or Medicare than it does today. Even stopping short of this possibility, a well-articulated strategy for VA purchased care could nevertheless help foster more effective resource administration, increase capacity development, and improve the performance of VA purchased care programs. We expand on the latter point in Section 8 of this report.

8 Conclusions and Recommendations

8.1 Summary of Assessment Findings

One of VA's core functions as an agency involves providing health care services to eligible Veterans. Although VA has traditionally carried out this role primarily by operating a national network of hospitals and other facilities, it also purchases health care services from outside providers. VA purchased care evolved primarily to address situations in which VA's direct care resources were unable to offer needed services. Although purchased care has accounted for only a small fraction of VA's health care budget over the past decade, that fraction is growing. In the wake of the recent crisis in access to care through VA facilities, stakeholders and policy-makers are revisiting the role and performance of VA purchased care. Specifically, they are considering whether modifications to VA's purchased care approach might be appropriate or desirable, given broader goals of expanding access to care, enhancing and developing trusted partnerships, and improving VA operations to deliver high-quality health care to eligible Veterans.

Pursuant to Section 201(a)(1)(C) of the Veterans Access, Choice, and Accountability Act of 2014, Congress mandated an independent assessment of VA specifically to address "[t]he authorities and mechanisms under which the Secretary may furnish hospital care, medical services, and other health care at non-Department facilities, including whether the Secretary should have the authority to furnish such care and services at such facilities through the completion of episodes of care." Put another way, the Congressional assessment mandate poses a few basic questions about purchased care. First, what authorities and mechanisms does VA have to purchase care? Second, does VA have the appropriate authorities and mechanisms to purchase care? Third, should VA have the authority to purchase care through the completion of episodes of care?

In answering these questions throughout this report, we observed that the Secretary already has considerable authority to furnish purchased care. In fact, that authority and related practice are long-standing. However, current VA authority and policy for purchasing care is complicated. It is structured around core provisions that establish what the Secretary *may* do, rather than what he or she *must* do, in purchasing care. Meanwhile, related eligibility criteria for Veterans, contracting parameters, and administrative mechanisms (for example, for authorizations and claims processing) involve a patchwork of interlocking rules and policies, which can be confusing even for VA personnel. In the discussion that follows, we offer some suggestions for how current purchased care authorities and policy might be modified to reduce this complexity and improve coherence, while empowering VA staff and facilitating VA operations.

Beyond the recommendations that we articulate here, we also identified many other possible revisions that might be made to purchased care authorities in the future.[142] Whether any of these changes are actually wise depends on what policy-makers and stakeholders hope to achieve by reforming purchased care. Different objectives could easily lead to different packages of reforms. An important priority for the future will involve forging consensus on the

---

[142] See, in particular, Section 6.

objectives for revising purchased care and on a corresponding strategy for purchased care policy consistent with VA's broader health care mission.

8.1.1 VA Has a Complex Set of Authorities to Purchase Care, Reflecting Tension Among Implicit Aims

The core authorities that govern VA purchased care activities are scattered across many different statutory and regulatory provisions. Central examples include 38 U.S.C. 1703 (contracts for medical care service with non-VA facilities), 38 U.S.C. 1725 and 1728 (reimbursement of emergency care), 38 U.S.C. 8153 (sharing of health care resources), and Section 101 of the Veterans Choice Act (defining the parameters of the Choice program). These statutory authorities are the foundation for a corresponding set of regulatory provisions. Collectively, the statutes and regulations form a complicated landscape for when and how the Secretary may purchase care and, by extension, which Veterans are permitted to obtain purchased care services.

Although the basic grant of authorities to the Secretary for purchased care is expansive in some respects, it is not unlimited. Both Congress and VA have imposed significant controls over the types of Veterans who can take advantage of external health care resources, the medical conditions that may be treated, and the procedures that must be followed to obtain a referral or reimbursement for an independent purchase of services. Such controls also govern how the existing availability and capabilities of VA personnel and facilities should be taken into account, the need for prior VA approval to access external providers, the process for contracting with outside providers and the substance of those contracts, and the length of time that purchased care can be obtained without additional authorization.

Moreover, the underlying intent of these varied controls implicitly reflects several interests beyond simply providing Veterans with access to outside care. One such interest is to limit the need for and costs of purchased care. Another is to balance VA's primary health care function as a direct provider of services with a more limited secondary function of paying for outside services when gaps arise in VA's direct-provider capacity. Finally, the controls may also be intended to ensure some degree of local-level VA discretion regarding the optimal mix of internal and external resources for allocating care in the field.

In sum, not only are VA's authorities for furnishing purchased care complex and scattered, but they also embody more than one aim, and those aims may operate in tension with each other.

8.1.2 The Episode of Care Defines the "Unit" of VA Authorization, and Helps Shape the Purchased Care in Practice

In Section 201(a)(1)(c) of the Veterans Choice Act, Congress posed the question of whether the Secretary should have the authority to furnish care at non-VA facilities *through the completion of episodes of care*. As discussed throughout this report, the Secretary already has significant authority to purchase care, but that authority is not explicitly tied to formal standards for episodes, beyond particular program requirements for authorization (for example, as specified under the Veterans Choice Act). Detailed clinical standards for defining episodes of care are still

---

in development, both within VA and across the U.S. health care system. Regardless, how these episodes are defined is important in purchased care because the episode conceptually bounds a clinical problem for which a Veteran may require outside services, so it might therefore may make sense to outsource as a coherent "unit."

As discussed in Section 5, revised standards for episodes of care may well become the basis for new forms of contracting, bundled-payment innovation, and purchasing of services in the future, inside and outside of VA. Likewise, new episode-of-care standards will likely become the foundation for important new techniques in performance measurement and quality improvement.

Given the ongoing changes within the U.S. health care system, which may include the future development of well-defined episode-of care-standards, sophisticated bundled payment arrangements, and robust episode-based performance measurement, the Secretary of VA should have more authority (and more responsibility) to build purchased care contracts around these developments. Specifically, the 60-day authorization period for purchased care through the Choice program (and established under the Veterans Choice Act) should be modified to accommodate the more effective use of bundled payment arrangements and other advancements in episode-of-care standards. Furthermore, it is clear that further refinements in defining episodes of care, along with an authority framework that allows the Secretary to adopt such refinements, will be critical to supporting VA in any move toward episode-based payment mechanisms in the future.

8.1.3 The Purchased Care Landscape Is Already in the Midst of Transformation

As of this writing (in the summer of 2015), numerous changes to VA's authorities and mechanisms for purchasing care were being proposed, planned, or implemented. VA, Congress, and the TPAs were collaborating to develop pilots in local areas to test new processes for administering Choice and PC3. These stakeholders were also reviewing the performance of VAMCs to determine whether local facilities were meeting demand through both direct and purchased care. According to recent congressional testimony and our own interviews, stakeholders and policy-makers are acutely aware of the variation in purchased care SOPs across the enterprise and are actively working to address it. Major changes along these lines are anticipated in the coming months.

Meanwhile, several related changes to the Choice program were under way. In May 2015, the Senate Veterans' Affairs Committee suggested that high costs may be associated with changes to the 40-mile rule to access care through the Veterans Choice Act—particularly if the rule were modified to take into account driving distance to the most appropriate facility for the treatment required (Exploring the Implementation and Future of the Veterans Choice Program, 2015). Both the House and Senate Veterans' Affairs committees are working closely with the Congressional Budget Office to assess these costs and the feasibility of possible changes to the 40-mile rule. On May 1, 2015, VA submitted a legislative proposal that included "major improvements to VA's authority to use provider agreements for the purchase of community care" (Exploring the Implementation and Future of the Veterans Choice Program, 2015). As of this writing, full details of that proposal were not available.

As of early June 2015, there was lingering uncertainty about the future of the Choice program. The Veterans Choice Act was enacted as a temporary bill, terminating on "the date on which the Secretary has exhausted all amounts deposited in the Veterans Choice Fund . . . or the date that is three years after the date of the enactment of this Act, whichever occurs first." Many stakeholders interviewed believed that the Veterans Choice Act would likely be extended. Beyond possible extension or termination, changes to the program's funding and eligibility may be on the horizon. VA has indicated that it would like to use Choice funds to support other purchased care programs, as well as hepatitis C treatment (Exploring the Implementation and Future of the Veterans Choice Program, 2015). In addition, VA has called for changes to eligibility restrictions that impede it from offering obstetrics, dentistry, and long-term care services under the Choice program (Exploring the Implementation and Future of the Veterans Choice Program, 2015). Various stakeholders have discussed the possibility, benefits, and challenges of merging purchased care programs and their associated funding streams. As of this writing, these issues continued to echo in congressional conversations about the future of VA purchased care programs (Assessing the Promise and Progress of the Choice Program, 2015; Exploring the Implementation and Future of the Veterans Choice Program, 2015).

With these facets of purchased care authorities and practice in flux, the landscape of VA purchased care is not just complicated, but dynamically so. Moreover, while the proposed policy changes seek to address many problems and issues, their sheer multiplicity suggests the drawbacks of a piecemeal approach to reform and the lack of guiding orientation and strategy for VA's purchased care enterprise as a whole.

8.2 Limitations of the Assessment

Our research approach in this assessment was subject to several basic limitations, deriving largely from our use of qualitative and legal research methods to answer the questions posed by Congress. As described in Section 2, one of our primary data collection activities involved stakeholder interviews. We interviewed several dozen stakeholders over the course of this study about many different aspects of VA purchased care policy and practice. This method offered the advantage of tapping the insights and expertise of highly knowledgeable individuals regarding how purchased care works in practice. However, it also involved soliciting the perspectives of a limited sample of stakeholders whose experience and perspectives may have been imperfect or biased. As discussed in Section 2, we sought to mitigate this limitation by speaking with multiple respondents from each of several different stakeholder vantage points, validating our interview data against data from other sources when possible, and focusing our interviews on collecting basic factual and institutional information about purchased care.

Somewhat different limitations applied to our request for local purchased care policy documents. Our request for documents was sent to all 141 VAMC administrative parents and 21 VISNs in the country, and the overall response rate was an impressive 86.4 percent (with 125 of 141 VAMC administrative parents and 15 of 21 VISNs responding). However, we have no independent way of confirming whether we received *every* relevant document from every entity responding to the request, whether local institutions had consistent assumptions about what was relevant and within the scope of our request, or whether nonresponses reflected the

absence of relevant policies at the local level, confusion regarding the nature of the request, or an inability to respond within a relatively short time frame. Another limitation of this research involved defining the scope of purchased care authorities. Per the assessment mandate, we focused on the authorities and mechanisms that govern purchased care. However, we note that if purchased care ramps up substantially, then VA will need to realign resources, which could require changes to authorities and mechanisms that are not directly related to purchased care. Such shifts in VA resources might include changes to a range of different dimensions of organizational capacity, including staffing, information technology, fiscal resources, and facilities. For example, VA might need to accommodate an increase in purchased care utilization through a reduction in its medical personnel and facilities. These organizational shifts would likely require changes to authorities, which could limit the time frame and circumstances under which the VA Secretary may undertake administrative reorganization, including consolidating, eliminating, abolishing, or redistributing VA functions, offices, facilities, or activities.

The limitation of this study's scope to the authorities and mechanisms that are directly related to purchased care reflects the constraints of the available data. A main theme of this report is that changes to authorities and mechanisms depend largely on policymakers' objectives for the purpose and trajectory of purchased care. Through a literature review, interviews, and an analysis of purchased care utilization data and budget allocations, we identified a clear trend toward increased usage of purchased care. However, even in interviews with senior VA leadership and other key stakeholders in which we directly asked about the future of purchased care, we were unable to distinguish the vision for purchased care in the immediate or long term. Without knowing the scale or direction of purchased care, it is impossible to analyze the full extent of potential changes to authorities and mechanisms that may be required as a result of shifts in VA organization. As such, we focused the scope of our assessment on authorities and mechanisms that clearly answer the research questions posed in the assessment mandate. Other dimensions of VA health care that may shift as a result of a dramatic reorientation toward purchased care are covered in greater detail in other assessments mandated by the Veterans Choice Act.

8.3 Recommendations

Our findings and analyses indicate that the challenges now facing VA purchased care can be best understood not only in terms of the Secretary's authorities, but also through the interplay among those authorities, mechanisms, and institutional management practices. Consequently, the solutions to the challenges are likely to involve a similar mix of reforms to authorities, mechanisms, and management practices. In the recommendations that follow, we suggest eliminating inconsistencies in authorities and changing the definition of the episode of care. We also recommend that VA develop an explicit strategy and improved management structure for purchased care while allocating responsibility for related activities to the appropriate levels of management and administration within VA.

Because we view our recommendations as complementary in addressing a complex problem, we have not attempted to rank or prioritize them, nor do we propose an ideal timeline for implementation. Clearly, VA might undertake some internal policy changes in purchased care

---

unilaterally, and it would not need to await congressional action before proceeding. On the other hand, our first recommendation involves developing an overarching strategy for purchased care. We recommend this in part because such a strategy could help script other responsive revisions to purchased care authorities and practice downstream.

Collectively, these recommendations seek to move VA toward a more holistic vision for purchased care, to align authorities and mechanisms in support of that vision, and to ameliorate some of the entangled problems that constrain purchased care administration.

Define a Strategy for Purchased Care

Working together, Congress and VA should articulate a clear strategy and set of goals for purchased care and how it fits into VA's broader health care mission. Moreover, VA and Congress should establish benchmarks for success in the adoption of related purchased care reforms.

Policy-makers might reasonably approach purchased care with a range of objectives for change. If the aim is to maintain or expand VA purchased care permanently, that might lead to one set of conclusions about modifying authorities. If the aim is simply to address short-term capacity gaps, that might lead to another set of conclusions. Finally, if the aim is to enhance the quality of purchased care services, Veterans' access to such services, or Veterans' care choices, that might lead to a third set of conclusions about modifying authorities. Given the link between the objective and the specific steps for carrying it out, the objective and broad strategic vision for purchased care should be determined before any concrete policy options are pursued. In turn, that objective and vision will determine the best combination of future policies.

VA is now at a crossroads regarding how to modify and whether to expand its purchased care programs. It already has the authority to purchase care, but with a limited scope that is secondary to VA's primary health care function in operating as a direct provider of services. Some stakeholders would like to see the greater use of purchased care at VA. Others would like VA to maintain its direct-care organization and core health care delivery capabilities. Congress has chosen a middle pathway with the Veterans Choice Act, providing more funding both for purchased care and for hiring in-house providers. These competing visions for VA make it difficult to reach consensus about the path forward.

In principle, a coherent strategy for VA purchased care should guide both the organizational ethos and the actions of those implementing purchased care programs. The strategy should offer a foundation for new rules and procedures with flexibility to support growth in demand, extenuating circumstances, and Veteran-centered care.[143] The strategy should also provide clear direction for when and how VA should purchase care, as well as the roles and responsibilities of key stakeholders. More focused changes to authority and guidance, and to program management and performance monitoring, would then follow from the strategy.

---

[143] Note that the concept of "Veteran-centered care" implies that providers actively engage with the Veteran in decision-making about individual options for treatment.

Ultimately, without a basic strategy for purchased care, questions about what authorities the Secretary should have become much harder to answer, and future purchased care reforms are more likely to be fragmented, incremental, and less focused in their effects.

Address Cost Control More Directly and Systematically

Cost control is one of the implicit design features of VA purchased care authorities. The existing authorities limit the amount of funding for purchased care and set priorities regarding which Veterans receive access (e.g., pursuant to the 40-mile rule under Choice). As discussed in Section 1, any proposal to modify purchased care authorities that focuses only on improving Veterans' access neglects the secondary goal of limiting spending on purchased care, particularly in the context of discretionary funding and annual appropriations for VA health benefits.

The role of the tiered access structure in permitting and gating access to care within a discretionary budget is critical. A pillar of the authorities governing VA purchased care, 38 U.S.C. Section 1710 identifies service-connected and other specific injuries and illnesses for which the department *shall* provide health care services. Section 1710 also indicates that illnesses and injuries not specified in the list of those that VA shall treat will be treated at the discretion of the Secretary, contingent on available resources.

Much of the relevant authority for cost control has been filled in by regulations and programmatic guidance. These regulations and guidance create mechanisms that give significant control and responsibility to personnel in the field charged with making decisions about whether to refer and authorize purchased care on a patient-by-patient basis.[144] This means that cost control in VA purchased care involves local decision-making that indirectly affects resourcing, when policy-makers have been unable or unwilling to make those resourcing decisions more directly.

We recommend that VA and Congress address cost control in purchased care more explicitly and systemically. Specific cost-control steps that might reasonably be implemented could include rigorous performance evaluation and auditing of current purchased care contracts (including PC3 contracts) and more systematic data collection on various costs associated with purchased care programs and administrative activities (e.g., network development, credentialing, training, claims processing). VA should also consider more aggressive deployment of traditional cost-control and cost-sharing mechanisms in health insurance, including co-pays, deductibles, and utilization review. Finally, VA can also address cost control more directly through adopting innovations in bundled payments, value-based contracting, and performance incentives for contractors.

Collect Better Data to Accurately Estimate Demand and Use of Purchased Care

---

[144] For example, 38 U.S.C. 1710 says that the Secretary shall furnish hospital care and medical services that he or she "determines to be needed." The determination of "need" presumably involves clinical judgment in any given case, together with an economic judgment about the most appropriate way to meet a clinical need.

VA should systematically collect data on purchased care processes and outcomes. Like TRICARE, VA needs to establish demand for purchased care and then design its outside provider networks to meet that need. The structure and success of purchased care is contingent on understanding the demand for care and shifts in demand for care over time. For example, Veterans who spend their winters in Phoenix, Arizona, reportedly increase demand for services in that area by a multiplier of eight to 10 during the winter.[145] Given the legacy approach to purchased care that is in place, VA should use direct care to meet demand while reserving purchased care to address treatment areas where there are gaps in capacity to meet demand.

VA lacks systematic data on purchased care arranged at the local facility level. VA patient experience surveys collect Veterans' assessments of their access to care, but that information lacks specificity. Furthermore, the surveys are collected too infrequently and response rates are too low to meaningfully inform purchased care planning and implementation. Previous assessments by the National Academy of Public Administration and GAO align with our conclusion that more systematic data collection should be embedded in purchased care processes, and both VA and its contractors should be able to analyze these data as needed to plan for and operate the purchased care program cost-effectively. A strong base of data, would allow VA to regularly monitor purchased care outcomes (e.g., improved access, quality, coordination, cost) and make targeted adjustments to policies and processes as needed.

Develop a Stronger Management Structure for Purchased Care and Allocate Responsibility and Authority to the Most Appropriate Levels

There is a need for improved program management of VA purchased care activities. Furthermore, program management for purchased care should allocate responsibility and authority for purchasing care to the most appropriate level within VA's administrative hierarchy. For example, referrals should be managed locally, while large contracts (such as PC3 and Choice) should be managed centrally. The role of senior leadership (and of VA) should be to clearly articulate the expected outcomes of the purchased care programs and enterprise. Senior leadership should also establish performance measures to determine whether those outcomes have been accomplished. The leadership can use these metrics to ensure that the purchased care provided to Veterans is both high-quality and cost-efficient. Moreover, senior leadership should issue clear policies and procedures for the field to follow and audit field performance at the facility level, drawing on both headquarters-level performance data reviews and site visits by program experts. Finally, there should be sanctions for noncompliance with approved policies and procedures.

A stronger program management structure should also facilitate appropriate flexibility in the field and at the local level. VA health care operations are far too complex and geographically varied to support a one-size-fits-all approach to purchased care. Better program management would help ensure that leadership is aware of and has input on local deviations from system-wide standards. If a significant deviation from approved policies is required, VA leadership should approve it beforehand. At the local level, VAMCs should offer better guidance on their

---

[145] According to a stakeholder interview.

SOPs, provide training on purchased care options and program implementation, and collect data on purchased care activities. Local program management should have a strong enough presence and priority to assist key decision-makers (like chiefs of staff) in addressing problems as they arise. Central program management should facilitate local administration and offer guidance as appropriate.

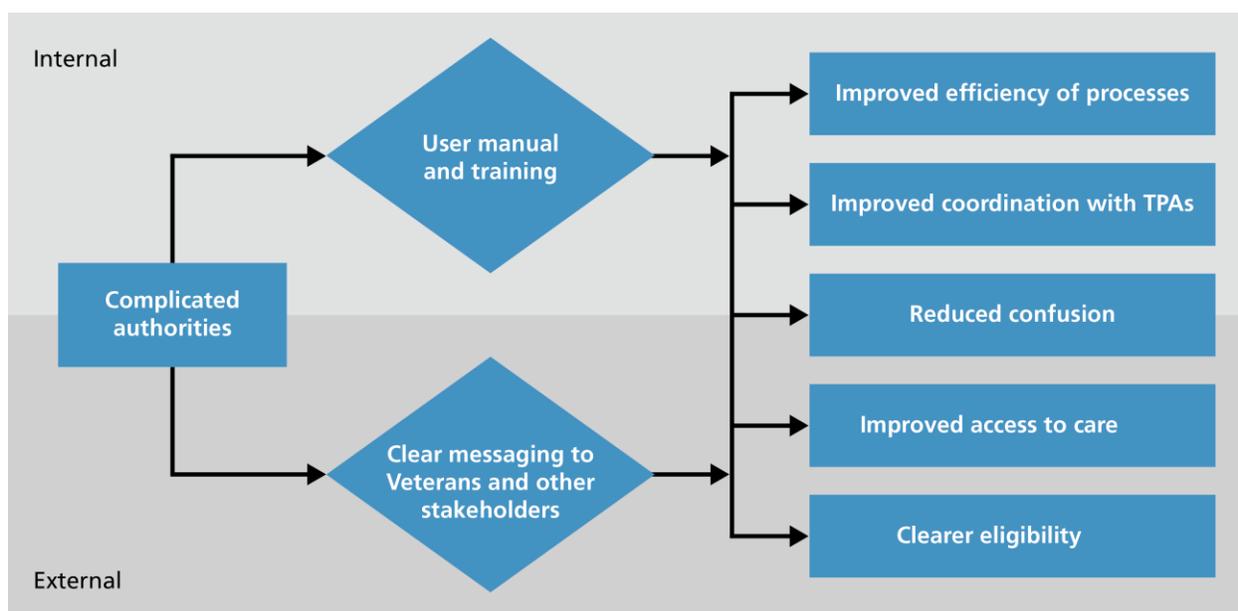
Evaluate the Third-Party Contractors Administering the PC3 and Choice Programs

As the PC3 and Choice programs continue to grow, VA should implement a process for evaluating the performance of the TPAs administering these programs. Performance evaluation should be based on a series of explicit criteria, including network strength, process efficiency, and Veterans' experiences. To assess network strength, VA should consider whether the TPAs have built provider networks to adequately address the needs of Veterans living in the regions covered by the TPA, including whether Veterans have a choice of providers and whether network providers are able to provide timely access to care. VA should also assess the efficiency and accuracy of claims processing, the timeliness and ease of referral processes, and other key outcomes related to technical performance. Finally, it should examine Veterans' experiences with accessing care through these programs. Evaluation of the TPAs should be routine and ongoing, implemented as part of a process of continuous quality improvement.

Develop Clear and Consistent Guidance and Training on VA's Authority to Purchase Care

While VA has a range of legacy manuals and directives on health care operation and procedures, the organization does not have a current, comprehensive manual that offers clear guidance on purchased care authorities and SOPs. Existing VA guidance on purchased care is scattered, outdated in parts, and inconsistent in setting clear standards for local VA officials to follow. Our research indicates that, as a consequence, local VAMCs have struggled with ambiguity when developing their own policies and procedures for purchased care.

VA should create a consolidated manual on purchased care, together with associated training and messaging that explains VA's authority to purchase care and clarifies eligibility and administrative processes for Veterans, VA staff, TPAs, and other stakeholders. Figure 8-1 shows how VA could translate statutes and regulations to internal and external audiences, clarify guidance, and improve processes and coordination.

Figure 8-1. VA's Approach to Informing Internal and External Stakeholders About Authorities


In the midst of ongoing shifts in purchased care and a barrage of messaging to Veterans and other stakeholders about the Choice program, enhanced coordination and communication will be pivotal to the success of purchased care programs. The combination of improved internal processes and external messaging will be critical to reducing confusion, clarifying roles and responsibilities, and, ultimately, improving performance of VA staff members, VA providers, private providers, and TPAs.

Ensure That Purchased Care Contracts Include Requirements for Data Sharing, Quality Monitoring, and Care Coordination

To provide better oversight and ensure the quality of care for Veterans receiving health care in the community, VA should incorporate into its contracts with non-VA providers and TPAs requirements for data sharing, routine quality-of-care reporting, and collaborative coordination of care. VA is a leader in quality-of-care measurement and improvement, yet it has limited visibility into the quality of care provided to Veterans through purchased care programs. Oversight entities have examined the quality of outside care provided to Veterans, but VA does not have sufficient internal data collection mechanisms to track the performance of purchased care administration and inform necessary adjustments. In developing contracts with non-VA providers and TPAs, VA should require routine reporting of quality measures to ensure that the quality of care that Veterans receive through non-VA providers matches the quality of care offered by VA. Such contracts should also make explicit how non-VA providers will communicate and coordinate with VA counterparts.

Consider Adopting Innovative (but Tested) Ways to Purchase Care

TRICARE and Medicare offer some lessons for efficiently purchasing care that VA could adopt regardless of whether policy-makers decide to expand its purchased care footprint or simply improve its current purchased care programs. Specifically, TRICARE and Medicare outsource

---

many of their administrative functions, such as claims processing and fraud tracking, often providing performance incentives to outside contractors. VA should consider incorporating the same approach into its current purchased care programs as well, particularly if policy-makers decide to expand the scope and size of VA purchased care.

Eliminate Inconsistencies in Current Authorities and Provide Flexibility for VA to Implement a Purchased Care Strategy

A key theme of this report is that the appropriate authority structure for purchased care depends, in part, on policy-makers' objectives for what purchased care should accomplish. That is, Congress and VA must first decide on a strategy for purchased care and then implement specific policy changes to carry out that strategy. Regardless of the specific direction of any new VA strategy for purchased care, Congress and VA can still eliminate inconsistencies in current authorities, which can improve care for Veterans. Aside from pursuing specific policy goals, these authorities should be clear, harmonious, and coherent.

We found several points of tension and confusion within existing authorities (for example, inconsistencies in VA standards for episodes of care, the subjective nature of some elements of 38 U.S.C. 1703, differences in definitions of geographic inaccessibility and wait times, and conflict between the language and intent of what constitutes a "medical facility" for applying the 40-mile rule under Choice). Beyond resolving these sorts of conflicts within the authorities, VA and Congress should also ensure that purchased care authorities are not so prescriptive that they restrict VA's ability to innovate, adopt new best practices, and surge to meet emerging needs.

VA already has basic authorities and mechanisms for purchasing care, but they are overly complex. The authorities are a relic of the evolution of purchased care over many years, and the mechanisms are not constructed or coordinated in a way that is easily navigated by Veterans, VA staff, TPAs, or other stakeholders. There are also many different rules about eligibility, reporting requirements, reimbursement rates, and authorization.

Beyond eliminating specific inconsistencies in purchased care authorities, a more ambitious step toward reducing confusion and ambiguity could involve consolidating and harmonizing VA's purchased care authorities, potentially by bringing together related programs under a single operating umbrella. Any such approach to consolidation would certainly involve significant political and practical challenges for Congress and VA, particularly in deciding how to harmonize existing authorities, and how much revision to do in the process of consolidating them. As discussed in Section 6, different versions of consolidation could look very different from one other, depending on exactly how Congress and VA choose to approach such a move. Regardless, policy-makers should at least consider the merits of simplifying the existing structure of authorities and programs through this kind of consolidation effort.

Revise How Episodes of Care Are Defined to Better Accommodate Veterans' Needs

Under Section 101(h) of the Veterans Choice Act, the Secretary is obligated to allow Veterans who use the Choice program to seek outside services through the completion of an episode of care, "but for a period not in excess of 60 days." This narrow authority constraint on the Choice program forces the reauthorization of an episode after a defined period of time. In practice, this

requirement may run contrary to evolving clinical practices and standards for episodes of care in the broader health care sector. It seems likely that the intent of Section 101(h) was to impose a basic resourcing gate on services purchased thereunder and to give VA both the authority and the responsibility to periodically review the Choice program's use of outside services to ensure that it is appropriate. In health care practice elsewhere, however, the term *episode of care* is much more flexible, accommodating clinical situations with either very short episodes (for example, the treatment of a minor, acute condition) or very long episodes (for example, the treatment of a chronic illness).

The episode of care construct is important clinically and administratively in helping to coordinate related services for an underlying medical problem. Outside the VA context, new standards for episodes, built around specific clinical conditions, have been focal points for emerging innovations in payment practice for purchased care. The 60-day requirement under Section 101(h) of the Veterans Choice Act (and regulations interpreting that section) is less than optimal for monitoring and coordinating care or for purchasing outside services in a manner that meaningfully corresponds to an episode. For policy-makers, our recommendation is to revise the current authority on episodes under the Act, to support VA monitoring of episodes of care in a more flexible and nuanced way in the future.

Adopt a Consistent Strategy for Reimbursement Rates Across Purchased Care Initiatives

This report reviewed some basic challenges to establishing reimbursement rates for VA purchased care. For example, the establishment of TPA provider networks has reportedly been hampered in some regions because providers are reluctant to accept Medicare (or sub-Medicare) rates for their services. In these regions, some specialty providers may be able to make more money by accepting patients with private insurance over Veteran patients. By extension, when VA reimbursement rates become unattractive to outside providers, purchased care may become a less effective way to address shortfalls in internal capacity.

Another challenge in purchased care involves the potential for intra-VA competition between different purchasing mechanisms. The competition is driven by the fact that VA pays various reimbursement rates to providers (as shown in Table 8-1). Notably, providers who otherwise meet eligibility requirements might choose among several different contracting arrangements, including (1) joining a TPA network under PC3, (2) joining a TPA network under Choice, or (3) avoiding joining a network and instead accepting VA patients on a case-by-case basis through individual agreements with local VAMCs or the Choice TPAs. Each of these options has the potential to generate a different reimbursement rate for outside providers. Holding other factors equal, higher reimbursement rates would presumably be more attractive for outside providers to pursue. VA should avoid influencing outside provider behavior as a result of the multiplicity of its purchasing channels and mechanisms.

Table 8-1. Provider Reimbursement Rates, by Purchased Care Mechanism

Feature	ARCH	PC3	Traditional VA Purchased Care	Choice
Typical Reimbursement rate	% of or full Medicare rate	% of Medicare rate	VA fee schedule, Medicare rate, or contracted rate	% of Medicare rate

To address these types of reimbursement problems, we recommend that VA and policy-makers adopt a coherent strategy for reimbursement across VA purchased care initiatives, balancing considerations of cost against those of ensuring access. The strategy should be clear in its application, with the determination of purchasing mechanism based first on ensuring access to services by Veterans and with the appropriate reimbursement rate then following. VA can and should secure lower rates where outside providers are highly competitive in a given local market. But in an uncompetitive local market, the rates need to be sufficient to ensure access to needed services. VA mechanisms and contracts for purchasing care should reflect this reality in the setting of outside reimbursement rates.

Establishing a more effective strategy for reimbursement rates may require revisions to current VA authorities. As we explained in Section 3, current VA purchased care laws tend to set upper bounds on provider reimbursement rates while establishing no floor.[146] However, in the context of a local market in which the pool of outside providers is very limited, such ceilings may actually be counterproductive and could undercut VA's ability to obtain needed services through purchased care.

Revisions to VA policy guidance will likely be equally important in adopting a more coherent approach to reimbursement rates. As discussed in Section 4, for some VA staff, simply determining which program or mechanism to use for purchasing care for a given Veteran— while considering the various options in the appropriate order—involves considerable complexity and ambiguity. To ensure better decisions about when and how to purchase care, we suggest revisions to VA policy, training, messaging, and oversight to bring the overall strategy on reimbursement rates into congruence and to reconcile alternative mechanisms for providers to seek appropriately competitive reimbursement.

---

[146] Under Section 101(d)(2)(B) of the Veterans Choice Act, for example, provider reimbursement rates generally cannot be higher than the Medicare fee schedule rates (except for care for Veterans residing in counties with population densities of less than seven persons per square mile). In the context of outpatient services under Section 1703 purchased care, for example, reimbursements can be based on the terms of any existing contract or agreement between the provider and VA. If no such contract or agreement exists, it would be the lower of the Medicare rate, the rate available through repricing (in which contractors offer VA discounted health care through a network of providers), or the amount the provider bills the general public for similar services.

8.4 Conclusions

Providing direct services for Veterans at VA facilities is a long-standing pillar of the VA health care system. At the center of this direct-care model is the nation's dual recognition that Veterans have unique health care needs and that VA should ensure that Veterans have timely access to high-quality care. While the nation's commitment to serving Veterans' unique health care needs is unwavering, the means to achieve this goal are shifting. As such, utilization of purchased care has increased significantly in recent years to supplement VA's capacity, given the increase in demand for care.[147]

Symptomatic of the widening gap between supply and demand for VA health care, the waitlists and the access issues at Phoenix and other medical centers signified a confluence of problems with VA health care. Per the Veterans Choice Act assessment mandate, we investigated the following research questions regarding VA purchased care:

1. What authorities and mechanisms does VA have to purchase care?

2. Does VA have the appropriate authorities and mechanisms to purchase care?

3. Should VA have the authority to purchase care through the completion of episodes of care??

We found that VA has a range of authorities to purchase care, but they are overly complicated. The authorities are complex and they reflect various interests regarding the purpose, utilization, oversight, and limits of purchased care. Such interests include cost control, balancing direct and outsourced care, and ensuring surge capacity to meet emerging care needs. While VA has the authorities to purchase care, policy makers must eliminate inconsistencies in the statutory and regulatory framework to reduce confusion and increase consistency of purchased care implementation. For instance, changes should be made to reduce inconsistencies in VA standards for episodes of care, the subjective nature of some elements of 38 U.S.C. 1703, differences in definitions of geographic inaccessibility and wait times, and conflict between the language and intent of what constitutes a "medical facility" for applying the 40-mile rule under Choice.

While we found that changes are needed to reconcile the inconsistencies in authorities, we also found that the issues with purchased care mechanisms pose even greater challenges for stakeholders. Through ad hoc addition of pilots and programs, purchased care mechanisms have grown evolutionarily, and as a result, navigating the multitude of options for outsourcing care is difficult for Veterans, VA staff, private providers, and TPAs. VA purchased care lacks the appropriate vision, strategy, and management structure to guide implementation. To improve management of purchased care, VA needs to develop clear and consistent guidance on SOPs and regularly communicate with stakeholders about the purpose of purchased care and it rules and requirements. In addition, VA should address cost controls more directly, through rigorous performance evaluation and auditing of contracts, systematic data collection on costs, more

---

[147] Assessment A's report discusses how demand for VA services has been steadily increasing, despite a decline in the overall Veteran population.

aggressive deployment by VA of traditional cost-control like co-pays and deductibles, and adoption of innovations in bundled payments, value-based contracting, and performance incentives for contractors. Furthermore, to better assess purchase care processes and outcomes, VA must collect better data on processes and evaluate TPA performance in implementing PC3 and Choice contracts.

Beyond changes to purchased care management, VA should modify authorities and mechanisms to position the Department to adopt best practices and make strategic decisions about outsourcing care in the long-term both at the local and enterprise level. Per the second research question posed, we assert that VA should have the authority to purchase care through the completion of episodes of care. However, the Department needs to revise the how episodes of care are defined to better accommodate Veterans' needs. Under the Veterans Choice Act, VA must allow Veterans who use the Choice program to seek outside services through the completion of an episode of care, "but for a period not in excess of 60 days." The legal requirement for a fixed-term reauthorization of an episode runs contrary to evolving clinical practice and standards in the broader health care sector. A revision of this authority would improve monitoring of episodes of care and reduce the administrative burden on VA staff and Veterans.

8.5 Looking Toward the Future

VA not only operates one of the largest health care systems in the world (VA, 2015a), but it is also widely renowned for the quality of its work in many areas of care, research, and development. For example, VA is a world leader in research and development in prosthetics-related care (VA, Office of Research and Development , 2015), and it excels in the care and treatment of spinal cord injuries, geriatric conditions, polytrauma, traumatic brain injury, and posttraumatic stress disorder (McDonald, 2014a). In addition, VA consistently receives high marks on customer satisfaction (VHA, 2012; U.S. Department of Veterans Affairs, Office of Public and Intergovernmental Affairs, 2014), and it continues to hone its capabilities in health IT, physical infrastructure, and other areas. VA's excellence in providing quality care to Veterans in a culturally sensitive manner has been widely touted, and Veterans and stakeholders recognize the value of the VA system. According to VA Secretary Robert McDonald,

> In the past nine months, I've learned that there is no substitute for VA. Veterans need VA, and Americans everywhere benefit from VA—from VA research contributing to major breakthroughs in medical science (three Nobel Prizes, seven Lasker Awards, the implantable cardiac pacemaker, the first successful liver transplants, and the nicotine patch to help smokers quit); from VA training of doctors, nurses, and other medical professionals, including 70 percent of America's physicians; and from VA's highly specialized expertise in delivering clinical and rehabilitative services to wounded warriors. (McDonald, 2015)

The VA system has built a reputation for the strengths of its size, progress, and innovation, which are backed by decades of experience and success in serving Veterans. While Veterans and other key stakeholders widely acknowledge the success of many facets of the VA enterprise, they also recognize that the Department faces significant organizational challenges and that, in some important respects, the operations and identity of the VA system are still

---

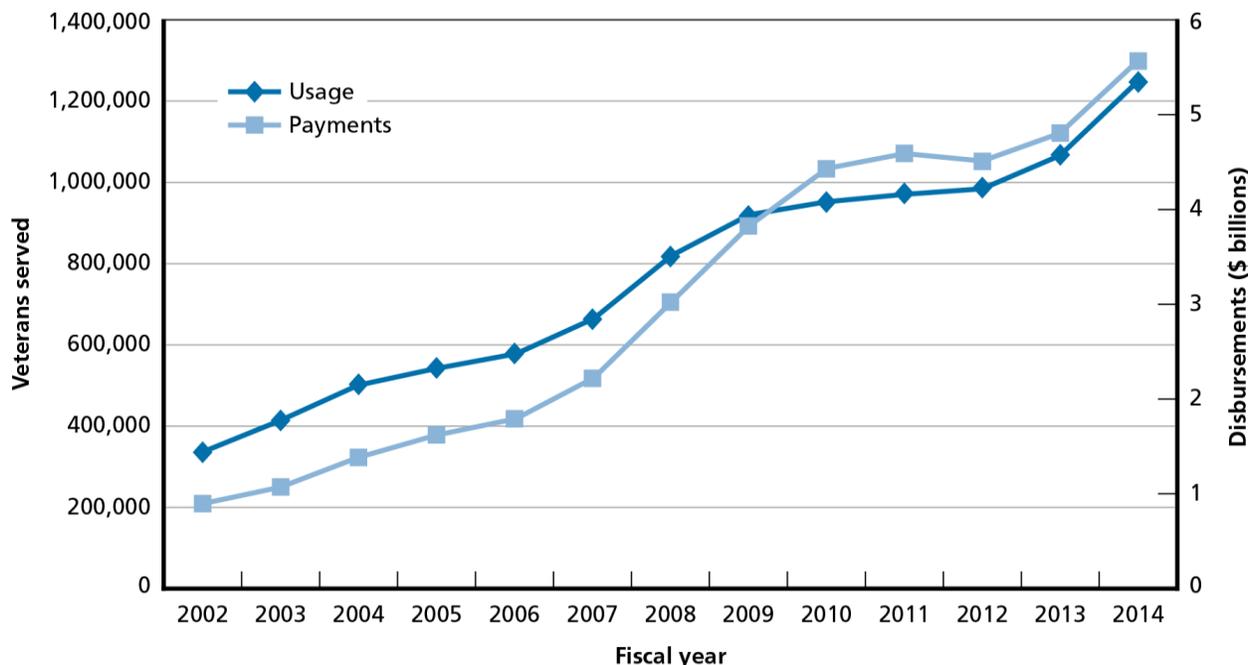
evolving. Furthermore, in the case of purchased care, related operations within the VA system have evolved faster than the patchwork of authorities and mechanisms that support them.

Improving the authorities and mechanisms for purchased care offers an enormous opportunity for VA. Synchronizing legal guidelines and supporting structures in support of a well-articulated objective and coherent strategy could empower the organization in the future in more effectively growing its provider network, improving its administration and processes, and fostering creative solutions for communicating and coordinating with private providers at both the federal and local levels.

The recommendations in this report aim to facilitate VA's adoption of best practices in purchased care, drawing on the collective experience of the wider health care community. Outside advancements in administrative functions, payment structures, performance management, standardization, and managed utilization can offer VA a blueprint for long-term gains in organizational efficiency and effectiveness. Defining and implementing improved standards for episodes of care is another way to improve internal processes and leverage VA's connections with the private health care community. Adopting some combination of these recommendations could help lift VA to new levels of organizational performance and, ultimately, improve the health and the lives of Veterans.

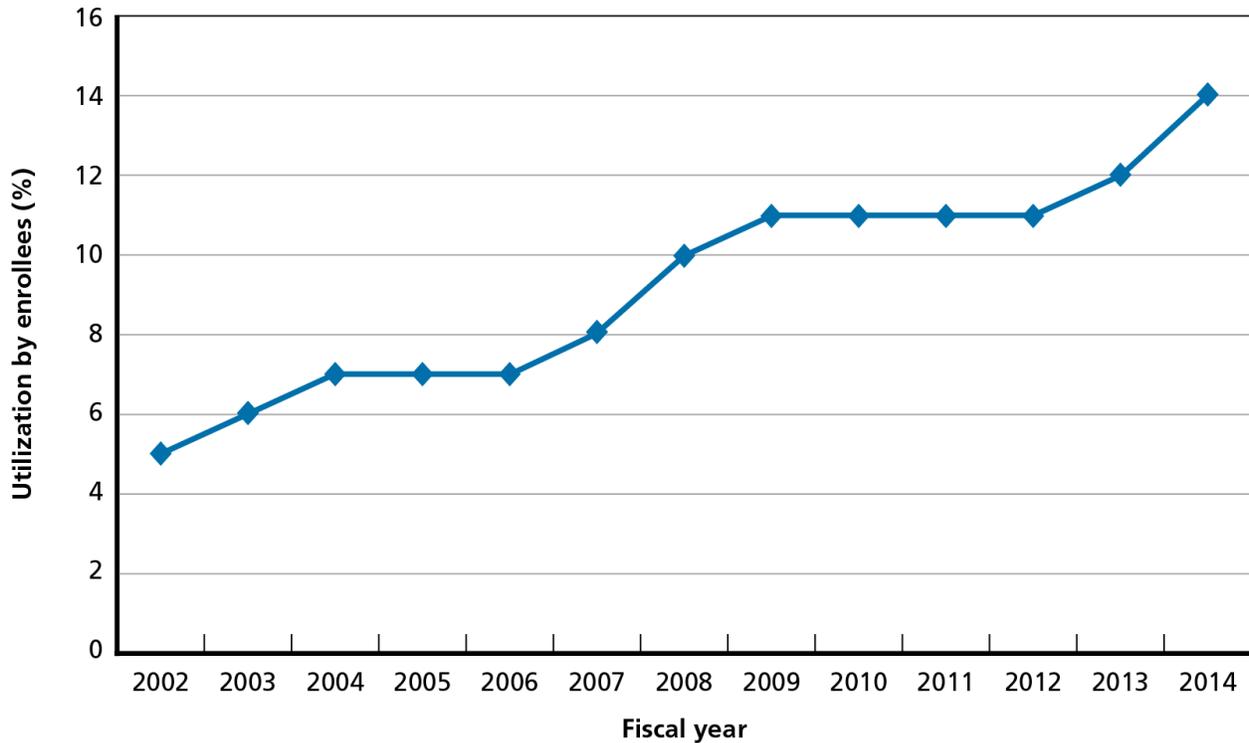
Appendix A   Growth in Purchased Care Utilization Rates and Authorizations

About 10 percent of VA's entire health care budget goes to purchased care. Pursuant to a request from RAND, VHA's Chief Business Office estimated that the total tab in FY 2014 for purchased care was $5.6 billion, after steady and significant increases year after year (Figure A-1; VA, 2014c). Other VA sources have provided different estimates of purchased care expenditures during this time frame, with Deputy VA Secretary Sloan Gibson testifying before the Senate Veterans' Affairs Committee on May 12, 2015, that VA had spent more than $8.5 billion on community care in FY 2014 (Exploring the Implementation and Future of the Veterans Choice Program, 2015). The difference in these estimates is likely because Deputy Secretary Gibson included Civilian Health and Medical Program of Veterans Affairs costs in his totals. Using another metric of purchased care utilization, Deputy Secretary Gibson noted that Veterans completed 55.04 million appointments at VA facilities and 16.2 million appointments in the community in FY 2014 (Exploring the Implementation and Future of the Veterans Choice Program, 2015).

Figure A-1. Growth in VA Purchased Care, FYs 2002–2014


SOURCE: Data obtained through a request to the VHA Chief Business Office, May 12, 2015, and originally derived from VA Central Office fee payment files.

The use of purchased care spiked in the wake of the Phoenix scandal and during implementation of the Choice Program. VHA has used purchased care to meet surge demands and reduce backlogs. As shown in Figure A-2, from FY 2013 to FY 2014, the rate of purchased care utilization by VHA enrollees increased from 12 to 14 percent. As the figure shows, purchased care was already increasing.

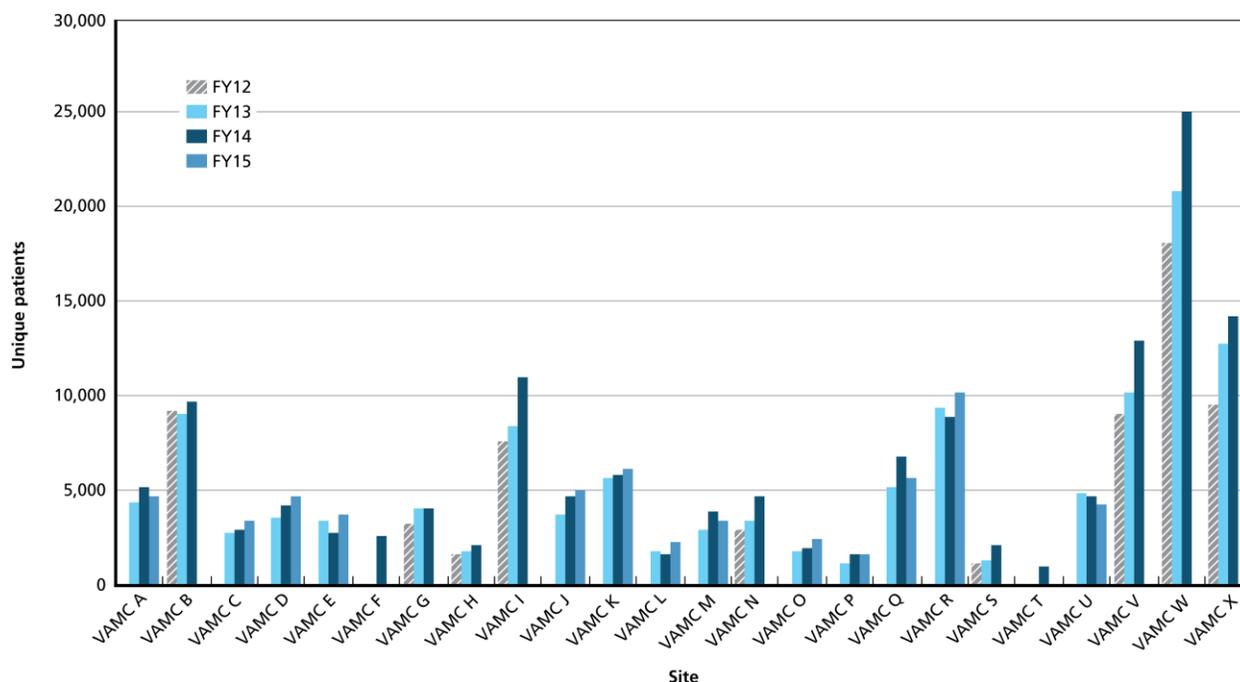
Figure A-2. Purchased Care Utilization by VHA Enrollees, FYs 2002–2014


As Table A-1 indicates, more than half of all expenditures for purchased care from FY 2008 through FY 2012 were for nonemergency inpatient and outpatient care.

Table A-1. VA Spending and Utilization, by Purchased Care Category, FYs 2008–2012

External Service	Type of Care	% of All VA Purchased Care Expenditures
Broad-based	Preauthorized inpatient	22.7
	Preauthorized outpatient, medical	36.3
	Preauthorized outpatient, dental	1.8
	Emergency care for Veterans with service-connected conditions	4.5
	Emergency care for Veterans for non–service-connected conditions	8.8
Specialized	Home health	13.3
	Community nursing home	12.3
	Compensation and pension exams	0.3
SOURCE: GAO (2013a, p. 38, Table 2).		

We also obtained VA purchased care utilization data for 24 individual VAMCs through our request for documents. The data showed interesting variations in the use of purchased care across distinct.[148] Although we collected data on only a subsection of the VAMCs across the United States, our analysis shows that some VAMCs are much more likely than others to employ VA purchased care mechanisms. For instance, while all VAMCs seemed to be in line with the national trend of increasing utilization of purchased care mechanisms over time, it appears that—among the 24 sites included in this segment of our analysis—utilization was highest in VAMC B, VAMC I, VAMC R, VAMC V, VAMC W, and VAMC X. Of those, VAMC W's utilization was particularly high, almost double that of the other high-utilization sites shown in Figure A-3.

Figure A-3. Purchased Care Utilization Across VAMC Sites, FYs 2012–2015


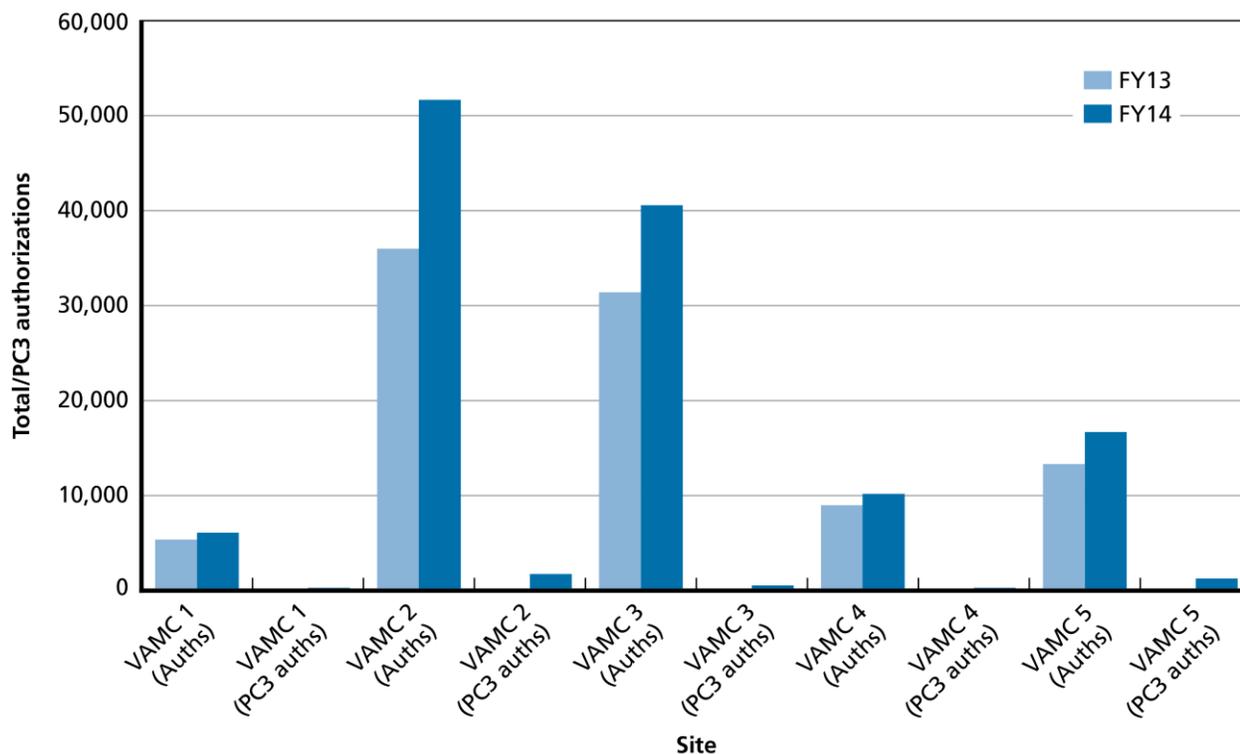
Additionally, we obtained VA purchased care authorization data for a different set of VAMC sites. The data showed both authorizations for all VA purchased care and those specifically for PC3 from FY 2013 through FY 2014. Again, as shown in Figure A-4, the data correspond with the

---

[148] We obtained VA purchased care cost and authorization data (total and PC3) from detailed VAMC site visit documents. Months in which fiscal years started and stopped varied by VAMC. We did not have access to numerical data on FY 2013 total authorizations and all costs for all VAMCs, so some of this information had to be imputed from bar graphs. We used the software program WebPlotDigitizer to compare the height of labeled y-axis ticks to the heights of bar graph columns and to impute the value of those columns. To check the robustness of the data imputed with WebPlotDigitizer, we matched FY 2014 imputed authorization values with real authorization values for sites that provided both a graph and the true value (both were available in site visit documents). In the case of one VAMC, for instance, the imputed number of FY 2014 authorizations was 40,945, whereas the real number was 40,679, showing a relatively minimal difference of 266, or a 0.65-percent deviation from the real value.

---

trends highlighted in Figure A-3, indicating overall increases in purchased care disbursements over time. However, there is also significant variation in such authorizations across VAMCs, even though the sites included in Figure A-4 are different from those included in Figure A-3.

Figure A-4. Total Purchased Care Authorizations and PC3 Authorizations Across Specific VAMC Sites, FYs 2013–2014


While we were unable to clearly discern the reason for such variation in VA purchased care utilization and authorizations, one cause may be that funding allotments for VA purchased care differed by VISN during this time frame. The Veterans Choice Act mandated that responsibility for funds for purchased care be centralized in VHA's Chief Business Office beginning in the October–November 2014 time frame, but prior to this centralization, each VISN managed its own purchased care budget. Many VISN directors with whom we spoke indicated that they based their planning for their VISNs' use of purchased care on their budget for such care each year.

Variations in the permissiveness and tone of purchased care SOPs across the VAMCs provide us with another working hypothesis to explain this variation in utilization, though such local-level policies may have ultimately been shaped by the knowledge of overarching budgetary constraints in a given region. As noted above, the RAND team coded all SOPs received through the data call with regard to their apparent focus/tone pertaining to utilizing internal VA care if at all possible, as opposed to being permissive regarding utilization of VA purchased care. The results were strikingly varied, with 70 SOPs containing language focused on keeping Veterans within the VA system and utilizing purchased care only as a temporary, last-resort option. Meanwhile, 102 SOPs were much more permissive in tone regarding the utilization of

purchased care; while they still tended to note that such care should serve as only a temporary solution, they were set up to facilitate the ease of use of the purchased care mechanism(s) in question. The remaining SOPs were deemed to be too neutral in tone to code either way. Nonetheless, the variation in tone across VAMCs regarding how permissive to be when authorizing purchased care services provides one possible explanation for the variance in actual utilization of VA purchased care mechanisms across sites.

The facility survey data also provide an interesting perspective on the frequency with which purchased care options are exercised. The survey asked respondents, "How frequently do you refer Veterans to fee-basis or contracted care?" It also directed respondents to use their best judgment to answer this question, specifying that they were not required to pull data from their administrative parent records to respond. Responses varied substantially, as shown in Figure A-5, with similar fractions of respondents (25–30 percent each) indicating that they referred Veterans to fee-basis or contracted care 2–4 percent of the time, 5–10 percent of the time, and over 10 percent of the time. Sixteen percent of respondents indicated that they refer Veterans to fee-basis or contracted care 1 percent or less of the time.

Figure A-5. Frequency with Which VA Facilities Refer Veterans to Fee-Basis or Contracted Care

Appendix B   Statutory and Regulatory Authorities for the Provision of Purchased Care to Veterans

Title 38 of the U.S. Code (Veterans' Benefits), enacted law that has not been codified, and Title 38 of the Code of Federal Regulations (Pensions, Bonuses, and Veterans' Relief), contain the existing law and regulations that create, govern, and regulate VA. These collections of law and regulation are the core repositories of the formal authorities granted by Congress to VA, and the product of VA's rulemaking authority to implement congressional direction. Below, we outline the relevant provisions relating to the use of non-VA provided health care for Veterans. This listing is meant as a reference and a roadmap of the law and regulation. Following this roadmap, we provide a lengthier discussion of how the law and policy play out in practice in the non-VA health care programs used by the Department.

B.1   Statutory Provisions Relating to Purchased Care

Title 38 of the U.S. Code contains enactments by Congress that create and establish the legal groundwork for VA and enumerate some of the benefits for which Veterans are eligible. These provisions outline several programs for Veterans, including compensation, pensions, insurance, housing, and burial benefits. Health care benefits are addressed in Chapter 17 of the U.S. Code. Chapter 17, "Hospital, Nursing Home, Domiciliary, and Medical Care," authorizes the Secretary to provide hospital care and medical services to Veterans. It details the hospital care and medical services to which Veterans are entitled, who is eligible for such care and services, and how the Secretary is to administer such care and services. Beyond Title 38, a small number of U.S. Code sections in Titles 10, 25, 26, 31, 41, and 42 directly or indirectly address issues related to purchased care.

In addition, Congress has enacted many bills that have never been formally codified, often because the nature of the legislation is temporary, such as would be true for an appropriations act addressing a single fiscal year. The Veterans Choice Act is an example of enacted law that was never codified because of its temporary status, though it does appear as a statutory note to 38 U.S.C. 1701.

The U.S. Code sections and enacted legislation that has never been codified that are most relevant to purchased care are summarized in Table B.1.

The primary sections that pertain to the department's ability to work with non-VA providers are Section 1703 and Section 1710. Section 1703 reads, in pertinent part,

> When Department facilities are not capable of furnishing economical hospital care or medical services because of geographical inaccessibility or are not capable of furnishing the care or services required, the Secretary, as authorized in section 1710 of this title, may contract with non-Department facilities in order to furnish any of the following. . . .

The statute then list the types of care available under contracting arrangements, including hospital care, medical services for disability treatments, medical emergencies, hospital care for female Veterans, diagnostic services, and outpatient dental services.

Table B-1. Statutory Provisions Relevant to Purchased Care

Citation	Description
10 U.S.C. 1074	"Medical and Dental Care for Members and Certain Former Members"; core authorizing statute for TRICARE, a health benefit plan for active-duty and retired military personnel and their dependents.
10 U.S.C.1097b	"TRICARE program: Financial Management"; allows reimbursement of providers at rates higher than authorized under certain conditions.
25 U.S.C. 1645	"Sharing Arrangements with Federal Agencies"; authorizes the IHS to enter into arrangements for sharing medical facilities and services with tribal governments, DoD, and VA.
26 U.S.C. 3101–3102	"Rate of Tax"-"Deduction of Tax Through Wages"; authorization for payroll taxes to be paid by both employers and employees for Medicare insurance.
31 U.S.C. 3901–3907	*Prompt Payment Act*; imposes time limits for paying proper invoices submitted to the federal government, along with interest and statutory penalties for delay under certain conditions.
38 U.S.C. 1151	"Benefits for Persons Disabled by Treatment or Vocational Rehabilitation"; treats compensation available to Veterans disabled as part of medical treatment or rehabilitation in the same way as if the disability was service-connected.
38 U.S.C. 1701	"Definitions"; core terms specified and defined.
38 U.S.C. 1703	"Contracts for Hospital Care and Medical Services in Non-Department Facilities"; authorizes the VA Secretary to contract with non-VA facilities to furnish inpatient and outpatient treatment and qualifying non-emergent and emergent care when VA facilities are not capable of furnishing economical hospital care or medical services because of geographical inaccessibility or are not capable of furnishing the care or services required.
38 U.S.C. 1705	"Management of Health Care: Patient Enrollment System"; describes VA's patient enrollment and priority system. Under Section 1705, no care can be provided if the Veteran is not enrolled (with the exception of disabled Veterans in a 12-month period after discharge from service).
38 U.S.C. 1706	"Management of Health Care: Other Requirements"; states that the VA Secretary shall, to the extent feasible, design, establish, and manage health care programs in such a manner as to promote cost-effective delivery of health care services in the most clinically appropriate setting.

Citation	Description
38 U.S.C. 1710	"Eligibility for Hospital, Nursing Home, and Domiciliary Care"; authorizes the VA Secretary to maintain an eligibility and ranking system for Veterans receiving hospital care and medical services. In addition, Section 1710(f) authorizes the Secretary to set copayment amounts and collect copayments.
38 U.S.C. 1710A	"Required Nursing Home Care"; authorizes the VA Secretary to provide nursing care to eligible Veterans.
38 U.S.C. 1710B	"Extended Care Services"; authorizes the VA Secretary to contract with community-based facilities to provide extended care services to eligible Veterans.
38 U.S.C. 1712	"Dental Care; Drugs and Medicines for Certain Disabled Veterans; Vaccines"; authorizes the VA Secretary to provide purchased care dental services to Veterans, subject to the requirements of Section 1703.
38 U.S.C. 1712A	"Eligibility for Readjustment Counseling and Related Mental Health Services"; notes that in furnishing counseling and related mental health services under subsections (a) and (b) of this section, the VA Secretary has the same authority to enter into contracts with private facilities that is available to the Secretary under sections 1703 (a)(2) and 1710 (a)(1)(B). This section is relevant to recently discharged Veterans.
38 U.S.C. 1716	"Hospital Care by Other Agencies of the United States"; authorizes the VA Secretary to reimburse the Departments of Health and Human Services (Public Health Service), Army, Navy, Air Force, or Interior for hospital care "when so specified in an appropriation or other Act."
38 U.S.C. 1717	"Home Health Services; Invalid Lifts and Other Devices"; authorizes the VA Secretary to furnish home health services to eligible Veterans.
38 U.S.C. 1718	"Therapeutic and Rehabilitative Activities"; authorizes the VA Secretary to enter into contracts for therapeutic and rehabilitative services for Veterans who suffer from a chronic illness and whose care is primarily home-based.
38 U.S.C. 1720	"Transfers for Nursing Home Care; Adult Day Health Care"; authorizes VA to transfer Veterans and service members to non-VA nursing homes under certain conditions.
38 U.S.C. 1720D	"Counseling and Treatment for Sexual Trauma"; authorizes the VA Secretary to enter into contracts with qualified mental health professionals for counseling and treatment for sexual trauma.

Citation	Description
38 U.S.C. 1720G	"Assistance and Support Services for Caregivers"; authorizes the VA Secretary to establish programs to provide instruction, training, and support to in-home caregivers.
38 U.S.C. 1722A	"Copayment for Medications"; sets rules and rates for medication.
38 U.S.C. 1724	"Hospital Care, Medical Services, and Nursing Home Care Abroad"; authorizes the VA Secretary to provide hospital care and medical services outside the United States under certain circumstances.
38 U.S.C. 1725	"Reimbursement for Emergency Treatment"; authorizes the VA Secretary to provide reimbursement to a Veteran directly or to the health care provider for emergency treatment under specified circumstances.
38 U.S.C. 1728	"Reimbursement of Certain Medical Expenses"; authorizes the VA Secretary to reimburse a Veteran for emergency treatment under specified circumstances.
38 U.S.C. 1741	"Criteria for Payment"; authorizes the VA Secretary to contribute to the per diem costs incurred by Veterans residing in state-run nursing homes or receiving domiciliary care or adult day health care from such facilities.
38 U.S.C. 1803	"Health Care"; requires the VA Secretary to provide health care to a child of a Vietnam War Veteran who is suffering from spina bifida.
38 U.S.C. 1813	"Health Care"; requires the VA Secretary to provide health care to a child of a Vietnam War Veteran who is suffering from certain birth defects.
38 U.S.C. 1821	"Benefits for Children of Certain Korea Service Veterans Born with Spina Bifida"; authorizes the VA Secretary to provide health care to a child of a Korea War Veteran who is suffering from spina bifida under certain circumstances.
38 U.S.C. 7302	"Functions of Veterans Health Administration: Health-Care Personnel Education and Training Programs"; mission statement for VHA with regard to assuring the adequacy of the nation's supply of health professionals.
38 U.S.C. 7409	"Contracts for Scarce Medical Specialist Services"; authorizes the VA Secretary to enter into contracts with certain persons and institutions for the provision of scarce medical specialist services.
38 U.S.C. 8111	"Sharing of Department of Veterans Affairs and Department of Defense Health Care Resources"; requires the VA and DoD secretaries to enter into agreements for coordinating, using, and exchanging each department's respective health care resources.

Citation	Description
38 U.S.C. 8153	"Sharing of Health-Care Resources"; authorizes the Secretary to enter into contracts or other agreements for the mutual use, or exchange of use, of health care resources between VA and any provider.
41 U.S.C. 1903	"Special Emergency Procurement Authority"; authorizes federal agencies to use simplified acquisition procedures under certain conditions.
41 U.S.C. 253	"Competition Requirements"; requires the use of full and open competition for federal procurement except under certain circumstances.
42 U.S.C. 1395 – 1395b-10, Parts A – E	"Health Insurance for Aged and Disabled"; the statutory basis for Medicare.
Pub. L. 84-569, 70 Stat. 250 (1956)	*Dependents Medical Care Act of 1955*; DoD's first purchased care program.
Pub. L. 85-56, 71 Stat. 83 (1957)	*Veterans' Benefits Act of 1957*; Sec. 501 et seq. provides the foundation for modern VA health benefit provision, including the use of non-VA providers and facilities.
Pub. L. 93-82, 87 Stat. 183 (1973)	*Veterans Health Care Expansion Act of 1973*; Section 106 provides the current basis for reimbursement of emergency medical care from non-VA medical resources.
Pub. L. 99–272, 100 Stat. 108 (1986)	*Consolidated Omnibus Budget Reconciliation Act of 1985*; Sec. 19012 ("Technical Revision of Authority to Contract for Hospital Care and Medical Services") sets forth much of what is now 38 U.S.C 1703; Sec. 19011 ("Eligibility for Health Care of Veterans with Non–Service-Connected Disabilities") provides an early definition of "episode of care."
Pub. L. 104-262, 110 Stat. 3179 (1996)	*Veterans' Health Care Eligibility Reform Act of 1996*; expanded the services VA could offer Veterans, required VA to establish priority categories and operate a patient enrollment system, and enhanced VA's sharing authority.
Pub. L. 106-117, 113 Stat. 1563 (1999)	*Veterans Millennium Health Care and Benefits Act*; Sec. 111 expanded reimbursement for non-VA emergency treatment to non–service-connected medical issues under certain circumstances.
Pub. L. 108-183, 117 Stat. 2661 (2003)	*Veterans Benefits Act of 2003*; Sec. 308 allows sole-source contracts under certain conditions.

Citation	Description
Pub. L. 109-114, 119 Stat. 2380 (2005)	*Military Quality of Life and Veterans Affairs Appropriations Act, 2006*; relevant to purchased care due to the publication of House Report 109-305 (2005) during its deliberation, which laid the foundation for Project HERO.
Pub. L. 110-387, 122 Stat. 4110 (2008)	*Veterans' Mental Health and Other Care Improvements Act of 2008*; Sec. 402 expanded reimbursement for non-VA emergency care; Sec. 403 required the Secretary to conduct a pilot program to facilitate the use of non-VA providers by highly rural Veterans (later referred to Project ARCH).
Pub. L. 111-137, 123 Stat. 3495 (2010)	*To amend title 38, United States Code, to expand veteran eligibility for reimbursement by the Secretary of Veterans Affairs for emergency treatment furnished in a non-Department facility, and for other purposes*; allowed reimbursement of emergency care for non–service connected issues even if a Veteran could receive partial payment from third-party source.
Pub. L. 111-163, 124 Stat. 1174 (2010)	*Caregivers and Veterans Omnibus Health Services Act of 2010*; Sec. 303 authorized the VA Secretary to conduct demonstration projects to test alternative approaches for expanding care to Veterans in rural areas; Sec. 308 modified the eligibility requirements for Project ARCH; Sec. 510 required the Secretary to establish a pilot program in which VA would contract with private dental insurance carriers.
Pub. L. 113-146, 128 Stat. 1754 (2014)	*Veterans Access, Choice, and Accountability Act of 2014*; Sec. 101 created the Veterans Choice Program; Secs. 102 and 103 expanded opportunities for collaboration with the IHS and Native Hawaiian health care systems; Sec. 104 extended the operational life of Project ARCH and addressed scheduling matters; Sec. 105 addressed prompt payment issues; Sec. 106 transferred local authority for purchased care to the VHA Chief Business Office.
Pub. L. 113-175, 128 Stat. 1901 (2014)	*Department of Veterans Affairs Expiring Authorities Act of 2014*; Sec. 409 made a number of technical amendments in regards to contracting to the Veterans Choice Act and the Veterans' Mental Health and Other Care Improvements Act of 2008 (Project ARCH).
Pub. Citation	Description
Pub. L. 114-19, 129 Stat. 215 (2015)	*Construction Authorization and Choice Improvement Act*; Sec. 3 amended the Veteran Choice Act to (1) change the basis for measuring distance between a Veteran's residence and VA medical facilities from straight line to driving distance, and (2) redefine "unusual or excessive burden."

Secon 1710, which is referenced in Section 1703, is a broader provision that directs the Secretary to provide hospital, nursing home, and domiciliary care. The conditions under which such care can be provided are related to a host of factors, including service-connected disabilities, receipt of disability compensation, prisoner-of-war status, and financial hardship.

Taken together, Congress has rather explicitly granted the Secretary the authority to contract with non-VA health care providers. The conditions under which this authority can be exercised are those situations when Department facilities are not capable of furnishing economical hospital care or medical services because of geographical inaccessibility or are not capable of furnishing the care or services required. Beyond this broad authority to contract for care, there are more specialized authorities for contracting for certain types of care (such as counseling for sexual trauma in Section 1720D and for therapeutic and rehabilitative services in Section 1718).

In short, even before the Veterans Choice Act legislation strengthened and expanded VA purchased care, the Secretary had the authority to engage non-VA practitioners to provide health care to Veterans. Section 3 provides detailed descriptions of the programs VA has used to provide purchased care. From an authorities perspective, Congress has given very clear language authorizing VA to contract for care at non-VA facilities. Decisions about contracting have been delegated to the Secretary and, as discussed in the next section, the Department has responded to the statutory language by developing regulation to implement Chapter 17's authorizations.

B.2 Regulatory Provisions Relating to Purchased Care

The statutes found in the U.S. Code as well as non-codified enacted legislation do not explain in great detail what procedures are to be followed to carry out their provisions for the care of Veterans. Regulations such as Title 38 of the Code of Federal Regulations are the product of the rulemaking process for implementing congressional authorizations. Title 38 of the Code of Federal Regulations (C.F.R.) explains how the provisions of Title 38 U.S.C. as well as non-codified enacted legislation are to be carried out. Whereas Congress creates the statutory foundation, VA creates the provisions of 38 C.F.R. These regulations constitute, then, a first look at how VA intends to implement the purchased care program.

Title 38 of the C.F.R. is entitled "Pensions, Bonuses, and Veterans' Relief" and it is divided into two chapters. Chapter 1 relates to the Department of Veterans Affairs and Chapter 2 relates to the Armed Forces Retirement Home. Chapter 1, Part 17 ("Medical") is the important part for our purposes. Some other regulations scattered throughout the C.F.R., such as those in Titles 5, 32, and 48, are also of interest. Table B-2 lists the regulations that are most relevant to purchased care.

Table B-2. Regulatory Provisions Relevant to Purchased Care

Citation	Description
5 C.F.R. 1315.1–1315.20	"Prompt Payment"; covers payments by executive branch agencies to vendors and contractors.
32 C.F.R. 199.17	"TRICARE Program"; establishes TRICARE, defines its purpose, sets forth the statutory authority for the program, and describes its features.
38 C.F.R. 17.30	"Definitions"; core terms specified and defined for VA medical regulations.
38 C.F.R. 17.36–17.40	"Enrollment Provisions and Medical Benefits Package." These sections detail how to enroll in the VA system, who is eligible to enroll, and what services are included in the "medical benefits package" available to enrolled Veterans. Sec. 17.38 states that the "medical benefits package" includes "emergency care in VA facilities; and emergency care in non-VA facilities in accordance with sharing contracts or if authorized by sections 17.52(a)(3), 17.53, 17.54, 17.120–132."
38 C.F.R. 17.41 and 17.42	"Examinations and Observations and Examinations." These sections detail categories of persons eligible for hospitalization for observation and physical examination.
38 C.F.R. 17.43–17.49	"Hospital, Domiciliary, and Nursing Home Care"; details who is eligible for such care. Sec. 17.46 provides authority to admit a Veteran to a hospital on a contract basis if authorized by 38 U.S.C. 1703 and 38 C.F.R. 17.52.
38 C.F.R. 17.50 and 17.51	"Use of Department of Defense, Public Health Service, or Other Federal Hospitals." Sec. 17.50 states that hospital facilities operated by any agency of the U.S. government may be used for the care of VA patients pursuant to agreements between VA and the department or agency operating the facility. Sec. 17.51 states that hospital care in facilities operated by any agency of the U.S. government may be authorized during an emergency.

Citation	Description
38 C.F.R. 17.52–17.56	"Use of Public and Private Hospitals." Sec. 17.52 states that "when VA facilities or other government facilities are not capable of furnishing economical hospital care or medical services because of geographic inaccessibility or are not capable of furnishing care or services required, VA may contract with non-VA facilities." Sec. 17.53 states that admission of any Veteran to a private or public hospital at VA expense will be authorized only when VA health care facilities are not feasibly available. Sec. 17.54 states that "[t]he admission of a veteran to a non-Department of Veterans Affairs hospital at Department of Veterans Affairs expense must be authorized in advance." Sections 17.55 and 17.56 detail procedures for payment of public or private hospital care.
38 C.F.R. 17.57–17.60	"Use of Community Nursing Home Care Facilities." Sec. 17.57 authorizes nursing home care in a contract public or private nursing home facility under conditions detailed in the section. Sec. 17.60 authorizes the extension of nursing care in a public or private nursing home care facility at VA expense beyond six months under conditions detailed in the section.
38 C.F.R. 17.80–17.83	"Use of Services of Other Federal Agencies"; provides detail on the requirements and procedures for contracts for outpatient services.
38 C.F.R. 17.85	"Research-Related Injuries"; states that "if a research subject needs treatment in a medical emergency for a condition covered by this section, VA medical facility directors shall provide reasonable reimbursement for the emergency treatment in a non-VA facility."

Citation	Description
38 C.F.R. 17.92–17.98	"Outpatient Services." Sec. 17.93 states that "[i]f the needed medical services are not available at a VA facility or Department of Defense facility, the VA shall arrange for care on a fee basis, but only if the veteran is eligible to receive medical services in non-VA facilities under § 17.52." Sec. 17.96 states that "[a]ny prescription, which is not part of authorized Department of Veterans Affairs hospital or outpatient care, for drugs and medicines ordered by a private or non-Department of Veterans Affairs doctor of medicine or doctor of osteopathy duly licensed to practice in the jurisdiction where the prescription is written, shall be filled by a Department of Veterans Affairs pharmacy or a non-VA pharmacy in a state home under contract with VA for filling prescriptions for patients in state homes," subject to conditions detailed in the section.
38 C.F.R. 17.108–17.111	"Copayments." Sec. 17.111 sets forth requirements regarding copayments for extended care services provided to Veterans by VA (either directly by VA or paid for by VA).
38 C.F.R. 17.120–17.132	"Payment and Reimbursement of the Expenses of Medical Services Not Previously Authorized"; describes rules for reimbursing emergency medical services from non-VA providers.
38 C.F.R. 17.140–17.142	"Delegations of Authority." Sec. 17.142 states that the Under Secretary for Health is delegated authority to enter into sharing agreements, contracts for scarce medical specialist services, and contracts for other medical services.
38 C.F.R. 17.160–17.169	"Dental Services"; describes eligibility for dental care provided by VA, as well as the rules surrounding the dental insurance program.

Citation	Description
38 C.F.R. 17.230–17.242	"Sharing of Medical Facilities, Equipment, and Information." Sec. 17.230 states that "[d]uring a period in which the Secretary is authorized to furnish care and services to members of the Armed Forces under paragraph (a) of this section, the Secretary may authorize VA facilities to enter into contracts with private facilities for the provision during such period of hospital care and medical services for certain veterans." Sec. 17.240 states that the Under Secretary for Health may enter into agreements for sharing medical resources with other hospitals, including State or local, public or private hospitals or other medical installations subject to provision in the section.
38 C.F.R. 17.270–17.278	"Civilian Health and Medical Program of Veterans Affairs (CHAMPVA)"; describes program for medical care for survivors and dependents of certain Veterans.
38 C.F.R. 17.400–17.410	"Hospital Care and Medical Services for Camp Lejeune Veterans and Families"; describes eligibility for special program to treat those who may have become ill at a North Carolina Marine Corps facility.
38 C.F.R. 17.700–17.730	"Purpose and Scope"; establishes grant program for transportation alternatives for highly rural Veterans.
38 C.F.R. 17.1000–17.1008	"Payment or Reimbursement for Emergency Services for Non-service-Connected Conditions in Non-VA Facilities"; describes rules for approving payment or reimbursement for emergency medical services.
38 C.F.R. 17.1500–17.1540	"Expanded Access to Non-VA Care through the Veterans Choice Program." Sec. 17.1510 details the eligibility criteria for care through the Veterans Choice Program. Sec. 17.1515 states that a Veteran eligible for the Veterans Choice Program may choose to schedule an appointment with a VA health care provider or select a non-VA provider if that entity or health care provider meets the requirements of Sec. 17.1530. Sec. 17.1530 details the conditions under which an entity or provider is eligible to deliver care under the Veterans Choice program.
38 C.F.R. 60.2	"Definitions"; describes an early VA definition of *episode of care*, albeit in the context of temporary lodging.
48 C.F.R. 801.670-3	"Medical, Dental, and Ancillary Service"; describes rules for acquisition of health care services when the dollar amount is under a specific floor.

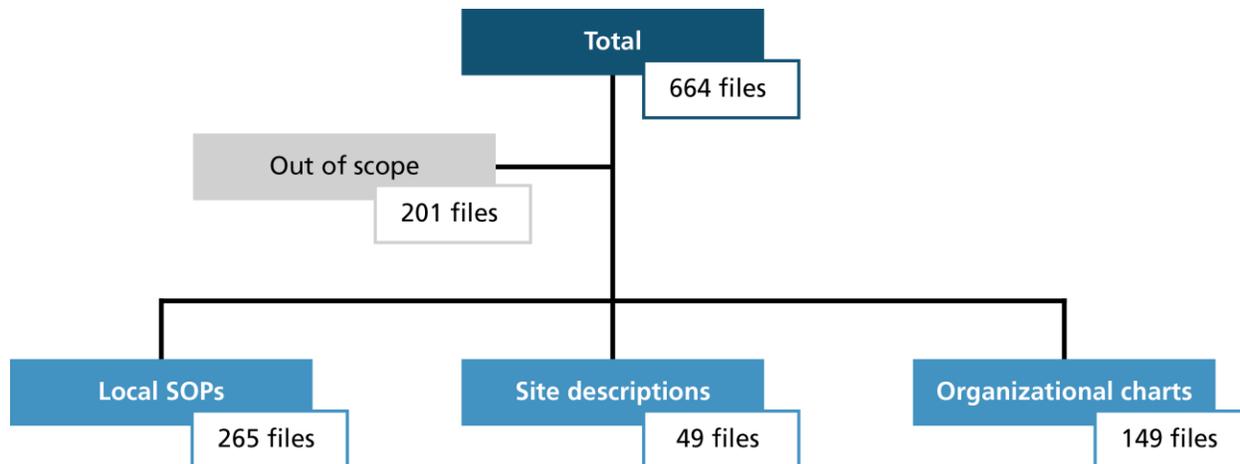
Citation	Description
48 C.F.R. 813.307	"Forms"; identifies certain forms that must be used when using simplified acquisition methods.
48 C.F.R. 853.213	"Simplified Acquisition Procedures (SFs 18, 30, 44, 1165, 1449, and OF's 336, 347, and 348)"; identifies certain forms that must be used with simplified acquisition methods.
48 C.F.R. 873.101–873.118	"Simplified Acquisition Procedures for Health-Care Resources"; describes rules that apply to the acquisition of health-care resources consisting of commercial services or the use of medical equipment or space.

Generally, 38 C.F.R. Part 17 tracks the statutory language in 38 U.S.C. and non-codified enacted legislation. The most relevant development of the statutorily authorized non-VA program is located in Section 17.52. That section states that "when VA facilities or other government facilities are not capable of furnishing economical hospital care or medical services because of geographic inaccessibility or are not capable of furnishing care or services required, VA may contract with non-VA facilities." That language mirrors 38 U.S.C. 1703. The regulations expand on that authority in section 17.53 and 17.54 by creating a system allowing admission of any Veteran to a private or public hospital at VA expense only with prior authorization. Sections 17.55 and 17.56 detail the financial and contracting procedures for payment of public or private hospital care.

Both statutory and regulatory authority allow for wide discretion and ample programmatic development at the department level—through programs and policies that operate outside of the federal rulemaking process.

Appendix C   Responses to Request for Local VA Policy Documents and Data

In coordination with MITRE, we issued a request to all 141 VA administrative parents of the VAMCs to share any available guidance or policy documents from the VAMC and VISN levels describing SOPs for conducting purchased care activities at the local or regional level. A total of 664 files were provided to the RAND study team in response to the request.

Figure C-1. Local Purchased Care Policy Documents Received


C.1   Response Rate

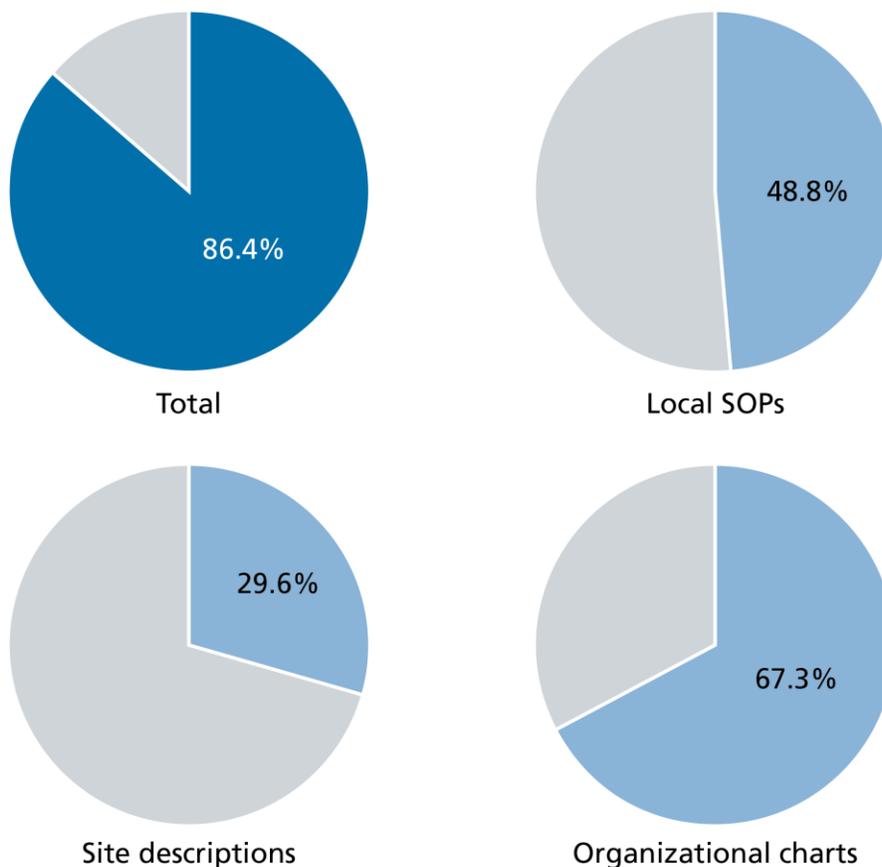
RAND received responses from 79 separate entities (78 VAMCs and one VISN) containing a total of 265 SOPs, as well as responses from 48 separate entities (47 VAMCs and one VISN) containing a total of 49 detailed VAMC site descriptions, and responses from 109 separate entities (94 VAMCs and 15 VISNs) containing a total of 149 organizational charts. Overall, RAND received an SOP, site description, or organizational chart from 140 of 162 total entities (125 of 141 VAMC administrative parents and 15 of 21 VISNs) to which the request was sent, resulting in an overall response rate of 86.4 percent. The response rate for SOP documents was 48.8 percent. The response rate for site descriptions was 29.6 percent, and the response rate for organizational charts was 67.3 percent (see Figure C-2).

Figure C-2. Response Rates for Local Purchased Care Policy Documents

Total — 86.4%

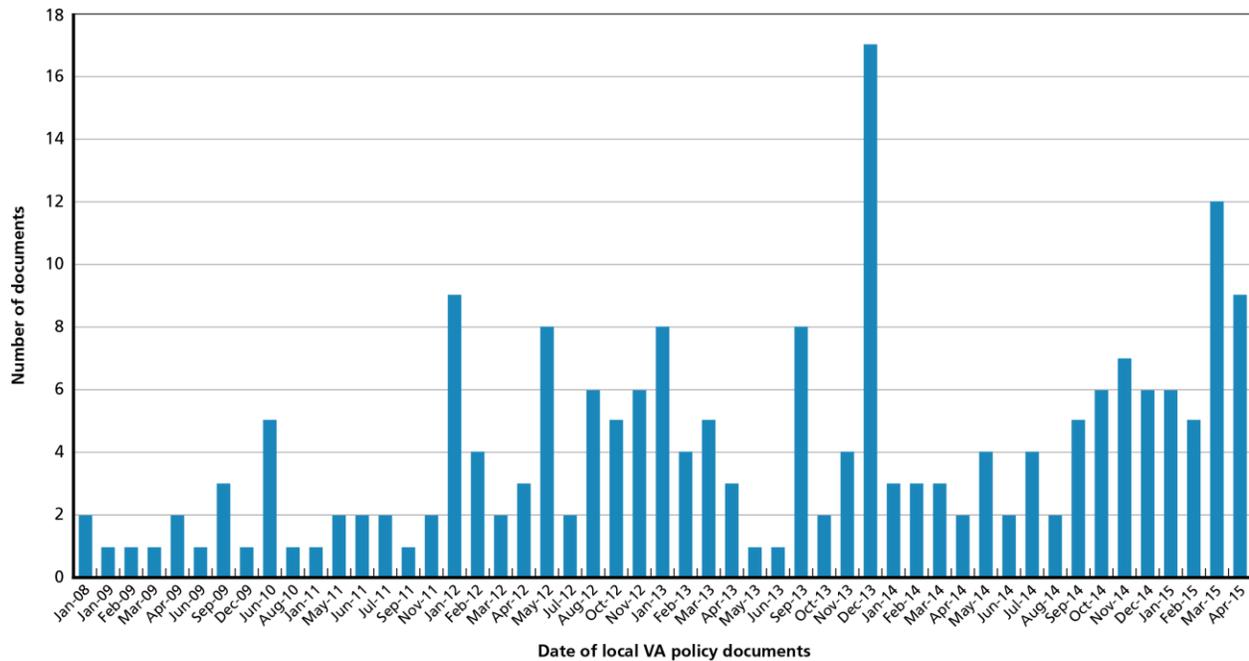
Local SOPs — 48.8%

Site descriptions — 29.6%

Organizational charts — 67.3%


C.2 Dates of Local VA Policies

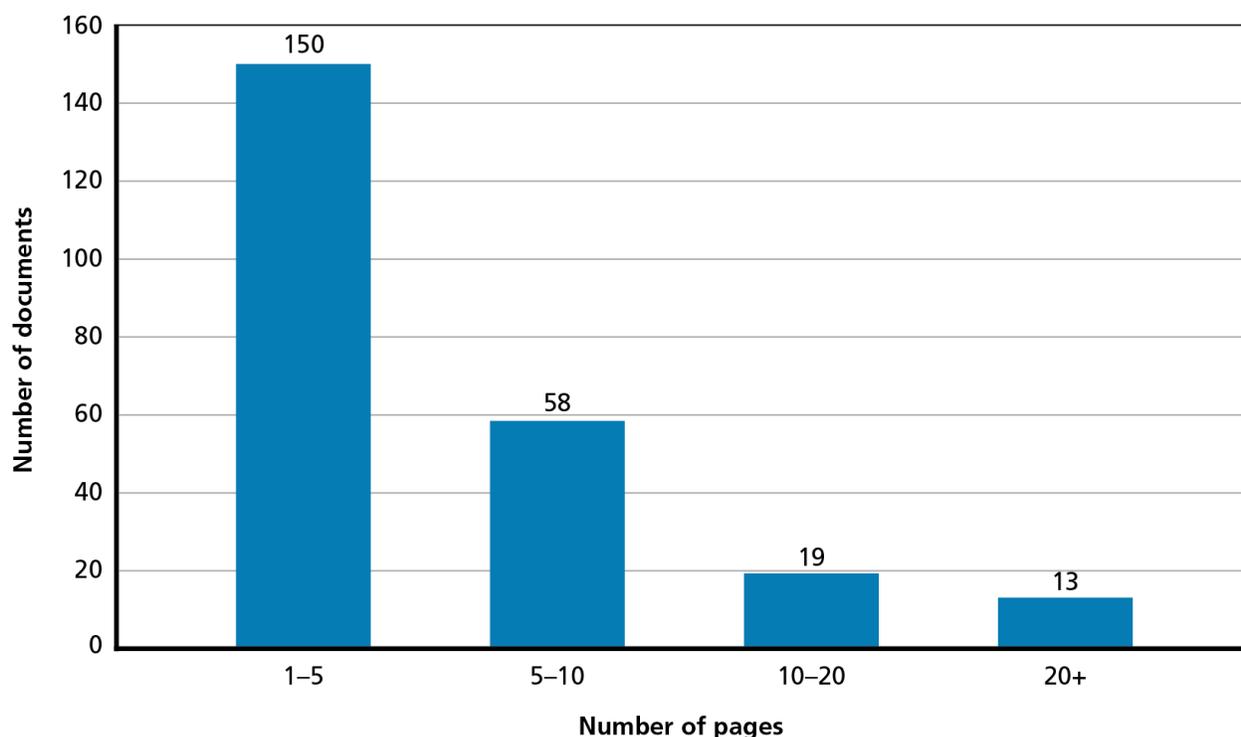
It is worth noting that 205 of the 664 total documents included a date, and the vast majority of these pre-dated the August 2014 passage of the Veterans Choice Act and the November 2014 establishment of the Veterans Choice Act program. Figure C-3 illustrates the breakdown of dates of the policies received through our request for data, showing that they spanned from January 2008 to April 2015, with the majority having been promulgated in 2012 and 2013. Moreover, the bulk of those documents *post*-dating the establishment of the Veterans Choice Act program were quite short and deemed by the study team as less useful for the purposes of elaborating key policies, processes, and SOPs on VA purchased care. For instance, many of these comprised one-page documents simply containing screen shots of how to enter a purchased care consult request into various computing systems, with little to no accompanying text.

Figure C-3. Distribution of Dates of Local VA Policies Received


In assessing the documents received through the request for data, we coded all SOPs by the following criteria: date; whether they were useful or not useful for understanding VA purchased care policies and procedures; the number of pages they comprised; the terminology used to refer to VA purchased care; the authorities cited by each; their level of detail; whether they urged VA staff to encourage the use of VA purchased care or, alternatively, staying within the VA system if at all possible; which VA staff were listed as being responsible for various steps in the purchased care referral and authorization processes; and whether and to what extent they discussed "episodes of care."

C.3   Local SOP Document Length

SOPs received through the data request ranged from one to more than 20 pages in length. While most fell at the shorter end of the spectrum, with 150 documents ranging from one to five pages, many other SOPs were longer (see Figure C-4). Fifty-eight documents ranged from five to 10 pages, 19 documents ranged from 10 to 20 pages, and 13 documents contained more than 20 pages. Document length was a fairly good (though not foolproof) indicator of the level of policy detailed contained therein, with 57 SOPs found to be highly detailed, 86 SOPs found to be moderately detailed, and 94 SOPs found to be minimally detailed.

Figure C-4. Page Ranges for SOP Documents Received


C.4   SOP Terminology

Moreover, there was little consistency in the terminology used to describe VA purchased care across these SOPs: some were specific to particular purchased care mechanisms (such as the Veterans Choice Act program or PC3), while others referred to "non-VA care," "purchased care," "fee basis," "fee authority," "community based services," or "non-VA fee consults." Still others referred to specific services in this context, such as dialysis, home health services, mammograms, and physical therapy. Most SOPs contained a section delineating responsibilities for particular staff members to fulfill in the VA purchased care referral and authorization process, but they varied widely in terms of both the staff positions listed and the responsibilities of each staff member.

C.5   Organizational Chart Analysis

Not only do VA facilities' purchased care policies and procedures vary, but their categorization and placement of VA purchased care within their organizational structure also vary. As noted above, RAND received 253 organizational charts from VAMCs and VISNs across the country as part of the request for data. On these 253 organizational charts, just 12 organizations (one at the VISN level) identified a separate non-VA care function or office. The dates of these 12 charts varied widely, from January 2012 to February 2015. Nine predated the implementation of the Veterans Choice Act in November 2014, and three were dated after its implementation. Offices relevant to VA purchased care at these organizations went by a variety of names:

- Four facilities and one VISN listed a "non-VA care" office.

- One facility listed a "non-VA care coordination/fee" office.
- Two facilities listed a "non-VA care coordination" office.
- One facility listed a "chief dental care/non-VA care" office.
- One facility listed a "fee basis, community care referral team."
- One facility listed an "integrated fee/non-VA care" office.
- One facility listed a "purchased care" office.

To gain a better understanding of where VA purchased care offices were located within the organizations, we recorded the degrees of separation between the office and the VAMC or network director for the 10 charts displaying the VAMC or VISN organizational structures. For example, if the VA purchased care office reported to the associate director who reported to the VAMC director, we counted two degrees of separation. If the office reported to a manager who reported to the associate director, who then reported to the VAMC director, we counted three degrees of separation. On average, we found 2.5 degrees of separation between the facility director and the VA purchased care office across the 12 organizations that listed a separate purchased care function or office on their organizational charts.

In the 12 organizations examined, purchased care offices reported through a variety of management channels. Two offices reported to the VAMC associate director for patient care services, three reported to the VAMC associate director, one reported to the VAMC assistant director of facility support, two reported to the VAMC chief of staff, and one reported to the VISN deputy network director. There appeared to be little standardization in VA purchased care reporting chains within the organizations examined.

Two of the charts showed the organizational structures of the VA purchased care offices. They were not placed in the context of the larger organization, so we were unable to determine the degrees of separation between these offices and the VAMC director. These two examples were very different from one another. A program management officer led the smaller office of the two examples (25 full-time-equivalent staff) and oversaw a clinical care coordination group and an administrative care coordination group. The larger office (52.5 full-time-equivalent staff) had a small business management team and large authorization and case management teams. Although additional examples would be needed to draw definite conclusions, it appears from these two preliminary examples that there is not a standard organizational model for VA purchased care offices or divisions.

C.6   Facilities Responding to Request for Data

Table C-1 characterizes the facilities that responding to our request for policy documents and the types of materials each provided.

Appendix D Facility Survey Questions and Frequency Response Data

Assessment C included the following seven questions in the chief of staff module of the 2015 Survey of VA Capabilities and Resources, which was sent to the chiefs of staff at all VAMCs in the United States. A description of the methodology for developing the questions can found in Section 2 of this report.

The invitation to participate in the survey was sent via email directly to each administrative parent's chief of staff. The email included instructions, links to the survey modules, and a signed letter from VA's Interim Under Secretary for Health encouraging VA employees to complete the survey. The web-based survey included nine modules. Each chief of staff was responsible for completing the chief of staff module, identifying the most appropriate individual to complete each of the clinical condition modules, and overseeing the completion and return of all survey modules. Of the 141 administrative parents to which the survey was sent, 117 started the survey and submitted a response. However, several respondents chose to discontinue the survey before answering every question, leaving 111 respondents—78 percent of the total sample—answering those questions pertaining to Assessment C.

9. How frequently do you refer Veterans to fee-basis or contracted care?

0 ☐   1% or less of the time

1 ☐   2–4% of the time

2 ☐   5–10% of the time

3 ☐   11–100% of the time

Response	n	%
1% or less of the time	18	16.2%
2–4% of the time	31	27.9%
5–10% of the time	33	29.7%
11–100% of the time	29	26.1%

---

10. On a scale from 1 to 4, where 1 is the **most important** reason and 4 is the **least important** reason, please rank which of the following are the most important reasons for referring Veterans to fee-basis care.

Response	N (answering question)	n (%) Ranking Importance as 1	n (%) Ranking Importance as 2	N (%) Ranking Importance as 3
a. Lack of clinical services available at VA facilities	111	86 (77.5%)	14 (12.6%)	11 (9.9%)
b. Veteran travel distance to VA facilities	111	12 (10.8%)	51 (45.9%)	48 (43.2%)
c. Veteran wait times at VA facilities	111	15 (13.5%)	46 (41.4%)	50 (45.0%)
NOTE: Some participants ranked more than one response.				

10D. Are there other important reasons why your local health care system refers Veterans to fee-basis or contracted care?

    1 ☐   Yes -- > Please describe your reason(s) in the comments box.

    2 ☐   No

Response	n	%
Yes	37	33.3%
No	74	66.7%

11. Please mark "yes" or "no" for the following questions.

Question	N (answering question)	Yes n (%)	No n (%)
a. Has your local health care system implemented the Non-VA Care Coordination (NVCC) internal referral management program?	111	106 (95.5%)	5 (4.5%)
b. At your local health care system, are Veteran priority ratings and the service-connection of the injury or illness considered when scheduling appointments?	111	45 (40.5%)	66 (59.5%)
c. Does your local health care system "bump" a Veteran from a scheduled appointment to accommodate the appointment needs of a Veteran of a higher priority group?	111	2 (1.8%)	109 (98.2%)

12. How often does your local health care system do the following things?

Question	N (answering question)	All of the Time n (%)	Most of the Time n (%)	Some of the Time n (%)	None of the Time n (%)
a. Share records with non-VA health care providers in electronic format?	110	5 (4.5%)	10 (9.1%)	43 (39.1%)	52 (47.3%)
b. Collect data about how long Veterans wait for appointments at non-VA health care providers?	111	15 (13.5%)	23 (20.7%)	45 (40.5%)	28 (25.2%)

13A. If you have to refer Veterans out for non-VA care, and the care requires more than one visit, do they need a referral for each visit?

       1 ☐   Separate referral for each visit

       2 ☐   One referral will cover all related visits to this specialist within 60-day time frame

       3 ☐   Other (please describe in the comments section for question 13A).

Response	n	%
Separate referral for each visit	9	8.1
One referral will cover all related visits to this specialist within 60-day time frame	51	45.9
Other	51	45.9

13B. What if the Veteran requires more than one visit to this specialist for his/her broken leg, but the care is anticipated to span a period longer than 60 days (e.g., seven months)? Does he/she need a referral for each visit?

       1 ☐   Separate referral for each visit

       2 ☐   One referral will cover all related visits to this specialist regardless of time frame

       3 ☐   Other (please describe in the comments section for question 13B).

Response	n	%
Separate referral for each visit	23	20.7
One referral will cover all related visits to this specialist regardless of time frame	41	36.9
Other	47	42.3

Appendix E   Veteran Health Benefits and Priority Grouping

E.1   VHA Enrollment and Priority Group Status

Veteran eligibility for health care services has evolved significantly over the years, reflecting changes in the relative capacity of VA health care and demand from Veterans. Over time, Congress has expanded or limited access to VA health care based on the conditions facing VA at that time, imposing various systems for the allocation of health care resources. In the most significant of these, and in an attempt to balance access and efficiency concerns (Panangala, 2006), Congress passed the Veterans' Health Care Eligibility Reform Act of 1996 (P.L. 104-262). This statute expanded the services VA could offer Veterans and required VA to establish priority categories and operate a patient enrollment system to manage access. In response, VA established eight enrollment priority groups based on service-connected disabilities or exposures, prisoner-of-war status, receipt of a Purple Heart or Medal of Honor, and income (see Table E-1). Although all "Veterans," as that term is defined in federal law, are eligible to obtain VA health care services, including a basic medical package, this priority system determined which Veterans could access such services, and also set rules for copayments for services and eligibility for additional health benefits. It is important to note that health benefits are not an "entitlement"; they are dependent on discretionary appropriations. Further, under VA's statutory health care mandates, the Secretary may increase cost sharing or suspend enrollment as needed to balance the agency's budget and serve those Veterans at the top of the priority group list.

Table E-1. VA Priority Groups

Priority Group	Eligibility Requirements
1	▪ Veterans with VA-rated service-connected disabilities 50% or more disabling ▪ Veterans determined by VA to be unemployable due to service-connected conditions
2	▪ Veterans with VA-rated service-connected disabilities 30% or 40% disabling
3	▪ Veterans who are former prisoners of war ▪ Veterans awarded a Purple Heart medal ▪ Veterans whose discharge disability was incurred or aggravated in the line of duty ▪ Veterans with VA-rated service-connected disabilities 10% or 20% disabling ▪ Veterans awarded special eligibility classification under 38 U.S.C. 1151, "benefits for individuals disabled by treatment or vocational rehabilitation" ▪ Veterans awarded the Medal of Honor
4	▪ Veterans who are receiving aid and attendance or housebound benefits from VA ▪ Veterans who have been determined by VA to be catastrophically disabled

Priority Group	Eligibility Requirements
5	Non–service-connected Veterans and noncompensable service-connected Veterans rated 0% disabled by VA with annual income below VA's and geographically (based on resident zip code) adjusted income limits. • Veterans receiving VA pension benefits • Veterans eligible for Medicaid programs
6	• Compensable 0% service-connected Veterans • Veterans exposed to ionizing radiation during atmospheric testing or during the occupation of Hiroshima and Nagasaki • Project 112/SHAD participants • Veterans who served in the Republic of Vietnam between January 9, 1962, and May 7, 1975 • Veterans who served in the Persian Gulf War between August 2, 1990, and November 11, 1998 • Veterans who served on active duty at Camp Lejeune for not fewer than 30 days between January 1, 1957, and December 31, 1987[a] • Veterans who served in a theater of combat operations after November 11, 1998, as follows: Currently enrolled Veterans and new enrollees discharged from active duty on or after January 28, 2003, are eligible for the enhanced benefits for five years post-discharge. • Combat Veterans who were discharged between January 2009 and January 2011 and did not enroll in the VA health care during their five-year period of eligibility have an additional year to enroll and receive care. The additional one-year eligibility period began February 12, 2015, with the signing of the Clay Hunt Suicide Prevention for America Veterans Act.[b]
7	• Veterans with gross household income below the geographically adjusted income limits for their resident location and who agree to pay copays

Priority Group	Eligibility Requirements

8	• Veterans with gross household income above VA and geographically adjusted income limits for their resident location and who agree to pay copays
	 • Veterans eligible for enrollment: Noncompensable 0% service-connected and:
	     o Subpriority a: Enrolled as of January 16, 2003, and who have remained enrolled since that date and/or placed in this subpriority due to changed eligibility status
	     o Subpriority b: Enrolled on or after June 15, 2009 whose income exceeds the current VA or geographic income limits by 10% or less
	 • Non-service-connected and:
	     o Subpriority c: Enrolled as of January 16, 2003, and who have remained enrolled since that date and/or placed in this subpriority due to changed eligibility status
	     o Subpriority d: Enrolled on or after June 15, 2009, whose income exceeds the current VA or geographic income limits by 10% or less
	 • Veterans not eligible for enrollment: Veterans not meeting the criteria above:
	     o Subpriority e: Noncompensable 0% service-connected (eligible for care of their service-connected condition only)
	     o Subpriority g: Non–service-connected

SOURCE: VHA (2015b).

[a] While eligible for priority group 6, until system changes are implemented, the Veteran would be assigned to priority group 7 or 8, depending on income.

[b] At the end of the enhanced enrollment priority group placement time period Veterans will be assigned to the highest-priority group for which their unique eligibility status qualifies at that time.

E.2 VA Health Care Benefits

VA provides a wide array of health care benefits to eligible Veterans. These include inpatient, primary, and specialty care through VA facilities and contractors; supporting services (such as home health care and hospice care); medical device support; medications; and linkages between VA health care services and other VA programs such as educational benefits, support to homeless Veterans, and cemetery benefits. This section summarizes below VA health care benefits and programs, providing basic information about the nature of the benefit, the population served, and the potential cost to Veterans.

E.2.1   Basic Medical Benefits Package

VA provides basic medical care to enrolled Veterans through the VA health care system and contracted care providers.[149] The standard medical benefits package includes the following:

- *Inpatient care* includes medical, surgical, mental health, dialysis, and acute care services.

- *Preventive/primary care* services include but are not limited to periodic exams, immunization, genetic counseling, and health and nutrition education. VA also offers three wellness programs to enrolled Veterans. In addition to clinic-based primary care, VA may provide home-based care for Veterans with complex health care needs. Home-based services are provided by an interdisciplinary treatment team.

- *Gender-specific care* is provided to female Veterans including gynecological care, breast and reproductive oncology, infertility treatment, maternity care, and newborn care for up to seven days if the Veteran delivers in a VA or VA-contracted facility.

- *Mental health and substance abuse care* are provided in inpatient and outpatient settings, and specialized programs are offered such as intensive case management for Veterans with serious mental illness and military sexual trauma counseling for Veterans with trauma resulting from sexual physical assault or battery while in the military.

- *Skilled home health care* is offered to Veterans who need skilled services, case management, assistance with activities of daily living, or instrumental activities of daily living on a short term basis. Services are provided by community-based home health agencies under contract with VA.

- *Hospice care* is provided to Veterans with a terminal condition with six months or less to live and is offered either in the home, community, outpatient, or inpatient setting.

- *Palliative care* does not require that the Veteran have a terminal condition and is offered in the home, community, outpatient, or inpatient setting.

- *Respite care* is for Veterans who need skilled services, case management, and assistance with activities of daily living or instrumental activities of daily living; are isolated; or their caregiver is experiencing burden. Veterans can receive respite care at home or in an inpatient or outpatient setting.

- *Adult day health care* primarily offers an opportunity for recreation and social interaction for Veterans who need skilled services, case management, and assistance with activities of daily living or instrumental activities of daily living; however, health services from nurses, therapists, and social workers may be available. The program may be offered at VA medical centers, State Veterans Homes, or community organizations.

- *Rehabilitation services* are available for blindness in inpatient and outpatient settings, for spinal cord injuries through Spinal Cord Injury Centers located throughout the country, and for amputation through regional and polytrauma/amputation sites. Additionally, residential rehabilitation and treatment services are available for Veterans with multiple

---

[149] See, generally, 38 C.F.R. 17.38 for authoritative summary of VA's medical benefits package.

and severe medical conditions, mental illness, addiction, or psychosocial deficits through the combined Domiciliary and Mental Health Residential Rehabilitation and Treatment Programs.

- *Medical equipment and prosthetic items* are provided to Veterans receiving care for any condition.

- *Eyeglasses and hearing aids* are provided under certain circumstances and only to Veterans who are otherwise receiving VA care or services. VA does not provide eyeglasses and hearing aids for "normal" vision or hearing loss.

- *Medications* are provided for prescriptions written by a VA provider and included in the VA National Drug Formulary.

E.2.2   Other Health Care–Related Benefits and Services

In addition to the basic medical package described above, VA offers other health-related programs and services to Veterans and their family members, some of which are available to all Veterans (e.g., peer to peer readjustment counseling) and some of which are based on eligibility criteria (e.g., dental care)

- *CHAMPVA* (Civilian Health and Medical Program of the Department of Veterans Affairs) is a health care benefits program that provides coverage to the spouse or widow(er) and to the dependent children of a qualifying Veteran or service member or the primary caregiver. The program pays for medical care from non-VA providers. Additionally, primary family caregivers of eligible Veterans who have no other health insurance may also receive counseling, training, and mental health services.

- *Dental care*. The eligibility requirements for dental care differ from the medical care requirements. Veterans are categorized into six classes that then determine the scope of treatment available. Dental care may be provided at VA facilities or by non-VA providers. VA is also operating a national pilot program to make private dental insurance available at reduced cost to enrolled Veterans and family members through CHAMPVA.

- *The Children of Women Vietnam Veterans* program under 38 U.S.C. 1813(b) covers external medical expenses from approved providers related to certain birth defects in children born after their mothers began duty in Vietnam. Similarly, the Children of Veterans Born with Spina Bifida program under 38 U.S.C. 1803(b) and 38 U.S.C. 1821(a) covers external medical expenses from approved providers related to spina bifida in the children of parents exposed to herbicides during duty in Vietnam or the Korean demilitarized zone.[150]

- *Peer-to-peer readjustment counseling.* In addition to the mental health care services described above, VA runs a system of approximately 300 "Vet Centers." These are community-based storefront centers that are staffed by Veterans who are part of the

---

[150] We include these programs because they are used by VA to purchase or acquire, either directly or indirectly, medical services from non-VA sources, even though the recipients of those services are not Veterans.

Readjustment Counseling Service. VA provides mental health and readjustment care through these centers to all Veterans, regardless of service characterization, priority grouping, or existence of a VA-rated service-connected disability, and does so at no cost to the Veteran. Veterans need not enroll with the VA health care system to access care at Vet Centers, and this care is not considered part of VA's basic medical care package.

- *Veterans Crisis Line.* A confidential toll-free hotline, online chat, or text service is available 24/7 for Veterans, family members, and friends.

- *Travel reimbursement* is available for travel related to obtaining health care services for Veterans in specified circumstances. VA may also pay the cost of overnight travel associated with obtaining health care services.

- *Family caregiver's program.* VA provides mental health services, access to health insurance, and other non–health-related services to caregivers of post-9/11 Veterans and service members who were medically discharged.

E.2.3   Specialized External Services and Specialized Veteran Populations

There are many VA programs that could be characterized as types of purchased care in that they rely on external providers and resources to deliver health care to Veterans. As we can see from the following program descriptions, however, their utility as a means of expanding a wide range of non-VA health care services to Veterans is generally limited:

- **Indian Health Service/Tribal Health Program Reimbursement Agreements Program.** These agreements reimburse IHS and Tribal Health Program health facilities for services provided to American Indian and Alaskan Native Veterans. Authority for the agreements can be found in 38 U.S.C. 8153 (which provides for mutual use or exchange of use of health care resources between VA and external agencies and providers), as well as section 405(c) of the Indian Health Care Improvement Act (requiring reimbursement of IHS, tribes, and tribal organizations for health services to Veterans).[151]

- **Scarce medical specialist services contracts**. Under 38 U.S.C. 7409, VA has the authority to enter into contracts with medical and nursing schools, "clinics," "any other group or individual" for the provision of "scarce medical specialist services." The enabling statute requires that the services be provided "at Department facilities."

- **Services outside of the United States**. Through the Foreign Medical Program under 38 U.S.C. 1724, VA is responsible for reimbursing medical expenses incurred by Veterans with service-connected disabilities (or, in some circumstances, Veterans receiving vocational rehabilitation assistance) who are residing or traveling abroad.

- **Long-term care programs**. VA also has a number of programs to provide long-term care in inpatient and at-home settings using non-VA resources:

---

[151] Section 405(c) of the Indian Health Care Improvement Act (2010) was amended by the Affordable Care Act, specifically at 25 U.S.C. 1645(c).

o The State Veterans Home Per Diem Program under 38 U.S.C. 1741 allows VA to contribute to the per diem costs incurred by Veterans residing in state-run nursing homes or receiving domiciliary care or adult day health care from such facilities.

o Community Nursing Homes under 38 U.S.C. 1720 are contracted public or private nursing homes.

o Purchased Home Health Care Services is the umbrella term for two programs under 38 U.S.C. 1710.[152] The first is Skilled Home Health Care Services, which contracts with community-based home health agencies to provide short-term services, such as nursing, physical therapy, and speech pathology, to homebound or remotely located Veterans.[153] The second is the Homemaker and Home Health Aide Services program, which uses contracted public and private health care agencies to provide in-home services and to pay stipends to family members.

- **Other programs**. There are other instances in which VA pays at least some of the cost of health care services provided by non-VA personnel or facilities, though such programs fall outside the scope of the mandate for this assessment:

  o The Home Hospice Care Program uses personnel from community hospice agencies.

  o Veterans who do not meet the limited eligibility standards for VA-supplied dental care can purchase a discounted dental insurance policy, through a national pilot program.

  o Examinations for VA disability compensation or pension benefits can be performed by external health care providers on a fee basis or under contract.

E.2.4 Emergency Services

As discussed in Section 3, services under 38 U.S.C. 1703 are often referred to as "preauthorized care" because the Veteran must receive explicit permission from VA prior to visiting external health care professionals or facilities or risk being personally liable for the costs of services rendered. In a crisis situation, however, obtaining appropriate VA approval prior to arriving at a hospital's emergency department or calling for paramedics may be impractical or put the Veteran's life or health at risk.

The first of two key statutes providing legislative authority for VA payment of external emergency care without prior approval is 38 U.S.C. 1728, under which VA will reimburse a Veteran for the costs of emergency treatment (or pay the provider directly) as long as the event was related to a service-connected disability (either directly or indirectly). Table E-2 describes various aspects of service-connected emergency care.

---

[152]Additional descriptions of these programs can be found in VHA Handbook 1140.6 (VHA, 2006).

[153] Skilled Home Health Care Services has also been known as "Purchased Skilled Home Care" and "fee-basis home care."

Table E-2. Key Features of Service-Connected Emergency Care

Feature	Description
Situational eligibility	(1) "Prudent layperson" would have reasonably expected treatment delay to be hazardous; **_and_** (2) VA or federal health care facilities not "feasibly available," **_and_** (3) unreasonable or unwise to attempt to first utilize VA or federal facilities (or prior attempts were refused)
Status eligibility	(1) Emergency treatment is related to a service-connected disability; **_or_** (2) Veteran has total permanent service-connected disability
VA discretion to utilize or pay for non-VA care	VA **_shall_** reimburse Veteran or provider for emergency services rendered, **_but_** only as per VA regulations
Provider qualifications or requirements	None
Veteran input into provider choice	Presumably unlimited
Additional requirements for inpatient treatment	None until point at which emergency ends
Additional requirements for outpatient treatment	None until point at which emergency ends
Payments	"Usual and customary" charges according to statute, but regulations add the following: If *inpatient*, "prospective payment system similar to that used in the Medicare program" If *outpatient*, (1) the amount described on any contract or negotiated agreement, **_or_** (2) if no contract or agreement exists (a) the "Medicare rate", (b) the "repricer" rate, **_or_** (c) amount the provider bills general public

---

Feature	Description
Direct payer of provider	VA or Veteran (who is later reimbursed by VA)
Medical record sharing requirements	None
Coverage	National
First year implemented or authorized	1973
Status	Active
Key statutes or laws	38 U.S.C. 1728
Key regulations	38 C.F.R. 17.120–17.121

The other main avenue to reimbursed external emergency care is 38 U.S.C. 1725, which does not require a Veteran to have a service-connected disability (see Table E-3).

Table E-3. Key Features of Non–Service-Connected Emergency Care

Feature	Description
Situational eligibility	(1) "Prudent layperson" would have reasonably expected treatment delay to be hazardous; **_and_** (2) VA or federal health care facilities not "feasibly available," **_and_** (3) unreasonable or unwise to attempt to first utilize VA or federal facilities
Status eligibility	(1) Must be "active" participant in VA health care receiving treatment in prior 24 months; (2) Veteran must not have any other health plans or coverage that could pay for some of the bill; **_and_** (3) Veteran must not have any other collateral sources that could cover the entire bill
VA discretion to utilize or pay for non-VA care	VA **_shall_** reimburse Veteran or provider for emergency services rendered, **_but_** only as per VA regulations
Provider qualifications or requirements	Must be hospital ER or a similar facility held out as providing emergency care
Veteran input into provider choice	Presumably unlimited

Feature	Description
Additional requirements for inpatient treatment	VA suggests that inpatient providers contact VA within 48 hours of admission
Additional requirements for outpatient treatment	None
Payments	"Reasonable value of emergency treatment" (secondary payer if third party collateral source provides some contribution) but VA establishes maximum amount payable by regulation: Lesser of (1) Amount for which the Veteran is personally liable *or* (2) 70 percent of Medicare fee schedule.
Direct payer of provider	VA or Veteran (who is later reimbursed by VA)
Medical record sharing requirements	None
Coverage	National
First year implemented or authorized	1999
Status	Active
Key statutes or laws	38 U.S.C. 1725
Key regulations	38 C.F.R. 17.1000–17.1008

E.3   Cost of Care to Veterans

Veterans enrolled in VA health care do not pay premiums; however, they may be charged copayments based on the type of care provided, whether the condition being treated is service-connected, and the Veteran's enrollment priority group. Copayments are charged for four types of health care services, including inpatient care, outpatient care (except preventive care), outpatient medication, and long-term care services. Only those Veterans in Priority Group 1 are never charged copayments; those with higher incomes (Priority Groups 7 and 8) are billed for copays for all four types of service. Veterans in Priority Groups 2, 3, and 5 may be charged co-pays for outpatient medication, and those in Priority Group 5 have copayments for long-term care services. Assessment B's report details the cost of VA care to Veterans, with data on various types of users, services, and insurance type.

VA is required by federal law to bill a Veteran's private insurance provider for health care services for any non-service connected condition, and it may also bill Medicare supplemental insurance plans.[154] In FYs 2015 and 2016, VA plans to recoup $3.2 billion in private payments for non–service-connected health care. Payments received from private insurers may be used to reduce Veterans' required copayments.

---

[154] The Balanced Budget Act of 1997 (P.L. 105-33) required VA to establish the "Medical Care Collections Fund," and to seek reimbursement from Veterans and/or private insurers for non–service-connected health care services. Importantly, this statute also allowed VA to retain these funds instead of returning them to the U.S. Treasury and to roll them over to later fiscal years. See Panangala (2013, p. 10).

Transforming Health Care Scheduling and Access

Getting to Now

Committee on Optimizing Scheduling in Health Care

Gary Kaplan, Marianne Hamilton Lopez, and J. Michael McGinnis,
Editors

INSTITUTE OF MEDICINE
OF THE NATIONAL ACADEMIES

The serpent has been a symbol of long life, healing, and knowledge among almost all cultures and religions since the beginning of recorded history. The serpent adopted as a logotype by the Institute of Medicine is a relief carving from ancient Greece, now held by the Staatliche Museen in Berlin.

INSTITUTE OF MEDICINE
OF THE NATIONAL ACADEMIES

Advising the Nation. Improving Health.

THE NATIONAL ACADEMIES
Advisers to the Nation on Science, Engineering, and Medicine

The **National Academy of Sciences** is a private, nonprofit, self-perpetuating society of distinguished scholars engaged in scientific and engineering research, dedicated to the furtherance of science and technology and to their use for the general welfare. Upon the authority of the charter granted to it by the Congress in 1863, the Academy has a mandate that requires it to advise the federal government on scientific and technical matters. Dr. Ralph J. Cicerone is president of the National Academy of Sciences.

The **National Academy of Engineering** was established in 1964, under the charter of the National Academy of Sciences, as a parallel organization of outstanding engineers. It is autonomous in its administration and in the selection of its members, sharing with the National Academy of Sciences the responsibility for advising the federal government. The National Academy of Engineering also sponsors engineering programs aimed at meeting national needs, encourages education and research, and recognizes the superior achievements of engineers. Dr. C. D. Mote, Jr., is president of the National Academy of Engineering.

The **Institute of Medicine** was established in 1970 by the National Academy of Sciences to secure the services of eminent members of appropriate professions in the examination of policy matters pertaining to the health of the public. The Institute acts under the responsibility given to the National Academy of Sciences by its congressional charter to be an adviser to the federal government and, upon its own initiative, to identify issues of medical care, research, and education. Dr. Victor J. Dzau is president of the Institute of Medicine.

The **National Research Council** was organized by the National Academy of Sciences in 1916 to associate the broad community of science and technology with the Academy's purposes of furthering knowledge and advising the federal government. Functioning in accordance with general policies determined by the Academy, the Council has become the principal operating agency of both the National Academy of Sciences and the National Academy of Engineering in providing services to the government, the public, and the scientific and engineering communities. The Council is administered jointly by both Academies and the Institute of Medicine. Dr. Ralph J. Cicerone and Dr. C. D. Mote, Jr., are chair and vice chair, respectively, of the National Research Council.

Reviewers

This report has been reviewed in draft form by individuals chosen for their diverse perspectives and technical expertise, in accordance with procedures approved by the National Research Council's Report Review Committee. The purpose of this independent review is to provide candid and critical comments that will assist the institution in making its published report as sound as possible and to ensure that the report meets institutional standards for objectivity, evidence, and responsiveness to the study charge. The review comments and draft manuscript remain confidential to protect the integrity of the deliberative process. We wish to thank the following individuals for their review of this report:

Karen S. Cook, Stanford University
Julie A. Freischlag, University of California, Davis, School of Medicine
Mark E. Frisse, Vanderbilt University
Christine Hunter, U.S. Office of Personnel Management
Beverley H. Johnson, Institute for Patient- and Family-Centered Care
Kenneth W. Kizer, University of California, Davis, School of Medicine
Charles E. Phelps, University of Rochester
Murray Ross, Kaiser Foundation Health Plan, Inc.
Vinod K. Sahney, Northeastern University
Katepalli R. Sreenivasan, New York University
Alfred F. Tallia, Rutgers University
Alan R. Washburn, U.S. Naval Postgraduate School

Although the reviewers listed above have provided many constructive comments and suggestions, they were not asked to endorse the conclusions or recommendations nor did they see the final draft of the report before its release. The review of this report was overseen by **Georges C. Benjamin,** American Public Health Association, and **Lawrence D. Brown,** University of Pennsylvania. Appointed by the National Research Council and the Institute of Medicine, they were responsible for making certain that an independent examination of this report was carried out in accordance with institutional procedures and that all review comments were carefully considered. Responsibility for the final content of this report rests entirely with the authoring committee and the institution.

Contents

Summary

The Institute of Medicine (IOM) report *Crossing the Quality Chasm* (2001a) identified six fundamental aims for health care—that it be safe, effective, patient-centered, efficient, equitable, and timely. Of these fundamental aims, timeliness is in some ways the least well studied and understood. How can timely care be ensured in various health care settings, and what are some of the reasons that care is sometimes not timely?

The report presented here was developed by the IOM Committee on Optimizing Scheduling in Health Care to answer such questions. Although the study was prompted by attention to a high-profile crisis in a health center operated by the Veterans Health Administration of the Department of Veterans Affairs (VA/VHA), and it was commissioned by the VA, the report focuses broadly on the experiences and opportunities throughout the nation related to the scheduling of and access to health care. As a "fast track" Academy study, the report is limited as to the detail of practice considerations. It reviews what is currently known and experienced with respect to health care access, scheduling, and wait times nationally, and it offers preliminary observations about emerging best practices and promising strategies. The report concludes that opportunities exist to implement those practices and strategies (including virtually immediate engagement) and presents recommendations for needed approaches, policies, and leadership.

STUDY CHARGE AND APPROACH

Convened at the request of the VA/VHA, the committee was charged with the following tasks: (1) review the literature assessing the issues, pat-

---

BOX S-1
Patient- and Family-Centered Care

Patient- and family-centered care is designed, with patient involvement, to ensure timely, convenient, well-coordinated engagement of a person's health and health care needs, preferences, and values; it includes explicit and partnered determination of patient goals and care options; and it requires ongoing assessment of the care match with patient goals.

---

terns, standards, challenges, and strategies for scheduling timely health care appointments; (2) characterize the variability in need profiles and the implications for the timing in scheduling protocols; (3) identify organizations with particular experience and expertise in demonstrating best practices for optimizing the timeliness of scheduling matched to patient need and avoiding unnecessary delays in delivery of needed health care; (4) consider mandates and guidance from relevant legislative processes, review wait time proposals from the VA/VHA Leading Access and Scheduling Initiative, and evaluate all evidence indicated above, along with input and comment from others in the field; (5) organize a public workshop of experts from relevant sectors to inform the committee on the evidence of best practices, their experience with acuity-specifics standards, and the issues to be considered in applying the standards in various health care settings; and (6) issue findings, conclusions, and recommendations for development, testing, and implementation of standards, and the continuous improvement of their application. Throughout its work, the committee has been guided by its view that health care must always be patient- and family-centered and implemented as a goal-oriented partnership (see Box S-1).

LEARNING FROM OTHER SECTORS

To address scheduling issues, the committee considered a number of established conceptual models and systems-based engineering approaches that have been applied in settings beyond health care. These approaches have enabled many organizations to improve quality, efficiency, safety, and customer experience. However, the success of these methods depends on their application simultaneously in every part of an interconnected system rather than being applied piecemeal to distinct individual processes, departments, or service lines. The notion of an integrated approach is a core concept for timely delivery of health care.

Systems strategies in health care delivery involve the use of scientific insights to illuminate the interdependencies of processes and elements and the effects of these interdependencies on health outcomes. The strategies also entail modeling system relationships, exploring design or policy changes, and optimizing overall performance to produce better health care delivery at lower cost and minimum waste. Most importantly, systems strategies emphasize the integration of all the systems and subsystems that influence health and the optimization of them as a whole. A systems approach to health care involves orienting the system on the needs and perspectives of the patient and family. It emphasizes an understanding of the system's supply and demand elements, developing a capacity for data analysis and measurement strategies, and incorporating evolving technologies. Finally, it relates to creating a culture of service excellence that empowers those on the front lines to experiment, identify limitations, and learn from trials.

LEARNING FROM EXPERIENCE AND BEST PRACTICES

Drawing not only on their expertise, but also on an extensive review of the literature, the comments at a public workshop held for open discussion of experiences and strategies, and an IOM discussion paper authored by leaders of five health care organizations that have implemented transformative changes, the committee identified innovative systems models that have been shown in limited settings to improve scheduling and wait time outcomes and to have either neutral or positive effects on the quality of care and patient experience. The examples presented reflect experiences in multiple specialties, care delivery settings, and business models and in organizations of various sizes and located in various geographical regions. They draw on process reengineering, resource reallocation, and behavioral change strategies. Applicable to ambulatory practices, hospitals, and rehabilitation facilities, such system-wide improvements can increase the likelihood that the right care will be delivered at the right time to every patient. Additionally, with further research into their efficacy, these models have the potential to be adopted more widely and to become the foundation for standards of care.

Specific approaches that have been successful in ambulatory care settings include scheduling strategy models and options that reframe supply and demand. Scheduling models include the advanced access model, also known as open access or same-day scheduling, in which a sizeable share of the day's appointments are reserved for patients desiring a same-day appointment (Murray and Berwick, 2003), and the smoothing flow scheduling model, which uses the operations management technique of smoothing flow to identify and quantify the types of variability in patient flow (demand) and the resources available to different patient groups (supply) (Litvak and

Fineberg, 2013). Options that reframe supply and demand include team-based workforce optimization strategies that increase provider capacity by assigning care tasks to appropriate members of the care team, delegating certain tasks to non-clinician team members (e.g., Brandenburg et al., 2015), and technology-based alternatives to in-person visits that address patient needs via phone, telemedicine, and/or mobile health units (Charles, 2000; IOM, 2000; Naylor and Imison, 2010).

Specific approaches that have been successful in inpatient and emergency care settings include the smoothing flow scheduling model, coordinated care models, and the use of systems and simulation models. Care coordination interventions can improve patient flow through hospitals by both improving output flow (i.e., assuring timely discharge) and preventing readmissions (Coleman et al., 2004, 2006). Systems models and techniques, such as Lean processes, can be used to identify and continuously monitor process inefficiencies causing the imbalances in patient demand and hospital capacity that lead to delays in patient flow and increased wait times (e.g., Cima et al., 2011; Lee et al., 2015). Simulation models can also be used as a planning tool to match hospital capacity to patient need (Everett, 2002; Jones and Evans, 2008; Kolker, 2008).

The committee presents case examples of organizations that have applied these systems strategies to improve scheduling and reduce wait times (see Chapter 4). The cases reflect experiences in multiple specialties, care delivery settings, and business models and in organizations of various sizes and geographical regions.

FINDINGS, BASIC ACCESS PRINCIPLES, AND RECOMMENDATIONS

Based on its review and discussions, the committee developed a set of findings and recommendations, which are presented throughout the report and described in detail in Chapter 5. The findings are summarized in Box S-2.

Additionally, throughout its work, the committee identified a number of commonalities among exemplary practices reflected in the literature and throughout the selected set of promising case examples. These commonalities, presented in Box S-3, represent a set of basic health care access principles for primary, specialty, and hospital and post-acute care scheduling, and also provide targets for expanded research and evaluation.

The committee recommendations, which are summarized in Box S-4, call out the need for leadership at both the national level and the level of each health care facility. Nationally, the committee emphasizes several key needs: the spread and implementation of the identified access principles; direct senior federal official collaborative leadership; tools and strategies

---

BOX S-2
Summary of Committee Findings

- **Variability:** Timeliness in providing access to health care varies widely.
- **Consequences:** Delays in access to health care have multiple consequences, including negative effects on health outcomes, patient satisfaction with care, health care utilization, and organizational reputation.
- **Contributors:** Delays in access to health care have multiple causes, including mismatched supply and demand, a provider-focused approach to scheduling, outmoded workforce and care supply models, priority-based queues, care complexity, reimbursement complexity, financial barriers, and geographic barriers.
- **Systems strategies:** Although not common practice, immediate engagement for patients is achievable through queue streamlining and related systems strategies to access and scheduling.
- **Supply and demand:** Continuous assessment, monitoring, and realigning of supply and demand are basic requirements for improving health care access.
- **Reframing:** Alternatives to in-office physician visits, including the use of non-physician clinicians and technology-mediated consultations, can often meet patient needs.
- **Standards:** Standardized measures and benchmarks for timely access to health care are needed for reliable assessment and improvement of health care scheduling.
- **Evidence:** Available evidence is very limited on which to provide setting-specific guidance on care timeliness.
- **Best practices:** Emerging best practices have improved health care access and scheduling in various locations and serve as promising bases for research, validation, and implementation.
- **Leadership:** Leadership at every level of the health care delivery system is essential to steward and sustain cultural and operational changes needed to reduce wait times.

BOX S-3
Basic Access Principles for All Settings

- **Supply–demand matching** through formal ongoing evaluation.
- **Immediate engagement** and exploration of need at time of inquiry.
- **Patient preference** on timing and nature of care invited at inquiry.
- **Need-tailored care** with reliable, acceptable alternatives to clinician visit.
- **Surge contingencies** in place to ensure timely accommodation of needs.
- **Continuous assessment** of changing circumstances in each care setting.

BOX S-4
Summary of Committee Recommendations

For National Leadership leading to:
1. **Basic access principles** spread and implemented.
2. **Federal implementation initiatives** with multiple department collaboration.
3. **Systems strategies** broadly promoted in health care.
4. **Standards development** proposed, tested, and applied.
5. **Professional societies** leading application of systems approaches.
6. **Public and private payers** providing financial incentives and other tools.

For Health Care Facility Leadership leading to:
7. **Front-line scheduling** practices anchored in the basic access principles.
8. **Governance commitment** to leadership on basic access principles.
9. **Patient and family participation** in designing and leading change.
10. **Continuous assessment** and adjustment at every care site.

---

developed to aid adoption of systems approaches to care scheduling and delivery; and coordinated efforts among key stakeholders to build the evidence base, test best practices, develop and implement standards, and create incentives for their application. In addition, leadership is necessary to ensure that in each health care setting, practices are anchored in the basic access principles; governance at the executive and board level is fully committed; and the perspectives of patients, families, and other stakeholder groups are included in planning, implementing, and evaluating institutional approaches to scheduling.

1

Improving Health Care Scheduling

INTRODUCTION

"How can we help you today?" Each of us would like to hear these words when seeking health care assistance for ourselves, for our families, or for others. It should not only be our wish, but our expectation. Health care that implements a "How can we help you today?" philosophy is care that is patient centered, takes full advantage of what has been learned about systems strategies for matching supply and demand, and is sustained by leadership committed to a culture of service excellence and continuous improvement. Care with this commitment is feasible and can be found in practice today.

Yet it is not common practice. In 2001, the Institute of Medicine (IOM) landmark report *Crossing the Quality Chasm* identified being timely as one of the six fundamental properties of high-quality health care—along with being safe, being effective, being patient-centered, being efficient, and being equitable (IOM, 2001a). Progress has been slow on many dimensions including programs to design, implement, and share innovative scheduling and wait time practices in order to advance the evidence base and create standards and accountability. The culture, technology, and financial incentives at work in health care have only recently begun to heighten awareness and attention to the issue that delays are often not the result of resource limitations but more commonly are the product of flawed approaches to the scheduling process and poor use of the full range of available resources.

Although prompted by attention to a high-profile crisis in a health center operated by the Veterans Health Administration of the Department

of Veterans Affairs (VA/VHA), and commissioned by the VA, this report focuses broadly on the experiences and opportunities throughout the nation related to the scheduling of and access to health care. As a "fast track" Academy study, the report is limited as to the detail of practice considerations. It reviews what is currently known and experienced with respect to health care access, scheduling, and wait times nationally, offers preliminary observations about emerging best practices and promising strategies (including immediate engagement), concludes that opportunities exist to implement those practices and strategies, and presents recommendations for needed approaches, policies, and leadership.

CONTEXT: VA PHOENIX HEALTH CENTER CRISIS

In 2014, in response to allegations of mismanagement and fraudulent activity pertaining to health care scheduling, the VA/VHA Office of Inspector General conducted an audit of the VA Phoenix Health Care System. The interim report from that audit confirmed that the Phoenix Health Care System had been falsely reporting its scheduling queues and wait times. The audit found that 1,700 veterans in need of a primary care appointment had been left off the mandatory electronic waiting list (EWL) that was reported to VA/VHA leadership (VA, 2014b). Of greater concern was that the VA/VHA final report, *Review of Alleged Patient Deaths, Patient Wait Times, and Scheduling Practices at the Phoenix VA Health Care System*, identified 40 veterans who had died while on the EWL waiting for an appointment. While the report found that there is not enough evidence to conclude that the prolonged waits were the cause of these deaths, it documented a poor quality of care in the Phoenix system (VA, 2014e). The report further determined that in an attempt to meet the needs of both veterans and the clinicians employed by the VA/VHA, certain facilities had developed overly complicated scheduling processes that resulted in a high potential of creating confusion among scheduling clerks and frontline supervisors (VA, 2014e). The report concluded that inappropriate scheduling practices are a systemic problem across the entire system nationwide (VA, 2014e) and called for an end to arbitrary scheduling standards, for more transparency and accountability, and for more attention to be paid to the "corrosive culture" that led to the manipulation of data in the system (VA, 2014e).

In response to the findings of the audit, the VA/VHA deployed the Leading Access and Scheduling Initiative (LASI), a 90-day program to develop and deploy rapid changes across its entire system. LASI, which ended in September 30, 2014, resulted in the completion of 120 tasks and 60 deliverables, including the development of new performance management plans; the addition of primary care into the Patient-Centered Com-

munity Care for non-VA care program; a focus on transparency through the monthly publication of wait time data (VA, 2015a); and a number of activities and policies focused on schedulers, which included interviews in the field, a review of schedulers' grades to combat high turnover rates, and an educational campaign to standardize scheduling processes across the system.

In August 2014, the Veterans Access, Choice, and Accountability Act was enacted to provide funds for veterans to receive care in the private sector in the case of prolonged waits at VA/VHA facilities and also to provide funds for the hiring of a large number of health care providers and the acquisition of additional VA/VHA sites of care (VA, 2014f). The bill also required the VA/VHA to conduct an independent assessment of the hospital care and medical services furnished in its medical facilities as well as an independent assessment of access to those services.

In October 2014, the VA/VHA established the Veterans Choice Program in accordance with Section 101 of the Veterans Access, Choice, and Accountability Act. The Choice Program addresses the VA/VHA wait time goals in such a way that veterans enrolled in VA/VHA health care will be provided clinically appropriate VA/VHA care within 30 days of making a request for medical services. Veterans who cannot receive a scheduled appointment within the 30-day standard or who reside more than 40 miles from the closest VA/VHA medical facility are able to receive care from facilities outside the VA/VHA system (VA, 2014f).

CONTEXT: NATIONAL ISSUES IN ACCESS AND WAIT TIMES

The data on access and wait times in health care are limited, and there is a prominent deficiency in research, evidence-based standards, and metrics for assessing the prevalence and impact of these issues (Brandenburg et al., 2015; Leddy et al., 2003; Michael et al., 2013). However, the limited information suggests that similar scheduling challenges are found well beyond the VA/VHA and exist throughout the public and private sectors of the U.S. health care system. The available data show tremendous variability in wait times for health care appointments within and between specialties and within and between geographic areas.

Variability in Access and Wait Times

The VA/VHA data released in October 2014 indicated an average wait time of 43 days for new primary care appointments, with a range of 2 to 122 days across all VA/VHA facilities (VA, 2014c). Detailed data from a review of Massachusetts physicians revealed average wait times of 50 days for internal medicine and 39 days for family medicine appointments (MMS,

2013). A 2014 MerrittHawkins study of appointment wait times in 15 cities across the United States found significant variation per city and per specialty. For example, average wait times to see a cardiologist ranged from a high of 32 days in Washington, DC, to a low of 11 days in Atlanta (Merritt Hawkins, 2014). A Department of Defense review of the Military Health System's military treatment facilities and privately purchased health care services found that their average wait times for specialty care (12.4 days) and for non-emergency appointments (less than 24 hours) exceeded their internal standards, but there was variation across settings as well as a lack of comparable data with vendors because of alternative access measures (DoD, 2014).

Studies have also shown that children with coverage from Medicaid or the Children's Health Insurance Program are more likely than those with private insurance to be made to wait more than 1 month, even for serious medical problems (Bisgaier and Rhodes, 2011; Rhodes et al., 2014). Academic medical centers, which often function as safety net providers, are less likely to deny appointments to children with Medicaid or the Children's Health Insurance Program, but those children still experience significantly longer wait times compared to privately insured children (Bisgaier et al., 2012).

Most U.S. data on access to care come from surveys of patient experience, which refers to health care processes that patients can observe and participate in (Anhang Price et al., 2014). These include objective experiences such as wait times and subjective experiences such as trust in a provider, and provider and staff behavior such as provider–patient communication and continuity of care (Anhang Price et al., 2014). "Patient experience" is distinguished from "patient satisfaction," which provides an assessment of a particular care experience (Anhang Price et al., 2014).

The Consumer Assessment of Healthcare Providers and Systems (CAHPS) surveys are the principal surveys done on patient experiences with health care access and quality in the United States. CAHPS covers hospitals, health plans, and ambulatory care, among others. Managed by the Agency for Healthcare Research and Quality (AHRQ) through a public–private initiative, the CAHPS program develops standardized, tested, and publicly available measurement tools of patient experiences with health care access and quality, as well as standardized and tested methods for collecting and analyzing survey data (Lake et al., 2005). In the 2013 CAHPS clinician and group survey, 63 percent of U.S. adults reported getting appointments, care, and information for primary and secondary care when they needed it (AHRQ, 2015). In addition to CAHPS, a number of private vendors provide patient satisfaction instruments, including Arbor Associates, Inc., the Jackson Group, Press Ganey Associates, Inc., and Professional Research Consultants, Inc. (Urden, 2002).

Impact of Delays in Access, Scheduling, and Wait Times

Generally, positive patient care experiences are associated with greater adherence to recommended care, better clinical care and health care quality outcomes, and less health care utilization (Anhang Price et al., 2014). A patient's inability to obtain a timely health care appointment may result in various outcomes: the patient eventually seeing the desired health care providers, the patient obtaining health care elsewhere, the patient seeking an alternative form of care, or the patient not obtaining health care at all for the condition that led to the request for an appointment. In any of these cases, the condition may worsen, improve (with or without treatment elsewhere), or continue until treated. Thus, long wait times may be associated with poorer health outcomes and financial burden from seeking non-network care and possibly more distant health care. Long wait times may also cause frustration, inconvenience, suffering, and dissatisfaction with the health care system.

Impact on Health Care Outcomes

Extended wait times and delays for care have been shown to negatively affect morbidity, mortality, and the quality of life via a variety of health issues, including cancer (Christensen et al., 1997; Coates, 1999; Waaijera et al., 2003); heart disease (Cesena et al., 2004; Sobolev et al., 2006a,b, 2012, 2013); hip (Garbuz et al., 2006; Moja et al., 2012; Simunovic et al., 2010; Smektala et al., 2008) and knee problems (Desmeules et al., 2012; Hirvonen et al., 2007); spinal fractures (Braybrooke et al., 2007); and cataracts of the eye (Boisjoly et al., 2010; Conner-Spady et al., 2007; Hodge et al., 2007). The timely delivery of appropriate care has also been shown to reduce the mortality and morbidity associated with a variety of medical conditions, including kidney disease and mental health and addiction issues (Gallucci et al., 2005; Hoffman et al., 2011; Smart and Titus, 2011).

A study of wait times at VA facilities analyzed facility and individual-level data of veterans visiting geriatric outpatient clinics, finding that longer wait times for outpatient care led to small yet statistically significant decreases in health care use and were related to poorer health in elderly and vulnerable veteran populations (Prentice and Pizer, 2007). Mortality and other long-term and intermediate outcomes, including preventable hospitalizations and the maintenance of normal-range hemoglobin A1C levels in patients with diabetes, were worse for veterans seeking care at facilities with longer wait times compared to those treated at VA facilities with shorter wait times for appointments (Pizer and Prentice, 2011b).

Reducing wait times for mental health services is particularly critical, as evidence shows that the longer a patient has to wait for such services,

the greater the likelihood that the patient will miss the appointment (Kehle et al., 2011; Pizer and Prentice, 2011a). Patients respond best to mental health services when they first realize that they have a problem (Kenter et al., 2013). However, because primary care providers can act as the gate-keepers for mental health care, patients face an even longer delay for mental health services because of the need to first get a primary care appointment.

Impact on Patient Experience and Health Care Utilization

Patient experience has also been shown to be associated with perceptions of the quality of clinical care (Schneider et al., 2001). A study of patient experiences in England found that although all elements of patient primary care experience (including access, care continuity, provider–patient communication, overall patient satisfaction, confidence and trust in doctor, and care planning) were associated with quality of care, straightforward initial access elements (e.g., the ability to get through on the telephone and to make appointments) were most strongly related with quality of care (Llanwarne et al., 2013).

The perception of longer wait times is also negatively associated with overall patient satisfaction (Thompson et al., 1996). A study of patients treated at a large U.S. academic medical center found that not only was overall satisfaction with the health care experience negatively affected by longer wait times, so too was the perception of the information, instructions, and treatment that the patients received from their health care providers (Bleustein et al., 2014).

Extended wait times are also associated with higher rates of appointment no-shows, as feelings of dissatisfaction and inconvenience discourage patients from attending a first appointment or returning for follow-up care (Meyer, 2001). In a survey of caregivers who brought children to an emergency department, difficulty getting needed care from a primary care provider, especially long wait times, was associated with increased non-urgent emergency department use, suggesting that delays that are unaddressed in one area of health care delivery may lead to delays in other parts of the health care system (Brousseau et al., 2004).

COMMITTEE CHARGE AND APPROACH

Scope of the Report

To address the challenges associated with access and scheduling of U.S. health care services, the VA/VHA requested the IOM to assess the range of experiences nationally and to identify existing standards and best practices. The aim was to make recommendations for improving performance

throughout the nation on health care scheduling, access, and wait times, including, but not specific to, the VA/VHA (see Box 1-1).

Study Approach

As an accelerated study, the committee's task was addressed through one in-person meeting, which included a public workshop (a brief summary of which can be found in Appendix B), numerous conference calls, and directed staff work to assemble the evidence and identify exemplary practices. Primary attention was given in this work to gathering and examining the available evidence documenting demonstrated practices for improving access, scheduling, and wait times in health care; learning from presentations by representatives of organizations deemed to have developed beneficial strategies for productive change; and identifying principles for best practices based on the experiences of those organizations.

BOX 1-1
Statement of Task

An ad hoc committee will conduct a study and prepare a report directed at exploring appropriate access standards for the triage and scheduling of health care services for ambulatory and rehabilitative care settings to best match the acuity and nature of patient conditions. The committee will:

1. Review the literature assessing the issues, patterns, standards, challenges, and strategies for scheduling timely health care appointments.
2. Characterize the variability in need profiles and the implications for the timing in scheduling protocols.
3. Identify organizations with particular experience and expertise in demonstrating best practices for optimizing the timeliness of scheduling matched to patient need and avoiding unnecessary delays in delivery of needed health care.
4. Organize a public workshop of experts from relevant sectors to inform the committee on the evidence of best practices, their experience with acuity-specific standards, and the issues to be considered in applying the standards under various circumstances.
5. Issue findings, conclusions, and recommendations for development, testing, and implementation of standards and the continuous improvement of their application.

In the course of their work, the committee will consider mandates and guidance from relevant legislative processes, review VA/VHA wait time proposals from the Leading Access and Scheduling Initiative, and evaluate all evidence indicated above, along with input and comment from others in the field.

Evidence to guide decisions or actions comes in many forms—randomized controlled trials, observational studies, and expert opinion among scientists and health care professionals, as well as that among patients and their families (IOM, 2001b). Similarly, evidence is used for many purposes, including application to learn the effectiveness of an intervention under controlled circumstances, development of standards for assessing outcomes, and use in comparing the results of different approaches under different circumstances. The strongest form of evidence, well-designed systematic trials with carefully matched controls, is important when introducing a new treatment, but is often not available, or even necessarily appropriate in the assessment of health services with highly variable input elements. The fact that trial data are not available to assess approaches to scheduling and access is not in itself limiting, but the overall paucity of reliable study and experiential outcomes data from any source presents a challenge. The committee therefore relied on an extensive environmental scan. In its scan of access and scheduling in U.S. health care services, the committee looked at the VA/VHA, private and public providers, and other sectors. The scope of the committee's review covers first appointments and follow-up appointments for primary care, scheduling and wait times for hospital care, access to rehabilitation care, referrals to specialty care, and first appointments for mental health. The committee considered wait times to get an appointment and wait times within appointments and also ways to meet patient demand for health care other than in-person appointments.

The committee also enlisted the leaders of five institutions—Denver Health, Geisinger Health System, Kaiser Permanente, Seattle Children's Hospital, and ThedaCare—to report on the strategies, experiences, and results achieved in their respective systems (Brandenburg et al., 2015). The conceptual framework (see Figure 1-1) that was developed by the committee to guide its assessment of the factors shaping overall system performance identifies supply and demand assessments as the anchor inputs, plus major enabling or constraining influences from culture, management, patients—e.g., the leverage contributed by evidence- and theory-based systems engineering, enlightened management that creates a culture of change and improvement, and the extent of patient involvement.

According to the statement of task, the committee was to look at "ambulatory and rehabilitative care settings." Given the evolving and adapting continuum of care, and recognizing that ambulatory, rehabilitative, and acute care are interdependent, the committee chose to focus on scheduling and access issues within acute care as well as ambulatory and rehabilitative care. Its aim was therefore to generate a report that was meaningful and relevant to the entire health care system.

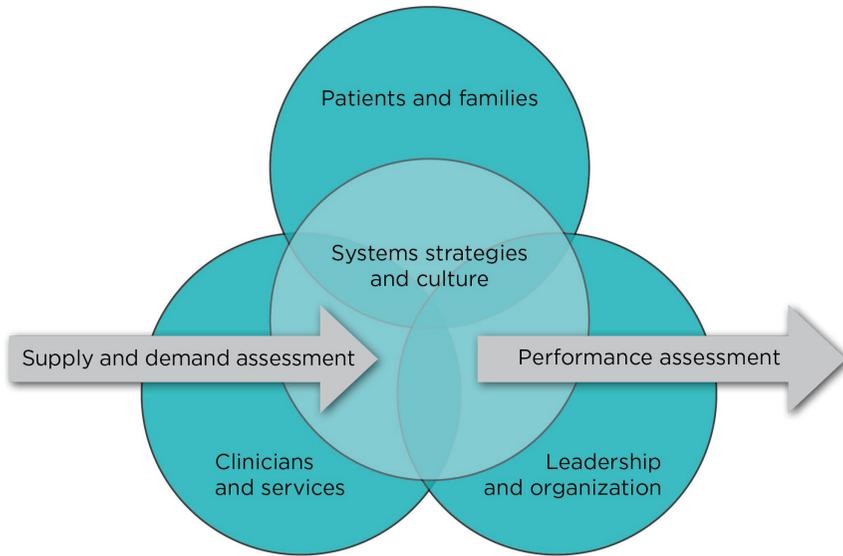
The statement of task also highlighted the Leading Access and Scheduling Initiative (LASI) for consideration and analysis, and the committee


FIGURE 1-1 Framework for access and wait times transformation.

engaged in ongoing conversations with the VA/VHA about the intent and outcomes of the initiative. The information gathered during this communication is summarized above. However, in the absence of published information about LASI, the committee has not conducted additional analysis of LASI or offered findings or conclusions specific to the Initiative.

Structure of the Report

This report is intended to be useful to both the public and technical audiences and is composed of five chapters. Following this introduction and overview of the report's goals, Chapter 2 describes the current situation concerning challenges with access, scheduling, and wait times in health care. Chapter 3 describes systems strategies for continuous improvement and offers examples of how these strategies have been applied in other sectors. Chapter 4 describes a number of emerging best practices and alternative models for scheduling, including framing and operationalizing assessments of supply and demand. Finally, Chapter 5 presents the committee's findings and recommendations for transforming access and scheduling in health care.

A primary focus of the report is on primary care services, while laying the groundwork for improved access throughout other areas of the

health care system. Primary care services form the core of the ambulatory health care system. Related scheduling approaches are key to success of initiation around accountable care organizations (ACOs) and medical homes. A foundational element of the committee's findings and recommendations is the centrality of orienting health care to the needs and perspectives of the patient and family (Berry et al., 2014). Patient-centered care has been described as an approach to the planning, delivery, and evaluation of health care that is respectful of and responsive to individual patient preferences, needs, and values (IOM, 2001a). With recent additional insights on the ability of meaningful patient engagement to improve the outcomes of care, the elements of patient-centered care have taken on additional clarity. Indeed, the committee views patient- and family-centered care not only to be designed with patient involvement to enable timely, convenient, well-coordinated engagement of a person's needs, preferences, and values but also to include explicit and partnered determination of patient goals and care options as well as ongoing assessment of the care match with patient goals (see Box 1-2). This is the perspective that has guided the committee's work throughout.

BOX 1-2
Patient- and Family-Centered Care

Patient- and family-centered care is designed, with patient involvement, to ensure timely, convenient, well-coordinated engagement of a person's health and health care needs, preferences, and values; it includes explicit and partnered determination of patient goals and care options; and it requires ongoing assessment of the care match with patient goals.

2

Issues in Access, Scheduling,
and Wait Times

As background for the discussions in the report, this chapter defines some of the common terms and concepts from the area of health care access and scheduling, describes the scheduling practices most often seen in various health care settings, and identifies the basic factors that play a role in scheduling delays and variability.

TERMS AND PATTERNS

In the U.S. health care system, the three most commonly used scheduling techniques for both inpatient and outpatient services are block scheduling, modified block scheduling, and individual scheduling (NAE/IOM, 2005). In block scheduling, patients are scheduled within specific times throughout the day, such as morning or afternoon, and then seen on a first-come, first-served basis within that time frame. Modified block scheduling assigns a smaller number of patients to smaller segments of time throughout the day, such as hourly. Individual scheduling, the most commonly used scheduling technique in the country, occurs when a single patient is scheduled for a specific point in time, with the timing of the appointments determined according to the supply of care providers (NAE/IOM, 2005).

Although delays in care delivery are common—and unpleasant—occurrences in both public and private health care systems, there are few reliable data with which to determine the prevalence, degree, or nature of the problem. Even defining when a delay in seeing a preferred health care provider is inappropriate is not always straightforward.

There are a number of approaches for categorizing scheduling and wait time delays. They include approaches, such as the third next available appointment (TNA) for ambulatory care, defined as the average length of time in days between when a patient requests an appointment and the third next available appointment; boundary approaches, such as the 4-hour wait time target for emergency departments used in England and Australia (Hughes, 2010; IHI, 2014a,b; Jones and Schimanski, 2010; Weber et al., 2012); and the "office visit cycle time," defined as the time between a patient's arrival and departure times at a medical office, which can be used to separate productive time from waiting time. Each of these scheduling tools is focused on a delay in a different part of the patient care continuum. For example, TNA captures the delay in getting an appointment or service, whereas cycle time measures the delay at the appointment or service. They are different methods designed to capture delays in different processes. Patient views of acceptable wait times are also poorly captured in available scheduling assessment tools, and the measurement of these factors becomes costly and is often imprecise (Paterson et al., 2006). Some of the terms commonly used in discussions of patient scheduling are listed in Box 2-1.

BOX 2-1
Concepts and Terms in Patient Scheduling

Access includes contact with the health care system, availability of appropriate services, and the delivery of the services necessary to meet patient needs.

Actual wait time, a measure currently used by the U.S. Department of Veterans Affairs, is a retrospective time stamp that uses the date the appointment was created in the scheduling system or the date that the patient desired as the start date for the wait-time computation. The time of the completed appointment is used as the end point.

Advanced open access scheduling, also referred to as advanced access, open access, or same-day scheduling, offers a patient calling for an appointment the opportunity to be seen on the same day, preferably although not necessarily by the patient's customary clinician.

Block scheduling schedules patients within specific times throughout the day, such as morning or afternoon, and then they are seen on a first-come, first-served basis within that time frame.

Capacity, or supply   is traditionally defined as the number of appointment slots available for a given period of time, such as 1 day, for all clinicians available during that period. Previous demand that has not yet been matched with appointments

BOX 2-1 Continued

shows itself as a backlog of work or a waiting list. The committee considers it important to view the term more broadly so that supply also entails resources that include labor, equipment, and any required physical environment for safe delivery. Demands can be met by supply elements that include face-to-face meetings, as well as other means, e.g., through a virtual care delivery infrastructure.

Demand traditionally refers to the total number of patient calls for appointments over a fixed period of time, such as 1 day, plus the number of walk-ins and the number of follow-up appointments generated by the physicians at a given practice site. Demand includes those patients that cannot be accommodated on a given day, as demand is independent of the limit of available appointments. The committee considers it important to view the term more broadly, so that demand not only covers the actual visits of patients but comprises all patients reporting problems daily.

Individual scheduling is the most commonly used scheduling technique in the United States, implemented through patient-by-patient scheduling for a specific point in time on a specific day, according to care provider availability in the care setting.

Modified block scheduling assigns a smaller number of patients to smaller segments of time throughout the day, such as hourly.

Office visit cycle time is a term applied to wait times that occur during an appointment. The office visit cycle time is generally measured from check-in to checkout for that appointment and can be broken down into various components of the visit. Each step in the cycle can be classified as either non-value-added time, such as time spent waiting for the next step in the visit, or value-added time, such as time spent with a care team member.

Supply–demand mismatch. An immediate cause of poor access to health care can be an imbalance between the demand for services and the available service capacity. Permanent imbalance, or mismatch, leads to a continued rise in delays until patients choose to seek medical care elsewhere. However, mismatch can also be impermanent, resulting from shifting variations in either supply or demand.

Third next available appointment (TNA) is a value determined by assessing appointment availability and is aimed at providing a reliable indication of the number of days that a patient has to wait to get an appointment (Murray and Berwick, 2003). Because the first and second available appointments are often the result of last-minute cancellations or other events, the third next available appointment best represents the performance of the appointment access system as a whole. TNA can serve as one metric to measure scheduling performance. It allows organizations to capture the TNA before and after an improvement is made.

Wait time to obtain an appointment within the health care system is a measurement of the access delay in the system and reflects the time differential between a patient's call or request for an appointment and an opening in a provider's schedule.

SCHEDULING PRACTICES BY SETTING

Health care scheduling practices vary by setting. Practices in the emergency room, for example, are different from those used by primary care physicians. This section provides an overview of the scheduling practices typically employed in various health care settings. It also discusses some of the issues that lead to delays and increased wait times.

Primary Care

Primary care providers typically serve a large and steady pool of regular patients, and relatively few new patients. The demand for primary care appointments usually has a predictable variation. There is higher demand for the first and last appointments of the day to accommodate work schedules and increased demand on Mondays and in the winter months. The variation in supply is less amenable to change, due to several factors, including competing priorities and responsibilities of the providers and workforce shortages. As a result of the recent Medicaid expansion and the number of patients who are now insured through state exchanges, a shortage has developed in the supply of primary care physicians in some areas of the country relative to the demand (Petterson et al., 2013). Although hiring additional physicians might seem to be the obvious solution to this shortage, given the financial constraints in today's health care sector, this is not a viable option for many health care organizations, and thus they need to find ways to make better use of the existing provider capacity.

No matter which of the three major scheduling techniques is used—block, modified block, and individual scheduling—the majority of scheduling decisions are generally based on predictions of patient need. Priority-based scheduling assigns different wait times to different patients according to assumptions made concerning the level of acuity or need associated with various conditions. For example, an individual with a history of congestive heart failure may be scheduled for follow-up visits at a periodic interval based on patient trends, rather than being given a schedule that reflects his or her actual needs, preferences, or circumstances. Priority-based scheduling creates multiple queues, each associated with a different wait time.

Specialty Care

Referrals and Transfers

The term *specialty care* describes any specialized practice that focuses on care for certain conditions or diagnostic or treatment approaches and primarily receives work as a consult, referral, or transfer (JHU, 2015).

Providing timely appointments for specialty care requires the same baseline measurements that are needed for primary care. Specialty care scheduling can be affected by a number of external factors that are not within the control of either the practice or the patient. These include delays caused by the requirement for insurance preauthorization, the need for additional diagnostic tests that are performed by third parties, and the referring provider not being co-located with the specialty care provider (Murray, 2002). For some conditions, it may be necessary for multiple specialists to coordinate their care, which introduces another level of variability that must be accommodated. An additional challenge for specialty care practices is responding to new patients with urgent needs while maintaining available appointments for returning patients.

Academic specialty practices experience a high degree of variability in providers' availability because the providers tend to have competing education, research, and clinical responsibilities. Although the natural variation in demand in an academic specialty setting is similar to what is seen in other types of settings, the higher degree of variability in supply can lead to challenges. These challenges are complicated by the presence of resident physicians, who are found in specialty care practices as well as other settings. Residents can increase the capacity of a clinic as their experience and training progress, but they can have frequent absences from the practice and require a more flexible model, with additional senior physician oversight. It is a challenge to achieve the competing goals of having patients see their own physicians, minimizing delay, and offering an educational environment for resident physicians. Any scheduling system used in specialty care must not only accommodate a clear definition of a care team, variable caseloads, and clinical times, it must also accommodate providers with substantially different experience levels.

Specialty Care: Providing Mental Health Services

With the implementation of the Affordable Care Act and the expansion of Medicaid, an increasing number of people are gaining access to treatment for mental health and addiction services because of the increased use of public and private insurance coverage. Yet timely access to these services is already a challenge for many Americans, especially veterans. And, given that both public and private health systems require patients to engage with primary care providers before allowing access to mental health care, the total wait times for such services are even longer. Because of the requirement to first see a primary care clinician, mental health patients waiting for transfer to facilities outside of the local health care system were found in one study to experience waits that averaged 15 hours (Weiss et al., 2012).

Emergency Care

Overcrowding, prolonged waiting times, patient care delays, and scarce resources are common in urban emergency medicine today (Yoon et al., 2003). Besides contributing to increased levels of patient frustration and anxiety, prolonged waiting times and protracted lengths of stay can also increase the proportion of patients who leave emergency departments without being seen by a physician (Johnson et al., 2009; Monzon et al., 2005). Emergency department wait times are often caused by hospital systems that require patients to remain in the emergency department while awaiting an opening elsewhere in the hospital (Hoot and Aronsky, 2008). Many hospitals in the United States have attempted to reduce emergency department wait times, but for various reasons their efforts often fail to produce sustainable results. One reason that many emergency department improvement programs do not produce long-lasting results is that the programs focus primarily on discrete processes, disregarding staff behaviors and overall system performance or organizational culture (Melon et al., 2013).

A factor considered as a critical contributor to emergency department overcrowding is patient boarding, or holding patients in the emergency department for observation, rather than discharging them or admitting them to the hospital (ACEP, 2008). Research has demonstrated a correlation between the length of stay in the emergency department and an increased risk of adverse events in patients who are subsequently admitted to the hospital (Guttmann et al., 2011). For example, as a relatively fixed resource for hospitals, bed availability becomes an increasing concern as occupancy increases. Using systems strategies, industrial models and optimization techniques, health care institutions can serve more patients treated in hospitals without increasing the number of actual beds, as is discussed in greater detail in Chapters 3 and 4.

Inpatient Care

Supply and demand are interconnected in a hospital process. There are entry points, exit points, and various steps or nodes involving patients within the system. Three types of delays can result: input delays, which are delays in access to a service, such as the delay for a bed, measured as the time between the decision to admit and the time the patient is actually admitted; throughput delay, or a delay that affects the length of time between a patient's admission and the time he or she is ready to be discharged from in the hospital; and output delay, a delay in the amount of time it takes to get a patient discharged from the hospital, such as a delay caused by a lack of availability of beds in a rehabilitation or extended-care facility (Hall, 2013).

Flow Coordination

Optimizing performance requires measuring the demand, capacity, and flow into and out of each node within the system, and system-wide assessments and adjustments are required to improve the overall collection of steps, including such steps as consolidating or removing processes in order to streamline patient service flow (Lee et al., 2015). The typical hospital includes individual departments and providers who work to meet or exceed patient care standards for their particular discipline. Although this can be an admirable goal, it can also lead to unintended inefficiencies, and it is preferable to rely on a whole-system model rather than a unit- or provider-centric model, which emphasizes performance in specific areas, often at the expense of interdepartmental or system-wide cooperation and coordination (IHI, 2003).

Transfer

Ideally, the movement of patients from admission through treatment and on to discharge should occur without significant delays. However, a department-centric or provider-centric environment focuses on the needs of individual areas, and one area's needs are not necessarily compatible with another area's priorities. For instance, nurses on a medical/surgical unit may not notify bed management that a bed has been vacated or may do so only after a substantial delay—because such notifications are not a high priority for the medical/surgery unit. This can lead to a situation in which there are vacant beds that could be occupied by patients who may be kept waiting somewhere else, including hallways or the emergency department.

Discharge

The discharge planning and placement processes require coordination and communication among personnel from different departments. The processes also need to have an agreed-upon care plan, and attention to various logistical challenges to ensure a patient's safety outside of the hospital setting, such as the arrangement of rehabilitative or in-home care. Ideally, discharge planning begins on the day of admission. Delayed discharges can cause problems because of their impact on hospital admissions and patient throughput. Delayed discharges may, for example, lead to a situation in which there are not enough available beds to meet incoming demand. Critical care units can find it difficult to move patients into step-down areas, which then directly affect admissions from the emergency department. Perioperative services can also experience backups while waiting for beds to become available in the post-anesthesia care unit (Jweinat et al., 2013).

Even under the best of circumstances, the discharge-planning process in hospitals is inherently complex. Patient-specific information (such as medical status and needs, patient and family preferences, and information about available community resources) must be gathered from many sources. Currently, Web-based discharge instructions have the potential to improve readmissions and transitional care (Bell et al., 2013). Poor-quality hospital discharge planning not only will affect the flow of patients within the hospital setting but also puts patients at risk for adverse events outside of the hospital, which in turn can lead to emergency department visits and hospital readmissions.

Rehabilitation Services

When returning to a home care setting is not an option, transfer to an inpatient rehabilitation facility (IRF), a skilled nursing facility (SNF), or a long-term care facility becomes necessary. The committee's review of the literature found scant information regarding IRF and SNF access, although reports are common of poorly informed family preferences leading to transfers and increased health care costs (Lamb et al., 2011).

IRFs provide hospital-level treatment with a focus on rehabilitation and face many of the same challenges related to access and wait times as acute care hospitals do. As with acute care hospitals, insurers have an influence on access to these facilities. In determining demand, it is important to have accurate measurements of admission trends, patient characteristics, and costs. At this time, the best practices for access to inpatient rehabilitation hospitals and skilled nursing facilities remain largely undocumented or validated and will require further development and evaluation.

FACTORS IN SCHEDULING DELAYS AND VARIABILITY

Some of the causes of prolonged wait times are inefficiencies in operation, in care coordination, and in health care organizational culture that result in flow disruption, the underuse of resources, and an imbalance between the demand of patients to be seen and the supply of providers, facilities, and alternative strategies to care for them at any given time (Mazzocato et al., 2010; Young and McClean, 2008). Organization-specific factors, including leadership and the resulting culture, can contribute to access difficulties and long wait times. The many complexities and process interdependencies of our health care system can complicate the challenge of balancing supply and demand.

Supply and Demand Issues

The most fundamental concept in scheduling is attention to the balance of supply and demand (Murray and Berwick, 2003). Unfortunately, most clinical settings do not take a broad enough view of the various options for either increasing supply or reducing demand, nor do they maintain the analytic capacity to observe and understand the dynamics involved (Murray and Berwick, 2003). As noted in Box 2-1, demand traditionally refers to the total number of patient calls for appointments over a fixed period of time, such as 1 day, plus the number of walk-ins and the number of follow-up appointments generated by the physicians at a given practice site. But many facilities define their supply simply in terms of the number of slots they have to fill on a given day or other period of time—that is, only in terms that relate to the availability of clinicians in that period of time. It is very unusual for a practice or clinic to keep a running record of the calls received, appointments made, wait-times, walk-ins, and no-shows, or to document how many queries could be handled by alternate clinicians, telemedicine, and electronic consults (Murray and Berwick, 2003).

Similarly, "supply" as traditionally defined in Box 2-1 is the number of appointment slots available for a given period of time, such as 1 day, for all clinicians available during that period. But often, for scheduling purposes, supply is viewed primarily as the slot availability for the clinician of record or requested by the caller, without consideration of (or the offering of) ways to augment the supply, such as other physicians and clinicians who are available; backup arrangements with other clinics for appropriate circumstances; and other sources, including digital and telephonic sources, that are available to meet callers' needs for information, referral, or advice. Without information of this sort, patterns of variability will be unobserved, alternatives will go untapped, and a supply–demand mismatch—which is often unnecessary—will be inevitable and chronic.

The committee considers it important to view the terms of supply and demand more broadly. Daily patient "demand" covers not only the actual visits of patients but also all contacts from patients reporting problems that day—each query requiring contacts from health care system resources to accommodate properly. Supply entails resources that include labor, equipment, and any required physical environment for safe delivery. Demands can be met via face-to-face setting or virtually. By reframing and expanding the notions of supply and demand, the relationship between a given care team and a patient panel could be expanded and redefined (Murray et al., 2007). Experience from various systems, including Kaiser Permanente and Group Health, suggest that at least 25 percent of patients calling in on a given day will not require an in-person visit but can have their needs addressed using methods such as telehealth (Darkins et al., 2008; Hsu et al.,

2012; Pearl, 2014). Regardless of the use of in-person appointments or alternatives, the supply and demand associated with any strategy that is adopted is dynamic and will become mismatched if not continuously measured, monitored, and readjusted as necessary.

The Current Provider-Focused Approach

The U.S. health care system is influenced by many competing priorities. Health care providers focus on providing care with autonomy and on receiving payment for that care. Providers have incentives to deliver higher paid services that can be supplied at low costs. Consumers seek accessible services and low out-of-pocket costs. Payers desire to select risks and limit costs. Because of these differences, the needs and priorities of different stakeholder groups are not always aligned (IOM, 2001a). The health care system currently reflects mainly the priorities of providers and organizations, which has resulted in a focus on traditional scheduling systems that have not been engineered to engage or satisfy patients but that instead are designed to fit a staff schedule that may be poorly aligned with patient perspectives or circumstances.

One emerging consequence is that, faced with the challenges of navigating the scheduling process for primary care, people often turn to other settings for their health care, such as retail health clinics (Zamosky, 2014). A 2013 survey of retail clinic users found that 58.6 percent of these patients used retail clinics because the hours were more convenient, and 55.9 percent because they could get care without an appointment (Tu and Boukus, 2013).

Outmoded Workforce Models

The Association of American Medical Colleges estimates that without an increased use of non-physician clinicians and staff, by 2025 the United States will have a shortage of 46,000-90,000 physicians (AAMC, 2014). Due to growth and replacement needs, the Bureau of Labor Statistics' Employment Projections 2012-2022 released in December 2013, projects 1.05 million job openings for registered nurses by 2022 (Bureau of Labor Statistics, 2013). The committee learned that efforts are under way, including within the VA/VHA, to identify and address the challenges of hiring and retaining core staff. For example, the LASI human resources workgroup's recommendations focused on such "areas as student loan repayment, the credentialing process, the pay system, hiring time frames, and nonmonetary incentives" (VA, 2014g).

Despite expected problems with physician understaffing, prevailing practices continue prioritizing physicians over other providers, and not

using non-physician clinicians and other staff to their full capacity, such as in the provision of immunizations, pre-visit record screens, escorting patients to exam rooms (Gabow and Goodman, 2014; Toussaint and Berry, 2013), and by making use of other means of providing needed information and by offering remote site consultation. Such current workforce models will not be sufficient to meet future health care demands without other practice transformations (IOM, 2011).

As described in the IOM's *The Future of Nursing* report, transforming the health care system from one that is centered on provider convenience to one that is patient-centered will require re-conceptualizing the roles of all health care professionals, including physicians, nurses, allied health professionals, social workers, pharmacists, and other staff (IOM, 2011). As patient demands shift away from a focus on acute care to greater needs for primary care and especially chronic care management, the roles of health care professionals in the primary care setting need to be reevaluated in particular (IOM, 2011). Improving the performance of the primary care workforce will require practice redesigns. Small changes include such strategies as divesting from physicians tasks and responsibilities that can be performed by other members of the care team, while greater transformations through the enhanced role of nurses may include using nurses to facilitate care coordination, implement and manage informatics systems, act as health coaches, and serve as primary care providers themselves (IOM, 2011). Improving primary care capacity will also require making use of other means of delivering needed information and consultation (e.g., phone and Web-based video consultations). To that end, non-physician clinicians have the opportunity to play a greater role in the development, redesign, implementation, and delivery of such technology-based services (IOM, 2011).

Priority-Based Queues (Acuity Model)

As noted above, priority-based scheduling assigns different wait times to different patients according to assumptions made about the predicted need associated with different categories of conditions. This not only tends to limit the services provided and to require additional visits for other primary care services, but it also creates multiple categories—groups or queues—each with a wait time threshold established through assumptions about predicted clinical urgency associated with a given classification. Visits presumed to be routine or less acute are put off until a future date.

These estimated wait times reflect the best clinical judgment of providers, and the scheduling model was originally developed to help ensure patient safety and fairness. However, little formal evidence exists for the estimates of risk and need that should guide protocols for the timing of

clinical appointments (Desalvo et al., 2000; Sirovich et al., 2008; Welch et al., 1999; Yasaitis et al., 2013). Furthermore, there are a number of challenges associated with the model. For example, urgent appointments placed through priority-based scheduling practices often address only one need per visit, which limits the opportunity for the care provider to meet multiple needs of the patient in a single visit. In addition, patients diverted to other settings for urgent care often want to follow up with their primary doctor later on, expanding a need for one visit into a need for multiple visits, and patients requiring visits deemed to be routine or less urgent can experience increased wait times (Murray and Berwick, 2003). Another challenge with the model is that—apart from truly immediate-need circumstances—the process of determining urgency in primary care using predictions of acuity that are based on a classification system is complex, difficult, and unreliable (Jennings, 2008).

Indeed, because of the limitations of the mathematical models used, priority-based scheduling models are likely to be unreliable any time that there is poor information on variation in demand or capacity. Because patients are sorted into multiple waiting queues, the provider supply is spread out, which introduces inefficiency and wasted time into the system. Queuing theory holds that the effect of variability on wait times will be more pronounced in a system with an increased number of queues (Saaty, 1961).

Care Complexity

As a result of health care innovation and the development of new treatments, patients are living longer with complex, chronic diseases, which has resulted in an aging population with increasing medical needs, involving physical and emotional conditions that require different types and amounts of health and related services (Bodenheimer et al., 2009). Providing appropriate, cost-effective care for a patient with multiple conditions can require coordination with multiple subspecialists, which can further complicate scheduling challenges. In the current provider-centered health care model, this requires the patient or the family to schedule multiple appointments, often on different days and in different locations, creating multiple opportunities for scheduling failures. Provider efforts are consistently challenged and strained by care complexity because of the limits of individual provider capacity (IOM, 2012).

Reimbursement Complexity

The ongoing changes in reimbursement have had a direct effect on patient access to health care. Medicaid patients, both adults and children,

are limited in their access to health care, by virtue of limited acceptance among physicians of Medicaid payments. They also often experience poorer health outcomes than privately insured patients (Bisgaier and Rhodes, 2011; Hwang et al., 2005; Merrick et al., 2001; Wang et al., 2004). As Medicaid reimbursement rates have decreased, the number of providers refusing to accept Medicaid patients has increased (Tanne, 2010). As a result, Medicaid patients have an increasingly limited choice of providers from which to receive primary and specialty care.

Also contributing to prolonged wait times is the requirement for pre-approvals imposed by payers. A preapproval is an authorization required by health insurance plans that patients must obtain before receiving certain services. Although intended as a cost-cutting measure to reduce unnecessary services, this requirement places an additional obstacle in the flow of care. A delay in any step of this process can lead to a prolonged wait time.

Financial Access

The Affordable Care Act has reduced the number of Americans without health insurance, but many in the United States still lack the financial means to pay for health care (KFF, 2015). In addition, as noted above, many practices, particularly specialty practices, do not accept patients who have public insurance. In one survey of wait times, the average rate of Medicaid acceptance by physicians across five specialties in 15 major metropolitan markets in 2013 was 45.7 percent, down from 55.4 percent in 2009, while in 2013 the average acceptance rate of Medicare patients was 76 percent (MerrittHawkins, 2014). Studies have also shown that children with Medicaid or Children's Health Insurance Program (CHIP) coverage are more likely than those with private insurance to be made to wait more than 1 month, even for serious medical problems (Bisgaier and Rhodes, 2011; Rhodes et al., 2014).

Geographic Access

The Veterans Access, Choice, and Accountability Act of 2014 offers a new national standard for geographic access for veterans and provides a choice to receive care in the private sector for those living more than 40 miles from the nearest VHA medical facility. The Department of Defense Military Health System has designated a standard of a 30-minute drive time for primary care appointments and a 60-minute drive time for specialty care appointments (DoD, 2014). For non-veterans receiving care in the private sector, access is typically determined by their insurance status, which requires patients to live within a specific geographic service area for

enrollment and varies with each payer program. Care provided outside of the insurer network typically has higher patient copayments.

The Centers for Medicare & Medicaid Services (CMS) has also developed its own criteria for geographic access for applicants for its Medicare Advantage program. In a sampling of geographic areas, CMS analyzed the percentage of beneficiaries with access to a specialty type and varied travel time and travel distance to improve the system, which resulted in maximum time and distance criteria that vary by specialty type and geographic area. Providers within Medicare Advantage must demonstrate that 90 percent of their provider network meets the established time and distance requirements (CMS, 2015d).

Underlying these geographic and physical barriers to access is the reliance of the U.S. health care system on the office visit as the default model of care. Telehealth, or telemedicine, and the use of electronic information and technologies to support long-distance health care can be an alternative to an office visit and is discussed later in more detail.

BENCHMARKING IN THE ABSENCE OF STANDARDS

With all the different factors in play and with the lack of organizational attention to issues of prolonged wait times, the wide variation in the wait times is not surprising. As previously noted, according to access data publicly reported from VA facilities, statewide data from Massachusetts, and private-sector data from 15 metropolitan areas, there is significant national variability in wait times among care settings, among specialties, and over time (Council, 2014; MerrittHawkins, 2014; VA, 2014d). In addition to the significant variability in wait times among care settings, among specialties, and over time, there is a lack of national standards and benchmarks for appropriate wait times. Although references to timely care appear regularly in legislative proposals, a prevailing definition of timeliness has not yet emerged.

Instead, individual institutions are developing varied approaches and standards for appropriate wait times. For example, the Military Health System and the California State Department of Managed Health Care developed benchmarks for access and included the following (DoD, 2014):

- 30-minute drive time for primary care
- Specialty care appointments within 4 weeks
- Routine appointments within 1 week
- Urgent mental health care by a physician or non-physician clinician within 48 hours
- Non-urgent appointments with specialist physicians within 15 business days

- Non-urgent appointments with a non-physician clinician within 10 business days
- Urgent care appointments generally not to exceed 24 hours
- Emergency room access available 24 hours per day, 7 days per week
- 60-minute drive time for specialty care
- Office wait times not to exceed 30 minutes unless emergency care is being rendered to another patient

Benchmarks such as these have served as useful reference points at the practice level in various places. Yet, because they have not been validated for national use, they are of limited applicability. Though useful as examples, they can even carry the potential for unintended adverse consequences if applied arbitrarily and without consideration to local circumstances. The committee contends that although benchmarks can help an organization set a goal and move toward improvement, the benchmarks should be determined according to the unique capacity and demand of each organization and care site.

3

Systems Strategies for
Continuous Improvement

The health care system is a complex collection of interacting elements, each of which affects the others in myriad ways. Effectively dealing with any health care system issue—especially as basic as scheduling and access—requires dealing with the various system dynamics in a coordinated way that takes into account how changes in one area will affect the functions in other areas. That is, it requires systems strategies and approaches.

Over the past 15 years, the Institute of Medicine (IOM) and the National Academy of Engineering (NAE), working both independently and collaboratively, have released publications calling attention to the growing concerns of patient safety, the quality of care delivered, and the cost of health care and also identifying potential solutions based on systems engineering approaches that have been widely adopted in technology and service industries (IOM, 2000, 2001a; IOM/NAE, 2005; Kaplan et al., 2013). For instance, the 2005 report *Building a Better Delivery System*, jointly published by the IOM and the NAE, observed that moving toward a functional system requires each participating element to recognize the interdependence of influences with all other units (IOM/NAE, 2005). More recently, a discussion paper described that a systems approach to health is "one that applies scientific insights to understand the elements that influence health outcomes, models the relationships between those elements, and alters design, processes, or policies based on the resultant knowledge in order to produce better health at lower cost" (Kaplan et al., 2013, p. 4).

Many other industries have faced issues similar to the scheduling and access issues faced today by the health care industry and have dealt successfully with them using systems strategies. In this chapter, the commit-

tee looks in particular to various industrial sectors for lessons on systems strategies that can be applied to health care. The chapter reviews the theory and practice of systems strategies as they have been applied to achieve continuous improvement in industry and how those strategies might be applied in health care, especially to improve scheduling and access.

LESSONS FROM INDUSTRIAL ENGINEERING PRACTICES

The tools of operations management, industrial engineering, and system approaches have been shown to be successful in increasing process gains and efficiencies (Brandenburg et al., 2015). In particular, a wide range of industries have employed systems-based engineering approaches to address scheduling issues, among other logistical challenges.

Systems-based engineering approaches have also been employed successfully by a number of health care organizations to improve quality, efficiency, safety, and customer experience, and these approaches have great potential for enabling further improvements in health care delivery (IOM/NAE, 2005). The success of these approaches will be dependent on achieving an overall integration across various health care domains and an application across interrelated systems rather than piecemeal testing across individual processes, departments, or service lines. By approaching improvement as a whole-system effort, a number of industries coordinate operations across multiple sites, coordinate the management of supplies, design usable and useful technologies, and provide consistent and reliable processes. With the right approach, it is likely that these principles can be applied to health care (Agwunobi and London, 2009).

Box 3-1 provides examples of systems strategies that originated in industry. The following sections further describe certain systems strategies that have been more widely applied to improve health care operations and performance. They are intended to illustrate the potential of systems approaches to improve health care scheduling and access.

Lean and Six Sigma

Lean is a value-creation and waste-reduction philosophy that was initially developed within the context of an automobile manufacturing system—the Toyota Production System—but that has now spread widely to service industries throughout the world. According to Lean philosophy, value is defined from the customer's orientation, meaning that valuable products and services are those that contribute to a customer's experience and needs and that can be provided to the customer at the right time and for the right price, all as defined by the customer (Womack et al., 2005). Correspondingly, waste is anything that does not add customer-defined

BOX 3-1
Systems Strategies

Deming Wheel or Plan-Do-Study-Act (PDSA) is a systematic series of steps for continuous improvement of a product or process. The cycle involves a "Plan" step, which involves identifying a goal and putting a plan into action; a "Do" step, in which the plan is implemented; the "Study" step, in which outcomes are monitored for areas for improvement; and the "Act" step which can be used to adjust the goal, to change methods, or to reformulate the theory.

Flow management is an operations research methodology involving the study of work flow and the introduction of dynamic control into processes.

Human factors engineering works to ensure the safety, effectiveness, and ease of use of various technological designs by explicitly taking into account human strengths and limitations in interactions with complex systems.

Lean is an integrated socio-technical systems approach and is derived from the Toyota Production System. The main objectives are to remove process burden, inconsistencies, and waste. In health care, the application of Lean has focused on the reduction of non-value-added activities and involves the identification of system features that create value and those that do not.

Queuing theory applies the mathematical study of waiting lines or queues in order to better design systems to predict or minimize queues. A variety of nonlinear optimization techniques (some based on the principles of statistical process control) have been put to work on different queuing applications, including challenges in telecommunications (phone call traffic), banking service management, vehicle routing, and even the express delivery of mail. Queuing theory has begun to be applied to multiple processes in health care involving groups or queues of patients.

Six Sigma is a quality management and continuous process improvement strategy. It improves efficiency by reducing variations in order to allow more capable and consistent products or processes. Six Sigma relies on the ability to obtain process and outcome data adhering to five principles: define, measure, analyze, improve, and control.

Statistical process control is a method of quality control that uses statistical methods to monitor and control a process to ensure that it operates at its full potential. This model focuses on the analysis of variation, the early detection of problems, and the reduction of waste and repeat work. In non-manufacturing applications, it has been used to identify bottlenecks in a system and reduce delays, including wait times.

Theory of constraints is a management paradigm used in complex systems to identify the most important limiting factors (constraints) in order to improve the performance of the system. Its application to health care is slowly increasing, and it has been used to increase capacity and revenue.

value to a product or service. The Lean approach relies on the continuous improvement of workflows, handoffs, and processes that function properly (Holweg, 2007; Ward and Sobek II, 2014). These workflows, handoffs, and processes required to produce and deliver a product to the customer constitute a "value stream." Value stream mapping is an important tool of the Lean approach. It documents in great detail every step of each process in a flow diagram, and it provides a visual portrayal of the many intricate details, sequences of workflow, and interdependencies in a process, which makes it possible to more easily identify problems and inefficiencies. As such, value stream mapping facilitates identifying activities that contribute value or waste or that are in need of improvement.

Lean is well suited for making changes to groups of processes rather than for making small, discrete changes to a single process, and in health care it has typically been used in large settings like hospitals. Lean has been used to improve both operational processes and clinical care, with applications ranging from improving insurance claims processing and improving patient safety processes to establishing a standardized set of instruments for surgical procedures (Varkey et al., 2007; Womack et al., 2005). The Lean philosophy has also been applied to health care delivery to reduce wasteful activities such as delays, errors, and the provision of unnecessary, inappropriate, or redundant procedures or care (Young et al., 2004). This capability is particularly promising for improving scheduling and access in health care.

Another business management and continuous process improvement strategy that has been widely adopted across service industries is Six Sigma.[1] Originally developed in Motorola, the approach is rooted in statistical process control and is aimed at dramatically reducing errors and variation. The term Six Sigma refers to achieving a level of quality so that there are no more than 3.4 defects per million parts produced. The Six Sigma approach has five phases, identified as define, measure, analyze, improve, and control (Harry, 1998). After its development at Motorola, the method was quickly adopted by industries ranging from hospitality to finance. Like Lean, Six Sigma has been applied to improve health care operations and delivery, with applications ranging from insurance claims processing to reducing medication errors and improving patient flow through laboratory services (Kwak

---

[1] Six Sigma is a data-oriented practice that originated in the manufacturing sector with interests to dramatically reduce defects from a production process. The approach has been applied both from a technical sense and a conceptual sense across various fields of practice. Sigma in statistics denotes deviation from the standard. At a one sigma level, the process may produce 691,462 defects per million opportunities (DPMO), and at three sigma, approximately 66,807 DPMO. At a six sigma, the process produces only 3.4 DPMO with a total yield of 99.99966 percent. Beyond the technical approach, Six Sigma concepts have also been used as a generic root cause analysis to detect and rectify defects toward reaching strategic goals (Evans and Lindsay, 2015; Schroeder et al., 2008).

and Anbari, 2006). Lean and Six Sigma are often combined when a key goal is to reduce waste and errors (Gayed et al., 2013; Paccagnella et al., 2012).

Crew Resource Management

In response to a series of airplane crashes caused by human error, the airline industry developed Crew Resource Management (CRM), a system for job training and information sharing (Cooper et al., 1980). Since CRM has been adopted industry-wide, pilots, flight attendants, and ground crews proactively communicate and work cooperatively, using tools such as checklists and dedicated listening techniques that have greatly reduced the hazards of commercial air travel. In the United States, the rate of fatal commercial aviation accidents fell from approximately seven per million departures in the mid-1970s to around two per million departures in the mid-1980s (Savage, 2013). Since 2005, the rate of fatal aviation accidents has remained under one per million departures (Savage, 2013).

The value of using checklists is already beginning to be realized in health care (Pronovost et al., 2006). Most notably, the checklists used in preoperative team briefings to improve communication among surgical team members are indicative of the potential that checklists have to improve patient safety (e.g., reduce complications from surgery) and reduce mortality in general (Borchard et al., 2012; Haynes et al., 2009; Lingard et al., 2008; Neily et al., 2010; Weiser et al., 2010).

Customer Segmentation and Cluster Analysis

Service and e-commerce industries commonly use customer segmentation and cluster analysis—modeling and marketing techniques that group potential customers by characteristics and preferences in order to appropriately tailor products and services. For example, Amazon looks to previous purchases and browsing behaviors to profile and segment its customer base (Chen, 2001). Netflix uses data mining and machine learning techniques to cluster user behavior data, like product ratings and page views, as well as product features such as movie genres and cast members to recommend new movies that customers are likely to rate highly (Bell and Koren, 2007). Values, Attitudes, and Lifestyles (VALS) is a commonly used research methodology for customer segmentation. Developed in 1978 by social scientist Arnold Mitchell at Stanford University, VALS breaks down customer motivations and resources and remains an integral aspect of large company marketing strategies to this day (Yankelovich and Meer, 2006).

One setting in which patient segmentation has been applied in health care is the use of patient streams in emergency departments. Patient streaming is the use of set care processes (or streams) to which patients are assigned

upon triage; a subset of streaming is fast track, in which lower acuity patients are assigned to a fast track stream (Oredsson et al., 2011). Evidence on patient streaming is limited, although studies suggest that use of severity-based fast track in emergency departments can be effective at reducing waiting times, length of stay, and the number of emergency department patients who leave before being seen, while also increasing patient satisfaction (Oredsson et al., 2011). These limited uses of patient segmentation therefore focus on patient characteristics like severity, urgency, and likelihood of adherence, but less information is known about the potential of segmentation by patient-driven characteristics, such as preferences and values (Liu and Chen, 2009).

Deming Wheel or Plan-Do-Study-Act (PDSA) Cycle

Deming Wheel or Plan-Do-Study-Act (PDSA) cycle is the scientific method used for action-oriented learning (Taylor et al., 2013). The PDSA cycle is a series of steps for gaining insight of the control and continuous improvement of a product or process. The cycle involves a "Plan" step, which involves identifying a goal and putting a plan into action; a "Do" step, in which the plan is implemented; the "Study" step, in which outcomes are monitored for areas for improvement; and the "Act" step, which can be used to adjust the goal, to change methods, or to reformulate the theory (Taylor et al., 2013). The PDSA steps are repeated as part of a cycle of continuous improvement. The Institute for Healthcare Improvement (IHI) Model for Improvement focuses on setting aims and teambuilding to achieve change. The model uses a PDSA cycle to test a proposed change in the actual work setting so that changes are rapidly deployed and disseminated, and it is best suited for a continuous process improvement initiative that requires a gradual, incremental, and sustained approach to process improvement changes that are not undermined by excessive detail or unknowns (Huges, 2008).

Common to each of these practice areas is the integrative dimension. A systems approach emphasizes integration of all the systems and subsystems involved in a particular outcome. Adjusting each component of a system separately does not lead to an overall improved system. The fundamental elements of a systems approach to health care scheduling and access and the potential of systems strategies to improve scheduling and access are discussed in the next section.

SYSTEMS STRATEGIES FOR HEALTH CARE
SCHEDULING AND ACCESS

The committee's view is that by using systems strategies, the organizational capacity or performance of health care system can be dramatically improved. Essential to the process is an understanding of the many system complexities and interdependencies. Although different resources and talents may require near-term additions, the aim is for better performance with fewer resources per service provided. Additional personnel and financial investment are generally not essential to achieving significant improvements in capacity over time (Lee et al., 2015b; Litvak, 2015). Figure 3-1 depicts the key principles of capacity management and their operational applications at Cincinnati Children's Hospital Medical Center (CCHMC), which was able to significantly improve productivity. CCHMC includes an administrative group that oversees the capacity of the system and evaluates and designs strategies to match changing demand. Using techniques of production planning from industry, CCHMC combines management and staff to set operating rules, monitor supply, measure delays, and make decisions about how shared resources are deployed.

Initiative	Operations Possibilities
Management of Variability	Identify Patient Streams – Inpatient/Outpatient Stream management, supply chain, best practices
Predictable Care Delivery	Best Practices, Identification of ALOS and outliers Physician Practice Models, Metrics of care delivery
Capacity Prediction	Integration of simulation modeling and planning Plan for flow vs reactive flow to plan
Capacity Management	Simulation to design for unit use and patient placement
Optimization of Flow Delivery	Placement initiatives – D:C Matching plans D/C planning, Home Care, Parent Initiatives
Flow:Safety Matching	Demand:Capacity Matching, SSE/Near Miss events related to placement, flow *watch-points* of care

FIGURE 3-1 System capacity management roadmap.
NOTE: ALOS = average length of stay; D:C = demand to capacity; D/C = discharge; SSE = serious safety event.

Defining Focus, Identifying the Components, and Building the Capacity

The basic building blocks of applying a systems approach to health care scheduling include fixing the system orientation on the needs and perspectives of the patient and family; understanding the supply and demand elements; creating capacity for data analysis and measurement strategies; incorporating evolving technologies; creating a culture of service excellence; assuring accountability and transparency; committing to continuous process improvement; and developing a supportive culture and organizational leadership that empowers those on the front lines to experiment, identify the limitations, and learn from those trials. These elements of health care scheduling from a systems perspective are discussed in more detail in the remainder of the chapter. With additional research and testing, these elements of health care scheduling could potentially serve as general principles for improving primary, secondary, hospital, and post-acute care. Although these elements are discussed independently, the central premise lies in their interplay; health care organizations are not discretely separated environments or services, but they are complex groups of processes, personnel, and incentives. These core access principles are therefore interdependent.

Fixing the System Orientation on the Patient and Family

Systems approaches focus on improving products and services placing customer needs at the forefront. When translating these approaches from the commercial setting to health care, however, identifying the "customer" has been challenging, because customers of health care may include patients and their families, providers (e.g., physicians), hospitals, and payers (e.g., the government, insurers, taxpayers) (Womack et al., 2005; Young et al., 2004). For example, improving scheduling includes reducing wasted time for both providers and patients. However, as described in Chapter 1, the committee's "How can we help you today?" philosophy for health care scheduling and access is driven by meeting patient need. Fundamentally, the patient is the primary focus for the organization and delivery of health care services and products. The activities to improve health care scheduling and access should aim to improve the patient experience and meet patients' needs as the foundational tenet of a patient-centered health care system (Bergeson and Dean, 2006).

The committee developed a framework for patient and family engagement for care, scheduling, delivery, and follow-up (see Figure 3-2). The framework uses a value-stream map for an office visit documenting the patient's care through the visit from the perspective of the patient as well as the attributes of an ideal system. As shown in Figure 3-2, each step encountered by the patient during a visit is documented, including the many

1. Query: Patient presents health question
- Patient can access system 24/7; system responds immediately
- Patient's concerns are respected

2. Engage: There is a collaborative process to answer question
- Communication is provided in an understandable and convenient way

3. Schedule: Patient can easily/quickly schedule consultation
- Patient can schedule care 24/7 and can do so online
- Rescheduling is easy and readily available
- New appointments can be synchronized with existing ones

4. Prepare: Patient can make preparations in the interim
- Needed prior approvals and forms are obtained automatically
- Needed lab tests are arranged and scheduled automatically
- New appointments can be synchronized with existing ones

5. Meet: Patient has encounter with health care provider
- Encounter takes place in person, online or by telemedicine
- Encounter takes place on time; patient is given alternatives to waiting (when delays occur)
- Staff is respectful and courteous; exam space private and comfortable
- Team goes to patient

6. Act: The patient and provider take follow-up action
- Understandable visit summary is provided on patient portal and hard copy
- Team uses teach-back to ensure patient understands critical information
- Rest of care team fully informed about visit
- Prescriptions are e-prescribed

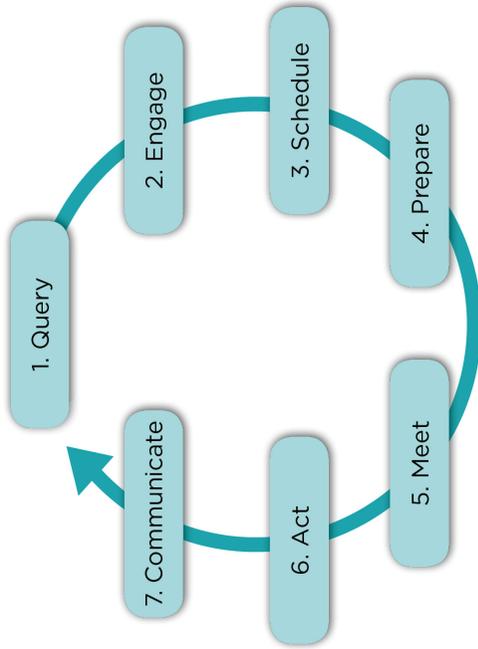
7. Communicate: Patient has ongoing care from care team
- Any follow-up appointments are scheduled
- Care team checks in to answer questions or ensure follow-up care


FIGURE 3-2 Framework for patient and family engagement: Care scheduling, delivery, and follow-up.

individual steps that are not intentional yet are part of the typical process. This is followed by a determination of whether each step actually improves the patient visit in some way. Following such an analysis, steps that are not valuable to patients are eliminated.

Institutions that have involved patients in systems redesign activities have reported positive results from such efforts, including improvements in patient safety with reductions in medical errors and improved satisfaction among patients and health care providers (Davis et al., 2007; Graban, 2012; Longtin et al., 2010; Toussaint and Berry, 2013). It is important to note that while involving patients in systematic improvement efforts has shown to have positive impacts, many unresolved questions remain that deserve additional study beyond the scope of this report, about who should be involved and how to ensure that patient involvement has more than a token impact (Armstrong et al., 2013; Martin and Finn, 2011).

Balancing Supply and Demand

Balancing supply and demand at each step along the care continuum is essential for an efficient and effective health care system (Hall, 2012). Poorly performing systems often contain design flaws, due to an excessive focus on the supply side and not on the demand side (Grumbach, 2009). Inherent capacity, for example, the number of appointment slots available, refers to the amount of demand each system can tolerate without creating a mismatch (Anupindi et al., 2005). Imbalance of patient demand and provider supply creates delays and increases wait times. If demand equals capacity, no delay exists. However, variations in either supply or demand can cause temporary mismatches that may increase wait times. Systems strategies require ongoing assessment of supply, demand, work flow, and patient flow, adjusting capacity across days and services, and continuous improvement.

In ambulatory primary care settings, temporary supply deficiencies can often be overcome by flexing or adjusting supply to keep up with demand, by temporarily increasing office hours, or adding another provider. In the primary care setting, capacity is determined by the number of providers, their hours worked, and the total number of patients seen each day. Capacity in the primary care setting is maximized through balanced panel sizes, a commitment to continuity, an appointment decision logic that directs patients to their own provider rather than the first open slot, and fully developed contingency plans that can address demand or supply variations. Optimal performance in this setting is currently measured as a TNA of zero for each patient's regular primary care provider (Murray and Berwick, 2003).

In the specialty care setting, capacity is affected by competing demands, with provider presence having the greatest impact. Capacity, therefore, is

influenced by the frequency of which specialists are absent from the office. A key factor in this setting is that new patients can be a more critical part of a specialty care practice, which necessitates the creation of specific provisions for accommodating both the high volume of work associated with a new patient and the large number of returning appointments that must also be available. As a result, capability in specialty care settings is often determined by the volume of new patients. Whereas primary care systems are designed for providers to act and function as independent units, specialty care systems are designed to function as units of interchangeable providers. In that respect, the design elements that can enhance the capability of specialty care practices include a logic that offers appointment to the first available new patient slot for any provider among the entire set of interchangeable providers, a commitment to continuity once a new visit is completed, and fully developed contingency plans to address demand or supply variation.

Creating the Infrastructure for Data Analysis and Measurement

A health information technology infrastructure, including the creation and implementation of electronic health records (EHRs), is designed to generate data that will enhance the quality of patient care. Better use of the capacity to track patient flow through the health care system is a logical application, with potential to improve understanding of patterns of patient demand, provider supply, and bottlenecks to patient flow, and, as a result, improved revenues, hospital performance, and patient care (Devaraj et al., 2013). Indeed, implementing and sustaining systems strategies to improve scheduling in health care requires real-time performance data. However, most data systems do not currently include operational (e.g., wait times) data.

New systems should ensure that operational data integrate seamlessly with existing processes, and also that operational data are interoperable to enable communication and data exchange with other health care organizations to allow for the creation of a nationwide health information network. To facilitate operational data interoperability and the assessment of comparative performance across various care settings, practices, and circumstances, data need to be collected in a standardized, consistent, and sustained manner. Several aspects of health care scheduling and access that should be measured and for which standards should be identified include: patient and family experience and satisfaction; care match with patient goals; scheduling practices, patterns, and wait times; cycle times, provision and performance experience for alternative care models (e.g., telehealth and other remote site services); and effective care continuity.

The most important standards-setting organization is the individual health care organization itself. Therefore, each health care organization will need to define measures to assess its commitment to creating a standard of

care and performance culture that supports timely scheduling and access. However, to define these measures and identify appropriate standards for scheduling and wait times, for which there are no existing national standards or benchmarks, health care organizations will need reliable information, tools, and assistance from various national organizations with the requisite expertise in developing and testing standards. Furthermore, given the need for flexibility of measures to assess the goals and performance of individual organizations, developing a measurement infrastructure for operational data will require inter-organization coordination to ensure harmony of reporting instruments and reference resources across the nation.

Once standards and benchmarks for access and wait times and corresponding patient experience measures have been identified, such performance data should be accompanied by analytic tools that can continuously monitor current conditions, including the scheduling measures of supply and demand. Health care organizations, again with the assistance of national organizations with expertise in developing and testing standards, will also need to develop, test, and implement standardized approaches to analyzing operational data.

Incorporating Evolving Technologies in Health Care

Various technologies are emerging with strong potential to improve real-time access to care, with the promise of totally new ways of scheduling and delivering care and gathering information on its utility. Use of digital and social media, telemedicine and telehealth, remote monitoring, and related evolving technologies are also well suited for deployment in health care practices. Still, their uptake has been relatively limited to date, for such reasons as unfamiliarity, system mismatch, and absence of reimbursement. Quickening use of these tools in health and health care will require receptivity to innovation, novel partnerships, and collaborative information and experience gathering. Health care providers are slowly developing new skills and integrating novel uses of technology into their organizations. The Health Information Technology for Economic and Clinical Health (HITECH) Act has accelerated use of EHRs, including more use of patient portals to aid information exchange with hospitals and other providers within the same system (Adler-Milstein et al., 2011).

Expanding EHR capabilities foster substantially enhanced insights into the continuum of patient and family experience, documentation of different patient information and preferences, analysis of data trends and predictions, and the integration of real-time monitoring of operations. To effectively use technology requires trust in the tools, adequate education of its potential, and a greater service commitment from the technology sector both for those working within the health care arena and for the patients.

The benefit to both parties must be demonstrated and reinforced, in part through organizational leadership and through individual providers. As practice efficiency and reimbursement changes occur, additional payment reform may be needed (Howley et al., 2015).

Some patients are beginning to take control of their own scheduling as they are gaining access to their medical information. This is not an entirely novel practice, having been implemented in high-performing, early-adopting organizations and practices. The changes described above point to a time when all clinical information is instantly available throughout the nation; when the EHR reveals not only past and scheduled appointments but also the sequence of referrals to specialists and resulting input, and patient preferences are documented throughout the scheduling process.

Creating a Culture of Service Excellence and Leadership Stewarding Change

Implementing systems approaches in health care, including strategies to address scheduling and access issues, requires changes not only in operational processes but also a fundamental shift in thinking. All members of a health care organization must transition from the siloed, independent, and fragmented mentality of traditional health care culture to a culture of service excellence, an integrated approach with shared accountability in which physicians, employees, and patients treat one another with respect and as partners, and patient satisfaction and employee engagement are high.

Organizational and cultural changes needed to support the implementation of systems approaches will require new competencies and participation from all members of a health care organization's senior management team (Trastek et al., 2014). Moreover, because changing an organization's culture often happens slowly, leadership and governing bodies at each level of the health care delivery sites are important in order to drive culture change and manage ongoing process changes (Kabcenell and Luther, 2012). Leadership is also important to establish and model standards of behavior for all employees and to establish educational opportunities to help employees learn the new behaviors. Finally, leadership and governing bodies' commitment at each level of the health care delivery sites is essential to promote transparency, accountability, successful adoption of technology, and continuous process improvement through ongoing monitoring of performance and process to avoid backsliding.

Transparency and Accountability

Transparency on performance draws data from disparate sources and delivers them to those at the front lines of care, including both patients

and providers. Transparency helps employees understand the relevance and impact of change, informs and motivates their actions (on access, scheduling, or the other important elements of the care process), and helps organizations track the progress that they are making toward the desired new culture. Applied to scheduling and access, transparency about operational processes and their effectiveness can facilitate identification of delays and their causes, and also the progress made to reduce those delays. Finally, transparency facilitates messaging that creates organizational consistency—when everyone hears the same message from their leaders, they are motivated to respond in similar ways, and this behavior change can reinforce culture change.

The corollary requirement to transparency is accountability, or shared responsibility for organizational performance, to ensure that change is sustained in an organization (Blumenthal and Kilo, 1998). Accountability for all persons promotes accountability at all levels of an organization (O'Hagan and Persaud, 2009). Whereas the fragmented, independent nature of traditional culture may lead to lack of accountability or individual blame, in a culture of service excellence that takes a systems approach to improvement, accountability ensures that problems are analyzed in a holistic manner. Applied to scheduling and access, accountability may help ensure that delays in patient flow are addressed by all relevant stakeholders across the care continuum, rather than with independent, piecemeal process changes.

Continuous Process Improvement

A defining characteristic of modern health care is the rapidly accelerating increase in information that is available to assist with the delivery of care and system management. This places a high premium on the need for systems to effectively manage the flow of information, but it also requires a commitment by the organization to build and incorporate processes for continuous learning, knowledge sharing, and innovative change. Such characteristics are shared by health systems, including Denver Health, Geisinger Health System, Kaiser Permanente, Seattle Children's Hospital, ThedaCare, and Virginia Mason Hospital and Medical Center, who have adopted methods of continuous improvement such as Lean, the IHI Model for Improvement, and Six Sigma to empower teams to question how things are done and recommend operational changes to improve efficiency (Brandenburg et al., 2015).

Continuous process improvement uses data for ongoing improvement of the quality of a product or service. Continuous process improvement encourages all health care team members to continuously question how they and their system are performing and whether performance can improve (Edwards et al., 2008). Data, transparency, and accountability are critical

enabling factors for a learning culture, which requires the creation of a structured approach to process and outcome evaluation.

CHALLENGES AND BARRIERS

Even in the face of substantial promise from the application of systems strategies to improve scheduling and access in health care, the committee is fully cognizant of the potential barriers and challenges to achieving the gains possible (see Table 3-1). Many have already been introduced in this report. They include practice and infrastructure barriers, such as those related to the challenge of obtaining reliable data (Kim et al., 2009), the capacity of existing technology (Murray et al., 2003; Pearl, 2014), the lack

TABLE 3-1 Possible Barriers to Implementing Systems Approaches in Health Care

	Practice and Infrastructure Challenges
Data	Metrics for organizational performance and clinical outcomes and systems
Technology	Digital health records designed for data needed, patient portals, telephone consultation systems
	Flexibility to accommodate variable information technology uptake and use by patients
	Staff retraining and rescheduling for telephonic and digital communication with patients
Staffing needs	Need for intervention design teams
	Availability of trained nurses, other non-physician clinicians
	Patient interface personnel, reframing responsibilities, training
Regulatory	Health Insurance Portability and Accountability Act (HIPAA) standards (facility and process redesign standards)
	Cultural Challenges
Preconceptions	Convincing that Lean production works with patient care as well as in manufacturing
Leader buy-in	Belief that systems strategies are evidence-based and refocus existing resources rather than requiring new ones
Staff buy-in	Assurance that retraining and reclassification are not threats and that jobs will not be lost
Patient skills	Need to communicate and educate patients about use of new practice procedures
Organizational	Moving organization from siloed, independent, and fragmented to integrated, aligned consultative, with shared accountability

of systems expertise, and the procurement and training of the necessary clinicians and staff (Coleman et al., 2006; Dhar et al., 2011; Jack et al., 2009), and the pressures of organizational and national regulations (Lee et al., 2015; Pearl, 2014). Cultural barriers include those related to pre-conceptions on the use of industrial systems engineering in complex patient circumstances (Kim et al., 2006), the need for leaders, staff, and patients to develop new skills, and preexisting tendencies for organizational units to prefer to work autonomously (Cima et al., 2011; IOM, 2015; Kim et al., 2006, 2009; Krier and Thompson, 2014; Lee et al., 2015; Meyer, 2011; Murray et al., 2003). In each, committed leadership is critical to identifying and addressing these issues.

4

Building from Best Practices

EXPERIENCES IN SERVICE EXCELLENCE

There are a number of emerging best practices associated with systems approaches, and the committee believes that testing, disseminating, and applying these best practices to various systems approaches to improving access and wait times is currently the most promising approach to making progress in this aspect of health care. Therefore, in this chapter the committee describes some emerging best practices in systems approaches that can be applied to the health care sector.

Identifying Emerging Best Practices

The committee identified case examples and innovative systems models that have been shown in limited settings to improve scheduling and wait times while having either neutral or positive effects on the quality of care and on the patient experience. With further research, these models have the potential to be adopted more widely and to become a foundation for standards of care. Such examples are found in all specialties, in all care delivery settings, and in different business models and geographic regions. The committee believes the changes illustrated in these examples can usually be achieved without significant additional investments in personnel or facilities, relying instead on process reengineering, resource reallocation, and behavioral change strategies within the individual settings.

Although national standards for access and wait times do not currently exist, the committee did also identify examples of organization-specific

---

BOX 4-1
Representative Benchmarks by Setting

- **Primary care:** Same- or next-day engagement for new and returning patients, contingent on their needs and preferences.
- **Primary care backup for urgent services:** Providers who are unable to see patients for urgent services within 48 hours refer them to others.
- **Specialty care:** Third next available waits of 10 days or less for specialty care new visits. For specialty care visits accompanied by greater sense of patient urgency (e.g., oncology), waits of no more than one day for new patients.
- **Emergency departments:** Ten-minute door-to-provider time (contact with a provider will occur within 10 minutes of patient arrival at an emergency room).
- **Hospital admissions from emergency department:** Holding time in the emergency department should not exceed 4 hours after a decision to admit.
- **Hospital discharge assessment:** Discharge planning begins immediately after admission and initial discharge assessment is completed in the first 24-48 hours of admission.

---

benchmarks within various health care settings. For example, some organizations set internal benchmarks of same-or next-day engagement for new and returning patients in primary care (Southcentral Foundation's Alaska Native Medical Center) or first time appointments of newly diagnosed cancer patients (Dana-Farber/Brigham and Women's Cancer Center in Boston);[1] internal benchmarks guide door-to-provider times within emergency departments (Virginia Mason Hospital), wait times for specialty new visits (Cincinnati Children's Hospital), and primary care backup practices for urgent services (Tufts Health Plan Network Health). The Joint Commission has also developed standards pertaining to emergency department boarding times and hospital discharge risk assessments. Organization-specific benchmarks, such as these, serve as promising reference points for future research and validation.

Box 4-1 presents these representative benchmarks and is followed by detailed information on various examples of innovative system models that have demonstrated promise in improving health care operations and performance.

Ambulatory Care

The committee has identified best practices for an immediate responsiveness approach to new or returning primary and specialty care patients. These include scheduling strategy models, such as working toward same-day engagement and continuous monitoring and matching capacity and demand, and activities intended to achieve the optimal alignment of supply and demand, including team-based workforce improvement strategies and technology-based alternatives to in-person visits.

Scheduling Strategy Models

Open access/same-day scheduling The advanced access model of patient scheduling, also known as open access or same-day scheduling, has as a core principle that patients can obtain an appointment on the same day if desired (Murray and Berwick, 2003). Appointments are not booked weeks or months in advance, but rather each day starts with a sizable share of the day's appointments being open, with the remainder being appointments for people who elected not to come to the office on the day they called. This workflow model involves only one primary care appointment type. In the early stages of implementation, appointments are divided into two queues or groups of patients, one dedicated to that day's urgent demand and the other open for appointments made when patients called on previous days but did not wish to come in on that day (Murray and Berwick, 2003).

Successful use of the open access model requires accurate forecasting, an engaged team of schedulers and providers, and a carefully determined transition plan. It also requires a commitment, as demonstrated by Baylor Family Medicine (see Box 4-2), to significantly transform scheduling practices. As outlined in Appendix A, the phases of the advanced access method include the initial measurements necessary to determine demand and capacity, the steps for matching demand and capacity, and a transition strategy to scheduling for same-day access, as well as lessons learned on the maintenance of the method and contingency planning.

An effective transition to this model requires the disciplined measurement of demand and capacity, the addition of providers if there is a permanent mismatch of demand and capacity, and the elimination of appointment types. Of key importance in the transition is the elimination of the unnecessary patient backlog, that is, of those patients who have been booked for future visits as a result of an insufficient supply of same-day or next-day visits. Eliminating this backlog requires a temporary increase in patient visits each day until the backlog is eliminated. As the backlog is eliminated, which may require several months, patients are told to call the office when they are ready to be seen, and future appointments cease

BOX 4-2
Examples of the Advanced Open Access Model
in Primary Care

Southcentral Foundation's Alaska Native Medical Center

Southcentral Foundation's Alaska Native Medical Center had some patients who waited hours for acute care or months for nonurgent appointments. To decrease wait times, the center's managers took the following steps: matched patients with physicians, actively worked to address the appointment backlog, developed surge contingency plans, encouraged continuity of care, and adjusted the workforce by assigning tasks to non-physicians (Murray et al., 2003). Now that advanced access scheduling has been implemented, patients are guaranteed same-day appointments if they call before 4 p.m. Although it took months to eliminate the appointment backlog, once it was resolved, roughly half of all appointment slots during the next month were held open for same-day appointments. Implementation challenges included poorly functioning telephones that prevented patients from calling for same-day appointments and, because patients can call for same-day appointments until 4 p.m. daily, a high volume of patients late in the day which can strain clinicians. The keys to successful implementation included the involvement of the entire staff, implementing a data system to track patient access, and technical assistance from outside experts with experience implementing advanced access (Murray et al., 2003).

Baylor Family Medicine

At Baylor Family Medicine, an academic primary care practice, TNA (time until the third next available appointment) ranged from 10 to more than 60 days. When planning to implement advanced access, the practice's projection was told that it would take 11 months to work down the backlog. Matching daily supply and demand in the face of the day-to-day variation in physician availability was also a challenge. To address these implementation challenges, Baylor Family Medicine opted to set a "go live" date for advanced access scheduling and, beginning 3 months prior to the "go live" date, made no appointments past that date. To give patients some flexibility in scheduling appointments, the practice also established a 5-day appointment window, which allowed patients to schedule either a same-day appointment or one in the next 5 days. Patients requiring follow-up appointments were told to call to make that appointment when they were ready to be seen, and the practice established a system to send patients reminders for necessary appointments. Patients were given access to their physicians' clinic schedules through the phone system, in a printed handout, and on the practice's website. The practice also established rules for provider leave, established a new process for complete physical exams, and maintained existing staffing levels. Baylor developed a daily activity report to review daily scheduling and monitor appointments over the coming 5 days. The changes reduced the length of the third next available appointment from an average of 17 days to 1 day, which the practice has sustained for more than 2.5 years (Steinbauer et al., 2006).

to exist. Using this model sustainably requires a deliberate and continuous evaluation of supply and demand and a recognition that the model is a quality improvement method that requires dedicated time and personnel within the practice. It also requires a significant change in thinking about how scheduling occurs—to a model where appointments are available in the near term rather than weeks of months into the future. Despite these implementation challenges, a systematic review found that implementing the advanced access model reduces wait times and no-show rates, although patient satisfaction outcomes are mixed (Rose et al., 2011). Box 4-3 describes case studies of how two primary care practices, Southcentral Foundation's Alaska Native Medical Center and Baylor Family Medicine in Houston, Texas, have implemented the advanced access model to improve scheduling and reduce wait times.

The smoothing flow scheduling model A different approach to achieving same-day access uses the operations management technique of smoothing flow. This method identifies and quantifies the many types of variability in patient flow (demand) and identifies the resources available to different

---

BOX 4-3
Example of the Smoothing Scheduling Flow Model
in Primary Care

St. Thomas Community Health Center

St. Thomas Community Health Center, a consortium of safety net practices throughout New Orleans, Louisiana, offers an example of system capacity management in the ambulatory setting. Following the passage of the Affordable Care Act, the amount of uninsured patients at the center increased from 18 percent to greater than 35 percent by early 2014. With fixed financial resources provided by Medicaid and clinic reimbursement rates averaging $30 per visit, the consortium needed ways to be more efficient and cost-effective. At the direction of the chief executive officer, techniques to smooth patient demand were used to improve practice capacity and performance. Improvement efforts based on the science of operations research targeted the widespread variability in the clinics. The methods were focused on improving efficiencies with both appointment setting and patient visits in order to increase throughput and flow. St. Thomas experienced a 35 percent increase in appointment capacity and a 25 percent increase in clinic visits. Increased efficiency has also resulted in reduced patient wait times, additional time slots for same-day and next-day appointments, and improved patient, family, and care team satisfaction. Although the improvement efforts were critical for the center's financial stability, they also proved invaluable in optimizing the center's function as a medical home and increasing its ability to provide high-quality care (Rickard, 2015).

patient groups (supply), with the goal of achieving improvements in wait times. Scheduling practices are tailored to minimize the number of appointment types in order to streamline patient visits (Litvak and Fineberg, 2013).

This approach, which can be applied in both primary and specialty care offices (see Boxes 4-3 and 4-4), involves the study of work flow in the office setting and uses smoothing as a form of dynamic control of the patient and work flow. Phase 1 of the approach focuses on balancing resources for the flow of patients with time-sensitive medical and elective or scheduled appointments. Phase 2 turns attention to the challenge of smoothing elective or scheduled patient flow, such as appointments for yearly physicals, immunizations, or blood pressure checks. Phase 3 addresses artificial variability in demand caused by individual priorities in order to ensure that patients are seen in the right setting, by the right provider, at the right time (IHO, 2015; Litvak and Long, 2000). Box 4-3 describes how St. Thomas Community Health Center, a primary care provider in the New Orleans, Louisiana, area, used the smoothing scheduling flow model to target variability in patient flow within a consortium of primary care safety net practices, and Box 4-4 describes how the Cincinnati Children's Hospital and Medical Center used the smoothing scheduling flow model, focusing on improving existing capacity, to improve and continuously monitor scheduling and wait times in its specialty outpatient clinics.

BOX 4-4
Example of the Smoothing Scheduling Flow Model
in Specialty Care

Cincinnati Children's Hospital and Medical Center Outpatient Clinic

Specialty clinics at Cincinnati Children's Hospital faced increasing demand. To balance this demand with their existing supply and thereby improve access, Cincinnati Children's focused its efforts on improving capacity, namely, provider and resource supply (IOM, 2015). The center first analyzed the supply in its clinics. To improve flow, appointments were reduced to two types (new or return visits), supplemental appointments were temporarily added to reduce backlog, clinic operations were standardized, and the center implemented a clinic cancellation policy (Krier and Thompson, 2014). Following implementation of these changes, the medical center was able to achieve its access target of 10 days or less for the third next available appointment for new visits (Krier and Thompson, 2014). Key to implementing these changes was leadership at all levels and engaging clinical leaders of each division. Although the center has been optimized to perform at peak capacity, continuous monitoring is still required. To that end, Cincinnati Children's Hospital has developed several tools, including a scheduling algorithm and an outpatient supply management tool. The center has also found it important to make financial and productivity data available to providers (IOM, 2015).

Reframing Supply-and-Demand Options

Team-based workforce optimization strategies The adoption of Lean and other techniques of continuous quality improvement could potentially help health care systems to become more team oriented. Team-based approaches to providing health care offer a means to provide health care more efficiently (Grumbach and Bodenheimer, 2004; IOM, 2001a; Leape et al., 2009; Wagner, 2000). These approaches all emphasize such concepts as shared goals, clear roles for team members, mutual trust, and effective communication among different parts of an organization, all in an effort to meet the goal of improving efficiency and eliminating waste (Grumbach and Bodenheimer, 2004). Team-based approaches have the potential to improve quality, productivity, efficiency, and satisfaction among both patients and employees (Montebello, 1994). In addition to increasing overall productivity and efficiency, appropriately and safely delegating certain tasks to non-clinician team members can help increase capacity and thereby improve scheduling and decrease wait times (Brandenburg et al., 2015).

Improving the health care workforce requires data for use in forecasting and managing patient demand in order to avoid an artificial provider-driven component. In practice, however, most forecasts are based on historical averages rather than on the use of newer methodologies based on predictive analytics. Workforce optimization also depends on optimally assigning care tasks to the appropriate members of the care team. For example, wait times for an appointment at the outpatient cardiology clinic at a children's hospital were exceeding 40 days until the program was redesigned to include management by pediatric nurse practitioners. After that, not only did wait times decrease in comparison to clinics run by physicians, but patient satisfaction scores remained high (Evangelista et al., 2012). Another study demonstrated the value of using extended role practitioners, such as physical and occupational therapists, to increase capacity and decrease wait times in an arthritis clinic (Passalent et al., 2013). The increased capacity allowed the clinic to accommodate a rise in patient volumes over the 2-year study period and enabled earlier detection and intervention for patients.

Box 4-5 describes how Group Health in the Northwestern United States implemented team-based care using a patient-centered medical home model (which broadened the role of registered nurses and clinical pharmacists) to improve scheduling in primary care and in chronic care management in particular. Within specialty care, the Thunder Bay Regional Medical Center in Ontario, Canada (profiled in Box 4-6), implemented a shared care clinic that co-locates mental health and primary care services in order to increase coordination across primary and mental health care and to reduce barriers to accessing timely mental health services.

BOX 4-5
Example of a Team-Based Approach to
Scheduling in Primary Care

Group Health

Group Health is an integrated delivery system serving more than 600,000 patients in Washington State and Idaho (Hsu et al., 2012). Having successfully implemented a patient-centered medical home (PCMH) pilot program at their Seattle clinic, Group Health decided to undertake a large, systemwide transformation and spread the PCMH model to all 26 of its primary care practices over 18 months (Hsu et al., 2012). Following a Lean management approach, Group Health implemented four system-level changes and four practice-level changes. Central to the practice-level changes was a team-based approach to chronic illness management. Providers were organized into physician-led teams. Key to this approach was the development of goal-driven chronic illness collaborative care plans and evaluations (Hsu et al., 2012). Physicians used a standardized, generic, disease-specific template to develop care plans with patients, and aimed to develop a care plan for each patient with a targeted chronic condition (e.g., diabetes, asthma, hypertension, chronic obstructive pulmonary disease). Physicians could also use care plans to identify patients requiring additional support. These patients received counseling and follow-up from a registered nurse or clinical pharmacist on the patient's care team until their condition improved. An evaluation of the prototype reported that patients used more e-mail, telephone, and specialist visits, but fewer emergency department visits, and patients reported greater satisfaction with the quality of their care (Reid et al., 2010).

An analysis of the PCMH spread throughout Group Health's integrated practice was also conducted. Among all adults impacted by the intervention, there was a 123 percent increase in the use of secure electronic message threads, a 20 percent increase in telephone encounters, no statistically significant changes for hospital admissions, and declines in emergency department visits at 1 and 2 years (13.7 percent and 18.5 percent) following the spread (Reid et al., 2013).[a]

_____

[a] The text in this box has been modified since the prepublication to include additional information about the analysis of the PCMH spread through Group Health's integrated practice.

Technology-based alternatives to in-person visits In the primary care setting, the care team often works to minimize or eliminate delays for each day's telephone appointment requests and return appointment requests. Some have suggested that many of the needs of the patients requesting appointments—both in primary and specialty care—could be addressed by non-physician providers or by phone, via telemedicine, or via mobile health units; these alternatives would not serve as a replacement for a needed visit but rather as an alternative form of health care (Charles, 2000; IOM, 2000;

BOX 4-6
Example of a Team-Based Approach to
Scheduling in Mental Health Care

Thunder Bay Regional Health Sciences Center Shared Care Clinic
Because long wait times for mental health care are associated with higher rates of missed appointments and less usage of mental health services overall, Thunder Bay Regional Health Sciences Center decided to implement a shared care model in one of its clinics to reduce wait times for mental health care in the clinics. Shared care for mental health services involves co-locating mental health services within primary care offices. The mental health and primary care providers also shared a common health record, engaged in consultations, and cared for their patients collaboratively. At the Thunder Bay shared care site two full-time mental health counselors and a part-time psychiatrist were added. Primary care physicians referred patients to the mental health services, where the counselors triaged patients to either counseling or psychiatry services, including cognitive-behavioral, psycho-educational, and supportive counseling. Before the establishment of the shared care clinic, the median wait time for mental health care was 97.6 days. For the 3 years after the shared care clinic was established, the median wait time for shared care was just over 30 days, while the median wait time across nonshared care sites was more than 80 days (Haggarty et al., 2012).

Naylor and Imison, 2010). This approach could be used in particular as a way to deal with issues in rural and underserved areas.

Technology can improve patient access to health care both directly and indirectly (IOM, 2012). Telemedicine, the use of electronic information and technologies to support direct clinical services, can be used as an alternative to an in-person visit to a physician and as a way to improve access at a lower cost (Charles, 2000; IOM, 2000). The development of virtual care platforms has made possible a variety of new care models, including electronic-visits, video chat consultations, and other approaches to home-based care. One key to expanding the use of these models will be the development of new payment models to ensure that providers are properly reimbursed and incentivized to install and use these capabilities in their practices. It will also be necessary to develop a technology infrastructure that makes it possible to track, report on, and provide oversight of these patients and their care.

Patient-tracking technologies can help caregivers work more efficiently and improve patient safety by providing real-time information on a patient's location in the hospital system and identifying obstacles to smooth and timely patient flow (Dobson et al., 2013). Interoperable and interactive health information technology systems can alert a care team of

missed appointments to a referring specialist, the presence of new results, or the need for follow-up appointments. Patients can receive reminders of upcoming appointments, manage their prescriptions, or schedule their own appointments (Pearl, 2014).

Technology can assist in the ambulatory environment by routing some office visits to telemedicine visits, with the patients being examined by a virtual clinician; such telemedicine options range from uploading a smart phone photo (e.g., of a skin rash) and sending an e-mail question to the clinician, to sending data from a personal device to the office. One important use of technology will be found in the prework portion of a health care visit. Patients could have a virtual previsit interview to determine the appropriate provider and time for a visit, the need for laboratory or testing in advance of the visit, the need for a medical record screen for outstanding specialist visits and reports, and the transportation needs of patients.

Box 4-7 provides details about how Teladoc in California, Kaiser Permanente Northern California (KPNC), and Virginia Mason Medical Center in Seattle, Washington, have all used technology-based alternatives to improve access to timely primary and specialty care, especially care outside regular business hours. Teladoc, a telemedicine provider with consultant physicians who have no regular relationships with the patients or their regular providers, provides round-the-clock consultations with licensed physicians via telephone or secure Internet video. KPNC offers patients access to providers in primary and secondary care via secure e-mail, telephone, or Web-based video in lieu of and in addition to regular office visits. Virginia Mason Medical Center uses a telephone triage tool to facilitate immediate access to urgent care and to improve scheduling for primary and secondary care appointments for patients presenting with headache symptoms.

Inpatient and Emergency Care Scheduling Strategies

The strategies for implementing an immediate responsiveness approach to inpatient and emergency care patients fall into several categories: admission strategies, care coordination strategies, and the use of predictive models.

Admission Strategies

As described below, some hospitals have redesigned operating room environments to balance resources and the flow of time-sensitive surgical cases with elective scheduled surgeries (Litvak and Fineberg, 2013; Litvak and Long, 2000). The focus of these efforts is to improve access to the operating rooms, emergency department, intensive care unit, and telemetry

BOX 4-7
Examples of Technology-Based Alternatives to
In-Person Primary Care Visits

Teladoc

Teladoc is a large telehealth provider in the United States offering 24-hour access to consulting Teladoc physicians via telephone or Internet video. Teladoc physicians have no established relationship with patients, but patients are matched with physicians licensed to practice in their state. To use Teladoc, patients must create an online account and enter their medical history. Patients can then request either a phone or video consultation with a Teladoc physician whenever they need care. Physicians typically respond to requests within 20 to 25 minutes of receiving the request. In April 2012 the California Public Employee's Retirement System began offering Teladoc consultations as a covered benefit with no copayment to members enrolled in its Blue Shield of California health insurance plan. An early evaluation of Teladoc among these users found that less than 1 percent of eligible members used Teladoc in the first 11 months of coverage; similarly, Teladoc visits made up less than 1 percent of total monthly visits to offices, to emergency departments, and via Teladoc combined. The evaluation found that more than one-third of Teladoc visits occurred on weekends or holidays, which was similar to the rate of weekend and hospital emergency department visits (36 percent) and substantially higher than the rate for office visits (8 percent). The top three diagnostic categories were for acute respiratory illness, urinary tract infections and urinary symptoms, and skin problems. This suggests that Teladoc can help increase access to after-hours primary care while also diverting non-urgent care away from emergency departments. Moreover, 21 percent of Teladoc visits were made by patients who had no previous health care use in 2011, suggesting that Teladoc could potentially increase access to care for individuals without a regular physician or who have difficulty accessing primary care. Finally, contrary to expectations, Teladoc visits were significantly less likely to result in a follow-up visit for a similar condition than visits to a physician's office or the emergency department. Although this early evaluation is suggestive of the potential for Teladoc to increase access to primary care, Teladoc users were younger, healthier, lived in more affluent neighborhoods than average, and may have fewer access needs than individuals with the greatest challenges accessing primary care, such as those living in rural or socioeconomically disadvantaged areas (Uscher-Pines and Mehrotra, 2014).

Kaiser Permanente Northern California

Kaiser Permanente Northern California (KPNC) provides alternatives to in-person office visits via secure e-mail, telephone, or Web-based video. KPNC members can send secure e-mail messages directly to their primary care physicians or to specialist physicians treating them. In addition to asking non-urgent questions in text, patients can attach images and submit completed forms. Frequently, physicians are able to resolve patient's concerns without scheduling inpatient visits. Physicians respond to 83 percent of cases the same day and to 98 percent of cases within 2 business days. For more than a decade, KPNC has

continued

BOX 4-7 Continued

offered 10-to-15-minute telephone visits with a physician in lieu of office visits, and patient satisfaction with the telephone visits is high. Finally, encrypted video technology has been adopted by a number of specialty practices. For example, KPNC began offering video visits to provide after-hours care among patients with urgent needs—but not emergency needs—during hours when both regular practices and urgent care clinics are closed. While patients requiring immediate care were directed to go to emergency departments, the physician consulting via video was able to input information from the video consultation in the patient's electronic health record and thereby facilitate the patient's treatment in the emergency department. These alternatives to office visits have the potential to provide high-quality care at a lower cost than in-person care, although the cost savings have yet to be seen. Assessing the effect of these technologies on the quality of care has also been challenging, because they were implemented at the same time as other quality improvement measures. Barriers to implementation include ensuring compliance with the Health Insurance Portability and Accountability Act (HIPAA) standards; differing uptakes by age, race/ethnicity, and region, which makes it necessary to maintain parallel paper, phone, and in-person systems for patients not using virtual technologies; and the need to readjust physicians' schedules to accommodate time to respond to patient e-mails (Pearl, 2014).

Virginia Mason Medical Center in Seattle

At Virginia Mason Medical Center in Seattle, Washington, a health system transformation using Lean methodology has been going on since 2002 (Nelson-Peterson and Leppa, 2007). One piece of this effort involved the redesign of care for patients with uncomplicated headaches. Analysis of internal data showed that roughly 80 percent of patients who contacted Virginia Mason with headache symptoms had uncomplicated headaches. Such headaches do not require magnetic resonance imaging (MRI) or other specialized imaging, emergency care, or a consultation with specialists; nonetheless, 14 percent of these patients underwent an MRI (Blackmore et al., 2011). To reduce avoidable visits to the emergency department and specialists as well as unnecessary imaging, Virginia Mason created and deployed a simple telephone triage tool consisting of questions that a lay telephone operator can ask to determine what initial level of care each caller needs. Patients with symptoms like fever or trauma that require immediate evaluation were directed to the emergency department, while all other patients were given the option of a scheduled appointment with either their regular doctor or a clinician in the headache clinic. Analysis of this staged triage intervention showed that a single visit with telephone follow-up was sufficient for the evaluation and initial treatment of most patients with uncomplicated headache and avoided multiple visits and referrals. Evaluation of the program between January and June 2010 found that same- or next-day appointments with the headache clinic nurse practitioner were available for 95 percent of the patients needing care, and patient satisfaction scores of patients leaving the headache clinic averaged 91 percent (Blackmore et al., 2011).

beds as well as to improve the quality of care and to determine the required hospital resources (e.g., nurses, operating rooms, beds).

Smoothing flow scheduling model The same strategy used to smooth variability in patient demand in primary care settings can also be used to improve patient flow in the admission process through providing a more structured and balanced scheduling of elective patients and surgical cases (Litvak and Fineberg, 2013). By balancing resources and the flow of time-sensitive emergency and urgent cases with elective and scheduled surgical admissions, the competition for beds and delays in surgical cases can be improved. The uneven influx of elective surgical cases—for which the standard practice is to schedule as many are requested by surgeons with admitting privileges—is a major reason why the demand for beds often exceeds capacity in inpatient units (Litvak and Fineberg, 2013). Smoothing elective admissions has been shown to be an effective mechanism for improving capacity in a busy hospital (Litvak and Fineberg, 2013). Appendix C includes an admission improvement plan detailing one way to smooth elective and scheduled patient flow, and Box 4-8 describes how Mayo Clinic, Florida, and Cincinnati Children's Hospital Medical Center used the smoothing scheduling flow model to improve surgical capacity.

BOX 4-8
Examples of Smoothing Patient Flow in
Inpatient and Emergency Care

Mayo Clinic, Florida, Operating Room Use

Faced with an increasing demand for surgical services, the Mayo Clinic, Florida, used a variability method to increase capacity without building new operating rooms by improving patient flow into hospital operating rooms. First, the surgical team, working with a design team familiar with variability methodology, defined surgical cases as urgent/emergent (cases that due to clinical need must be performed within 24 hours), work-in, or elective. Due to clinical need urgent/emergent cases had to be performed within 24 hours and were further subdivided into five classifications. Work-in cases were defined as those that needed to be performed within 5 days, but not within 24 hours, and were further classified based on clinical versus administrative needs. All other cases were defined as elective. Next, the hospital collected data for 3 months, during which time no changes were made to operating room scheduling procedures. These data were then used to model various scheduling scenarios and allocate rooms to perform urgent/emergent, work-in, or elective cases. For elective rooms, data were also used to

continued

BOX 4-8 Continued

allocate elective operating room block time across rooms and throughout the week to ensure that elective cases were evenly distributed. All existing policies regarding operating room scheduling and functioning were reviewed and modified to align with the redesigned process. The new scheduling procedure was implemented for the entire surgical practice beginning November 1, 2010. The design team managed the implementation, using dashboards covering daily, weekly, monthly, and quarterly data to monitor the program, and they developed decision trees to facilitate real-time scheduling decision making and to manage conflicts. One year after the reengineered scheduling program had gone into effect, surgical volume had increased by 4 percent, representing nearly 500 additional cases annually. Staff overtime decreased by 27 percent, resulting in more than $100,000 in cost savings. The day-to-day variability in surgery case volume and the number of same-day changes to the elective surgery schedule both decreased substantially as well (Smith et al., 2013).

Cincinnati Children's Hospital Medical Center

As is the case in many hospitals, surgeons at Cincinnati Children's Hospital Medical Center scheduled elective surgeries unevenly throughout the week (Litvak and Bisognano, 2011). The hospital chief executive officer used variability methodology to spread these surgeries out over days in order to smooth the flow of patients through operating rooms (Litvak, 2009). By focusing on capacity management and patient flow through the hospital, hospital management was able to achieve a reduction of 28 percent in weekday operating room wait times for emergency and urgent surgical cases, even with an increase in case volume of 24 percent (Litvak, 2009). Furthermore, weekend operating room waiting time fell by 34 percent, despite a 37 percent increase in volume (Litvak, 2009). Using a "pit crew" approach to bed management, the hospital management used coordinated team efforts to complete critically important tasks in the minimum amount of time while avoiding errors (Reid et al., 2009; Ryckman et al., 2009). It has been estimated that, if each of the 5,700 hospitals in the United States achieved only 10 percent of the financial savings that Cincinnati Children's did through this approach, the U.S. health care system would avoid $57 billion in capital costs associated with building new operating rooms and hospital bed occupancy would increase from 65 percent to greater than 80 percent, enough to provide hospital care for every American lacking health insurance (Litvak and Bisognano, 2011).

Implementing a Coordinated Approach to Care

Care coordination is a strategy to improve effectiveness, efficiency, and quality in health care (Bodenheimer, 2008; Hall et al., 2013; IOM, 2001a). Increased care coordination has the potential to prevent unnecessary delays by eliminating redundancies and inefficiencies (Bodenheimer, 2008). Care coordination is particularly critical at various transitions, such as between

providers. In the hospital and post-acute setting, coordinating care is particularly important at discharge. Thus care coordination interventions that have nurses or other non-physicians deliver and coordinate care after discharge, that promote patient self-management in the community, or that otherwise facilitate comprehensive discharge planning can improve patient flow through hospitals by both improving output flow (i.e., assuring timely discharge) and preventing readmissions (Coleman et al., 2004, 2006).

Box 4-9 contains two case studies of organizations that applied a coordinated approach to improving scheduling and wait times in inpatient and emergency care. Specifically, the box describes the UPMC Health System Patient and Family Centered Care Method, which established

---

BOX 4-9
Examples of Coordinated Approach to Improving Scheduling and Wait Times in Inpatient and Emergency Care

UPMC Health System Patient- and Family-Centered Care Method

UPMC Health System, formerly the University of Pittsburgh Medical Center, is a nonprofit, integrated delivery system containing 20 hospitals, outpatient sites, and a health insurance division (Meyer, 2011). Anthony DiGioia, an orthopedic surgeon at UPMC in Pittsburgh, and colleagues developed a care process, the Patient and Family Centered Care Method, to improve patient experiences in the hospital's orthopedic program (DiGioia et al., 2010). The method has six steps: (1) selecting a care experience; (2) establishing a care experience guiding council; (3) evaluating the current state of the care experience using tools such as patient shadowing, care flow mapping, patient storytelling, and patient surveys; (4) developing a working group to develop an improvement strategy; (5) creating a shared vision of the ideal patient and family care experience; and (6) identifying improvement projects and assigning project teams (DiGioia et al., 2010). In 2007, UPMC Presbyterian used the method to improve its trauma service care experience. The staff at UPMC Presbyterian began by establishing a PFCC trauma care guiding council, which identified cervical spine collar clearance as an initial project area. A multidisciplinary working group composed of representatives from a variety of professions including: nursing, parking operations, admissions, pharmacy, corporate communications, and physical therapy was then established for this project (DiGioia et al., 2010). The working group shadowed patients and their families and conducted care flow mapping. Next, they mapped out an ideal care experience from the perspective of patients and families. Based on these activities, the working group created a prioritization process for patients requiring cervical spine collar clearance, upgraded the health information technology system for online X-ray reading, and implemented an alert system that uses pager

continued

BOX 4-9 Continued

messages to notify care managers about potential avoidable delays or avoidable hospital days (for which there were an existing process and existing resources) (DiGioia et al., 2010). Within 2 weeks of appointing the working group, wait times for cervical spine collar clearance for priority patients had been cut in half, from 26.5 to 12 hours. In addition, patient satisfaction rates for the emergency department, general trauma inpatient unit, and trauma step-down unit all increased roughly 10 percent (from 77 to 87.4 percent for the emergency department, 70.3 to 79.7 percent for general trauma, and 68.3 to 72.5 percent for trauma step-down) (DiGioia et al., 2010). There are various implementation challenges, particularly as the hospital system scales up the intervention, and one of the more important is getting buy-in from leadership at all levels—specifically, getting hospital executives and departmental leadership to understand that the method is intended to make better use of existing resources and not to increase costs with new purchases (Meyer, 2011). Despite these challenges, the program has since been applied widely to other departments in eight hospitals in the UPMC Health System.

Boston Medical Center

Boston Medical Center is a large, urban, safety net hospital that wanted to reduce the rates of rehospitalizations and emergency room visits after discharge. To improve discharge services, the hospital implemented a program called re-engineered discharge (RED). The RED intervention is built around nurse discharge advocates and clinical pharmacists. Nurse discharge advocates are trained using a standardized manual with scripts and practice sessions to coordinate the discharge plan within the hospital and to educate patients about and prepare them for discharge. Specific activities include making appointments for post-discharge clinician follow-up or testing, coordinating who will follow up with results from any pending tests, confirming the medication plan, reviewing processes for what to do if problems occur, and ensuring that each discharge plan is aligned with national standards. The nurses then assemble information gathered from these activities into an after-hospital care plan, an illustrated, individualized booklet designed to be accessible to individuals with low health literacy. Following scripts and using teach-back methodology, the nurses review the after-discharge care plan with patients prior to discharge. On the day of discharge, nurses send both the after-hospital care plan and the discharge summary to the patient's primary care provider. Two to 4 days after discharge, a clinical pharmacist calls the patients, making at least three attempts to reach them, and follows a scripted interview with them to review the discharge plan. The pharmacist also reviews medications by asking the patients to bring their medications to the phone, addresses potential problems, and reports any issues to the patient's primary care provider or nurse discharge advocate. Results from a randomized study found that patients participating in the RED intervention were significantly less likely to have a subsequent hospitalization than patients under usual care. Patients participating in RED also reported a higher follow-up rate with their primary care physician (62 percent) compared to usual care patients (44 percent). The intervention also resulted in cost savings of roughly one-third, compared to usual care (Jack et al., 2009).

multidisciplinary teams to identify priority areas, obtain patient and family input, and address wait times for cervical spine collar clearance for priority patients, as well as a program at the Boston Medical Center that used nurses and clinical pharmacists to improve discharge processes.

Use of Systems and Simulation Models

Simulation models use a set of rules, or assumptions, to forecast how different scenarios will play out and can be used as a planning tool to match hospital capacity to patient need (Everett, 2002). In the case of inpatient or emergency department planning or scheduling, these assumptions may cover such things as the number of patients, the interval between patients, the number of staff, the number of operating rooms, and the number of patient beds. Working from these assumptions, simulation models can then examine the effect of various hospital staffing configurations on patient flow (Jones and Evans, 2008). Different scenarios can then be compared in order to identify optimal scheduling scenarios (Kolker, 2008). Simulation models can also be used to model how individual patients move through a health care unit. By showing patient flow, simulation models can help identify bottlenecks and indicate ways to improve patient flow and decrease delays (Coats and Michalis, 2001; Stainsby et al., 2009).

Emergency departments have used a variety of techniques, including Lean (the Toyota Production System) to guide redesign efforts (Holden, 2011). As discussed in Chapter 3, Lean is a method to achieve continuous improvement which identifies the features of a system that create value and those that create waste. Lean processes can be used to identify and continuously monitor inefficiencies that may lead to imbalances in patient demand and hospital capacity that in turn lead to delays in patient flow and thus increased wait times, although additional research is needed about the opportunities and implementation challenges associated with modeling for the purposes of predicting and improving scheduling practices. Box 4-10 describes how Grady Memorial Hospital in Atlanta, Georgia, used systems engineering techniques to re-engineer the hospital's emergency department and how Mayo Clinic, Rochester, used Lean and Six Sigma methods to improve surgical processes.

Scheduling Models in Post-Acute Care

Systems approaches and tools from systems engineering applied to scheduling in primary and acute care can also be applied to post-acute settings such as rehabilitation hospitals and skilled nursing facilities. Increased care coordination, the use of multidisciplinary teams, and alternative approaches to in-person visits are all strategies that can be used to improve

BOX 4-10
**Examples of Employing Systems Engineering Techniques to
Predict and Monitor Work and Patient Flow in
Inpatient and Emergency Care**

Grady Memorial Hospital

Grady Memorial Hospital in Atlanta, Georgia, is the fifth-largest safety net hospital in the United States; the hospital serves a population with diverse socio-economic groups, and before the implementation of the Affordable Care Act only 8 percent of patients whom Grady Hospital served were covered by private insurance. Struggling to remain financially solvent, in 2008 Grady management in collaboration with operations researchers undertook a seven-step process to reengineer emergency department operations. This included process mapping of emergency department patient and work flow; analyses of patient arrival, emergency department service processes, and hospital data; the development of a predictive analytic framework to assess patient admissions demands; the application of a simulation model to improve the emergency department system performance; the identification of system improvements for implementation; and the evaluation of system improvements. The optimization model identified several areas for system improvements, of which the hospital adopted the following: combining registration and triage for certain patient groups, reducing laboratory and X-ray turnaround time, optimizing staffing, eliminating batching of patients to bring from walk-in to one of various treatment zones, and establishing a walk-in center to treat non-urgent patients. These changes resulted in a 33 percent reduction in average length of stay, a 70 percent reduction in average wait time, an increased annual throughput across the emergency department, a 32 percent reduction in the number of patients who left without being seen, a 28 percent decrease in avoidable 72-hour and 30-day readmissions among patients with emergency and urgent conditions (Emergency Severity Index acuity levels 1 through 3), and substantial cost savings. Grady Memorial Hospital has subsequently applied this methodology to other units. The emergency department model has also been implemented in 10 other emergency departments, in which performance and clinical outcomes have been similar to those seen at Grady (Lee et al., 2015).

Mayo Clinic, Rochester

Mayo Clinic, Rochester, is an academic medical center with 88 operating rooms in two acute care hospitals (Cima et al., 2011). To improve operating room efficiency, Mayo Clinic, Rochester, used Lean and Six Sigma methods to implement a surgical process improvement intervention. The hospital first developed a value-stream map of patient flow through operating rooms that detailed event location, personnel, and information technology requirements; alternative pathways; and key performance elements (Cima et al., 2011). A multidisciplinary leadership team then analyzed the map and identified five work streams to organize process improvements:

BOX 4-10 Continued

1. To reduce unplanned variation in elective surgical cases, details about prescheduled cases (e.g., case time and estimated duration) and planned surgeon absences were made available to all surgeons, and each surgical specialty was required to develop a standardized case description.
2. To streamline the preoperative process, the hospital developed standardized preoperative assessment criteria, staggered operating room start times (assigned to each operating room and did not change) and respective report times, and staggered patient entry through three self-triaging check-in lines based on report time.
3. To reduce time in operating rooms spent on nonsurgical tasks, the hospital implemented parallel processing, in which these tasks were performed in parallel with ongoing cases in non-operating rooms. The hospital also established targets for turnover time between cases and posted weekly performance metrics outside each operating room monthly.
4. To reduce redundancies in patient documentation, the hospital streamlined its electronic health record in which information collected earlier in the preoperative process was automatically put into future records.
5. Finally, to ensure staff engagement, the hospital established a communication council composed of representatives from all stakeholders that developed and delivered consistent communication plans to stakeholders and resolved concerns. The hospital also conducted staff satisfaction surveys.

The surgical process improvement intervention resulted in significantly fewer wait times of longer than 10 minutes at surgical admissions, significantly higher rates of on-time arrival to the preoperative area, and significantly quicker operating room turnover times. Furthermore, these efficiency improvements resulted in better financial performance and the need for fewer nursing and other non-clinical staff for daily operations, and late shift and overtime needs among surgery and anesthesia nurses decreased despite an increased surgical volume. Despite efficiency and effectiveness gains, there was a need for enhanced staff support/liaison efforts, with three-fourths of respondents to a staff satisfaction survey reporting that the improvement program increased their efforts and staff expressing concerns about job security even though no nursing or allied health staff were either laid off or reassigned to other work (Cima et al., 2011).

scheduling and patient flow and to decrease wait times. Similarly, as is the case in both primary and acute care settings, systems engineering tools that facilitate system-wide assessments and adjustments can be used to streamline patient flow in post-acute care (Litvak and Fineberg, 2013). For example, the Veterans Affairs Polytrauma Telehealth Network (profiled in Box 4-11) supports increased access and care coordination in post-acute care by using video teleconferencing and peer-to-peer networking across rehabilitation teams and between patients and specialty care providers.

BOX 4-11
Example of Innovative and Emerging
Scheduling Models in Post-Acute Care

Veterans Affairs Polytrauma Telehealth Network

Injuries sustained in combat during Operation Iraqi Freedom and Operation Enduring Freedom are of unprecedented severity and complexity, and they frequently require long-term rehabilitation; some combat-wounded veterans will require rehabilitative services for the rest of their lives (Darkins et al., 2008). The reduction in time between sustaining a battlefield injury and arrival for care in the United States further complicates the rehabilitative needs of combat-wounded veterans. To meet this need, in 2006 the Department of Veterans Affairs (VA) established a telerehabilitation system consisting of four polytrauma rehabilitation center (PRC) hub sites that support 21 regionally based polytrauma network sites (PNSs). The Polytrauma Telehealth Network (PTN) was established to make specialist expertise in PRCs available at PNSs and to coordinate rehabilitation services across sites. PTN is also intended to provide comparable or enhanced quality of care at the same or lower cost. Specifically, PTN supports videoconferencing and peer-to-peer networking of rehabilitation teams across the VA, links care across the VA sites and also to Department of Defense counterparts (e.g., Walter Reed Army Medical Center and Bethesda Naval Hospital), allows patients and their families to access distant VA sites (e.g., for specialty care), and supports multicasting for clinical and education activities (e.g., grand rounds). For severely injured patients who may require acute inpatient care in the early stages of their rehabilitation, PTN can facilitate ongoing outpatient care with the same providers in later stages while also allowing the patient to live in his or her local community. For less severely injured patients, PTN allows access to specialty care in their local communities (e.g., direct patient care) and also facilitates care coordination across treatment teams. In 2006 the VA provided 37,234 teleconsultations for patients with mental conditions and supported 25,586 telehealth devices for patients at home who would otherwise have required institutional care (Darkins et al., 2008). Since 2006, the program has been expanded to include 5 PRCs, 23 PNSs, 86 Polytrauma Support Clinic Teams, and 39 Polytrauma Points of Contact located at VA medical centers nationally (VA, 2015b).

Engaging Patients and Families in Systems Design and Implementation

As has been emphasized throughout this report, the committee recognizes that it is important for patients to be core partners in systems redesign. Studies have shown that patients' active management of their own health care is associated with the patients' greater satisfaction with their care and with better health outcomes, quality of life, and economic outcomes (Hibbard and Greene, 2013; IOM, 2013). However, as noted in Chapter 1, providing patient-centered care goes beyond consideration

and concern in direct care. It requires a delivery system that supports the provision of care that meets patients' needs—and thus one that integrates patient values, experiences, and preferences into the design and governance of the health care organization. Designing such a system requires engaging patients in organizational design and governance as well as in their direct care (Carman et al., 2013).

With regard to scheduling and access, as described in Chapter 3, a patient-centered health care system understands its inherent capacity, patient demand, and variations in this supply and demand; this leads to a system that performs at its optimal capability, including with minimal delays, but that is also sufficiently flexible to handle temporary fluctuations in either its provider supply or patient demand. Engaging patients in the assessment, design, and improvement processes can lead to a better understanding of patient demand and thus how the system can be realigned to meet that demand.

Simply implementing an advanced scheduling system is not a patient-centered action unless it strengthens the patient–clinician partnership, promotes trust and collaboration, and facilitates the patient's involvement (Davis et al., 2005). To assess patient experiences and patient satisfaction, including with access and scheduling, health care organizations can use and analyze survey data concerning patient experience and satisfaction, such as data from the Consumer Assessment of Healthcare Providers and Systems (CAHPS) surveys that were described in Chapter 1. These data can then be used to identify areas of waste or delays and also to inform access improvement activities such as process redesigns. The implementation of partnerships with patient advisors and the development of patient and family advisory councils have proven to be effective ways to gather this essential information; however, other methods are needed to evaluate the patient's ability to obtain ambulatory and office-based appointments quickly.

Currently, little information exists on the effects of patient involvement in access-related improvement activities on either operational or health care outcomes. However, areas in which patients could be included in efforts to improve access and optimize scheduling may include: defining preferences, exploring alternative access strategies, contributing to the design of pilot improvement efforts, helping to shape communication strategies, and interfacing with governance and leadership. Box 4-12 describes how Seattle Children's Hospital incorporated patient and family needs and preferences when designing its scheduling approach.

Additional opportunities to engage patients in scheduling and access include increasing transparency and communication through publishing wait times data and developing information systems to support communication about scheduling and future care needs. Currently, few data are available to patients regarding wait times, whether for scheduling appointments or

---

BOX 4-12
Example of Patient and Family Engagement
in Design and Evaluation

Seattle Children's Hospital

For over a decade, Seattle Children's Hospital has used a Continuous Performance Improvement (CPI) program, a modified version of the Toyota Production System that adapted Lean methods for the health care setting, to improve the quality of the health care that it delivers (Hagan, 2011). A core principle of CPI is focusing primarily on patients. In practice, this means examining each process and determining which steps add value to the patient from the patient's perspective and which do not (Hagan, 2011; Stapleton et al., 2009). The hospital also involves patients and their families in many, but not all, of its improvement efforts, and their direct participation early in the improvement process has reinforced the value of their input (Hagan, 2011; Toussaint and Berry, 2013). For example, when the hospital built its new Bellevue Clinic and Surgery Center, input from patients and their families early in the construction process revealed that it was important for parents to be able to stay with their children in the preoperative area. The space was designed and built accordingly, resulting in more efficient construction (Toussaint and Berry, 2013). However, patients and their families were not always included in quality improvement activities early on. When Seattle Children's redesigned its ambulatory center, it discovered that despite having reduced appointment wait times by 50 percent, patient satisfaction measures were actually falling (Brandenburg et al., 2015). Further inquiry revealed that many families were less interested in same-day access than in the choice to make an appointment on a more convenient day, and Seattle Children's subsequently changed the scheduling algorithm to include an assessment of family needs and preferences (Brandenburg et al., 2015). Thus, despite the use of multidisciplinary teams including members of executive and clinical leadership (e.g., the chief operating officer, the chief medical officer, and department chairs) and representatives of care teams (e.g., physicians, nurses, and residents) (Stapleton et al., 2009) to improve hospital processes driven by a focus on the patient, without direct patient participation in the process the organization was making inaccurate assumptions about patient preferences (Brandenburg et al., 2015). Leadership is now evaluating other organizational assumptions about patient needs and preferences (Brandenburg et al., 2015).

---

for receiving on-time care at the time of an appointment; similarly, there are few data available concerning which systems are achieving the best results with reducing wait times (Brandenburg et al., 2015). The transparency of such data could potentially help patients make better-informed decisions about their care. Patient-centered care requires communication and education, such as providing patients with details on recommended treatment

plans and on the need for and availability of future appointments. The integration of care plans, scheduling, and automatic reminders is a promising application of information technology that could improve access and scheduling throughout the care continuum (Pearl, 2014).

COMMONALITIES IN SUCCESS

This chapter has explored a range of potential approaches and strategies for achieving timely care access across different populations and health care institutions. Because of the nature of the access challenge and the diversity of care settings, it is necessary to employ strategies that can be adapted to local conditions and that are flexible enough to meet changing needs. In the ambulatory care setting, best practices prioritize same-day care and rapid response to ensure that capacity is aligned with demand. Inpatient and emergency care are more variable, so that both care coordination strategies and more sophisticated analyses using predictive modeling may be required. Post-acute care presents an even higher level of variability and may benefit from strategies that prioritize multidisciplinary approaches and developing alternatives to in-person visits that meet patients' needs. Based on a review of the cases as well as the scan of the literature presented in Chapters 2 and 3, the committee identified a number of commonalities among exemplary practices that serve, in effect, as a set of basic health care access principles for primary, specialty, and hospital and post-acute care scheduling (see Box 4-13). These basic access principles are as follows:

Supply–demand matching. A formal and ongoing quantitative assessment of supply and demand is the first principle in providing timely appointments for each request requiring a visit. As described in detail in Chapter 3, measuring and then balancing supply and demand at each step along the care continuum is essential to efficient and effective health care and is also the basic component of a systems approach to managing scheduling and

---

BOX 4-13
Basic Access Principles for All Settings

- **Supply–demand matching** through formal ongoing evaluation.
- **Immediate engagement** and exploration of need at time of inquiry.
- **Patient preference** on timing and nature of care invited at inquiry.
- **Need-tailored care** with reliable, acceptable alternatives to clinician visit.
- **Surge contingencies** in place to ensure timely accommodation of needs.
- **Continuous assessment** of changing circumstances in each care setting.

access to health care. Predictive analyses and simulation models are potentially helpful mathematical tools that health care organizations can use to assess patient demand and to project optimum capacity (see Box 4-8).

Immediate engagement. Every patient or family request for care should be engaged upon inquiry, with a query concerning what the problem is and what might be helpful in the moment. "Immediate engagement" may result in setting a goal of same-day appointments in primary care (see Box 4-2), in specialty care clinics meeting their internal scheduling goals of 10 days or less (see Box 4-4), or in practices that seek alternatives to in-person visits to meet immediate, non-emergent needs (see Box 4-5).

Patient preference. Patients should be invited to express their preferences on the timing of the care interaction (Berry et al., 2014). As detailed in Chapter 3, the focus on meeting patient need should drive systems strategies aimed at improving health care, and systems-based approaches to improving health care scheduling and access should be aimed to improve the patient experience and meeting patients' needs, as defined by patients themselves. At UPMC Health System (see Box 4-9), the collection and analysis of patient preference data, assembled using such methods as patient shadowing, patient storytelling, and patient surveys, is an important component of the institutional strategy to improve access. As was the case with Seattle Children's Hospital (see Box 4-12), patient preference data contributed to the redesign of the health system's existing systems program.

Need-tailored care. The options for same-day response should include various proven methods for meeting patients' needs or concerns. As described in Chapter 3 and presented in the examples above, these tailored methods for providing immediate engagement may incorporate evolving technologies in health care for the scheduling and delivery of care, including providing various options for in-person visits with physicians such as phone calls, e-mails, teleconferences, telehealth, e-prescribing, and other forms of e-consults (see Box 4-7). Other methods may use non-physician clinicians such as nurses and clinical pharmacists in new capacities (see Boxes 4-5 and 4-9).

Surge contingencies. Every practice setting should have contingency provisions for accommodating patients' acute clinical problems or questions that cannot be addressed in a timely manner. As discussed in the examples above, technology-based alternatives to in-person visits (e.g., phone calls and videoconferences) to treat urgent but not emergency medical issues after regular office hours have been shown not only to meet patients' immediate concerns but also to allow consultant physicians to ensure the continuity of

care by, for instance, scheduling follow-up in patient visits with the patient's regular doctor and entering clinical notes and messages for the patient's regular doctor through an interoperable electronic health record (see Box 4-7).

Continuous assessment. Patient access metrics—including data on patient and family experience and satisfaction, scheduling practices, patterns, and wait times, cycle times, provision and performance experience for alternative care models, and effective care continuity—should be collected, evaluated, and reported for each practice and clinic. The data collected within each health care organization can serve as tools for evaluating daily activity and monitoring appointments over a specified time period (see Box 4-2), or data can be used to design and test various scheduling models (see Box 4-8). Moreover, to facilitate the interoperability and assessment of comparative performance across care settings, standards and benchmarks on access and wait times should also be developed, tested, and implemented with the assistance of national organizations with expertise in standards development and testing.

CAPACITY IMPLICATIONS

Standards and Quality Improvement Organizations

Throughout the report, the committee has noted that few standards and measures exist to adequately reflect performance on health care access. Reviewing the current evidence and the current state of health care systems, the committee determined that it is not currently possible to develop a nationwide standard, but instead standards must be tailored to reflect the influences of the specific setting. As the evidence base grows, standards and quality improvement organizations should design more specific measures and standards to complement and even replace the current best practices. It is important that these measures and standards be evidenced-based and achievable.

Under the auspices of the Department of Health and Human Services (HHS), both the Centers for Medicare & Medicaid Services (CMS), and the Agency for Healthcare Research and Quality (AHRQ) provide federal oversight of health care quality throughout the nation and provide the leadership needed to incorporate access and methods for improvement into the national strategy for health care redesign. Together the two agencies can assist with the incorporation of access and the integration of systems strategies and operations management.

A particularly important possibility is that CMS could incorporate access and scheduling elements into its current portfolio of funded projects, including the Center for Medicare & Medicaid Innovation, the Hospital

Inpatient Quality Reporting Program, the Hospital Outpatient Quality Reporting Program, the Physician Quality Reporting System, and other long-term care and ambulatory care projects. AHRQ can further the development of access and performance-based measures and incorporate them into the National Quality Measures Clearinghouse.

Representing the private sector, the National Quality Forum (NQF), the National Committee for Quality Assurance (NCQA), and The Joint Commission offer natural complements to the efforts of the federal agencies to spur attention and needed improvements in health care access. Further improvements can be achieved through the integration of routine measures and standards of access as a starting point of a national health care redesign. As the clearinghouse of performance measurement, preferred practice, and frameworks for health care improvement, NQF is an essential stakeholder in the efforts to implement, assess, and improve the recommendations of this report. Of particular importance will be the role of NQF in the development of access measures, specifically patient experience measures that are linked to outcome. In addition, the integration of systems engineering, capacity management, and operations research into their education and outreach programs will be key to ensuring further development of the field.

As a consensus builder in the field of quality improvement and standards, NCQA can assist in the spread of the best practices described in this report. In particular, NCQA's work with technology development and uptake and with the integration of access measures into the Healthcare Effectiveness Data and Information Set and Consumer Assessment of Healthcare Providers and Systems is essential to the redesign to a patient-centered model of health care. The Joint Commission initiative Outcomes Research Yields Excellence is well suited to integrating access-related performance measures into accreditation for hospitals and retail health care clinics. In addition, the inclusion of access measures into the National Patient Safety Goals, and partnership with patient safety organizations that advocate for transparency for patients and consumers (such as the Leapfrog Group) will be a key to introducing and enforcing national attention to this critical component of health care redesign. See Box 4-14 for additional information on these organizations.

Engaging Stakeholders in Design and Implementation

To successfully apply emerging best practices, health care delivery organizations need the expertise and vision of a range of stakeholders, including patients and families, health care organizations, professional societies, insurers and other payers, and the government. The section below describes key stakeholders that are important for implementing, regulating, and sustaining scheduling approaches.

BOX 4-14
Standards and Quality Improvement Organizations

A variety of organizations are involved in establishing and maintaining standards in health care as well as developing measures for the monitoring and assessment of these standards. Brief descriptions of key standard organizations are provided below.

- The Centers for Medicare & Medicaid Services (CMS) plays an important role in the development of standards through the administration of Medicare, Medicaid, the Children's Health Insurance Program, and related insurance and care programs. This includes standards for providers and organizations nationwide as well as a range of programs aimed at improving quality, safety, and payment in the health system, many of which are housed in the CMS Innovation Center (CMS, 2015a).
- The Joint Commission is an independent accreditation and certification program for health care organizations. This includes the development and maintenance of standards for health care quality and performance as well as measures to enable evaluation. The Joint Commission conducts on-site surveys of all certified organizations every 2 to 3 years (JC, 2015).
- The National Committee for Quality Assurance is a care quality organization that administers a variety of programs to support measurement, improvement, transparency, payment reform, and accountability. This includes the accreditation of health plans and the development of measures, standards, and tools for tracking progress and comparing performance, including the Healthcare Effectiveness Data and Information Set (NCQA, 2015).
- The National Quality Forum is a membership-based organization that endorses health care quality measures. Activities include convening multi-stakeholder working groups to evaluate measures, seeking continuous feedback on measure performance, and serving as a forum for stakeholders in the health care measurement community (NQF, 2015).

Patients and Families

A key foundation of this report is that patients and their families are essential to the redesign of health care to improve access. Therefore, their preferences should be actively sought and considered when developing and implementing systems approaches to scheduling. Patients and their families can contribute expertise to help clarify patient demand challenges and help seek innovative solutions. Through a number of informal or formal channels (e.g., patient and family advisory councils, surveys, and focus groups), patients and their families can help define preferences, explore alternative access strategies, and contribute to the design of pilot improvement

efforts, shape communication strategies, and interface with governance and leadership.

Engineering and Operations Research Leaders

As health care further changes with increased financial uncertainty, a continuing need for improved efficiency, and continued vigilance for high quality and safety, the leaders of systems engineering and operations management could contribute to the redesign of scheduling practices. The role of systems engineering leaders could involve offering education to physician executives and administrative leaders as well as the development of an infrastructure of talent and expertise (Valdez et al., 2010).

Professional Societies

Developing partnerships between providers and systems engineers will require the introduction of professional societies to systems approaches and to their potential applications in health care. Professional societies have enormous potential to drive policy, determine priorities for their members, and provide an important lever of change for leaders within organizations and practices. Participating in joint workshops and education efforts will begin the process of creating an interdisciplinary partnership and developing the field of systems engineering in health care. Research has always been a high priority for professional organizations and could be focused on designing and overseeing a systems engineering portfolio of projects. Professional societies could then assist their members in the development of appropriate projects and the implementation of new methods within their practices and organizations (Valdez et al., 2010).

Insurers and Other Payers

Governmental agencies, including HHS, the Department of Veterans Affairs (VA) and the Veterans Health Administration (VHA), and the Department of Defense's Military Health System together influence the delivery of health care to millions of people in the United States and are intimately involved in a variety of efforts that affect health care access. Together with private insurers, they can play a crucial role in the redesign of health care to improve access and decrease cost (DoD, 2014; Levinson, 2014; Murrin, 2014; Nelson et al., 2014).

Insurance company policies have a significant influence over the delivery of health care. Incentivizing providers and administrators to use the techniques of systems engineering to reduce wasteful processes and to streamline health care would lead to a beneficial partnership for all (Valdez et al.,

2010). Insurers are increasingly partnering with providers in accountable care efforts, and the associated financial support could serve to drive a large number of much-needed improvement activities. Insurers play an essential role in health care access reform because of their interest in having a strong financial performance over a longer period of time. As many of the financial effects resulting from systems engineering approaches accrue over several years with no rapid return on investment, this partnership will require a careful calibration of expectations (Gong et al., 2015).

Government

HHS has provided the impetus for the adoption of health information technology (health IT) through the Health Information Technology for Economic and Clinical Health Act (HHS, 2015). As part of the meaningful use of IT, interoperability has been singled out as an area requiring further development, and it is a factor that will have a direct impact on health care access (McGowan et al., 2012). HHS's role in driving additional changes in IT infrastructure and governmental oversight cannot be overstated. The introduction of additional IT functionality through the Office of the National Coordinator for Health Information Technology to ensure standardized measurement and scheduling would allow successful access reform (ONC, 2015). As the national agency responsible for the training, design, and monitoring of the health care workforce, the Health Resources and Services Administration (HRSA) will play an important role in implementing the recommendations, partnering with professional organizations to educate the health care workforce and offer new roles for members of the care team (HRSA, 2015).

Also under HHS, the CMS Innovation Center is involved in funding many start-up projects investigating new payment and delivery models that align with the triple aim to achieve better care for patients, better health for our communities, and lower costs (CMS, 2015c). CMS has already provided funding for the first group of improvement efforts, including the use of e-Consult and e-Referral, and it will be a valuable partner in overseeing the implementation of the recommendations in the heterogeneous setting of health care (CMS, 2015e). The CMS Partnership for Patients was an important partner for emphasizing the need for the patient-centered focus in care redesign, and it laid an important foundation for how this principle of patient-centeredness can be applied to solving access challenges. Because access reform involves a movement toward patient-centered care, CMS wields strong influence in this movement through funding efforts, spreading success, and generally broadcasting the success of using systems engineering and operations management techniques to address the profound delays within the health care system (CMS, 2015b).

National health care providers are also important for facilitating scale and spread of best practices and expanding the evidence base. As presented in this report, the Department of Defense Military Health System is already studying variability of wait times within its own organization, seeking strategies for geographic barriers, and developing benchmarks for wait times and access (DoD, 2014). The VA/VHA efforts will require significant attention to the roles of leadership and the command and control management found within the organization. However, with some of the new efforts recently put into place and the staged introduction of techniques that were previously successful in various VA/VHA facilities, systems approaches could yield very rich results. In a system combining both financial and clinical data, the VA/VHA is set to be the national leader of integrating systems engineering into health care (VA, 2014a).

The cases presented within this chapter, as well as the literature reviewed by the committee, provide a foundation for the committee's recommendations (presented in Chapter 5), which emphasize the needs to anchor scheduling practices within the identified access principles; to adopt systematic approaches to health care scheduling; to address variation of scheduling practices through coordinated efforts to build the evidence base, test best practices, and develop standards; and to incorporate the perspectives of patients and other stakeholder groups in planning, implementing, and evaluating new approaches to scheduling.

5

Getting to Now

CAPTURING THE MOMENT

As chronicled in the committee's assessment, access and wait time challenges exist for patients and families—as well as for providers—throughout the nation. On the other hand, the committee has found ample potential for positive and far-reaching improvements. The term "Getting to Now" reflects the committee's determination—based on their expertise, models found within other sectors, and the literature and case examples found within health care—that there is currently an opportunity to develop systems-based approaches to scheduling and access that provide immediate engagement of a patient's concern at the point of initial contact. These approaches include use of in-person appointments as well as alternatives like team-based care, electronic or telephone consultations, telehealth, and surge capacity agreements with other caregivers and facilities. To reach the goal of immediate engagement, given the complexity of the health care system and the interdependence of participants and processes, no single stakeholder alone can bring about the changes needed to improve access.

In the face of both the increasing complexity of diseases and interventions and the need for greater efficiency and effectiveness, the roles of health care providers have been changing rapidly, from the traditional model of autonomous practice to the current ideal of collaborative, team-based care. This is a significant change and requires the development of an entirely new mental model, particularly for physicians, who may have little experience or training in team-based care. The application of a systems perspective is

a similarly novel concept for practice cultures that have been substantially bounded by their own siloed cultures.

The committee has found that the problems resulting from access and wait time issues go beyond the costs imposed on patients by prolonged wait times, delays in the provision of care, and geographic limitations. These access challenges also generate significant costs associated with the poor quality and waste caused by delays and decreased access. Despite the extent of the challenges, this is an issue that has received little attention, is not routinely measured and reported, and is under-studied. Existing standards for appropriate wait times to get an appointment are few, are based on little evidence, and amount essentially to little more than general reference points.

Still, experiences in various places indicate that the potential exists for progress through process, service, and workforce redesign that need not be resource intensive. Although areas of excellence are steadily becoming more common—including many such areas found in the Department of Veterans Affairs (VA) and the Veterans Health Administration (VHA)—best practices are not yet broadly disseminated, and there has been limited uptake of proven tools and techniques. The collective use of systems strategies, new management approaches, and improved involvement of patients and families can move the current system forward to one that is more patient-centered and can help to provide convenient, efficient, and excellent health care in a variety of settings, without the need for costly investment. As part of the redesign process, decision makers must make creative use of the full range of factors that help to smooth demand and improve supply, including digital technologies, social media, telemedicine, and other new avenues of care delivery. Continuous personal, organizational, and national learning should be the driving forces for improved access, simplified scheduling, and decreased wait times for the nation.

The issues considered by the committee are emblematic of broader challenges and opportunities in health care: e.g., the need to orient all processes and decisions to the perspectives of patients, the importance of taking a systems perspective in dealing with the interplay of complex processes, and the requirements of executive-level leadership to affect change. Each of these challenges is important within the access and scheduling domain. Because change will require broad leadership from stakeholders throughout the nation, the findings and recommendations that follow are targeted to national and health care delivery leaders. With this report, the committee seeks to present both a vision and a roadmap for national progress in this vital area.

COMMITTEE FINDINGS

Throughout this report are various findings related to systemic problems the committee has observed, promising practices it has identified, basic premises for implementation, and the foundations and capacities required for progress (see Box 5-1). The committee's specific findings are presented below.

Variation in Timeliness of Care

Finding: Timeliness in providing access to health care varies widely. Variation ranges from same day in some circumstances to several months in others. This is the product of generally unstructured and nonsystematic

---

BOX 5-1
Summary of Committee Findings

- **Variability:** Timeliness in providing access to health care varies widely.
- **Consequences:** Delays in access to health care have multiple consequences, including negative effects on health outcomes, patient satisfaction with care, health care utilization, and organizational reputation.
- **Contributors:** Delays in access to health care have multiple causes, including mismatched supply and demand, a provider-focused approach to scheduling, outmoded workforce and care supply models, priority-based queues, care complexity, reimbursement complexity, financial barriers, and geographic barriers.
- **Systems strategies:** Although not common practice, immediate engagement for patients is achievable through queue streamlining and related systems strategies to access and scheduling.
- **Supply and demand:** Continuous assessment, monitoring, and realigning of supply and demand are basic requirements for improving health care access.
- **Reframing:** Alternatives to in-office physician visits, including the use of non-physician clinicians and technology-mediated consultations, can often meet patient needs.
- **Standards:** Standardized measures and benchmarks for timely access to health care are needed for reliable assessment and improvement of health care scheduling.
- **Evidence:** Available evidence is very limited on which to provide setting-specific guidance on care timeliness.
- **Best practices:** Emerging best practices have improved health care access and scheduling in various locations and serve as promising bases for research, validation, and implementation.
- **Leadership:** Leadership at every level of the health care delivery system is essential to steward and sustain cultural and operational changes needed to reduce wait times.

approaches to the design, implementation, and assessment of scheduling protocols.

Consequences of Delays in Access to Care

Finding: Delays in access to health care have multiple consequences, including negative effects on health outcomes, patient satisfaction with care, health care utilization, and organizational reputation. These consequences are experienced throughout the U.S. health care system, impact how care is delivered and experienced by patients, and could be substantially diminished.

Causes of Delays in Access to Care

Finding: Delays in access to health care have multiple causes, including mismatched supply and demand, the current provider-focused approach to scheduling, outmoded workforce and care supply models, priority-based queues, care complexity, reimbursement complexity, financial barriers, and geographic barriers.

Systems Strategies

Finding: Although not common practice, immediate engagement for patients is achievable through queue streamlining and related systems strategies to access and scheduling. Contrary to the notion that same-day service is not achievable in most sites, same-day options have been successfully employed through a variety of strategies, when devoted to supply and demand assessments, working through backlogs, and achieving balance in the resource allocations and flow patterns.

Supply and Demand Assessment

Finding: Continuous assessment, monitoring, and realigning of supply and demand are basic requirements for improving health care access. Full accounting of capacity elements, scrupulously monitoring the volume and nature of demand, process redesign aimed at improving patient flow and clinic workflow, and better matching patient needs with available staff skills and duties can improve patient volume and access, decrease the cost of care, and lessen the need to add personnel.

Reframing and Expanding Alternate Supply Options

Finding: Alternatives to in-office physician visits, including the use of non-physician clinicians and technology-mediated consultations, can often meet

patient needs. Reframing the supply and demand options is possible also through electronic consultations, telehealth, and surge capacity agreements with other caregivers and facilities.

Lack of Standards for Timely Access to Care

Finding: Standardized measures and benchmarks for timely access to health care are needed for reliable assessment and improvement of health care scheduling. Standards are needed to provide reliable information on comparative performance across various care settings, practices, and circumstances with respect to patient and family experience, including care match with patient goals; scheduling practices, patterns, and wait times; cycle times; the provision of and performance experience regarding alternative care models; and effective care continuity.

Inadequate Evidence

Finding: Available evidence is very limited on which to provide setting-specific guidance on care timeliness. Reliable performance standards cannot be established without better data. To develop the evidence base, health care organizations will need reliable information, tools, and assistance from various national organizations with the requisite expertise—as well as inter-organization coordination to ensure the harmony of reporting instruments and reference resources.

Best Practices for Timely Access to Care

Finding: Emerging best practices have improved health care access and scheduling in various locations and could serve as promising bases for research, validation, and implementation. Although there is not enough available evidence to establish specific standards for scheduling and wait times, innovative systems models and case studies can be identified on the basis of empirical observations of successful practices. With further research into their efficacy, these models have the potential to be adopted more widely and to become the foundation for standards of care.

Leadership

Finding: Leadership at every level of the health care delivery system is essential to steward and sustain cultural and operational changes needed to reduce wait times. Leadership must be devoted to reflecting, sustaining, and enhancing patient-centered care in scheduling and access and the results

must be continually gathered, assessed, made available, and deployed in order to drive and reward improvement.

COMMITTEE RECOMMENDATIONS

Based on these findings, the committee offers 10 recommendations that it believes will accelerate progress toward the spirit and the practice of the immediate responsiveness envisioned as health care's goal (see Box 5-2). The committee recommendations are aimed at the widespread adoption of the basic access principles described in Chapter 4 and summarized in Box 5-3: supply matched to projected demand, immediate engagement, patient preference, care tailored to need, surge contingencies, and continuous assessment.

BOX 5-2
Summary of Committee Recommendations

For National Leadership leading to:
1. **Basic access principles** spread and implemented.
2. **Federal implementation initiatives** with multiple department collaboration.
3. **Systems strategies** broadly promoted in health care.
4. **Standards development** proposed, tested, and applied.
5. **Professional societies** leading application of systems approaches.
6. **Public and private payers** providing financial incentives and other tools.

For Health Care Facility Leadership leading to:
7. **Front-line scheduling** practices anchored in the basic access principles.
8. **Governance commitment** to leadership on basic access principles.
9. **Patient and family participation** in designing and leading change.
10. **Continuous assessment** and adjustment at every care site.

BOX 5-3
Basic Access Principles for All Settings

- **Supply–demand matching** through formal ongoing evaluation.
- **Immediate engagement** and exploration of need at time of inquiry.
- **Patient preference** on timing and nature of care invited at inquiry.
- **Need-tailored care** with reliable, acceptable alternatives to clinician visit.
- **Surge contingencies** in place to ensure timely accommodation of needs.
- **Continuous assessment** of changing circumstances in each care setting.

The recommendations that follow are aimed at building the essential foundational elements for the implementation of these basic access principles at the national level and on through to the levels of the individual health care facility. The embedded centerpiece of the recommendations is a focus on the needs of the patient and family, and the development of the skills and tools necessary to lead an organizational culture of service excellence in the execution of that focus.

Recommendations for National Leadership

The committee recommends that

1. National initiatives to address scheduling and access issues related to primary, specialty, hospital, and post-acute care appointments should be anchored in spreading and implementing basic access principles, including: supply matched to projected demand, immediate engagement, patient preference, care tailored to need, surge contingencies, and continuous assessment.

2. With active support and leadership led by the Secretaries of the Department of Health and Human Services, the Department of Veterans Affairs, and the Department of Defense, coordinated federal initiatives should be initiated to draw upon the leadership and resources of the multiple federal agencies that are important to the practical and reliable realization of access principles throughout the nation. These efforts more specifically include

    a. The Secretary of Health and Human Services, in close collaboration with the Secretaries of Defense and Veterans Affairs, should develop and test strategies to move from the office visit as the default site of care delivery to a broader care system, with expanded roles for telehealth, in-home visits, and group visits.

    b. The Agency for Healthcare Research and Quality should strengthen its efforts to identify and disseminate the experiences of organizations with effective, innovative activities to expedite patient access.

    c. The Office of the National Coordinator for Health Information Technology (ONC) should develop and test models of information technology to support the monitoring and analysis of operational data, including access metrics on scheduling and wait times. These data should integrate seamlessly into existing systems and be interoperable to enable communication and data

exchange with other health care organizations and the assessment of comparative performance. ONC should also develop and test analytic tools that can continuously monitor current operational conditions, including the scheduling measures of supply and demand. ONC should provide technical assistance to health care organizations regarding the implementation of these operational data systems and analytic tools.

d. Major federally operated direct clinical service providers, including the Department of Defense and the Department of Veterans Affairs, should work individually and cooperatively to develop and test emerging best practices across different settings and geographic locations. The principles of the most successful models should be widely implemented.

e. The Health Resources and Services Administration should strengthen the capacity of its network of community health centers to share information about successes and failures in efforts to transform access to care, and it should assist with the implementation of the recommendations by partnering with professional organizations to offer education of the health care workforce.

3. All coordinated efforts across federal agencies should include representation from leaders of health care delivery systems, patients and families, and industrial engineering who should work collaboratively with leadership of the federal departments to improve the broad application, assessment, and promotion of systems strategies for continuous learning and improvement in health and health care.

4. Measure developers and accreditors such as the National Quality Forum, the National Committee for Quality Assurance, The Joint Commission, and the Leapfrog Group should collaborate in research and development initiatives to build understanding and action for proposing, testing, and applying standards related to the access principles. These initiatives should include

a. Capacity assessments (supply)—Assessment should be conducted on staffing levels, exam room capacity, and hours and days of operation.

b. Patient factor assessments (demand)—Research should be conducted on the various implications of patient numbers, patient query volume, patient timing preferences, and impacts of no-shows.

    c.   Pilot demonstrations—Alternative approaches should be tested through pilot demonstrations.

    d.   Systems tools and expertise—Assessment instruments should be developed for use by organizations in identifying and applying systems-oriented practices and professionals.

    e.   Best practice assessment—Inventories should be developed and assessed on best practices under different circumstances.

5.   Professional societies should work with standards and certification organizations to advance professional awareness, understanding, and application of systems approaches, tools, and incentives for the implementation/uptake of systems strategies to assess and improve health care scheduling and access that are grounded in the six access principles. This includes

    a.   Engineering partnership models—Models should be developed for partnering with systems engineering professionals for care improvement.

    b.   Systems curricular components—Curriculum initiatives should develop modules for incorporating systems approaches into the education of health professionals.

    c.   Care access research and demonstration—A research agenda should be developed for demonstration projects to improve insights on the necessary education, skill sets, and cultures that are most conducive to advancing systems approaches to care access.

6.   Public and private payers—and employers who pay for care—should be active participants in system improvement through initiatives that encourage creativity and innovation in the implementation and achievement of the access principles. These initiatives include

    a.   Payment that is consistent with or supportive of innovative approaches—Payment strategies should be developed to enable innovative access improvement approaches, such as the use of teams, virtual consults, and expanded hours.

    b.   Access assurance networks—Support strategies should be developed to encourage access assurance networks, such as inter-organization backup and redundancy plans.

    c.   Access learning networks—Approaches should be developed to ensure more rapid information sharing concerning successful strategies for access improvement.

Recommendations for Health Care Delivery Systems Leadership

The committee recommends that

7. The front-line scheduling practices of primary, specialty, hospital, and post-acute care appointments should be anchored in basic access principles, including supply matched to projected demand, immediate engagement, patient preference, care tailored to need, surge contingencies, and continuous assessment.

8. The leadership and governing bodies at each level of the health care delivery sites should demonstrate commitment to implementing the basic access principles through visible and sustained direction, workflow and workforce adjustment, the continuous monitoring and reframing of supply and demand, the effective use of technology throughout care delivery, and the conduct of pilot improvement efforts.

9. Decisions involving designing and leading access assessment and reform should be informed by the participation of patients and their families. The potential ways that patients could provide their expertise through informal or formal channels (e.g., patient and family advisory councils, surveys, and focus groups) include contributing input on their expectations, experiences, and preferences for scheduling practices and wait times; helping representatives of health systems explore alternative access strategies; contributing to the design of pilot improvement efforts; helping to shape communication strategies; and interfacing with governance and leadership.

10. Care delivery sites should continuously assess and adjust the match between the demand for services and the organizational tools, personnel, and overall capacity available to meet the demand, including the use of alternate supply options such as alternate clinicians, telemedicine consults, patient portals, and Web-based information services and protocols.

ACCELERATING PROGRESS

Focus on Patient and Family

Achieving meaningful improvement in scheduling and access will depend directly on how engaged patients are in the improvement process. Understanding the demand side of the scheduling equation requires a

thorough evaluation of patients' needs and expectations for their care as well as a continuous monitoring of patients' ability to access the care they need. No matter whether one approaches the area from the perspective of the philosophy of the care process, the effectiveness of the clinical outcome, the satisfaction of both patients and clinicians, or the development of patient-controlled health care tools, it is clear that, to an ever-increasing degree, patients have a critical and very active role to play in health care. This role is not limited to their own care but extends to participation in shaping the progress of the nation's health system toward improved quality, efficiency, and access at every stage. Harnessing the engagement and the potential of patient and family leadership for improvements in scheduling and access can be a critical step down the path of the broader culture change that will lead to health care that is more effective and more efficient.

Systems-Oriented Strategies

The committee's exploration of successful case studies and strategies for success revealed a strong potential—and need—for learning from the practices of other sectors in which operations research and systems strategies have transformed overall performance. There is certainly much to be gained through the use of systems strategies in reducing wait times and ensuring adequate and timely access to care while improving the effectiveness and the efficiency of the health care organization. Tools such as Lean and the lessons learned from such industries as aviation and customer service have demonstrated the significant potential that exists in the health care system for gains in efficiency and access. The success in some places of applying queuing theory and engineering models to deal with the complexity inherent in health care scheduling—the diversity of populations served, the range of services provided, and the frequency of no-shows and other anomalies—offers but one example of the importance of a system-wide perspective across all aspects of health care in embedding engineering practices, tools, and skills as a fundamental component of health care that continuously learns and improves.

Leadership

Ultimately, the successful implementation of the committee's recommendations—and of broader efforts to transform performance in health care—will depend on leadership. This certainly means leadership from the top of the organization, at the level of the chief executive officer and board of directors, but it also means leadership involvement from stakeholders in every aspect of health care. Achieving meaningful access will require not only strategic vision at the outset but also sustained attention, assessment,

feedback, and initiative at every level of the organization. The basics of a culture of service excellence, with the full involvement of patients and families, commitment to continuous monitoring and assessment, transparency, accountability, and empowering organizational leadership and decision making from participants at every level, will help ensure that every patient—whether they are seeking help immediately or at a later point—receives the right care at the time they need and expect it.

Background Papers

OPEN ACCESS OR ADVANCED ACCESS SCHEDULING

Mark Murray, M.D., M.P.A.
Mark Murray & Associates, LLC

Primary care services form the core of the ambulatory health care system, are in high demand, and are characterized by the most prolonged waits. Access to robust primary care also lies at the heart of effective delivery system reforms, such as with the formation of accountable care organizations (ACOs) and patient-centered medical homes. Current attempts to triage health care appointments based on anticipated patient acuity are unreliable, costly, and operationally difficult. Preferable is the presumption of same-day response to requests, with patient preference serving as the key determinant of the actual timing and nature of care or provision of alternative arrangements. Presented below is one successful method to provide same- or next-day appointments. Although presented in sequence, many of the steps will overlap in practice. Active involvement of patients and their families is an integral part of the design, implementation, and evaluation of this plan.

Actions in Phase One:
Past and Prospective Data Collection

Current visit rate = total number patient visits in the last year ÷ total number of patients

Demand = the number of appointments generated on any given day. This includes appointments made ON today FOR today and appointments made ON today FOR any day in the future.

* If demand is counted only as appointments seen on any given day, it would only equal the number of appointments on the schedule. The demand calculation could then potentially miss any appointments that could not be accommodated and were therefore pushed out to a future day.

Supply (Capacity) = (the number of appointment slots per day for each clinician in a practice) × (the days of work per week by the clinician)

Activity = the daily number of patients who arrive and receive care from a provider

Panel size = the number of patients seen by a physician in the past 12 months

    a.   Patients who have seen only one provider for all visits are assigned to that provider.

    b.   Patients who have seen more than one provider are assigned to the provider they have seen most often.

    c.   The remaining patients who have seen multiple providers the same number of times are assigned to the provider who performed their most recent physical or health check.

Backlog = appointments booked for future dates = previous demand showing as work to be completed in the future.

Actions in Phase Two:
Balancing Demand and Capacity

- Determine panel size for the practice and for each provider within the practice, and calculate the unique unduplicated patients seen in the last year. The panel sizes for each provider may be different.
- Determine the practice visit rate using the practice average as well as the individual visit rates. Recognize that the patient visit rate includes visits to the patients' preferred provider in addition to visits to someone else in the practice.
- Develop a spreadsheet that compares *demand* to *capacity* at both the practice and individual practitioner level.
- If the practice balances but the individuals do not, develop a plan to achieve balance by an immediate transfer of patients or a gradual change of patients through natural attrition. The goal is for each provider to be slightly underpaneled to provide some surge capacity and slack.
- If providers are overpaneled (too many patients per provider), use strategies to reduce demand and improve capacity enhancement to achieve a balance before addressing any backlog.
- Start to measure and record daily demand, capacity, and activity.
- Monitor panel size monthly.
- Determine the current third next available appointment (TNA) for the practice and each provider. In the case of an extended TNA, develop a backlog reduction plan.
- Book future appointments for 3 to 4 months in advance only and do not hide demand within a waiting list.
- After initial review of patient panels, restrict the responsibility for shifting patients from one provider to another to a single individual (a "broker"), and keep track of the reasons for change.

Actions in Phase Three:
Addressing Backlog

- Measure extent of backlog. This can be done by TNA or by counting the number of prebooked appointments on the schedule. Some of these patients are appropriately prescheduled in the future due to physiology. The backlog is not as bad as count.
- Set a date to start backlog reduction and an expected end date. The end date will be the start date for the new advanced access schedule

template. Backlog reduction is "everybody work," not just provider work—staying late involves everyone.

- Add capacity in the form of more visits per day in order to stop the delay from accumulating and to catch up to the delay.
- During backlog reduction, there will be three queues:
  — A queue for the currently prebooked appointments for the day,
  — A queue for urgent/same-day appointments, and
  — A queue for patients booked into the future, backlog appointments.
- Initially, the urgent slots will fill early and most of the backlog slots will be urgent. With progress toward eliminating the backlog, gradually loosen the criteria for who gets into the backlog slots. At the end of backlog, as evidenced by a significant reduction in TNA, the backlog slots will be filled by traditional types of appointments.
- Once the backlog is gone, eliminate both the urgent slots and the backlog slots and commit to finishing all the work each day.

Actions in Phase Four:
Using the New Scheduling Template

- The goal is to see patients on the day they call the office and not schedule the majority of visits into the future.
- Build the new schedule template with a single appointment type, which will involve a significant workflow change. Instead of appointing new patients to the first open slot on any schedule, schedulers will look for the specific designated provider and appoint to that provider.
- Once there is no daily backlog, as evidenced by open slots each day, continue to measure the TNA for the single appointment type.
- Schedule return patients back late in the week and early in the day, when demand is usually lowest. This is load leveling.
- When scheduling return appointments, it is essential to look at the entire schedule to avoid overbooking of any particular day in the future. The goal is to spread out demand from patients who choose a day other than today with prescheduled return visits in order to preserve enough time for expected daily demand.
- Develop contingency plans:
  — Plan for post-vacation and out-of-office recovery. Make a plan for equitable coverage of patients from the absent providers.
  — Develop a plan to manage the end of the day, particularly when the schedule is "full."
  — Develop a safety-recovery plan to determine if a patient needs to be seen immediately. In the absence of urgency, all patients are offered an appointment today. Most are appointed today. Some may be

seen immediately. Patients who choose to wait are appointed onto the future schedule.

- Use a care team workload analysis for the entire practice to drive unnecessary work away from providers.
- Demand reduction strategies can help balance an unbalanced equation or can serve to open capacity for new patients entering the practice when supply and demand are balanced. Examples of demand reduction strategies include:
  — Committing to continuity to reduce "system churn"
  — Doing more with each visit
  — Extending visit internals
  — Using the telephone as a means for follow-up
  — Expanding the use of staff for some appointment work
  — Scheduling group visits when appropriate
- Distribute the new patient work only to underpaneled providers. Monitor the over-under panel monthly, and open or close providers to new patients either monthly or weekly.
- Once the practice is in a steady state, new patients are accepted at the same rate that patients graduate from the practice.
- Create a flow map of the patient journey at the encounter, and identify delays between steps. Use office efficiency strategies to improve the flow of work.

REENGINEERING FLOW THROUGH THE PRIMARY CARE OFFICE

Eugene Litvak, Ph.D.
Institute for Healthcare Optimization

The balance of providing timely appointments to patients who need and want them while maintaining a smoothly running practice can be a challenge. Transition is often best accomplished in phases and involves the active participation of all those affected by the change, including patients and families. The following represents one three-phased approach. Phase one focuses on balancing resources and flow of patients with time-sensitive medical complaints with those with elective or scheduled appointments. The main goals of this phase are to improve patient access for those with time-sensitive needs (same-day access and walk-ins) and to decrease the operational chaos that results from competing demands for appointments. The second phase turns attention to the challenge of smoothing elective or scheduled patient flow, such as appointments for yearly physicals, immunizations, or blood pressure checks. The main goals of this phase are to maintain continuity with a specific provider to maximize the quality of care, decrease competition between scheduled and unscheduled appointments, and to enhance office throughput of patients. The third phase aims to optimize capacity in the office to improve quality, safety, and throughput. Using alternative ways of addressing patient concerns, alternative settings of care, and alternative providers when needed creates the opportunity to correct the size of the appointment type and number to better match capacity with demand.

Actions in Phase I

- Separate patients into homogenous groups (i.e., same-day access or walk-ins versus scheduled flows, new patients versus return patients). or
- Develop and implement a physician-driven urgency classification system for triage based on key patient symptoms.
- Prospectively collect 3 months of data based on the above classification system to accurately determine case mix in terms of urgency.
- Calculate how many appointment slots are needed based on past statistics and staff accordingly.
- Develop and establish standard operating procedures and processes to appropriately accommodate unscheduled and scheduled patients.
- Reduce waiting times for same-day or walk-ins, increase throughput, and decrease overtime for staff by evaluating patient flow through clinic and the involved processes that provide roadblocks.

- Walk-ins and same-days may not always get to see their own doctor. Continuity is not a problem—another set of eyes may be good.
- Implement redesign, and monitor patient flow performance.

Actions in Phase II

- Prospectively collect 3 months of data based on the above classification system to accurately determine case mix in terms of urgency.
- Track cancellations and no-shows.
- Develop a cancellation policy for scheduled appointments and no-shows. Options include
  — Overbooking patient appointments if the number is less than 10 percent. If for a particular weekday, statistics for a single provider reveal that there are two no-shows, then on average, two patients can be overbooked without any risk of overtime.
  — Allow additional overbooking if providers agree to work until all patients are seen.
- Smooth the flow of scheduled patients to decrease the competition from unscheduled office arrival, such as walk-ins and same-day appointments, maximizing the throughput to decrease wait times.
  — Analyze drivers of variability, and identify necessary scheduling changes to achieve schedule smoothing.
  — Increase officewide throughput to achieve consistent nurse-to-patient staffing.
  — Increase patient placement in appropriate areas within the clinic, such as in registration, lab, office, and checkout.
- Phone call data can be used as a means to improve throughput.
  — Determine the distribution of calls for each day and hour of the day.
  — Determine the drivers of call variability.
  — Develop office strategy and resources for answering phone calls to minimize the loss of potential patients.

Actions in Phase III

- Once scheduled demand is smoothed, determine the number of appointment slots needed for same-day, walk-ins, and prescheduled patients.
- Evaluate the role of artificial variability in flow and scheduling bottlenecks to minimize the influence of provider and staff preference on throughput.
- Estimate resources (e.g., providers, staff, rooms, shared equipment) needed for each type of flow to ensure right care.
  — Determine alternative ways of addressing patient concerns (phone call, e-mail, smart phone data, etc.).

- — Consider alternative settings of care (group visits, virtual clinician, mobile health unit, etc.).
- — Develop alternative providers when needed (office staff for prescription refills, postdischarge follow-up by nurses, scheduler-led triage, managers for billing and insurance triage, etc.).
- — If the number of nonclinical calls is negligible, an ad hoc method to address them could be adequate; however, if the number of these calls is significant, carve out a resource with a defined role to provide nonclinical intervention.
- Prospectively collect data based on the above criteria to accurately determine demand.
- Review office capacity scenarios using data, and make necessary changes to better match capacity to demand.

REENGINEERING FLOW THROUGH THE
ACUTE CARE DELIVERY SYSTEM

Eugene Litvak, Ph.D.
Institute for Healthcare Optimization

Coordinating the function of the operating room and inpatient units is one of the most challenging tasks in health system reengineering and is perhaps best tackled in stages. Key to the successful design, implementation, and evaluation of these plans is the active participation of patients and families. The following represents one three-phase approach. Phase one focuses on balancing resources and flow of time-sensitive emergent/urgent with elective/scheduled admissions (mostly surgical). The main goals of this phase are to improve patient access and decrease daily operational chaos that results from competing demands. The second phase turns attention to the challenge of smoothing elective/scheduled patient flow (e.g., surgical, catheterization lab, or radiology procedure) to inpatient units. The main goals of this phase are to improve quality and safety of care on corresponding units, decrease competition between scheduled and unscheduled flow on inpatient units, and to enhance elective surgical or medical throughput (or both) depending on the hospital's priorities. The third phase aims to correctly size inpatient units to improve quality, safety, and throughput to alleviate medical ward bottlenecks that can feed back to the operating room. This phase addresses artificial variability in admissions, discharges, and transfers and improves throughput in selected medicine units by ensuring appropriate patient placement and improving the timeliness of admissions, discharges, and transfers out. In doing so, it also creates the opportunity to correctly size medical wards to better match capacity with demand.

Actions in Phase I

- Develop and implement a surgeon-driven urgency classification system that will determine the maximum acceptable wait time for each surgical case.
- Prospectively collect 3 months of data based on the above classification system to accurately determine case mix in terms of urgency.
- Develop and establish standard operating procedures to appropriately accommodate unscheduled and scheduled flows.
- Evaluate and choose from redesign models based on data.
- Implement redesign, and monitor patient flow performance.

Expected Outcomes in Phase I

- Increased surgical throughput.
- Decreased operating room overtime.

- Decreased wait time for urgent/emergent surgeries, and improved compliance with desired maximal acceptable wait times.
- Decreased hospital acute length of stay for urgent/emergent patients
- Improved outcomes for urgent/emergent surgical patients.
- Enabled further operating room efficiency improvement such as on-time starts, lower turnover time, and high-performance teams for elective blocks.
- Improved patient satisfaction relating to decreased elective case delays.
- Improved staff satisfaction and retention.

Actions in Phase II

- Accurately determine your truly elective inpatient admission volume for the selected service(s).
- Collect prospective data if needed.
- Analyze drivers of variability, and identify necessary scheduling changes to achieve schedule smoothing.
- Assess and realign weekend resources as needed.
- Evaluate and choose from redesign models based on collected data.
- Implement smoothing redesign, and monitor patient flow performance.

Expected Outcomes in Phase II

- Increased throughput in smoothed inpatient unit.
- Increased placement of patients in the optimal units with decreased postanesthesia care unit boarding and interunit transfers.
- Higher reliability in nurse-to-patient staffing level leading to lower morbidity and mortality.
- Improved staff satisfaction and decreased use of nursing overtime.
- Quality improvement in terms of decreased readmissions, decreased use of rapid response teams, decreased rate of hospital-acquired infections, and patient safety issues.

Actions in Phase III

- Develop and implement patient-centered admission, discharge, and transfer criteria that will determine what clinical characteristics are necessary for admission to and discharge from the selected unit(s).
- Implement admission, discharge, and transfer criteria; monitor adherence to criteria as well as patient flow performance.
- Prospectively collect data based on the above criteria to accurately determine demand and clinically appropriate length of stay for the selected unit(s).

- Review bed capacity scenarios using data, and make necessary changes to better match capacity to demand.

Expected Outcomes in Phase III

- Increased placement of patients in the optimal units.
- Decreased waits and emergency department boarding.
- Decreased interunit transfers.
- Improved emergency department and inpatient unit staff satisfaction.
- Potential decrease in acute length of stays.
- Quality improvement with decreased readmissions, decreased use of rapid response teams, decreased rate of hospital-acquired infections, and increased patient safety.

FRAMEWORK FOR ACTIVE PATIENT INVOLVEMENT IN ACCESS AND SCHEDULING

James B. Conway, M.S.
Harvard School of Public Health

Core Principles of Patient- and Family-Centered Care

- Dignity and respect: Providers listen and honor patient and family perspectives and choices.
- Information sharing: Providers share complete and unbiased information in ways that are affirming and useful.
- Patient and providers equally participate in care and decision making.
- Patients and providers equally collaborate in policy and program development, implementation, and evaluation, as well as the delivery of care (IPFCC, 2010).

Tenets of a Patient- and Family-Centered Access and Scheduling System

- Patients are the source of control (IOM, 2001).
- Access is defined from the patient perspective.
  - I get information and services that meet my needs, not just a visit, by using a wide range of asynchronous approaches—smart phone apps, e-visits, my home or workplace, and online scheduling.
  - I have access to the right people to match my needs, not just to physicians, but to community health workers, lay care coordinators, interdisciplinary teams, and pharmacists.
- Right care, right place, right time, every time.
  - "I get the care and information I want and need when, where, and how I want and need it"—Donald Berwick, IOM Engineering Optimal Health Care Scheduling: A Public Workshop (2014).
- Waits can contribute to the burden of illness.
- All health systems set the goal of offering an appointment on the day and time the patient choses.
- The system meets the patient where they are:
  - By expanding hours worked per day and number of days worked per week;
  - By addressing cultural and technological competency;
  - By including navigation assistance whenever needed; and
  - By remembering that, for many patients and family members, engagement is therapeutic.
- All health systems set goals of increasing access, supporting care continuum, and reducing time to next appointment.

- As part of future models, the team comes collectively to the patient as opposed to the patient seeking out multiple individuals.
- Engagement is not just looking good but doing good.

Hypothetical Model of Application

1. Questions arise around health and health care:
   — Patient, family, and staff seek counsel when new questions arise or new information is needed.
   — The system for moving forward is understood by all.
2. Collaborative processes are implemented to move forward and to get answers:
   — Focus first and foremost on meeting the needs of the patient: providing the right care, at the right place and the right time, every time.
   — Use a wide range of asynchronous approaches.
   — Ensure access to the right people to match needs.
   — Engage patient and family members in full partnership, with questions prompted, invited, answered, and understood by all.
   — Make a consultant immediately available.
3. Scheduling test, treatment, consult, and so on:
   — Ensure an efficient processes: one person, one call, one time.
   — Offer a wide range of approaches, such as scheduling online, in person, or over the phone, with navigation and other assistance, such as language and access support, when needed.
   — Determine what works best for the patient and family.
   — Seek out and address any special needs and requirements.
   — Prepare in advance, and provide fact sheets.
4. In the interval: focus on questions and preparations:
   — Ensure immediate access to a person 24/7.
   — Solicit and answer questions.
   — Distribute and follow through on preparations.
   — Provide directions.
   — Provide preappointment notifications.
5. Once the appointment is held:
   — Update administrative needs and medication.
   — Ensure that all parties are on time (patient, family, and staff), or are informed if not.
   — Deliver care in appropriate and respectful setting.
   — All parties prepare questions, listen, and respond.
   — Patient choses who is with them.
   — Document in electronic health record (EHR) system.
   — Next visit follow-up before leaving.

6. Follow-up actions taken:
   — Results and follow-up actions are communicated to patient and family members in real time in person, via end-of-visit note, and in patient portal.
   — Results are communicated to care team in real time.
   — Patient and family members are engaged in any revision to care plan.
7. Ongoing care is provided with care team (patient, family, and all staff).

Patient and Family Collaboration in Design and Continuous Improvement of Access and Scheduling Systems

- Overarching principle: Patients and family members collaborate in policy and program development, implementation, and evaluation, as well as in the delivery of care (IOM, 2011).
- Application: This principle is applied in the individual experience of care, in microsystems, in organizations and systems, and in the community.
- Specific to access and scheduling:
  — Design/re-design: Any time groups meet to design or redesign access to and scheduling of care, patients and family representatives are full members of the design team from the beginning through the end of the process.
  — Continuous improvement: The voice of the patient and family is sought as a key collaborator in improvement.
  — Construct design: Embracing application of the findings on high reliability and mindfulness is a helpful illustration (Weick and Sutcliffe, 2001).
  — Transparency of real-time performance is the goal.
  — Improvement practice is grounded in high-reliability principles of mindfulness as explained in Table A-1.

TABLE A-1 Application of Mindfulness to Patient- and Family- (P&F-) Centered Access and Scheduling

Principle	Definition	Applications to Scheduling
Preoccupation with failure	Regarding small, inconsequential errors as a symptom that something is wrong; finding the half-event	Staff asking, P&F reporting, and everyone listening to what P&Fs experienced in access and scheduling or almost experienced.
Sensitivity to operations	Paying attention to what's happening on the front-line	Staff seeks to understand from P&F the gap between system designs on paper versus actual delivered. P&F are probed for their experience as they moved over time and across the continuum.
Reluctance to simplify	Encouraging diversity in experience, perspective, and opinion	Staff measures the effectiveness in meeting what matters most to P&F. Diverse counsel is sought in all system design. "One-size-fits-all" solutions are rejected.
Commitment to resilience	Developing capabilities to detect, contain, and bounce back from events that do occur	There is a commitment to resilience. Whenever things go wrong, P&F are engaged in the solution. All simulations of new processes are conducted in partnership with P&F.
Deference to expertise	Pushing decision making down and around to the person with the most related knowledge and expertise	There is respect for all that the P&F bring as partners in care at every level of the organization.

IOM Workshops in Brief

INSTITUTE OF MEDICINE
OF THE NATIONAL ACADEMIES

Engineering Optimal Health Care Scheduling: Perspectives for the Nation— Workshop in Brief

On November 21, 2014, the Institute of Medicine's (IOM's) Committee on Optimizing Scheduling in Health Care convened a public, one-day workshop titled "Engineering Optimal Health Care Scheduling." Funded by the Department of Veterans Affairs (VA), the aim of the session was to explore standards for patient access to health care services across the continuum of care to inform the work of the committee and to shape the content of their upcoming consensus report.

As outlined in introductory comments by committee chair Gary Kaplan, CEO of Virginia Mason Health System, the identification and assessment of best practices and standards for wait times in health care require looking at the entire care delivery system as a single and complex entity with many interrelated and dynamic parts. The workshop convened leading authorities on care delivery, operations management, systems engineering, and patient engagement and satisfaction to

- Better understand the current practices and standards in appointment scheduling and reasons for variation;
- Consider optimization strategies and experiences in health care and other industries;
- Discuss the role of patients and family as catalysts for achieving operational excellence in health care;
- Explore the changing mental model for frontline personnel involved with scheduling improvements; and
- Examine the disciplined structure for change and a strategic and scalable approach to continuous improvement.

The workshop included four panels: current best practices, patient experiences and expectations, technical approaches to wait time improvement, and an overview of the day's discussion. In addition, a working lunch session considered issues in identifying a toolkit for health systems to implement optimal scheduling practices. For each panel, a moderator and several speakers provided framing comments and presentations that then opened to general discussion. This brief summary of the workshop captures the major topics and issues that emerged over the course of the day and is accompanied by a Workshop in Brief specifically targeted to perspectives for the Veterans Health Administration. Statements, recommendations, and opinions expressed are those of individual presenters and participants and are not necessarily endorsed or verified by the Committee on Optimizing Scheduling in Health Care or the IOM, and they should not be construed as reflecting any group consensus.

Current State: Practices, Standards, and Innovation

Throughout the course of the workshop, many presenters and commenters, including Kaplan and Mark Hallett of ThedaCare Center for Healthcare Value, emphasized the importance of addressing this issue from a systems view, focused on the value stream throughout the continuum of care. "Underlying the system changes are the stories that either propel us to new pinnacles or keep us pinned to our current performance," said Peter Pronovost of Johns Hopkins Medicine.

The observation came from many speakers that the components that drive the scheduling process are dynamic and require continuous monitoring and balancing of the supply and demand on the system.

> Our scheduling process actually begins with a single question when we get a patient calling on the phone. That question is: "Would you like to be seen today?" Recognizing that patients have different needs and different behaviors, and in fact, those behaviors, be it speed sensitive or relationship sensitive, aren't static. They are dynamic. They change based on the situation (Hallett).

David Krier of Cincinnati Children's Hospital emphasized in his presentation that "from [Cincinnati Children's] perspective, it is not terribly complicated, but that doesn't mean it is easy . . . For the most part, we have kept our focus on supply. That is primarily because it was within our sphere of control to do so." Terra Thompson, also from Cincinnati Children's Hospital, expanded upon this concept, detailing the processes and measurements that the health system uses to gauge their capacity (see Figure 1, page 3). They have found that making the financial and productivity data available to their providers is key.

Continuing the notion of using a systems approach to improve access and wait times, Andrew Gettinger, of the Office of the National Coordinator for Health IT, stated in his presentation that managing outcomes goes beyond managing IT. He outlined the variation in the scheduling systems at the Dartmouth Hitchcock Hospital and Lahey Clinic, explaining that neither system was better, but rather built to produce outcomes specific to their unique environments. "I don't believe it is about the IT. I believe it is about the operations that implement the IT," he said. Reflecting on the panel, Steven Lawless of Nemours introduced the distinction between designing a system to be optimal versus efficient. "Efficient could be more of an internal phenomenon; optimal has to be from the customer's perspective," said Lawless.

Patients and Families as Change Agents: Experiences and Expectations

The need to engage patients and family members in the beginning stages of designing a better scheduling system was raised by several speakers and discussants, both with respect to improving patient satisfaction in current systems as well as achieving optimal systems in the future. Panelists divided their comments to focus on the human factors aspect of scheduling and the patient perspective on wait times.

Sara Czaja from the University of Miami provided an overview of the changing trends in consumer expectations and roles in their care. Cjaza noted that "consumers are expected to be empowered and take a more active role in health self-management. There is an increased use of technology within the health care arena that has expanded the realm of health-related tasks that consumers are expected to or can perform." Pascale Carayon, University of Wisconsin, continued on this theme, speaking to the multifaceted role of the scheduler. As Carayon put it, "They also have huge social organizational functions. Their role is a lot more than a formal role. There are a lot other informal roles... [and] it is really unclear whether providing different technology is something that is going to reduce or potentially increase visits in the clinic."

David Andrews noted that from his standpoint as a patient with significant experiences with waits and scheduling, "How much of the issue is the wait, [and] how much is the communication about the wait?" He and several other commenters discussed the importance of turning time spent waiting into valuable time in which information is exchanged between the provider and patient. Ashley Benedict of the VA spoke to the potential value that could be added if IT systems could integrate patient appointment times with clinical needs, to identify and complete work that could be done prior to the patient–physician face-to-face.

The discussions of human factors and patient perspective were synthesized into closing remarks by Kristen Carmen of the American Institutes for Research, who noted that "efficiency and optimization is always from a perspective, purchaser's perspective, payer's perspective, patient's perspective, and provider's perspective. I think we need to do a much better job of making those differences in perspective or those commonalities in perspectives transparent."

ounty.

A Roadmap for the Nation

William Pierskalla of the UCLA Anderson School of Management facilitated a discussion on developing a short-term roadmap for institutions to address scheduling issues and to begin transitioning to an optimal method of scheduling and access to care. He highlighted the major components of the care delivery process: the pre-visit period of scheduling and patient arrival to the care facility, the waiting period prior to connecting with the provider,

and the period in which care services are delivered. He emphasized that improving patient flow through these stages required continuous process improvement rather than addressing issues and increasing resources in each discrete period.

To kick off the audience participation portion of the workshop, Pierskalla asked where the roadmap begins. A range of ideas emerged. Both Kaplan and Andrews underscored the need to engage patients at the ground level of transformation. Michael Davies of the VA noted the importance of increased transparency and standardization of acceptable wait times used across the nation, in both public and private sectors. Jackie Griffin of the Department of Defense (DoD) advocated for increased flexibility in hospital operating procedures, and Michael Dinneen of the DoD re-emphasized the need to assess the entire value stream rather than individual parts.

Pierskalla guided the conversation from high-level comments on culture change to focus on the specific measures that health care institutions could implement to affect said change. Several participants considered the incorporation of a measure assessing the linkage between mortality and wait times. Teri Pipe of Arizona State University suggested that measures should focus on the patient and caregiver experience as well as the experiences of inter-professional and interdisciplinary teams in the hospital setting. Patricia Gabow, formerly of Denver Health, described the need to distinguish measures by application, on the individual or system level. Warren Sandberg cautioned against focusing on individual metrics given the complexity of the system, saying that by doing so, "we may actually sub-optimize the system." Kaplan echoed this sentiment and described the approach at Virginia Mason, in which every employee is required to have a comprehensive understanding of the management system and its basic principles.

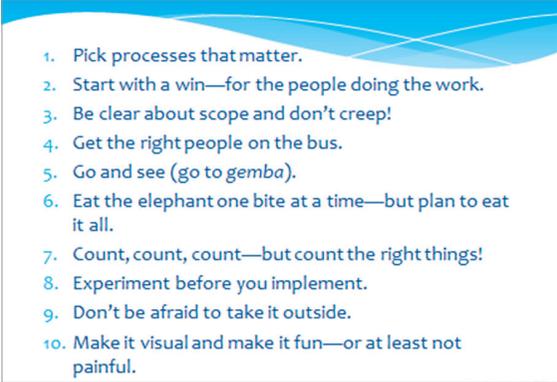
Technical Approaches to Wait Time Improvement

Thomas Nolan from the Institute for Healthcare Improvement framed the panel by acknowledging that other industries have had success with implementing technical approaches, using "scheduling as an intervention" to optimize customer satisfaction and reduce waste in systems. The presenters used their experiences working both in health care and other industries to detail the ways in which IT tools can be harnessed to implement systems changes to scheduling processes in the care delivery setting.

Wes Walker of Cerner described innovative health IT tools, such as mobile scheduling platforms and patient portals that are being implemented by individual organizations across the country that view access and scheduling improvement as a key component of achieving high-quality care. As he put it, "[The University of Missouri Health System] put the patient at the center, and they looked at the holistic process with the understanding and the idea that the appointment was a means to an end. The goal was the clinical interaction."

Speaking from her expertise in operations research, Zelda Zabinsky of the University of Washington provided several anecdotes of the consequences related to a segmented approach to improving patient flow, thus emphasizing the importance of maintaining a systems view when tackling these issues. Determining the specific bottleneck in the system is difficult, said Zabinsky, describing the phenomenon: "You have a big balloon, and you squeeze one place, and it pops out another place."

Judy Worth, of the Lean Transformations Group, LLC, provided strategies for creating sustainable organizational change across a value stream according to Lean principles (see Figure 2, page 5). Reflecting on the implementation of Lean principles in manufacturing operations, Worth highlighted the need to connect these principles to the institution's broader purpose and goals, as was learned from the Toyota experience.

Several of the discussants raised the issue of an unevenly distributed workflow burden with the implementation of some of these IT tools, and stressed that the tools showing the most promise are those that are collaborative in nature. While agreeing that IT tools are adding value, Michael Harrison, from the Agency for Healthcare Research and Quality, noted, "You can get a really fantastic algorithm that is going to solve a specific problem, but it doesn't generate capacity among the members of that system to deal with the next thing down the line, whether it is an unintended consequence or something else."


1. Pick processes that matter.
2. Start with a win—for the people doing the work.
3. Be clear about scope and don't creep!
4. Get the right people on the bus.
5. Go and see (go to *gemba*).
6. Eat the elephant one bite at a time—but plan to eat it all.
7. Count, count, count—but count the right things!
8. Experiment before you implement.
9. Don't be afraid to take it outside.
10. Make it visual and make it fun—or at least not painful.

FIGURE 2 The Lean Enterprise Institute's 10 Strategies for Organizational Change.

Best Practices for Health Care

Donald Berwick from the Institute for Healthcare Improvement reminded the workshop audience of the charge set by Kaplan at the beginning of the day to inform the committee on the best practices and strategic priorities that could be included in the report recommendations. He opened the final panel with a series of questions: "What did you hear that is cross-cutting and memorable? What are the implications of what we heard today for future steps to take? One of the things I am going to be thinking about and hope our panelists will comment on is: is there any way to accelerate the embrace of the sciences of systems in the kind of care we give?"

Maureen Bisognano of the Institute for Healthcare Improvement re-emphasized the need to redesign the care delivery system around the user, patients and caregivers. Christine Sinsky of the American Medical Association highlighted the discussion points surrounding balancing supply and demand from a systems view. Robert Dittus of Vanderbilt University reviewed the players and resources that health care organizations need in order to fully implement systems engineering methods. He advocated for more coordination among health care teams, and for redefining these teams to include industrial engineers, mathematicians, and most importantly, patients as equal contributors. Additionally, he spoke to the variation across the care continuum and recommended that systems be flexible, saying, "If your scheduling system doesn't acknowledge the different settings that can be utilized, you are not going to have the right system."

Kaplan closed the session by inviting the audience to view the workshop as a call to action. "We need to create a movement," he said. "I think the trump card is really the patients and how we galvanize our communities around what is reasonable to expect from the health care system, and then, how do we make sure that we use the systems engineering approaches as well as the many other things that we have talked about to make that happen."

Engineering Optimal Health Care Scheduling: Perspectives for the Veterans Health Administration— Workshop in Brief

On November 21, 2014, the Institute of Medicine's (IOM's) Committee on Optimizing Scheduling in Health Care convened a public, one-day workshop titled "Engineering Optimal Health Care Scheduling." Funded by the Department of Veterans Affairs (VA), the aim of the session was to explore appropriate standards for access, triage, and scheduling of health care services across the continuum of care to inform the work of the committee and to shape the content of their forthcoming consensus report.

As outlined in introductory comments by committee chair Gary Kaplan, CEO of Virginia Mason Health System, the workshop convened leading authorities on care delivery, operations management, systems engineering, and patient engagement and satisfaction. Kaplan discussed the potential role that systems engineering could play in driving improvement in health care. "How do we better bring together the systems engineering principles that have been so effective in so many industries and yet have gotten only very little traction in health care?" he asked. He said that applying systems thinking and intelligently deploying measurement and analysis could be transformative for the health care system by unlocking new potential pathways for change.

The workshop included four panels: current best practices, patient experiences and expectations, technical approaches to wait time improvement, and an overview of the day's discussion. In addition, a working lunch session considered issues in identifying a toolkit for health systems to implement optimal scheduling practices. For each panel, a moderator and several speakers provided framing comments and presentations that then opened to general discussion.

This brief summary of the workshop captures the major topics and issues discussed over the course of the day that are most applicable to the Veterans Health Administration, and it is accompanied by a Workshop in Brief targeted at perspectives for the broader U.S. health care system. Statements, recommendations, and opinions expressed are those of individual presenters and participants and are not necessarily endorsed or verified by the Committee on Optimizing Scheduling in Health Care or the IOM, and they should not be construed as reflecting any group consensus.

Current VA Practices and Standards in Appointment Scheduling

Peter Pronovost of Johns Hopkins Medicine introduced the session on current practices and standards, saying that the controversy regarding VA wait times for available appointments brought to light needless suffering and the disrespect associated with poor management of scheduling and resources at the VA and in the health care system nationally. This session was an opportunity, he said, to hear stories told by organizations that were able to make meaningful improvements in this area. "Underlying the system changes are the stories that either propel us to new pinnacles or keep us pinned to our current performance," he said.

Throughout the first panel discussion, speakers discussed the challenges, limitations, and opportunities for the VA in its efforts to improve scheduling. Mike Davies of the VA noted that the VA faces a variety of technical challenges. "The VA's information system is 30 years old," he said, and the VA has been asked to measure individual

patient waiting times, which is a complex and sophisticated function. David Krier of Cincinnati Children's Hospital noted that the VA currently measures wait times, in the context of an appointment visit cycle time, as the time between when registration ends and when a clinician begins to document in the electronic record. As a result, he said, the VA has not yet been able to monitor how long patients wait in the exam room, or more generally, how much time may be wasted once a clinical encounter begins. He acknowledged that this challenge exists in the private sector as well. "I think that is what our biggest struggle is," said Krier.

Patients and Families as Catalysts for Achieving Operational Excellence in Health Care

The second panel of the day focused on the perspectives, needs, and roles of patients in optimizing scheduling. Matt Puglisi, a veteran now working at Aptima, Inc., provided background on some of the specific challenges the VA faces in meeting patients' expectations for timely care. "The VA system was not consciously designed," he said, instead growing over time, beginning with the Civil War, in reaction to post-war needs for expanded health care resources for veterans. He noted that categorization and associated eligibility requirements for veterans contribute significantly to the complexity of connecting veterans with needed health care services at the VA. "The eligibility for an individual veteran depends. Did you serve during the war? Do you have a service-connected disability? How bad is that disability? That affects what care can be provided by the VA." These decisions about eligibility are further complicated when patients are also eligible for Medicare and/or Medicaid or have private insurance.

Several commenters, including Ashley Benedict from the VA and Pascale Carayon from the University of Wisconsin, also discussed the significance of variations in patients' perceptions of wait times. "The idea of perceived versus actual wait is not the same for every patient," said Benedict. Additionally, Benedict noted a need for balancing measures for people's perceptions. "From the IT component, if we could predict what patients needed and their appointments coming up, and I could get my lab work done, that might not be a waiting time for me because there is a value-added activity that is happening between now and being seen in my actual appointment." Carayon and Puglisi discussed some of the potential limitations of measuring time alone in assessing waits, noting that measures of perceived wait times or of patients' satisfaction with wait times could add critical additional meaning. "You may find that by talking a little to patients if you can spare the time, they may be able to withstand longer wait times and be as or more satisfied," said Puglisi.

Optimization Strategies and Experiences in Health Care

Mark Hallett from ThedaCare Center for Healthcare Value discussed patient-centered scheduling and the practices to improve capacity of their system:

> Our scheduling process actually begins with a single question when we get a patient calling on the phone. That question is: "Would you like to be seen today?" Recognizing that patients have different needs and different behaviors, and in fact, those behaviors, be it speed sensitive or relationship sensitive, aren't static. They are dynamic.

The presenters from Cincinnati Children's Hospital, Krier and Terra Thompson, acknowledged the similarities between their home organization and that of Hallett's as adopters of systems-thinking to transform their systems and achieve high quality results. Yet they also cautioned that even once a system is optimized and performing at its peak capacity, it is still extremely complex and fragile and thus challenging to sustain. As a strategy for maintaining performance, Thompson highlighted the importance of leadership at various levels, stating the need to ensure that clinical leadership at the division level is engaged and aware of their role in the optimization strategies for the system (see Figure 1).

Notification to Cincinnati Children's at childrens-quality@cchmc.org when this document is being adopted, adapted, implemented, or hyperlinked to by your organization is appreciated. © 2014 Cincinnati Children's Hospital Medical Center.

SOURCE: Cincinnati Children's Hospital, as presented by David Krier and Terra Thompson on November 21, 2014.

Several speakers and commenters, including Patty Gabow (Denver Health), Krier, and Hallett, also discussed centralized scheduling as a necessary precondition for achieving a meaningful reduction in wait times, while ensuring that high-quality clinical decision making is applied in triage. Krier said that he would support separating scheduling and triage functions, such that scheduling becomes centralized and triage functions move closer to clinicians.

Andrew Gettinger of the Office of the National Coordinator for Health IT spoke of the operational details that contribute to optimizing scheduling, such as open access to appointment times and appointment pre-approvals. In discussing the ability to enhance capacity using advanced IT tools, such as virtual visits, Christine Sinsky of the American Medical Association cautioned that "they are an enhancement, but they are not necessarily the solution."

Identifying a Structure for Change

In the closing session on common themes and best practices, participants including Davies, Pronovost, and Donald Berwick, Institute for Healthcare Improvement, commented on potential approaches to both improving scheduling at the VA and ensuring that scheduling is well managed throughout the care system. Berwick identified "two different voices in the room"—(1) the conversation focused specifically on the challenges surrounding scheduling mechanics and immediate strategies for improvement, and (2) the conversation focused on broader organizational changes possible by implementing and embracing systems engineering techniques.

Davies and Berwick discussed the potential benefits of identifying baselines and benchmarks for scheduling and wait-time performance, as a tool for both understanding the causes and consequences of wait times and for monitoring progress as interventions are undertaken at the VA. Davies said:

> In the context of all of these forward thinking, clearly exciting and relevant comments, I would just ask you to think about the question of how do we ensure some floor, some standards, something that is a little deeper that would have given us some predictive [indicator] that this was going to happen.

Several discussants, including Benedict and Robert Dittus, Vanderbilt University, emphasized the importance of ensuring that systems engineering approaches are incorporated into the care delivery setting. Kaplan closed the session by reminding the audience that this issue is a national challenge. "We need to create a movement," he said. "I think the trump card is really the patients and how we galvanize our communities around what is reasonable to expect from the health care system, and then, how do we make sure that we use the systems engineering approaches as well as the many other things that we have talked about to make that happen."

Appendix C

Committee Member Biographies

Gary Kaplan, M.D., FACP, FACMPE (*Chair*), has served as Chairman and CEO of the Virginia Mason Health System since 2000. He is also a practicing internal medicine physician at Virginia Mason. Dr. Kaplan received his medical degree from the University of Michigan and is board certified in internal medicine. Since Dr. Kaplan became Chairman and CEO, Virginia Mason has received significant national and international recognition for its efforts to transform health care. The Leapfrog Group named Virginia Mason "Top Hospital of The Decade" for patient safety and quality, a distinction shared with only one other hospital. For the fifth consecutive year, The Leapfrog Group also named Virginia Mason as 1 of 65 U.S. hospitals to be designated as a "Top Hospital." In addition, Virginia Mason has received HealthGrades' "Distinguished Hospital Award for Clinical Excellence" for 5 consecutive years. Virginia Mason is considered to be the national leader in deploying the Toyota Production System to health care management. In addition to his patient-care duties and position as CEO, Dr. Kaplan is a clinical professor at the University of Washington and has been recognized for his service and contribution to many regional and national boards, including the Institute for Healthcare Improvement, the Medical Group Management Association, the National Patient Safety Foundation, the Greater Seattle Chamber of Commerce, and the Washington Healthcare Forum. Dr. Kaplan is a founding member of Health CEOs for Health Reform. In 2007, Dr. Kaplan was designated a fellow in the American College of Physician Executives. In 2011, he was named the 12th most influential U.S. physician leader in health care by *Modern Healthcare* magazine, and the same publication ranked Dr. Kaplan 33rd on its list of the "100 Most

Influential People in Healthcare." In 2012, he was named the second most influential U.S. physician leader in health care by the same publication. In 2009, Dr. Kaplan received the John M. Eisenberg Award from the National Quality Forum and The Joint Commission for Individual Achievement at the national level for his outstanding work and commitment to patient safety and quality. Additionally, he was recognized by the Medical Group Management Association (MGMA) as the recipient of the Harry J. Harwick Lifetime Achievement Award. Each year, the MGMA and the American College of Medical Practice Executives honor one individual who has made outstanding nationally recognized contributions to health care administration, delivery, and education in his or her career, advancing the field of medical practice management.

Jana Bazzoli, M.B.A., M.S.A., CMPE, joined the Cincinnati Children's Research Foundation and the Department of Pediatrics as vice president of Clinical Affairs. Ms. Bazzoli has nearly 20 years' experience in hospital administration, having earned her M.B.A. at Augusta State University in Georgia and her M.S.A. at Central Michigan University. Her most recent position was associate administrator of outpatient operations at Nemours/Alfred I. DuPont Hospital for Children in Wilmington, Delaware. At Cincinnati Children's, Ms. Bazzoli works closely with departmental business directors and division directors to improve clinical care and systems. One of her primary responsibilities is to develop and implement new initiatives to achieve the departments' clinical, operational, and academic goals while maintaining Cincinnati Children's quality of care.

James C. Benneyan, Ph.D., is a leading authority on health care systems engineering, founding director of two federally awarded health care engineering centers, and professor of Industrial Engineering and Operations Research at Northeastern University. Dr. Benneyan has served as director, codirector, principal investigator, or co–private investigator in seven engineering research centers, and research laboratories totaling more than $32 million in funding. His research focuses on mathematical modeling and optimization of health care systems broadly, with particular emphasis and area expertise in patient safety, access, logistics, comparative effectiveness, quality, and treatment optimization. Dr. Benneyan currently serves as a director of the National Science Foundation (NSF) Center for Organization Transformation, the New England U.S. Department of Veterans Affairs (VA) Engineering Resource Center, and Northeastern's Quality and Productivity research laboratory. The work of these three enterprises collectively integrates academic research, real-world application, and workforce development. Methods research foci include statistical quality engineering, probabilistic optimization, computer simulation, risk-adjusted statistical

methods, rare events, spatial surveillance, risk-benefit, and comparative effectiveness models. Benneyan has published more than 100 papers and served as senior or associate editor of 4 academic journals in the above areas, has received 6 teaching, service, and research awards, and has taught engineering to ages 6 through 60. Dr. Benneyan is a vice president of the Institute for Industrial Engineers (IIE), past president of the Society for Health Systems (SHS), senior fellow and faculty at the Institute for Healthcare Improvement, fellow of SHS and the Healthcare Information and Management Systems Society (HIMSS), operations research faculty for Northeastern's NSF-Nanoscale Science and Engineering Center, Center for High-Rate Nanomanufacturing (CHN), and board member or advisor for several health care organizations. Prior to joining Northeastern, Dr. Benneyan was senior systems engineer for Harvard Community Health Plan, principal of Productivity Sciences Incorporated, and an industrial engineer at IBM and later Digital Equipment Corporation. Primary funding sources include NSF, National Institutes of Health, Veterans Health Administration, National Institute on Drug Abuse, Regenstreif Institute, United Network for Organ Sharing, U.S. Air Force Surgeon General's Office, and Agency for Healthcare Research and Quality.

James Conway, M.S., is an adjunct lecturer at the Harvard School of Public Health in Boston and Senior Consultant for Safe and Reliable Healthcare in Evergreen, Colorado. From 2006 to 2009 he was Senior Vice President of the Institute for Healthcare Improvement (IHI) and from 2005 to 2011, Senior Fellow. During 1995-2005, Mr. Conway was Executive Vice President and Chief Operating Officer of Dana-Farber Cancer Institute, Boston. Prior to joining DFCI, he had a 27-year career at Children's Hospital, Boston, in Radiology Administration, Finance, and as Assistant Hospital Director. His areas of expertise and interest include governance and executive leadership, patient safety, change management, crisis management, and patient- and family-centered care. He holds a Master of Science degree from Lesley College, Cambridge, Massachusetts. Mr. Conway is the winner of numerous awards, including the 1999 ACHE Mass. Regents Award, the 2001 first Individual Leadership Award in Patient Safety by The Joint Commission and the National Committee for Quality Assurance. In 2008, he received the Picker Award for Excellence in the Advancement of Patient Centered Care, in 2009 the Mary Davis Barber Heart of Hospice Award from the Massachusetts Hospice and Palliative Care Federation, and in 2012 both the Institute for Patient and Family Centered Care Leadership Award and the first Honorary Fellowship of the National Association for Healthcare Quality. A Lifetime Fellow of the American College of Healthcare Executives, he has served as a Distinguished Advisor to the Lucian Leape Institute for the National Patient Safety Foundation. Institute of Medicine (IOM)

committees have included Identifying and Preventing Medication Errors and a Learning Healthcare System. Current board service includes board member Winchester Hospital; board member American Cancer Society, New England Region; and member, Board of Visitors, University of Massachusetts, Boston. In government service, he served from 2006 to 2010 as a member of the Commonwealth of Massachusetts Quality and Cost Council.

Susan Dentzer is Senior Policy Adviser to the Robert Wood Johnson Foundation, the nation's largest philanthropy focused on health and health care in the United States. In this role, she works closely with foundation leaders to carry out the organizational mission of building a culture of health and improving the health and health care of all Americans. One of the nation's most respected health and health policy thought leaders and journalists, she is also an on-air analyst on health issues on the PBS *NewsHour*. From 2008 to April 2013, she was the editor-in-chief of *Health Affairs*, the nation's leading peer-reviewed journal of health policy, and led the transformation of that journal from a bimonthly academic publication into a highly topical monthly publication and website with more than 120 million page views annually. From 1998 to 2008, she led the PBS *NewsHour*'s health unit as on-air health correspondent and was the recipient of numerous honors and awards. Ms. Dentzer is an elected member of the Institute of Medicine and the Council on Foreign Relations. Ms. Dentzer graduated from Dartmouth College, is a trustee emerita of the college, and chaired the Dartmouth Board of Trustees from 2001 to 2004. She is a member of the Board of Overseers of Dartmouth Medical School and is a member of the board of directors of the International Rescue Committee, a leading humanitarian organization. She is also on the board of directors of Research!America, an alliance working to make research to improve health a higher priority; is a public member of the Board of Directors of the American Board of Medical Specialties; and is a member of the board of directors of the Health Data Consortium, which seeks to foster use of public and private data to improve the health and health care of Americans. A widely admired communicator, Ms. Dentzer is a frequent speaker before a wide variety of health care and other groups and a frequent commentator on such National Public Radio shows such as the *Diane Rehm Show* and *This Life*.

Eva Lee, Ph.D., is a professor in the H. Milton Stewart School of Industrial and Systems Engineering at Georgia Institute of Technology, and Director of the Center for Operations Research in Medicine and HealthCare, a center established through funds from the National Science Foundation (NSF) and the Whitaker Foundation. The center focuses on biomedicine, public health, and defense, advancing domains from basic science to translational medical research; intelligent, quality, and cost-effective delivery;

and medical preparedness and protection of critical infrastructures. She is a Distinguished Scholar in Health Systems, Health System Institute at Georgia Tech and Emory University. She is also co-director of the Center for Health Organization Transformation, an NSF Industry/University Cooperative Research Center. Dr. Lee partners with hospital leaders to develop novel transformational strategies in delivery, quality, safety, operations efficiency, information management, change management, and organizational learning. Dr. Lee's research focuses on mathematical programming, information technology, and computational algorithms for risk assessment, decision making, predictive analytics and knowledge discovery, and systems optimization. She has made major contributions in advances to medical care and procedures, emergency response and medical preparedness, health care operations, and business intelligence and operations transformation. Dr. Lee received the NSF Faculty Early Career Development (CAREER) program Young Investigator Award for research on optimization and parallel algorithms and their applications to large-scale logistics and medical applications. She is the first and only industrial engineer/operations research recipient for the prestigious Whitaker Foundation Biomedical Grant for Young Investigators. In 2005, she received the Institute for Operations Research and Management Sciences Pierskalla Best Paper Award for research excellence in HealthCare Management Science for her work on emergency response and planning, large-scale prophylaxis dispensing, and resource allocation for bioterrorism and infectious disease outbreaks. Together with Dr. Marco Zaider from Memorial Sloan Kettering Cancer Center, they were named winners of the 2007 Franz Edelman award for their work on using operations research to advance cancer therapeutics. Dr. Lee was selected by the National Academy of Engineering (NAE) to serve on the organizing committee and to lead the "Engineering the Healthcare Delivery System" cluster for the 2009 NAE Frontiers of Engineering Symposium for outstanding young engineers. In 2011, her work with the Centers for Disease Control and Prevention on emergency response and mass dispensing was selected as an Edelman finalist. In the same year, her paper on vaccine response immunogenicity prediction in *Nature Immunology* was named "Paper of the Year" by the International Vaccine Society. Her work on optimizing and transforming emergency department workflow and patient care was recognized as second prize winner in the 2013 Daniel H. Wagner Prize Excellence in Operations Research Application. She has received seven patents on innovative medical systems and devices.

Eugene Litvak, Ph.D., is President and CEO of the Institute for Healthcare Optimization (IHO). He is also an Adjunct Professor in Operations Management in the Department of Health Policy & Management at the Harvard School of Public Health, where he teaches the course "Opera-

tions Management in Service Delivery Organizations." Since 1995 he has been leading the development and practical application of the innovative Variability Methodology for cost reduction and quality improvement in health care delivery systems. Application of this methodology has resulted in significant quality improvement and multimillion dollar margin improvements for every hospital that has applied it. Dr. Litvak was a member of the Institute of Medicine committees on The Future of Emergency Care in the United States Health System and The Learning Healthcare System in America, as well as a member of the National Advisory Committee to the American Hospital Association for Improving Quality, Patient Safety and Performance. On behalf of IHO, he serves as principal investigator in many hospital operations improvement projects in the United States and internationally, including the Centers for Medicare & Medicaid Services–funded Partnership for Patients initiative with 14 hospitals in New Jersey and the nationwide Whole System Patient Flow Improvement initiative in Scotland.

Mark Murray, M.D., is an international authority on the development of access and flow systems within health care. He has specific expertise in areas such as patient access to appointments in primary, specialty, and ancillary care; patient access to information; and health care demand/supply matching and balance. Drawing from his direct experience in health care delivery and management, Dr. Murray has a unique perspective as a physician who practiced in multiple environments, as well as an understanding of how other businesses and industries use flow and demand/supply matching. He has also initiated and developed multioperational quality improvement efforts and has consulted with health care organizations worldwide on a variety of quality improvement strategies, including efficiencies in office practices, the development of health care teams, change management in health care settings, physician compensation, and "big system" flow. Dr. Murray has worked with various types of organizations, including the U.S. government; fee-for-service and capitated environments; health practices, systems, plans, and organizations; insurance companies; and various medical groups. In addition, he has worked extensively abroad. Dr. Murray completed his undergraduate training at St. Mary's College in California; attended Creighton University Medical School in Omaha, Nebraska; completed a residency in Family Medicine at the University of California, Davis; and obtained a master's degree in Health Services Administration from St. Mary's College. Following his medical training, he organized and developed a medical practice in an underserved rural area in Northern California. He also worked for Kaiser Permanente for 19 years, holding various administrative positions, including Assistant Chief of Medicine, North Sacramento Valley, where he had operational responsibility for the care of 270,000 patients; and director

of a regional call center that served 1.2 million patients. He left Kaiser in 1999 to pursue independent consulting on waits and delays in health care.

Thomas Nolan, Ph.D., is a statistician, author, and member of Associates in Process Improvement, a group that specializes in the improvement of quality and productivity. Over the past 25 years, he has assisted organizations in many different industries in the United States, Canada, and Europe. He is a Senior Fellow of the Institute for Healthcare Improvement (IHI). At IHI he has guided the Research and Development function and led several of IHI's strategic international initiatives such as the Triple Aim. His health care experience includes helping integrated systems, hospitals, and medical practices to accelerate the improvement of quality and the reduction of costs in clinical and administrative services. Dr. Nolan holds a doctorate in statistics from George Washington University and is the author of three books on improving quality and productivity. He has published articles on quality and safety in a variety of peer-reviewed journals, including the *Journal of the American Medical Association* and the *British Medical Journal*. He was the year 2000 recipient of the Deming Medal awarded by the American Society for Quality. In 2010 the Statistics Division of the American Society for Quality awarded him the William Hunter Award for innovative applications of statistical methods.

Peter Pronovost, M.D., Ph.D., is a practicing anesthesiologist and critical care physician who is dedicated to finding ways to make hospitals and health care safer for patients. In June 2011, he was named director of the new Armstrong Institute for Patient Safety and Quality at Johns Hopkins, as well as Johns Hopkins Medicine's senior vice president for patient safety and quality. Dr. Pronovost has developed a scientifically proven method for reducing the deadly infections associated with central-line catheters. His simple but effective checklist protocol virtually eliminated these infections across the state of Michigan, saving 1,500 lives and $100 million annually. These results have been sustained for more than 3 years. Moreover, the checklist protocol is now being implemented across the United States, state by state, and in several other countries. *The New Yorker* magazine says that Dr. Pronovost's "work has already saved more lives than that of any laboratory scientist in the past decade." Dr. Pronovost has chronicled his work to improve patient safety in his book, *Safe Patients, Smart Hospitals: How One Doctor's Checklist Can Help Us Change Health Care from the Inside Out*. In addition, he has written more than 400 articles and chapters related to patient safety and the measurement and evaluation of safety efforts. He serves in an advisory capacity to the World Health Organization's World Alliance for Patient Safety. Dr. Pronovost has earned several national awards, including the 2004 John Eisenberg Patient Safety

Research Award and a coveted MacArthur Fellowship in 2008, known popularly as the "genius grant." He was named by *Time* magazine as 1 of the world's 100 "most influential people" for his work in patient safety. He regularly addresses Congress on the importance of patient safety, prompting a report by the U.S. House of Representatives' Committee on Oversight and Government Reform strongly endorsing his intensive care unit infection prevention program. Dr. Pronovost previously headed Johns Hopkins' Quality and Safety Research Group and was medical director of Hopkins' Center for Innovation in Quality Patient Care. Both groups, as well as other partners throughout the university and health system, have been folded into the Armstrong Institute.

Ronald M. Wyatt, M.D., is the medical director in the Division of Healthcare Improvement at The Joint Commission. In this role, Dr. Wyatt promotes quality improvement and patient safety to internal and external audiences, works to influence public policy and legislation for patient safety improvements, and serves as the lead patient safety information and education resource within The Joint Commission. Dr. Wyatt collaborates in the development of National Patient Safety Goals, and oversees data management and analyses related to the Sentinel Event database. Prior to coming to The Joint Commission, Dr. Wyatt served as the director of the Patient Safety Analysis Center at the Department of Defense (DoD) where he directed and maintained the DoD Patient Safety Registries. These registries house de-identified clinical, root cause analyses, and failure mode and effects analyses data on the DoD's adverse patient safety events. Previously, Dr. Wyatt was the medical director at several health care organizations where his responsibilities included directing patient safety and quality improvement activities. He also served as a captain in the U.S. Army Reserves and was on active duty in the Internal Medicine Clinic at Reynolds Army Hospital in Ft. Sill, Oklahoma. He has received numerous awards, including a U.S. Army Commendation Medal for his service in Desert Storm. Dr. Wyatt served on the Food and Drug Administration (FDA) Drug Safety Oversight Board, the Agency for Healthcare Research and Quality (AHRQ) Science of Public Reporting Special Emphasis Panel, and the Comprehensive Unit-Based Safety Program to Eliminate Health Care–Associated Infections (CUSP) Technical Expert Panel. He is a mentor to the Center for Medicare & Medicaid Innovation (CMI) Advisors program at the Centers for Medicare & Medicaid Services (CMS) and a member of the American College of Physicians. Dr. Wyatt is on the faculty at the Institute for Health Care Improvement. He was named 1 of the "Top 50 Patient Safety Experts" in the United States by *Becker's* magazine in 2013 and 2014. Areas of special interests include social determinants of health, health disparity, patient activation, and professionalism (disruptive behavior). Dr. Wyatt co-authored the DoD

Patient Activation tool kit. He contributed to the National Patient Safety Goal on Medical Alarm Management, the revised Sentinel Event Policy, and the development and writing of the Patient Safety Systems chapter for The Joint Commission hospital accreditation manual. Dr. Wyatt is an internist with more than 20 years of practice experience and is currently licensed in the state of Alabama. He earned his medical degree at the University of Alabama at Birmingham and completed residency at the St. Louis University hospital, where he served as the first African-American Chief Resident in the department of Internal Medicine. Dr. Wyatt earned the Executive Master of Science in Health Administration (MSHA) from the University of Alabama at Birmingham. In 2000, the Morehouse School of Medicine conferred Dr. Wyatt with an honorary Doctor of Medical Sciences degree. As a George W. Merck Fellow with the Institute for Healthcare Improvement in 2009-2010, Dr. Wyatt was trained in performance improvement, measurement, epidemiological, and statistical principles. He also completed a Harvard School of Public Health program in Clinical Effectiveness—a joint program of Brigham and Women's Hospital, Massachusetts General Hospital, Harvard Medical School, and Harvard School of Public Health. Dr. Wyatt actively presents on a variety of patient safety topics throughout the United States and Canada. He has written and published numerous articles on patient safety topics.

Section 201: Independent Assessment of the Health Care Delivery
Systems and Management Processes of the Department of Veterans
Affairs

Assessment E (Workflow – Scheduling)

September 1, 2015

This page intentionally left blank.

Preface

Congress enacted and President Obama signed into law the Veterans Access, Choice, and Accountability Act of 2014 (Public Law 113-146) ("Veterans Choice Act"), as amended by the Department of Veterans Affairs (VA) Expiring Authorities Act of 2014 (Public Law 113-175), to improve access to timely, high-quality health care for Veterans. Under "Title II – Health Care Administrative Matters," Section 201 calls for an independent assessment of 12 facets of VA's health care delivery systems and management processes.

VA engaged the Institute of Medicine of the National Academies to prepare an assessment of access standards and engaged the Centers for Medicare & Medicaid Services (CMS) Alliance to Modernize Healthcare (CAMH)[1] to serve as the program integrator and as primary developer of the remaining 11 Veterans Choice Act independent assessments. CAMH coordinated the assessments and is furnishing a complete set of reports of individual assessment findings and recommendations to the VA Secretary, the House and Senate Veterans Affairs Committees, and the Commission on Care. This report describes the results of assessing workflow processes for scheduling appointments for Veterans at VA medical facilities.

The research addressed in this report was conducted by McKinsey & Company, Inc., and Atlas Research under a subcontract with The MITRE Corporation.

Executive Summary

Health systems across the U.S. have struggled with ensuring optimal patient access to the services they provide, and Veterans Health Administration (VHA) is no exception. Although VHA has faced public concerns about access to outpatient care for several decades, many factors that influence access have been only partially analyzed to date at VHA and were called out in the Choice Act as areas for independent assessment. The Choice Act tasked Assessment E with assessing the "workflow process at each medical facility of the Department for scheduling appointments for Veterans to receive care, medical services, or other health care from the Department." The assessment was also asked to address several supplemental areas related to provider scheduling templates, scheduler training, the use of call centers and the appointment scheduling system. All of these factors – as well as others explored in Choice Act assessments such as overall health care capabilities (Assessment B) and clinical staffing (Assessment G) – are critical to ensuring that our Veterans receive improved access to care.

In this assessment, we have reviewed VHA performance in the scheduling workflow areas against best practices from both within VHA and across the private sector. The major finding of this assessment is that VHA is not fully leveraging provider resources, scheduling best practices, or scale to deliver the best possible scheduling experience and access for Veterans. These shortcomings have a negative impact on both patient access to outpatient appointments (in terms of total number of appointments available and the matching of patients to those available appointments) and the patient experience of scheduling an appointment with VHA. It is likely that, with improved data visibility, more streamlined processes and performance management, VHA could expand the supply of appointments even with its existing provider base, as well as improve overall utilization of appointment supply and patient experience.

More specifically, we observed the following challenges that reduce the overall effectiveness of VHA scheduling today:

- **System limitations prevent accurate visibility into the supply of available appointments, inhibiting VHA's ability to understand the gap between total appointment supply and demand and to effectively manage current performance and plan for the future**. Due to system design limitations, some providers operate across multiple, potentially overlapping, booking templates or "clinic profiles" for any given day or session. As a result, these profiles, when aggregated, provide an inaccurate picture of total available appointment supply and make it challenging to easily understand whether appointment supply matches the quantity VHA should expect given the number of providers. The issue of overlapping profiles not only affects centralized calculations of overall and provider-level appointment supply, but also makes it challenging to calculate provider utilization rate, which is an essential metric for managing access to care. These limitations mean VHA cannot determine how much patient demand its current provider capacity can meet in a timely manner.

- **Imbalance between supply and demand has led to policies that add responsibilities for schedulers and administrators.** Because VHA has a persistent backlog of patient demand, VHA created additional policies that do not exist in the private sector, such as the capture

of patient desired date and the use of the Electronic Wait List (EWL). These policies for measuring wait times and managing waitlists have resulted in a significant number of additional activities required within the scheduler's day-to-day workflow. Further, the implementation of these policies is left largely to frontline interpretation, which may also result in inconsistent experience for patients across clinics or facilities. For example, use of the EWL varies across clinics; some clinics use it solely to measure backlog while others use it to highlight patients who may be willing to take an appointment that becomes available at the last minute (Choice Act site visits, interviews 2015). Veterans may then experience variation in when they are removed from the waitlist depending on how their clinic has implemented EWL.

- **Clinics do not consistently employ standard industry practices related to schedule setup and other scheduling processes.** VHA clinics are inconsistent in their use of industry and VHA best practices in scheduling, resulting in a fewer appointment slots available than may be possible within existing provider capacity and a significant number of booked appointments not being completed as originally scheduled. On schedule setup, examples of these practices in common use in industry and within certain services (such as Primary Care) within VHA include using standard appointment lengths within a sub-specialty and determining appointment mix (for example, number of new patient slots) based on patient demand (Institute for Healthcare Improvement (IHI), "Reduce Scheduling Complexity," n.d.; Primary Care Clinic Profile Standardization Guide, 2014). Similarly, inconsistent scheduling practices, such as the ways in which appointment reminders are used, exist across facilities and clinics. For example, a patient could expect a reminder from a clinic and not receive it (and potentially not go to the appointment as a result). Ultimately, the variability in these practices may result in reduced appointment availability and utilization as well as inconsistent patient experience.

- **Facility-level differences in performance management and accountability limit system-wide improvements in access.** VHA facilities lack consistent organizational structures for managing scheduling or access and, in many cases, lack dedicated resources to manage performance and outcomes for these activities. Given structural differences, formal monitoring of schedules is not a clearly defined duty for any staff members at the facility level, which hinders cross-system sharing of best practices, policy dissemination, and process standardization. In addition, this lack of consistency in organizational structure and accountabilities limits VHA performance management of facilities, as no one individual is specifically accountable and data analysis is cumbersome.[2] The Veterans Choice Act (section 303) identified this lack of accountability and aims to assign management of access responsibilities to a particular role within each clinic and to provide tools and processes to help perform this duty ("Veterans Access, Choice, and Accountability Act of 2014," 2014). VHA plans to fulfill this mandate without any new facility hires; instead, the organization will designate current FTEs as owners of these

---

[2] For example, at present, there is no easy or automated way to consistently and accurately monitor provider schedules.

responsibilities at the clinic and facility levels (Access and Clinic Administration Program [ACAP], interviews, 2015).

- **VHA-specific processes paired with a scheduling system that does not simplify processes leads to a greater reported need for scheduler training**. In response to a survey, 90 percent of schedulers noted the need for additional training in at least one area (for example, wait times and wait list policies) to become proficient at executing their basic responsibilities (Assessment E VHA Employee Survey, 2015). This perceived need for enhanced training may be due to systems and processes that do not simplify scheduler responsibilities, a common focus among private sector health system executives we interviewed. For instance, scheduling systems of private sector health systems have more user-friendly interfaces, fewer unique programs, and more automated processes (Private sector health system, interviews, 2015). As a result of greater complexity, VHA schedulers must receive additional training (on wait times and wait list policies, for example) to become proficient at executing basic VHA scheduler responsibilities.

- **Scheduling call centers are not maximizing their performance due to their small scale and disparate service offerings.** VHA call centers are smaller than industry standard (median size of 12 agents within VHA compared to 28 agents in private sector health systems and 110 agents across other industries) (Assessment E national data call, 2015; Belfiore et al., 2015). The scheduling call centers that do exist provide different services and support different specialties depending on the facility. Due to efficiencies in managing call demand that can lead to service improvement for patients, other provider systems have, in some cases, moved to pooling call volumes in more central locations. Larger scale call centers can also have lower per-unit costs and put less stress on space-constrained facilities than facility- or clinic-based operations. Further, larger call centers may be able to offer more coaching, training and career options to schedulers.

VHA has received significant feedback on ways to improve its scheduling and access performance. In fact, since 1999, more than 35 reports by the Government Accountability Office, VA itself, VA Office of the Inspector General (OIG), and independent contractors have commented on possible approaches for VHA to improve scheduling and access. Despite the number of reviews, there has been little articulation of the fundamental need for VHA to solve its ability to manage provider appointment slot supply until the Institute of Medicine's February 2015 "Innovation and Best Practices in Health Care Scheduling" white paper, which recommended that VHA get "back to the basics" to understand provider supply vis-a-vis patient demand and ultimately design schedules that optimize the two. With the access crisis and subsequent Choice Act in 2014, VA/VHA have accelerated several efforts to address issues raised in past reports, including funding provider hiring and non-VA care, initiating the procurement of a commercial off-the-shelf (COTS) scheduling system referred to as the Medical Appointment Scheduling System (MASS), and designing a clinic manager training program to better manage the scheduling process. However, to drive overall improvement to scheduling and address the specific challenges described above, we recommend that VA and VHA successfully complete in-flight initiatives and consider additional actions, which would be most effective if executed in an integrated manner. These actions include the following:

- **Address system limitations to provide visibility into aggregate appointment supply, alternative measures of wait times, and provider-level performance data.** VHA providers can operate across multiple and sometimes overlapping clinic schedules (also known as "profiles"),[3] which can result in double-counting of appointment slots when aggregated. VHA has a current initiative to clean-up overlapping schedules and unused clinic profiles that should result in a more accurate view of each clinic's appointment slot supply. Although this is an important first step, the effort may not eliminate all overlap in schedules and will not by itself allow understanding of appointment supply and utilization. One consolidated schedule for each provider would allow VHA to capture total appointment supply and measure the industry-standard wait time metric. With VA OI&T's current procurement of a new scheduling system (discussed in detail in section 7, Scheduling System), VHA may be on the path to addressing system limitations. Of course, when updating or acquiring a system to support scheduling, it is important to understand the business case relative to modifying the existing system or locally sourcing solutions at the facility/regional level.

- **Codify proven scheduling practices and empower clinics to improve appointment utilization and deliver a consistent patient experience.** Several pockets of scheduling best practice exist within VHA, such as the predictive missed opportunity model. However, many of the best practice VHA tools and processes are not widely disseminated nor utilized. The VHA ACAP Office reported that it is beginning to codify system-wide knowledge of scheduling best practices, but there is also an opportunity to ensure that these practices are consistently utilized in the field (ACAP, interviews, 2015). This will require addressing the lack of clinic management resourcing, addressing scheduler vacancies and ensuring that providers have an understanding of why certain practices (for example, overbooking) may be necessary to provide access.

- **Streamline scheduling policy implementation with supporting tools and implementation guidance; where possible, utilize technology to support.** The current Scheduling Directive policy is designed to aid VHA facilities in managing in an environment of excess demand relative to the appointment supply it is offering. This has resulted in policy steps, such as wait time capture and wait list management being added to the scheduling process, which can result in inconsistent patient experience due to discrepancies in policy interpretation and implementation in the field. For instance, to adhere to the policy regarding the Electronic Wait List, the scheduler will place a patient scheduled outside of 90 days on a wait list, an additional step in the scheduling process (Choice Act site visits, interviews, 2015). Further, while the EWL prioritizes Veterans to be scheduled based on policy, schedulers can find it challenging to use the list in conjunction with other policies (e.g., how many times the patient should be called before moving to the next patient on the list). In contrast, an ideal system would automatically place relevant patients on the EWL, provide a manager with a comprehensive dashboard for monitoring the waitlist demand, and prioritize which patients should get the first available appointments based on

---

[3] Described in Provider Availability Section 5 of this report

additional parameters. As a result, these changes would improve schedulers' efficiency and improve consistency of policy implementation.

- **Improve scheduler training by sharing local best practices and increasing experiential and on-the-job training, while also minimizing the need for training by simplifying policy implementation and improving system functionality.** Currently VHA's need for scheduler training is exacerbated by its scheduling software, policies (like EWL), and clinic- and provider-specific scheduling rules. Improvements to the scheduling systems, streamlining policy implementation, and minimizing unnecessary clinic-specific rules would reduce demands for schedulers' training and create more consistent patient scheduling experience. To optimize its training program, VHA should also leverage local best practices to create an improved and standardized curriculum for training and minimize duplication of materials development at the facility-level. In addition, training should be delivered using more experiential training methods to increase its effectiveness and information retention by schedulers.

- **Design scheduling call centers that can provide expanded services for Veterans relative to current state.** Currently, VHA scheduling call centers are managed locally at the facility level. As a result, most are small (median size of 12 schedulers, based on facilities that responded to our data call) and each call center varies in regards to the responsibilities and specialties for which it is responsible (Assessment E national data call, 2015). Decentralized call centers are difficult to centrally monitor and manage with regards to patient experience. Through the new MyVA effort, the organization is examining how it interacts with Veterans across various channels (such as, web, call centers, mail). This includes a VA-wide Call Center Task Force that may ultimately address scheduling; however, the scope does not yet appear to be clearly defined. VA has an opportunity to evaluate its current call center use for scheduling and develop an approach based on existing VHA call centers in other areas (like Health Resource Centers) and leading private sector scheduling call centers. VHA can then evaluate which responsibilities and specialties should be handled at larger scheduling call centers. Additionally, VHA should analyze the appropriate degree of centralization (for example, regional or virtual call center) and the call center locations.

- **Ensure that the clinic manager training program and subsequent implementation are appropriately scoped and resourced to drive access and clinic management.** Different roles, accountabilities and levels of expertise exist across facilities for managing access and scheduling, which affects how access and scheduling is managed and prioritized at different facilities. Via the Choice Act, VHA was directed to develop a clinic management training program to address these gaps within the system. While many important scheduling functions are reported to be addressed in the training curriculum as it is currently envisioned, resourcing and accountability for these activities will be equally important in ensuring that VHA is able to fully utilize its provider capacity and the appointment supply made available to Veterans. Further, tools need to be developed and distributed to ensure that these new clinic managers are successful.

Despite many of its broader organizational and operational challenges, VHA can leverage multiple positive aspects of its current scheduling and access management practices in the

---

future. For instance, VHA's scheduling policy has created the mechanism to identify potential supply-demand imbalances by tracking patients waiting for care at the clinic level. Similarly, VHA's efforts to encourage patient appointment adherence through a multi-pronged patient reminder approach, coordination of transportation and efforts to coordinate multiple services, where possible, demonstrate a commitment to supporting Veterans receiving care. Additionally, locally developed scheduling innovations demonstrate the potential for new scheduling tools and practices within the organization. For example, several VA Medical Centers (VAMCs) have developed home-grown "best practice" tools, including the predictive missed opportunity model, aggregated views of provider availability, and facility-centralized patient reminder systems across multiple modalities. In addition, VHA can build on its early efforts to modernize its patient-facing scheduling capabilities, such as online self-scheduling. This foundation suggests that VHA can draw on experience and assets within the organization, as well as on external best practices, to improve its scheduling processes.

In summary, if VA/VHA were to continue to build on existing assets, execute on its in-flight initiatives and supplement them by executing on the recommendations above, it may be able to offer a more consistent experience across clinics and facilities, expand appointment supply with existing provider resources and ensure better utilization of its supply. The impact of this for Veterans could come in the form of both improved experience and improved access.

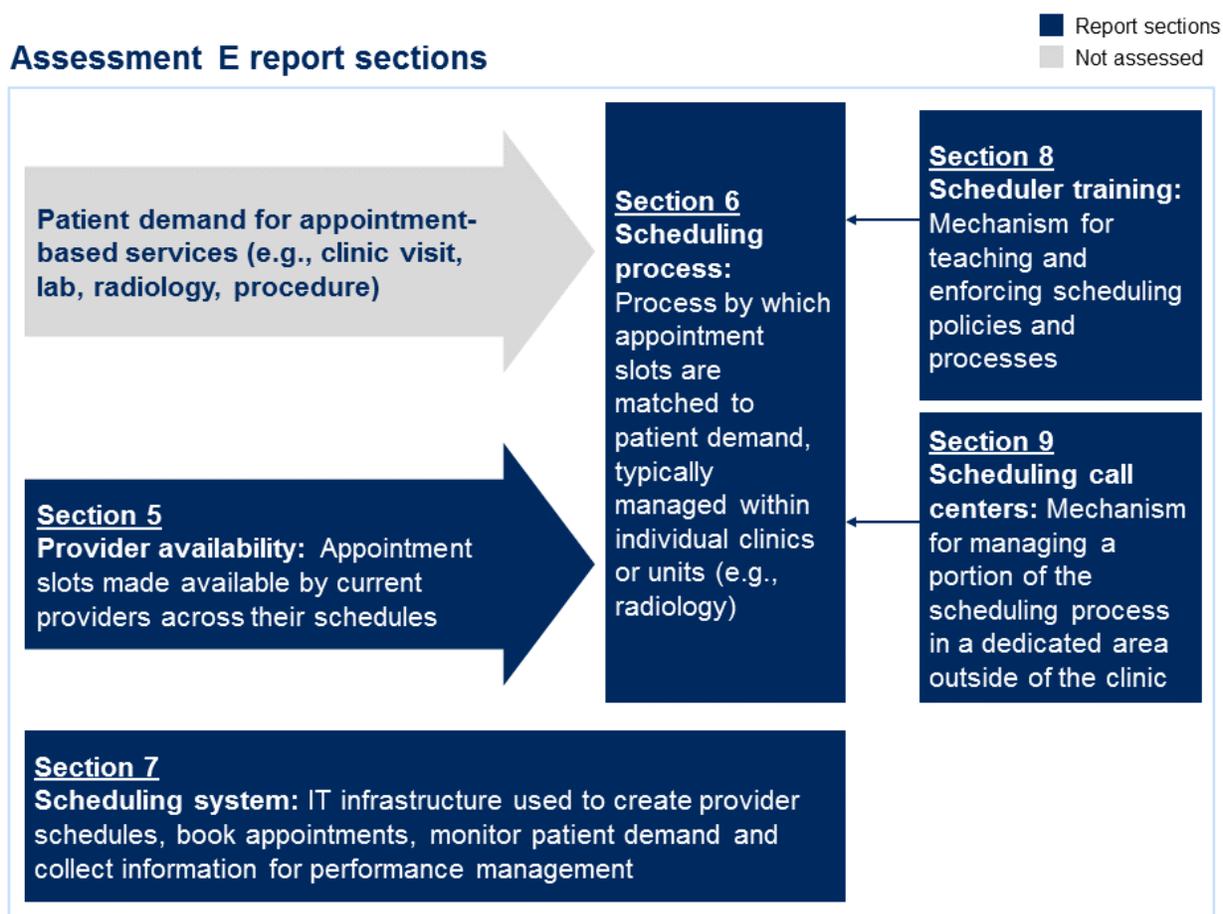
1   Introduction

The task of Assessment E was to assess the "workflow process at each medical facility of the Department for scheduling appointments for Veterans to receive care, medical services, or other health care from the Department." There are two major factors that affect the ability of any provider system to meet patient appointment demand in a timely matter: overall provider capacity, which translates into the supply of available appointments, and the effective matching of that capacity with patients, the "scheduling process" and its supporting elements such as having well-trained schedulers. The act of booking an appointment is only one part of the scheduling workflow picture, and its effectiveness often depends on the state of appointment availability. A scheduler cannot book an appointment for a patient if there are no appointments available to be booked. Therefore, Assessment E focused on understanding the ways scheduling workflow could be optimized to both increase the appointment availability of current providers and ensure more effective matching of this availability to demand through the scheduling process. This assessment was conducted within the constraint of current provider capacity. Note that provider availability is also influenced by patient demand as demand should inform the mix of appointments (e.g., new, urgent, follow) offered by an individual provider.

The following exhibit defines the elements of the scheduling workflow that Assessment E considered:

Figure 1-1. Overview of the Relationship Between the Components of Assessment E


The following table describes the way in which the report is structured across these elements to address the requirements of the Choice Act:

Table 1-1. The Five Areas Correspond in the Following Way to the Choice Act Elements

Report section	Corresponding Choice Act language	Chapter
▪ **Provider availability**: This considers the availability of providers to offer care for Veterans in outpatient clinics, including how overall time in clinic is managed; how schedules are developed; and how schedule changes may affect the availability of appointments.	*(1) (E) The workflow process at each medical facility of the Department for scheduling appointments for Veterans to receive hospital care, medical services, or other health care from the Department.* *(2)(A)(iv) Assess whether health care providers of the Department are making changes to their schedules that hinder the ability of employees*	5

Report section	Corresponding Choice Act language	Chapter
	conducting such tasks to perform such tasks. *(vi) Assess whether booking templates for each medical facility or clinic of the Department would improve the process of scheduling such appointments.*	
▪ **Scheduling process**: This assesses the scheduling process from beginning to end, including making appointments for clinic visits, surgery, procedures and ancillary services (e.g., radiology); measuring wait times; managing wait lists and backlogs; monitoring patient appointment adherence; and defining the role of the scheduler (Medical Support Assistant or MSA).	*(1) (E) The workflow process at each medical facility of the Department for scheduling appointments for Veterans to receive hospital care, medical services, or other health care from the Department.* *(2)(A)(viii) Recommend actions, if any, to be taken by the Department to improve the process for scheduling such appointments, including the following:* *(II) Changes in monitoring and assessment conducted by the Department of wait times of Veterans for such appointments.*	6
▪ **Scheduling system**: This covers the technology used for scheduling, including where the pain points are for administrators, schedulers and patients. This section also looks at proposed efforts to procure a new scheduling system.	*(iii) Assess whether changes in the technology or system used in scheduling appointments are necessary to limit access to the system to only those employees that have been properly trained in conducting such tasks.* *(vii) Assess any interim technology changes or attempts by Department to internally develop a long-term scheduling solutions with respect to the feasibility and cost effectiveness of such internally developed solutions compared to commercially available solutions.* *(viii) Recommend actions, if any, to be taken by the Department to improve the process for scheduling such*	7

Report section	Corresponding Choice Act language	Chapter
	appointments, including the following: *(III) Changes in the system used to schedule such appointments, including changes to improve how the Department—* *(aa) measures wait times of Veterans for such appointments;* *(bb) monitors the availability of health care providers of the Department; and* *(cc) provides Veterans the ability to schedule such appointments.*	
▪ **Scheduler training:** This evaluates who has been trained on scheduling; MSA scheduling training content; delivery practices; and the organizational reporting structure for MSAs.	*(2)(A)(i) Review all training materials pertaining to scheduling of appointments at each medical facility of the Department.* *(ii) Assess whether all employees of the Department conducting tasks related to scheduling are properly trained for conducting such tasks.* *(viii) Recommend actions, if any, to be taken by the Department to improve the process for scheduling such appointments, including the following:* *(I) Changes in training materials provided to employees of the Department with respect to conducting tasks related to scheduling such appointments.*	*8*
▪ **Scheduling call centers:** This studies the use of call centers for scheduling, and considers whether further centralization could improve timeliness and the scheduling experience.	*(v) Assess whether the establishment of a centralized call center throughout the Department for scheduling appointments at medical facilities of the Department would improve the process of scheduling such appointments.*	*9*

Please see Appendix A for findings and recommendations from this report mapped to the Choice Act language.

Assessment E is closely connected to several other assessments within the Choice Act, including, but not limited to, assessments B (health care capabilities), D (access standards), G (clinical staffing), H (information technology), and L (leadership). In order to avoid overlap and duplicative analysis, assessments were completed in coordination where possible. We have indicated instances where further relevant analysis is included in related assessment reports. In particular, with respect to access standards including wait times for appointments at VHA relative to the broader industry, Assessment E relied on the findings of the Institute of Medicine's Assessment D. Wait times are influenced by a number of factors including provider supply/availability, patient demand (including services required and the location of patients relative to VHA locations), as well as the scheduling process itself. Therefore, Assessment E focused on scheduling outcomes around available appointment slots and appointment slot utilization rates rather than wait times, which are influenced by a number of other factors, to describe the current state of VHA scheduling workflow performance.

A number of other factors beyond the workflow process for scheduling appointments and other areas of the Choice Act assessments contribute to access to care for Veterans. However, this assessment did not examine several areas that were out of scope of the Choice Act legislation, but may warrant further study:

- Outpatient clinical workflows that could drive provider productivity improvements, including facility/space resources, clinical and non-clinical staffing levels, outpatient clinic throughput/clinic operations
- Other mechanisms to create access, such as the increased use of new care delivery models like telehealth, specialty patient-aligned care teams, or outsourced care provision
- The requirements, career path, and pay grade of the Medical Support Assistant (MSA), a position with significant scheduling responsibility
- Scheduling for non-VA care, including that which is facilitated by the Choice Act; however, this assessment did consider the hand-off to the non-VA care office

This page intentionally left blank.

2   Methodology

To design and conduct this assessment, we developed a methodology that drew on literature review on scheduling workflow best practices, previous VA/VHA scheduling workflow-related reports, private sector case studies, and our experience with successful access/scheduling transformations across public and private sector health systems in the U.S. Our approach included the following three steps:

2.1   Assessment Design and Best Practice Codification

To design this assessment, we developed a detailed data/information request covering categories typically available from provider systems, including appointment-level data, scheduling policies, and other information detailed in Appendix B.1. Concurrently, the assessment team researched best practices[4] in literature, interviewed health system leaders responsible for training and scheduling systems sourced from a third party market research group, interviewed leadership from two integrated systems, Kaiser Permanente and Geisinger Health System, and drew on our previous assessment work with other systems. This input informed an on-site interview guide and collection tool for our site visits (site visit selection described in more detail below), a frontline survey, and a set of standard analytics to complete (for example, provider time in clinic).

Note, there are significantly fewer published academic or professional association standards in the patient scheduling area than in other areas impacting patient care, such as quality. Despite this, we attempted throughout the report to compare and contrast VHA performance in scheduling to external standards, where possible. To supplement literature, we use "private health system practices", drawn from private health system leadership interviews and McKinsey scheduling/access transformations, or specific health system examples (where those health systems are known for access or have integrated characteristics similar to VHA) to demonstrate common practices that health systems utilize to improve scheduling and access. We use the term "high performance" selectively to refer to practices utilized by select VAMCs that performed well on certain metrics (e.g., telephone average speed of answer).

2.2   Information/Data Collection, Analysis and Comparison to Best Practice and Industry Practice

This step focused on our assessment through site visits and data/information collection (full list of sources and site visit selection methodology is detailed in Appendix B.2).

VHA site visits: We visited 25 randomly selected VA Medical Centers (VAMCs) and 23[5] community-based outpatient clinics (CBOCs) near these facilities. In combination, these

---

[4]   Best practices detailed in Appendix C.1, D.2, E.2, F.2, and G.1

[5]   We had originally been scheduled to visit 24 CBOCs (one CBOC per randomly selected VAMC, plus additional CBOC in Lexington during pilot phase). However, our visit to Northport VAMC's Bay Shore CBOC did not occur due to closure, resulting in 23 total CBOC visits.

facilities were statistically representative of VHA facilities across a selection of criteria: size, geography, access performance, and other factors detailed in the Appendix B.2. We also visited two additional VAMCs not randomly selected, Indianapolis and Phoenix. Indianapolis was chosen because it is the only VHA facility in the country that uses a software system other than VistA to schedule outpatient appointments. Phoenix was visited due to its attention in previous reports. We completed group interviews for both schedulers and administrators at each of the 25 facilities, which included 187 schedulers and 174 administrators. In addition, we conducted 486 total interviews, including 31 with schedulers, 126 with providers,[6] and 329 with administrators.[7]

VHA data analysis: Wherever possible for our quantitative analyses, we attempted to look at large datasets across facilities and clinics to understand differences in scheduling performance. These datasets included the Clinic Access Index available through the Veterans Support Service Center (VSSC) and Corporate Data Warehouse (CDW) booked appointment data, which we reviewed across site visit facilities and the system more broadly, where possible. It should be noted that we did not conduct a *review* to validate the accuracy of data that was provided, although, where applicable, we did note potential data integrity issues highlighted during site visit interviews.

In some cases, our analysis is based on manual sampling of provider schedules where accurate centralized data was not available (for example, time scheduled in clinic). However, the scale of these manual reviews was selective due to their time-intensive nature and the ability of sites to provide data in a timely manner. As a result, we have attempted to use these as examples of individual provider-level variability rather than representations of VHA-wide performance.

In addition, to understand certain aspects of the scheduling workflow across all facilities, we requested VAMC data and information from a national data call to which 102 VAMCs (67 percent facility response rate, assuming 152 VAMCs)[8] responded and a front-line survey of schedulers, providers and administrators that was distributed nationally and received 6,649 responses.[9]

VHA interviews: We supplemented our site visits with an additional 37 VHA Central Office and subject matter expert interviews to obtain a fuller picture of the scheduling workflow. These interviews included clinical, administrative and technology leaders.

Additional industry interviews: As described above, we conducted 20 interviews of leaders in private sector health systems with responsibility for patient access or specific elements of the scheduling workflow, for example, technology. We also visited Kaiser Permanente and

---

[6] Includes Chief of Staff interviews

[7] Includes clinic- and facility-level administrator interviews

[8] The number of facilities cited in Assessment E's report may differ from numbers cited in other assessments. Our facility statistics come from 2014 VA Site Tracking (VAST) data, which was provided in December 2014. A new site classification system was announced in March 2015, which reclassified a number of VAMCs and CBOCs (Clancy, 2015).

[9] Response rate unknown, as total numbers for these groups were not available

---

interviewed leadership within Geisinger Health Systems; both are integrated systems known for leadership in access.

Using this information, we then compared our qualitative and quantitative observations of VHA performance to best and broader industry practices to assess the current state of VHA scheduling workflows and provide insight into overall findings and potential recommendations.

2.3   Synthesis of Findings and Recommendations

In this step, we synthesized findings to draw out the most prominent insights from our assessment as a whole. From this set of synthesized findings, we developed recommendations that VHA could consider.

An independent Blue Ribbon Panel, consisting of high-level health care industry leaders, was formed by CAMH to provide expert input throughout the assessment process. The panel members possessed a thorough understanding of health care industry best practices and leading edge practices. The Blue Ribbon Panel provided advice and feedback on the emerging findings and recommendations for the assessment.

Due to a significant finding around the lack of available appointment slot supply data, we were limited in our ability to estimate the impact of recommended changes. This data limitation is due to system design constraints, described in detail in Provider Availability Section 5, that prevent accurate measurement of appointment supply.

2.4   Limitations

This assessment has several important limitations including: we were not able to survey Veterans or collect their input at scale, we operated under an aggressive time frame, and – as often noted – there were limitations on the availability of data.

Two of the significant data/information limitations were relevant to Scheduling Process Section 6 and Scheduling Systems Section 7:

Scheduling Process:

We requested data from VHA to analyze scheduling outcomes data (for example, appointment slot utilization) across a range of appointment-based services, including clinic visits, lab and radiology (note, our interviews suggested that not all facilities schedule services such as lab and radiology in advance, and instead use same day scheduling or do not schedule appointments at all). For lab and radiology, VHA was not able to provide data on appointment slot supply, where it would be applicable (facilities that schedule the services), nor utilization rates for these services. Therefore, our understanding of challenges in appointment scheduling for services beyond clinic visits was limited to interviews with administrative heads of the lab, radiology and procedure units at a sub-set of site visit facilities, and was noted, where there were unique insights, in Scheduling Process Section 6. As mentioned in the Executive Summary, clinic appointment slot supply cannot be calculated in aggregate due to overlapping provider schedules (described in Provider Availability Section 5); however, we were able to analyze data

on completed clinic appointments to understand scheduling outcomes and potential challenges (shown in the Scheduling Process Section 6).

Scheduling System:

For Assessments E and H, a full scope assessment of the current plan to acquire a commercial off-the-shelf solution via the MASS procurement was not possible due to sequestration and legal constraints on VA and VHA staff during the selection period. Due to the constraints surrounding the technical evaluation for MASS, we were unable to interview key members of the MASS procurement team, including program management leadership, which would have provided insights into the budgeting, vendor selection process, and implementation planning for the scheduling system replacement. These MASS team members were involved over the life of the RFP development (initiated May 2014), and some have had a far longer involvement in both Scheduling and other VHA/OI&T programs and projects. As of July 2015, the technical evaluation was still on-going.

3   Cross-Cutting Findings

This assessment has surfaced six cross-cutting findings that suggest significant opportunity for improvement to the VHA scheduling process. In total, we believe that these issues are negatively impacting both patient access to outpatient appointments (in terms of total number of appointments available and the matching of patients to those available appointments) and the patient experience of scheduling an appointment with VHA.

3.1   System Limitations Prevent Accurate Visibility Into the Supply of Available Appointments, Inhibiting VHA's Ability to Understand the Gap Between Total Appointment Supply and Demand and to Effectively Manage Current Performance and Plan for Future

Due to system design limitations, some providers operate across multiple potentially overlapping booking templates or "clinic profiles" for any given day or session. As a result, these profiles, when aggregated, provide an inaccurate picture of total available appointment supply and make it challenging to easily understand whether appointment supply matches the quantity VHA should expect given the number of providers. The issue of overlapping profiles not only affects centralized calculations of overall and provider-level appointment supply, but also makes it challenging to calculate provider utilization rate, which is an essential metric for managing access to care. These limitations mean VHA cannot determine how much patient demand its current provider capacity can meet in a timely manner.

3.2   Imbalance Between Supply and Demand has led to Policies That Add Responsibilities for Schedulers and Administrators

Because VHA has a persistent backlog of patient demand, VHA created additional policies that do not exist in the private sector, such as the capture of patient desired date and the use of the Electronic Wait List (EWL). These policies for measuring wait times and managing waitlists have resulted in a significant number of additional activities required within the scheduler's day-to-day workflow. Further, the implementation of these policies is left largely to frontline interpretation, which may also result in inconsistent experience for patients across clinics or facilities. For example, use of the EWL varies across clinics; some clinics use it solely to measure backlog while others use it to highlight patients who may be willing to take an appointment that becomes available at the last minute (Choice Act site visits, interviews, 2015). Veterans may then experience variation in when they are removed from the waitlist depending on how their clinic has implemented EWL.

3.3   Clinics do not Consistently Employ Standard Industry Practices Related to Schedule Setup and Scheduling Processes

VHA clinics are inconsistent in their use of industry and VHA best practices in scheduling, resulting in a fewer appointment slots available than may be possible within existing provider

---

capacity and a significant number of booked appointments not being completed as originally scheduled. On schedule setup, examples of these practices in common use in industry and within certain services (such as Primary Care) within VHA include using standard appointment lengths within a sub-specialty and determining appointment mix (for example, number of new patient slots) based on patient demand (Institute for Healthcare Improvement (IHI), "Reduce Scheduling Complexity," n.d.; Primary Care Clinic Profile Standardization Guide, 2014). Similarly, inconsistent scheduling practices, such as the ways in which appointment reminders are used, exist across facilities and clinics. For example, a patient could expect a reminder from a clinic and not receive it (and potentially not go to the appointment as a result). Ultimately, the variability in these practices may result in reduced appointment availability and utilization as well as inconsistent patient experience.

3.4 Facility-Level Differences in Performance Management and Accountability Limit System-wide Improvements to Access

VHA facilities lack consistent organizational structures for managing scheduling or access and, in many cases, lack dedicated resources to manage performance and outcomes for these activities. Given structural differences, formal monitoring of schedules is not a clearly defined duty for any staff members at the facility level, which hinders cross-system sharing of best practices, policy dissemination, and process standardization. In addition, this lack of consistency in organizational structure and accountabilities limits VHA performance management of facilities, as no one individual is specifically accountable and data analysis is cumbersome.[10] The Veterans Choice Act (section 303) identified this lack of accountability and aims to assign management of access responsibilities to a particular role within each clinic and to provide tools and processes to help perform this duty ("Veterans Access, Choice, and Accountability Act of 2014," 2014). VHA plans to fulfill this mandate without any new facility hires; instead, the organization will designate current FTEs as owners of these responsibilities at the clinic and facility levels (Access and Clinic Administration Program [ACAP], interviews, 2015).

3.5 VHA-Specific Processes Paired With a Scheduling System That Does not Simplify Processes Leads to a Greater Reported Need for Scheduler Training

In response to a survey, 90 percent of schedulers noted the need for additional training in at least one area (for example, wait times and wait list policies) to become proficient at executing their basic responsibilities (Assessment E VHA Employee Survey, 2015). This perceived need for enhanced training may be due to systems and processes that do not simplify scheduler responsibilities, a common focus among private sector executives we interviewed. For instance, scheduling systems of private sector organizations have more user-friendly interfaces, fewer unique programs, and more automated processes (Private sector health system, interviews,

---

[10] For example, at present, there is no easy or automated way to consistently and accurately monitor provider schedules.

2015). As a result of greater complexity, VHA schedulers must receive additional training (on wait times and wait list policies, for example) to become proficient at executing basic VHA scheduler responsibilities.

3.6 Scheduling Call Centers are not Maximizing Their Performance due to Their Small Scale and Disparate Service Offerings

VHA call centers are smaller than industry standard (median size of 12 agents within VHA compared to 28 agents in private sector health systems and 110 agents across other industries) (Assessment E national data call, 2015; Belfiore et al., 2015). The scheduling call centers that do exist provide different services and support different specialties depending on the facility. Due to efficiencies in managing call demand that can lead to service improvement for patients, other provider systems have, in some cases, moved to pooling call volumes in more central locations. Larger scale call centers can also have lower per-unit costs and put less stress on space-constrained facilities than facility- or clinic-based operations. Further, larger call centers may be able to offer more coaching, training and career options to schedulers.

Overall impact on patients

The above findings have significant implications for the patient. Overall, limited visibility into supply prevents VHA from understanding its true workforce needs such that it can appropriately plan for patient demand. Variation in how provider schedules are developed and managed likely results in more limited appointment availability for patients even at existing provider capacity. In addition, inconsistent application of policy and scheduling practices from clinic to clinic as well as different service levels and service availability outside of the clinic from call centers result in variation in patient experience, which can be confusing for the patient.

While we did not talk to Veterans directly as part of this assessment, we did review Veterans' perspectives on scheduling that were shared publically. A 2014 survey of more than 20,000 Veterans conducted by the Wounded Warrior Project echoed several of the challenges that we observed during this assessment. For mental health and physical healthcare services, more than 40 percent of respondents cited "difficulty in scheduling appointments" and "experienced lapsed and inconsistent treatment because of canceled appointments and switches in providers" as the top two most common reasons for difficulties in getting health care. Approximately 60 percent of those surveyed had VA health insurance. (2014 Wounded Warrior Project Survey Report of Findings).

Quotes from several Veterans further described their scheduling experience:

> "I think the biggest issue is the transition of health care. I always am told by VA doctors that it's "my health care," but it seems like they do very little on their end. I can't ever seem to get the appointments I need, they switch my providers constantly, dragging out even the most basic of medical issues for years now" (2014 Wounded, pg. 130)

> "I contacted the VA medical center near me to schedule my medical intake. I had a set appointment that was canceled by the VA. When I called to reschedule, I

---

was given a new appointment. This was again canceled by the VA because they said I was missing paperwork which I had already given to the VA. When I called to reschedule again, they instructed me since I missed two appointments, which were canceled by the VA, I would have to restart the entire medical intake process. I have not yet been through the VA medical intake. I am in constant pain and see a chiropractor at least once a week. The VA disability states my issue is non-permanent and I will lose my rating. My pain limits me from working out and enjoying the things I used to before this pain began." (2014, Wounded, pg. 129)

 ". . . you are out there trying to work and go to school and take care of yourself by utilizing the VA health care system because it's all you can afford, but they can only schedule appointments in the middle of the day when you have to work. How about a little flexibility there!?..." (2014 Wounded, pg. 130)

These perspectives along with our findings from this assessment collectively suggest that VHA facilities have an opportunity to increase appointment supply within existing resource constraints, ensure that available appointments are fully utilized and create an improved patient experience for the Veterans it serves.

4   Cross-Cutting Recommendations & Implementation Considerations

4.1   Cross-cutting Recommendations

Given the access crisis and the recent Veterans Access, Choice and Accountability Act, VHA reports that many new efforts are already underway to address some of the issues described above. VHA plans to introduce short-term system enhancements to improve system usability for schedulers and longer-term changes to enable a resource-based view of providers and other assets (for example, facility space). VHA is also developing a clinic/group practice manager role and management training program, which was required by Section 303 of the Choice Act and requires VA to "…to provide in-person, standardized education on systems and processes for health care practice management and scheduling to all appropriate employees…" ("Veterans," 2014). Additionally, VHA released scheduling policy clarifications in May 2015 to clarify elements of the existing Scheduling Directive including the use of wait lists and other scheduling and access-related practices. Finally, in May 2015, VA launched an organization-wide Contact Center Taskforce to review the current state of telephone services at VA across various areas including scheduling. Further details of relevant efforts underway can be found in the recommendations sub-sections of the report.

If successful, the above efforts will improve the ability to monitor appointment supply and demand, introduce facility-level owners for access management, clarify policies, and improve baseline call center performance and best practices. In addition, it may be important to address limitations in these initiatives. For example, these initiatives may not create tools to ensure success and accountability of the clinic managers, do not automatically create one schedule per provider, nor address ways to automate national scheduling policies. Further, they may not ensure the dissemination of best practices, address the need to improve call center service levels, or reduce the need for training.

To address these gaps, we recommend several actions. In alignment with Section 201 of the Choice Act, Section 201 assessments' findings and recommendations were developed independently. We therefore expect these recommendations would be refined by VHA leadership and the Commission on Care. Additional detail on the supporting recommendations can be found in the sub-assessment sections of this report (Sections 5-9).

Our overarching recommendations for Assessment E are the following:

4.1.1 Address System Limitations to Provide Visibility Into Aggregate Appointment Supply, Alternative Measures of Wait Times, and Provider-Level Performance Data

VHA providers can operate across multiple and sometimes overlapping clinic schedules (also known as "profiles"),[11] which can result in double-counting of appointment slots when aggregated. VHA has a current initiative to clean-up overlapping schedules and unused clinic profiles that should result in a more accurate view of each clinic's appointment slot supply. Although this is an important first step, the effort may not eliminate all overlap in schedules and will not by itself allow understanding of appointment supply and utilization. One consolidated schedule for each provider would allow VHA to capture total appointment supply and measure the industry-standard wait time metric. With VA OI&T's current procurement of a new scheduling system (discussed in detail in section 7, Scheduling System), VHA may be on the path to addressing system limitations. Of course, when updating or acquiring a system to support scheduling, it is important to understand the business case relative to modifying the existing system or locally sourcing solutions at the facility/regional level.

4.1.2 Codify Proven Scheduling Practices and Empower Clinics to Improve Appointment Utilization and Deliver a Consistent Patient Experience

Several pockets of scheduling best practice exist within VHA, such as the predictive missed opportunity model. However, many of the best practice VHA tools and processes are not widely disseminated nor utilized. The VHA ACAP Office reported that it is beginning to codify system-wide knowledge of scheduling best practices, but there is also an opportunity to ensure that these practices are consistently utilized in the field (ACAP, interviews, 2015). This will require addressing the lack of clinic management resourcing, addressing scheduler vacancies and ensuring that providers have an understanding of why certain practices (for example, overbooking) may be necessary to provide access.

4.1.3 Streamline Scheduling Policy Implementation With Supporting Tools and Implementation Guidance; Where Possible, Utilize Technology to Support

The current Scheduling Directive policy is designed to aid VHA facilities in managing in an environment of excess demand relative to the appointment supply it is offering. This has resulted in policy steps, such as wait time capture and wait list management being added to the scheduling process, which can result in inconsistent patient experience due to discrepancies in policy interpretation and implementation in the field. For instance, to adhere to the policy regarding the Electronic Wait List, the scheduler will place a patient scheduled outside of 90 days on a wait list, an additional step in the scheduling process. Further, while the EWL prioritizes Veterans to be scheduled based on policy, schedulers can find it challenging to use the list in conjunction with other policies (e.g., how many times the patient should be called

---

[11] Described in Provider Availability Section 5 of this report

before moving to the next patient in the list). In contrast, an ideal system would automatically place relevant patients on the EWL, provide a manager with a comprehensive dashboard for monitoring the waitlist demand, and prioritize which patients should get the first available appointments based on additional parameters. As a result, these changes would improve schedulers' efficiency and improve consistency of policy implementation.

4.1.4 Improve Scheduler Training by Sharing Local Best Practices and Increasing Experiential and on-the-job Training; Simultaneously, Minimize the Need for Training by Simplifying Policy Implementation and Improving System Functionality

Currently VHA's need for scheduler training is exacerbated by its scheduling software, policies (like EWL), and clinic- and provider-specific scheduling rules. Improvements to the scheduling systems, streamlining policy implementation, and minimizing unnecessary clinic-specific rules would reduce demands for schedulers' training and create more consistent patient scheduling experience. To optimize its program, VHA should also leverage local best practices to create an improved and standardized curriculum for training and minimize duplication of materials development at the facility-level. In addition, training should be delivered using more experiential training methods to increase its effectiveness and information retention by schedulers.

4.1.5 Design Scheduling Call Centers That can Provide Expanded Services for Veterans Relative to Current State

Currently, VHA scheduling call centers are managed locally at the facility level. As a result, most are small (median size of 12 schedulers, based on facilities that responded to our data call) and each call center varies in regards to the responsibilities and specialties for which it is responsible (Assessment E national data call, 2015). Decentralized call centers are difficult to centrally monitor and manage with regards to patient experience. Through the new MyVA effort, the organization is examining how it interacts with Veterans across various channels (such as, web, call centers, mail). This includes a VA-wide Call Center Task Force that may ultimately address scheduling; however, the scope does not yet appear to be clearly defined. VA has an opportunity to evaluate its current call center use for scheduling and develop an approach based on existing VHA call centers in other areas (like Health Resource Centers) and leading private sector scheduling call centers. VHA can then evaluate which responsibilities and specialties should be handled at larger scheduling call centers, and which ones to outsource. Additionally, VHA should analyze the appropriate degree of centralization (for example, regional or virtual call center) and the call center locations.

4.1.6 Ensure That the Clinic Manager Training Program and Subsequent Implementation are Appropriately Scoped and Resourced to Drive Access and Clinic Management

Different roles, accountabilities and levels of expertise exist across facilities for managing access and scheduling, which affects how access and scheduling is managed and prioritized at different

facilities. Via the Choice Act, VHA was directed to develop a clinic management training program to address these gaps within the system. While many important scheduling functions are reported to be addressed in the training curriculum as it is currently envisioned, resourcing and accountability for these activities will be equally important in ensuring that VHA is able to fully utilize its provider capacity and the appointment supply made available to Veterans. Further, tools need to be developed and distributed to ensure that these new clinic managers are successful.

4.2   Implementation Considerations

Below, we have listed the changes that we believe are fundamental preconditions for successfully implementing the recommendations described in Section 3 and the detailed report sections, as well as suggested immediate actions to be taken at the national level.

4.2.1   Pre-conditions for Implementation

Many of the challenges we and other assessment teams have observed are interrelated and highly complex. Implementing solutions to long-standing challenges will require collaboration among Congress and the Executive Branch, VA and VHA leadership (VA Central Office, VISN, and VAMC) and staff, as well as the unions and external stakeholders. We see this assessment as an opportunity for improvement, to be achieved by all stakeholders through a combination of local, regional, and national action. Addressing these challenges will require sustained commitment as a part of an integrated transformation effort for the system as a whole.

The VHA scheduling process involves many complex policies and processes, some of which do not exist in private industry. The recommendations summarized earlier in this section include both fundamental shifts to the system as well as tactical changes that can be made at the local level, while more far-reaching solutions are being implemented. We believe there are several essential preconditions to implementing these and transforming scheduling at VHA:

4.2.1.1   Introduce End-to-end Owner of Access & Scheduling Implementation to Ensure Successful use of Desired Policies and Scheduling Practices

Policies that impact scheduling are developed centrally by VHA (for example, by the VHA ACAP office) and then implemented in the field by local frontline leaders. The intended purpose of a policy is not always clear to the facility and clinical leadership. As a result, many policies are not implemented as intended or not implemented at all. In other cases, facility and clinical leaders understand the policies but do not feel that they have the tools (for example, standard operation procedures, prediction models, waitlist dashboards) to successfully implement the desired policy. Further, groups at VHA that are tasked to create the national policies do not have the operational control to test and refine policies in the field due to a lack of reporting oversight of operations. As a result, policies are not always informed by the frontline view of how best to operationalize. By introducing an end-to-end owner of access and scheduling management in the VHA field organization (e.g., above the VISN level), the organization can increase accountability and ensure timely implementation of needed changes. This end-to-end

ownership for cross-cutting areas should be developed in the broader context of organizational changes recommended in Assessment L.

4.2.1.2 Increase Performance Management and Accountability for Access and Scheduling Performance

Today, the field is held accountable for facility performance through VISN leadership reporting up to the Deputy Undersecretary for Health for Operations and Management. There is a wide range of targets and metrics the field is held accountable for across its operations. However, if VHA is to prioritize performance on specific dimensions (e.g., access), it may need to refine and streamline its performance management systems, including operational measures, targets, and rewards, as described in detail in Assessment L.

4.2.1.3 Convene a Standing Group to Streamline the Policy Approval Process to Allow Flexibility and Responsiveness to the Field

Currently, new policies must be approved by a myriad of departments across various levels of VHA. As a result of this well-intended consensus-driven approval process, policies or policy clarifications take months or even years to approve and launch, which hampers the ability to respond to the needs of the field in an ever-changing environment. For instance, the Scheduling Directive was released in 2010, but the first clarification was not released until May 2015. An accelerated policy approval process could reduce the ability of any individual or group to prevent the policy from gaining approval. It would also significantly simplify the approval process needed for simple clarifications of existing policies that currently need to be approved by the same process as national directives.

4.2.1.4 Improve the Existing Hiring Process to Ensure Adequately Skilled Scheduler and Provider Staffing

Today, as documented by Assessment F, the hiring process for both clinical and non-clinical staff is challenging due to both national and local hiring practices. As a result, it is not atypical for a facility to go six months before replacing a vacant position. With fewer providers, clinics have fewer appointments to offer patients, which may result in their inability to meet demand. With fewer schedulers, standard practices may not be used on a daily basis and patients may have to wait longer before a scheduler can attend to their scheduling needs. By improving the hiring process for all staff, VHA can ensure it has the manpower to follow best practices scheduling processes and provide timely appointments to its patients.

4.2.1.5 Ensure Progress Against Organizational Effectiveness Recommendations Described in Assessment L

Large-scale change management efforts, such as what would be required to meaningfully improve the scheduling workflows at VHA, will require several fundamental organizational changes that go beyond scheduling. Assessment L describes these changes in detail. Specific to scheduling, VHA will also need to undergo a change management process in which clinical leadership and providers are engaged in the scheduling transformation. Given the number of

process, system and organizational changes suggested by this assessment, engaging and empowering clinical leadership in the transformation effort will be critical. In our experience with scheduling/access transformations, clinical leadership engagement has been a key determinant of success in improving patient experience and increasing access in all situations.

4.2.2 Immediate Actions for Consideration

Across our recommendations, some actions should be considered for immediate implementation, while others will likely require more advanced planning and resourcing before meaningful design or implementation can begin. Recommended immediate actions against each of our cross-cutting recommendations should include:

Table 4-1. Recommendations and actions for consideration

Recommendation	Potential immediate actions
Address System Limitations to Provide Visibility Into Aggregate Appointment Supply, Alternative Measures of Wait Times, and Provider-Level Performance Data	▪ Within VHA, continue effort to clean-up clinic profiles; ensure that facility-level clinical leaders are committed to this effort ▪ Across VA and VHA, ensure that process design, budgeting and implementation/roll-out planning (including for non-systems changed required to get the full value of any new scheduling system) are progressing for MASS (assuming imminent vendor selection)

Codify Proven Scheduling Practices and Empower Clinics to Deliver a Consistent Patient Experience, Improve Appointment Utilization	▪ As part of ACAP's continued efforts on scheduling and access,
	
	  — Engage clinical leadership at the facility level on the principles of provider scheduling management, supplementing the development of the clinic manager training program
	
	  — Direct clinics to increase use of strategic overbooking, which does not require new resources, and provide "how to" principles to accelerate the work down of current backlog (can revisit strategy over time)
	
	  — Redistribute and offer training on the VHA-developed missed opportunity predictive model to VISNs/facilities

Recommendation	Potential immediate actions
	to build awareness of the tool where it may not exist today
Streamline Scheduling Policy Implementation With Supporting Tools and Implementation Guidance; Where Possible, Utilize Technology to Support	▪ Assemble a cross-functional working group with the charge of policy approval ▪ Determine a regular process and timeline that ensures that (1) decision-making occurs in a timely manner (2) any proposed changes are accompanied by supporting implementation tools that are field-tested (3) there is a clear plan for subsequent disseminated to all relevant personnel (4) there is a mechanism for measuring impact (positive or negative) of any policy or policy changes that should be centrally addressed
Improve Scheduler Training by Sharing Local Best Practices and Increasing Experiential and on-the-job Training; Simultaneously, Minimize the Need for Training by Simplifying Policy Implementation and Improving System Functionality	▪ Building on the materials received during this assessment's national data call, ACAP should continue to codify best practice training materials examples and share at VISN/facility level
Design Scheduling Call Centers that can Provide Expanded Services for Veterans Relative to Current State.	▪ VA/VHA should clarify scope and timeline of activity for VA Call Center Taskforce as it relates to scheduling call centers ▪ Building on the materials received during this assessment's national data call, ACAP should develop recommendation on scope (scheduling services offered, clinical services covered) and size of scheduling call centers for facilities to consider

This page intentionally left blank.

5 Provider Availability

5.1 Context & Approach

The Institute for Healthcare Improvement (IHI) describes the fundamentals of access management as consisting of two management processes: 1) monitoring appointment demand, and 2) managing appointment supply to that demand ("Measure," n.d.). In any provider setting, appointment availability can fluctuate due to several factors, including last minute clinic cancellations, vacation, leave, and other changes to schedules. These factors have a significant impact on patients when a lack of availability inhibits access or when clinic-initiated reschedules result in an additional administrative burden for patients and schedulers. According to the 2014 VHA Access Audit, the "highest scored single barrier or challenge [to timely access to care] was lack of provider slots" based on frontline staff responses ("Access Audit," 2014).

The Choice Act identified two areas to assess related to provider availability: 1) whether providers were making changes to their schedules that inhibit scheduling, and 2) whether standard booking templates[12] at each facility or clinic could improve scheduling process. To conduct this assessment, we considered the following elements (described in Figure 5-1), which can all contribute to the need for a standard template.

---

[12] A booking template refers to the basic structure of a provider's schedule, including clinic hours, appointment slot lengths, and types of appointments offered in each slot (Kumar et al., 2014).

Figure 5-1. Elements of Provider Availability

Provider availability overview

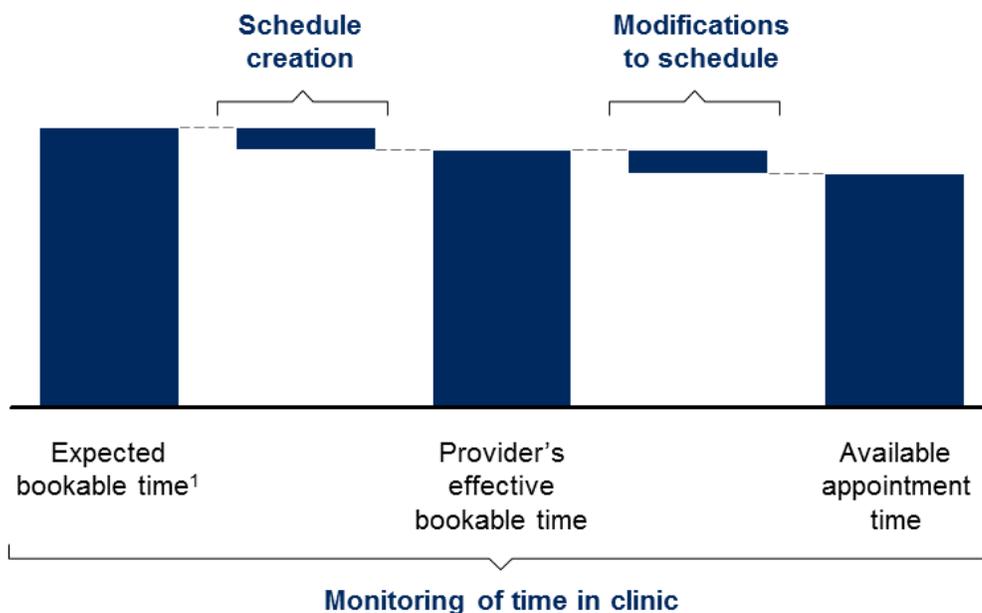
Schedule creation

Modifications to schedule

Expected bookable time[1]

Provider's effective bookable time

Available appointment time

Monitoring of time in clinic


1 Equal to expected time in clinic (percent of clinical FTE) minus allowed time for support tasks (e.g., documentation, patient messaging)

Expected bookable time is defined as the amount of time a provider should be making available for appointments based on the provider's contractually-defined clinical full-time equivalent (clinical or cFTE), a measure of a provider's time for clinical activities in total, and expected time in clinic (versus other settings of care like the operating room). When schedules are created in the scheduling system, the schedule should be created to reflect this bookable time. Any deviation from the expected bookable time that happens when schedules are created or modified can reduce the overall available appointment time. The number of available appointment slots (appointment supply) is then dependent on how the appointment time is distributed across appointment types (e.g., urgent, new, follow-up), which may also have different lengths.

VHA providers (independently licensed clinical practitioners) work with their specialty's administrative leadership (including administrative officers (AOs), service chiefs, and section chiefs)[13] to confirm the hours in which they will see patients (bookable time) and to determine the length and mix of appointments (appointment slot supply). This information is then

---

[13] Service and section chiefs are both clinical leaders. The key difference is scope of management, as sections are a sub-component of services (e.g., Orthopedic Surgery is a section underneath the Surgery service).

translated into the provider's schedule through a request from the clinical administrative leadership to the IT group responsible for generating profiles in the VistA Scheduling System. The turnaround time and processes for changes can vary due to the volume of change requests and the capacity of the group who generates the profiles in the scheduling system (Choice Act site visits, interviews, 2015). The administrative leadership is ultimately responsible for making sure that providers have structured their schedules to ensure they are offering the expected level of bookable appointment time (ACAP, interviews, 2015).

What is unique to VHA is that a provider's schedule is often spread across multiple "clinic profiles," another term for any individual schedule that a provider maintains for specific appointment types. Several important terms and definitions related to clinic profiles will be used frequently throughout the rest of this section. These terms include:

- **Clinic profile or profile**: One of several individual schedules a provider might be required to use, which combined together form his or her full schedule. Providers may have multiple profiles to differentiate appointment types by specialty, type of care, location, hours, and length of appointment (ACAP, interviews, 2015; Brandenberg et al, 2015). VHA policy requires separate profiles for each:
  - **Stop code**: Stop codes, a VHA-specific identifier used to track outpatient workload, serve as the building blocks for VistA Scheduling System. A profile requires a unique stop code so that completed appointments can be counted consistently across the facility and VA system. For the purpose of capturing workload, only one stop code can be used per profile (VHA Directive 1731, 2013). Examples include 409 – Orthopedic Surgery; 306 – Diabetes; 322 – Women's Primary Care.
  - **Standard length clinic day**: An individual profile can have a daily clinic length of no more than eight hours.
  - **Single location per profile**: An individual profile can have only one location per profile.
  - **Identical base time unit**: An individual profile can have only one base unit of time[14]
- **Overlapping profiles:** If a provider's profiles are mutually exclusive (non-overlapping), then they can be summed to determine accurate provider appointment supply; however, if providers have appointment availability within different profiles at the same time, then profiles will overlap, which can result in overestimation of true supply.
- **Schedule:** Aggregation of a provider's availability across all clinic profiles.

In addition to definitions, it is important to understand that primary and specialty care operate under different working models; this affects both how profiles are created and how productivity is monitored. Primary care providers manage a given number (or "panel") of patients in a team-based model known as Patient-Aligned Care Teams (PACT). National

---

[14] The base unit is the minimum bookable amount of time (15 minutes, 20 minutes and 30 minutes) and must be established for each clinic. Only multiples of the base unit can be booked within the same profile (e.g., a 15 minute visit and a 40 minute visit cannot be booked in the same profile, whereas a 15 minute and a 30 minute visit can) (ACAP, interview, January 8, 2015; SCS, 2015).

guidelines govern panel size, as well as access and quality outcomes (VHA Handbook 1101.10, 2014). It should be noted that a new primary care guide for profile creation was released in 2015, but was not in time for its impact to be observed on our site visits (Choice Act site visits, interviews, 2015). In contrast, specialty care providers generally are not responsible for panels of patients, but rather treat patients with specific problems for a limited period of time. In both cases, however, the set-up and management of clinic profiles is an important component of patient access.

To understand these elements in detail, we relied on several specific data sources, including:[15]

- Interviews at 24 VAMCs and 23 CBOCs with 109 providers (39 percent primary care, 42 percent specialty care, 18 percent mental health care), 17 chiefs of staff, 111 clinic administrators[16] (35 percent primary care, 26 percent specialty care, 14 percent mental health care, 12 percent lab/radiology, 11 percent OR/procedure suite, 3 percent multiple care types), separate group interview discussions with approximately ten schedulers and ten clinic managers at each VAMC visited
- National survey of 1,054 providers from 111 VAMCs and 173 CBOCs
- National data call responded to by 617 clinics across 102 VAMCs focusing on provider policies
- Clinic Access Index data for the 25 VAMCs that were visited as part of this assessment's site visits, including metrics such as the ratio of new to existing patients seen and reasons for cancellations
- Analysis of Corporate Data Warehouse (CDW) appointment-level data from 152 out of 152 VAMCs and 811 of 819 CBOCs, including 5,644 total clinics, over seven-month timeframe in 2014
- Manual review of provider schedules and comparison to time-in-clinic for two specialties at one VAMC; 15 physicians and 12 profiles over a six-month timeframe in 2014-15

5.2   Findings

5.2.1   VHA Lacks an Understanding of Aggregate and Provider-Level Appointment Supply Relative to Demand Due to System Design Constraints

According to the IHI, "the foundation of improved access scheduling is the matching of supply and demand on a daily, weekly, and monthly basis. This work requires a very good understanding of demand and supply" ("Balance," n.d.). Senior leaders at Kaiser Permanente, a leading integrated provider system, also assert that an access transformation can only be accomplished with a quantitative and disciplined approach to understanding appointment supply and demand (Kaiser interview, 2015). Mayo Clinic, Seattle Children's Hospital, and other

---

[15] For detailed methodology on data sources, clinics chosen for analysis and time frames of data, see Appendix B

[16] Administrative officers (AOs), nurse managers and other clinic administrators

private sector health systems similarly depend on an understanding of appointment supply and demand to achieve access improvements (Brandenburg et al., 2015). This capability is important when considering potential improvements to scheduling and to timely access to care.

Because of shortcomings in the current VistA systems, VHA appears to have limited insight into provider availability for outpatient services ("Access Audit," 2014), and limited ability to assess the extent to which a shortage of providers or inefficient use of current capacity are contributing to its access challenges. Much of the problem appears to be driven by choices in data capture as well as centralized reporting requirements that can result in the multiple, overlapping provider profiles described in the context. Due to this, VHA does not get a true picture of the provider's available appointment supply because the data cannot simply be aggregated.[17] To see what this means in real life, consider Figure 5.2.

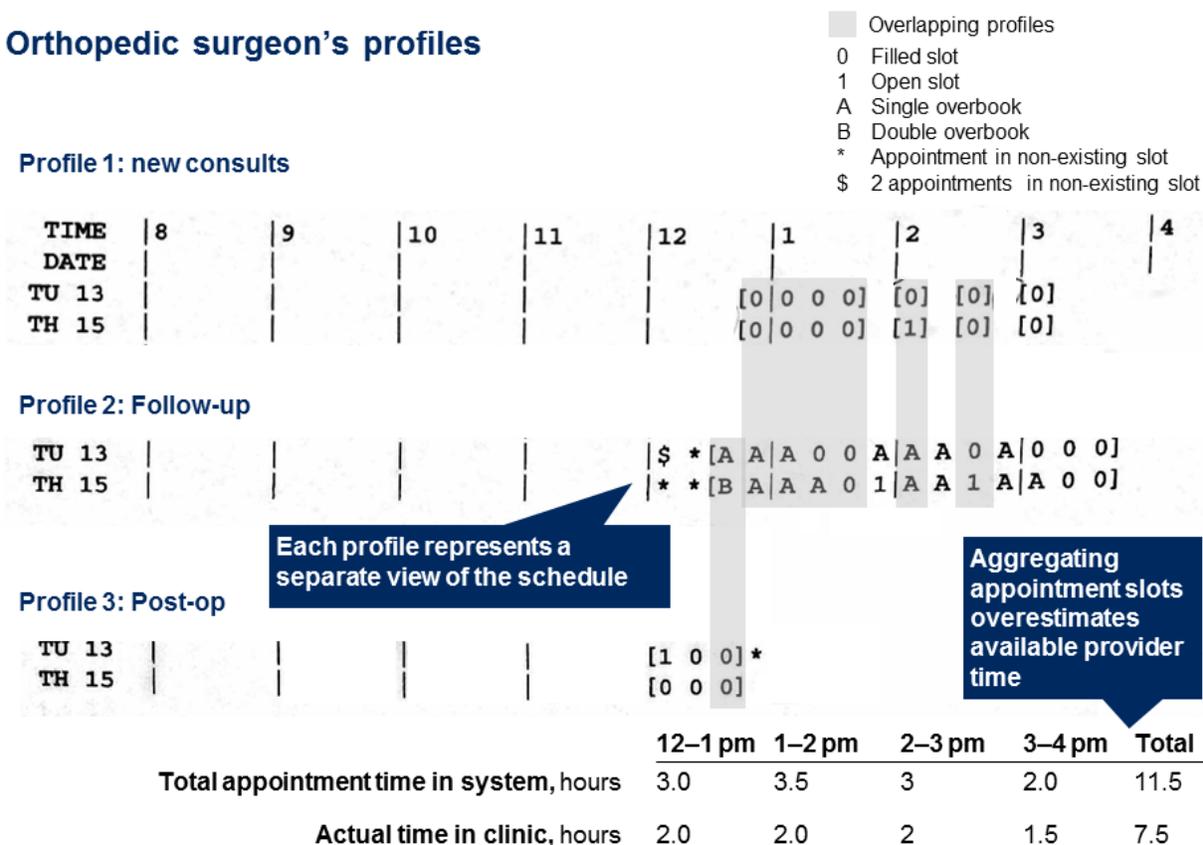
Figure 5-2. Actual Orthopedic Surgeon's Profiles


Figure 5-2 shows an orthopedic surgeon's three outpatient clinic profiles – new, follow-up and post-op – for January 13 and 15, 2015. This figure shows that while the physician is only in clinic

---

[17] This is a well-known issue to facility and VHA central office leadership (ACAP, interviews, 2015); see section 5.3.2 of this report.

---

for 7.5 hours over the course of the two days, the profiles suggest 11.5 hours of appointments were made available for booking. These overlapping slots represent a 53 percent artificial increase in appointment supply. These profiles were provided by a Surgery AO from a medium-sized, high complexity VAMC. Key: 0 = filled slot; 1 = open slot; A = single overbook; B = double overbook; * = patient booked outside a clinic's regular hours; $ = two patients booked outside a clinic's regular hours. Source: site visit VAMC, 2015.

The figure shows an orthopedic surgeon's three clinic profiles or schedules – new, follow-up and post-operative – in a medium-sized, high complexity VAMC for January 13 and 15, 2015. In reality, a scheduler could not view these multiple, overlapping profiles at the same time on their computer screen; these are consolidated into one view for the purpose of this example. While the physician is actually in the clinic for 7.5 hours over the course of the two days, the profiles suggest 11.5 hours of appointments were made available for booking, suggesting an inaccurate 53 percent "increase" in appointment supply.

Three primary data sources exist for understanding appointment-level information at VHA: the Corporate Data Warehouse (CDW), which houses retrospective appointment data and is limited to booked appointments,[18] the Clinic Access Index report, which, along with the Clinic Utilization Statistical Summary report, shows appointment slots and utilization; and provider schedules. Unfortunately, none of these reports provides accurate visibility into total appointment supply given the issue of overlapping profiles. The Clinic Access Index, for instance, while meant to provide a way to understand provider availability for appointments and clinic-level utilization, aggregates data from multiple profiles, which results in inaccurate numbers being reported if any profiles overlap. According to interviews with 115 AOs and clinic administrators during site visits, the only way to accurately assess appointment supply is to manually review schedules at the provider level, which is a time-consuming task that appears to be performed at fewer than five percent of VAMCs and CBOCs. Interviews with VHA Central Office leaders confirmed this estimate (VHA Central Office, interviews, 2015).

5.2.2 VHA Does not Utilize Demand Analysis and Forecasting to Develop Schedules that Match Patient Needs

Health systems can measure and forecast patient demand for appointments on both a short- and long-term basis. True appointment demand represents "the total number of requests for appointments received on any given day from both internal (e.g., provider requests for return visits) and external (new patient referrals) sources" ("Measure," n.d.). While long-term demand modeling enables workforce planning (e.g., hiring of providers), the IHI recommends health systems use short-term demand forecasting in addition to develop provider schedules ("Measure," n.d.). Specifically, the IHI recommends forecasting on a daily, weekly, and seasonal basis[19] ("Measure," n.d.). Further, a 2015 Institute of Medicine (IOM) report identified the need

---

[18] Any appointment slots that go unused are not captured. VA does use the Veteran Equitable Resource Allocation (VERA) model, which uses historical utilization data to allocate VA funding annually. However, this model measures utilization (e.g., visits), not appointment supply.

[19] Currently, VA forecasts long-term demand for budget request purposes using a complex model.

---

for "vigilant and dynamic management" to "make on-the-fly adjustments when events happen that upset the [supply-demand] balance" (Brandenburg et al., 2015).

VHA does not consistently use short-term demand analysis and forecasting to develop schedules that match patient needs. VHA's ability to build schedules around demand forecasts is limited in that its demand models do not provide prospective demand predictions by type of appointment (e.g., new, follow-up, pre-operative). For instance, VHA utilizes the Enrollee Health Care Projection Model (EHCPM), which is maintained and operated by private contractor Milliman, Inc. (Harris et al., 2008). This tool enables the forecasting of future demand in terms of physician RVUs by specialty at the administrative parent facility level, which refers to a medical center and all facilities under the same leadership (link to Assessment B). However, the EHCPM does not predict mix of appointments, which prevents it from being used to design schedules as is best practice (Gupta and Denton, 2007). VHA's other demand models, such as the Specialty Productivity Access Report and Quadrant (SPARQ) Tool, similarly do not enable prospective demand modeling ("Productivity," 2015).

High-performing private health systems monitor demand closely. For example, Kaiser Permanente employs a dedicated analytics team to monitor and compare expected appointment supply to forecast demand by appointment type;[20] then the system's clinical and administrative leaders review these supply and demand data on a weekly basis to identify potential gaps and to increase supply[21] if needed (Kaiser interview, 2015). Cleveland Clinic reduced wait times from 14 to seven days and added 100,000 visits a year through the use of supply-demand analytics and prediction tools ("Creating," n.d.). University of Michigan employed a similar strategy of closely matching capacity of providers to predicted demand for services from various patient populations to improve access performance (Nolan et al., 1996).

5.2.3 VHA Does not Develop Schedules to Ensure Optimal Appointment Supply or Mix (For Example, New, Urgent, Follow-Up)

5.2.3.1 Provider Schedules may be Created Without Clear Linkages to Assigned Clinic Time

The IHI suggests that provider schedules be set to match expected cFTE ("Measure," n.d.).[22] By explicitly measuring available appointment time and comparing it to time expected in clinic, clinics can identify opportunities to increase patient access without adding providers.

---

[20] Based on historical demand, seasonality, membership changes and other inputs

[21] Short-term appointment supply can be increased by decreasing non-clinical time, denying non-essential leave and shifting focus to new patient appointments.

[22] For the purpose of this report, "schedulable time" is referred to as a percentage of a clinical full-time employee (FTE). In other words, for each provider, there is a specified amount of time to be spent at the VHA facility. Of that time, a certain amount is allocated to seeing patients (often called "clinical time" and defined as a percentage of clinical or cFTE). Of that clinical time, a portion is allocated to the outpatient clinic setting for direct patient care (% cFTE); this is the focus of the report.

Across VHA facilities, schedules are developed at a local level for each provider with limited central guidance on translating cFTE to expectations of bookable time (Office of Productivity, Efficiency & Staffing, interviews, 2015). Of the 617 clinics responding from 102 VAMCs to our national data call, only 8 percent reported receiving national guidance on how long their clinic sessions should be, and 31 percent received no guidance at all (Assessment E national data call, 2015). Due to a number of factors, including this lack of central guidance on the number of expected bookable hours in direct patient care based on assigned outpatient clinic time, some provider profiles are structured to reflect less bookable time than their cFTE. Consequently, fewer appointments than expected may have been available.

For example, Figure 5-3 shows two full-time physician profiles from the same outpatient clinic for the week of Sept 8-12, 2014.

Figure 5-3. Actual Physician Profiles From Same Clinic, Both Intended to be 1.0 cFTE

Figure 5-3 shows two actual physician profiles provided by one facility's Mental Health service for the week of Sept 8-12, 2014. The figure shows that one physician's standard profile provided twice as many 30-minute appointment slots per week compared to another physician's (56 slots compared to 28) and that neither is mapped fully to expected bookable time. This analysis, based on guidance from the AO, assumes 35 hours of bookable appointment time per week, with one hour per day for documentation, phone calls, and other

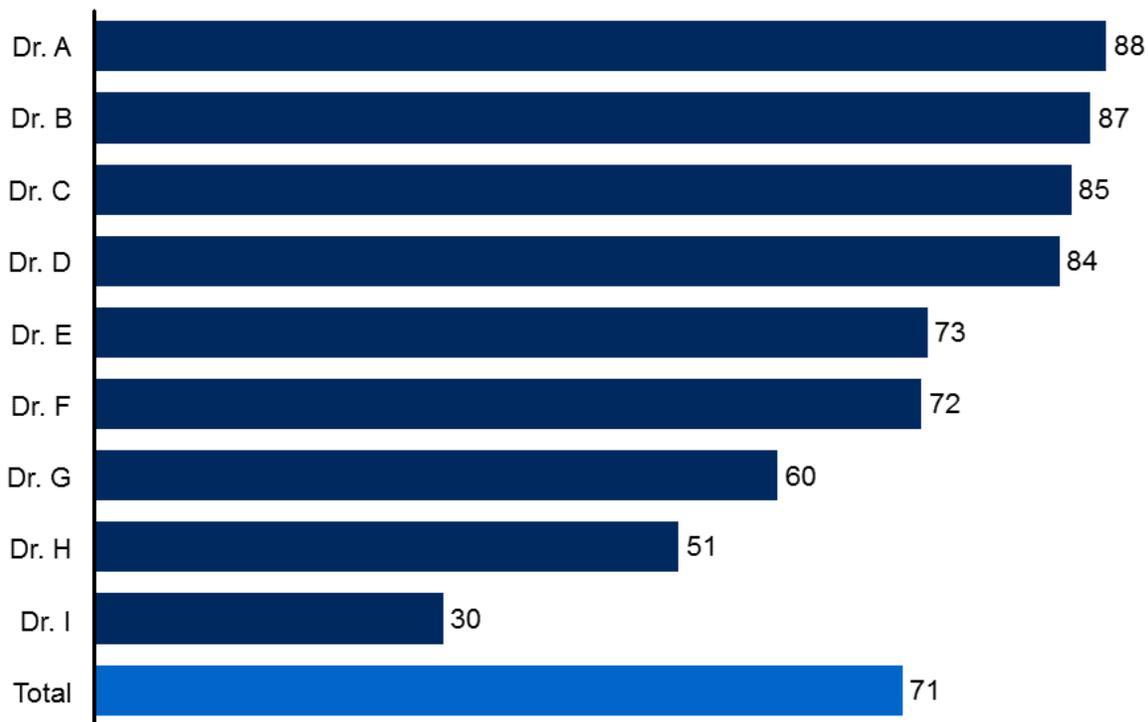
administrative work related to direct patient care. Key: 0 = filled slot; 1 = open slot; A = single overbook. Source: site visit VAMC, 2015.

The clinic's AO confirmed that each provider in Figure 5-3 was one full cFTE at VHA, but one provider was scheduled to provide twice as many appointments per week (56 slots compared to 28). These slot availabilities represent 93 percent and 47 percent of expected appointment supply, respectively, based on 35 hours per week of bookable time[23] with one hour per day for documentation, phone calls, and other patient-related administrative work.[24]

Figure 5-4 demonstrates similar variability across the rest of this clinic over a six month period.

Figure 5-4. Portion of Assigned Outpatient Clinic Time Made Available For Appointment, Sept 2014 – Feb 2015

Portion of assigned outpatient clinic time made available for appointment booking for one clinic's physicians
Percent, N=9 physicians

Physician	Percent
Dr. A	88
Dr. B	87
Dr. C	85
Dr. D	84
Dr. E	73
Dr. F	72
Dr. G	60
Dr. H	51
Dr. I	30
Total	71


The amount of expected bookable time assumes providers work 35 hours per week, with 0.5 hours per session, two weeks of vacation, and seven holidays over the six-month period, Sept

---

[23] Based on maximum of eight hours allowed in each clinic profile per day with one hour for lunch (Choice Act site visit interviews, 2015).

[24] AO provided all labor information and general expectations for bookable time and confirmed neither of the two physicians has other administrative, research or clinical duties filling the identified time gaps.

2014 – Feb 2015. Due to limitations in VHA provider time allocation data, it is not possible to understand how providers' unscheduled clinic time is being spent, so these individuals may be engaging in patient care activities (such as secure messaging) that is not captured. Source: Site visit VAMC, 2015.

Due to the manual nature of collecting FTE information and all profiles over a six-month period for every physician, only two of eight clinics asked were able to fulfill our request for this information, and representatives from other clinics reported that they could not comply given the amount of time this task would take. The time-consuming nature of this analysis given the multiple profiles clearly reduces the level of transparency of available bookable time to administrators. This can result in some providers making less time available for booking relative to their peers and should be explored more broadly across VHA given that the above analysis is an example of one clinic.

That said, the variability exhibited in this example is consistent with variability observed in more than ten health systems in which we have participated in scheduling/access transformations. Our experience has shown that even well-performing systems can generate 5-10 percent additional appointment capacity from improved matching of provider clinic schedules to assigned provider time. The constraints of other resources (such as exam rooms and non-clinical staff) would also need to be explored to validate this opportunity.

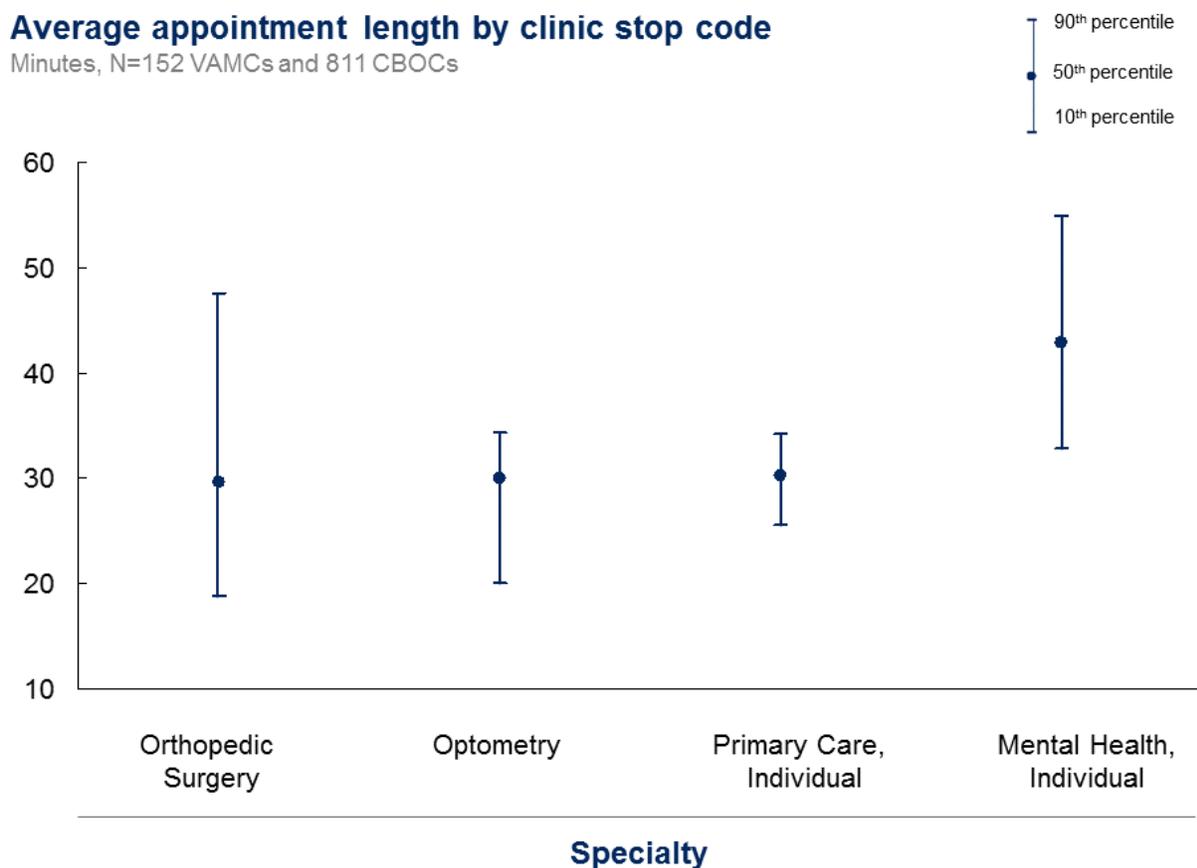
5.2.3.2 Lack of National Standards Regarding Appointment Lengths may Contribute to Patient Volume Variability from Provider to Provider

The IHI recommends that appointment slots accurately match expected appointment length for each sub-specialty ("Reduce," n.d.). Except for primary care, which has examined appointment slot lengths nationally and provided system-wide guidance on precise lengths for different appointment types, slot length determination is left to individual providers and their local clinical leadership. Of the 617 clinics across 102 VAMCs included in the data call, 67 percent had policies in place regarding appointment length, with the large majority of these policies (78 percent) developed at the service or section level (Assessment E national data call, 2015). In about 32 percent of cases, clinics reported that no policy existed at all, and that appointment length was left entirely up to the provider.

An analysis of seven months of established patient follow-up appointment data from 2014 found significant variations at the specific stop code (outpatient service identifier) level as seen in the following two Figures 5-5 and 5-6.

Figure 5-5. Follow-up Appointment Slot Length by Stop Code,
Jan – July 2014 n = 152 VAMCs, 811 CBOCs

Average appointment length by clinic stop code
Minutes, N=152 VAMCs and 811 CBOCs

90th percentile
50th percentile
10th percentile


Specialty

Figure 5-5 shows the average lengths of follow-up appointment for select top codes. Average appointment length varies significantly within the same specialties across facilities. This data comes from Corporate Data Warehouse (CDW) data across 152 VAMCs and 811 CBOCs for seven months in 2014. Source: CDW, 2014.

As stop codes are identifiers that are intended to be used consistently across VHA for workload capture and accounting purposes, this type of variation is not necessarily expected. For example, across 338 facilities offering optometry services for seven months in 2014, average time scheduled for follow-up appointments for one stop code ranged from 15 to 61 minutes (10th percentile = 20 minutes, 90th percentile = 34 minutes). While an individual patient may take more or less time to be seen, these slot lengths represent the average scheduled appointment length for all of a clinic's visits. If the upper end constitutes an inefficient use of time, fewer patients would be seen, thus reducing overall access. Some of the variation in this analysis may be the result of visit types beyond "new" and "established," as the stop code categorization did not provide this level of detail. Further, primary stop codes do not enable analysis by provider type (such as physicians, mid-level providers and sub-specialties). This can also have an effect on appointment length as can in-clinic procedures/testing. However, given

the variability seen even in specialties such as optometry that have less inherent clinical variability, it is likely that appointment length represents an opportunity.

In order to further test the level of variation, we measured the average appointment length for each clinic within Optometry (stop code 408) for follow-up appointments.

Figure 5-6. Average Follow-up Appointment Slot Length for Optometry, Stop Code 408

Follow up appointment length – Optometry, stop code 408
Portion of clinics with average follow-up slot length in detailed range
Percent, N=338 clinics

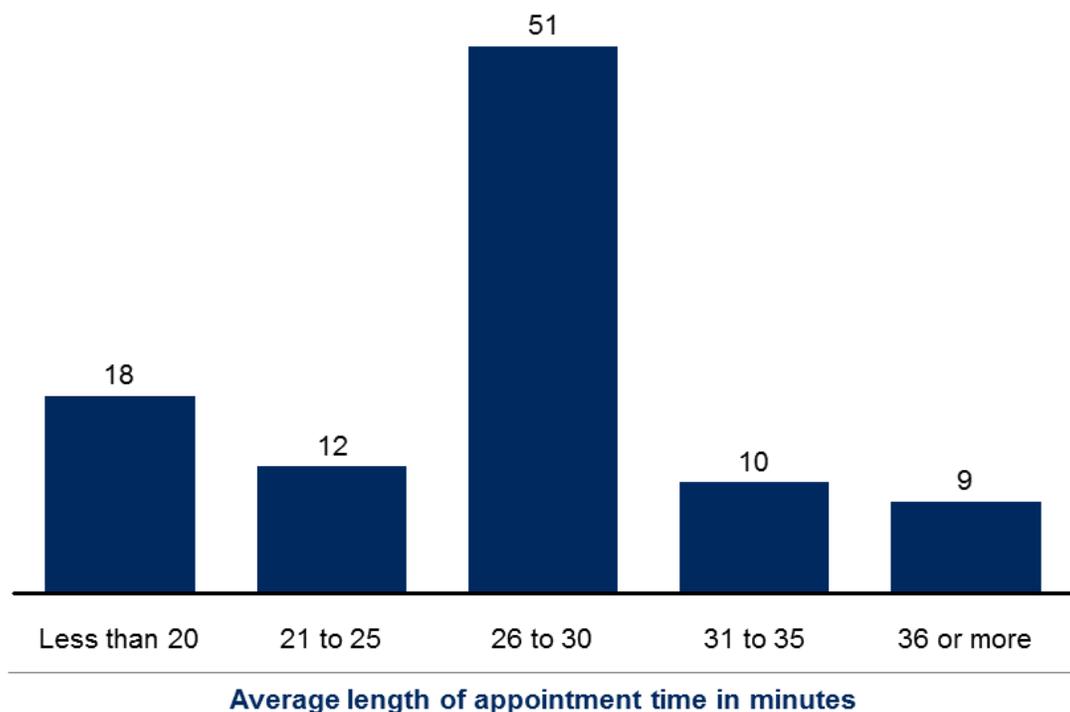
Average length of appointment time in minutes


Figure 5-6 shows the distribution of average follow-up visit appointment slot length for Optometry, stop code 408. While most appointments (51 percent) lasted on average 26 to 30 minutes, 18 percent lasted 20 minutes or less and 9 percent lasted 36 minutes or more. This data comes from seven months of Corporate Data Warehouse appointment-level data in 2014. Source: CDW, 2014.

This analysis, which included multiple provider types, found a wide range of average clinic appointment slot lengths. While most appointments (81 percent) were scheduled for an average of 30 minutes or less, 10 percent were scheduled for 31-35 minutes and 9 percent for 36 minutes or more. This range represents a potentially large difference in the number of patients able to be seen. For instance, if providers could reduce appointment lengths from 40 to 30 minute average without impacting quality and service, they could see three to four more

patients a day,[25] effectively increasing capacity by a third. The finding that over 80 percent of other providers are already seeing patients within this shorter time period suggests this could be done without compromising patient care.

While there are several limitations to this analysis, other integrated provider systems including the Henry Ford Health System[26] provide guidance on appointment length at the system level. In part by implementing standard appointment lengths across providers, Henry Ford was able to reduce third next available appointment wait time, a commonly used industry metric, by 31 percent over two years (McCarthy et al., 2009). Systems working to standardize appointments lengths should also consider how clinical workflows (ability to move patients through the clinic) and individual provider capabilities (e.g., new versus experienced provider) should factor into standards.

For specialty care, the standardization of appointment lengths may be more difficult given the variability between and within specialties (Gupta and Denton, 2007). However, a sustained effort by one VAMC's department of orthopedic surgery shows that it is possible.

VHA high-performance example: Palo Alto VAMC orthopedics
In 2013, Palo Alto VAMC orthopedics was experiencing long wait times and frequent overbooking that resulted in long in-clinic waits to be seen (Choice Act Site visits, interviews, 2015). Two advanced-practitioners worked to address these issues in part by overhauling provider schedules. They measured throughput for each provider in the clinic and then calculated average visit length by appointment type. On that basis, they established standard appointment lengths for all their clinic providers. For example, they found that follow-up visits consistently lasted about 20 minutes, even though some providers had 15- minute slots and others had 30-minute slots. So they changed the system to allow 20-minute slots, reducing the need for overbooking and enabling providers to perform documentation in real-time. In conjunction with other efforts, this schedule overhaul cut average patient wait times from six weeks to less than one. In-clinic wait times improved because there was more accurate booking. Providers and staff also were pleased: "We're a lot happier with the flow of clinics," one said, "because they start and end on time, which never used to happen." Most importantly, Veterans themselves were more satisfied; patient complaints decreased from five per week to about one a month (Choice Act Site visits, interviews, 2015).

5.2.3.3   Appointment Mix May not Match Demand

Across VHA, performance on patient access metrics is generally worse for new patients than for existing ones. According to VHA, approximately 30 percent of new patients have wait times beyond VHA's access standard, compared to fewer than five percent of established patients

---

[25] Assuming seven hours of bookable appointment time

[26] Henry Ford is a vertically integrated health care system that provides health insurance and health care delivery. It employs over 1,100 physicians who staff its 26 outpatient medical centers ("Henry Ford Facts and Statistics," 2015).

("Strategic," 2014). Multiple factors could be driving this, including the consult process, as discussed in detail in Scheduling Process Section 6. The way scheduling profiles are set up may contribute to these differences, specifically through appointment mix—that is, the relative number of appointment types seen by a provider. Establishing similar ratios of slots to demand (for example, new patient slots to new patient demand, follow-up slots to established patient demand), ensures more consistent access across patient types.

Differences in appointment mix are especially important within specialty care, where patients often have more acute needs. This requires specialists to determine when they can return their established patients back to the management of their primary care providers so the specialists can accommodate new patients. Within primary care, the mix is more relevant to assess at the team rather than the individual provider level, since the PACT model relies on a unit of providers and support staff working together to treat patients.

Appointment mix is generally set at the provider- or clinic-level, even within Primary Care, for which the reservation of some appointment slots for same-day appointments is mandated. Determining appointment mix at the local level is consistent with the practices of private integrated providers. The difference is that compared to the private sector, VHA has limited ability to accurately measure true supply or utilization of appointments by type due to providers' multiple profiles. Moreover, gaps in accountability and monitoring mean that VHA management may not notice mismatches between patient demand and available slots by appointment type.

To understand whether appointment mix was an issue within VHA, recognizing data limitations, we did an analysis of six months of Clinic Access Index reports for four stop codes[27] in 25 VAMCs. For specialty care, the analysis found a wide range in the ratios of established patients to new patients across 25 clinics within each specialty (Orthopedic Surgery: 0.4 to 7.6; Dermatology: 1.6 to 6.1). A number of factors outside of the control of the clinics could have contributed to this wide range in mixes, including differences in demand across new and established patients. However, schedule set-up, provider behavior, and appointment mix monitoring are important enablers for consistent patient access. For instance, if there are too few new patient slots in a provider's schedule, established patients could fill up the schedule, reducing new patient access to specialty care.

To identify such mismatches, Kaiser Permanente measures its appointment supply and demand by appointment type and adjusts provider schedules accordingly (Kaiser interview, 2015). Regular monitoring enables Kaiser Permanente to anticipate mismatches and adapt appropriately, whether by staggering provider schedules, shifting same-day slots to certain hours, or increasing the percentage of new patient appointments. Other systems incorporate patient preferences, such as demand for same-day appointment slots by time of day and day of week, into demand modeling to optimize appointment mix (Gupta and Denton, 2007).

---

[27] Primary Care – Individual; Mental Health – Individual; Dermatology; Orthopedic Surgery

5.2.4 Provider Cancellation and Leave Policies are Inconsistent and Poorly Monitored

Managing cancellations by clinic, which are appointment cancellations that are initiated by the clinic, is critical because a cancelled visit can negatively impact the patient experience and also increase the workload of schedulers. An analysis of six months of appointment data in four stop codes (Orthopedic Surgery, Dermatology, Primary Care – Individual, and Mental Health – Individual) in 25 VAMCs shown in Figure 5-7 suggested significant differences in the percent of clinic visits cancelled by the clinic across our site visit VAMCs.

**Figure 5-7. Rate of Appointment Cancellations by Clinic,
Feb – July 2014, n = 99 Clinics Across 25 VAMCs**

Figure 5-7 shows appointment cancellation by clinic rate for four specialties (Primary Care – Individual, Mental Health – Individual, Orthopedic Surgery, and Dermatology). Clinic cancellation rates range from near 0 percent in some clinics to 25 percent with an average of 9 percent. This analysis comes from Clinic Access Index data from 25 site visit VAMCs.
Source: Clinic Access Index reports, 2014.

This analysis suggests that clinics cancel a large number of appointments (nine percent) before the scheduled time. There is also a considerable range in performance, from next-to-none in some clinics, to up to 25 percent in others.

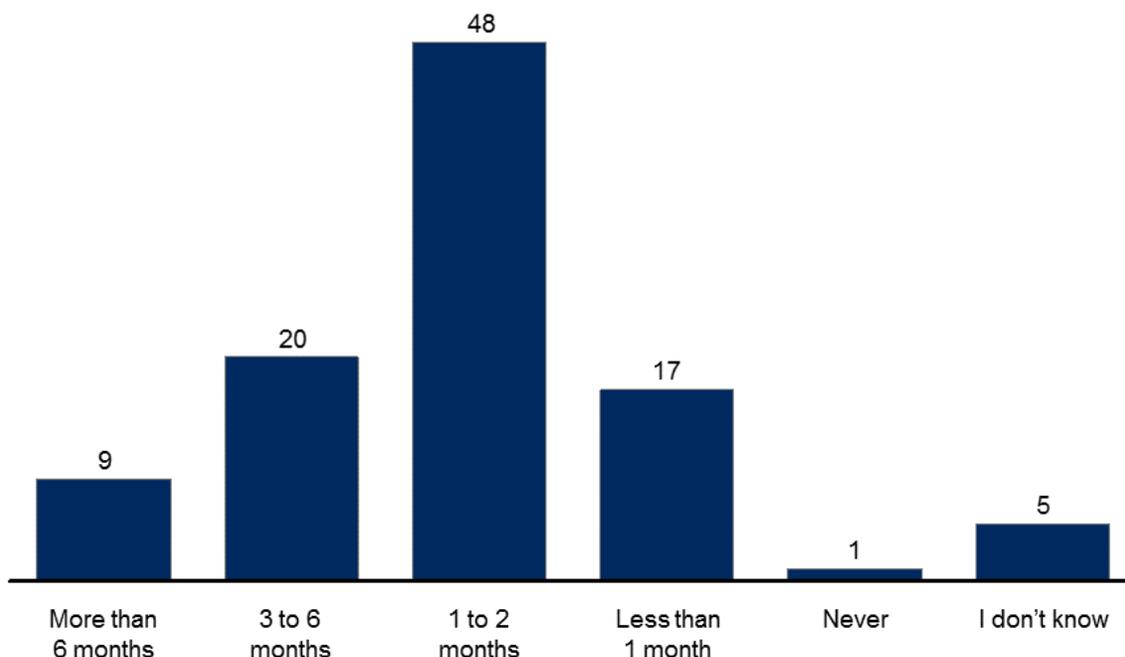
Some provider cancellation is inevitable, due to illness, deaths in the family, and other unavoidable causes. These cancellation rates do not compare favorably to industry, however, where cancellation by clinic rates within large academic medical centers have been shown to range from two to five percent (Quigley et al., 2011; Davis and Glick, 2013). Similarly, unavoidable causes of cancellation also likely would not explain the wide variation observed in the analysis. This analysis, while admittedly limited, suggests that there is considerable room for improvement and cause for management attention.

Schedulers also reported that clinic cancellations can be very inconvenient for patients, as patients may have already coordinated other appointments or transportation to coincide with the original appointment, as well as delay care: "We try to reschedule patients close to the date of their original appointment, but sometimes it's just not possible, so they may have to wait an extra week or two," reported one scheduler. Rescheduling can also significantly impact scheduler workload. For instance, at one clinic our team visited, there were two schedulers that worked full-time on rescheduling cancelled clinic appointments, many of which were reportedly cancelled by the clinic (Choice Act site visits, interviews, 2015).

Potential reasons for cancellations, according to the schedulers and administrators with whom we spoke, include misalignment of leave with scheduling (meaning that a provider takes leave during a period of time that was already scheduled with patients), poor communication of approved provider leave from clinical administrative leadership to the clinic, limited enforcement of leave policy requiring advanced notice of absences, and scheduler error.

With respect to the misalignment of leave requests with how far in advance patients can schedule care, follow-up appointments can be booked up to 90 days in advance (VHA Directive 2010-027), which often exceeds the amount of notice providers are required to give for leave requests. Required leave notice in the clinics we visited varied from 30 days to six months to "as early as possible" (Choice Act site visits, interviews, 2015). Our national survey of providers supported this finding, as can be seen in Figure 5-8.

Figure 5-8. How Far in Advance do you have to Submit Requests for Leave/Vacation?
n = 1,054 Respondents from 111 VAMCs and 173 CBOCs

How far in advance do you have to submit requests for leave / vacation?
Percent, N=1,054 respondents from 111 VAMCs and 173 CBOCs


SOURCE: VHA Employee Survey 2015

Figure 5-8 shows the required amount of notice for leave/vacation reported by providers in our national survey. Amount of required notice varies widely, with only 29 percent reporting minimum notice of at least three months. This data comes from our national survey of 1,054 providers from 111 VAMCs and 173 CBOCs. Source: Assessment E VHA employee survey, 2015.

This analysis shows that the majority of clinics (71 percent) do not require providers to submit leave requests as far out as appointments can be booked. Only 29 percent of clinics require providers to give at least three months' notice for leave and vacation. As a result, while providers may be following their specific clinics' leave policies, appointment slots may already be booked for that time period. Providers then may need to cancel and reschedule patient appointments, leading to potential patient inconvenience and scheduler rework.

Additionally, the process for communicating leave to schedulers is also inconsistent. Some clinic administrators, after receiving leave requests, ensured the providers' profiles were updated in VistA by "closing" those periods for booking. Other clinic administrators did not actually close the profile, relying instead on letting schedulers know that the requested leave slots should not be booked.

Third, the existence and enforcement of cancellation policies also varies by clinic and facility. Many facilities reported having official cancellation policies, although individuals responsible for enforcement varied. Over 87 percent of the 617 clinics across 102 VAMCs responding to our national data call reported the existence of a formal cancellation policy, with the large majority (90 percent) of these policies created at the local service or section/specialty level. Policy enforcement also reportedly varies, with 59 percent enforced by the service chief, 22 percent by the section/specialty chief, and 18 percent by other individuals (such as AOs).

While most clinics have cancellation policies in place, in our group interviews with schedulers and administrators, no groups considered leave and cancellation policy to be strictly and consistently enforced. Instead, these policies were regarded as guidelines rather than rules. As one group interview with clinic administrators summarized, "Even if there's a policy in place [against taking leave on short notice], it is just words on paper if no one enforces it. The Chief of Staff approves every single clinic cancellation request." This was echoed by providers:

- "We're supposed to get in leave requests at least 30 days ahead of time, but it's not something that's strictly enforced."
- "I think the policy technically is 30 days, but it's more of a suggestion than a rule."
- "We are supposed to provide at least 90 days' notice, but I don't think requests are denied if they're less than that. Things come up."

An in-depth analysis we performed of the profiles of nine physicians at one mental health clinic from September 2014 to February 2015 at a facility that requires leave requests to be made 90 days in advance found that cancellation rates were significantly higher on Fridays. If these cancellations were based on unavoidable events such as sickness, one would expect rates of unavoidable causes to be roughly evenly distributed throughout the week, not the high incidence of Friday cancellations. Of course, this is a small sample, and this clinic may not be representative; however, the pattern suggests an area for review. AOs report that providers with cancellation issues are usually known: "It's pretty obvious which providers are cancelling a lot of their clinics." In the manual analysis, individual cancellation rates ranged from 9 to 28 percent over a six month period. At the moment, automated and centralized monitoring of provider-level cancellation rates is not possible due to VistA system limitations.[28]

These practices can be improved, as examples in the private sector demonstrate. In our interviews with integrated systems, Geisinger and Kaiser Permanente, both systems stressed the importance of having their leave policies match with their appointment booking horizons. Geisinger Health System requires all providers to submit leave requests at least 90 days in advance, and leave policies are strictly enforced (Geisinger interview, 2015). These leave requests are appropriately and consistently blocked in the scheduling system, so schedulers do not book time by mistake. Kaiser Permanente tracks and closely monitors provider cancellation rates (for any reason) at both the provider and the clinic level (Kaiser interview, 2015).

---

[28] Cancellation rates for a particular clinic profile can be monitored, but because individual providers often have multiple profiles, these would need to be manually summed; Office of Informatics and Analytics, interviews, 2015).

5.2.5 Provider-Customized Rules and Schedule Holds can Result in Unfilled Appointment Slots and Difficulty in Rotating Schedulers

Providers can also influence their schedules by superimposing additional rules and restrictions onto their standard templates for schedulers to follow. According to interviews with schedulers and clinic administrators, providers are able to add rules for schedulers that range from clinically relevant (for example, no overbooking of particular types of Mental Health visits) to provider preference-based (like no urgent patients on Fridays). According to our data call, the large majority of clinics (71 percent) do not have formal policies in place on what types of rules are acceptable. These provider rules vary significantly between providers in the same clinic. According to group interviews with schedulers, these rules are sometimes incorporated into the profiles themselves in the form of text at the bottom of the profile, whereas others are not formally documented.

While in some cases these rules may increase convenience for the provider and staff without impacting patient access, provider fill rate can be impacted when informal, undocumented provider- and clinic-specific rules result in scheduler error. These rules can also impact schedule availability in general or for a specific patient type. "We aren't allowed scheduling urgent patients on Fridays in Dr. [omitted]'s clinic," reported one scheduler.

The existence of provider- and clinic-specific rules was commonly raised as an issue in facilities where schedulers rotated through different clinics. As also covered in Scheduler Training Section 8, schedulers reported:

- "Switching to a new clinic is like learning how to be an MSA all over again"
- "It's really hard to start in a new clinic because everything is different"
- "Sometimes we have to cover in unfamiliar clinics when someone's out [on sick leave]. You feel so clueless"
- "I'm trained to be a float and in theory should be able to cover multiple clinics, but even I have trouble keeping up with all the differences"
- "When I find out I'm in a new clinic for the day, I know I'm going to fail before I even start"

These rules can increase training requirements and limit scheduler cross-coverage of clinics. Schedulers reported that learning official national scheduling policy, although complex, is relatively straightforward compared to becoming proficient at scheduling for a particular clinic, even within the same facility. Indeed, even experienced schedulers reported difficulty working in an unfamiliar clinic due to variation in practices and provider preferences, many of which are not documented, but instead must be learned (Choice Act site visits, Interviews, 2015).

The IHI recommends that all non-essential rules be eliminated, increasing the ease and consistency with which schedulers can book appointments ("Reduce Scheduling Complexity," n.d.). Once this is done, clinics can document and/or codify remaining rules and provide schedulers with "tip sheets" to increase consistency. The removal of these restrictions, combined with other provider template design improvement and standardization, has been shown in the private sector to have significant impact. For instance, one academic medical center was able to release 10-30 percent more capacity across its clinics, without increasing the

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

41

number of providers, while also improving the ease with which schedulers can move from clinic to clinic, improving overall efficiency (Kumar et al., 2014).

VHA high-performance example: Detroit VAMC
Detroit VAMC is a facility that has taken the initiative to increase availability through the codification and removal of scheduling restrictions that may have limited access. According to an administrator in Detroit, previously "we couldn't pull in a scheduler [into an unfamiliar clinic] because they didn't understand the [scheduling] grid." To address this issue, this facility requires all clinics to codify any rules specific to the clinic in the VistA profiles and also to eliminate unnecessary schedule restrictions. Now schedulers can work in any clinic,[29] improving the administrator's ability to "flex" schedulers to cover unfamiliar clinics when necessary and reducing scheduler error rates (Choice Act Site visits, interviews, 2015).

5.2.6 There is no Chain of Accountability/Ownership in Understanding and Managing Provider Availability and Schedule Design

There is no clear-cut chain of responsibility for who should monitor the areas mentioned above at the facility level. According to site visits and VHA interviews, formal monitoring of schedules is not a clearly-defined duty for anyone at the facility level and the responsibility of schedule set-up can fall to clinic administrators, AO and others, depending on the facility and organization of the clinical service/clinics. However, on monitoring time in clinic specifically, clinic administrators, nurse managers, and providers at 90 percent[30] of on-site visits reported that provider presence in clinic was observed, which could help monitor outlier behavior. Unless providers are missing significant clinic time, though, in the form of large blocks at a time, this type of monitoring may not be sensitive enough to identify gaps.

One additional reason for the general lack of monitoring and accountability is that all aspects of provider schedule management, including setting up profiles, monitoring profile changes, and monitoring overall time in clinic, are largely manual and too time-consuming for managers to do given their other clinic responsibilities. At present, there is no easy or automated way to consistently and accurately monitor provider schedules. Beyond the administrators, thirty-two percent of providers interviewed[31] reported that the creation, maintenance, and appointment booking components of VHA's scheduling system represent a significant challenge to their daily operations. Within this group, two major issues included:

- 42 percent identified VistA's inflexibility and long lead time to modify profiles

---

[29] All schedulers within this facility report to ward administration, which falls under newly created Chief of Clinical Operations

[30] Site visit provider interviews, N=44 of 48 respondents; site visit clinic administrators, N=37 of 42 respondents. Question was moved to Clinic Administrator interview guide mid-way through assessment due to Provider interview guide length concerns

[31] Site visit provider interviews, N=90 asked this question

---

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

- 26 percent reported difficulty in understanding their schedules due to multiple profiles

As a result of these issues, many providers have come to see scheduling within VHA as a barrier rather than a tool to improve clinic workflows. According to one provider, "I have no flexibility in my schedule, because the profiles can't be easily changed. If I want to work longer one day or come in early, I have to go through a weeks- or months-long process. It's a huge pain. In private practice, I could just flip a switch."

The Choice Act Section 303 identified the need for "a role-specific clinic management training program to provide in-person, standardized education on systems and processes for health care practice management and scheduling to all appropriate employees." ("Veterans," 2014). The goal of the training program is to assign management of access responsibilities to a particular role within each clinic and to provide tools and processes to help perform this duty (EES, interviews, 2015). As detailed in section 5.3's review of ongoing VHA initiatives, the scope of this role is ambitious and includes many areas of clinic management. Our site visit interviews, however, raised concerns that simply adding these duties to an existing position may prove problematic due to lack of currently available tools and time. As one AO put it, "We keep getting more and more things added to our plates, but nothing ever gets taken away" (Choice Act site visits, interviews, 2015).

5.3   Recommendations

The implication of the above findings is that current VHA providers may not be offering as many available appointment slots as they could be relative to their expected in-clinic time. Several providers in our site visit interviews suggested that one of the benefits of being within VHA was that the pressure to meet patient volume targets was more limited than what they had seen in the private sector. They also believed that this results in higher quality care as more time can theoretically be spent with each individual patient (Choice Act site visit interviews, 2015). Nevertheless, the trade-off in spending additional time with one patient is less time spent with another patient, which could affect the rate at which a clinic works down its backlog of new patients. In addition, if time is not being made available for patients in the first place due to schedule design, certain VHA providers may not be treating as many patients as they should be based on the allocation of their cFTE time to the clinic. (See Assessment G for a comparison of provider productivity and encounter volume for VHA versus industry benchmarks).

Few reports on VHA have explicitly addressed provider availability. A 2008 independent report recommended that VHA and its facilities should monitor provider productivity more closely. A 2012 OIG report similarly recommended that primary care panel sizes should be reviewed and closely maintained to ensure adequate provider workload ("Review of Veterans' Access," 2012). However, previous reports have not made specific recommendations on understanding and managing the full capacity of the clinics, including monitoring provider time in clinic, profile or template creation, or provider- or clinic-specific rules and schedule restrictions. (For a detailed review of these reports, see Appendix C.2.)

According to interviews with VHA leadership, a number of initiatives are underway to address some of the challenges presented above. These include:

- Efforts to improve the accountability and the training of clinic practice managers who would have responsibility for some of the activities mentioned in the Findings, including:

  o **Development of a clinic practice management model:** VHA is in the process of developing a standardized clinic practice management model for primary care, medical specialty care, surgical specialty care and mental health. According to several individuals leading this effort, the model will detail management practices, ownership, tools, and processes. The predicted scope of management is quite ambitious, covering data validation (for example, across sources such as the Clinic Access Index, Clinic Utilization Statistical Summary (CUSS), VSSC), patient experience (for example, Survey of Healthcare Experience of Patients (SHEP) monitoring), capacity management (such as provider profiles and contingency planning), backlog management (for example, EWL, consults), productivity (such as panel sizes), and clinic flow/throughput (for example, staffing, space, IT, equipment). As of the writing of this report, initiative leaders are sharing prototypes of the practice model, including expected tools and role ownership, with individual facilities for feedback, so the extent to which the above responsibilities will be included in the model is not confirmed. Importantly, these activities are planned to be carried out without any new facility hires; instead, currently existing FTEs will be designated as owners of these responsibilities at the clinic- and facility-level (ACAP, interviews, 2015).

  o **Creation of a national clinic manager training program:** Parallel to the development of the clinic practice management model, VHA is designing a national training program for individuals with clinic management responsibilities. This training will include a list of expected duties for each role as well as recommended processes and tools. This is a multi-stage initiative required by the Choice Act Section 303 that will be rolled out over the next two years, with an expected completion date of February 2017.

- Efforts to improve visibility of supply, including:

  o **Provider profile clean up and standardization via the Scheduling Clinic Standards (SCS) work group:** This 2015 internal, multi-disciplinary work group proposed VHA-wide streamlining and standardization of clinic profiles and labor mapping ("Scheduling Clinic Standards," 2015); the establishment of specialty-wide appointment lengths for different appointment types; and a nationally-standardized vacation and clinic cancellation process. The report does not address session length or monitoring clinic time in detail. Its recommendations have been submitted to relevant VHA program offices, and the Interim Under Secretary for Health stated in June 2015 that "clinic profile standardization is under way at every site" (Clancy, 2015). Some VISNs have begun facility-level review of clinic profiles on a regular basis to reduce overlapping clinic profiles and eliminate any unused profiles (OPES, interviews, 2015; ACAP, interviews, 2015). However, this is not required by Central Office.

  o **Stop Code Council revision of stop codes:** Stop codes increase the number of profiles under which a provider might operate. An ongoing, multi-disciplinary group meets at least once a year to review stop code use, publish standard operating procedures and

eliminate unused codes (Brandenberg, et al., 2015). Over the last ten years, the number of stop codes has been reduced from over 500 to about 360.

- o **VistA Scheduling System improvements:** As discussed in detail in the Scheduling System Section 7, VistA Scheduling Enhancements (VSE) and mobile applications are two near-term scheduling improvement programs that will address some of the software ease of use issues, including the lack of a "single screen" view of a provider's schedule and multiple unintegrated waitlists. However, these solutions cannot provide aggregate and provider-level appointment supply relative to demand due to system design choices. VHA is exploring potential replacement of the current VistA Scheduling System through the Medical Appointment Scheduling System (MASS) request for proposal, which is covered in detail in the Scheduling System Section 7.

- **Efforts to increase scheduling standardization via the Primary Care profile standardization directive:** The 2015 "Primary Care Clinic Profile Standardization Guide," which was officially released after our site visits had concluded, establishes: VHA-wide standard appointment lengths (30 minutes for established patients, 60 minutes for new patients); requirement of same-day appointment slots; maximum number of clinic profiles; and use of recall and of EWL (Prentice, "Appointment Age," 2015). This directive does not address management of delinquent recall list, clinic cancellation monitoring, or recommended appointment mix. According to ACAP leadership, local facilities generally seem to be aware of and abiding by national PC guidelines on profile standardization. Other services, including surgery, are evaluating whether to develop similar appointment length recommendations at the specialty level.

If successful, these initiatives would result in more standardized appointment schedules and thus better scheduling and monitoring capabilities. Potential gaps may include:

Implementation gaps: The eventual impact of these initiatives depends on multiple factors. One potential implementation gap identified for the clinic practice management model is resourcing. Currently, despite the wide scope of access-critical responsibilities assigned to the new clinic manager roles, there is a risk that no additional individuals will be hired, and instead these responsibilities will be designated to potentially already overextended individuals, according to interviews with VHA personnel (ACAP, interviews, 2015). This lack of sufficient dedicated time may make clinic management practices difficult to implement. Similarly, without standard processes and tools to enable management across this broad scope of activities, managers may struggle to consistently implement practices. With respect to accurately addressing provider supply, the initiatives aiming to standardize profiles depend on facility leadership and sufficient local facility IT support to manage profile clean-up, two success factors that we did not assess. With respect to provider cancellations, while the SCS work group has recommended nationally-standardized leave and clinic cancellation policies, there may be risk that these recommendations will not be adopted ("Scheduling Clinic Standards," 2015).

Scope gaps: While these initiatives will likely result in more streamlined schedules and more accurate aggregate reporting, there is a risk that several issues may not be addressed. First,

cleaning up existing profiles does not address the root causes of multiple profiles, specifically the underlying system design constraints that have resulted in the proliferation of clinic profiles and limit the ability to account for and manage appointment supply. Until there is a one-to-one schedule to each provider, data reliability will continue to be an issue. If and when MASS is implemented successfully, VHA will be on a path to addressing this. Other issues that may not be addressed by current initiatives are further standardization of booking templates and greater focus on managing clinic cancellations. On standardizing templates, for example, only primary care has moved systematically to establish guidelines related to profile design/set-up.

Given the status of these initiatives and the important gaps mentioned above, VHA should consider the following recommendations:

5.3.1 In the Short-Term, Complete the Clinic Profile Cleanup Initiative to Improve Understanding of Appointment Supply

This would be a first step to addressing the issue of the limited visibility that VHA has into supply as discussed in the first finding of this section. This effort could:

- **Identify provider and administrative champions at each VAMC to oversee clinic profile cleanup efforts:** VHA should identify owners of clinic profile clean-up for each clinical area and allow dedicated time to facilitate these processes. Facilities also should ensure appropriate staffing is in place to accommodate profile modification requests.
- **Require all services to perform clinic profile cleanups across all facilities:** VHA should provide national guidance on appropriate stop code use and clinic profile setup for each specialty to ensure standardization within specialties, as Primary Care has provided in its clinic profile standardization guide. VHA should mandate completion within three to six months, which is consistent with Primary Care's three-month implementation timeline. Virtual auditing should be managed by the central office to ensure compliance

5.3.2 In the Longer Term, Transition to a System Design That Allows Accurate Viewing of Provider Supply

The several ongoing profile clean-up initiatives, while improving the accuracy and reliability of appointment supply and utilization monitoring in the short term, will not necessarily eliminate the potential for overlapping profiles. The existence of potential overlap therefore limits the transparency of scheduling performance and the potential to view overall appointment availability. With VA OI&T's current procurement of a new scheduling system, VHA may be on the path to do this. Scheduling System Section 7 describes the recommendations for successful implementation of a new system in detail.

5.3.3 Develop an Appointment Demand Model to Supplement the Ability to Monitor and Forecast Aggregate Supply

VHA's facility and clinic-level understanding of demand is predominantly retrospective. As such, it is difficult to identify and plan for short- and long-term supply-demand mismatches. By

---

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

46

improving appointment supply monitoring (as mentioned in recommendations 5.3.1 and 5.3.2) and also creating an appointment demand model, VHA will be better able to manage access holistically. The model should incorporate historical demand data as well as projected population changes to enable forecasting of hourly, daily, and weekly appointment demand at the clinic level. The historical demand data required for this tool are likely already available within the VSSC system, which houses pending appointment information, and the Corporate Data Warehouse, which contains clinic-level utilization by date, time, season, and other factors, along with other sources. The key success factors for this model will be making sure it is flexible and able to be improved upon over time as well as ensuring it is quick and user-friendly to operate on a regular (even daily) basis at the clinic level. This recommendation, in concert with improved supply visibility, will enable more dynamic access management and planning.

5.3.4 Consider National Sub-Specialty-Specific Standards/Guidance on Session/Appointment Length and Develop VHA-Wide Policies for Provider Leave and Cancellations

As mentioned above, the national Primary Care program office has taken a more active role in establishing VHA-wide standards for appointment lengths, same-day appointment slots, maximum number of clinic profiles, and use of recall and of EWL (Prentice, "Appointment Age," 2015). We would consider the standards for appointment lengths to be one element of a standard booking template. However, this directive does not address several other management practices (like clinic cancellation monitoring and appointment mix determination) or address elements of a standard booking template for specialty care.

VHA should expand upon efforts within Primary Care by providing specialty and sub-specialty-specific standards for booking templates. This effort could:

- **Develop provider template standards for each specialty and sub-specialty:** VHA should provide sub-specialty national guidance on clinic session length per clinical FTE allocation and appointment lengths for different types of patients. Recommendations on appointment length should include consideration of clinical workflow factors (such as clinical and non-clinical support staff, exam rooms, equipment, provider tenure) that may vary by provider and clinic. VHA should also provide guidance on developing appropriate appointment mix and adjusting mix to match local demand. These recommendations should standardize and improve clinic operations, resulting in better throughput, increased provider availability for patients, and improved process accountability.

- **Develop system-wide policies on provider leave and cancellations:** A system-wide leave policy should require providers to submit leave requests that match the appointment booking horizon for both new and established patients. VHA also should introduce standard operating procedures to ensure vacation/leave requests are reflected in the scheduling system and that communication practices are standardized across clinics and facilities. VHA should establish national targets for cancellation rates by clinic type and track performance against this target at a provider-level. This recommendation should result in a reduced rate of cancellations by clinics, which likely will improve patient satisfaction and reduce the amount of scheduler time spent on rework.

5.3.5 Appropriately Scope, Resource, and Implement the Clinic Manager Program to Ensure That Provider Availability is Actively Managed

- **Prioritize monitoring and managing of provider time within new clinic manager role:** VAMCs should utilize new clinic manager positions at facility- and clinic-level to monitor provider time in clinic and include the monitoring of provider clinic time in group practice manager and clinic access manager responsibility expectations. In the short term, clinic managers should manually compare time available across clinic profiles to assigned time in clinic on at least a quarterly basis and whenever a provider requests a template profile change. In parallel, profiles should be consolidated into one view to enable the monitoring of true provider supply and fill rate, as well as to reduce scheduler workload and error rate. It is important that VHA consider approving and funding additional hires to fulfill clinic management responsibilities, as the expected scope of activity outlined in the clinic management model initiative is both ambitious and necessary to improve scheduling and access more broadly. As an example, Kaiser Permanente and Cleveland Clinic both have dedicated consulting resources, informatics, and analytics resources to assist with execution of similar access management tasks (Kaiser interview, 2015; Cleveland Clinic interview, 2015). By implementing the above recommendations, VHA likely would achieve improved provider availability and increased patient access to care.

- **Continue to develop and distribute key tools and processes to enable more consistent management:** These might include operating procedures; standard tools for facility- and clinic-level performance management;[32] and comparative analyses of metrics like utilization rate, appointment length and appointment mix ratio.

---

[32] Many of these tools and processes are referenced in draft GPM and clinic manager training curriculum materials ("CPM Curriculum," 2015).

---

6 Scheduling Process

6.1 Context & Approach

Appointment scheduling at VHA facilities involves a number of interrelated policies, processes, performance measures and accountabilities that together can influence when a Veteran receives care and the Veteran's experience as he or she navigates the system. Many of the processes described in this section outside of the core function of scheduling are unique to VHA, both by virtue of it being an integrated system and a government organization with public reporting responsibilities.

A number of these VHA-specific policies exist at the national and local level and are aimed at gaining transparency into unmet demand and managing backlogs. These policies range from the 2010 Scheduling Directive and its recent clarification memo, which primarily articulate policies for capturing information to assess wait times and for using new patient wait lists (often referred to as the Electronic Wait List or EWL) to facility and clinical specialty-level service agreements that determine how primary care and the consulting specialty will manage patients when needs for specific specialty services arise (called the "consult" process) to the use of the Veteran's Choice List, which is utilized when patients are deemed eligible and are waiting to be scheduled for care outside VHA when access to a particular service or specialty is not available ("Veterans," 2014).

To understand wait times for care, VHA has generally used one of two measures:

1. If the patient is new to the clinic, then the wait time is calculated as the difference in days between the creation date of the appointment in the VistA system and the day of the appointment.

2. For an established patient, policy states that the wait time is equal to the difference in days between the patient's "desired date" for the appointment and the date of the actual appointment. The scheduler is responsible for inquiring about and entering the patient's desired date into the system.[33]

VHA has recently introduced two new wait time measures:

1. Preferred date, which is described as the "date the patient prefers to come in for his appointment"

2. Clinically-indicated date (CID), which is described as the "date the provider and the patient agree upon for a follow-up visit" ("Clarification" Webinar, 2015).

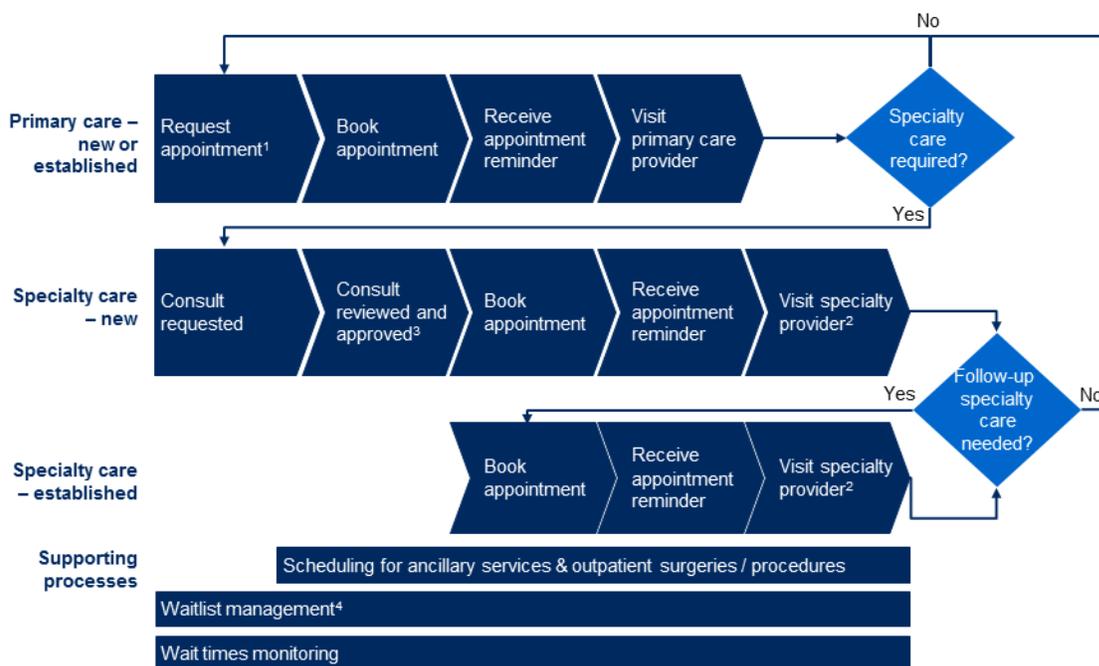
In addition to national, facility and clinical service-level scheduling policies, VHA requires clinics to use additional scheduling practices such as the recall system, which allows patients to defer booking a follow-up appointment until closer to the date in which they are to be seen (commonly seen in primary care and dental scheduling in the private sector when patients

---

[33] See Appendix D-1 for more information

receive a reminder to schedule an annual visit). For additional background on the VHA scheduling process, see Appendix D.1.

The Choice Act specifically identifies the need to assess the workflow for scheduling appointments as well as potential changes to the monitoring/assessment of wait times that VHA uses. Therefore, this section covers the end-to-end scheduling process and related policies for new and existing patients as well as related processes that disproportionately impact scheduling, for example, the consult process. Our review included the areas highlighted in (Figure 6-1).

Figure 6-1. Overview of VHA Scheduling Process


1 Assumes Veteran determined eligible
2 This step includes scheduled specialty care (visits, procedures, surgeries) as well as ancillary care (radiology, labs)
3 Request must be approved for patient to see specialist
4 Waitlists are used for new patients and certain established patients

Figure 6-1 shows the typical patient journey along with supporting processes. This flow generally applies to both new and established patients. However, patients may not need to start at the very beginning of process if they are already established with a particular clinic. Source: Choice Act site visits, interviews, 2015.

To understand these processes, we used a variety of data sources in addition to our site visits to 25 VAMCs and 23 CBOCs, interviews, and research to codify best and private sector practices. These sources and analysis included:

- Analysis of CDW appointment-level data from 152 VAMCs and 811 CBOCs, including 5,644 total clinics for a seven-month period in 2014, including information on appointment cancellations, missed opportunities and overbooking
- Clinic Access Index data for the 25 VAMCs that were visited as part of this assessment's site visits, including metrics such as clinic cancellations
- A survey of Medical Support Assistant (MSA), the primary scheduler role, supervisors (N=86) covering use of patient reminders
- Review of locally stored consult status and time statistics data from three VAMCs for a six month-period of 2014, including completion rate and processing time
- Manual review of provider schedules (often referred to as grids, profiles or templates), and assessment of time in-clinic for two specialties, 15 physicians and 12 profiles over six months in 2014 and 2015
- Analysis of MSA turnover and staffing data from 2014 and 2015, including current vacancies across all facilities as of March 2015, from VHA Healthcare Talent Management Office

6.2 Findings

6.2.1 Schedulers' Ability to Efficiently Identify and Book Available Appointments is Limited by System Usability

As described in Provider Availability Section 5, the VistA Scheduling System was designed to capture provider workload across multiple clinic profiles, and does not optimize for scheduler usability. Specifically, schedulers are not able to search across multiple profiles or weeks for available slots without "rolling and scrolling" through multiple screens as they can only see a week of availability in one profile at a time. Figure 6-2 shows screenshots from the VistA Scheduling System of an example set of profiles for one provider that a scheduler would have to review to book an appointment.

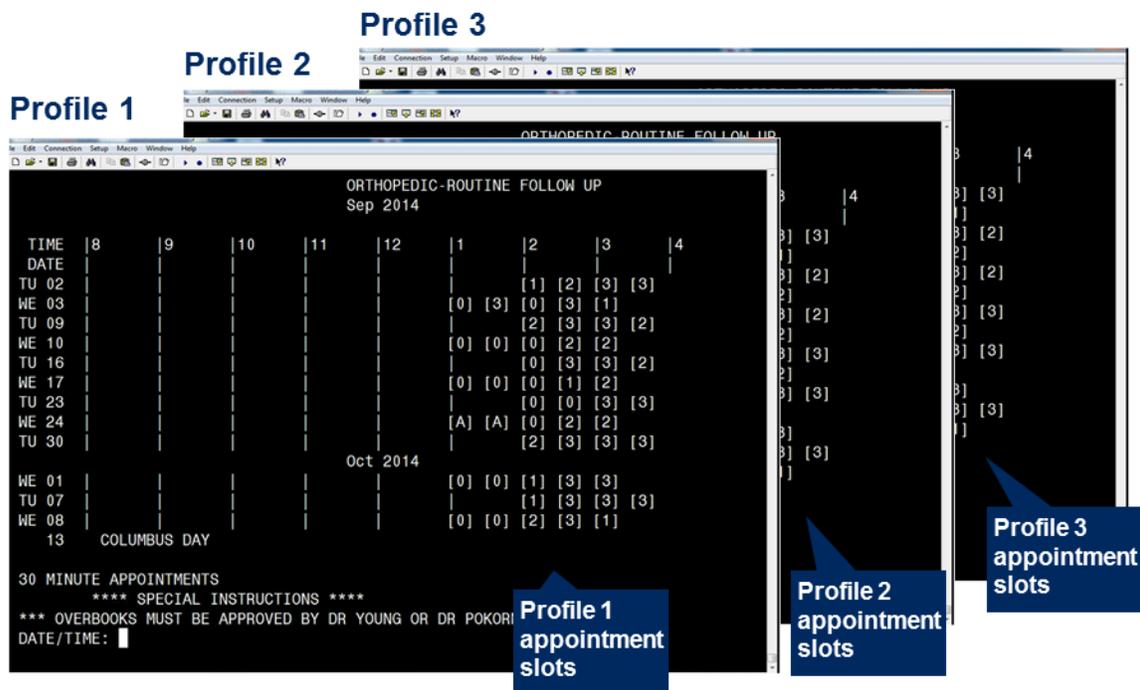
Figure 6-2. Screenshots from VistA Scheduling System


Figure 6-2 shows a screenshot from within VistA Scheduling of a set of clinic profiles for one provider. This exhibit demonstrates that a provider's schedule may be spread across multiple, separate clinic profiles. Schedulers may need to look through each of these profiles (in this example, four different profiles) to find an available appointment. Each hour is across the top and each date over an 11-day period is down the left side. Key: 0 = filled slot; 1 = open slot; 2 = 2 open slots; 3 = 3 open slots. A = single overbook. Source: ACAP office webinar ("Making Appt v2_7-23-2014 1.51.07pm," accessed June 25, 2015).

A large majority (74 percent) of scheduler group interviews[34] identified scheduling system usability as a key issue that impacts their daily lives. Thirty-nine percent of scheduler group interviews[35] specifically identified the lack of a "single screen" view of a provider's schedule as particularly cumbersome. As one scheduler described, "I have to look through three or four profiles to try to find an open appointment slot, which means it takes three or four times as long [as other systems] to book an appointment." The current system can also result in issues such as missing an available appointment slot to offer. "Sometimes there might be an open appointment slot, but if you don't know where to look for it [within multiple profiles], you can

---

[34] Site visit scheduler group interviews, N=17 of 23 VAMCs

[35] Site visit scheduler group interviews, N=9 of 23 VAMCs

---

easily miss it. Then that slot may go unused," reported one scheduler. Finally, the lack of an entire view of a provider's schedule in one screen potentially inhibits a scheduler's ability to effectively implement booking strategy (such as overbooking).

Beyond standard appointment booking, schedulers may need to schedule additional services that add to the number of profiles with which they must be familiar. For example, schedulers are able to schedule into any profile to which they have access, which may include, for example, radiology or procedures for schedulers who support a procedural provider specialty. Schedulers, as a service to patients, may also attempt to coordinate different types of appointments with services or providers whose schedules they may not be able to access. This coordination is often important given that a third of VHA patients have at least three chronic conditions, and 22 percent have four or more (Yoon et al., 2011). According to one scheduler, "many of our patients have a lot of appointments, and it's really difficult for us to line them all up on the same day, much less in the same couple hour window" (Choice Act site visits, interviews, 2015).

Coordinating appointments can be logistically challenging for those schedulers. Even with access to the schedules, schedulers would, for example, need to check multiple profiles from providers across two or more clinics for available appointments on the same morning or afternoon. "I have to look at four or five profiles to check when primary care is available, and then I have to look at just as many for podiatry. Then I have to call down to radiology to make sure they have availability, because I can't see their [system]. It's a mess," according to one (Choice Act site visits, interviews, 2015). This issue is further compounded in access-limited clinics as available appointment slots can be scarce and take longer to find in the system.

According to 10 private health system executives with insight into scheduling systems interviewed as part of this assessment, very few scheduling systems in the U.S. are this difficult to search. The ultimate impact of these VHA-specific limitations is that the system is not user friendly, potentially resulting in less efficient booking of appointments and patients receiving sub-optimal appointment dates/times.

6.2.2 Numerous Policies And Processes Designed to Manage Appointment Supply/Demand Imbalance Increase Complexity for Schedulers and Result in Inconsistent Patient Experience

To ensure transparency into patient access and demand management, VHA has developed a number unique processes not typically present in the broader industry's approach to scheduling. These unique processes include a series of patient wait lists as well as scheduler-driven capture of wait times, which are designed to give VHA and other organizations visibility into VHA facilities' management of wait times and backlogs. Another unique process is the consult process, which is intended to help manage the demand for specialist appointments by ensuring that only appropriately referred patients take up scarce appointment supply.

To embed the wait list and wait time management steps in the scheduling process, VHA developed a national scheduling policy to which facilities are required to adhere. The policy focuses on providing guidance for how to collect data in a standardized, reliable fashion to

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

53

enable facilities and VHA more broadly to monitor and compare performance internally as well as report it externally. Nearly 40 percent of the most recent directive focuses on data capture; these sections focus on either definitions of care (27 sections) or desired date capture instruction (13 sections) (VHA Directive 2010-027). In addition, the definitions, purpose, and eligibility of the EWL and other VHA-specific lists (such as recall) are described. These wait lists are detailed in Appendix Table D-1.

6.2.2.1 Waitlist Policies, While Necessary to Understand Demand Backlog, Complicate the Scheduling Process Without Sufficient Implementation Guidance

When national policy is disseminated, the field receives limited guidance and support for operationalizing, according to our site visit interviews. Administrators at 14 VAMCs[36] we visited cited lack of implementation support as a major challenge to adhering to new policies. The use of the EWL was an often-cited example of a challenging policy to manage, especially for clinics with significant provider capacity issues as the wait list is most administratively burdensome in these environments due to its length. Specifically, the EWL is the "official VHA wait list" and catalogues all patients who are new[37] to a clinic but have appointments scheduled beyond 90 days (VHA Directive 2010-027). The length of this wait list often is used as a measure of backlog and provides VHA with comparable data across facilities and clinics. The Scheduling Directive provides guidance on:

- **Adding patients to the wait list**: New patients who "cannot be scheduled in target timeframes" should be added to the EWL."

- **Reviewing the wait list:** "Schedulers in all clinics at all locations (substations) must review the EWL daily to determine if newly enrolled or newly registered patients are requesting care in their clinic at their location."

- **Removing patients from the wait list:** "When appointments become available and the facility has at least three days to give patients notice, scheduling personnel [must] offer appointments to patients who are either on the EWL waiting for appointments, or currently have appointments more than 30 days past the desired dates of care."

- **Prioritization:** When "Veterans are removed from the EWL…Veterans who are [service connected (SC)[38]] 50 percent or greater, or Veterans less than 50 percent SC requiring care for a SC disability must be given priority over other Veterans."

However, to implement this policy effectively, administrators must be able to interpret it correctly and train schedulers to:

1. Determine when to put a patient on the EWL

---

[36] Site visit scheduling administrative leader interviews, N=14 of 24 VAMCs

[37] Per the 2010 scheduling directive, any patient not seen by a qualifying provider type within a defined stop code or stop code group at that facility, within the past 24 months

[38] Refers to "injuries or diseases that happened while on active duty, or made worse by active military service" ("Disability Compensation," 2015)

---

2. Access the EWL, in a separate program linked to VistA Scheduling, and use the EWL as a call list for patients to contact if a slot were to become available

3. Prioritize the use of EWL in light of other clinic duties (such as making appointment reminder calls)

Interviews suggested that the dissemination of tools to support administrators in doing the above was limited and left to VISNs or individual facilities to develop for their clinics. One facility, for example, designed its own aggregated dashboard for wait lists so that administrators could more effectively monitor their use. Others created step-by-step handbooks to guide schedulers through the mechanics of adding patients to the wait list programs.

Despite these local efforts at many facilities, we observed that the wait list was not used consistently or according to policy across clinics. Examples of this included:

- **Example A**: In these clinics, schedulers were encouraged to add any eligible patients to the wait list. However, the clinic would not necessarily consistently manage the list. Instead, the list was primarily used to document potential backlogs to the facility, VISN, and national leadership. This was reportedly due to a number of factors, including lack of time and limited instruction for how and when to remove patients from the list. As a result, patients on the EWL may not have been seen in as timely a manner as they could have been if the list were actively managed against open slots.

- **Example B**: Within this scenario, schedulers, like in type A, added eligible patients to the EWL, consistent with national policy. However, in addition to using the list as a measurement of backlog, it also served as a source of patients to be fit into newly available appointment slots. For instance, when an appointment became available with at least three days into the future, schedulers called patients from the EWL to ask if they wanted to move up to an earlier appointment time.

- **Example C**: In this implementation form, schedulers used the list as a measurement of backlog (like in A and B) and as a way to get patients with long waits in sooner (like in B). However, in this scenario, schedulers also prioritized patients based on policy guidance (giving preference with higher service connection) as well as other factors such as the number of contacts already made.

While difficult to understand the individual patient impact from these examples, it was clear that patients were not necessarily being treated consistently across facilities. This variability may result in patients with extended wait times not receiving an opportunity to be seen earlier, resulting in potentially worse patient outcomes and decreased patient satisfaction.

Another example of policy that the field has found challenging to manage is the Veterans Choice Program and accompanying Veterans Choice List (VCL). The Choice Program, which was rolled out in late 2014 under a compressed time frame, was designed to enable patients who have longer than 30 day wait times or live greater than 40 miles from a VA facility to seek care outside VA ("Veterans," 2014). According to VHA leadership, the pace at which the program was rolled out prevented complete implementation planning before engaging patients and the field (ACAP, interview, 2015). From the perspective of leaders of non-VA care offices at the sites

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

55

we visited, the implementation of this program was largely left to individual facilities (Choice site visits, interviews, 2015). In addition, in our discussions:

- Seventy-one percent of non-VA care office interviews[39] cited Choice Act implementation challenges and 62 percent[40] cited the additional administrative burden/processes as a major challenge
- Seventeen percent of scheduler group interviews[41] and 43 percent of clinical administrator group interviews[42] cited "Choice" or "VCL" as challenges

"We didn't get any guidance or time to plan. We were just told, 'Go do it,'" reported one HAS administrator. Individuals from multiple roles across sites reported that while a lack of tools were an issue, the lack of clear operational planning was even more problematic. "[The Choice Program] process makes no sense. They didn't think through how it would actually work at the facilities. Now we're left to pick up the pieces," explained a surgical service AO. The ultimate result of these issues has been variable implementation. Facilities have developed different processes for identifying eligible patients for Choice, handing thee patients off from clinics to Choice Program administrators, reviewing and approving requests, contacting Veterans and non-VA providers to create the appointment, ensuring patients keep their non-VA appointments, and documenting the results of their visits. Creating these process flows locally has likely resulted in differences in patient experience and also frustration and confusion for VHA employees. One scheduler summarized the impact to the patient, "Veterans are confused and frustrated because we're confused and frustrated" (Choice Act site visits, interviews, 2015).

6.2.2.2 VHA's Consult Processes May Delay Scheduling and Affect Timeliness of Care

At 76 percent of facilities, chiefs of staff[43] identified the consult process (when one provider requests care for a patient from another provider) as a challenge for both primary care and specialty providers (Choice site visits, interviews, 2015). While national policy mandates that consult requests be reviewed within seven days of receipt (VHA Directive 2008-056), as of the writing of this report, the consult standard operating procedures (SOPs) remain in draft. VHA has embarked on an extensive training campaign for consults ("VHA Consult"; "VISN," 2015). However, these efforts may not have been fully reflected on our site visits or data analysis, which suggested that the consult review process varies by facility in terms of frequency, type of reviewer, method of communication, and likelihood that patients are accepted by the consulting service. Figure 6-3 shows consult times for 19 of the top 20 stop codes at two large urban facilities in the second half of 2014 by the average number of days between the consult being generated and the appointment for the service being scheduled.

Figure 6-3. Time From Consult Submission to Appointment Creation for two VAMCs

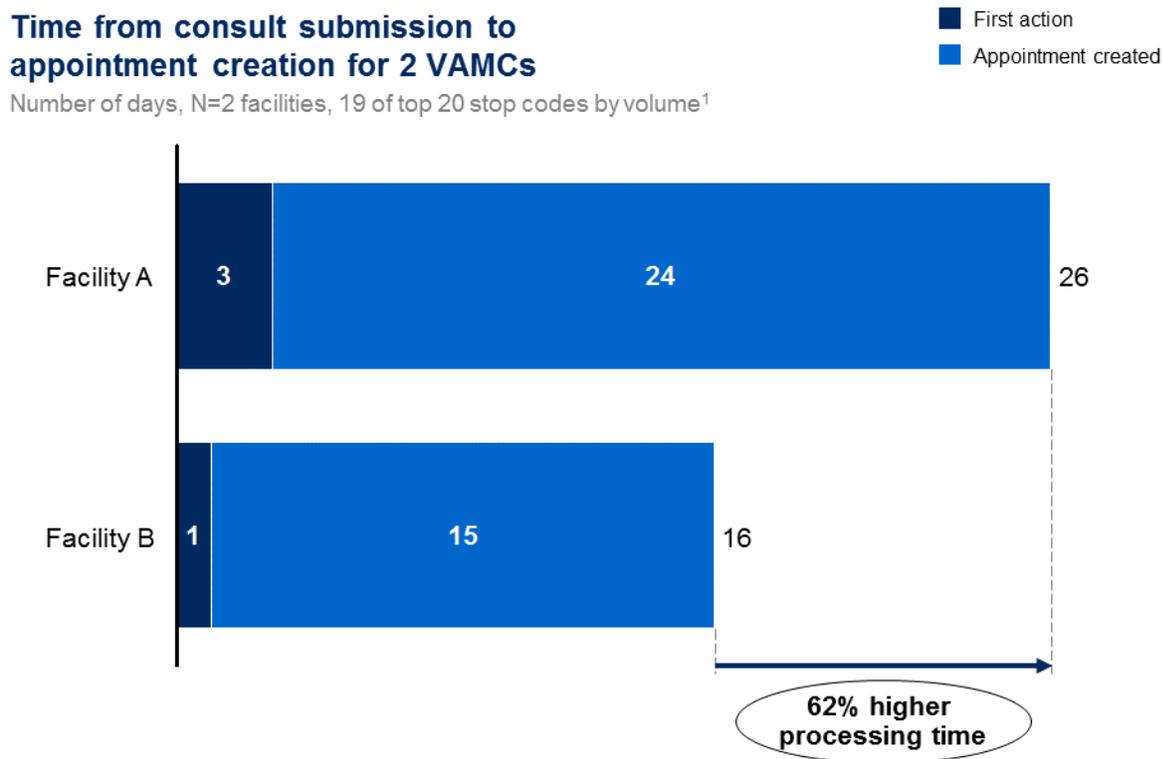
Time from consult submission to appointment creation for 2 VAMCs

Number of days, N=2 facilities, 19 of top 20 stop codes by volume[1]

Legend: First action, Appointment created

Facility A: 3 | 24 | 26

Facility B: 1 | 15 | 16

62% higher processing time


1 One facility only submitted 19 stop codes, so only these stop codes were compared across facilities
2 Includes stop codes: 203: Audiology; 205: Physical Therapy; 304: Dermatology; 305: Endo/Metab (Except Diabetes); 307: Gastroenterology; 312: Pulmonary/Chest; 313: Renal/Nephrol (Except Dialysis); 314: Rheumatology; 315: Neurology; 316: Oncology/Tumor; 321: GI Endoscopy; 349: Sleep Medicine; 403: ENT; 407: Ophthalmology; 408: Optometry; 409: Orthopedics; 411: Podiatry; 414: Urology; 420: Pain Clinic

Figure 6-3 shows average number of days until an appointment is scheduled for each step of the process for two facilities across the top 20 stop codes by consult volume. This analysis shows that the consult approval and appointment creation process takes 62 percent longer (26 days vs. 16 days) for Facility A than B. This data was compiled based on facilities' locally stored consult data metrics and represents six months of consult data from two large, urban, high complexity facilities. This time period was chosen because new business rules went into effect in June 2014. Source: Local VAMC data, 2014.

The results show that Facility A has significantly longer processing and scheduling times than Facility B. The approval and appointment creation process takes 62 percent longer (26 days vs. 16 days) in Facility A than Facility B. By simply decreasing the consult processing time to the level of Facility B's, Facility A could reduce consult wait time by 10 days.

A separate analysis of consult completion rates was performed across two large urban high complexity facilities. Interestingly, while the facilities frequently had widely different completion rates within the same specialties, neither facility consistently fared better than the other. For instance, within Optometry 95 percent of one facility's consults were completed compared to 54 percent of the other's; for the Pain Clinic, the range was similarly wide (83 percent vs. 31 percent), only this time the relationship was reversed in terms of which facility had the higher success rate. Numerous factors may be affecting these success rates. For

instance, consults may show as incomplete even if the Veteran was seen because the clinic note was not linked to the consult. Similarly, Veterans may decide they do not want to see the specialist and so never make an appointment. Providers in this situation may be reluctant to cancel the consult to protect the patient's ability to see the specialist in the future. Despite these limitations, if providers were operating consistently across facilities in terms of consult request, review, and closing of consult, then same-specialty completion rates would be expected to be similar, which they are not for at least this limited sample.

The variable time and completion performance across facilities could delay care for Veterans. This inconsistency is likely driven in part by a lack of finalized consult SOPs, as mentioned previously, as well as variable existence of well-designed care coordination agreements. These agreements between referring and receiving clinics, which specify what the consulting services will receive and/or what information they might require in order to do so, are created at the local level ("VHA Consult," 2008). Our interviews with providers suggest that comprehensive care coordination agreements can mitigate some of the review challenges as each specialty has to set forth and agree with its referring providers what constitutes a consult requiring an appointment. According to providers interviewed, the lack of a well-structured agreement between a primary care physician and a specialist may result in submitting the wrong kind of request to the specialist, improper work-ups (for example, insufficient testing done), and/or denial of a consult that requires an appointment, all of which may be contributing to the differences in completion rates described previously.

Within integrated health systems in the private sector, some have gone beyond system-wide service agreements and allow primary care providers to determine whether a patient should be seen by a specialist without the specialist's input or review in advance. For example, Kaiser Permanente allows primary care providers to directly schedule specialty appointments on behalf of the patient. Often, this is done from the PCP's office while the patient is still there (Kaiser interview, 2015). Direct scheduling of consult visits by primary care offices is encouraged within the consult policy, but this practice was not observed on site visits (VHA Directive 2008-056; Choice Act site visits, 2015). For example, one PCP mentioned that even if he knew a patient would be accepted by the consult service for a time-sensitive issue, the PCP still would have to formally request a consult electronically and then call the specialist physician to review the request before the patient could be scheduled. Kaiser's process bypasses this need for approval and reduces potential delays in care.

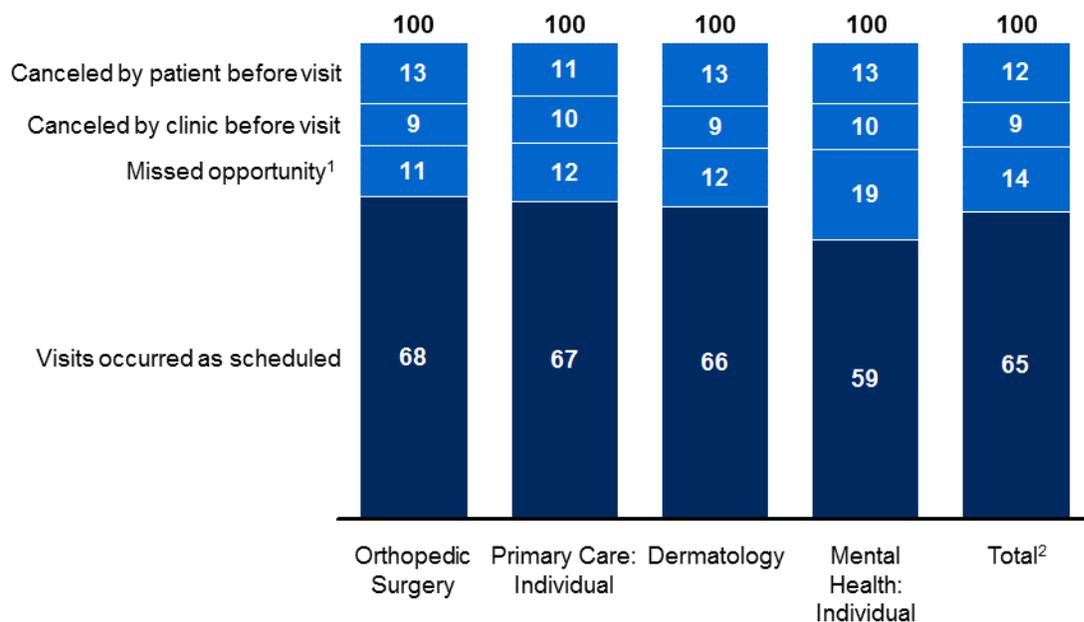
6.2.3 Clinics Are not Maximizing Number of Appointments Completed as Originally Scheduled

Our analysis of six months of appointment data for four high-volume stop codes (outpatient identifiers) across 25 VAMCs in 2014 suggests that approximately 35 percent of visits did not result in appointments as originally scheduled (Figure 6-4).

Figure 6-4. Percentage of Clinic Appointments Completed as Originally Scheduled

Clinic appointments completed as originally scheduled for select stop codes
Percent of appointments booked, N=25 VAMCs

■ Original appointment did not result in patient visit

	Orthopedic Surgery	Primary Care: Individual	Dermatology	Mental Health: Individual	Total[2]
	100	100	100	100	100
Canceled by patient before visit	13	11	13	13	12
Canceled by clinic before visit	9	10	9	10	9
Missed opportunity[1]	11	12	12	19	14
Visits occurred as scheduled	68	67	66	59	65


1 No-show or canceled by clinic / patient after appointment time such that provider time went unused
2 Total of these four stop codes

SOURCE: Clinic Assess Index

Figure 6-4 shows appointment outcomes for select stop codes. This analysis shows that 35 percent of visits did not result in appointments as originally scheduled. These specialties were chosen based on both volume (323, Primary Care – Individual; 502, Mental Health – Individual represent two largest stop codes) and desired representation from medical (304, Dermatology) and surgical (409, Orthopedic Surgery) specialties. All four specialties are within top 10 clinic stop codes by volume. Source: Clinic Access Index reports, 2014.

Of the appointments that did not occur as scheduled, approximately half were "missed opportunities"—meaning no shows or cancellations after the appointment time ("Access Audit," 2014). Missed opportunities result in unused provider capacity if additional patients, such as walk-ins or overbooks, cannot fill in. VHA's target rate for missed opportunities is 10 percent, but some clinic administrators reported they struggle to meet this standard. While patients failing to keep their appointments is a significant issue for private sector providers as well, best practice national rates range from five to seven percent versus 12 to 14 percent at VHA facilities (Woodcock, 2007). The issue of missed opportunities may be especially prominent in the VA patient population, among whom mental illness, multiple co-morbidities and transportation issues are more common, as these factors have been linked to higher missed opportunity rates (Defife et al., 2010).

As discussed in Provider Availability Section 5, cancellations by clinic, which make up an additional portion of the appointments not completed as originally scheduled, can result in a reduction in overall appointment supply if they are not made up, or inconvenience for the patient and schedulers in the clinic where rescheduling is required. This analysis suggests VHA has an opportunity to improve the utilization of available provider time where it may have gone unused due to missed opportunities. Reducing current levels of missed opportunities and cancellations by clinic could increase patient access with current resources, and improve patient experience and minimize scheduler rework by reducing the need to reschedule.

Beyond the average rates of missed opportunities and cancellations by clinic shown in the data above at the stop code level, variability exists across facilities. As shown in Figure 6.5, facilities vary in their ability to manage missed opportunities and clinic cancellations. Of the 25 site visit facilities, cumulative missed opportunity and cancellation by clinic rates ranged from 17 to 31 percent.

Figure 6-5. Missed Opportunity and Clinic Cancellation Rate, Feb – July 2014

Site visit VAMCs

1 Clinics include Primary Care – Individual, Mental Health – Individual, Orthopedic Surgery, and Dermatology across 25 site visit VAMCs
2 No-show or canceled by clinic / patient after appointment time such that provider time went unused

SOURCE: Clinic Access Index

Figure 6.5 shows missed opportunity rate and cancellation by clinic rates as a percent of total booked appointments by VAMC. This analysis shows the cumulative rate of these two outcomes ranges from 17 to 31 percent across 25 site visit VAMCs. Missed opportunity rate includes no shows and cancellations by patient or clinic after the scheduled appointment time. Cancellations by clinic rate includes cancellations by providers and staff before the appointment

time. These data come from six months of Clinic Access Index reports from 2014 for each VAMC. These data include four stop codes: 323, Primary Care – Individual; 502, Mental Health – Individual; 304, Dermatology; and 409, Orthopedic Surgery. Source: Clinic Access Index reports, 2014.

Some facilities have significantly lower missed opportunity rates than others (range of 8 to 21 percent across all VAMCs). Not shown is missed opportunities for other services beyond clinic visits, such as procedures and surgeries, where missed opportunities are an especially important issue because of the resources that could go unused. Several administrators responsible for procedure or surgery scheduling[44] identified patients failing to keep appointments as a significant challenge. "If a patient doesn't show up, it's not like we can just fill the spot with someone else because there's prep work that needs to be done," said one gastroenterologist. An OR manager reported, "If a patient doesn't show up for his surgery, that's a big loss. We waste surgeon time, nursing and support staff time, and OR time that could've gone to another patient."

The variable use of scheduling practices, such as patient-friendly appointment reminders and well-designed provider cancellation policies, within certain clinics may be leading to variability in scheduling outcomes. Across VHA, scheduling practices at the clinic level vary significantly, as they often do in the private sector; however, many are not strategically using industry standard techniques to manage missed opportunities via overbooking or minimize cancellation by clinic.

VHA high-performance example: St. Cloud VAMC
St. Cloud VAMC is a low complexity, urban facility, which, at 8.4 percent, had the lowest missed opportunity rate during the sample time period of any VAMCs within the continental U.S. St. Cloud has accomplished this low rate of missed opportunities through several key actions. First, the facility has standardized appointment reminders across all clinics. Patients, regardless of clinic, receive a reminder letter 30 days ahead of their appointment date and an automated phone call two days before. Second, the facility uses a no show predictor tool to identify patients who are high-risk for failing to keep their appointments. This tool was created by the VA Systems Redesign team in conjunction with the University of Pittsburgh Joseph M. Katz Graduate School of Business to identify individuals who are most likely to fail to keep their appointments. It incorporates a large number of inputs from the patient's medical record and was shown in several VAMC pilots to significantly reduce missed opportunity rates when combined with targeted reminders (Systems Redesign, interviews, 2015). Schedulers then call all high-risk patients one day before their appointment date to remind them of their appointment and confirm their attendance. Finally, the facility adheres strictly to the national policy against "blind scheduling," in which an appointment is made without Veteran input. Schedulers are trained on this standard process and are expected to execute it consistently. In concert, these efforts have led to system-leading missed

---

[44] Site visit OR and procedure unit interviews, N=3 of 5 VAMCs

> opportunity rates as well as improved patient experience (St. Cloud Business Office, interviews, 2015).

While use of the no show predictor tool was not systematically evaluated for this report, only a subset of clinic administrators at a minority (less than 10 percent) of site visit facilities reported its use. This is despite a national memo to network directors in 2014 requesting that clinics utilize the Missed Opportunity Call List available in VSSC, which provides a list of patients at high-risk for no show that should be contacted in advance ("VHA Missed," 2014). The major barrier to the tool's implementation, according to those leading the sharing effort, was that it was "just one more thing for the scheduler to have to do that they don't have time for." Because the tool was not accommodated into standard scheduling practice, some facilities abandoned it, despite experiencing success, according to Systems Redesign leadership.

In addition to addressing the missed opportunity rate, private sector health systems working to improve access employ another practice to ensure provider time does not go unused: overbooking to the expected no show (or in the case of VHA, missed opportunity) rate (Kumar et al., 2014; Gupta and Denton, 2007, see Appendix D.2). No VHA clinic administrators interviewed stated that schedulers were encouraged to overbook appointments based on the missed opportunity rate and many suggested that overbooking was typically left to the provider's discretion without a clear strategy for overbooking as a whole. According to 88 percent of clinic administrators interviewed,[45] schedulers must receive and document permission for every overbooked appointment, a time-consuming process. In addition, when overbooking policies are left up to providers, the results can be limited, as many of them are not aware of the details of their schedules.

To effectively overbook, many private sector health systems, on the other hand, closely monitor missed opportunity rates by provider, day of week, and season, and then encourage schedulers to book accordingly (Kumar et al., 2014). For example, if 10 percent of patients do not show up for their appointments with a given provider on Friday afternoons, schedulers overbook the provider's slots by 10 percent on that day. Overbooking can also help providers to trim wait lists. While overbooking's impact has not been evaluated in isolation from other scheduling initiatives, our work with provider systems on scheduling/access transformations suggests a potential 10-20 percent increase in visit volume, with overbooking playing a key role in these improvements.

6.2.4 Patient Communication With Respect to Appointments can be Confusing and Contribute to Missed Opportunities or Lost to Follow-up Cases

6.2.4.1 Patient Communication is Inconsistent Between Clinics, Creating Confusion

A common issue raised in scheduler group interviews was the level of confusion that many patients have around navigating the VHA system given its size and the number of different services offered. A particular area that was consistently surfaced was confusion around patient

---

[45] Site visit clinic administrator interviews, N=59 of 67 respondents

reminders, particularly when Veterans interact with more than one clinic or service, which is common given 48 percent of Veterans have multiple chronic conditions (Yoon et al., 2011). As mentioned previously, the Veteran patient population, for a variety of reasons, is more likely than the general U.S. patient population to fail to keep appointments. As such, VHA dedicates significant effort to patient reminders, as can be seen in Figure 6-6.

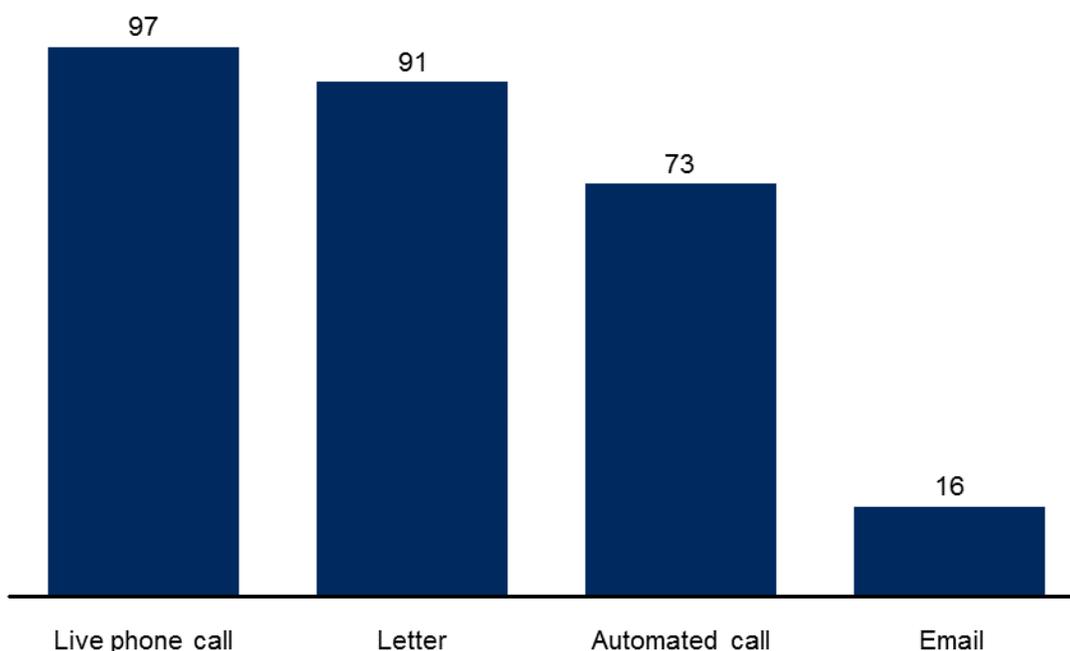
Figure 6-6. Positive Response for use of Reminder at any Time in Scheduling Process From Schedulers Asked: "When do you use the Following Reminders?" VHA Employee Survey, N = 86 MSA Supervisors From 46 VAMCs and 20 CBOCs


Figure 6-6 shows use of appointment reminder types by clinic. Almost all clinics use live phone calls (97 percent) and letters (91 percent) to remind patients of their appointments. Many also use automated calls (73 percent). Data come from national survey of 86 MSA supervisors from 46 VAMCs and 20 CBOCs. Source: Assessment E VHA employee survey, 2015.

Our survey showed that almost all clinics use live phone calls (97 percent). According to research, live human calls are very effective at reducing missed opportunity rates (Dockery et al., 2001; Sawyer et al., 2002). However, despite the rate of use reported within the survey, we observed on site visits that live phone calls are often not used consistently by frontline schedulers. As one scheduler supervisor noted, "Our clinic policy is to call everyone, but there's just not enough time." "When we get a few free minutes, we do the reminder calls. But most days we never get any free time." Clinics blamed high patient volume and low staffing levels as

a reason they could not make live phone calls. Some clinics were able to rely on non-clinic-based schedulers, such as volunteers or call centers for help.

Almost all clinics (91 percent) also use a standard system-generated letter to remind patients of upcoming appointments. Interestingly, the timing used varied significantly across clinics, which some scheduler group interviews reported resulted in patient confusion. Twenty-eight percent of clinics report sending a reminder letter at the time the appointment is made, 28 percent in the week leading up to the appointment, and 35 percent with no standard time. When patients receive care from multiple clinics, this inconsistency can lead to patient confusion. "The patient said that he didn't show up for his appointment because he thought he would get a reminder letter the week before like he does with his primary care doctor. We [in Cardiology] only send the letter when the appointment is made." Additionally, the actual wording of the letters may be confusing. Postcards and letters use the VistA clinic profile name in the notification, which schedulers suggest can be hard to interpret, as the reminder does not necessarily specify the provider name or reason for the appointment. Further, the scheduling system limits the number of characters for the clinic name and often can lead to the use of names that Veterans or their caregivers may not recognize. A hypothetical example taken from the Primary Care Profile Standardization Guide for appropriate clinic naming is "MIA PACT REDTEAM" (Prentice, "Appointment Age," 2015); a Veteran may understandably find it difficult to understand that this reminder is for a visit with his or her primary care doctor at the Miami VAMC.

Seventy-three percent of clinics in the above survey also opted to use a "robocall" system to deliver an automated reminder about an upcoming appointment. However, clinic administrators noted that robocalls provide very little information about the appointment itself. Robocalls offer listeners the option to press a button to leave a message, but this message box often goes unmonitored. "Patients sometimes get upset that they don't get a call back but we can't even access the mailbox," reported one scheduler. According to a clinic administrator, "Patients get confused because they think leaving a message will reschedule their appointment, but then the appointment never gets cancelled and no one calls the patient back to reschedule." This confusion and lack of straightforward communication with VHA may contribute to higher missed opportunity and late cancellation rates.

Many private sector health systems allow patients to choose how and when they would like to be reminded. Beyond live calls, text messaging is particularly popular, and also effective (Koshy et al., 2008, detailed in Appendix D.2). Cleveland Clinic, for instance, allows its patients to opt in to text message reminders; when they receive a reminder text the day before their appointment, they can then confirm or cancel the appointment ("Appointment Checklist," n.d.). With the exception of a text message reminder pilot at one VAMC, VHA does not permit the use of text or email reminders due to security concerns. While some clinics reported using secure messaging to remind patients of upcoming appointments, no clinic administrators identified that as a standard practice. By using patient-centered appointment communications, clinics can improve the patient experience and manage capacity better.

<table>
<tr><td>

VHA high-performance example: Detroit VAMC

The Detroit VAMC, operating with guidance from VISN 11, has overhauled its facility-wide reminder process to make it more patient communication more consistent by contracting with a third party vendor to operate its reminder system (Choice site visits, interviews, 2015). Across all clinics within Detroit VAMC, the third party vendor provides written appointment reminders. The vendor mails all reminders ten days before the appointment, which include postcards with patient-friendly naming of clinics[46] and directions to the facility. Additionally, automated phone calls are all performed three days before the appointment. According to the administrator interviewed, using this system has not only improved patient service but also reduced scheduler workload as they no longer have to prepare the reminder letters. One drawback mentioned to this standardized communication method is that some appointment notices (for example, cancellations) may look too similar to appointment confirmations and reminders, potentially resulting in patient confusion. Overall, patient response to the standardized reminder letters has been positive. According to one scheduler, "The patients like it because they know what to expect" (Choice site visits, interviews, 2015).

</td></tr>
</table>

6.2.4.2 Current Recall Process and 90-Day Scheduling Horizon may Also Create Patient Confusion, Limit Future Access for Individual Patients and Increase Scheduler Workload

Under current national policy, schedules should be kept open three to four months into the future and patients who need an appointment beyond that timeframe may be placed on the recall list (VHA Directive 2010-027). Placement on the recall list means that the clinic will follow up with the patient at a future date with a reminder to schedule an appointment. [47] The recall process was intended to reduce missed opportunity rates for follow-up appointments scheduled far in advance; internal VHA research on appointment data has shown that longer appointment lead times are associated with fewer appointments being kept (Prentice, "Appointment Age," 2015). However, there have been a number of unintended consequences for scheduler workload and patient access.

Scheduler group interviews at 35 percent of site visit VAMCs[48] identified the recall reminder process as a major challenge they would like to see addressed. First, schedulers noted that the recall process is confusing for patients, as the recall notice can look similar to appointment reminders, and some patients would have preferred to have been scheduled while they were leaving the clinic. Second, some patients cannot be reached at a future point and may be "lost" to the clinic without receiving their recommended follow-up appointments. Third, patients may

---

[46] Instead of using the VistA system name (e.g., "DET PACT MD1 RED TEAM"), the postcards may use "Primary Care")

[47] Some clinics reported not using recall. According to the 2015 national scheduling directive clarification, facilities can opt out of recall if missed opportunity rates are below 10 percent for three months and clinics can opt out if backlog is greater than 90 days.

[48] Site visit scheduler group interviews, N=18 of 23 VAMCs

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

find that the clinic does not have available appointments when they are supposed to return if the clinic is using recall in a backlog situation.

According to the schedulers with whom we spoke, patients are called during daytime hours; those who work full-time jobs during daytime hours may not be able to answer the clinic's calls. A significant percentage, the schedulers say, never do. Typically, after two daytime call attempts, the patient is notified by letter; the onus is then on the patient to call the clinic to schedule an appointment (the 2015 scheduling clarification requires that "a minimum of three documented contacts [usually two phone calls and a letter] must be made on separate days using available contact numbers") ("Clarification," 2015). Schedulers also report that contacting patients to schedule follow-up appointments can be time-consuming at the expense of other activities, especially if the patient is unavailable during normal business hours. "I have two full-time schedulers who exclusively call patients on the recall list," said one clinic supervisor.

While the overall process of reminding patients to book follow-up appointments is consistent with industry standards in the private sector, there are several areas of difference. With respect to the scheduling horizon, Geisinger Health System, for instance, generally sets scheduling horizons for its clinics as the normal return visit interval for that specialty plus one month[49] to allow more patients to leave with scheduled appointments (Geisinger interview, 2015). In addition, the private sector uses a wider range of communications. Dental practices, for example, often use text messaging to remind patients to schedule their annual cleanings ("Dental Practice," 2013). Of 10 private sector health system leaders responsible for training who we interviewed, the majority said that their health systems asked patients about preferred hours and phone numbers to increase the likelihood of actually reaching them (Private sector health systems, interviews, 2015). Additionally, increasing contact success rates reduces scheduler workload. According to one scheduler, reducing the number of times needed to reach patients would "cut down easily the most time-consuming part of [his] day."

Facilities are looking at ways to improve the recall process (Choice Act site visits, interviews, 2015). For instance, in Texas, the Temple VAMC's Medical Administration Service is surveying patients about which hours they would prefer to be contacted (Choice Act site visits, interviews, 2015). By improving communication methods, schedulers are more likely to be able to contact patients in fewer attempts, reducing overall workload and improving patient satisfaction.

6.2.5 VHA-Specific Personnel Issues, Including Vacancies, may Hinder Use of Scheduling Best Practices

While employees in a variety of roles are able to schedule (as described further in Scheduler Training Section 8), MSAs are the primary VHA frontline scheduling clerks in the clinics. Currently, of the 21,407 approved MSA positions in VHA, almost a quarter are vacant, as shown in Figure 6-7.

---

[49] For instance, if primary care normally has patients return every six months for follow-up visits, then the scheduling horizon would be seven months (three month interval plus a one month buffer).

Figure 6-7. Medical Support Assistant (MSA) Positions, on-the-job, Approved Hires, and Vacancies, Fiscal Year 2014

Figure 6-7 shows number of approved, onboard and vacant scheduler (MSA T38) positions across 158 VAMCs as of 3/17/15. This exhibit shows that 23 percent of MSA positions are currently vacant across VHA. Source: VHA Healthcare Talent Management Office, FY2014.

According to interviews with clinic administrators, the lack of scheduler resources makes it difficult to employ best practices or effectively implement VHA-specific policy, because they must focus on "putting out fires" rather than making operations work as well as possible. Administrators blame inefficient human resource processes for not letting them fill the people gaps. According to one, "I have the positions approved, but it takes six months to hire anyone." Another commented, "We are currently down over 20 [schedulers] from where we should be. We have the positions approved, but HR won't fill them."

This finding is consistent with VHA's Blueprint for Excellence labeling hiring as a "critical challenge" across all of VHA ("Blueprint," 2014). Similarly, Assessment L's report states, "HR has not been able to meet the recruiting requirements of the VAMCs and VISNs. Recruiting is crippled due to the length of process and cumbersome systems that don't "talk" to one another and are not user-friendly. The length of time to hire priority positions stretches for months, and the process is not user-friendly to applicants. HR is expected to fill a position within 60 calendar

---

days, 80 percent of the time, but process requirements, even if perfectly executed, take ~49-62 day."

In addition to being short-staffed, VHA schedulers also tend to be responsible for more activities than non-VHA schedulers (Figure 6-8).

Figure 6-8. Typical Scheduling Responsibilities, VHA and Private Sector

Typical responsibilities for in-clinic scheduling clerks – VHA and private sector

☐ Scheduling related

Scheduler responsibility	VHA	Private sector
Clinic-flow related tasks (e.g., check in/out patients)	X	X
Other clinic support-related tasks (e.g., answer phones)	X	X
Book / modify / cancel appointments	X	X
Remind patients about appointments	X	X
Add / remove patients from wait list if no available appointment	X	X
Manage multiple other lists (e.g., recall, EWL , VCL)	X	
Capture wait time reference data	X	

Figure 6-8 shows standard expectations for scheduling in VHA compared to private sector. This exhibit shows that VHA schedulers are typically responsible for additional scheduling-related responsibilities compared to private sector schedulers. This list was created from interviews with private sector health system administrators. Source: Choice site visits, interviews, 2015; Private sector health systems, interviews, 2015).

Individuals in 78 percent of scheduler group interviews[50] said that having so many responsibilities was a barrier to completing scheduling-related activities in a timely manner. For example, a scheduler may be attempting to schedule one patient on the phone when another patient walks up to the clinic front desk to check in. Before the scheduler can book the caller's

---

[50] Site visit scheduler group interviews, N=18 of 23 VAMCs

appointment, a desired date must be determined and entered into the system to enable wait time performance monitoring. Depending on the appointment selected, the scheduler also may be required to add the phone patient to the EWL, requiring the use of a different program outside of the VistA Scheduling package, introducing several extra steps. All this takes time, and keeps the in-person patient waiting. Additionally, schedulers and administrators report that schedulers are often asked to perform tasks that do not technically fall within their job descriptions, which can decrease the amount of available time for scheduling. To reduce the pressure on schedulers, one administrator met with providers and administrators in each clinic to detail which duties schedulers were and were not responsible for. Another strategy is to devise solutions to decrease their workload, such as increased use of call centers and patient self-scheduling (e.g., through online booking). A workforce assessment around productivity was not performed, and this may represent an opportunity in the future.

6.2.6 Wait Time Metrics Require Subjective Input and Are Not Currently Supplemented With Industry Standard Metrics

The use of the patient's desired date to measure wait times can result in additional process steps and less reliable data compared to private sector wait time measurement, which is typically captured directly from the system rather than entered by schedulers. The desired date has been a frequently studied issue at VHA, with at least five recent reports focusing on its potential subjectivity and ability to impact wait times.[51] Despite these concerns, the recent Choice Act requires patient preference, a concept similar to desired date, be incorporated into nationally established wait time goals of "not more than 30 days from the date on which a Veteran requests an appointment" ("Veterans Access," 2014). While a memo on the 2010 directive was released in 2015 and provides clarity on some of the subjective components of the desired date determination process ("Clarification", 2015), schedulers still are responsible for manually entering these data, leaving wait times information susceptible to interpretation and, perhaps more concerning, manipulation. Scheduler group interviews at 22 percent of VAMCs[52] specifically identified interpretation of desired date as a challenge.

Due to the data challenges discussed in Provider Availability Section 5 associated with the lack of a consolidated view of a provider's schedule, VHA has been limited in using other standard wait time metrics. In the private sector, a standard wait time measurement is the amount of time in days until the "third next available" appointment for each provider[53] (Brandenburg et al., 2015; "Third," n.d.; Kumar et al., 2014). According to the Institute of Medicine's 2015 *Transforming Health Care Scheduling and Access* and *Innovation and Best Practices in Health Care Scheduling* white paper, the third next available metric represents "a nationally reported measure against which organizations can monitor their performance… [that] is felt to represent a more accurate assessment of actual appointment availability and function of the system,

---

[51] Audit of Alleged Manipulation of Waiting Times in Veterans Integrated Service Network

[52] Site visit scheduler group interviews, N=5 of 23 VAMCs

[53] Third next available is tracked at the appointment sub-type level (e.g., new patient appointment, follow-up appointment, urgent appointment)

---

rather than an opening due to a cancellation or acute event" (Brandenburg et al., 2015). Additionally, this measure removes the data capture responsibility from frontline schedulers, allowing them to focus solely on making the appointment. VHA currently can measure third next available but cannot view this metric accurately at the individual provider- or appointment type-level due to the existence of multiple provider profiles. Proposed technology changes described in Scheduling System Section 7 further describe how this might be addressed.

According to the IOM, other measures, such as patient experience or satisfaction with wait times, can also be considered (Brandenburg et al., 2015). Using patient experience or satisfaction to monitor access performance avoids desired date subjectivity and reliability issue while also monitoring an important patient-centric outcome. These metrics also would likely not require changes to the current technology system.

6.2.7 Lack of Accountability and Resources for Managing Patient Access and Scheduling Practices at the Facility Level may Limit the Spread and use of Best Practices

Ownership of access-related responsibilities across site visit facilities varied. The roles of schedulers, clinic administrators, providers and facility leaders are not always well-defined when it comes to the management of access (waitlists and wait times) and scheduling practices. Several VAMCs had a patient access champion, other facilities relied on Health Administration Service (HAS), and for others access was a clinic-level responsibility. Within many facilities, there was often no single point of accountability. This gap is in the process of being addressed through the creation of a clinic practice management model. However, as discussed in section 6.3, the program may not have additional FTEs to manage the large list of new responsibilities, and tools and processes have not yet been developed to execute many of these duties. As such, consistent implementation may be difficult.

In the private sector, health systems often provide administrative and analytical support to frontline providers and clinic administrators to help manage access. Kaiser Permanente and Cleveland Clinic both provide clinics with central consulting, informatics, and analytical support to aid in access management. This assists the frontline clinical leaders and administrators responsible for managing backlogs (Kaiser interview, 2015; Cleveland Clinic interview, 2015). One example of regular access management the IHI recommends is team "huddles," including clinic providers, staff and administrators, at the beginning of each day ("Use Regular Huddles and Staff Meetings to Plan Production and Optimize Team Communication," n.d.). These huddles help clarify provider and staff availability for the day, identify patients requiring extra time and assistance, and deal with any last-minute schedule changes such as patient cancellations (Stewart & Johnson, 2007). The IHI further recommends weekly or monthly production planning meetings with providers and administrators to help identify and address potential backlog sources. These access management meetings require provider involvement and buy-in. By replicating private sector access management accountability practices and resources, VHA may have an opportunity to improve management of existing resources and generate better patient access to care.

6.3   Recommendations

As part of this assessment, we reviewed 37 reports dating back to 1999. Over half (19 of the 37, or 51 percent) of the reports made specific recommendations on the scheduling process itself. (For additional detail on these reports, see Appendix D.3). These recommendations predominantly focused on four main areas:

- **Access management and wait lists:** Six of the 19 reports (32 percent) made recommendations to either standardize wait list management practices, improve monitoring of lists, or implement national review. These recommendations stem from findings of significant variability in wait list management practices across facilities, especially with regard to accountability.

- **Scheduling policy:** Six of the 19 reports (32 percent) recommended improving the consistency of scheduling policy implementation and compliance. These reports focus largely on the inconsistent compliance across facilities with desired date policy. The 2014 VHA Access Audit recommended revising the scheduling policy itself to reduce ambiguity and improve compliance ("Access Audit," 2014). Per the report, the scheduling process has evolved over time into an "overly complicated" system with a "high potential to create confusion among scheduling clerks and front-line supervisors." The report subsequently calls for a revision of the scheduling policy.

- **Consults:** 11 of 19 reports (58 percent) recommended improving the consult process. The recommendations included improving coordination of care, standardizing the process of addressing unresolved consults, increasing consistency in the consult process across facilities and minimizing the screening process. A consistent theme was the need to improve the consult process from the patient perspective by ensuring patients have strong handoffs from primary care to specialists and from specialists back to primary care.

- **Patient reminders:** One of the 19 reports (5 percent) recommended improved patient reminders through identification and best practice sharing. The key driver for this recommendation was inconsistent and variable use of reminders.

These recommendations are all consistent with the opportunities suggested in our findings. According to interviews with the ACAP office, the group responsible for defining, standardizing and coordinating system-wide administrative clinic operations and management, a number of initiatives are under way in this area that may not yet have presented themselves in the field, including:

- **Efforts related to access management and wait lists:** As mentioned in Provider Availability Section 5, VHA is creating a clinic practice management model with both facility- and clinic-level administrative and clinical leadership roles focused on access-related areas. Initiative leaders reported that this model and the associated training program will be implemented in 2015 and 2016, in compliance with the Choice Act. Wait list management, as well as data validation, patient experience, capacity management, productivity, and clinic flow/throughput are planned to be included as part of their responsibilities for primary care, medical and surgical specialty care, and mental health. On paper, the pace and coverage, both of which are dictated by the Choice Act legislation,

---

are impressive. As discussed above, though, the lack of additional clinic- and facility-level FTEs to manage the large number of new responsibilities, combined with a limited number of existing tools and processes, suggests execution may be difficult.

To facilitate sharing of best practices, ACAP has started a Community of Practice program. Specifically, each facility is asked to provide a representative for the system-wide "Community of Practice," an informal organization through which facilities can learn from one another through a group mailing list and monthly conference call. Currently, there are three Communities of Practice, two of which are in development: clinic profile managers, scheduling leads (in development), and group practice managers (in development and dependent on clinic management model initiative described above).

- **Efforts to clarify scheduling policy**: An update to the 2010 VHA outpatient scheduling directive was released on May 18, 2015. The update provides clarification on multiple topics within the national scheduling policy, including wait time reference points (for example, desired date, return to care date) and list eligibility (like recall and EWL), to ensure more standardized data capture. This update was expected to be released in 2014 but was delayed multiple times due to need for approval from multiple organizations within VHA, according to our interviews with ACAP. Along with the new scheduling policy, ACAP reports that a scheduling handbook will be released, but the draft is still under review. ACAP also held a webinar to "train the trainer" on these updates in early July 2015 ("Clarification" Webinar, 2015).

- **Efforts to standardize consult process**: VHA is involved with multiple initiatives to improve the consult process. Two of the more prominent initiatives are ACAP's development of national consult standard operating procedures and handbook and ACAP's creation of a standard consult audit process in conjunction with the Compliance and Business Integrity (CBI) office. These are all currently in draft form. VHA has disseminated these drafts and also embarked on a VISN training program that was underway during the period covered by this assessment ("VHA Consult"; "VISN", 2015).

- **Efforts to improve patient reminder strategy**: Several ACAP initiatives aimed at improving patient appointment adherence are in progress, including a national group researching missed opportunity rates; two separate initiatives checking validity of recall system through evidence review and pilots; and a one-facility pilot of text messaging patient reminders.

- **VistA Scheduling software improvements**: As discussed in detail in the Scheduling System Section 7, VistA Scheduling Enhancements (VSE) and mobile applications are two near-term scheduling improvement programs that will address some of the software ease of use issues, including the lack of a "single screen" view of a provider's schedule and multiple unintegrated waitlists.

If successful, these initiatives could likely result in more consistent scheduling policy implementation across facilities and improved sharing of best practices. The access-focused roles at facilities will be especially helpful in standardizing the use of existing scheduling tools and processes. Implementing evidence-based patient appointment reminders should help

reduce missed opportunity variability. Standardizing consult process operating procedures and auditing should similarly reduce unnecessary variation across facilities.

However, gaps may exist in the above initiatives.

Implementation gaps: As discussed in Provider Availability Section 5, the clinic manager roles and training program may not be appropriately resourced and focused to ensure that these roles can handle the diverse range of duties that will be required. Simply adding clinic management expectations to facilities without providing dedicated staffing, processes, and tools may inhibit the effectiveness of these new clinic management roles.

Scope gaps: Several scope gaps may exist in VHA's current initiatives to improve the scheduling process. First, the initiatives may not address the lack of common scheduling practices, such as overbooking to the missed opportunity rate or the use of standard, patient-friendly communications. The clinic practice management model includes access management responsibilities, but ensuring the implementation of specific industry-standard scheduling practices, or detail on what those processes are, has not been outlined in preliminary training curriculum materials developed for either the group practice manager or clinic manager positions ("Clinic Management," 2015). Second, these initiatives may not address the lack of top-down guidance on scheduling process implementation. The recent national policy update does not provide any additional guidance on how to schedule or which processes/tools to utilize (for example, care coordination agreements, missed opportunity strategies). Third, best practice sharing between facilities and VISNs is only partially addressed by the creation of Communities of Practice, as there is no mechanism to ensure that best practices surfaced in this forum are actually implemented.

To address these gaps, VHA should consider the following recommendations:

6.3.1 More Effectively Implement Policy by Providing Supporting Tools and Processes, Utilizing Technology to Automate Tasks, and Creating National Enablers for Consult Process

- **Continue to support the consistent implementation of the scheduling process through VHA dissemination of tools and standard operating procedures (SOPs):** With the recent scheduling policy update, VHA is in the early stages of disseminating and reinforcing the use of the tools and processes necessary to ensure consistent implementation of scheduling management across facilities. Consistent with Assessment L's recommendation to increase coordination across policy (VHA Central Office [VHACO] program office 10P) and operations (VHACO program office 10N), all policy guidance should be reviewed, approved, and prioritized by operations before being released to the field. Reviews should ensure that policies are feasible to implement, have necessary resources to execute, and a proper feedback mechanism to indicate whether the field is able to successfully act on guidance. Policies should not be overly prescriptive but instead provide operational guidance and support to achieve clear, measurable outcomes. Necessary resources include tools (e.g., SOPs and protocols) to ensure consistent scheduling practices (e.g., overbooking) and outcomes (e.g., utilization of provider time) across facilities. These tools

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

73

should draw on already existing local best practice processes and tools, such as the no show predictor model. VHA should also examine resource needs (e.g., regional best practice teams, dedicated VHACO personnel) for continued development of these tools and processes.

- **Improve scheduler efficiency and policy implementation consistency by automating as many VHA-specific tasks as possible:** Schedulers are hampered by a difficult-to-use scheduling system and the requirement to manually carry out several VHA-specific responsibilities. As covered in detail in Provider Availability Section 5 and Scheduling System Section 7, VHA should update its scheduling system design to show all of a provider's available appointments in one view and provide accurate visibility into the third next available wait time metric. Third next available is recommended by the IOM as industry standard and would eliminate data reliability concerns associated with desired date subjectivity. This recommendation would require moving to a consolidated view of a provider's schedule, as mentioned in Provider Availability and the Scheduling System sections. Similarly, VHA should automate many of the manual VHA-specific processes, including wait list addition, removal, and prioritization. These improvements will require modifications to the scheduling software package, but should ultimately result in improved scheduler efficiency as well as more consistent policy implementation across clinics and facilities.

- **Develop system-wide care coordination agreements and finalize operating procedures to standardize consult process:** VHA should create VHA-wide care coordination agreements between Primary Care and all common specialties/subspecialties that encourage consistency across facilities, where possible. These agreements should include a well-defined list of appropriate patients for automatic or expedited approval. VHA should strongly encourage Primary Care scheduling (either by PCP or scheduler) of specialist appointments before the patient leaves the clinic for pre-approved problem types. To enable this, VHA should define a clinic manager role to monitor the consult process and ensure timely and coordinated handoffs. These recommendations should result in more timely access to specialty care, improved care coordination, reduced provider time waste and more accountable process management.

6.3.2 Improve and Standardize Facility Level Scheduling Practices to Ensure Utilization of Existing Appointment Supply and Consistent Patient Experience

- **Empower clinics to implement consistent scheduling best practices:** VAMCs and VISNs should be held accountable for dissemination and implementation of nationally provided tools and processes per 6.3.1. VHA should ensure that clinics are aware of scheduling practices used in the private sector to increase access (e.g., VHA could guide clinics on how to appropriately overbook to a steady state missed opportunity level). Beyond awareness, empowering clinics to implement these practices will require sufficient clinic management resourcing, adequate scheduler staffing levels, and provider education on why certain practices (for example, overbooking) may be necessary to provide access.

- **Modify recall process timeline to make recall process more patient-friendly:** The timing of the reminder system should be changed. Specifically, reminders to book appointments should be informed by recent pilots (Prentice, "Appointment Age", 2015) and could be sent further in advance (for example, reminders sent at least six to eight weeks in advance instead of two to four weeks) or more frequently to ensure adequate availability from which patients can choose appointments. Patient-friendly communication methods, as described in the recommendation above, should be employed. Accountability should be assigned at each facility to monitor the recall list and ensure delinquent recall list patients are not lost in the process. VHA should also consider extending the scheduling horizon to reduce the number of patients requiring recall. These recommendations, paired with improved patient reminder systems and better provider leave submission operations, should improve ease of patient navigation, reduce loss of patients in the system, decrease scheduler workload, and improve process accountability.

- **VAMCs should adhere to a standard appointment reminder process, including use of patient-friendly methods and timing:** VHA should develop an evidence-based standard appointment reminder process (like robocall seven days ahead and live call three days ahead for all specialties) that incorporates individual patient preference (for example time of day and method). Clinics should be encouraged to utilize live calls to those patients identified as high risk by the no show predictive modeling tool. The use of email and/or text message reminders should be offered to Veterans who choose to opt in. The communications content should be standardized across clinics with clear, patient-friendly language. VHA also should ensure Veterans can easily manage their appointments (for example, online cancellations, dedicated cancellation line) so that they choose to cancel instead of not attending their appointments. These recommendations should result in improved use of provider time and better patient access.

6.3.3 Create and Reinforce a Strong Practice Manager Role to Ensure Implementation and Accountability

- **Establish standard expectations for clinic- and facility-level point people managing access and their roles/responsibilities:** Since VHA appears to lack coordination between its policy and operations program offices, VHA should consider a single point of responsibility in each facility for managing backlogs and disseminating policy to enable a more consistent delivery mechanism across facilities. As discussed in depth in Provider Availability Section 5 of this report, VHA currently is taking steps toward addressing this by creating a facility-level group practice manager role and possibly service-level roles as well that are focused on access. This program should be scoped to ensure appropriate resources (for example, tools and processes), are in place to enable successful implementation of activities.

- **Ensure facilities have sufficient staffing to implement access management model:** Perhaps as important as assigning ownership of access management responsibilities, VHA should provide sufficient staffing to support this increased workload. Recruiting, which was cited as a key issue in Assessment L's report as well as in VHA's Blueprint for

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

75

Excellence as a critical challenge, will be important to ensure all positions are filled by capable individuals. Even with adequate tools and processes, managing access on a daily basis is a time-intensive duty.

7 Scheduling System

7.1 Context & Approach

VHA currently uses the Veterans Health Administration Systems and Technology Architecture (VistA) as the architecture backbone for its IT system. VistA supports major IT modules (like scheduling and medical records) as well as performance management. VistA uses Massachusetts General Hospital Utility Multi-Programming System (MUMPS) programming language, a code developed in 1966. MUMPS is a common software language in the health care space due to its ability to efficiently store and query data with many attributes (for example, encounter, procedure) by placing data in multi-dimensional arrays. Other systems use MUMPS in their platforms (Schwarz, 2010; O'Kane, 2014; Congdon 2014).

The VistA electronic medical record (EMR) has received accolades in the health care industry (Billings, 2012). In a 2014 survey across 25 specialties conducted by the American Academy of Family Physicians and Medscape, 18,575 physicians rated VistA as the top EMR, beating out popular commercial systems. Criteria included ease of use, overall satisfaction, and usefulness as a clinical tool.

In contrast, issues with the VistA Scheduling application have been the focus of several recent reviews, including the OIG 2014 report on Phoenix. Built in the early 1980s, VistA Scheduling has received criticism because it "lacks any meaningful analytical capabilities" and requires "manual workarounds" for schedulers ("Opportunities," 2014). VA's Chief Technology Officer shared with Politico that "[VistA] scheduling [is] a serious problem" (Gold, 2014). Limitations partially stem from the fact that developers did not design the scheduling system as an outpatient scheduling system, but rather for inpatient care ("MASS Business Blueprint," 2014). Schedulers use VistA Scheduling for creating and managing appointments at all VHA locations except the Richard L. Roudebush VAMC, in Indianapolis, Indiana. Roudebush purchased a commercial-off-the-shelf (COTS) scheduling solution, Resource Management System (RMS),[54] from Unibased System Architect in 2002.

VHA has made past attempts to replace the VistA Scheduling System. In Fiscal year 2002, VHA determined the need to replace VistA Scheduling. VA OI&T selected a proposal to replace VistA Scheduling with a COTS software program. However, in 2009, the project was terminated because the code was "not viable" (Department of Veterans Affairs, "RSA," 2009). VA OI&T/ VHA have several current initiatives in progress to address scheduling system enhancements:

VistA Scheduling Enhancements (VSE):

- Functions as temporary system solution to address scheduler usability issues until more comprehensive system is developed
- Provides graphical user interface (GUI) that sits on top of the existing VistA Scheduling System

---

[54] Now called Streamline Health Looking Glass

- Maintains previous reporting and inter-program interfaces
- Has three original components of VSE1, VSE2, and VSE3 that provide "aggregated view of clinic profile scheduling grids, a single queue of requests lists, and a resource management dashboard" for each program respectively ("VistA 4," 2014).
- Includes the VSE4 component to address numerous VistA Scheduling issues that changes had not yet addressed, including fixing issues that developers must address in order to implement VSE1, VSE2, and VSE3 (ACAP, interviews, 2015).
- Is in the initial operational capability (IOC) phase across pilot sites as of June 2015 for VSE1, VSE2, and VSE3 (ACAP, interviews, 2015) with roll-out expected toward the end of the 2015 (ACAP, interviews, 2015)

Veteran Appointment Request (VAR) Mobile Application: Separately, the VHA Office of Connected Health is currently in the IOC phase with a patient-facing mobile application, VAR, at the Washington D.C. VAMC. The first part of VAR, VAR1, would allow patients to request primary care and mental health appointments. The second piece of VAR, VAR2, would allow patients to directly schedule a primary care appointment using their mobile devices (Connected Health, interview, 2015).

MASS Replacement System: In November 2014, VA OI&T released a request for proposal, called the Medical Appointment Scheduling System (MASS), for a commercial-off-the-shelf (COTS) scheduling system, detailed in the MASS Business Blueprint. MASS would completely replace the current VistA Scheduling System as well as VSE and VAR, with national implementation starting in 2018. The maximum total value a vendor can charge is $690 million. The selected bidder would be tasked with providing a system that delivers core capabilities (like the creation of a resource-based scheduling system) to all VHA medical facilities within the first two years of the contract, and other capabilities (for example, patient self-scheduling) that would be rolled out over the following three years ("Performance Work," 2014). The MASS Business Blueprint, a document developed in 2014, outlines the desired system capabilities, but the final list of capabilities required and the scale of MASS may depend on the success or failure of the intermediate VSE and VAR solutions (VAR also will offer some patient scheduling capabilities, for example). As of June 2015, according to the ACAP office, the procurement process is still underway. Post selection, its implementation would rely on Congressional allocation and approval of its budget.

Within the Choice Act language for assessment E, we were asked to "assess any interim technology changes or attempts by Department to internally develop a long-term scheduling solutions [sic] with respect to the feasibility and cost effectiveness of such internally developed solutions compared to commercially available solution." We were also asked to recommend any system changes required for measuring wait times, monitoring provider availability, and providing Veterans with their own ability to schedule appointments.

To address the request for an assessment of cost effectiveness and feasibility, we defined "feasibility" as VA OI&T's ability to purchase a scheduling system with the desired features, given that they are pursuing MASS. We defined "cost effectiveness" to be the ability to implement the desired scheduling system features on time with a demonstrated net benefit,

---

including improvement to Veteran experience. To complete this area of the assessment, we relied on specific data sources, including:

- Interviews regarding VSE, mobile applications, or MASS with individuals at VA central office across three departments (Access Clinic Administration Program (ACAP), Office of Information & Technology (OI&T), and Connected Health)
- Interviews with 10 private health system CIOs and executives with deep experience related to procuring or implementing scheduling system products
- Review of reports and assessments on past implementation efforts

As discussed in section 2.4 and in accordance with *Federal Acquisition Regulation Subpart 15.3 Source Selection*, U.S. Government rules require the sequestration of individuals involved in the procurement process. Individuals involved with the MASS procurement signed a non-disclosure form that included language on "[not discussing] evaluation or source selection matters, including proprietary proposal information, with any unauthorized individuals (including Government personnel), even after the announcement of the successful contractor, unless authorized by proper authority" ("MASS RFP," 2014). As a result, details on MASS in this section relied on interviews with VHA individuals knowledgeable about MASS who were not sequestered, as well as publicly available information. This limited our ability to assess the cost effectiveness and feasibility of the planned procurement based on what is known currently within VA and VHA. We also did not complete an independent verification of any potential costs due to the sequestration.

7.2   Findings

7.2.1   VistA Scheduling Allows Basic Function of Booking an Appointment; However, Broader System Limitations Create Operational Challenges for Schedulers and Administrators

One-on-one observations of 31 schedulers consistently showed that VistA Scheduling provides the basic functionality to schedule appointments (Choice site visits, interviews, 2015). This is consistent with previous reports on VHA's scheduling system, including the most recent report from the Northern Virginia Technology Council in Fall 2014, which articulated that VistA Scheduling "fundamentally does what it's designed to do: it allows the scheduling clerk at the clinic or call center to schedule…an initial or follow up appointment" (p. 34). For the most part, schedulers appeared to have a reasonable level of comfort with the system once they had a chance to learn how to use it, even though many did not have any other scheduling system experience against which to compare VistA.

Beyond the basic appointment booking function, a number of interviews cited broader system issues. The most commonly raised issues included:

Usability for administrators (raised in 48 percent of site visit clinic administrator group interviews[55])

- Lacks an understanding of aggregate and provider-level appointment supply relative to demand due to system design choices (30 percent of administrator IT issues raised in group interviews[56])

- Does not automate clinic and facility-specific practices (19 percent of administrator IT issues raised in group interviews[57])

- Lacks a consolidated view of unmet demand, due to multiple wait lists and scheduling queues that are not typically aggregated in a user-friendly way (19 percent of administrator IT issues raised in group interviews[58])

- Other usability issues, such as unfriendly interface and lack of integration with the Computerized Patient Record System (CPRS) (32 percent of administrator IT issues raised in group interviews[59])

Usability for patients:

- Lacks functionality to support patient self-scheduling, which could increase convenience for patients and reduce workload for frontline schedulers (Choice site visits, interviews, 2015)

7.2.1.1 System Constraints do not Allow Industry Standard Levels of Supply/Demand and Performance Management, Including Wait Time Measurement

As mentioned in the two previous sections of this report, there are ways to improve scheduling without changes to the VistA Scheduling application. However, major limitations exist around monitoring and managing provider supply and wait times. This finding is consistent with the Northern Virginia Technology Council's report, which found that "the current system lacks any meaningful analytical capabilities" and VistA was "neither intended nor designed to be used as a measurement tool," and thus presents challenges when performance data is required ("Opportunities," 2014).

One common VistA Scheduling System challenge cited by administrators on site visits was the inability to accurately aggregate data to calculate metrics around total supply and provider performance. One AO interviewed on a site visit shared "It's difficult to look at the schedule to see how productive providers are." Further, because providers are not attached to an appointment until after a patient checks in and out, any appointments not resulting in a visit (like missed opportunities and cancellations, for example) are not able to be tracked for specific providers without tedious, manual review ("Access Audit," 2014; "Opportunities," 2014). In the

---

[56] Site visit clinic administrator group interviews, 14 of 47 total issues identified

[57] Site visit clinic administrator group interviews, 9 of 47 total issues identified

[58] Site visit clinic administrator group interviews, 9 of 47 total issues identified

[59] Site visit clinic administrator group interviews, 15 of 47 total issues identified

words of a clinic administrator, describing the current system's limitations on generating performance metrics, "no one is providing us with the software and tools to make us successful."

In addition to challenges with monitoring supply and demand, VHA's current system limits its ability to accurately measure patient wait times using metrics beyond desired date, return to clinic, or create date. For example, as noted in the VHA Access Audit, this desired date is not used outside of the VHA system and is "difficult to reconcile against more accepted practices such as…using a 'return to clinic' interval requested by providers" ("Access Audit," 2014). Because of potentially overlapping clinic profiles, the calculation of the industry-standard metric for wait time, third next available appointment (Brandenburg et al., 2015), is faulty.

7.2.1.2 VistA Scheduling Does not Automate Several Scheduling Processes nor Simplify Managing Wait Lists

As stated in the MASS Business Blueprint, "VistA Scheduling was built in the early 80s with few embedded clinical delivery business rules" ("MASS Business Blueprint," 2014). Certain private sector providers build automation into their scheduling system and mobile apps to "eliminate dependence on individual diligence or memory" (Brandenburg et al., 2015). As VHA scheduling operational processes are complex and variable, it is particularly challenging to execute standard practices without a scheduling system that automates many of those practices. Because the current system lacks robust automation capabilities, there are likely greater inconsistencies across clinics (like prioritization of removing patients from waitlists, timing of patient appointment reminders, and handling of no-shows), and more onerous training requirements. It is also very challenging to fix the scheduling system to improve functionality.

One scheduler in Indianapolis who used the COTS RMS scheduling system, which supports the automation of operational processes (for example, ordering necessary lab work before an appointment), said "with RMS, you don't have to memorize [things about each provider]…you could train someone [on just the tool] and have them making appointments at the end of the day."

Automation of operational processes is a component of most enterprise scheduling products provided by major EMR and scheduling system vendors, according to the private sector executives interviewed (2015). The MASS Business Blueprint envisions that "scheduling [will be] simplified because business rules [will be] captured during setup and used throughout the scheduling processes" ("MASS Business Blueprint," 2014). This decreases the necessity of understanding complex national policies or various preferences across clinics because developers automatically code some practices into the process during setup. Additionally, it could enable increased standardization of scheduling functions at the facility or national level because clinic-specific rules (for example, overbooking is preferred during the pre-lunch session for one provider, another provider requires that all new patients complete lab work) could be programmed automatically into the system instead of memorized. Thus, a scheduler could book an appointment in any clinic, as long as the system automated clinic-specific differences.

As mentioned in Scheduling Process Section 6, one-on-one observations with schedulers during site visits indicated that using waitlists in VistA creates challenges for schedulers because they

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

81

lack an automated way to filter waitlists by criteria that are relevant (like clinical need of the patient, for example). This may explain in part the VHA Access Audit's findings that eight percent of scheduling staff were using alternatives to the Electronic Wait List (EWL) ("Access Audit," 2014). According to the 2015 IOM report *Innovation and Best Practices in Health Care Scheduling*, manually recording waitlist information leads to inconsistencies in the ways that schedulers review the wait list and is against scheduling directive policy (Brandenburg et al., 2015; VHA 2010-027).

Clinic administrators also struggle with the current waitlists because there is not a way to consolidate them in order to measure patient demand or manage allocation of tasks within the clinic (Choice Act site visits, interviews, 2015). As detailed in Scheduling Process Section 6 of this report, waitlist challenges do not commonly exist in the private sector, as backlogs, and thus waitlists, are rare.

7.2.1.3 System Does not Offer Schedulers a User-Friendly way of Viewing Provider Availability

The way VistA Scheduling displays providers' schedules presents challenge for schedulers searching for available appointments. Schedulers are unable to look at one screen to see a provider's overall schedule if that provider operates across multiple clinic profiles. The current system requires a scheduler to "roll and scroll" through multiple screens to search just one day of a provider's schedule, which becomes even more tedious with multiple days or multiple providers. According to the 10 private health system leaders interviewed specifically on scheduling system technology as part of this assessment, very few scheduling systems in the U.S. are this difficult to search.

In contrast, schedulers using the RMS system at the Indianapolis VAMC with a GUI interface did not have to click through multiple screens as RMS, unlike VistA scheduling, does not disperse provider schedules across multiple profiles. The following figure displays what a scheduler sees in each system:

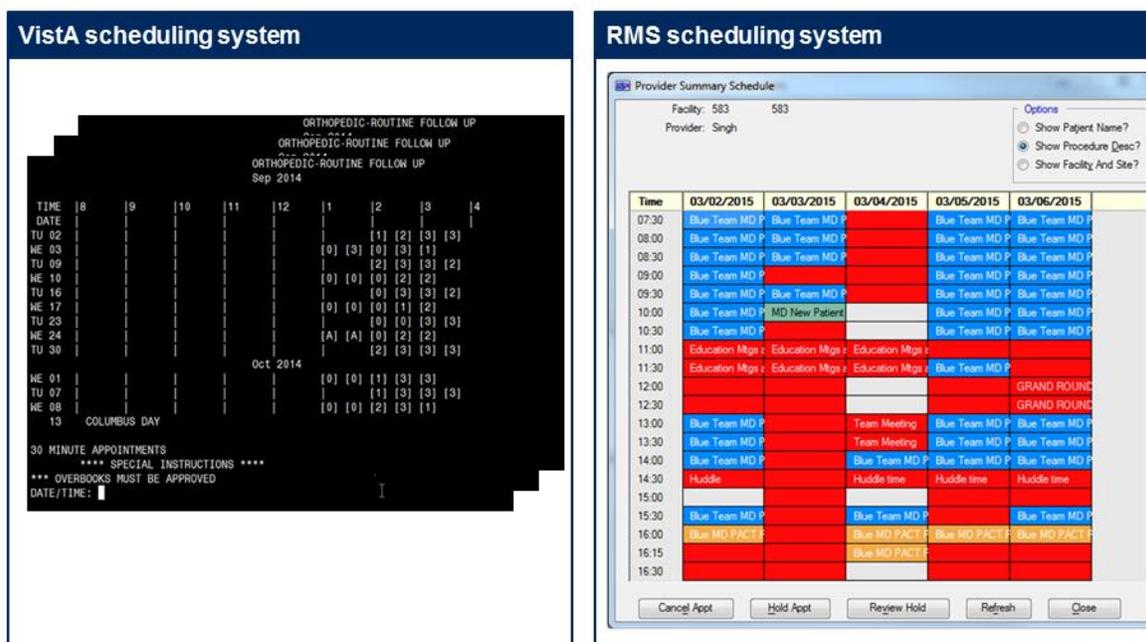
Figure 7-1. Scheduling System Comparison


Figure 7-1 compares an individual provider's schedule in VistA to RMS. In the VistA system, the provider's schedule for one day is displayed using numerals and is only shown partially on one screen because of multiple clinic profiles. In RMS, the scheduling system displays an entire schedule in one combined calendar with different colors representing different types of appointments through a GUI interface. Available slots are easy to see, and the schedule combines different clinic profiles. Sources: ACAP office webinar (left, "Making Appt v2_7-23-2014 1.51.07pm", accessed June 25, 2015) and Indianapolis site visit screen shot (right).

In addition to streamlining the viewing of appointments, RMS allows the schedulers to search provider availability for a specific appointment type based on configured rules. Most schedulers at the Indianapolis VAMC have not used the VistA Scheduling System because the Indianapolis VAMC implemented RMS in 2002. However, in contrast to other schedulers, they did not report that finding an available appointment took a long time. The shorter time required to find availability could result in shorter hold times on the phone for patients booking an appointment or waiting in clinic to schedule. We spoke with one scheduler who had recently transferred from another VAMC that used VistA Scheduling, allowing her to compare the two systems. She said, "I can view [the doctor's] schedule all right here [on this one screen]. It is just like [Microsoft] Outlook and much more intuitive."

7.2.2 Interim Scheduling System Solutions Will Address Some Usability Challenges, But Will not Comprehensively Address Root Cause Issues

According to VHA leaders, VHA's two near-term scheduling improvement programs, VSE and VAR, will address the previously noted scheduler and patient usability challenges captured below:

Usability for schedulers

- "Single-screen" view of a provider's schedule due to system architecture choices that have led to multiple clinic profiles as well as a scheduling system (that is, VistA) that does not provide an aggregated view across these profiles. VistA also does not allow for a singular schedule beyond eight hours nor across two locations.

- An easy-to-use cancellation list, due to multiple wait lists and scheduling queues that are not typically aggregated.

Usability for patients

- Functionality to support patient self-scheduling, which could increase convenience for patients and reduce workload for frontline schedulers.

However, interim solutions will not address the following challenges with the current system:

Usability for administrators

- Ability to support an understanding of aggregate and provider-level appointment supply relative to demand due to system design choices.

- Automated clinic and facility-specific practices, making it a manual process.

- Consolidated view of demand, due to multiple wait lists and scheduling queues that are not typically aggregated to measure overall demand.

Collectively, the main features of VSE and VAR will address the major issues of scheduler and patient usability. However, these solutions are currently limited to only two specialties, primary care and mental health. Primary care was chosen because it is a high volume specialty and tends to have more standard clinic profiles. Mental health was also chosen because it is a high volume specialty and because there are many different profiles that schedulers must look at. According to VHA leaders, VSE will introduce changes that will "ease the burden on the scheduler" by providing users with an integrated provider calendar view, a centralized waitlist management tool, and a dashboard that tracks appointment "requests" as well as completed appointments. However, VSE, like RMS in Indianapolis, is still constrained by clinic profiles. As a result, VSE cannot measure aggregated appointment supply more accurately than in current state.

In addition, VHA also has efforts to provide additional patient friendly-scheduling features through VAR using the same programming code as My Health*e*Vet (Connected Health, interview, 2015). Like the other VA mobile applications, VAR will be "stand alone" and not built using the VistA Scheduling infrastructure (Frisbee, 2015). This infrastructure will enable it to be integrated with future scheduling systems. Through VAR, patients can request or schedule an appointment, but only in primary care or mental health. Capabilities exist only for patients requesting an appointment with a provider previously visited and for patients who have registered at the VAR website. Offering VAR to patients for all specialties will be challenging because any patient-facing application still has to deal with the current limitations of VistA Scheduling (like multiple clinic profiles) and VAR will require another work queue for schedulers to manage. According to interviews with the Connected Health office, physicians are generally supportive of the software, and the team piloting the software believes it will increase patient

satisfaction scores which are tracked in the national Survey of Healthcare Experience of Patient (SHEP) survey.

7.2.3 MASS Plan is Intended to Address Major Scheduling Capability Gaps Highlighted in This Report Through a COTS Product, Similar to Several Private Sector Providers

Overall, previously mentioned interim improvements (VSE, VAR) will provide a bridge between the current VistA scheduling process and a future, more comprehensive solution. MASS is under consideration to address this more comprehensive need with a COTS product.

Feature requirements listed in the MASS Business Blueprint include the following (See Appendix E.1 for detailed listing of MASS requirements):

- VistA reporting and coding must continue to support non-scheduling business processes, as it currently does today, so that all data extracts continue to support other non-scheduling processes without disruption.
- Capture of the patient preferred appointment date metric must be consistent with the national scheduling directive.
- System must support proactive resource management-based scheduling that schedules all resources, including staff, facilities, rooms, and equipment.
- Patients must be able to self-schedule and manage their engagement through multiple avenues, such as mobile applications and the web.
- System must create a single view of the patient across the enterprise so that VHA can maintain a coherent view of the patient across facilities.
- Interface must enable efficient and error-free scheduling of resources.

Over 90 percent of all U.S. hospitals have a COTS scheduling product, including 14 of the 15 U.S. News and World Report top hospitals and eight out of the 10 largest hospital systems in the U.S. ("Healthcare," 2015). This high use of COTS scheduling products is partly because health care systems are increasingly purchasing integrated electronic medical records (EMR) with most or all including scheduling capability. Most EMR implementations include a suite of products from a single vendor that better enable integration between programs.

According to the health system leaders interviewed for this assessment, most of the desired features in MASS are common in COTS systems. If paired with changes to the data capture functionality for location and stop code (which VistA currently uses multiple provider schedules to do), a COTS scheduling system can likely address most of the major usability pain points highlighted in this report. However, because waitlists are not common outside of VHA, it is not possible to evaluate how a COTS system can address challenges related to this topic.

7.2.4 Further Study is Required to Determine Whether the MASS Plan is Feasible and Cost Effective

It appears to be feasible for VA to obtain a product with the scheduling features it desires. However, our access to the leaders of the procurement has limited our ability to assess overall

feasibility and cost effectiveness in a definitive manner. While significant documentation about MASS is publically available, including its request for quotation (RFQ) to vendors and its requirements articulated in the MASS Blueprint, we have not been able to complete or verify the existence of a robust Analysis of Alternatives (AOA). OI&T and the Office of Enterprise Development completed an assessment of alternatives for a new scheduling system before the MASS effort in 2009 ("Healthevet," 2009). However, no public documents exist to confirm that VA has made any effort to refresh this cost comparison for MASS.

A complete AOA would compare the financial and non-financial costs and benefits of both MASS and all of its alternatives, including using locally sourced COTS solutions at each facility, internally developing a custom solution, and the status quo (that is, no system changes). Costs components should include all total costs of ownership including system costs, maintenance costs, and implementation costs as well as the time required to implement. Benefits considered should include, but not be limited to, financial savings, operational improvements on the scheduling process, and patient satisfaction. Further, implementation and maintenance cost estimates should be risk-adjusted based on past VA efforts to reflect the most likely cost figures (see Assessment H report).

7.2.5 VA's Past IT Implementation Successes and Failures Demonstrate That a Feasible and Cost Effective Solution is Possible, but not Guaranteed

VA has shown in the past that it is able to implement a COTS scheduling system in a cost effective way with RMS, the COTS program used in Indianapolis. RMS went through the procurement process with five vendors in 1999 and evaluated each for cost, ease of usability, and ability to integrate with VistA. The independent installment of RMS in Indianapolis was not a pilot. The project team implemented RMS under the $250,000 budget, which did not include licensing fees of $50,000 per year (Choice Act site visit interview, 2015). According to Indianapolis leaders interviewed, the main reason why the RMS COTS product was feasible and cost effective was that its project owners decided not to add significant customization. As a result, implementation successfully addressed some scheduling usability issues and demonstrated that a COTS system could successfully integrate with the overall VistA system. However, this was a small scale implementation that was not replicated again.

Despite the success in Indianapolis, other efforts to replace the scheduling system overall have not been successful. As further explored by Assessment H, the media, VA Office of Inspector General (OIG), and the Government Accounting Office (GAO) have documented many public failures over the last 15 years.

For example, in fiscal year 2000, VA determined the need to replace VistA Scheduling with a new system referred to as Replacement Scheduling Application (RSA), "due to the age of the software, as well as a 1998 GAO report concerning excessive wait times for Veterans to schedule appointments" ("Review," 2009). This effort was unsuccessful for three reasons, according to the VA Office of Inspector General:

- There was a lack of program and requirement planning due to numerous changes in direction including some due to the Health**e**Vet initiative

---

- VA did not have staff members with the necessary expertise to execute a large scale IT project
- Responsibility of the project changed four times between fiscal years 2000 and 2009 leading to a lack of accountability

In 2009, in response to the failure of RSA, the VA Chief Information Officer initiated the Program Management Accountability System (PMAS). PMAS is an IT development process owned by OI&T that project teams must use across VA for IT implementations with a value greater than $250,000. According to the PMAS website, there are eight major principles of the PMAS approach: incremental development, integrated teamwork across VA, accountability, resource management, transparency, senior leadership engagement, direct participation by the customer, and an emphasis on agile practices. Unfortunately, a recent OIG audit found that PMAS has not completely succeeded in removing the project management deficiencies that led to the previous failures because it has not yet established "key management controls to ensure PMAS data reliability, verify project compliance, and track project costs have not been well established."

Findings from Assessment H, as well as a 2012 internal review of OI&T, highlight that the broader VA organizational structure for IT may also limit the ability for VA to fund and implement IT capabilities. This structure affects the likelihood that MASS could successfully roll out. For instance, Assessment H found that VHA and OI&T are not effectively collaborating with respect to the planning of IT strategies for managing and furnishing health care. Further, they found that stakeholder engagement in requirements definition is limited as a result. An internal review of OI&T in 2012 allegedly found many issues with capabilities within OI&T, including a disconnect between OI&T and the rest of the organization as well as excessive management layers between the facilities and OI&T leadership (Konkel, 2013).

Learnings from successful IT implementations outside of VA can inform continued planning efforts for MASS.

Research suggests that there are several key success factors for successfully implementing IT projects. These factors include:

- **Manage customization:** Successful efforts carefully determine the appropriate level of customization by weighing the costs and benefits of each additional build-out and avoiding "gold plating." As previously mentioned in Scheduling Process Section 6, scheduling processes vary significantly across facilities. There are over 140 instances of VistA today due to past local customization (Connected Health, interview, 2015). VHA facilities may need to change some of their processes to match a new system in order to avoid excessive customization. VA leaders interviewed do not know how much customization business owners will request as part of MASS nor what the process will be for managing it.
- **Engage the business owner:** IT rollouts are successfully completed on time and on budget if the implementation and requirements are substantially driven by the business owner (both at the top-level business sponsorship level and at the user level). The ACAP office,

the business owner of MASS, is reportedly in close communication with OI&T. However, it is unclear if OI&T has yet engaged the day-to-day users of the scheduling system.

- **Pilot and test major features/functions:** Project teams should test all major functionalities in various environments of the ultimate user base. Within VHA, this would help demonstrate the functions of the system in different facilities (for example, VAMCs, CBOCs), across multiple specialties (for example, primary care, mental health, cardiology), for multiple resources (for example, providers, rooms, equipment), and with multiple users (for example, schedulers, clinic administrators, providers, and patients).

- **Build rigorous performance management structure** by: 1) establishing a program structure with clear governance, roles, and decision rights, 2) creating a simple, visual, master program plan with logical work streams and milestones, 3) measuring and tracking progress against transparent short-term and long-term milestones, 4) engaging business customers in the project delivery, and 5) aligning incentives of project and program management team to overall project performance metrics.

7.3 Recommendations

Previous work by VA, OIG, and other independent groups indicated that there are key system capabilities missing from VistA Scheduling, which, in turn, affect the scheduling process for schedulers, administrators, and patients. Further, GAO recommended actions to introduce software changes that would allow a scheduler to view provider availability on a single screen and require fewer keystrokes for each action. According to OIG, these issues cause errors in the scheduling process.

To improve the system usability for administrators, many groups recommended system changes to address the need for increased and easier access to data. Specific recommendations included that VA standardize management data through use of standard data dashboards ("Audit," 2008). See Appendix E.3 for additional detail on previous reports.

As described in this section, VA is in the process of several changes to its scheduling system, many of which appear to be necessary improvements. Additionally, it will be necessary to address potential opportunities to ensure the effectiveness of current initiatives. Regarding its scheduling system, VA/VHA (as relevant depending on ownership of specific element of IT process) should consider the following recommendations:

7.3.1 Implement Necessary non-System Changes Described in This Report; Continue to Implement Interim System Improvements That are Already in Progress

It is evident from this assessment that system changes alone will not improve the scheduling process. Instead, scheduling system improvements need to be paired with other improvements addressing the major scheduling issues highlighted throughout this report including the lack of accountability and resourcing at the facility level for scheduling and access management (described in 5.2.6 of Provider Availability and 6.2.7 of Scheduling Process) and variability in the use of scheduling best practices at the clinic level (described in 6.3.2 of Scheduling Process). As

discussed in this section, interim solutions, VSE and VAR, are likely to address select scheduler and patient usability challenges, but will not comprehensively address all of the current underlying system issues outlined such as the need to accurately measure appointment supply. As of May 2015, VA reports that both solutions are moving through the implementation process (for example, user testing) against a fall 2015 timeline (ACAP, interview, 2015). VHA should ensure that this implementation is set up for success in terms of planning and resourcing for roll-out, while maintaining a near-term timeline given that MASS will take several years before being fully implemented.

7.3.2   Perform Full Analysis of MASS Alternatives (if one has not yet Been Completed) and Ensure Comprehensive Implementation Plan

The MASS procurement was undertaken to obtain a COTS scheduling product similar to what is used in the broader industry. As mentioned, we were not able to validate the existence of a robust analysis of alternatives (AOA) that considered the relative cost and benefits of MASS as compared to other system change or procurement approaches (e.g., changes to VistA Scheduling, local procurement of COTS products). To feel confident in the cost effectiveness of its selection, VA OI&T should ensure that this analysis has been completed and is informing the MASS plan.

In addition, VA OI&T has already been working closely with the MASS business owner, VHA's ACAP office, to develop business and technical requirements for MASS. However, OI&T should perform a careful AOA along with systematic planning (if it has not already done so) that also addresses broader IT program challenges articulated in Assessment H.

For MASS, additional robust planning (where not already in progress) could include the following:

- Ensure that VA OI&T, ACAP and field leadership are working in close coordination to make joint decisions on detailed design (e.g., minimizing custom scheduling features as is typical in the private sector) so that further requirements development occurs in a coordinated manner with an eye toward prioritization and robust cost/benefit analysis.

- Ensure that OI&T continues to enlist both the ACAP office as well as its broader stakeholders (patients, providers, schedulers, administrators) in the rollout of MASS. For the rollout, OI&T, ACAP, facility leadership and scheduling system users will all need to contribute to the planning in a meaningful way if the roll-out is to be successful. For example, the joint team could complete the initial phases of deployment across separate VISNs, in multiple care settings (like VAMC, CBOC, etc.), in various medical specialties (for example, primary care, mental health, cardiology), for multiple resources (like providers, rooms, equipment), and with multiple users (for example, schedulers, clinic administrators, providers, patients) to ensure it understands the needs of the end users and proactively manages in advance of full implementation. This could help to ensure that MASS improves scheduling across all VHA facility settings and that the full roll-out proceeds more smoothly.

- Ensure that OI&T establishes a robust performance management and governance structure addressing any known limitations to PMAS to ensure the broader cost effectiveness and feasibility of the MASS project. This could require, where not already expected to happen, a monthly cadence of performance management meetings with senior leaders to review key milestones, assess the budget, review performance metrics (like time required to complete an appointment, scheduler satisfaction, etc.), review changes in scope, and problem-solve issues.

7.3.3 Scheduling System Improvements (Likely Through MASS) Should Address the System Changes Summarized in the Table Below

Table 7-1**. Choice Act Requirements and Relevant Recommendations**

Choice Act requirements	Relevant Recommendation
(iii) Assess whether changes in the technology or system used in scheduling appointments are necessary to limit access to the system to only those employees that have been properly trained in conducting such tasks.	8.3.1 Continue requiring all schedulers to receive training before receiving access to the scheduling system; utilize more initial training, on-the-job training, and experiential methods to equip schedulers for their responsibilities
(viii,II) Changes in monitoring and assessment conducted by the Department of wait times of Veterans for such appointments. [note: this was not specific to IT, but requires IT support]	6.3.1 Update scheduling system design to accurately aggregate available appointment slot information to provide visibility into the third next available wait time metric
(viii,III,aa) Changes in the system used to schedule such appointments, including changes to improve how the Department measures wait times	6.3.1 Update scheduling system design to accurately aggregate available appointment slot information to provide visibility into the third next available wait time metric
(viii,III,bb) Changes in the system used to schedule such appointments, including changes to improve how the Department monitors the availability of health care providers of the Department	5.3.2. In the longer term, transition to a system design that enables an accurate view of provider supply; this would allow administrators to be able to accurately assess provider availability without significant manual analysis
(viii,III,cc) Changes in the system used to schedule such appointments, including changes to improve how the Department provides Veterans the ability to schedule such appointments.	7.3.1. Implement necessary non-system changes described in this report to improve patient experience; continue to implement interim system improvements that are already in progress, which would include

Choice Act requirements	Relevant Recommendation
	VAR, a program that would allow Veterans to request and schedule appointments online for some specialties

8 Scheduler Training

8.1 Context & Approach

VHA policy requires that standard online and classroom training be provided to all individuals to obtain system privileges, regardless of role (VHA Directive 2010-027). According to ACAP, this initial training currently covers three main topics:

- Scheduling and related systems (for example, VistA Scheduling, CPRS)

- Processes and policies (for example, when to use EWL)

- Soft skills (such as patient interaction) (ACAP, interviews, 2015).

The mandatory online modules for these topics are administered through VA's Talent Management System (TMS); the modules are often referred to as "TMS training." In addition to the TMS training, a nationally developed soft skills training, comprising videos and classroom-based discussion, is administered locally by the facilities. Local facilities frequently develop supplemental materials as needed. See Appendix F.1 for details on this initial training.

VHA policy requires that schedulers receive training of some form whenever new policies are introduced or after an annual scheduling audit if deficiencies are identified, additional training can be administered at any time (VHA Directive 2010-027). All staff members who have any of the VistA Scheduling options that may be used for scheduling patients are placed on the Master List. Those on the Master List have an annual VHA assessment, which is administered by their facility (VHA Directive 2010-027). When these assessments reveal knowledge gaps, training is required and is administered on an individualized basis. Typically, this includes retaking modules from initial training and, in some cases, receiving one-on-one coaching with supervisors.

The Choice Act required a review of scheduling training material and an assessment of whether employees conducting tasks related to scheduling were properly trained.

To conduct this area of the assessment, our data sources included:

- Talent Management System (TMS) training modules required for those with system privileges

- A survey with specific training-focused questions for "schedulers," individuals who indicated that they schedule appointments for outpatient care (N=825), including both frontline MSAs (N=726) and non-MSAs with scheduling privileges (N=99); as well as MSA supervisors (N=70), clinic administrators (N=80), providers (N=1,054), administrative officers (N=86), and clinical leaders (N=121).[60]

  The survey was intended to reach all facilities and respondents represented 137 VAMCs (90 percent of all VAMCs) and 320 CBOCs (39 percent of CBOCs) overall.[61] Given this sample size the survey results have a margin of error of approximately 3.4 percent.

---

[60] Response rate unknown, as total numbers for these groups were not available

[61] Assuming 152 VAMCs and 819 CBOCs (VSSC, 2014)

- A data call distributed to all VAMCs via the 21 VISN directors requesting three types of information: training content and delivery, reporting structure and audit performance, and policy dissemination. A total of 102 VAMCs responded (67 percent response rate) to at least some part of the data call. This included a survey regarding the creation, maintenance, and delivery of trainings (N=49 VAMCs, 32 percent response rate); a survey of facilities' scheduler reporting structures and scheduler audit performance (N=73 VAMCs, 48 percent response rate); and a collection of national and local training materials for MSAs on new policies (N=51 VAMCs, 34 percent response rate).

  The materials collected were analyzed for the period in which they were delivered, the topics they covered, and the format of delivery used to discover best practices currently taking place within VAMCs.

- 22 interviews related to scheduler training approach with designated lead administrator responsible for training during on-site visits at 17 VAMCs

- Interviews with 10 private sector health care system administrators with responsibility for scheduler training

8.2   Findings

8.2.1   Not All VHA Schedulers Receive Enough Initial Training or on-the-job Training; Training That is Delivered is Rarely Experiential, a Difference From Private Sector Health Systems

8.2.1.1   Some Schedulers Receive Relatively Little Initial Training; a Majority of Schedulers, AOs, and Providers Report That More Training for Schedulers Would be an Improvement

The largest groups with scheduling system access based on our data call are:

- MSAs (36 percent of total)

- Allied health professionals (22 percent of total)

- Nurses (17 percent)

- Administrators (14 percent)

- Pharmacists (3 percent)

- Other less than 2 percent each: Care coordinators, Managers (2 percent), Physicians (2 percent), Employees in ancillary roles (1 percent), Nurse practitioners (1 percent), Physician's assistants (1 percent)

According to 825 survey responses from schedulers, (MSAs [N=726] and non-MSAs [N=99]), across 97 VAMCs and 128 CBOCs, 79 percent of schedulers reported receiving at least two hours of initial training on scheduling systems. Seventy-two percent reported receiving at least two hours of initial training on policies and processes, and 70 percent did so for training on soft skills. This means that for each of the required topics of national training, more than 20 percent of schedulers report receiving less than two hours of initial training. There are several possible

explanations for this, other than incomplete implementation of mandatory training. First, because the TMS modules are self-paced, it is possible that some individuals simply took less time than expected to go through the training. Second, some schedulers may have started before training became nationally mandated in 2010. Regardless, the current state in which less than 80 percent of schedulers report receiving at least two hours of initial training on each topic suggests implementation of mandated training could be more rigorous.

We also found that the amount of training schedulers receive differs significantly between facilities. Based on the responses of 333 schedulers who come from the 20 largest facilities surveyed, there is a statistically significant variability (p value = 0.041) in how many hours of initial training facilities provide on using scheduling systems, for example. There are similarly wide ranges between facilities for training on soft skills, scheduling policies and processes, and on-the-job training. See Appendix F.1 for full analysis. If mandatory TMS training time were summed across all scheduling-specific modules, approximately half of a day of TMS training would be expected. This amount is shorter than what is typical in the private sector, where initial classroom training typically ranges from one to five days (Private sector health systems, interviews, 2015). Geisinger Health System, for instance, places new hires in clinic settings for several days to learn how a clinic operates and then provides several days of classroom training (Geisinger interview, 2015).

Consequently, among AOs, providers, and schedulers who we interviewed, a majority of each group identified current training for schedulers as inadequate. In group interviews of schedulers, 65 percent[62] identified training as a major challenge. Their focus was primarily on the content of training not matching with their actual jobs: "We learn how to book an appointment in a vacuum but then we show up on our first day and it's a whole new world," reported one scheduler.

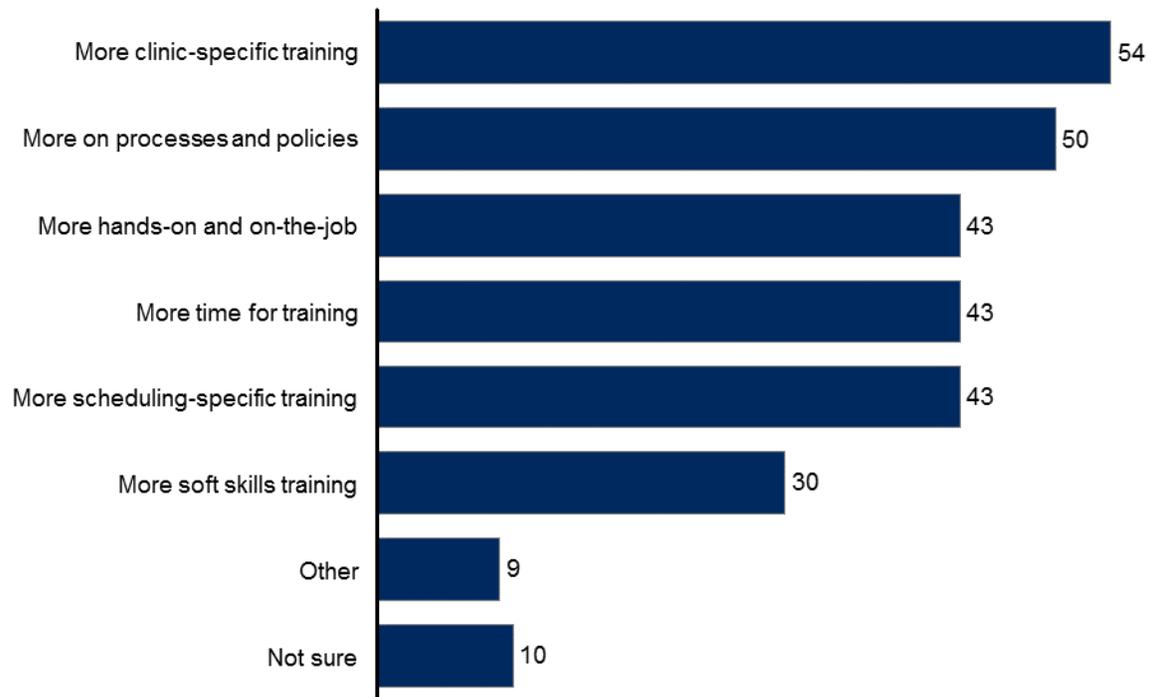
Our survey of schedulers (see Figure 8-1) likewise showed that 90 percent listed at least one area in which they would like more training. A breakdown of how schedulers believed training could be improved is below:

---

[62] Site visit scheduler group interviews, N=15 of 23 VAMCs

Figure 8-1. Response of Schedulers Asked: "How Would You Improve the Training of Schedulers?" 2015 VHA Employee survey, n = 825 Schedulers from 97 VAMCs and 128 CBOCs

How would you improve training of schedulers?
Percent, N=825 responses from 97 VAMCs and 128 CBOCs

Category	Percent
More clinic-specific training	54
More on processes and policies	50
More hands-on and on-the-job	43
More time for training	43
More scheduling-specific training	43
More soft skills training	30
Other	9
Not sure	10


SOURCE: 2015 VHA Employee Survey

Figure 8-1 shows schedulers' desired areas for training improvement based on a national survey. This survey shows that a large portion of schedulers want more training in several specific areas, including clinic-specific content (55 percent), processes and policies (51 percent), scheduling-specific (44 percent), and hands-on and on-the-job training (43 percent). This survey includes responses from 825 schedulers from 97 VAMCs and 128 CBOCs. Source: Assessment E VHA employee survey, 2015.

From interviews with AOs and clinic managers it was clear that they, too, see lack of training for schedulers as a challenge; 65 percent of group interviews[63] identified training as an area that needs to be addressed. Their most common areas of concern were the lack of content focusing on day-to-day processes and the perceived infrequency of training. For example:

Content

- "[Schedulers] don't get enough training on how processes work in the real world."

---

[63] Site visit clinic administrator group interviews, N=15 of 23 VAMCs

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

- "Their training is not matched to their actual duties."
- "Schedulers get trained on how to book appointments and put people on lists, not how to function in a clinic, which involves a lot of other things."

Frequency

- "Training doesn't happen often enough."
- "Once [schedulers] finish their initial training, there's not much that happens."
- "I can't even remember the last time one of my MSAs got training."

Certain providers also indicated that a lack of adequate training for schedulers may impede their ability to see patients. In our survey of 1,054 providers, only 56 percent of providers responded "yes" when asked if they feel that their schedulers are adequately trained. Specifically, providers were concerned that training is not actually ensuring high quality scheduler performance. According to providers:

- "Scheduling mistakes among schedulers are common, which wastes [provider] time."
- "Schedulers will put new patients in follow-up slots, which is impossible for me to handle. The rest of my day then runs behind."
- "The MSAs in my clinic need more training on how to serve patients. They are the face of the clinic, and sometimes they don't act like it."

8.2.1.2 VHA Uses Less Experiential Training Than Many Private Sector Health Systems, Which may Result in More Limited Training Retention and Scheduler Performance

As described in the previous section, VHA's nationally standardized training is focused on scheduling software, processes, policies, and soft skills. These topics are consistent with private sector training content. However, the major difference between VHA and private sector initial training is the delivery method. VHA largely delivers training through online modules rather than through interactive or experiential learning. According to many schedulers, the use of online TMS modules is potentially ineffective:

- "All we do [in TMS modules] is look at screenshots of VistA and CPRS; we never get to actually use them."
- "We need more training than what we get with TMS."
- "TMS isn't helpful for our day-to-day jobs"

As described in Figure 8-2, many private sector health system use significantly more experiential training, or training that involves application of learnings in realistic settings such as through role play scenarios or in a simulation lab. In interviews, private sector administrators consistently mentioned that they used practice labs with test accounts set up for schedulers to use for practice.

**Figure 8-2. Comparison of VHA and Private
Sector Initial Training Delivery for Schedulers**

Comparison of VHA and private sector initial training delivery for schedulers

	VHA	Typical private sector
Trainer	• Usually centralized	• Centralized
Length	• 0.5-1 day in classroom	• 1-5 days in classroom
Delivery method		
Software training	• Online modules[1,2] • No live practice	• Live instruction • Practice lab with scenarios
Processes and policy	• Online modules[3] • Lecture • Occasionally scenarios	• Lecture, largely scenario-based
Soft skills	• Scenario-based role play	• Varies, with classroom role play common
Testing	• Concepts-based with no demonstration of skills	• Competency-based with skill demonstration required

1 TMS module "Make an appointment"
2 TMS module "Recall/Reminder"
3 TMS module "Business Rules"

Figure 8-2 shows a comparison of initial training delivery between VHA and best-in-class private sector health systems for schedulers. This information comes from a review of VHA national training materials and interviews with health system administrators at 10 private sector health systems. Sources: Choice Act site visits, interviews, 2015; Private sector health systems, interviews, 2015.

Experiential training typically includes trainee completion of typical scheduling scenarios. These scenarios include start to finish processes, such as registering a patient, scheduling an initial appointment, scheduling a follow up appointment, processing a referral, and other standard processes, beginning with more basic processes and moving to more complex scenarios. Multiple private sector health systems also reported requiring schedulers to successfully demonstrate scheduling competencies prior to beginning their scheduling duties.

Consistent with private sector use of experiential training, research suggests that organizations should minimize in-classroom training and online modules in favor of experiential activities (Whitmore, 2002). Specifically, research has found that experiential training (like practicing potential scenarios on a computer rather than through lectures or manuals) leads to higher retention of the content, as seen in Figure 8-3. This best practice contrasts with VHA's

nationally standardized training materials focused on online modules. For additional detail on best practices, see Appendix F.2.

Figure 8-3. Adult Learning Theory, Methods and Their Effectiveness, Based on Data From IBM Research and UK Post Office, Whitmore, 2002

Adult learning theory, methods and their effectiveness

Learning by	Effectiveness, Percent Recall after		Formats
	3 weeks	3 months	
Explanation (hearing)	70	10	• Lecture • Textbook • Video • Discussion
Example (seeing)	72	32	• Demonstration
Experience (doing)	85	65	• Role play • Simulation • Game • Exercise • Case
Expertise (teaching)	100	100	• Learner explains or demonstrates to third party

SOURCE: IBM research

Figure 8-3 outlines adult learning methods and their effectiveness. Experience (doing) and expertise (teaching) result in higher short- and long-term retention rates (65 percent and 100 percent at three months, respectively) compared to explanation and example (10 percent and 32 percent at three months). Source: Whitmore, 2002 on IBM Research and UK Post Office.

Despite the overall lack of experiential training reported by many schedulers, there are some facilities that excel in this area.

VHA high-performance example: The Robert J. Dole VAMC
The Robert J. Dole VAMC has developed a three-day training program followed by in-clinic observation. The three days include PowerPoint step-by-step instructions, instructor demonstration, and then hands-on practice for multiple scheduling processes such as scheduling an appointment, placing a Veteran on the EWL or recall list, and cancelling an appointment. Each day is concluded with a quiz to test understanding of the day's materials.

> Several VAMCs have also developed scheduler competency checklists to document the scheduler's demonstration of required competencies (Assessment E national data call, 2015)

Other facilities, which did not use as much experiential training, cited multiple challenges preventing them from adopting these methods, including a lack of space, technology limitations, and a lack of dedicated trainer time. Regarding space, several scheduling administrators mentioned that no dedicated training space exists within their facilities, so it would be difficult to find physical locations to house a practice lab or perform additional classroom-based training. As for technology, many private sector scheduling systems allow trainees to access a test environment and work through a specified set of activities; however, no facility reported using VistA Scheduling for this type of activity. Altogether the lack of space, technology limitations, and full-time trainers inhibit a facility's ability to provide experiential training, including scenarios, role plays, and practice lab activities.

8.2.1.3 On-the-job Training is Inconsistent at VHA Facilities, With Some Schedulers Reporting a Difficult Transition From Classroom to Clinic or Call Center

On-the-job training includes initial training in the actual work environment, such as side-by-side coaching and receiving feedback. In the private sector, shadowing and pairing new employees with more experienced schedulers are commonly used practices to ensure a smooth transition from the classroom to scheduling independently. Geisinger Health System, for instance, requires all new schedulers to sit with an experienced scheduler for at least two to three weeks (Geisinger interview, 2015). These new employees begin this training period by exclusively observing the scheduler and clinic flow. Over time, they take on additional responsibilities until, by the end of the period, the new employees are capable of functioning independently. In addition to providing relevant, real-world training, another benefit administrators mentioned is that on-the-job training serves as a final quality check before schedulers operate on their own. "If [a scheduler] isn't performing well, we can bring them back for more training," said one administrator.

According to interviews with administrators at site visit facilities, 47 percent of VAMCs[64] reported providing some shadowing or placement of new schedulers with more experienced schedulers. However, the delivery of on-the-job training at VHA is not standardized, resulting in variable use across facilities. Our survey of schedulers revealed that 28 percent of schedulers received more than 20 hours of on-the-job training while 45 percent received five or fewer hours, as shown in Figure 8-2. Overall, 43 percent of schedulers desire more on-the-job training (see Figure 8-4), and for the schedulers who receive few hours of on-the-job training, the experience can be challenging. As one scheduler said, "We go straight from training in the classroom to being on our own in the clinic. [We're] just thrown into the deep end."

---

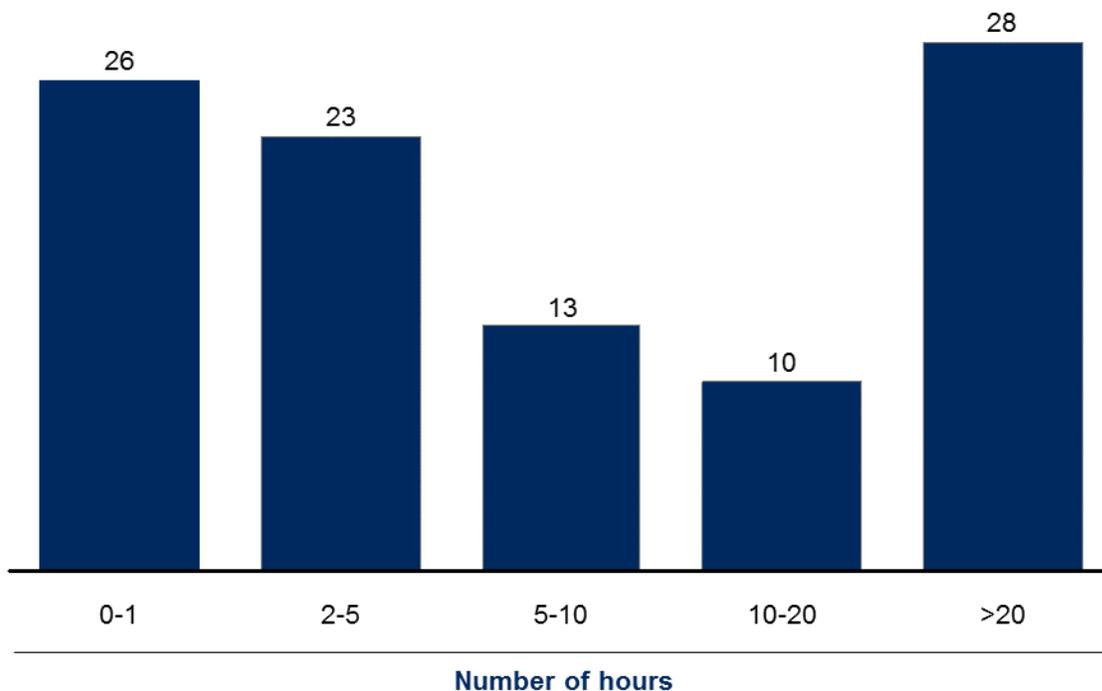
Figure 8-4. Response of Schedulers Asked: "How Many Hours of Training Specific to the Following Topics did you Receive in Your Initial Training: On-the-job-training (for Example, Side-by-Side Coaching, Receiving Feedback)?" 2015 VHA Employee Survey, n = 825 Responses from 97 VAMCs and 128 CBOCs

How many hours of on the job training (e.g., side by side coaching, receiving feedback) did you receive in your initial training?
Percent of schedulers, N=825 responses from 97 VAMCs and 128 CBOCs


SOURCE: 2015 VHA Employee Survey

Figure 8-4 shows the number of hours of initial on-the-job training reported by schedulers for each facility. This survey shows that while some facilities provide over 20 hours of initial training (28 percent), almost half receive fewer than five hours (21 percent zero to one hour, 24 percent two to five hours). Source: Assessment E VHA employee survey, 2015.

VHA high-performance example: Cincinnati VAMC
An example of a facility that does provide on-the-job training is the Cincinnati VAMC, where all new schedulers receive at least one to two weeks of on-the-job shadowing and working one to one with another supervisor before working independently. Administrators in this facility, as well as leaders at several other facilities, mentioned that shadowing actually did not add much time to the training process, as schedulers could do this while waiting to be granted official access to the system, which can take days or weeks (Choice Act site visits, interviews, 2015).

For the 45 percent of facilities that provide five or fewer hours of initial on-the-job training, scheduler group interviews suggest that the need to quickly fill scheduler vacancies may lead to

schedulers being immediately put to work, rather than having time for on-the-job training. This same issue was raised as far back as the 2007 VA Office of the Inspector General Report. Indeed, 23 percent of scheduler positions VHA-wide are unfilled, according to the VHA Talent Management Office. As one AO reported, "In an ideal world, everyone has time to shadow. Unfortunately, we're so desperate for bodies right now that we can't wait [for them to start on their own]."

8.2.2 VHA's Scheduling Processes are not as Simple and Standardized as Those in Many Private Sector Health Systems, Increasing Schedulers' Need for Training

8.2.2.1 Unlike VHA, Many Private Sector Health Systems Streamline the Overall Scheduling Function, Which Results in a Minimized Need for Training

As discussed in Provider Availability Section 5, Scheduling Process Section 6, and Scheduling System Section 7, VHA schedulers must navigate a large number of processes and unique VHA responsibilities while relying on difficult-to-use software. This results in the need for significant training for schedulers in order to become high-functioning. Private sector health care systems, on the other hand, aim to minimize the amount of training needed by simplifying and automating as much of the scheduling process as possible. "We try to make their role in the scheduling process like clicking a button, so all they have to learn is how to provide a great patient experience," according to one private sector administrator. Some of the industry standard ways used to minimize training requirements include:

- **User-friendly software interface:** Private sector systems utilize user-friendly point-and-click GUI, which are similar to other scheduling tools used in an employee's personal life. In contrast, VHA schedulers must learn VHA's unique scheduling system. Further, compared to private sector scheduling systems, VHA scheduling software requires additional steps for even the most basic tasks such as finding an available appointment slot.

- **Minimized number of software programs:** In private sector, electronic medical record systems often have built-in scheduling functionality, reducing the number of unique systems schedulers must learn to use. VHA schedulers must learn to use multiple software programs, including VistA Scheduling to make appointments, CPRS to look at orders, VetLink for check-ins, Insurance Capture Buffer (ICB) to capture insurance information, Technical Reference Model (TRM) for documentation, and in some cases call center-specific software as well (for example Customer Relationship Management (CRM).

- **Business rules built into scheduling software:** Private sector health care systems build logic into the scheduling software to prevent mistakes from being made. As an example, if a patient is indicated to need a Sports Medicine appointment by the referring provider, only pertinent slots in the appropriate subspecialty clinic will be shown to the scheduler for booking. This capability is limited within VistA Scheduling.

- **Fewer scheduler responsibilities:** Private sector health systems have largely removed any non-scheduling related responsibilities from schedulers. One example of this is the

capture of wait times data, for which private sector schedulers usually do not play a role. VHA schedulers, on the other hand, must manage within an environment of ambiguous policies (for example, the use of desired date) used to capture data that the private sector can typically capture via its systems. See Scheduling Process Section 6 for more detail.

Compared to schedulers in many private sector systems, VHA schedulers work with a larger set of rules and processes that are widely variable in implementation and use less advanced technology. VHA has not done as much as private sector health systems to reduce the need for scheduler training.

8.2.2.2 Inconsistent Practices Within a VHA Facility's Clinics may Also Increase the Training Needs of Schedulers who Switch Between Clinics

Aspects of the scheduling process currently vary significantly between clinics. Examples include different implementations of national policies and clinic- or provider-specific scheduling rules. While some variations are necessary and found in private sector organizations as well, other variations could be standardized without harming clinical care.

When schedulers switch to a new clinic, these differences lead to challenges and mistakes. According to schedulers:

- "Switching to a new clinic is like learning how to be an MSA all over again"
- "It's really hard to start in a new clinic because everything is different"
- "Sometimes we have to cover in unfamiliar clinics when someone's out [on sick leave]. You feel so clueless"
- "I'm trained to be a float and in theory should be able to cover multiple clinics, but even I have trouble keeping up with all the differences"
- "When I find out I'm in a new clinic for the day, I know I'm going to fail before I even start"

While a portion of this clinic variability may be necessary (due to clinical differences between specialties, for example), much of the variability that makes it difficult for schedulers to rotate clinics is not. There are two sources of variation within VHA: common processes that have variable implementation and rules specific to particular providers and clinics.

An example of the former is patient reminders. As discussed in Scheduling Process Section 6, patient reminder use varies in terms of method and timing. One solution was adopted at the Detroit VAMC, where they adopted a standard appointment reminder process in which all patients receive a letter ten days ahead of time and an automated phone call three days ahead of time (Choice Act site visits, interviews, 2015). By implementing this across all of its clinics, Detroit VAMC was able to remove this source of variation while potentially improving patient access. This reduction in variation between clinics has resulted in improved ability to float schedulers across clinics. According to an administrator within the facility, "Our goal is to be able to have any scheduler work in any clinic."

An example of rules specific to particular providers and clinics was provided in group interviews with schedulers. One scheduler said, "Some doctors only want new patients in this time slot, some only want them in that time slot. How am I supposed to know all this?" Some of these

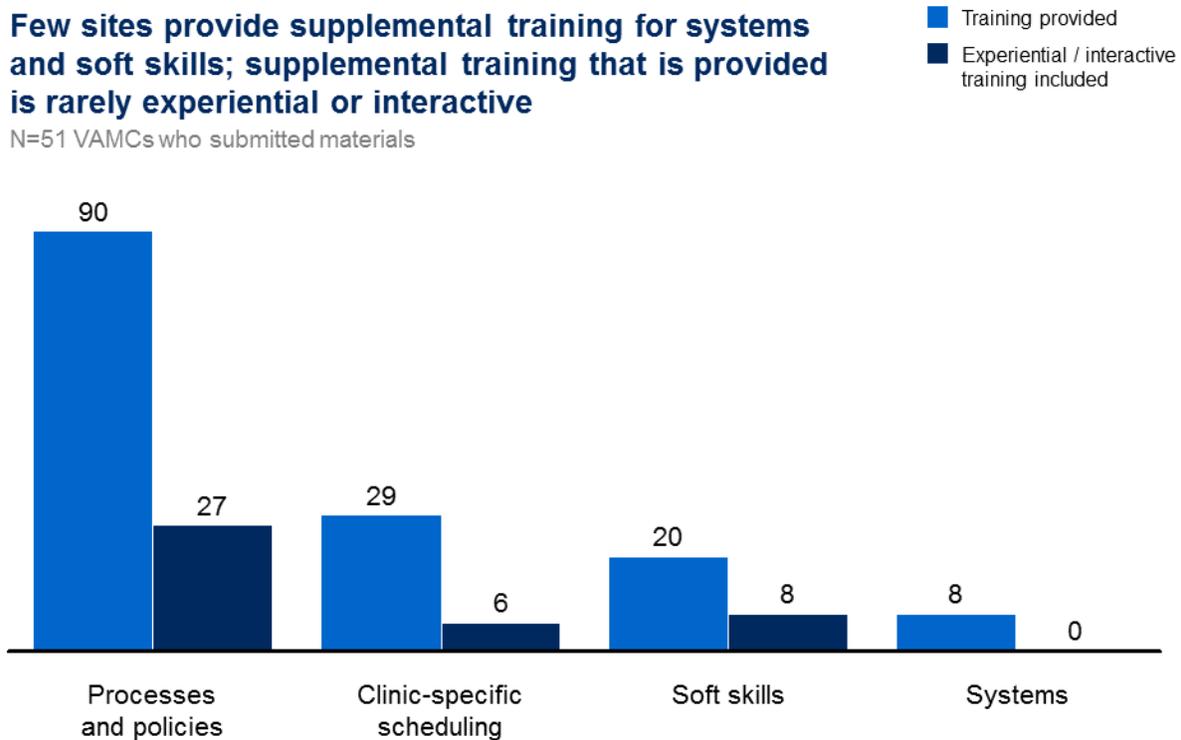
provider-specific preferences may be well-intended (for example to minimize chance of too many new patients scheduled in one day), but their impact on scheduling is clear: the more restrictions providers place on their schedules, the more difficult it is to learn how to schedule for these providers. Schedulers particularly feel the difficulty with learning a new clinic when provider preferences are not clearly documented. Undocumented rules are not written within the provider's profile or in any sort of manual for the clinic but rather must be passed down informally from one scheduler to the next or through direct conversations with providers. The existence of undocumented provider- and clinic-specific rules makes it more challenging for schedulers in a new clinic to avoid mistakes, as previously discussed in Provider Availability Section 5.2.5.

Private sector health systems have addressed the level of difficulty with which schedulers can rotate clinics in a number of ways, all with the goal of increasing the speed at which a new scheduler becomes proficient. The first way to reduce switching difficulty is through standardizing processes across clinics. According to one private sector administrator, "[We aim to provide the] same experience across our entire hospital for both patients and schedulers." This is accomplished largely through the standardization of schedule setup across providers and specialties, which is not currently done within VHA, as mentioned in Provider Availability Section 5. Additionally, private sector systems aim to minimize unnecessary clinic- or provider-specific rules and document all those deemed necessary within the system. This does not mean that all clinic should have the same practices for all processes, but rather that policies and process have a clear, published implementation practice and a clear delineation of between what processes and policies must be implemented a certain way and where facilities have flexibility. It also means that when facilities do customize a process, it is well documented and integrated into the system business rules to make the change easy to implement for schedulers. As discussed in 8.2.2 and in Scheduling System Section 7, private sector systems utilize their systems this way to reinforce clinic-specific practices.

8.2.3 Training Deployment Practices are Less Efficient Than They Could be

8.2.3.1 Facilities are Developing Duplicative Training Material

Ongoing training content creation is frequently left to individual facilities with minimal guidance, and VHA does not currently play a strong role in facilitating the dissemination of best practice materials across VHA facilities. "We are the ones responsible for our materials, but we don't get any guidance on how we should do that," reported one administrator involved with training. Administrators commonly feel that they lack the materials needed to train schedulers. As a result, many facilities develop their own ongoing training materials, as can be seen in Figure 8-5. For example, 90 percent of facilities develop materials for policies and processes. Looking deeper into policies and processes, we find most of these materials specifically cover scenarios for desired date and various lists, such as Recall and Electronic Wait List. These are nationally applicable content areas, which should be covered in TMS training, suggesting facilities do not regard the national training as adequate.

**Figure 8-5. Portion of VAMCs Locally Developing Training Material
by Content Area, 2015 National Data Call, n = 51 VAMCs**


SOURCE: Choice Act Assessment E Data Call

Figure 8-5 shows the portion of VAMCs that have developed training materials locally by content area. Processes and policies represent the most common content area (90 percent of VAMCs), whereas all other areas are <30 percent. The figure also shows that the large majority of locally developed material is not experiential. This analysis is based on manual review of training materials from 51 facilities who submitted materials in response to our national data call. Source: Assessment E national data call, 2015.

The proportion of facilities creating supplemental training materials for policies and processes has three implications.

- The national level could support local facilities greatly by improving national-level training on these topics

- Facilities who do create supplemental training materials could benefit from more sharing of those resources. For example, 30 facilities have created training materials just for desired date. At least some of that work is likely duplicative and would be unnecessary if facilities were sharing more materials with one another

- Schedulers in different facilities are likely receiving slightly different training on national-level policies. For example, from training materials we reviewed, one facility's training

explained that only new Veteran patients can be placed on EWL, while another facility's training included two exceptions to that principle.

In this case, the different trainings would clearly lead to different experiences for patients seeking appointments at these schedulers' facilities.

If facilities were sharing materials with each other, potential practices that could be used by a variety of clinics include nationally consistent standard training agendas, training checklists, and guides as can be seen in Figures 8-6 and 8-7 below. Figure 8-6 reflects a facility that uses exams to assess schedulers' readiness, and also seeks for what follow up actions may be needed to prepare the scheduler. Likewise, Figure 8-7 shows how a facility can standardize detailed parts of a process for schedulers.

Figure 8-6. Excerpt from MSA Training Checklist

Module 1: Desire Date/ Veteran's Choice List	Assessment Method Used	Rating	Follow up Action
Accurately obtains a correct desire date using the common language "What date would you like to be seen?"	□ Exam □ Observation □ Demonstration □ Verbal Discussion □ Audit Report	□ Performs competently □ Performs with assistance □ Does not perform competently □ Requires action plan	
Comprehensively explains the purpose of the VCL and the basic role of Triwest to patients interested in enrollment	□ Exam □ Observation □ Demonstration □ Verbal Discussion □ Audit Report	□ Performs competently □ Performs with assistance □ Does not perform competently □ Requires action plan	
Consistently adds patients scheduled 30 days beyond desire to the Veteran's Choice List in the appropriate VCL location	□ Exam □ Observation □ Demonstration □ Verbal Discussion □ Audit Report	□ Performs competently □ Performs with assistance □ Does not perform competently □ Requires action plan	
Notifies patients that they have been added to the Veteran's Choice List and gives them the toll free number and/or flyer	□ Exam □ Observation □ Demonstration □ Verbal Discussion □ Audit Report	□ Performs competently □ Performs with assistance □ Does not perform competently □ Requires action plan	
Can accurately identify the difference between wait times one and two	□ Exam □ Observation □ Demonstration □ Verbal Discussion □ Audit Report	□ Performs competently □ Performs with assistance □ Does not perform competently □ Requires action plan	
Appropriately uses cancel by clinic and cancel by patient	□ Exam □ Observation □ Demonstration □ Verbal Discussion □ Audit Report	□ Performs competently □ Performs with assistance □ Does not perform competently □ Requires action plan

Figure 8-7. Excerpt From "Scheduling How To's"

Desired Date	Recall Reminder
Definition: The desired date is appointment date on which the patient (external demand) or provider (internal demand) wants the patient to be seen.	**Provider Determines RTC Date (defined as internal demand)** **Definition:** Used for established patients who require a follow-up appointment greater than 90-days into the future.
• Patient Requests-Desired Dates are recorded without regard to appointment availability. • The desired date is to be determined jointly by the patient and the provider.	• Provider negotiates RTC visit with patient before patient leaves providers office. • Scheduler follows providers RTC text order in CPRS to determine if patient is to be scheduled (less than 90 days into the future) or placed on the Recall Reminder System via VISTA appointment management system.

Calculation:
A. Established Patient –Desired Date is based on Provider return to Clinic Order and patient preferred date. Established Veterans should be scheduled to be seen for the service requested within30days of their desired date.
B. New Patient-Desired Date is based on when the patient wants to be seen.
C. The patient's desired date is entered into the computer and is not altered no matter when the appointment is scheduled.
	Calculation:
	A. If the provider RTC order is identified greater than 90 days into the future, the patient is placed in the Recall reminder software for the date on the provider's order to be scheduled.
	B. Recall reminder list is pulled up daily by scheduler.
	C. Patients are called with negotiated date from providers RTC note:
	  1. Primary Care- patients are called one month prior to RTC date. Patients are called 3 times on 3 consecutive days.
	  2. Specialty Care- Recall letters are mailed 3 weeks prior to RTC date, if no response another letter is mailed 1 week prior to RTC date.

Special Notes: • The clerk is not to use the clinic availability to initiate the desired date. • If the patient does not agree or accept recommended interval and request to be seen more than 30 days later, resolution will be referred back to the provider for further guidance. • Schedulers will not Blind Schedule (defined as scheduling appointments without patient input) at any time. • When no guidance is provided by the provider, the desired date will be determined by asking the patient for his/her preference.	**Special Note:** • Desired Date changes only if patient requests an appointment greater than 30 days from the providers return to clinic order. • Primary Care- The scheduler will make three (3) documented attempts to contact the patient to schedule their appointment; if no response, a letter will be mailed to patient to contact the clinic to schedule the appointment. The patient has thirty one (31) days to call and schedule his/her appointment before being removed from the recall reminder software. When a patient is removed due to failure to contact after 31 days, a clerical note will be entered. • Specialty Care- If Patient does not call in response to the recall reminder letters, 3 documented phone attempts will be made to contact the patient to schedule the appointments. If attempts to contact the Patient have been unsuccessful, the patient will be removed from the recall reminder software.

Source: Assessment E national data call, 2015

8.2.3.2 Lack of Clear Ownership for Training Hinders Dissemination of Standard Materials and Consistent Facility-level Delivery

In our private health systems interviews, more than half had full-time trainers who deliver scheduler training. In VHA, 12 percent of site visit facilities reported using trainers,[65] and these are often provided by the VISNs for their multiple facilities. Instead, most facilities relied on other full-time staff (for example, chief of Health Administration Service (HAS),[66] Nursing administrator chief, an IT program support analyst, or an MSA supervisor) to monitor and deliver training. According to clinic administrators, this lack of a dedicated trainer results in a void of clear ownership over both training material development and delivery. Consequently, that responsibility may default to the clinics in which schedulers operate. "The burden is on [clinic managers] to make sure [schedulers] are up to date with national policy," said one AO. "It's often left to the clinics to provide training whenever rules change," reported another AO. The lack of ownership over training may result in inconsistent training, and thus scheduler behavior, across clinics, as seen with the variable uses of EWL mentioned in Scheduling Process Section 6. While training is obviously not the sole driver of variations like these, consistent training would enable more consistent process and policy implementation.

Additionally, MSA reporting structures vary significantly across VHA, potentially resulting in training differences observed across facilities. Whereas some MSAs are directly responsible to the clinic in which they sit, some MSAs, even if they sit in-clinic, report to centralized organizations. There are several different centralized organizations seen within facilities in VHA, including Health Administration Services (HAS), Medical Administration Service (MAS), and the Business Service Line. Depending on the facility, the degree to which MSAs report to these central organizations varies. These are described in Figure 8-8 below:

---

[65] Site visit scheduling administrative leader interviews, N=2 of 17 VAMCs

[66] HAS performs numerous medical center-level administrative and clerical functions, including scheduling, medical records management, telephone switchboard operation, and other tasks necessary for the effective, overall management of inpatient and outpatient care (VHA 2008-056)

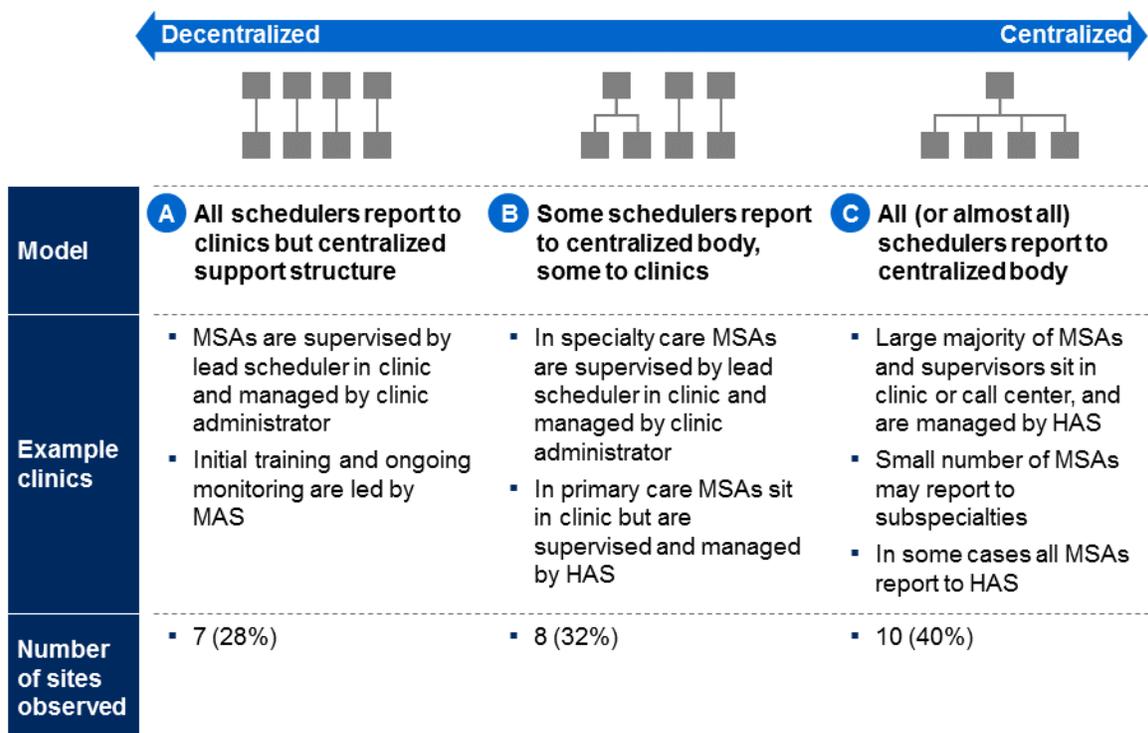
Figure 8-8. Archetypes of Reporting Structures Seen on Site Visits, n = 25 VAMCs


Figure 8-8 shows VHA archetypes of reporting structures observed on site visits. The chart shows that 40 percent use a fully centralized MSA reporting structure, 28 percent of VAMCs use decentralized reporting, and 32 percent use a hybrid approach. This analysis is based on site visit interviews with administrators responsible for scheduling at each facility. Source: Choice Act site visits, interviews, 2015.

Archetype C was the most common version (40 percent of site visit VAMCs[67]) we observed with schedulers reporting to a centralized body. In this archetype, a central organization manages MSAs in all services (except for a small number of complex sub-specialties in some instances) and supervisors from the centralized entity act as liaison between MSAs and clinics. All support functions for MSAs (for example, performance management, training) are operated by the central organization. Twenty-eight percent of VAMCs[68] operate in a decentralized structure, in

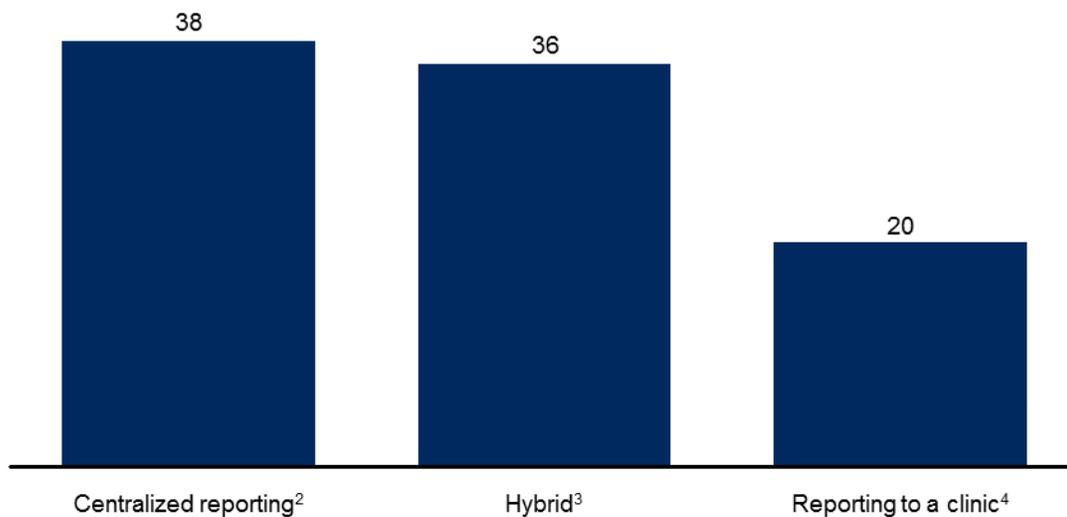
---

[67] N=10 of 25 site visit VAMCs
[68] N=7 of 25 site visit VAMCs

which schedulers report to individual clinic leadership. Thirty-two percent[69] reported a hybrid reporting structure in which some clinics reported to a central body whereas others reported to their individual clinics.

Of note, a significant portion (20 percent[70]) of VAMCs reported an in-progress or recent move toward centralized reporting for schedulers, with many switching from fully decentralized (archetype A) to fully centralized (archetype C). The major reasons reported for this move were more consistent training and improved oversight of MSAs and scheduling processes. Some were moving towards centralization by mandate of their respective VISN. Indeed, from our national data call we found that the more centralized a facility's MSA reporting structure, the more likely its schedulers were to receive ongoing training at least once per month, as seen in Figure 8-9.

Figure 8-9. Portion of Schedulers Receiving Ongoing Training at Least Once per Month by Reporting Structure, 2015 National Data Call, n = 24 MSA Supervisors From 20 VAMCs

How often do schedulers receive ongoing training?
N=24 MSA supervisors from 20 VAMCs[1]


1 Data for the frequency of ongoing training comes from 70 MSA supervisors from 36 VAMCs and 20 CBOCs. Here that data is combined with results from the Data Call, which has responses from 73 VAMCs regarding their reporting structure for MSAs. Of these 73 VAMCs who responded to the data call, 20 also had MSA supervisors submit the VHA survey. From those 20 VAMCs 24 VHA surveys were received.
2 A facility is considered to have "centralized reporting" if more than 70% of MSAs report centrally
3 A facility is considered "hybrid" if between 30% and 70% of its MSAs report centrally
4 A facility is considered to have "reporting to a clinic" if more than 70% of its MSAs report to a clinic

SOURCE: Choice Act Assessment E Data Call

Figure 8-9 shows the portion of schedulers reported to receive at least monthly training by reporting structure. Schedulers in centralized and hybrid reporting structures were reported to

---

[69] N=8 of 25 site visit VAMCs

[70] N=5 of 25 site visit VAMCs

be more likely to receive monthly training than those reporting to a clinic (38 percent and 36 percent compared to 20 percent, respectively). This data comes from 24 MSA supervisors across 20 VAMCs in response to our national data call. Source: Assessment E national data call, 2015.

The key difference reported between facilities with centralized reporting and facilities with decentralized reporting appears to be more consistent ongoing training. More consistent training, as shown in the figure above, is potentially due to more defined ownership of training across schedulers as well as improved ability to pull schedulers out of clinics for training, as mentioned in sub-section 8.3.2.2.

Regarding centralized reporting structures, some clinical services expressed concerns about the reorganization and how it would affect their clinic functioning. Providers, especially, were concerned that it would decrease accountability to their specific clinic needs, cause errors due to their scheduling nuances, and reduce the MSAs' sense of being part of the team. Despite these concerns, in examining the facility-reported audit performance 1,176 MSAs from 73 VAMCs in our national data call, we did not find any significant difference between the performance of schedulers at facilities with centralized reporting and schedulers at facilities reporting to a clinic. This suggests that centralized reporting structures can increase the frequency and efficiency of training for schedulers without negatively impacting scheduler performance.

8.3 Recommendations

As far back as the 2005 VA Office of the Inspector General Report (OIG), there has been a call for improved training for schedulers. A 2007 OIG report recommended mandatory and annual scheduler training, including training for the VistA Scheduling Systems. For additional detail on these reports, see Appendix F.3. While mandatory training policies were reported at all site visits, surveys showed that more than 20 percent of schedulers receive less than two hours of training per topic, and almost all schedulers believe training would be improved if it were increased.

According to interviews with VHA leadership, several initiatives are currently in progress to improve best practice sharing, which may include training materials. These include:

- **Creation of a Community of Practice:** ACAP recently launched a Community of Practice that is training-related, a virtual community meant to surface shared scheduler solutions across facilities. Training may be discussed within this community, but it is not its only focus. Over time, this program could guide facilities on creating additional training materials to simplify scheduling processes (ACAP, interviews, 2015).

- **Development of a knowledge management system:** Additionally, a knowledge management system is being created, which, although it is not exclusive to training, can facilitate the sharing of training materials across VHA (ACAP, interviews, 2015). This system is planned to be mostly functional (for example, FAQs section, inventory of training tools) by the end of 2015.

While these initiatives touch on several ways to improve best practice sharing, they may not address:

Implementation gaps: The above initiatives may not address the lack of training ownership in the form of a dedicated trainer at each facility with sufficient bandwidth to monitor and deliver training locally.

Scope gaps: The above initiatives, while potentially useful in codifying available best practices and materials already in use at the facility level, may not address the need for more national ownership of scheduling curriculum development, including content, delivery, and resource guidance. They also may not address the addition of experiential or on-the-job training for schedulers.

To fill these gaps, VHA should consider the following recommendations:

8.3.1 Utilize More Initial Training, on-the-job Training, and Experiential Methods to Equip Schedulers for Their Responsibilities

- **Ensure all schedulers, including non-MSAs, are receiving initial training, and also encourage more on-the-job training**. Increase tracking of initial training to ensure schedulers are receiving the mandated topics, and regularly report on training to facility and VISN leadership for accountability. Importantly, this training should include everyone who has scheduling privileges, not just MSAs, as per VHA's 2010 Scheduling Directive, and only schedulers who have received training should receive scheduling privileges on the scheduling system. Create a general on-the-job training curriculum, including time for the scheduler to learn facility- or clinic-level policies and processes and shadow a more experienced scheduler. Development of a competency assessment for schedulers to pass before they can begin scheduling would help ensure the delivery and effectiveness of initial and on-the-job training for schedulers. It would also provide facilities with a view of what gaps the schedulers still need to overcome and prevent schedulers from beginning to work before they are ready. With the implementation of recommendations in Assessment F to reduce scheduler vacancies (for example streamlining the hiring process and relaxing hiring regulations), VHA should be able to ensure schedulers are properly trained for their responsibilities and Veterans receive quality service.

- **Modify the national training curriculum to include more experiential training methods.** Disseminate materials to facilities along with guidance on necessary resources for successful delivery (like trainers, technology, and space). Experiential training should include live scheduling labs at each facility, as well as additional interactive classroom-based scenarios, and interaction with VHA's knowledge management system so schedulers can discover where to find additional resources. These experiential activities may require more trainer time, dedicated space, and additional technology resources than current nationally required training. However, experiential training should result in improved long-term retention of skills and higher performing schedulers.

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

111

8.3.2 Reduce Schedulers' Need for Training through More User-Friendly System and Streamlining National- and Clinic-Level Policies and Processes

- Continue to implement interim system improvements like VSE that are already in progress and will make schedulers' jobs easier to master: As mentioned in the Scheduling System subsection 7.3.1, VSE will address some of the software ease of use issues, including the lack of a "single screen" view of a provider's schedule and multiple unintegrated waitlists as well as the inability to support online patient scheduling. By addressing these technology issues, scheduler appointment booking and waitlist management will be more straightforward and thus easier for schedulers to master, potentially reducing the need for scheduler training.

- **Develop more streamlined policies and implementation support for VHA-specific policies such as the use of EWL:** As mentioned in Scheduling Process Subsection 6.3.1, examine existing policies to identify those that are particularly onerous (like recall) or inconsistently implemented across facilities (like EWL) and provide clear guidance on and support consistent implementation across facilities and clinics. This includes development of a user-friendly dashboard to manage lists as well as automation of as many processes as possible (for example, use of text messaging reminders).

- **Minimize unnecessary clinic- and provider-specific rules**: As mentioned in Scheduling Process Subsection 6.3.2, local provider and administrative leadership should be encouraged to eliminate all unnecessary provider- and clinic-specific rules, (for example specific time slots for specific types of patients for certain providers). All necessary rules should then be incorporated into the scheduling software automatically, which would require software system changes as outlined in Scheduling System Section 7. In the meantime, all clinic- and provider-specific rules should be documented within provider profiles and clinic SOPs. This will reduce the learning curve for schedulers switching between clinics.

8.3.3 Leverage Current Best Practice Knowledge and Develop Training Personnel to Make Training Deployment More Efficient

- **Integrate local best practice knowledge into the national curriculum used for initial training, and increasingly facilitate knowledge sharing between facilities**. Establish VHA-level leadership, which could be new positions or existing personnel (for example, the current training department within VA Human Resources), to own development and dissemination of best practice training materials. Specifically, these individuals could identify areas in need of additional training, collect and identify best practice materials already created by the field, improve upon these practices where possible, and disseminate them widely. This training leadership could then develop additional material to fill any remaining gaps. Existing best practice infrastructure, such as the Community of Practice and the knowledge management system, combined with the train-the-trainer program (below), could be used to accelerate best practice dissemination and ensure regular communication with VHA-level training leadership.

- **VAMCs and CBOCs should identify training leads in their facility.** Encourage each facility to have a local training lead and simultaneously organize a committee of training leads from VHACO and from facilities to help create and disseminate experiential training materials. This committee could also support facility training leads in implementing the revised national curriculum and adopt experiential training methods. Training leads could additionally take part in the Community of Practice and be responsible for disseminating materials from the knowledge management system to their schedulers along an appropriate timeline.

9   Scheduling Call Centers

9.1   Context & Approach

In accordance with the requirements set out in the Choice Act, this section examines whether the creation of centralized scheduling call centers would benefit the VHA scheduling process.

VHA's definition of a call center is:

> "A designated point in a VHA facility's call tree that has two or more staff dedicated solely to answering the phone. Call centers at the VHA have a scope of service of the types of calls they are designed to handle. Call centers can take many forms – from very large call centers, such as the VA Health Resource Center, to small call centers with a few staff embedded in a Community Based Outpatient Clinic" (ACAP, interview, 2015).

Outside of VHA, the typical private sector call center has 50 to 250 employees and receives inbound and makes outbound calls, usually for customer service or sales (Holman et al., 2007). Most private sector organizations (healthcare and other industries) would not consider a group of two staff to be a call center, as VHA currently does (Belfiore et al., 2015). Existing VHA-defined "call centers" (across several functions, not solely scheduling) fall into three main categories:

- National call centers, including the Veterans Crisis Line, Women's Health, and Smoking Cessation call centers
- Regional call centers, including several Health Resources Centers (HRC) and the Health Eligibility center. Both national and regional call centers are managed by the VA Corporate Business Office
- Call centers related to individual medical centers, which often include scheduling, pharmacy, and nurse triage (ACAP, interview, 2015)

Today, the majority of patient scheduling is conducted by individuals who sit within clinics at VAMCs and CBOCs (and who often have multiple roles that include scheduling and other activities). A portion of patient scheduling[71] is conducted at small call centers that support a facility or a group of facilities.

Within the Choice Act language for assessment E, we were asked to "assess whether the establishment of a centralized call center throughout the Department for scheduling appointments at medical facilities of the Department would improve the process of scheduling such appointments."

To conduct this portion of the assessment, our data sources included:

---

[71] 14 percent (Assessment E national data call, 2015)

- A data call for scheduling information completed by 73 VAMCs covering VHA operating and reporting structures for scheduling, scheduler headcounts, self-reported call performance, and call center specialties and responsibilities

- A survey with training and coaching questions for frontline schedulers (N=726) that can be used to compare responses from call centers and clinics. MSA supervisors (N=70) were also asked which metrics they regularly track and their opinions towards scheduling call centers

- National provider-specific call center benchmark data set from Benchmark Portal which includes employee counts, call volume, and performance metrics (Belfiore et al., 2015)

- VHA reviews of telephone services, including the 2014 Telephone Access White Paper and recommendations from other internal studies, including Managing Veterans Access via the Telephone (MVAT)

9.2   Findings

9.2.1   Most VHA Scheduling is Conducted Outside Call Centers; Where They Exist, VHA Scheduling Call Centers are Smaller Than the Provider Average

Scheduling call centers were created by various VAMCs to address local needs to handle call volume and provide patients telephone access. As such, VA has not historically coordinated scheduling call centers on a national scale. Based on the data call, an estimated fourteen percent of VHA schedulers are working outside of clinics and in scheduling call centers nationally, yet there is no comprehensive centrally available information about VHA's scheduling call centers, including information on:

- How many scheduling call centers exist

- How many schedulers these call centers employ

- What specialties the call centers support

- Which organizations the call centers report to

- What functions the call centers serve.

Simply put by one interviewee who ran a scheduling call center, "It would be nice to know where else there are [scheduling] call centers and talk to them." This lack of information is, in part, due to the fact that there is no central owner of scheduling call centers at VHA, as scheduling call centers are typically owned by the local facility or region. The MVAT project resulted in a documentation of basic business models related to scheduling (e.g.., centralized call centers versus teams in clinic) as well as initial best practices and options for structuring contact management (e.g., at the regional level) (Managing, 2014). However, because there is no centrally available scheduling call center information on metrics such as number of FTEs per call center and call center-specific performance on average speed of answer, this assessment collected basic information to provide a fact base for VHA.

Fourteen percent of VHA schedulers from facilities that participated in the national data call operate in what VHA considers call centers. The remaining schedulers operate in clinics. Most

VHA scheduling call centers are fairly small with a median size of 12 schedulers. Eighteen percent of all scheduling call centers have five or fewer schedulers (Assessment E data call; Choice Act site visits, interviews, 2015). VHA scheduling call centers also do not necessarily handle the same type of calls as those of other organizations. Thus, it is probably not appropriate to directly compare the performance of VHA scheduling call centers to industry call center best practices, nor to differentiate them from clinic scheduling. However, for reference, call centers across private sector providers have an average of 28 agents and call centers across industries have an average of 110 agents (Belfiore et al., 2015). See Appendix G.1 for more detail on call center best practices.

9.2.2 Existing VHA Scheduling Call Centers Have Highly Variable Organizational Structures and Scopes of Responsibility

The organizational structure of VHA scheduling call centers varies by location. Sixty-five percent of schedulers who operate out of a call center report to a central administrative office at the facility. Even the names and roles of these central groups differ across facilities: for instance, names of central groups include Health Administration Service (HAS), Medical Administration Service (MAS), the Business Service Line, and Ward Administration. The remaining 35 percent of call center schedulers report to a clinical service (such as Cardiology) despite the fact that they do not operate out of a clinic.

As shown in exhibit 9-1, VHA scheduling call centers support various specialties depending on the facility to which they are connected. Primary care is the most common specialty supported. 85 percent of scheduling call centers support primary care and 52 percent of all call center schedulers are focused solely on primary care. Optometry, sleep medicine, dermatology, and pulmonology are also common specialties managed by call centers.

Figure 9-1. Response of Facilities Asked: "What Specialties Does Your Call Center support?", n = 72 facilities

What specialties does your call center support
Percent of all call centers, N=72

Specialty	Percent
Primary Care	85
Optometry	57
Sleep Medicine	46
Dermatology	44
Pulmonary	43
Neurology	42
Orthopedics	40
Mental Health	39
Ophthalmology	39
Urology	38
Endocrinology	36
Ear, Nose, and Throat (ENT)	33
Physical Therapy	33
General Surgery	32
Gastroenterology	32
Audiology	28
Infectious Disease	28
Rheumatology	26
Nephrology	26
Oncology	26
Vascular Surgery	22
Cardiology	21
Rehabilitation	21
Podiatry	18
Dental	15

SOURCE: Choice Act Assessment E Data Call

Figure 9-1 shows the portion of call centers that serve various medical specialties. Some facilities will serve only a few (or just one) specialty, while others will serve almost all of them. Source: Assessment E national data call, 2015.

Decisions on which specialties scheduling call centers support are made locally and thus specialty coverage varies significantly. One scheduling call center visited only supported primary care and mental health. Another scheduling call center did not support primary care, but did support most specialties, including oncology, pulmonology, and dermatology.

As shown in exhibit 9-2, some functions are more common across scheduling call centers than others. Eighty-five percent of all scheduling call centers can cancel patient appointments. Booking follow up appointments and routing calls are also both fairly common across VHA. In contrast, functions, such as scheduling consults and dealing with overbooking, are much rarer.

Figure 9-2. Response of Facilities Asked: "What Functions Does Your Call Center Support?", n = 72 facilities

What functions does your call center support?
Percent of all call centers, N=72

Function	Percent
Canceling appointments	85
Receiving patient calls for follow-up appointments and scheduling appointment	83
Routing calls	82
Receiving patient calls for recall and scheduling appointment	81
Receiving patient calls for new patient appointments and scheduling appointment	69
Receiving patient calls for consults and scheduling consult	49
After hours canceling appointments	32
Calling patients for patient reminders	25
Calling patients for recall	24
Calling patient for recall and scheduling appointment	24
After hours scheduling appointments	19
Calling patient for follow-up appointments based on RTC order and scheduling appointment	15

Calling patient for consults and scheduling appointment	11
Booking provider administrative time	1

SOURCE: Choice Act Assessment E Data Call

Figure 9-2 shows the portion of call centers that serve various functions. The figure shows that several functions (such as "canceling appointments") are performed by almost all call centers, while some other functions (such as "overbooking providers") are performed by only a few. Source: Assessment E national data call, 2015.

9.2.3 VHA Does not Consistently Measure Performance Across its Scheduling Call Centers or Clinics

VHA does not centrally track information or performance metrics on all scheduling call centers[72]. As a result, some scheduling locations do not track any metrics. In many cases, this is because the scheduling location does not have the telephone systems, such as an Automatic Call Distributor (ACD), to track and record this data. Other locations track various call metrics, but do not report them centrally because they are not required or not "asked" to do so.

---

[72] VHA does however, track call metrics for all VAMCs with greater than 5000 unique patients (regardless if it has a call center or not). However, it is not tracked which data are from call centers and which are not (ACAP, interviews, 2015)

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

Across both call centers and clinics, some VHA scheduling locations measure first call resolution (FCR) and average call hold time, but these measures are not tracked or defined consistently, as captured in the figures below. FCR is a typical call center quality metric that measures the percent of customer issues resolved within one phone call into the service center (Madsen, 2012). Hold time is a common quality metric to ensure callers do not have a long wait time to speak to an agent (Chaturvedi, 2005).

Figure 9-3. Response of Clinic Administrators Asked: "How frequently is Average Call Hold Time for Patients Tracked and Reported?", n = 71 from 46 VAMCs and 20 CBOCs (certain facilities submitted multiple responses)

SOURCE: Choice Act Assessment E Data Call

Figure 9-3 shows the frequency with which average call hold-time is tracked and reported at 46 VAMCs and 20 CBOCs who responded to the VHA survey. Average call hold time measures the time patients spend on the phone waiting to speak with a representative. The figure shows that the tracking and reporting of this metric is highly variable, with 35 percent of call centers tracking it weekly and 31 percent not tracking it at all. Source: Assessment E national data call, 2015.

Figure 9-4 shows the frequency with which first-call resolution rate is tracked and reported at 46 VAMCs and 20 CBOCs who responded to the VHA survey. First call resolution rate measures the percent of calls that can be resolved without a transfer to an additional representative. The figure shows that the tracking and reporting of this metric is highly variable, with 23 percent of call centers tracking it weekly and 35 percent not tracking it at all. Source: Assessment E national data call, 2015.

9.2.4 VHA Call Center Performance is Below Industry Average Where it is Measured

Call center scheduling and clinic scheduling within the VHA cannot easily be compared, as the data does not define which data points are from call centers and which are from clinics. Additionally, there is no clear data on the number of schedulers per scheduling location. Thus, it is difficult to contextualize performance for any facility, regardless of call center structure. For example, a site with large call volume but with the same number of schedulers as a site with small call volume would understandably compare poorly with the smaller-volume site. Thus, this section of the report compares the current performance of VHA-defined scheduling call centers and clinic scheduling points with VHA's own targets.

Because it is not measured centrally for all scheduling call centers, this assessment collected performance metrics via a data call. Data available shows that average speed of answer (ASA) in scheduling call centers that participated in the data call was 79 seconds and average abandonment rate is 11 percent. In comparison, average private hospital call centers achieve a 32 second ASA and a 5.15 percent abandonment rate (Belfiore et al., 2015). This signifies that patients are waiting longer to reach a scheduler at VHA, and that patients often give up and hang up the phone.

Figure 9-5. Self-Reported ASA and Abandonment Rate for Scheduling Call Centers; n=65

Figure 9-5 shows the average speed of answer and the average abandonment rate for 65 call centers in 2014. The figure shows the average speed of answer is 79 seconds. The figure also shows that the average abandonment rate is 11 percent, meaning more than one in 10 callers abandons their call before being served. Source: Assessment E national data call, 2015.

9.2.5 Health System Scheduling Call Centers Seek to Maximize Performance by Leveraging Scale

9.2.5.1 Many Private Sector Provider Scheduling Call Centers are Large and Centralized

Since 2008, Cleveland Clinic has had a centralized scheduling call center with over 100 schedulers (Rodak, 2013). Centralization has led to a 28 percent decrease in abandoned calls, a decreased scheduling error rate, increased physician utilization of scheduling templates, and a 12 percent increase in the number of patient visits. According to the executive director of the call center, "By centralizing, we were able to capitalize on economies of scale," (Rodak, 2013).

Cleveland Clinic's call center provides a model for VHA; they enhanced their operations by establishing centralized call centers and achieved performance improvements as a result. As shared by Cleveland Clinic's Executive Director of the scheduling call center, "Centralized models for scheduling increase accuracy and patient access. We believe other hospitals and health systems can adopt this model and achieve similar results" (Rodak, 2013).

Geisinger Health System also has large-scale scheduling call centers in addition to its clinic schedulers who handle the processing of referrals, prescriptions, and medical records as well as book follow-up appointments as patients they leave their appointments (Geisinger interview, 2015). It has 154 schedulers across two call center locations off-site from their hospitals, completing 2.3 million outbound and inbound calls each year. They also have 26 call center agents who work from home but are virtually part of the main call centers and receive calls from the main phone queue. They support comprehensive scheduling functions for all specialties except for primary care, which is scheduled in the clinic. They also cover ancillary services such as lab testing, radiology, and procedural testing (for example, cardiac testing), but do not schedule surgeries. Schedulers are grouped into 14 "pods," each focused on a specialty or group of similar specialties. For instance, there are three medicine pods, including one that serves gastrointestinal, nutrition, and dermatology. Staff are trained to primarily support one pod and cross-trained to support one or two other pods as backup. Supervisors are grouped with pods in a ratio of 10 to 16 schedulers for every one supervisor.

9.2.5.2 Private Sector Scheduling Call Centers Measure Performance Consistently and Comprehensively

Geisinger Health System has a "very metric-driven" call center and scheduling organization, according to an executive interviewed for this assessment (Geisinger interview, 2015). Each scheduler receives a daily scorecard with his or her scheduling and call performance metrics. Schedulers are also offered an annual incentive of up to nine percent of their salary based on individual performance across a group of metrics that varies each year. In 2015, the incentive is based on the performance of the percentage of calls answered within 30 seconds, average answer delay, slot utilization, and percentage of hospital discharges that are scheduled within two days of discharge.

When asked how Geisinger Health System was able to successfully shift from a decentralized to a centralized model for scheduling, the executive interviewed said, "It's very hard, but if you provide results and you're transparent with information on your performance, you can make it work." This approach focused on proving the concept via improved performance, is similar to that of the VA New York Harbor Healthcare System, which has one of the largest and highest-performing scheduling call centers in the country. In 2014, this VAMC had the best abandonment rate performance (1.0 percent) and fourth best ASA (10.2 seconds) across all VAMCs (SAIL, 2014). This facility shared that one can "make the case [for scheduling call centers] by comparing call center metrics and clinic metrics," because call centers will outperform clinics on scheduling and phone metrics.

To ensure the quality of patient interactions with schedulers at Cleveland Clinic, calls are monitored and reviewed by supervisors and coaching staff. In order to measure the satisfaction, patients have the option to take an after call survey to rate their experience. Data collected from this survey is then used as a patient satisfaction metric in the call center. Patients are asked the following questions (Cleveland Clinic Interactive Voice Response, 2015):

- "Was your request to schedule or reschedule completed?"
- "Were you satisfied with the location of your appointment?"
- "Where you satisfied with the time of your appointment?"
- "Were you satisfied with the provider you were scheduled with?"
- "Was the person you spoke with courteous?"
- "Was the person you spoke with knowledgeable?"
- "On a scale of one to five, how satisfied were you with the overall experience?"

9.2.5.3 Private Sector Scheduling Call Centers Have Tools That Optimize the Scheduling Process

Historically, each clinic at the Cleveland Clinic had its own schedulers who booked appointments for only their assigned service areas. To ensure provider-specific scheduling rules and preferences were accommodated, schedulers followed rules from paper notes and manuals. Today, functionality in their scheduling system guides schedulers to the appropriate physicians based on key words the patient uses. For example, if the patient mentions a headache, the scheduling system triggers a series of questions about headaches for the scheduler to ask the patient. Answers to these questions automatically direct the scheduler to the appropriate department and patient. This allows schedulers to book appointments for a wide spectrum of specialties and providers (Rodak, 2013). Each scheduler at Cleveland Clinic can book an appointment with any specialty or procedure, except hematology, oncology, cardiology, and operating room procedures.

At Geisinger Health System, the leadership of the scheduling call centers credit technology as part of its success, noting that the call center technology "wouldn't be available in a decentralized model" because it is cost prohibitive. He added, "without a strong workforce management tool, we wouldn't know where our peaks and valleys [of call volume] are" (Geisinger interview, 2015). Geisinger Health System's call center has workforce management

software that tracks and projects call volume, allowing managers to adjust the staffing of schedulers accordingly.

9.2.6 Larger Scale Call Centers Have Better Performance Outcomes

9.2.6.1 Centralizing Scheduling Could Improve Customer Experience for Patients and Could Reduce Staffing Needs

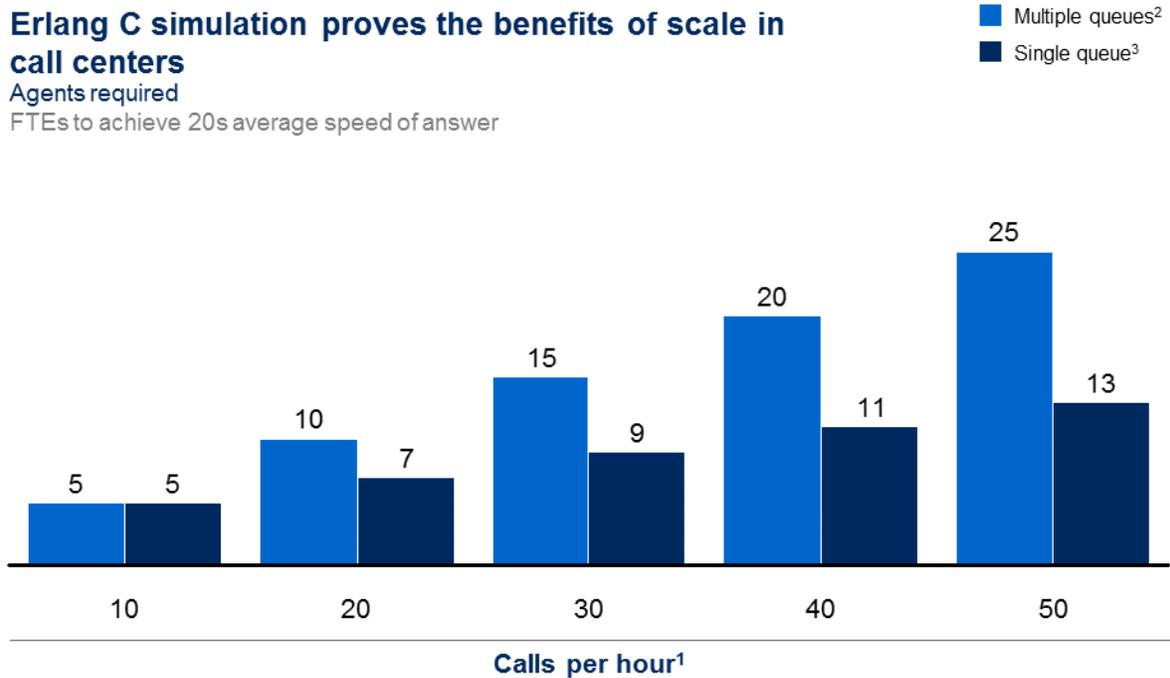
The goal of managing capacity in any call center is to efficiently match the available resource capacity (supply of schedulers) against the incoming call volume (demand), while maintaining a desired service level (average speed of answer). This can be particularly challenging because calls arrive randomly and are thus hard to predict. In order to best estimate the required capacity and service levels, statistical queue modelling tools are used. The most prevalent model, the Erlang C, is a modeling formula used in call center scheduling. Erlang C is based on three factors:

- The number of agents (schedulers) answering calls
- The number of incoming calls (arriving at random times modeled as a Poisson distribution)
- The average amount of time it takes to serve each call

Given a set volume, average call duration, pattern of calls, and desired speed of answer, Erlang C can be used to understand inherent tradeoffs between service levels and staffing requirements.

Figure 9-6. Benefits of Scale in Call Centers; FTEs Required Based on Queue Characteristics

Erlang C simulation proves the benefits of scale in call centers
Agents required
FTEs to achieve 20s average speed of answer

Legend:
- Multiple queues[2]
- Single queue[3]


Calls per hour[1]

1 Assumes 600s average handle time
2 Number of queues scales with call volume, each queue handles 10 calls / hour
3 All call volume merged in one queue

SOURCE: Chromy, 2011

Figure 9-6 shows a relationship between call volume (calls per hour) and agents required to handle that volume. It demonstrates that the resource need is significantly lower if all call volume is pooled in one queue as opposed to handled in multiple queues of identical and constant capacity. As simulated in an Erlang C model, a queue of 10 calls/hour at 600 second call duration needs five agents staffed in order to reach a 20s average speed of answer. Handling times that volume (50 calls/hour) in five identical queues requires 25 agents, while pooling the same volume into one single queue would require only 13 agents. The capacity savings of 12 agents can be redeployed to improve service levels or increase staffing in other queues. Source: Erlang C simulator, accessed June 5, 2015.

The exhibit above illustrates staffing benefits, controlling for service levels, achieved from pooling call volumes using the Erlang C model. Calls can be received at the same physical location or can be pooled virtually. For instance, a queue of 10 calls per hour at a 600 second average call duration needs five agents staffed in order to reach a 20-second average speed-of-answer. Therefore, handling five times that volume (fifty calls per hour) in five identical queues requires 25 agents. In contrast, pooling that same volume into one single queue would require only 13 agents. The reason for this is that at an increased scale, the real-time matching of calls to call agents is much more efficient, given the random nature of call arrival patterns (Chromy, 2011). This explains why Cleveland Clinic requires fewer schedulers now that it has created a

centralized call center (Rodak, 2013). In the example above, the organization could also choose to pool calls into one queue but still maintain all 25 of its agents. Service metrics would improve significantly (approaching 0 seconds ASA) because only 13 agents would be needed to meet the previous service levels (Chromy, 2011).

VHA is not currently leveraging potential economies of scale in scheduling. Many scheduling phone calls are handled in decentralized clinics manned by one to five schedulers (Assessment E data call, 2015), who are also performing multiple other functions, and therefore possibly away from the phone. This means that VHA is not performing at the service level it could achieve by increasing centralization. Alternatively, this finding shows that with the same service levels as today, VHA could reduce the number of schedulers needed. Implications for the number of required schedulers are particularly relevant because 23 percent of approved scheduler positions are currently vacant as mentioned in Scheduling Process Section 6, Figure 6-7.

Increasing call center scale could also improve the customer experience by creating a single location for patients to call into. Today, patients calling to schedule appointments often have to call different phone numbers, potentially navigate different parts of the phone tree, and talk to different individuals to schedule appointments across various clinics. In fact, of the site visit locations participating in the pre-site questionnaire, only 21 percent have a single, centralized phone number for patients to call for appointment scheduling (Choice Act Pre-site visit questionnaire, 2015). Further, as noted in Scheduling Process Section 6, process vary significantly across clinics in the same facility, which can complicate the scheduling process further. This is particularly challenging when a patient is trying to schedule multiple appointments on the same day because each scheduler may not be able to book, let alone, see appointments in another clinic. In contrast, call centers enable the patient to call one phone number and talk with one scheduler. That scheduler can book and coordinate multiple appointments.

VHA high-performance example: Detroit VAMC
Detroit VAMC shared that they strive to be a "one stop shop" where patients can make almost all of their appointments through calling a single phone number and phone tree branch into the call center. VA New York Harbor Healthcare system, which has 25 schedulers serving three areas of New York City, is one of the highest performing VHA scheduling locations in terms of ASA and abandonment rate (SAIL, 2014). The scheduling call center for the VA New York Harbor Healthcare System has one central, toll free scheduling phone number, but also provides "warm transfers" to nurse triage and pharmacy offices so that the patient does not need to place another call (Detroit Scheduling Call Center, interviews, 2015; New York Harbor Healthcare System, interviews, 2015).

Many administrative leaders at VAMCs believe that shifting some scheduling workload to call centers relieves the burden on in-clinic schedulers and allows them to focus on the patient experience. Select quotes from site visits detailing the relationship between call center scheduling and clinic scheduling include:

- "In-clinic MSAs focus on patient interaction as well as scheduling ... [The call center] has minimized missed opportunities and abandoned calls."
- "All schedulers appreciate the presence of the Call Center because it removes a substantial set of tasks from their responsibilities"
- "[The call center] lightens [the] call workload of clinic-based MSA"

Not only do call centers improve the patient experience of calling in to schedule an appointment with VHA, they also may improve the in-clinic experience of Veterans by reducing unnecessary phone traffic that disrupts care. As mentioned in Scheduling Process Section 6, VHA schedulers must juggle many tasks in the clinic. These tasks include things that are unique to VHA, such as wait time capture and waitlist management. This can result in challenges balancing various tasks such as checking patients in, answering phones, and booking appointments. "There are so many distractions it is easy to make a mistake," according to one manager interviewed on a site visit. By allowing some scheduling tasks to be completed outside of the clinic, clinic schedulers may have more time to focus on the patients that are physically present in the clinic.

Finally, creating large call centers across the country and queuing calls across them could provide longer hours of operations. By routing calls across regions, an Eastern time zone VHA could provide phone coverage three hours after the end of its business day by routing calls to the west coast. Routing of calls across time zones could also support 24-hour coverage.

9.2.6.2 Centralized Scheduling Call Centers Have Lower per-Unit Resource Costs and put Less Stress on Space-Constrained Facilities

Today, most schedulers operate out of the facilities they serve (for example, VAMCs, CBOCs), either sitting in the clinic they schedule for or in an on-site space designated as the call center. As mentioned in Assessment K's report, VHA facilities are particularly space constrained with a projected $11 billion on construction projects attributed to space needs over the next ten years (total capital need is $52 billion). However, relocation of a portion of schedulers across VHA to space outside the main clinical facilities could create a material amount of space.

Placing staff outside of facilities could also present an opportunity to hire in locations where there is a greater availability of qualified schedulers. Differences in location can have large staffing implications. For instance, discussions with the Palo Alto VAMC highlighted that the high cost of living in Palo Alto was a major issue. One administrator shared "It is hard to hire a GS5 person at that salary in Palo Alto, but could in Reno." This issue has led leaders in Palo Alto and Reno to explore the creation of a region-wide call center spanning a portion of VISN 21. This effort aims to leverage locations where there is a lower cost of living, and thus lower turnover, in order to better service phone calls.

Additional central scheduling call centers could also lead to improvements in procurement of hardware, software, and telephony costs (Paulding, 2013). For instance, Xerox estimates that consolidating operations can achieve five to ten percent technology savings, driven by platform and network savings, shared customer relationship management applications, consolidated customer self-service applications, improved call routing efficiencies, and optimized agent

desktop tools ("Contact," 2013). Technology cost efficiencies are achieved in larger call centers "because more agents are taking advantage of the same core set of materials. The use of one software platform can spread a single software license to all agents in a center" (Houser, 2015).

9.2.6.3 Larger Scale Call Centers can Provide More Coaching, Training, and Career Options Than Clinics

Across industries, larger scale call centers generally provide in-depth coaching for their frontline staff. This is because managers are co-located with staff and can spend significant time with them (Houser, 2015). At VHA, schedulers working in a call center were almost three times as likely as peers located in clinics to report receiving more than five hours of one-on-one or group coaching and feedback each week by their managers. Further, schedulers in call centers also reported receiving more on-the-job training than in-clinic schedulers (49 percent to 35 percent respectively). As current VHA scheduling call centers are small, these coaching benefits might be even greater in a larger scale call center. This finding is especially relevant as training is a crucial element of ensuring appropriate scheduling practices, as detailed in the Scheduling Process and Training Sections.

Below are site visit quotes from clinic administrators who do not operate in a call center responding to the question, "How much time do you spend with schedulers discussing how to improve the scheduling process, mentoring or training, or discussing new or changed policies?" As the quotes demonstrate, not all administrators are spending significant time coaching.

- "[We have] weekly MSA meetings [and] daily one-on-one training when needed"
- "…No regular discussions because [schedulers are] doing well"
- "There is weekly, open communication about performance metrics, daily audits of scheduler performance and work plans for improving individual MSA performance"
- "Monthly for one-on-ones to review performance, solicit improvement ideas, review any audit findings"
- "[I spend] 10-15 minutes per day supervising and giving performance feedback. I spend most of my time in meetings"
- "Not a lot of time to do this; [it's] 'feast or famine' based on availability" (Choice Act site visits, interviews, 2015)

Increases in scale also allow larger call centers to offer resources that a 10 or 15 person call center could not, in order to optimize operations. For instance, across industries, larger call centers typically have team leaders, quality analysts, reporting analysts, network analysts, workforce managers, telecom analysts, recruiters, and trainers (Bergevin et al., 2010). Individuals in these roles can ensure the call center runs as efficiently as possible and enable supervisors to focus on coaching.

Paired with additional management layers (such as supervisors and managers), non-frontline call center roles mentioned above provide career options that may not exist today for VHA schedulers. Twenty-three percent of approved and funded scheduler positions are vacant and 13 percent of MSAs turnover each year (VHA Healthcare Talent Management Office Data,

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

129

2015). New promotion options in call centers could provide much needed relief to managers who share that "[schedulers] leave the second they get another opportunity here at the VA or anywhere else" (Choice Act site visits, interviews, 2015).

Providing career advancement options for schedulers is one reason Geisinger Health System uses centralized call centers. It is also a major focus of their organizational structure. Their scheduling call center offers a career ladder with four levels of scheduler positions. New schedulers are at "level 1" for about six months until they are fully trained. "Level 4" schedulers are those that Geisinger Health System is grooming for management positions. They "get involved in policy development, training process, process improvement, and are required to pass a National Association of Healthcare Access Management (NAHAM) certification" (Geisinger interview, 2015). Additionally, schedulers at the scheduling call centers are typically recruited into other roles in the call center including quality assurance, training, provider template creation, workforce management, and analysis.

9.2.7 Implementation Difficulties Raised by Facility-Level Staff Highlight Prerequisites for Larger Scale Call Centers

Issues raised about the small scheduling call centers that exist today can inform the design of future, larger call centers. During site visit interviews, 76 percent of call center schedulers and supervisors interviewed[73] shared barriers specific to call centers. Of those barriers shared, 32 percent[74] cited challenges learning the different rules and preferences of various clinics. For instance, one call center employee said "different rules for each clinics makes it so hard to book, [it] even varies by provider." This challenge highlights the needs to standardize processes across clinics or introduce an improved system that can automatically incorporate various clinic practices, like Geisinger Health System and Cleveland Clinic did, before instituting a larger scheduling call center. Challenges with clinic variation also might explain why larger call centers have not been pursued in the past, because high variation exists today.

If VHA were to adopt a standardized approach, this could address concerns that were raised by senior administrative leaders including:

- "[Call center schedulers don't] understand the nuances of facilities and specialties."
- "Call center personnel need to have knowledge of the patients, clinics, providers (nurses, doctors, pharmacists, etc.), facility, etc., so they have an understanding of context and circumstances and can provide a personal touch."
- "The major barrier is that you need schedulers who know the facility, the clinics, the providers, and the patients." (Choice Act site visits, interviews, 2015).

Twenty percent of call center supervisors and schedulers[75] identified the phone system, particularly the inability to pull detailed data about patient calls from the phone system, as a

---

[73] Site visit call center scheduler and supervisor interviews, N=19 of 25 respondents
[74] Site visit call center scheduler and supervisor interviews, N=8 of 25 respondents
[75] Site visit call center scheduler and supervisor interviews, N=5 of 25 respondents

major challenge. One scheduler shared "through the system there is no way to determine the reason for each call and other important information." It might be possible to sustain a small call center with minimal phone technology, however larger VA call centers tend to need more sophisticated tracking (HRC, interview, 2015).

Forty-four percent of call center supervisors and schedulers[76] mentioned not having adequate staffing to handle the high call volume. This may be because scheduling management did not adequately staff the call center or because of overall staff shortages. As discussed, larger call centers could more efficiently leverage existing staff and minimize some of this challenge.

Twelve percent of those interviewed[77] cited the lack of physical space. As mentioned above, if scheduling call centers are created outside of the current medical facilities, call centers can use greater space, and facilities can reclaim much needed clinical and office space. Other barriers mentioned above, including the poor phone system, inadequate staffing, and the lack of physical space could likely be addressed by increasing the scale of the call center and by following other recommendations throughout this report.

Facility-level staff also see benefits from the current, small-scale scheduling call centers, even though they are sub-scale. Quotes from scheduling staff across site visits and the survey include:

- "[Call centers] provide coverage when schedulers may be on leave or when clinics are very busy…and help with breaks and lunches. Schedulers get a better understanding of various clinics and their processes. Decentralizing will not provide adequate coverage in clinics."

- "[The] call center has reduced some of the administrative/call burden off of certain primary care and specialty care schedulers."

- "[The call center has] helped tremendously -- clerk at front desk can now focus on patients in front of them".

9.2.8 Outside of Scheduling, VA has Proven it has the Capabilities to Sustain Call Centers at Scale

In place since 2002, the VA National Call Center—Health Resource Center (HRC) provides an example of what a large-scale VA scheduling call center could look like. HRC is a call center that "provides customer service and support…regarding VA health benefits, eligibility, billing and pharmacy-related inquiries" (HRC, interview, 2015).

HRC sits within VHA's Chief Business Office (CBO) and employs over 1,000 people. It responds to over six million Veteran inquiries by way of phone, email, and web chat each year. Despite agents working across multiple locations (Topeka, Kansas, Waco, Texas, and Canandaigua, New York), it has developed standard operating procedures (SOPs) and job aids to optimize processes. HRC has existed since 2002 and utilizes a sophisticated tracking and workforce

---

[76] Site visit call center scheduler and supervisor interviews, N=11 of 25 respondents

[77] Site visit call center scheduler and supervisor interviews, N=3 of 25 respondents

management tool that allows managers to plan agent staffing needs based on projected call volume.

The HRC has a separate training center and offers between four to five weeks of training for all new employees, including two weeks of on-the-job training. Once agents are fully trained, their supervisors audit ten calls per month to ensure no additional training is needed.

HRC managers have mentored other VA call centers that are trying to build scale, including the Veterans' Crisis Line and the National Call Center for Homeless Veterans. According to a Choice Act interview, HRC was the first federal governmental call center accredited by the International Customer Management Institute and therefore provides an example for what VA scheduling call centers could eventually achieve.

9.3   Recommendations

As these findings suggest, VHA could benefit from enhanced use of call centers for scheduling, consistent with recent findings of other reports. For example, the NVTC recommended that VHA "should centralize the call and scheduling functions into facility-based call centers with extended hours of operations", and "invest in more current and usable telephone systems" ("Opportunities," 2014). A 2012 GAO report recommended that VAMCs implement best practices to improve telephone access for clinical care (this included but was not limited to scheduling). An internal 2014 report on PACT call centers recommended the establishment of additional call center metrics, the creation of a metric to measure Veteran satisfaction with call centers, and the need for appropriate staffing to handle patient phone calls. Previous reports have not made specific recommendations on how these efforts would be implemented generally nor how they would apply more specifically to the scheduling context. See Appendix G.2 for additional detail on past reports related to call centers.

According to interviews with VHA leadership, a number of initiatives have been launched to address some of the challenges presented above. These initiatives address a broad range of call centers (though none of the following efforts are exclusive to scheduling), and include:

- Efforts to study how VA call centers should optimize their operations and pilot new solutions, including:
  - o **Leveraging learnings from the MVAT project**: The Managing Veterans Access via the Telephone (MVAT) working group was launched in September 2013 out of the Telephone Access and Contact Management (TACM) office to capture best practices related to people, process and technology components found throughout VA call centers. The project lasted for one year and documented where many of the call centers operate, as well as their staffing composition and services (MyVA, Meeting Minutes, 2015). The three stated learnings regarding existing VA call centers include:
    - – There is no standard best practice for how to handle calls from Veterans
    - – There are pockets of excellence throughout the VISNs and VAMCs, but these successes are not often shared outside of the individual VISN or VAMC

- Each VISN and/or VAMC has adapted their call management model to meet their local Veteran population needs, using the resources they have available to them (MyVA, Meeting Minutes, 2015).

  o **Piloting of solutions via IVAT:** Improving Veterans Access via the Telephone (IVAT) was launched in September 2014 and will run until September 2015. It intends to build on learnings from MVAT. As part of this effort, VISN 19 is piloting new concepts with support from the IVAT team, which will help inform planned revisions to the Telephone Improvement Guide (VHA Telephone Access White Paper, 2014).

- Efforts to convene VA call centers in order to create a centralized understanding of the VA call center footprint and share best practices, including:

  o **Establishment of a VA-wide call center task force:** For the first time in VA history, owners of major call centers are coming together to create a common understanding of the current state of call centers at VA and share information on best practices. The kickoff meeting was in April of 2015 at the HRC call center in Topeka, Kansas. Many call centers sent representatives, including Caregiver Support, Women's Health, Coaching into Care, and the Combat Call Center. Leaders from the Office of Veteran Experience and OI&T also attended. The stated goal of the first meeting was threefold: allow call centers in attendance to network with one another, create a sense of unity surrounding contact management, and understand the missions of each call center in attendance (MyVA, Meeting Minutes, 2015).

- **Efforts to directly improve the Veteran experience of navigating call centers, including:**

  o **Exploration of a single phone number for Veterans:** Since October 2014, The Veterans Experience Office, under guidance from Secretary Robert McDonald, is examining the more than 900 Veteran-facing, toll-free phone numbers that exist today and what would be needed to provide a single 1-800 number for Veterans or a "311" style service to direct Veterans to the appropriate level of service (MyVA, Meeting Minutes, 2015).

  o **Simplification of medical center phone trees:** In 2012, the VHA National Leadership Council approved the implementation of a standardized telephone tree at all VAMCs. The goal was to improve telephone access and the service experience of Veterans calling into medical centers. This new tree includes a 15 second introduction and simplified menu options designed to easily channel the patient to the appropriate area. The first set of menu options are standardized across VAMCs, however the second and third levels can vary by facility. Implementation was expected at all locations as of October, 2013 (VHA Telephone Access White Paper, 2014).

If successful, the above initiatives would result in a better understanding of how call centers operate at VA and what best practices exist. However, further changes would also be required to improve call center performance based on potential gaps, including:

Implementation gaps: While efforts to simplify the navigation of the phone system at VA/VHA are a necessary step for improving a Veteran's experience with the system, it is not clear how the assessment of the current state as part of MyVA will translate into action. Given that VA is

early in the process of its MyVA effort, which would affect these initiatives, we were not able to ascertain how they will be addressed or how the implementation would occur.

Scope gaps: Due to the early stage nature of the VA call center taskforce, it was not possible to assess the degree to which this effort will encompass facility-based scheduling call centers. We were also unable to assess the timeline against which the taskforce will be assessing call center operations, making recommendations and setting up for implementation.

To address these gaps, as noted below, VHA should consider consolidating its leadership structure for call centers, building a plan for more call center capacity, and establish stronger performance management systems at large call centers and across all locations that engage in scheduling. Specifically, VHA should consider the following recommendations:

9.3.1   Designate a Central Owner for Scheduling Call Centers

Today, VHA scheduling call centers usually report to facilities and there is no central owner of scheduling phone operations across VISNs (though the VHA Telephone Access and Contact Management Office supports the field through a matrix role). In contrast, call centers in other parts of VA and in leading private sector institutions report to one organization. A central owner of call centers should:

- **Coordinate with the ACAP office:** Close coordination between ACAP and a central owner will be required to create standard operating procedures for the call center that reflect the VHA's scheduling best practices as well as national policy.

- **Leverage learnings from existing call centers:** VHA scheduling call centers need to operate at the high level of performance established by other VA call centers (like HRC). A central owner should therefore coordinate with existing VA call centers as well as the VA Call Center Task force to implement proven practices where relevant.

- **Partner with the larger VHA scheduling call centers that exist today**: Larger scheduling call centers, such as the one supporting the New York City VAMCs, can serve as a model and thought partner for implementing successful operations at a VHA scheduling call center. Thought partnership should explore topics such as staffing ratios, division of specialties amongst schedulers (for example, pods), investment costs, and phone tree simplification.

- **Consider partnerships with private sector scheduling call centers**: Institutions with large scheduling call centers, such as Geisinger Health System and the Cleveland Clinic, can provide necessary guidance on how to achieve more standardization while also allowing clinic-specific practices. They can also share advice for building organization support for call centers.

9.3.2   Design Scheduling Call Centers that Can Provide Expanded Services for Veterans Relative to Current State

As discussed, today's VHA scheduling call performance is below benchmark, but could likely improve by the use of larger scale call centers, through either co-location of schedulers or

through virtual centralization. VA should therefore launch an effort to establish larger regional scheduling call centers. This effort should:

- **Evaluate which responsibilities lend themselves to centralization:** Some responsibilities, including those requiring in-person interactions with a patient or provider (for example, patient check-in, follow-up appointments booked while in office), should remain in the clinic. Other responsibilities (like cancelling appointments after hours, patient reminder calls, and new patient appointment scheduling) do not require face-to-face interactions and are or could be more standardized across locations, making it easier to support from a call center environment. ACAP should further analyze the complete set of scheduler responsibilities and assess which can be shifted to a larger scale call center based on the ability to standardize level of complexity, and need for in-person interaction with a provider or patient.

- **Assess which specialties should be placed in the call center first:** All specialties could likely be scheduled centrally as they are across some private sector health systems. However, some specialties (for example, primary care) may have fewer types of appointments and therefore are easier to initially support with an at scale call center. Further, some specialties (like optometry) have much higher volume of appointments than others, so there may be greater benefits of moving these to call centers first. ACAP should further analyze all VHA specialties and determine which ones could most easily be supported by large-scale call centers, and which may require more time to transition.

- **Analyze the appropriate degree of centralization:** ACAP should project the total volume of calls that could be handled by national, large-scale call centers. This projection should be based on the number of responsibilities and specialties that ACAP determines can be supported centrally and how much VHA decides to increase the standardization of scheduling processes. ACAP can then project the number of necessary call center schedulers based on this call volume. Leveraging learnings from the VA Call Center Task Force, ACAP can then determine the number of call centers needed and the degree of required centralization (such as large regional call centers tied to MyVA regions).

- **Research possible call center locations and costs:** VHA should undertake a study to consider which locations may be optimal for the newer regionalized call centers (for example, new call centers in low cost-of-living areas, additions to existing VA call centers such as Waco, Dayton), with the overall goal of improving knowledge/talent sharing and decreasing costs.

Appendix A   Choice Act Legislation

Figure A-1. Choice Act Language for Assessment E

E) The workflow process at each medical facility of the Department for scheduling appointments for Veterans to receive hospital care, medical services, or other health care from the Department.
(2) PARTICULAR ELEMENTS OF CERTAIN ASSESSMENTS.—

▪ SCHEDULING ASSESSMENT.—In carrying out the assessment required by paragraph (1)(E), the private sector entity or entities shall do the following:
 	
  ○ Review all training materials pertaining to scheduling of appointments at each medical facility of the Department.
 	
  ○ Assess whether all employees of the Department conducting tasks related to scheduling are properly trained for conducting such tasks.
 	
  ○ Assess whether changes in the technology or system used in scheduling appointments are necessary to limit access to the system to only those employees that have been properly trained in conducting such tasks.
 	
  ○ Assess whether health care providers of the Department are making changes to their schedules that hinder the ability of employees conducting such tasks to perform such tasks.
 	
  ○ Assess whether the establishment of a centralized call center throughout the Department for scheduling appointments at medical facilities of the Department would improve the process of scheduling such appointments.
 	
  ○ Assess whether booking templates for each medical facility or clinic of the Department would improve the process of scheduling such appointments.
 	
  ○ Assess any interim technology changes or attempts by Department to internally develop a long-term scheduling solutions with respect to the feasibility and cost effectiveness of such internally developed solutions compared to commercially available solutions.
 	
  ○ Recommend actions, if any, to be taken by the Department to improve the process for scheduling such appointments, including the following:
 	
    – Changes in training materials provided to employees of the Department with respect to conducting tasks related to scheduling such appointments.
 	
    – Changes in monitoring and assessment conducted by the Department of wait times of Veterans for such appointments.
 	
    – Changes in the system used to schedule such appointments, including changes to improve how the Department—
 	
      - Measures wait times of Veterans for such appointments;
 	
      - Monitors the availability of health care providers of the Department; and
 	
      - Provides Veterans the ability to schedule such appointments.
 	
      - Such other actions as the private sector entity or entities considers appropriate.

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

Appendix B   Methodology

B.1   Description of Data/Information Sources

Sources from VHA:

- **Policy review:** This included Central Office-driven policies related to scheduling for outpatient clinic appointments, scheduling for surgery/procedures/radiology, telephone care, and the Patient Aligned Care Team (primary care) model.

- **Central office, VISN and facility interviews:** This included interviews with over 40 individuals with cross-cutting responsibilities including subject matter experts and leaders in the Access & Clinic Administration Program (ACAP) office, including the Telephony Directive team, Clinical Operations, Connected Health, OI&T, and the VA office of Veteran Experience. A wide range of topics were covered including scheduling policies, clinical operations (surgery, primary care, mental health), scheduler training, information & analytics, telephony and provider productivity.

- **Clinic Access Index available through the Veterans Support Service Center (VSSC), Corporate Data Warehouse (CDW) schedules:** This included a scorecard of access performance, called the Clinic Access Index, which provides metrics such as "missed opportunities" rates (no shows and late cancellations), appointment reschedules and appointment lengths. Data on pending appointments was also available through this system.

- **Frontline staff survey:** A survey with specific training-focused questions for "schedulers," individuals who indicated that they schedule appointments for outpatient care (N=825), including both frontline MSAs (N=726) and non-MSAs with scheduling privileges (N=99); as well as MSA supervisors (N=70), clinic administrators (N=80), providers (N=1,054), administrative officers (N=86), and clinical leaders (N=121). The survey was intended to reach all facilities and respondents represented 137 VAMCs and 320 CBOCs overall.

- **Facility-level information collected via a centralized "data call":** A data call distributed through all 21 VISNs to 152 VAMCs requesting three types of information. A total of 102 VAMCs responded to at least some part of the data call. This included a survey regarding the creation, maintenance, and delivery of trainings (N=49 VAMCs); a survey of facilities' scheduler reporting structures and scheduler audit performance (N=73 VAMCs); and a collection of national and local training materials for MSAs on new policies (N=51 VAMCs). The materials collected were analyzed for the period in which they were delivered, the topics they covered, and the format of delivery used to discover best practices currently taking place within VAMCs.

Data and information from broader government and external sources were also gathered to understand previous reports on VHA wait times and inform comparison to best practice outside of VHA. This work included:

- **Literature review of past findings and recommendations:** This included thirty-seven past reports on VHA related to scheduling since 1999. The appendix relating to each section of

---

this report includes a grid describing the recommendations from past reports that informed our findings.

- **Interviews and select site visits with four leading hospital systems:** This included interviews with representatives from four leading hospital systems, including two integrated networks, on their scheduling and access management practices to understand approaches that they had found to be successful.

- **Interviews with hospital executives with experience procuring or implementing an IT scheduling system:** The team interviewed 10 executives at private hospital systems to better understand how the current and proposed VA scheduling system compared with those used in the private sector.

- **Interviews with health systems administrators with experience in frontline scheduler training:** The team interviewed 10 private sector health system administrators to better understand how content, method, and cadence of training is performed for both new and existing schedulers.

- **Review of McKinsey research on and public sector experience with IT implementations:** The team reviewed research that McKinsey has developed drawing on findings from 5,000 IT implementations along with the Firm's direct experience with twenty U.S. public sector IT implementations since 2010.

- **Review of private sector scheduling practices:** Industry standard and best practices were catalogued through review of academic literature and published case studies. These best practices are detailed in the relevant section in this report and are referenced in the bibliography.

B.2 Description of Site Visits to VA Medical Centers (VAMCs) and Community-based Outpatient Clinics (CBOCs)

B.2.1 Site Selection Approach for VAMCs

To increase consistency and generalizability of findings, a subset of assessment teams has coordinated sampling methods to the extent possible to select a core set of VAMCs to visit that are representative of the VAMC system as a whole across critical facility demographic and performance outcome metrics.

The VAMC site selection process followed the following steps:

1. **Stratification of facilities:** Stratified random sampling, with VISN as a strata, was used to select an initial list of facilities. To reduce sample size, a subset of VISNs was randomly selected, from which one of the two initially selected sites was randomly de-selected.

2. **Review of distribution:** Chi-square testing was used on each of the key facility profile and performance variables to ensure the distribution of scores in the sample was representative of the population. Variables were chosen to reflect anticipated drivers of facility performance, and included: VISN, rurality, adjusted admissions, complexity level

(on VHA rating scale), adjusted length of stay, adjusted patient satisfaction, cumulative access score, and facility age.

3. **Refinement of facility selection:** Initial facility list was vetted with internal and external SMEs and augmented as needed, to include facilities that are considered critical for inclusion (e.g., a Polytrauma Center, facilities with innovative tools/practice) and to ensure that all selected facilities offered the range of services being assessed.

This method resulted in a sample of 23 facilities that in combination were representative across each of the criteria used in selection. Assessment E also visited two additional VAMCs not randomly selected, Indianapolis and Phoenix. Indianapolis was chosen because it is the only VHA facility in the country that uses a software system other than VistA to schedule outpatient appointments and the team wanted to understand the scheduling challenges in Indianapolis and compare them to those of other facilities. Further, the team wanted to learn about the software implementation process of a new scheduling system. Phoenix was visited due to its attention in previous reports.[78]

Results for Fisher's exact Chi-square test[79] demonstrate that the sample is not significantly different from the population of VAMCs:

Table B-1. Chi-square Testing Results for VAMC Representativeness

Numerical Complexity Level Variable (p-value for Fisher's Exact Test: 0.80)					
	Population	% pop	Selected	% Selected	Difference
-1	2	1%	0	0%	-1%

4	25	17%	5	22%	5%
Total	150	100%	23	100%	

Operational Data Quartile (p-value for Fisher's Exact Test: 0.87)					
	Population	% pop	Selected	% Selected	Difference
1	38	25%	5	22%	-4%
2	74	49%	11	48%	-2%
3	38	25%	7	30%	5%
Total	150	100%	23	100%	

B.2.2 Site Selection Approach for CBOCs

Due to the focus on outpatient care, for every visit to a randomly selected VAMC, Assessment E also visited a nearby CBOC. These facilities were prioritized by geographic proximity due to budgeting constraints and checked for representativeness of VHA facilities nationally using chi-square testing by comparing them to the general CBOC population across the following variables: size in terms of number of monthly outpatient appointments completed, wait time performance in primary care, specialty care, and mental health, and types of services offered (e.g., primary care, mental health, specialty care).

CBOC chi-square testing results

Chi-square testing demonstrates the sample is not significantly different from the population of CBOCs:

Table B-2. Chi-square Testing Results for CBOC Representatives

Monthly appointment volume (p-value for chi-square test: 0.67)					
	Population	% pop	Selected	% Selected	Difference
-1	20	3%	0	0%	-3%
1	149	19%	4	17%	-2%
2	435	55%	12	50%	-5%
3	192	24%	8	33%	9%

0	470	59%	15	63%	3%
1	326	41%	9	38%	-3%
Total	796	100%	24	100%	

B.2.3   Methodology for Site Visits

The team used site visits to develop a more nuanced understanding of the current state of scheduling across VHA facilities. Each visit covered all assessment topics (scheduling process, scheduler training & reporting, scheduling operating structure, scheduling system and provider availability). On-site assessments included interactions with both clinical and administrative leadership across multiple levels of the organization, involving:

- **Individual/small group interviews:** The team conducted interviews in order to understand which policies and processes were in place at each site across multiple clinics
- **Group interviews with schedulers and clinic administrators/administrative officers:** The team conducted two large group interviews at each VAMC where each group was asked to discuss the largest challenges in scheduling patients today as well as recommendations to improve the process.
- **Observations:** The team shadowed frontline schedulers and call center staff to observe and understand the processes they use each day.

The following exhibit describes the range of roles touched on each site visit, the number of VAMCs, CBOCs and call centers (which varied in location between the VAMC and CBOC) and the number of interviews conducted over the course of the assessment. The following exhibit describes a sample visit schedule:

Table B-3. Typical Site Visit Schedule – Day 1

Time Frame (min)	Session Type	Facility	Objective	Target Audience
15	Kick-off	VAMC	Background of the Choice Act Legislature, Overview of the Assessment Teams, Discuss Site Visit Principles	Facility Leaders and Staff, Site Visit Team

Time Frame (min)	Session Type	Facility	Objective	Target Audience
60	Interview	VAMC	Get overview of how scheduling works across the site	Director/Deputy Director of HAS/C BO/MAS (most senior person/people responsible for clinic administration & scheduling (role varies)), including patient access champion (if applicable) with a maximum of 3 people
30	Interview	VAMC	Discuss patient scheduling processes, systems, and policies	2 Department Manager/Supervisors together (to compare/contrast)
30	Interview	VAMC	Discuss patient scheduling processes, systems, and policies	1 Procedure Suite Manager & 1 Operating Room manager together
30	Observation	VAMC	Appointment scheduling process	1 scheduler in Medical or Surgical Specialty Care Clinical Area A & B
30	Local material review with Scheduling Training Coordinator or Scheduling Supervisor/ manager	VAMC	Review policy, training, procedures local to the facility	Administrative Leader of scheduling
30	Policy interview	VAMC	Review provider policies in place	Senior clinical Leader (chief of staff)
30	Lunch			
60	Scheduler assessment workshop	VAMC	Understand barriers/pain points in process	Assessment workshop of ~10 schedulers/people with >50 percent of role on scheduling representing various specialties

Time Frame (min)	Session Type	Facility	Objective	Target Audience
60	Clinic admin assessment workshop	VAMC	Understand barriers/pain points in process	Assessment workshop of ~10 admin leads (distinct from above; different individuals from interview required)
30	Interview	VAMC	Varies	Non-VA care lead (person responsible for coordinating with non-VA facilities if a patient can't get in quickly enough)
60	Clinic/service observation	VAMC	In clinic interviews	Medical specialty or Mental Health; 30 min interview with 1 AO/clinic administrator responsible for service; 30 min interview with 1 lead provider (50 percent or more VA and/or clinical service chief)

Table B-4. Typical Site Visit Schedule – Day 2

Time Frame (min)	Session Type	Facility	Objective	Target Audience
75	Clinic/service observation	VAMC	In clinic interviews	Surgical specialty; 45 min interview with 1 AO/ clinic administrator responsible for service; 30 min interview with 1 lead provider (50 percent or more VA and/or clinical service chief)
30	If call center: Kick-off and tour	Call center (where relevant)	Understand structure of scheduling/call center	Management lead interview and walkthrough
60	If call center: Service observation and discussion	Call center (where relevant)	Observation & small group discussion	30 min with 1 "scheduler" direct observation; 30 min with 2-3 schedulers small group discussion

Time Frame (min)	Session Type	Facility	Objective	Target Audience
75	Clinic/service observation	VAMC	In clinic interviews	Primary care clinic; 45 min interview with 1 AO/ clinic administrator responsible for service; 30 min interview with 1 lead provider (50 percent or more VA and/or clinical service chief)
30	Observation	VAMC	Appointment scheduling process	1 scheduler in Primary Care (if no call center)
30	*Lunch*			
30	Presentation/interview	CBOC	Understand barriers/pain points in process	Site admin lead interview
75	Clinic/service observation	CBOC	In clinic interviews	Primary care Clinic ; 45 min interview with 1 AO/ clinic administrator responsible for service; 30 min interview with 1 lead provider (50 percent or more VA and/or clinical service chief)
75	Clinic/service observation	CBOC	In clinic interviews	Specialty Clinic; 45 min interview with 1 AO/ clinic administrator responsible for service; 30 min interview with 1 lead provider (50 percent or more VA and/or clinical service chief)

The following table describes the roles touched:

Table B-5. Roles Interviewed at Site Visits

Site	Audience	Interviewee	Number of individuals interviewed
VAMC	**Leadership**	Admin leadership in charge of MSAs	49
		Admin leader in charge of policy/training	51
		Chief of Staff	17
		AO or clinic admin of Primary Care	18

Site	Audience	Interviewee	Number of individuals interviewed
	A.O. or Clinic Administrator	AO or clinic admin of Medical Specialty[80]	24
		AO or clinic admin of Surgical Specialty[81]	14
		Group interview of 8-12 clinical administrators and A.O.s	174
	Scheduler	Group interview of 8-12 schedulers	187
		Scheduler observation	31
	Provider	Provider Primary Care	22
		Provider Medical Specialty/Mental Health	35
		Provider Surgical Specialty	15
	Other "deep dive" areas	OR and Procedures	11
		Lab and Radiology	13
		Non-VA Care office administrator	48
CBOC	**Provider**	Primary Care provider	21
		Specialty provider[82]	11
	Management	AO/nurse manager	26
		Admin Leader	22
Call centers	**Management**	Call center administrators	48

---

[80] Cardiology, dermatology, mental health, optometry, neurology

[81] Ortho, urology, podiatry, ophthalmology

[82] Specialties at CBOCs were limited; specialties included mental health, women's health, dermatology, ophthalmology

---

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

Appendix C   Provider Availability

C.1   Best Practices for Provider Availability

Table C-1. Scheduling Process – Best Practices and Benchmarks

Component	Best practice/benchmark
Supply and demand	▪ Use supply and demand to forecast optimal scheduling supply (Gupta and Denton, 2007)
	▪ Use sophisticated modeling to understand patient needs across a population[83] (Brandenberg et al., 2015; Gabow and Goodman, 2015)
	▪ Use real-time dashboard to guide process improvement[84] (Brandenberg et al., 2015)
	▪ Use level loading to reduce unnecessary supply-demand variation[85] (Brandenberg et al., 2015)
	▪ Smooth the work flow by scheduling routine care in low demand times (Nolan et al., 1996)
	▪ Flex staffing to account for demand variability (e.g., flu season, allergy season)[86] (Brandenberg et al., 2015)
	▪ Use historical emergent or urgent visits to estimate appropriate number of same-day slots[87] (Nolan et al., 1996)
	▪ Track data on demand by day, week, month, and patient type (Brandenberg et al., 2015)
	▪ Monitor demand on a daily, weekly, and seasonal basis ("Measure," n.d.; "Balance," n.d.)
	▪ Set provider schedules to match expected clinical FTE ("Measure," n.d.)

---

[83] Study foundh that 2-3 percent of patients constituted 30 percent of costs, suggested access may need to be prioritized for these patients

[84] Seattle Children's reduced wait times and patient flow-through from ED to inpatient bed using visual dashboard

[85] Seattle Children's used real-time communications to improve efficiency. As an example, the hospital successfully flexed provider supply to create evening appointments based on historical demand data.

[86] Kaiser uses historical demand data to flex appointment supply

[87] This strategy employed successfully by eight health systems.

Component	Best practice/benchmark
	▪ Use supply-demand analytics and prediction tools to reduce wait times ("Measure", n.d.)
	▪ Make appointment slots match expected appointment length for each sub-specialty ("Reduce," n.d.)
	▪ Eliminate non-essential rules to increase the ease and consistency with which schedulers can book appointments ("Reduce," n.d.)
	▪ Incorporate patient preferences into demand forecasting to ensure adequate appointment supply by type (Gupta and Denton, 2007)
	▪ Manage demand to reduce delays[88] (Nolan et al., 1996)
Profile/schedule creation	▪ Slots are reserved for certain types of patients each day, depending on medical urgency, type of service requested, and whether the patient is known to the provider (Gupta and Denton, 2007)
	▪ Establish a visits-per-day target as the starting point for designing a schedule ("Management," 2010)
	▪ Incorporate patient preferences (e.g., same-day, future appointment) into demand modeling to improve appointment mix (Gupta and Denton, 2007)
	▪ Use historical demand to predict optimal appointment mix type (Gupta and Denton, 2007; Nolan et al., 1996[89])
	▪ Measure historical appointment length to adjust slot length to closely match; this practice reduces down time and need for overbooking ("Management," 2010)
	▪ Use of a schedule that matches closely to actual practice (e.g., appointment length is equal to slot length) results in improved provider and patient satisfaction (Heaney et al., 1991)
Performance Management	▪ Use productivity as one of several measures rather than alone in performance management (Nolan et al., 1996)

---

[88] Can be accomplished through multiple ways, including disabling automatic scheduling of follow-up appointments and alternative treatment models (e.g., group care, secure messaging).

[89] By setting aside 30-70 percent of appointments as same-day appointments based on predicted demand, canceled appointments fell and patient satisfaction/provider productivity increased.

Appendix D   Scheduling Process

D.1   Additional Detail on Scheduling Process

Appointment scheduling at VHA facilities involves a number of different interrelated processes, wait lists, and rule sets depending on whether the patient is "new" or "established" and the type of care needed. The processes and rules below are detailed in the national scheduling directive. In addition, supplementary scheduling rules may exist at the local level as well.

Managing scheduling for patients who are established with VHA and the clinical service from which they are seeking care

Established patients are defined as those who have received care from a particular specialty within the last 24 months. These patients are able to schedule a follow-up visit as long as their providers have submitted a return to clinic (RTC) order into the system, along with a clinically indicated date for this visit to happen. The process for scheduling a follow-up visit depends on whether the patient requires care within 90 days or greater than 90 days.

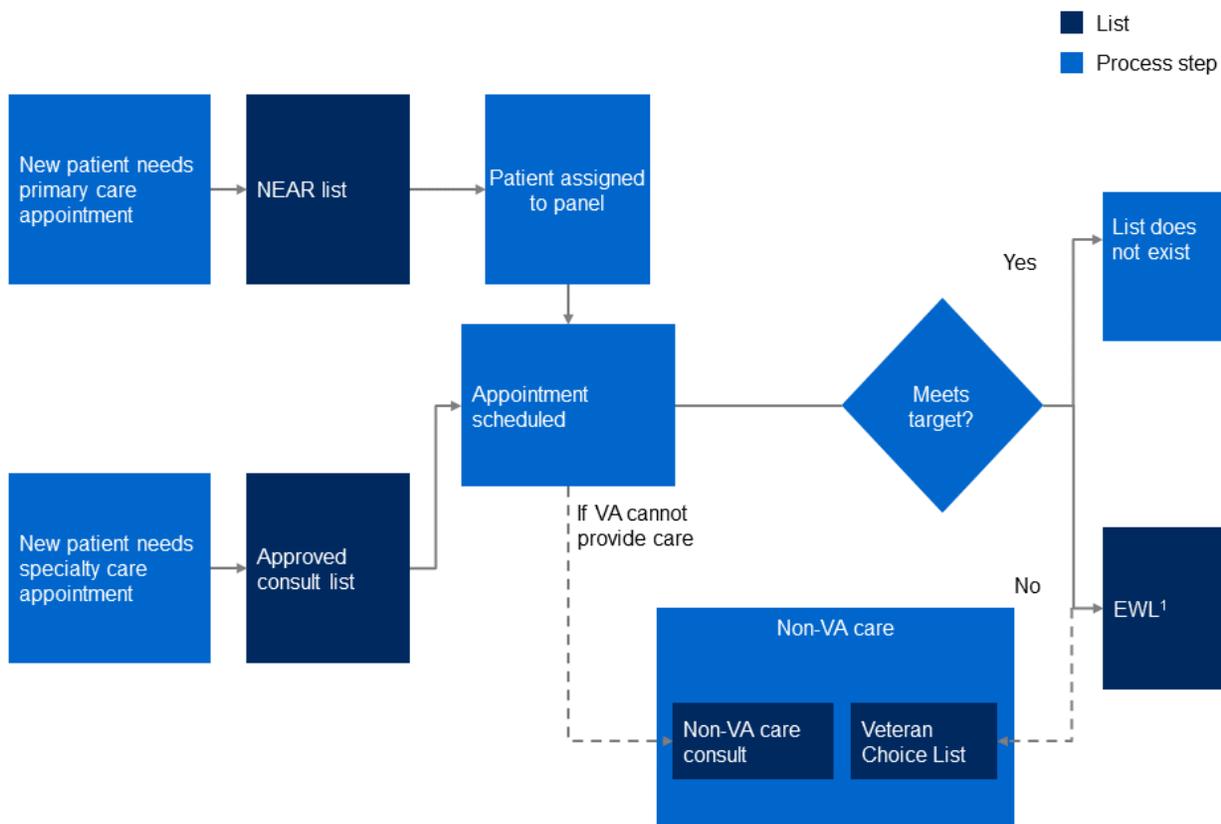
RTC date less than 90 days: Patients who have a RTC order for care within 90 days of the current date are able per national policy to immediately schedule a return visit for any time after the stated RTC date. If the patient is not able to be seen in a timely manner or if a particular type of service (such as a specialized procedure) is not available through this facility, he or she may be eligible to see a non-VA provider.

RTC date >90 days: If the patient's RTC date is more than 90 days away, he or she is not immediately scheduled and placed on the recall list (see Glossary of patient lists) for scheduling at a future date. This patient is then contacted by the provider's office two to three weeks before the RTC date via mail to schedule an appointment.[90]

See Figure D-1 for a simplified visual depiction of the established patient scheduling process.

---

[90] While use of the recall list for patients with RTC dates >90 days is national policy, some departments have been given permission not to use the recall list and instead book appointments.

Figure D-1. Established Patient Appointment Booking Process


1 Serves as a form of electronic documentation of patient waiting to be scheduled

Managing waitlists of new patients (new to a clinical service) waiting for care and their appointment booking

New patients are defined as Veterans who have not received care from a particular specialty within the last 24 months. These patients could either have recently become eligible for VA care, be new to the region, require a new type of care (like cardiology), or need to be seen by a specialty for the first time in more than 24 months.

New to Primary Care: Patients who are new to Primary Care must first be deemed eligible at the national Health Eligibility Center. Once deemed eligible, patients are added to the New Enrollee Appointment Request list, from which they are assigned to a specific Patient Aligned Care Team (PACT).[91] Once a Veteran is assigned to a particular team, schedulers from the primary care clinics contact the patient to schedule an initial visit. If the visit is scheduled outside of 90 days due to a lack of available appointment slots, the patient is added to the Electronic Wait List (EWL, see Table D-1, "Glossary of Patient Wait Lists"). If there is no provider available within the VA system who can see the patient in a timely manner or within reasonable

---

[91] PACTs refer to team-based primary care model, which is a VHA-customized version of the patient-centered medical home model of care

---

distance, then the patient may be authorized to receive care from a non-VA provider through a Non-VA care consult (NVCC) or the Choice card program.

New to Specialty Care: Patients who require specialized care that cannot be provided by a primary care provider (PCP) are referred to a specialty care provider by the PCP. The PCP must submit a consult request to the desired specialty, and, if approved by the specialty, the patient will be eligible to schedule an appointment. Similar to new patients requiring primary care, those patients scheduled for an appointment outside the 90 day target are added to the EWL. If the specialty care required is not offered at the patient's local VHA facility or if care is not available within a timely manner, then the patient may be eligible to visit another VHA facility within the region or see a provider outside the VHA system.

The use and maintenance of a series of lists is mandated by national policy to monitor patients requiring care and track potential backlogs in the system.[92] These lists vary in terms of patient population, type of care required, and purpose. It is national policy that all lists must be kept within VistA, as these lists provide the data monitored at facility, regional, and national levels to ensure adequate access to care. See Table D-1 – Glossary of patient lists.

Table D-1. Glossary of Patient Wait Lists

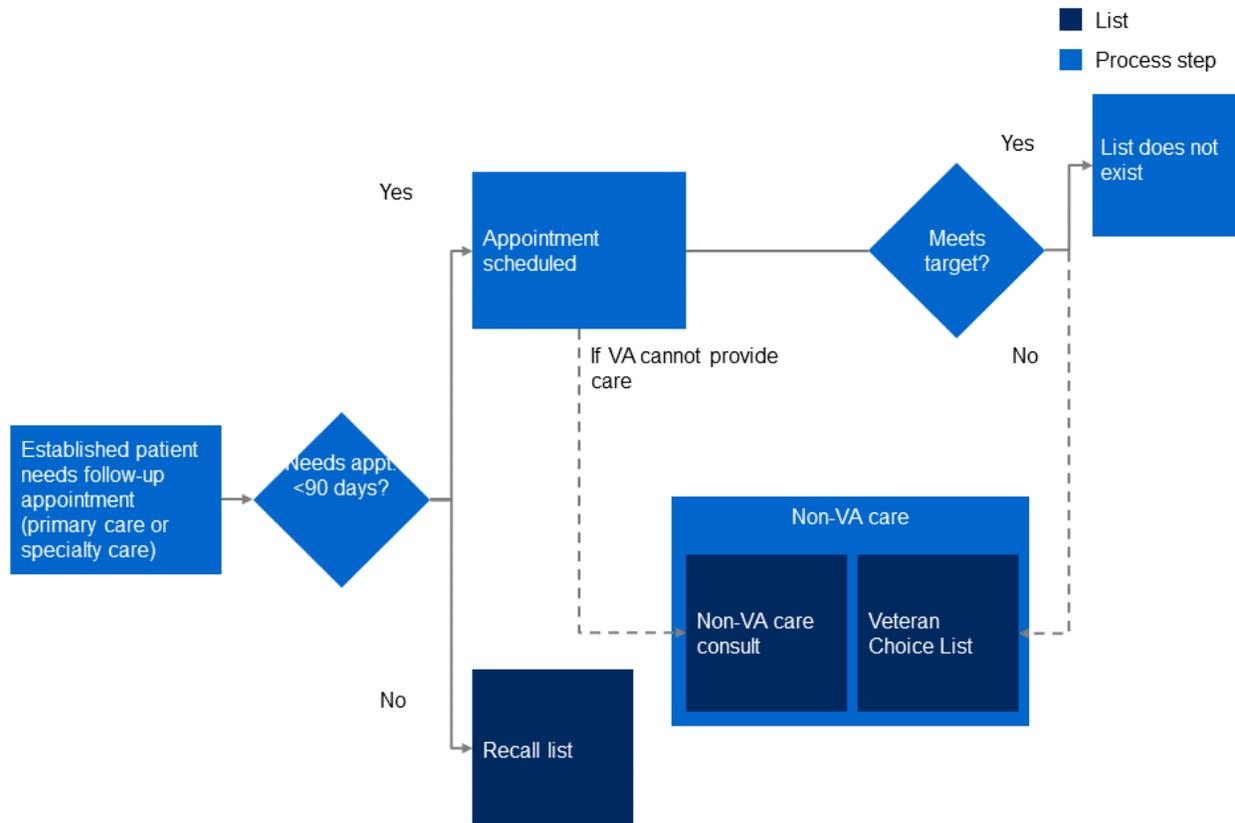
List name	Patient population	Type of care	Purpose
New Enrollee Appointment Request (NEAR)	New to service	▪ Primary care	▪ NEAR list is used to document all newly eligible patients who do not yet have PCPs, assign these patients to primary care providers, and monitor potential primary care backlogs
Electronic Waiting List (EWL)	New to service	▪ Primary care ▪ Specialty care ▪ Mental health	▪ EWL keeps track of all new patients with scheduled appointments that are >90 days outside the patient's desired appointment date ▪ If an appointment becomes available sooner (e.g., due to cancellation), a patient on the EWL will be given the option to take the earlier appointment

---

[92] The use of lists, both official and unofficial, has come under significant scrutiny since it was discovered in spring 2014 that the Phoenix VAMC was using "secret," or unofficial, waitlists, in part to mask delays in patient care. According to VHA national policy, all lists outlined below must be kept electronically and through the official VHA IT package to ensure proper monitoring practices and accurate data tracking. Any unofficial lists are expressly forbidden.

List name	Patient population	Type of care	Purpose
Consult	**New to service**	▪ Specialty care	▪ Consult list is made up of all patients who have been approved by the specialty service (e.g., cardiology) to be seen but have not yet been scheduled
Non-VA Care (NVCC) list, Veteran choice List (VCL)	**New to service, follow-up**	▪ Primary care ▪ Specialty care ▪ Mental health	▪ NVCC list is composed of established patients who are deemed to need care not available at VHA (e.g., service not offered) by referring service (usually specialty care) ▪ VCL was recently created by the Choice Act and is made up of new and established patients who are located >40 miles from a VHA facility or cannot be seen within 30 days by a VHA provider

See Figure D-2 for a simplified visual depiction of the new patient scheduling process.

Figure D-2. New Patient Appointment Booking Process


Wait times measurement & monitoring

While VHA looks at a number of supplemental access metrics, wait times at VHA are generally calculated one of two ways: 1) if the patient is new to the clinic, then the wait time is calculated as the difference in days between the creation date of the appointment in the VistA system and the day of the appointment; or 2) if the patient is established, policy states that the wait time is equal to the difference in days between the patient's "desired date" for the appointment and the date of the actual appointment. Policy states that the desired date should be determined by asking the patient when he or she would like to be seen without regard to availability of appointments. The scheduler is responsible for inquiring about and entering the patient's desired date into the system.

While the desired date form of measurement may seem straightforward, it has come under significant scrutiny due to its ability to be manipulated to decrease reported established patient

wait times, as has been reported multiple times in the previous decade.[95-99] By altering the desired date to a date the patient agrees based on appointment availability, the scheduler can artificially bring the wait for appointment times down to 0 days, even if patients may have to wait months to see their providers. Even if the scheduler is not intending to alter desired date to manipulate wait times, there still remains a subjective component to the process that may lead to variability among schedulers.

A component of the updated scheduling policy currently under VACO review is the replacement of the desired date with the "preferred date." The preferred date is defined much more narrowly for all patients to remove any subjectivity in the entering of the reference date. For example, under the proposed changes, the provider's return to clinic (RTC) date will become the desired date, regardless of patient input, with the goal of removing scheduler subjectivity from the wait time measurement process.

Patient appointment adherence management

Once patient appointments are scheduled, it is important that patients keep their appointments by arriving at the clinic on time and with all necessary pre-work (e.g., labs, imaging) so the visit can be effective. VHA facilities employ a number of different tools to manage this including live and robo reminder calls from the clinic and appointment reminder letters. As part of its patient-oriented IT development, VHA is also considering other features for reminders (e.g., text).

Another method that VHA is using to reduce no-show rates is the recall system, which was created in response to VHA patient data showing patients are more likely to no-show the further an appointment is booked into the future.[98] According to national scheduling policy, patients requiring follow-up appointments beyond 90 days into the future are not allowed booking those appointments and instead should be entered into the recall system. The recall system is a component of the VistA Scheduling package that tracks patients requiring future appointments and automatically reminds patients by letter 2-3 weeks ahead of their would-be appointment date to book their appointments. If patients do not respond to this letter, then the clinic must call the patient to schedule the appointment. The goal of this process is to reduce the time between booking date and visit date.

[97] Delays for Outpatient Specialty Procedures: VA North Texas Health Care System Dallas, Texas

[98] Access and Clinic Administration Program, interviews, 2015

Managing additional scheduling situations

Surgery and procedures: Procedures are scheduled in an analogous way to the outpatient visit appointment scheduling process above. A separate national policy exists for surgical/OR services, and relies on a different scheduling package than the one used for clinic visits and procedures.

Clinical laboratory testing and radiological imaging: The scheduling of laboratory testing (e.g., bloodwork) or imaging (e.g., x-ray, MRI) is slightly different from the visit scheduling process. Patients are not scheduled for clinical labs. Radiology scheduling can differ depending on the type of study. For instance, x-rays are usually performed on a walk-in basis, whereas other equipment (e.g., MRI, CT) typically utilizes open access scheduling,[99] in which schedulers are able to schedule patients into the appropriate modality ("Open Access Scheduling," n.d.).

Role of the front-line scheduler in the scheduling process

While scheduling may be performed by a range of roles at VHA, medical support assistants (MSAs), or "schedulers," typically perform the scheduling process. The clerks responsible for scheduling can either be located physically in the clinics for which they schedule or, alternatively, sometimes may sit in call centers located either within the facility or elsewhere. These clerks are required to have a high school education and generally one year of work experience, although no previous experience working in a clinical setting is required for certain scheduling-related roles.[100,101]

MSA duties may include, but are not limited to patient appointment scheduling, scheduling patients off of wait lists, front-desk duties (e.g., answering phone calls, checking in patients) and other clerical duties as requested by the clinic (e.g., obtaining patient records, making photocopies).

D.2 Best Practices for Scheduling Process

Table D-2. Scheduling Process – Best Practices and Benchmarks

Component	Best practice/benchmark
Overall	▪ Leverage a provider champion to drive change (Nolan et al., 1996)

---

[99] https://cahps.ahrq.gov/quality-improvement/improvement-guide/browse-interventions/Access/Open-Access.html

[100] Access and Clinic Administration Program, interviews, 2015

[101] Work and education requirements vary by grade level

Component	Best practice/benchmark
	▪ Focus on patient wait times to improve patient satisfaction[102] (Brandenberg et al., 2015; HCAHPS, 2015)
	▪ Utilize same-day or open access scheduling to avoid trying to estimate patient acuity[103] (Brandenberg et al., 2015; Murray, 2003; IHI, 2015)
	▪ Overbook to the no show rate to improve utilization of available provider time (Kumar et al., 2014; Gupta and Denton, 2007)
	▪ Use team "huddles," including clinic providers, staff and administrators, at the beginning of each day ("Use Regular Huddles," n.d.)
Scheduler duties	▪ Improve slot availability to reduce time in negotiating appointments with patients (Murray, 2003)
Patient appointment adherence	▪ Consider no-shows and late cancellations (<24 hours) similarly in terms of ability to fill the previously scheduled slot (Moore et al., 2001)
	▪ Use mobile text messaging to reduce no show rates[104] (Koshy et al., 2008)
	▪ Reduce no-show rates by requiring patient to commit verbally to cancelling appointment if he/she plans on not keeping the appointment[105] ("How to Reduce," 2001)
	▪ Measure differences in no-show and walk-in rates by time of day[106] (Moore et al., 2001)

---

[102] Patient satisfaction increased from 10th and 20th percentiles to 50th due to improved patient access for Kaiser

[103] Same-day or open access requires accurate demand and supply measurement, elimination of appointment types, and eradication of backlog to be successful

[104] Use of mobile-phone short message service (SMS) reminders was associated with a 38% reduction in appointment non-attendance in study of over 9,000 patients

[105] This study showed a decrease from 30 percent to 10 percent no-show rate in restaurant reservations after framing the reminder to cancel from a statement to a question

[106] This study in a family practice clinic showed higher no-show rates in the morning and higher walk-in rates in the afternoon, resulting in greater waste of provider time in morning sessions

---

Component	Best practice/benchmark
	▪ Improve no-show rate with more timely access[107] (Brandenberg et al., 2015; Kehle et al., 2011; Pizer and Prentice, 2011)
	▪ Use same-day appointments to lower no-show rates[108] (Brandenberg et al., 2015)
	▪ Provide patient education about impact of no-show to reduce no-show rate ("Management," 2010)

Table D-3. Wait Times – Best Practices and Benchmarks

Component	Best practice/benchmark
Access Target	▪ Track third next available appointment as key access metric[109] (IOM 2015; IHI 2015)
	▪ Calculate third next available either automatically in system or manually, if needed[110] (IHI, 2015)
	▪ Establish goal for third next available to zero days for primary care and two days for specialty care (Brandenberg et al., 2015; IHI 2015)
	▪ Set patient expectations appropriately to achieve better patient satisfaction (Brandenberg et al., 2015; Cosgrove et al., 2013)

---

[107] 8-12 percent no-show rate achieved largely through improved access; no-show rate expected to improve further with self-scheduling and increased same-day scheduling

[108] Denver Health successfully lowered no-show rates by providing same-day access

[109] The IHI defines third next available appointment as the "average length of time in days between the day a patient makes a request for an appointment with a physician and the third available appointment for a new patient physical, routine exam, or return visit exam"

[110] To calculate manually, "Count the number of days between a request for an appointment (e.g., enter dummy patient) with a physician and the third next available appointment for a new patient physical, routine exam, or return visit exam. Report the average number of days for all physicians sampled. Note: Count calendar days (e.g. include weekends) and days off. Do not count any saved appointments for urgent visits (since they are "blocked off" on the schedule.)"

Appendix E   Scheduling System

E.1   Additional Detail on Scheduling System

Table E-1. MASS Setup Unique/High Priority Business Needs

Medical Application Scheduling System Setup		
ID	**Feature or Characteristic**	**Measure of success**
UHP1.1	▪ Current VistA reporting and DSS coding must continue to support non-scheduling business processes as it does today	▪ All scheduling data extracts continue to support other non-scheduling processes without disruption
UHP 1.2	▪ Resources, such as provider, support staff, equipment and facilities, can be configured for availability and services	▪ When scheduling appointments, those resources required to fulfill the appointment that are available and appropriate are presented. ▪ Scheduling is simplified because business rules are captured during setup and used throughout the scheduling processes ▪ Errors in scheduling are reduced because the solution prompts, warns or otherwise enforces the configured business rules
UHP 1.3	▪ Ability to create system level configurable business rules that are leveraged throughout the scheduling process	▪ Automation of business rules throughout the process
UHP 1.4	▪ Access to schedule resources must be role-based, allowing for various levels of access.	▪ Different user groups may be granted differing levels of access throughout the system, at the functional level (view appointment vs schedule appointment) and at the data level (one facility vs another, one service line vs another)
UHP 1.5	▪ Development and sharing of templates to ease implementation	▪ Templates for facility or service configurations can be created and shared, allowing for easy propagation of common configuration of business rules
UHP 1.6	▪ Configuration must mirror the multi-level construct of VHA, national, VISN, Health System, Facility, Outpatient clinics,	▪ A policy established at any level of the hierarchy is automatically enforced (soft enforcement with a warning, hard

Manage Veteran Information		
ID	**Feature or Characteristic**	**Measure of success**
UHP 2.1	▪ VistA reporting and DSS coding must continue to support non-scheduling business processes as it currently does today	▪ All scheduling data extracts continue to support other non-scheduling processes without disruption
UHP 2.2	▪ The scheduling solution shall capture special needs and preferences for each patient	▪ Schedulers can easily identify patients with special needs and preferences and use this information throughout scheduling processes
UHP 2.3	▪ Patient information must be consistent with other VA data about the patient	▪ The same patient data update does not have to occur more than once because the initial update was not propagated
UHP 2.4	▪ Patient information is shared with any facility where the patient will be seen	▪ Patients scheduled in a facility that is not their preferred facility will have the patient information at the time of service
UHP 2.5	▪ VHA eligibility and enrollment data must be integrated into scheduling process	▪ Scheduling process takes into consideration the eligibility of the patient throughout the scheduling process
UHP 2.6	▪ The scheduling solution shall allow patients to schedule appointments at any facility based upon service line permissions and patient permissions	▪ The patient can access their personal information and applicable lists of available appointments for any facility ▪ The patients can schedule an appointment at any facility
UHP 2.7	▪ New, easily accessible reporting capability allowing for broader analysis (across VHA) and deeper analysis (category of patient, condition, era, etc.) of scheduling performance	▪ Easily accessible data for trend analysis across the VA (broad analysis) as well as deep analysis for specific conditions or populations

SOURCE: MASS Business Blueprint, 2014

Table E-3. Request Management Unique/High Priority Business Needs

	Request Management	
ID	**Feature or Characteristic**	**Measure of success**
UHP 3.1	▪ VistA reporting and DSS coding must continue to support non-scheduling business processes as it currently does today	▪ All scheduling data extracts continue to support other non-scheduling processes without disruption
UHP 3.2	▪ Able to capture requests for service from multiple sources, to include NEAR, EWL, Recall, patient, providers	▪ All current list purposes are captured and maintained
UHP 3.3	▪ Patients are able to request care using different modes such as email, web access, mobile applications, etc.	▪ Patients can request appointments via different modes such as email, web access, mobile applications, etc. ▪ Routine or follow up appointments are easily scheduled without error by patients without the aid of a VHA scheduler
UHP 3.4	▪ Robust capability to manage multiple sources of requests to achieve appointment fulfillment rate standards	▪ Schedulers can create appointments directly from the list to improve efficiency rates, reduce data and scheduling errors, provide traceability and ensure accountability of all list entries
UHP 3.5	▪ Able to track all dates associated with any services from VA. Dates/times should be system-protected and not changed, reportable, auditable	▪ When VHA can track all patient interactions with VHA services from first contact to the end of provided care. Dates/times should be system-protected and not changed

Table E-4. Appointment Management Unique/High Priority Business Needs

	Appointment Management	
ID	**Feature or Characteristic**	**Measure of success**
UHP 4.1	▪ Current VistA reporting and DSS coding must continue to support non-scheduling business processes as it currently does today	▪ All scheduling data extracts continue to support other non-scheduling processes without disruption

Appointment Management		
ID	**Feature or Characteristic**	**Measure of success**
UHP 4.2	▪ Capture preferred date in accordance with policy for each appointment created	▪ When preferred date is captured indicating the source of the preferred date (patient, provider, other) for each individual appointment
UHP 4.3	▪ Automated implementation of business rules as configured (setup) when searching for resources and creating appointments	▪ Scheduler training requirements are decreased since majority of business rules are automated ▪ Reduction in scheduling errors because of automated business rules ▪ Scheduler has immediate feedback and visibility when scheduling outside of policy, guidance or business rules
UHP 4.4	▪ Flexibility to substitute appropriate resources assigned to appointment	▪ Reduced cancellations due to short term unavailability of resource
UHP 4.5	▪ Improve notification process through capture of patient preference for notification, configurable and enforceable notification templates	▪ Patients consistently receive notifications in their preferred method (phone, email, USPS) in a timely and accurate manner
UHP 4.6	▪ Ability to coordinate multiple resource sets at multiple locations for a single appointment (telehealth)	▪ Telehealth appointments are coordinated seamlessly between the provider(s), equipment, facilities and patients with on time delivery of care, no lost time due to poorly coordinated appointments
UHP 4.7	▪ Ability to link associated and/or dependent appointments	▪ Schedulers able to view, coordinate and link multiple appointments (series or multiple same-day)
UHP 4.8	▪ Create appointment for any service at any facility and delivery type based upon role-based access as defined in setup	▪ Patients can schedule services as they desire

Appointment Management		
ID	**Feature or Characteristic**	**Measure of success**
UHP 4.9	▪ Ability to coordinate multiple appointments for a patient	▪ Patients have an itinerary of appointments that suits their needs, with appointments coordinated in an efficient manner
UHP 4.10	▪ Use scheduling preferences when scheduling appointments	▪ Patients preferences are automatically considered when creating appointments
UHP 4.11	▪ Coordinate special needs throughout scheduling process	▪ Staff are aware of and prepared for patients with special needs when they are being scheduled and when they present for care

E.2 Best Practices and Benchmarks for Scheduling System

Table E-8. Scheduling Systems – Best Practices and Benchmarks

Best practice/benchmark
▪ Use IE/OR models to determine what types of data are needed to support future operational decisions (Gupta and Denton, 2007)
▪ Build automation into the scheduling system and mobile apps to "eliminate dependence on individual diligence or memory" (Brandenburg et al., 2015)
▪ Solidify the technology/business relationship via governance. Integrate technology into strategic planning. Set and shape a simple, multi-year roadmap for overall business strategy. Establish an open planning process. Teach and promote communication and relationship skills (Faeth, 2012)
▪ Stick to the schedule. Resist changes to a project's scope. Break the project into discrete modules. Assemble a team that includes IT experts, outside experts, and vendors. Prevent turnover among team members. Frame the initiative as a business endeavor, not a technical one. Focus on a single target and measure every activity against it (Flyvbjerg and Budzier, 2011).
▪ Assess if the company is strong enough to absorb the hit if the IT project goes over budget 400% and less than half the expected benefits are realized. And assess if the company can take the hit if 15% of its medium-sized tech projects exceed costs by 200% (Flyvbjerg and Budzier, 2011).
▪ Break big projects down into limited size; make contingency plans to deal with unavoidable risks; use the best possible forecasting techniques (Flyvbjerg and Budzier, 2011)

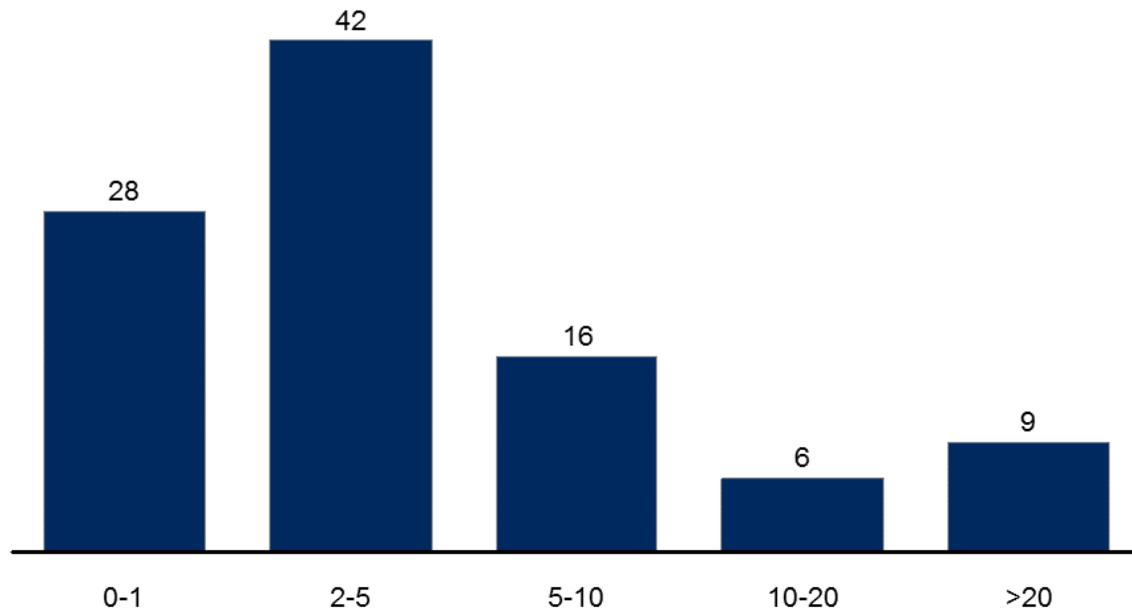
Recall/reminder ▪ Recall Reminder Software Functions	TMS online module	Self-paced, approx. 1 hour
Soft skills ▪ How to interact with Veterans	Classroom	4 hours

Figure F-1. Scheduler Training – Initial Training for Schedulers on Policies and Processes

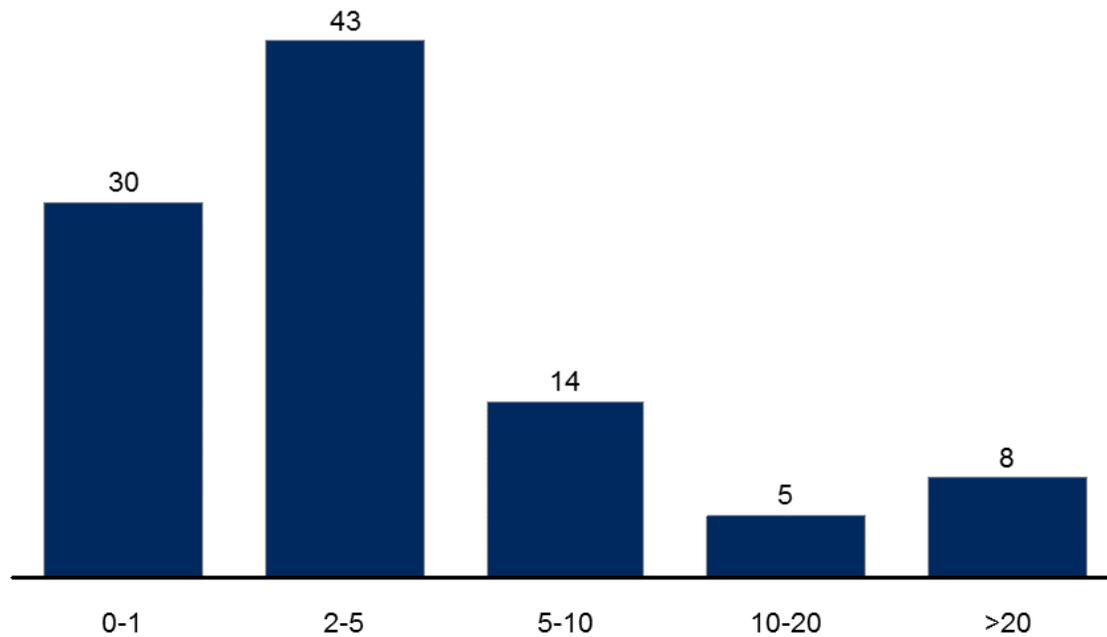
How many hours of training did you receive in your initial training about scheduling policies and processes?

Percent, N=825 responses from 97 VAMCs and 128 CBOCs


SOURCE: 2015 VHA Employee Survey

Figure F-2. Scheduler Training – Initial Training for Soft Skills

How many hours of training did you receive in your initial training about soft-skills (e.g., leadership training, customer service)?

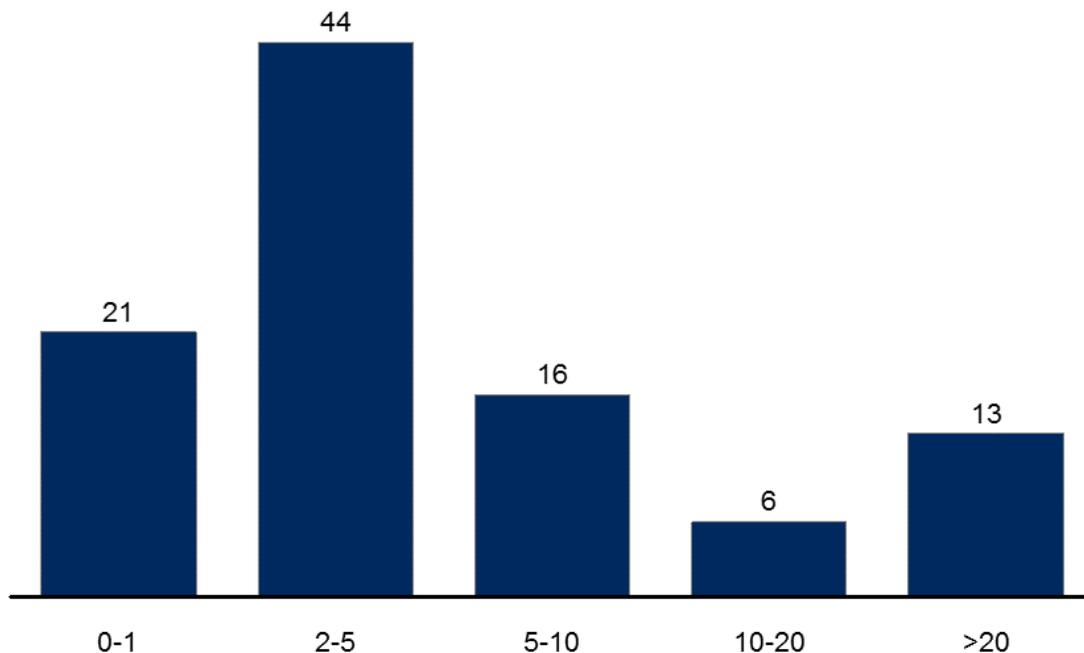
Percent, N=825 responses from 97 VAMCs and 128 CBOCs


SOURCE: 2015 VHA Employee Survey

Figure F-3. Scheduler Training – Initial Training for Scheduling Systems

How many hours of training did you receive in your initial training about scheduling systems (e.g., VistA, CPRS)?

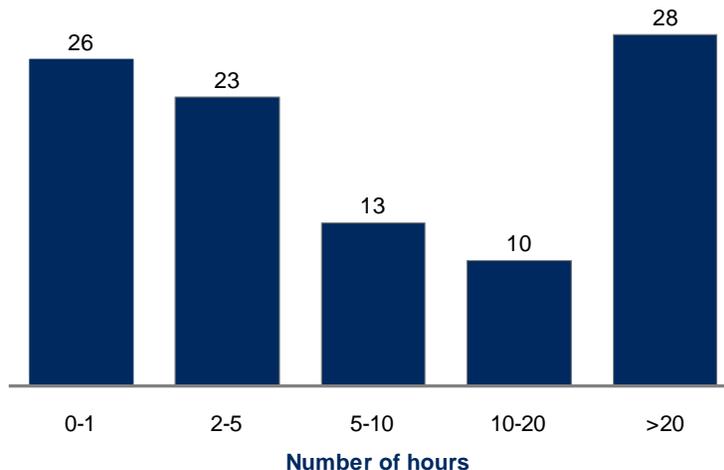
Percent, N=825 responses from 97 VAMCs and 128 CBOCs

0-1	2-5	5-10	10-20	>20
21	44	16	6	13


SOURCE: 2015 VHA Employee Survey

Figure F-4. Scheduler Training – Initial Training for Scheduling Systems

How many hours of on the job training (e.g., side by side coaching, receiving feedback) did you receive in your initial training?

Percent of schedulers, N = 825 responses from 97 VAMCs and 128 CBOCs


SOURCE: 2015 VHA Employee Survey

F.2   Best Practices and Benchmarks for Scheduler Training

Table F-2. Training – Best Practices and Benchmarks

Component	Best practice/Benchmark
Content	▪ Provide schedulers protocols, cheat sheets, and simplified guidance to ensure consistency in scheduling ("Management," 2010)
	▪ Link training content to performance objectives and business requirements ("A Guide to," 2015)
	▪ Embed industry-recognized skills certifications into training ("A Guide to," 2015)
Training delivery and assessment	▪ Give front-line employees structured on-the-job training including a stage of competency assessment (Jacobs, 2003)
	▪ Minimize in-classroom training and online modules in favor of experiential activities (Whitmore, 2002)
	▪ Encourage a variety of informal on-the-job learning options (e.g., feedback, networking, stretch assignments ("A Guide to," 2015)

Component	Best practice/Benchmark
Sharing of best practices	▪ Create knowledge and learning platforms that give employees access to content on demand ("A Guide to," 2015)

F.3 Past Reports for Scheduler Training

Figure F-5. Previous Reports Relevant to Scheduler Training and Operating Structure

Component	Best practice/Benchmark
Sharing of best practices	▪ Create knowledge and learning platforms that give employees access to content on demand ("A Guide to," 2015)

F.3 Past Reports for Scheduler Training

Figure F-5. Previous Reports Relevant to Scheduler Training and Operating Structure

Appendix G   Scheduling Call Centers

G.1   Best Practices and Benchmarks for Scheduling Call Centers

Table G-1. Call Center – Best practices and Benchmarks

Component	Best practice/Benchmark
Call center staffing and structure	▪ Provided booking operations through remote call centers rather than through on-site schedulers (Gupta and Denton, 2007)
	▪ Centralize call centers to decrease abandoned calls and scheduling error rate and increase physician utilization of scheduling templates and number of patient visits (Rodak, 2013).
	▪ Consolidate operations to achieve five to ten percent technology savings, driven by platform and network savings, shared CRM applications, consolidated customer self-service applications, improved call routing efficiencies, and optimized agent desktop tools ("Contact," 2013)
	▪ Provide in-depth coaching for their frontline staff and have managers co-located with staff to spend significant time with them (Houser, 2015)

G.2   Past Reports for Scheduling Call Centers

Figure G-1. Previous Reports Relevant to Scheduling Call Centers

Past reports relevant to scheduling call centers

Identified in study

Ind = Independent Contractor
VA = VA Internal Audit
OIG = VA Office of the Inspector General
GAO = Government Accountability Office

Category	Recommendations	2005	06	07	08	09	10	11	12	13	2014
Asset investment	Ensure availability of IT necessities (headphones, monitors, bandwidth)										Ind
	Invest in people, processes, hardware, and call center software										VA
	Hire, train, and maintain the necessary number of schedulers										VA
Measurement and evaluation	Establish KPIs, specifically first-call resolution and customer satisfaction										VA
	Develop a national assessment for Veterans' satisfaction with call centers										VA
	Establish a quality management system for data and driving change										Ind
	Publish a guide for call centers based on lessons from call center pilots										VA
Leadership	Convene a summit to align leadership on a shared vision for the future										VA
	Establish a steering committee to oversee changes to call centers										VA
	Develop a network of FTE to facilitate schedulers sharing best practices										VA
	Ensure VAMCs provide implement best practices for telephone access								GAO		

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

Assessment F (Workflow – Clinical)

September 1, 2015

This page intentionally left blank.

Preface

Congress enacted and President Obama signed into law the Veterans Access, Choice, and Accountability Act of 2014 (Public Law 113-146) ("Veterans Choice Act"), as amended by the Department of Veterans Affairs (VA) Expiring Authorities Act of 2014 (Public Law 113-175), to improve access to timely, high-quality health care for Veterans. Under "Title II – Health Care Administrative Matters," Section 201 calls for an Independent Assessment of 12 areas of VA's health care delivery systems and management processes.

VA engaged the Institute of Medicine of the National Academies to prepare an assessment of access standards and engaged the Centers for Medicare & Medicaid Services (CMS) Alliance to Modernize Healthcare (CAMH)[1] to serve as the program integrator and as primary developer of the remaining 11 Veterans Choice Act independent assessments. CAMH subcontracted with Grant Thornton, McKinsey & Company, and the RAND Corporation to conduct 10 independent assessments as specified in Section 201, with MITRE conducting the 11th assessment. Drawing on the results of the 12 assessments, CAMH also produced the Integrated Report in this volume, which contains key findings and recommendations. CAMH is furnishing the complete set of reports to the Secretary of Veterans Affairs, the Committee on Veterans' Affairs of the Senate, the Committee on Veterans' Affairs of the House of Representatives, and the Commission on Care.

The research addressed in this report was conducted by McKinsey & Company under a subcontract with The MITRE Corporation

Executive Summary

Part F ("Assessment F"), Section 201 of the Veterans Access, Choice, and Accountability Act of 2014 ("The Choice Act") mandates an assessment of the "organization, workflow processes, and tools used by the Department to support clinical staffing, access to care, effective length-of-stay management and care transitions, positive patient experience, accurate documentation, and subsequent coding of inpatient services." Assessment F looked at these five sub-assessments (clinical staffing, access to care, effective length-of-stay management and care transitions, positive patient experience, accurate documentation, and subsequent coding) as both individual components as well as part of the interdependent continuum of inpatient care[2].

Inpatient care is delivered to more than 600,000 Veterans annually across more than 150 Veteran Affairs Medical Centers (VAMCs) in all 50 states and Puerto Rico (VSSC, 2014). The scale and variety of services the Veterans Health Administration (VHA) provides are extensive. VAMCs range considerably in complexity, from high-complexity, high-volume sites ("level 1a") to lower-complexity facilities more focused on outpatient care ("level 3")[3]. Approximately 80 percent of high- and medium-complexity facilities[4] have Community Living Centers (CLCs—VA nursing homes), ~50 percent have Domiciliary Residential Rehab Treatment Programs , ~25 percent provide Polytrauma services[5], ~20 percent are Regional Spinal Cord Injury Centers, and ~10 percent are Blind Rehabilitation Centers. VHA also has complex partnerships with other organizations: 100 percent of high- and medium-complexity facilities are academically affiliated and ~2 percent are joint DoD facilities. Ensuring consistently high-quality services and efficient operations across such a large and varied system is a considerable task.

Assessment F's focus was exclusively on the acute inpatient care setting[6]. To understand the strengths and challenges of VHA practices across such a varied system, we interacted with more than 750 VHA employees, including front-line staff, VAMC leadership, and VHA subject matter experts at VA Central Office (VACO), VHA Central Office (VHACO), and VAMCs. We visited a representative sample of 21 VAMCs across the country, conducting interviews with leadership and staff, interdisciplinary workshops with front-line personnel and managers, and shadowing in acute inpatient units. We supplemented site visits with analysis of national VHA data sets, a system-wide survey and data call, and interviews. We then compared VHA practices against industry benchmarks and best practices.

---

[2] Table 1-1 in section 1.3.6 provides a cross map of the sub-assessments' findings and recommendations with the organization, workflow processes and tools framework

[3] VHA has five complexity levels: 1a, 1b, 1c, 2, and 3, with 1a being the most complex and 3 being the least complex

[4] Levels 1a, 1b, 1c, and 2. Our assessment is tasked with assessing inpatient care, and therefore focused on higher-complexity facilities, which have more substantial inpatient services

[5] Includes Polytrauma Rehabilitation Centers (~5 percent) and Polytrauma Network Sites (~20 percent)

[6] Choice Act 201 specifies a focus on the inpatient setting, as such our assessment does not cover outpatient, VHA-operated long-term care facilities (e.g., community living centers, domiciliary care), or VAMCs that do not provide acute medical care in the inpatient setting as their primary service (Level 3)

Our assessment identified both cross-cutting strengths and opportunities for improvement as well as findings and recommendations specific to each of the five sub-assessment areas included in this report. Cross-cutting findings and recommendations can be found in Sections 3 and 4, while sub-assessment-specific findings and recommendations can be found in Sections 5 to 9. In brief, we found:

- **Cross-cutting findings:** We observed three common themes supported by findings across sub-assessment areas.

  o **Ineffective data collection and management drives a lack of transparency into many key aspects of clinical operations, hindering VHA's ability to effectively manage inpatient care.** Despite having a well regarded electronic medical record (EMR) system and the capability of tracking extensive clinical data, poor data collection and management of operational metrics was a consistent theme heard during site visits. Furthermore, it was clearly evident from our central and local requests for specific information. Data that is standard in private sector hospitals was frequently inaccessible in a timely manner or not tracked in a usable format by VHA.

  o **VHA resources (e.g., staff, beds) do not always match Veterans' care needs.** The practical allocation and prioritization of resources across the VHA system may not be consistently aligned to meeting the broader health needs of the Veteran patient population. Mismatch of resources to patient care needs manifests itself in three ways: hiring that does not consistently match staffing needs; allocation of staff to tours ("shift") that do not consistently match Veteran demand; and limited access to appropriate outpatient and post-/sub- acute care options.

  o **While best practices exist in selected pockets, communication and support for implementation at scale appears to be a challenge.** Our site visits revealed several clear best practices in place at various VAMCs (please see Appendix A-2 for a list of best practices identified during site visits and highlighted throughout this report); however, adoption of these practices was isolated even within the facility. Case studies of particularly strong programs are included in all sub-assessments. Despite successfully adopting best practices in some units, however, facilities appeared to struggle to implement programs house-wide. Moreover, information-sharing between VAMCs appears to be limited and ad hoc. As one Assistant Director of Patient Care Services described, "I'm shameless about stealing what works at other places, the problem is, I don't know what other places are doing. We need a way to connect, to learn from each other"[7]. This sentiment was echoed by staff across all of the facilities we visited.

- **Sub-assessment finding, clinical staffing:** Siloed resource management (e.g., limited coordination across service lines on FTE requests), poor data management, and limited guidance on staffing methodology result in staffing practices that are seldom evidence-based, outside of a few best practice areas (such as nursing). This prevents VHA from knowing whether staffing allocations are appropriate. Furthermore lengthy hiring

---

[7] Facility interview

timelines and inconsistent alignment of staff to patient care needs have downstream implications.

- **Sub-assessment finding, access:** Best practices exist at disparate facilities; however, their lack of systemic adoption, combined with an inaccurate understanding of patient demand and available capacity, and inconsistent admission and bed assignment practices, hinder inpatient access.

- **Sub-assessment finding, length-of-stay and care transitions:** National efforts to improve length-of-stay have been hampered by challenges meeting discharge needs of patients requiring specialized post-acute care (e.g., homeless, psychiatric diagnoses), inefficiencies in care delivery practices (e.g., limited availability of weekend consults), and inconsistent approaches to discharge planning often delay care transitions and discharge beyond private sector benchmarks.

- **Sub-assessment finding, patient experience:** Best practice innovations are evident at the national and local levels, but challenges with patient satisfaction data transparency and national implementation support limit system-wide adoption.

- **Sub-assessment finding, documentation and coding:** Limited understanding by providers and coders of the link between coding and resource allocation, coupled with limited performance management, likely contribute to sub-optimal documentation practices yielding lost revenues and misaligned resources. Despite these challenges, coding performance is an area of relative strength and comparable with industry standards.

Cross-cutting recommendations: Across sub-assessments, our recommendations also fall under three main themes:

- **Improve clinical management through establishing clear operational metrics, and streamlining data collection focused on clinical priorities, monitoring, and performance management.** Appropriately defining standards for high performance and having accurate information on how departments and facilities measure against defined targets is the foundation of managing operations. Site visits, data analysis, and comparison against best and standard practices suggest that VHA lacks such visibility into clinical operations, significantly reducing its ability to address challenges and innovate (see Section 3.1). We believe that improving transparency is critical to ensuring effective, timely, and efficient delivery of care to Veterans, across many of our sub-assessment areas. In part, transparency could be improved through enhanced data management, meaning both better data integrity and sharper focus on a targeted set of key metrics needed to assess performance. Equally important, VHA should ensure that facilities have clear operational guidelines on how to set and track appropriate performance goals (e.g., by providing comprehensive staffing methodologies for service lines with no national guidance).

- **Realign resourcing (for example, staff, facilities) to allow VHA to serve patients at the appropriate level of care (such as, increase Veteran access to sub-acute and post-acute care to reduce clinically inappropriate admissions and prolongation of acute inpatient stays).** We observed many instances in which VHA resources were not appropriately matched to patient demand. As described in Section 3.2, there is a disconnect between resources and demand in delayed hiring of staff needed to support patient care, mis-

allocation of staff to tours (i.e., shifts), and limited outpatient and post-acute care options needed to ensure treatment at the appropriate level of care. In order to provide high quality care that promotes the health and well-being of Veterans in a cost efficient manner, VHA should ensure that resourcing allows the system to serve patients at the appropriate level of care. Broadly, we see three categories of changes that could help effect this recommendation: improve hiring, allocate staff to match patient demand (e.g., align that staffing on weekend, holiday, and evening hours is sufficient to meet patient need), and increase access to outpatient and post-acute care options.

- **Scale existing best practices and support further innovation at the local and national levels.** A consistent theme during our site visits and interviews was that the opportunity to build off of existing strengths within the system was encumbered by limited sharing of best practices across VAMCs (see Section 3.3). In instances where best practices have been developed nationally, challenges appear to exist due to unclear guidance on implementation, occasional flaws in the design of programs, and lack of VAMC adoption. In instances where best practices have been developed locally, scaling seems to be inhibited by limited infrastructure for information-sharing and lack of resources. To address both sets of challenges and fully leverage and build off of institutional strengths, we suggest improving practices through a combination of targeted national guidance (e.g., streamline Veteran-centered care initiatives and mandates) and nationally-supported local best practice-sharing and innovation (e.g., build infrastructure to promote cross-facility sharing of patient flow best practices).

Our cross-cutting recommendations are supported by individual recommendations in each sub-assessment. Furthermore individual recommendations have been cross mapped to prior assessments' findings and recommendations in the appendices for each sub-assessment, highlighting the need for well-coordinated and comprehensive action. Understanding that several of recommendations will require national coordination -- while others could be implemented in the near-term at the facility level, we have provided additional tactical steps, titled near-term actions, for associated recommendations at the sub-assessment level and encourage facilities to review these and consider action quickly at the local level where appropriate.

Additionally, we believe there are several preconditions to successfully implementing our recommendations. These preconditions, described below, represent fundamental shifts in VHA operations and management, however we believe that they are necessary in order to fully and sustainably transform clinical workflows.

- **Clearly define the range of services VHA is responsible for providing, as well as its target Veteran recipients**, define the degree to which VA will fund and provide inpatient care that does not meet clinical appropriateness criteria (for example, for homeless or difficult to place patients), and ensure sufficient resourcing to provide this care, whether through VHA facilities or contracts with external organizations.

- **Substantially streamline congressional mandates and VHA directives** including reporting requests, required programs, and earmarked funding, in order to sharpen VHA's focus and allow VAMCs the flexibility they require to address local care needs.

- **Understand resource implications of new and existing congressional mandates and VACO VHACO directives** that are judged necessary to ensure adequate resources are available without negatively impacting other programs and services.

- **Increase transparency and accountability for performance** against a limited set of the most important metrics.

In summary, our assessment took an end-to-end view of inpatient clinical operations across five key sub-assessment areas and all high- and medium-complexity VAMCs. We acknowledge strengths and provide suggestions for addressing challenges in the provision of inpatient care across VHA. Implementing solutions to long-standing challenges will require collaboration among Congress and the Executive Branch, VA leadership (VACO, VHACO, VISN, and VAMC) and staff, as well as the unions, Veterans and external stakeholders. We see this assessment as an opportunity for improvement, to be achieved by all stakeholders through a combination of local, regional, and national action. Addressing these challenges will require sustained commitment as a part of an integrated transformation effort for the system as a whole.

1 Introduction

1.1 Purpose

With the goal of improving access, quality, and effectiveness of health care delivery for Veterans, the Veterans Access, Choice, and Accountability Act of 2014 ("The Choice Act"), Section 201 mandated a forward-looking, independent assessment of current practices and opportunities for improvement within VA facilities. Specifically, Assessment F is tasked with a review of the "organization, workflow processes, and tools used by the Department to support clinical staffing, access to care, effective length-of-stay management and care transitions, positive patient experience, accurate documentation, and subsequent coding of inpatient services" (Section 201, Part F).

1.2 Scope

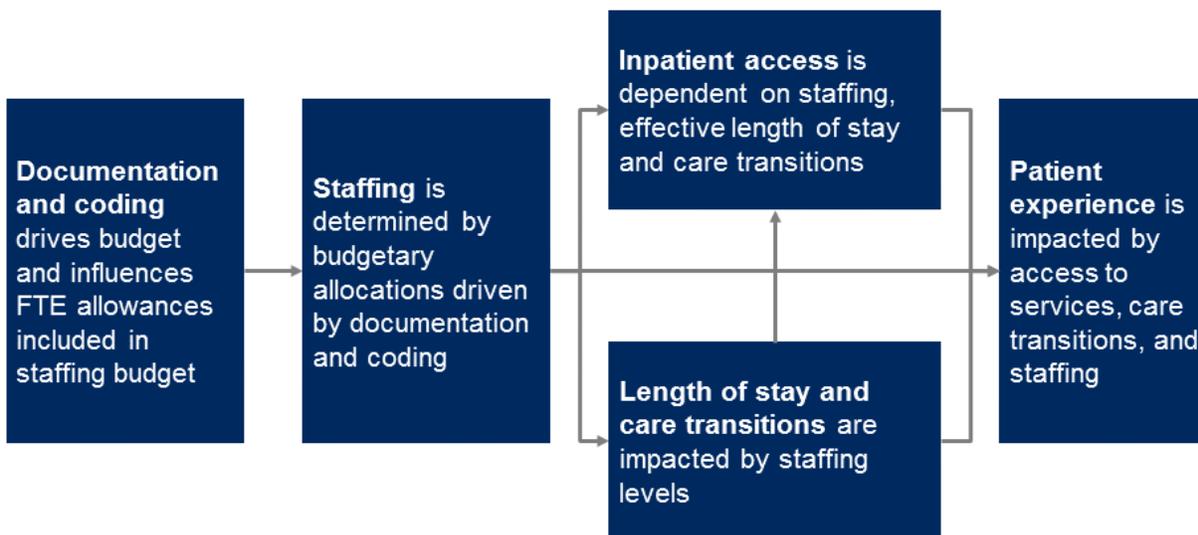
Pursuant to the language provided in Section 201 of the Choice Act, the scope of our assessment focuses on the organization, workflow processes, and tools (i.e., structural components and approaches) in place within acute care hospitals to facilitate clinical staffing, access, effective length-of-stay management and care transitions, positive patient experience, and accurate documentation and subsequent coding, all within the acute inpatient setting. Comparison of current VHA practices to accepted best practices (drawn from literature and professional associations), as well as standard practices (drawn from public and private sector benchmarks) provided insight into alternative approaches and recommendations. While selected performance outcomes were used to prioritize areas of focus, a complete analysis of clinical, performance, operational, or other outcomes associated with the employed approaches was not in scope for this assessment. We would however, be remiss not to acknowledge that, per Assessment B, VA's performance against reviewed clinical outcomes was found to be on-par or better than industry averages in many cases.

Assessment F is closely connected to several other assessments within the Choice Act, including, but not limited to, assessments B (capabilities and resources), E (scheduling), G (staffing), H (information technology), I (business processes) and L (leadership). In order to avoid overlap and duplicative analysis, assessments were completed in close coordination. We have indicated key instances where further relevant analysis is included in related assessment reports. Examples of these adjacencies include the VISN-VAMC relationship (Assessment L), surgical scheduling processes (Assessment E), clinical outcomes (Assessment B), and provider productivity (Assessment G).

1.3 Sub-Assessments

The five identified sub-assessment areas (clinical staffing, access to care, effective length-of-stay management and care transitions, positive patient experience, and accurate documentation and coding) for inpatient workflows are closely linked, driving and affecting each other in multiple ways (see Figure 1-1).

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

**Figure 1-1. Relationships and Interdependencies Between
Assessment F Sub-assessment Areas**


SOURCE: Veteran's Access, Choice, and Accountability Act of 2014

Documentation and coding captures patient utilization of specific services. This data can be used to identify trends and changes in care needs of the patient population, which drive the allocation of resources (VERA, 2014). These resources include budgetary allocations for staffing. Sufficient staffing in turn affects facilities' ability to provide access to safe, high-quality care that meets patient needs. Access is also affected by length-of-stay management and care transitions, insofar as delayed lengths-of-stay reduce facilities' ability to admit new patients. Documentation and coding, staffing, access, and length-of-stay management and care transitions all affect the quality of care provided and patient experience, as well as cost of care (Kleinpell, 2008). The recommendations sections within sub-assessments highlight the potential impact of our recommendations on performance outcomes and costs, as appropriate.

Please note that for the purposes of this report, we have sequenced the individual sub-assessment sections in accordance with the legislation: clinical staffing, access to care, effective length-of-stay management and care transitions, positive patient experience, accurate documentation and coding. Subsections 1.3.1-1.3.5 provide an overview how we approach each one of these sub-assessments, followed by sub-section 1.3.6, which maps Assessment F to the Choice Act legislation.

1.3.1 Clinical Staffing

Clinical staffing accounts for a large portion of a hospital's operating budget, and is the foundation for providing safe and effective patient care. Staffing levels drive access, affect patient outcomes, and influence patient and staff satisfaction. In keeping with standard industry approaches to staffing, we have examined four main aspects of staffing: (1) core staffing (i.e., resource management); (2) scheduling; (3) flexing (i.e., changes in staffing to meet variation in demand); and (4) supporting infrastructure. Given that Assessment F refers to "clinical staffing," we have included roles primarily responsible for direct patient care: physicians, nurse practitioners, physician assistants, nurses, nursing assistants, psychologists, pharmacists, pharmacy technicians, allied health professionals (e.g., physical therapists), therapy assistants and health technicians (see Appendix B for more detail on defining clinical staff). Ancillary support (e.g., environmental services) and administrative roles (e.g., bed management) are examined insofar as they affect staffing of clinical roles. Staffing levels, productivity, and allocation of clinician time are the focus of Assessment G, and are therefore not included in Assessment F.

1.3.2 Access

The ability to receive the necessary level of care in the most appropriate setting is essential to the effectiveness and efficiency of a health care system. In the inpatient setting, "access" refers to the process by which patients, in need of acute hospital care, are appropriately triaged and admitted to an inpatient bed. Patients may be admitted through a series of different channels including: through the Emergency Department (ED), as a direct admission from a physician's office, as a transfer from another facility, or as a scheduled admission following a procedure (i.e., a surgery that requires hospitalization following the procedure). Annually, approximately 75 percent of all VAMC admissions come through the ED, making ED throughput a major focus of our assessment. In particular we have examined three key processes related to inpatient access to care: (1) ED throughput and care delivery practices; (2) admission workflow from the ED and surgical suites; and (3) bed assignment following admission decision. Several factors contribute to inpatient access including, but not limited to, the availability of beds, staffing and individual provider capacity, scheduling of elective procedures relative to projected demand for beds, and the discharge of patients who no longer require acute care. While the scheduling process for elective outpatient procedures impacts inpatient access to care, it is an adjacency that falls in scope for Assessment E.

1.3.3 Effective Length-of-Stay (LOS) Management and Care Transitions

Length-of-stay (LOS) management and effective care transitions are key to VHA's ability to optimally provide cost-efficient, patient-centered, high-quality care across its approximately 600,000 annual admissions.[9] We have examined current VHA practices related to three key areas shown in the academic literature to impact effective LOS management and care transitions: (1) processes for providing timely and evidence-based care; (2) discharge planning;

---

[9] 2014 VHA Support Service Center (VSSC)

and (3) post-acute placement. Based on the inpatient focus outlined in part F of the Choice Act legislation, our assessment does not cover VHA-operated or partnered post-acute nor non-acute care facilities (e.g., community living centers, domiciliary care).[10] It would however, be valuable for VHA to complete a similar assessment on these areas as well in order to fully gauge the impact on LOS and care transitioning.

1.3.4 Positive Patient Experience

Veterans receiving treatment from within the VHA system should benefit from best-in-class integrated care tailored to meet the specific needs of those who have served our country. Drawing on the academic literature on predictors of positive patient experience, we have chosen to focus on several key themes associated with patient experience: (1) engage Veterans and their families in care; (2) promote employee responsiveness and service recovery; (3) personalize patients' health care to their individual needs; and (4) encourage open communication and shared decision-making. While patient experience is shaped throughout the continuum of care including the outpatient setting and touch points outside of clinical encounters, this section focuses exclusively on patient experience in the inpatient setting.

1.3.5 Documentation and Coding

Proper documentation and coding ensure that VHA is able to appropriately distribute its Congressional budgetary allocation, effectively collect revenues from third-party insurers, accurately track patient demographics, and successfully monitor performance (e.g., by assessing provider productivity) (VERA, 2014). We have examined three key areas that are industry standard for ensuring optimal documentation and coding performance: (1) provider documentation practices; (2) medical coding procedures; and (3) quality review processes. Separate assessments within the Choice Act are devoted to VHA's information technology tools and strategies as they relate to clinical documentation (Assessment H) and the processes for billing and collection of third-party billable claims (Assessment I); the reports corresponding to these assessments should be consulted for additional details on these topics.

1.3.6 Legislation

In accordance with Part F of the Choice Act legislation, we have covered the organization, workflow processes, and tools used by VHA to support the five identified sub-assessment areas (clinical staffing, access to care, effective length-of-stay management and care transitions, positive patient experience, accurate documentation and coding) in the inpatient setting. Additionally, because organization, workflow processes, and tools are cross-cutting in nature, we have taken a broader view across the sub-assessments, as well. The specific elements of the legislation are discussed in depth in sections five through nine, as detailed in Table 1-1, with additional cross-cutting findings and recommendations detailed in sections three and four.

---

[10] This is consistent with CMS's definitions of what constitutes an inpatient stay (CMS, 2014)

2 Methodology

A range of quantitative and qualitative tools were used to assess practices at VHA inpatient facilities. System-wide analysis of organizational data (e.g., policies and procedures) and performance data (in sub-assessments where evaluation of performance is included in the Choice Act language, e.g., "effective length-of-stay management") was done to understand variation within the system and compare against benchmarks. This data analysis was supplemented by visits to 21 inpatient facilities across the nation, a survey distributed to relevant clinical staff roles at all VAMCs, a data call for local policy documents and data at all VAMCs, and interviews with subject matter experts both internal and external to VA. We also looked at previous studies and assessments of VHA's inpatient clinical workflow. It is, however, important to note that this assessment has several limitations including the fact that we did not have access to survey Veterans or collect their input at scale, we operated under an aggressive time frame, and in many instances, as noted throughout this assessment, there were limitations on data. Additionally, due to the required independence of the Choice Act, Section 201 assessments, findings and recommendations were developed independently. We therefore expect these recommendations would be refined by VHA leadership and the "Commission on Care."

2.1 VAMC Site Selection

Stratified random sampling was used to select a core set of VAMCs for on-site assessment. This set of VAMCs was representative of the VHA system as a whole across critical facility demographic and performance outcome metrics (see Appendix A for further detail). Given the focus of Assessment F on inpatient medical facilities, we chose to only visit VAMCs providing substantial inpatient medical care (complexity levels 1a, 1b, 1c, and 2), and did not include other types of facilities (e.g., community-based outpatient clinics [CBOCs], complexity level 3 facilities).

Additional information on distribution of VAMCs against specific service lines is shown in Appendix B. As figures in Appendix B indicate, 84 percent of complexity level 1 and 2 facilities have Community Living Centers (CLCs), 48 percent have Domiciliary Residential Rehab Treatment Programs, 2 percent are joint DoD facilities, 4 percent are Polytrauma Rehabilitation Centers, 20 percent are Polytrauma Network Sites, 20 percent are Regional Spinal Cord Injury Centers, 11 percent are Blind Rehabilitation Centers, and 100 percent are academically affiliated in some form.

2.2 Data Sources and Analysis

We analyzed data from several sources: (1) national VHA data sets; (2) a survey of relevant front-line clinical inpatient staff at all VAMCs; (3) a data call made to all VAMCs; (4) more than 150 interviews during visits to 21 VAMCs and with other subject matter experts; (5) 80 total assessment workshops held during site visits; and (6) more than 65 unit shadowing sessions conducted during site visits.

We believe that the interactive approach used during site visits differentiates this assessment from many others that have been conducted. We purposefully selected sites representing VHA as a whole, and not only conducted observations of their behavior and processes, but also took extra time to focus on gathering front-line employee input to better understand their actions and perspectives. Several interviewees thanked us for including them and made comments to the effect of "Most survey teams come to our facility and speak exclusively with senior leadership – it's refreshing to be included in this important work, especially since we know what's broken, what works, and what has failed in the past." During our site visits, through the interviews, assessment workshops and shadowing sessions mentioned above, we met with more than 750 employees across roles, departments, and tenure levels. We believe this has enabled us to bring a broad perspective to the conversation on VHA's strengths and challenges.

In many instances, VHA was unable to provide data typically used by private sector hospitals to manage performance. This was either because requested data did not exist (e.g., payroll data by shift), was not available at the national level (e.g., time from Post-Acute Care Unit (PACU) transfer order to admission to the floor), was reported to be so inaccurate that conclusions could not be drawn from it (e.g., number of operational beds), or required effort to compile beyond what time and resources could allow (e.g., hourly data on ED visits by facility). Lack of data impeded our ability to fully assess VHA clinical operations. Data challenges are also a finding in and of themselves: without basic information on its operations—such as the number of currently active inpatient beds—VHA has very limited ability to manage performance. This is a critical issue, which emerged in each of our sub-assessment areas.

Our approach to collecting data from various sources is included below. We primarily used descriptive statistics to analyze the data we collected (e.g., analyzing the frequency with which a particular tool was used). In some instances, we supplemented this approach with regression analysis, used to determine associations between different variables (e.g., to understand whether allied health professionals were more likely than nurses to believe that their occupation was adequately staffed).

National VHA data sets:

To develop a baseline understanding of current practices across VHA, we requested access to national VHA data sets. Key sources included: the survey of health care experiences and patients (SHEP), strategic analytics for improvement and learning (SAIL), national bed control database (NBCD), national utilization management integration (NUMI), inpatient evaluation center (IPEC), medical SAS inpatient dataset (MedSAS), emergency department integrated software (EDIS), national surgical office (NSO), human resources (HR), and payroll. It should be noted that we did not conduct a review to validate the accuracy of data that was provided.

Surveys:

To gather additional insight into front-line workers' perspectives of VHA, we conducted a survey of staff perceptions of practices related to each of the sub-assessment areas within Assessment F. To ensure a breadth of perspectives and a sufficient response rate, the survey was sent to leadership at all VAMCs to distribute to all staff within selected relevant roles (e.g., Emergency Department charge nurses). 2,684 inpatient staff members responded to one or

---

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

8

more sections within the inpatient survey. Surveys were tailored to be role specific and ask for respondents' perceptions of the organization, processes, and tools used to support each of the sub-assessment areas, meaning that total respondents varied by role, question, and sub-assessment. Due to the fact that VHA does not track the setting of work (i.e., inpatient or outpatient) in available human resource data and we did not control the distribution of the survey to the end-user, we are unable to calculate the significance of the total response rate, but do not believe it to be a representative sample across any of the roles. Given this, survey data should be viewed as providing anecdotal insights as opposed to a representative data sample.

Data call:

To access data that is captured in many cases solely at the facility level (e.g., FTEs by department, overtime use by department, type of tool utilized for specific tasks), as well as policies housed at individual VAMCs (e.g., side agreements with unions), we initiated a data call to all VAMCs. Approximately 120 unique VAMCs across 100 percent of VISNs responded to one or more portions of the data call, with an average of 60 unique VAMCs responding to each sub-assessment specific questionnaire.

Interviews:

To gain insight into facility-level strengths and challenges as well as current practices, we conducted nine individual and group interviews of key facility staff at each VAMC visited (e.g., Department chiefs, case managers, patient advocates) for a total of more than 150 interviews[11] across 21 VAMCs. In addition to interviews conducted on-site at facilities, we interviewed 52 members of VA Central Office (VACO) and VHA Central Office (VHACO) leadership and subject matter experts identified by our assigned VA point-of-contact (POC).

Assessment workshops:

To understand clinical operations processes and the feasibility of potential solutions, we held four interdisciplinary assessment workshops at each of our 21 site visits, for a total of 80 workshops[12]. These workshops focused on clinical staffing, ED throughput (a major part of inpatient access), the discharge process (a key component of length-of-stay management), and documentation and coding. Workshops were held with an average of 5 to 7 interdisciplinary participants and included interactive activities such as process mapping, brainstorming of solutions, and ranking of proposed solutions.

Unit shadowing:

To identify current facility tools and processes, we gathered primarily quantitative data through shadowing front-line staff members in key departments (e.g., number of ICUs using

---

[11] Individual iterviews were conducted by members of the Assessment F Team and often applied to multiple sub-assessments of F, as a result the number of interviews cited by individual sub-assessments are not additive.

[12] Four workshops were cancelled due to scheduling reasons and/or poor attendance

standardized vent-weaning protocols) across 21 VAMCs. Data was collected using standardized checklists, to ensure consistency.

2.3 Benchmarking

We used a two-pronged approach to benchmarking VHA organization, processes, and tools. First, we drew on the academic literature, recommendations made by professional associations, and case studies of high performing facilities (internal and external to VHA) to identify industry best practices. Professional associations were selected based on their influence on industry standards, indicated by the size of their membership and prevalence of use of their standards and products in clinical practice. Hospitals were identified as having best-in-class practices based on placement in hospital rankings (e.g., Hospital Consumer Assessment of Health Care Providers and Systems [HCAHPS] rating). We also selected high performing facilities based on recommendations by external experts, interviewing staff where possible and building case studies of highly effective practices, within and beyond VHA.

Second, in cases where there was no clear consensus in the literature or professional community as to the best practice, we used industry standard practices as the benchmark. We relied upon external surveys of private sector hospitals (published in academic literature or by professional associations) and interviews with median-performing facilities to develop a view of standard practices. We have noted where a practice is industry standard, rather than necessarily ideal.

VHA is unique relative to the private sector in many respects: its patient population, scale, and integrated nature are particularly clear examples. Private industry best practices as well as standard practices are therefore not always directly applicable to VHA. We have included these practices as benchmarks, however, to give a sense of how VHA clinical operations compare to those governing the health care provided to most Americans, in private facilities. As noted earlier, we have also reviewed internal best practices at high-performing VAMCs to illustrate organizational structures, processes, and tools that have been effective within VHA's context.

Finally, an independent Blue Ribbon Panel, consisting of high-level health care industry experts, Veteran advocates, and other key opinion leaders was formed to provide expert input throughout the assessment process. The panel members possessed a thorough understanding of health care industry best practices and leading edge practices. The Blue Ribbon Panel provided advice and feedback on the emerging findings and recommendations for the assessment.

3   Cross-Cutting Findings

We found three common themes across the sub-assessment areas included in this report: (1) ineffective data collection and management drives a lack of transparency on many key aspects of clinical operations, hindering VHA's ability to effectively manage inpatient care; (2) VHA resources (e.g., staff, beds) do not always match Veterans' care needs; and (3) while best practices exist in selected pockets, communication and support for implementation at scale appears to be a challenge.

3.1   Ineffective Data Collection and Management Drives a Lack of Transparency on Many Key Aspects of Clinical Operations, Hindering VHA's Ability to Effectively Manage Inpatient Care

Despite having a well regarded EMR system and the capability of tracking extensive clinical data, poor data management was a consistent theme heard during site visits, and was clearly evident from our central and local requests for specific information. Data that is standard in private sector hospitals was frequently inaccessible in a timely manner or not tracked in a usable format by VHA. For example, VHA FTE and payroll data includes information by clinical occupation but not by department, which prevented planned analysis of the appropriateness of staffing, since needed staffing levels vary considerably by department (e.g., the ICU requires more concentrated nursing attention than medical/surgical floors; see Section 2 for more detail). VHA also lacks accurate insight into inpatient bed capacity (and, thereby, inpatient access). VHA assesses inpatient bed capacity using nationally reported "operational beds." However, approximately 40 percent of facilities responding to our data call reported having to close beds temporarily due to staffing shortages; these temporary closures can actually last for extended periods, and are not reported nationally. This means that bed capacity on the ground may be substantially lower than VHACO has visibility into, affecting decision-making in areas such as construction and staffing (see Section 3 for more detail). We observed data integrity and availability issues significantly affecting VHA's visibility into clinical operations in four of our five sub-assessment areas (described below) and believe that this likely affects VHA's ability to manage operations at the local and national levels. While we were unable to conduct a root cause analysis as to the fundamental causes of poor data collection and management, we do believe that further exploration of this topic is necessary for VHA to improve clinical operations in a meaningful way.

Supporting sub-assessment findings:

- **Clinical staffing, 5.2.1:** VHA does not have the tools or data to set or monitor staffing levels appropriately. Variable VHA HR and payroll data systems give different FTE numbers for the same clinical occupations and VAMCs. While the nursing service has developed a strong staffing methodology, many other clinical occupations lack any central guidance on how to estimate FTE need. As one AHP leader said, "We'll be adding 10,000 patients [to one of our sites next year]…how many more PTs do I need? I don't know."

- **Access, 6.2.1:** Data gaps limit VHA's understanding of patient demand patterns and available VAMC capacity. Inconsistent methods for tracking physical bed counts and patient demand patterns at the unit and facility level limit VHA's ability to analyze VAMC staffing and available bed capacity based on patient demand. While VHA maintains several different systems to manage access and flow, these systems do not integrate with one another, further limiting end users' ability to aggregate information across systems.

- **Patient experience, 8.2.3:** Challenges with respect to timeliness and specificity in the SHEP survey results limit VAMCs' ability to drive performance improvement. Lack of timeliness (3-6 month delay in reports) and specificity (aggregate facility level results as opposed to unit or individual level) of SHEP survey results limit the perceived effectiveness, accuracy, and ability to execute against patient satisfaction results.

- **Documentation and coding, 9.2.1:** Inconsistent emphasis on clinical documentation impedes consistent capture of complete clinical information, hindering appropriate resource allocation and revenue collection. Varied emphasis on accurate clinical documentation and coding across the organization results in potentially incomplete data. While some VAMCs have stressed proper documentation to maximize budgetary allocations and improve quality ratings, many have not. This is evidenced by differences in local approaches to documentation training: only 57 percent of physicians participating in the Choice Act survey reported that their facility provides training regarding documentation and coding.[13]

3.2 VHA Resources (e.g., staff, beds) do not Always Match Veterans' Care Needs

The practical allocation and prioritization of resources across the VHA system may not be consistently aligned to meeting the broader health needs of the Veteran patient population. Mismatch of resources to patient care needs manifests itself in three ways: hiring that does not consistently match staffing needs; allocation of staff to tours ("shift") that do not consistently match Veteran demand; and limited access to appropriate outpatient and post-/sub- acute care options.

As an example of limited outpatient and post-acute care options, we found many instances in which Veterans were admitted to the hospital despite not meeting acute criteria to warrant admission, or remained in the hospital past the point of medical necessity, due to challenges in accessing the appropriate level or type of care (e.g., primary care, detoxification center, post-acute rehabilitation). NUMI data[14] indicates that 23 percent of inpatient admissions do not meet admission criteria (see Section 6 for more detail) and 34 percent of inpatient stays overall do not meet continued stay criteria (see Section 7 for more detail). The disconnect between resources and demand has clear implications on VHA's ability to effectively and efficiently provide the care needed to improve the health and well-being of Veterans. Non-medically-

---

[13] Choice Act survey (N=434)

[14] NUMI (National Utilization Management Integration): supports national utilization management agenda by providing a common tool for tracking performance on utilization management metrics across facilities

indicated stays may be well-intentioned, but they are a suboptimal use of acute medical resources. This reduces inpatient access, delays care transitions (increasing healthy patients' exposure to hospital-acquired infections) and increases the overall cost of Veteran care. Supporting sub-assessment findings are listed below, indicating areas where we observed mismatch of resources to demand.

Supporting sub-assessment findings:

- **Clinical staffing, 5.2.2:** Hiring timeline significantly exceeds private sector benchmarks, affecting ability to fill vacancies on patient care teams. VHA HR targets 60 days from receiving a request for a job posting to making a tentative offer; this timeline exceeds private sector timelines for hiring most clinical staff, and does not count steps needed to make a final offer. Interviewees and workshop participants consistently reported that hiring exceeds the 60 day target, reaching ~6 months for most clinical occupations. The length of the hiring process was cited as a challenge in 100 percent of staffing workshops.[15]

- **Clinical staffing, 5.2.3:** Allocation of staff does not consistently match patient care need. We found that staffing levels drop considerably on evenings, nights, and weekends (e.g., by ~65-100 percent for intensivists, depending on the shift), often beyond what is recommended in the academic literature as safe minimum staffing levels, potentially affecting patient care.

- **Access, 6.2.2:** Hospital visits and admissions that are not clinically appropriate contribute to ED bottlenecks and limit bed availability. More than 120,000 admissions, approximately 20-25 percent of admissions from the ED and following surgical procedures, fail to meet McKesson InterQual admissions criteria.[16] Of those clinically inappropriate VHA admissions, we found that 30 percent or 7 percent of total admissions, are attributed to limited access to the appropriate setting of care (e.g., level of care availability, outpatient access, and social issues).

- **Length-of-stay, 7.2.2:** Existing post-acute care options (e.g., rehabilitation/skilled nursing facilities) do not always match Veteran needs, delaying discharge. Patient LOS is, on average, ~3.1 days longer for Veterans discharged to post-acute care settings compared to patients discharged to home. Participants in 55 percent of on-site workshops reported challenges with transitioning Veterans into post-acute care, including difficulty arranging transportation, securing timely placement in VHA-operated programs, and contracting with community facilities.[17]

- **Length-of-stay, 7.2.3:** Typical VAMC operating models do not promote efficient inpatient care, leading to prolonged LOS. Limited availability of important clinical services (e.g., specialty and allied health consults) on weekends contributes to ~15-45 percent increases in LOS for admissions extending through the weekend. In addition, implementation of

---

[15] Site visit staffing assessment workshops (N=19)

[16] McKesson InterQual is a tool that provides evidence-based clinical decision support on the appropriateness of care (including admissions and continuing stays)

[17] Site visit discharge planning assessment workshops (N=20)

evidence-based inpatient protocols and care pathways have been left to individual facilities, resulting in variable adoption nationally.

3.3   While Best Practices Exist in Selected Pockets, Communication and Support for Implementation at Scale Appear to be a Challenge

Our site visits revealed several clear best practices in place at various VAMCs; however, adoption of these practices was isolated even within the facility. Case studies of particularly strong programs are included in all sub-assessments. Despite successfully adopting best practices in some units, however, facilities appeared to struggle to implement programs house-wide. Moreover, information-sharing between VAMCs appears to be limited and ad hoc. As one Assistant Director of Patient Care Services described, "I'm shameless about stealing what works at other places, the problem is, I don't know what other places are doing. We need a way to connect, to learn from each other"[18]. This sentiment was echoed by staff across all of the facilities we visited.

Supporting sub-assessment findings:

- **Access, 6.2.3:** Best practices related to workflow and performance management exist at some facilities, but have not been scaled across the system. Despite successful implementation of many operational best practices (e.g., fast track, clinical protocols in triage, flow management teams) in select facilities, adoption is limited system-wide. Additionally, even in top-performing facilities based on ED length-of-stay and left without being seen rates, delays in inpatient access can result from insufficient bed availability and inconsistent admission and bed assignment processes.

- **Length-of-stay, 7.2.1:** Implementation of national LOS programs and initiatives has failed to achieve organization-wide improvements despite local pockets of best practice adoption. National programs, including the Utilization Management (UM) program and several collaboratives (for example, Transitions Collaborative, Flow Collaborative), have been launched to address existing challenges with LOS and care transitions. Although several facilities have experienced improvements through participation in these programs, national LOS challenges persist: the difference between VHA LOS and average DRG-adjusted Medicare LOS has increased by 5 percent since beginning of FY2012, while restrictions on VHA programming have contributed to a ~50 percent decrease in the number of facility spots available within national collaboratives.[19]

- **Length-of-stay, 7.2.4:** Use of discharge planning best practices is inconsistent, decreasing effectiveness and coordination. Nationwide, VHA adoption of practices to appropriately manage LOS and promote effective care transitions has not matched practices of high performing hospital systems. For example, only 48 percent of VAMCs[20] have dedicated

---

[18] Facility interview

[19] Facility interview

[20] VHA data call (2015) (N=60)

inpatient case managers to coordinate the overall discharge planning process (compared to private sector facilities that commonly employ a team of RN case managers, social workers, utilization management specialists, and discharge planners), which may result in avoidable discharge delays.

- **Patient experience, 8.2.2:** Adoption of facility level best practices and engagement of program office support services are varied across VAMCs. While initiatives at both the central and facility levels exemplify Veteran-centered care and industry accepted best practices, adoption across the system is limited by the level of facility leadership engagement and insufficient infrastructure to codify and share facility-driven initiatives across the system.

- **Documentation and coding, 9.2.2:** Adoption of documentation best practices is variable, resulting in inconsistent quality of clinical documentation system-wide. Interviewees and workshop participants during our site visits consistently reported challenges with clinical documentation, including 80 percent of sites reporting suboptimal template use and 55 percent reporting inappropriate use of copy-paste.[21] The persistence of these challenges despite 87 percent of VAMCs[22] reporting quarterly performance of EHR quality reviews suggests opportunities to improve the EHR review process.

- **Documentation and coding, 9.2.3:** System-wide focus on coding standards has resulted in coding performance typically meeting or exceeding private sector benchmarks. National inpatient coding accuracy is ~93 percent[23] and inpatient coding occurs ~4 days after discharge, suggesting that VHA coding metrics are closely aligned with industry benchmarks. Routine internal auditing of coding performance at the facility-level and development of a national dashboard for performance tracking appear to be contributing to strong overall performance.

4 Cross-Cutting Recommendations and Implementation Considerations

4.1 Cross-Cutting Recommendations

We have identified three priority recommendations for VA to consider to address the key findings included in Section 3, above: (1) improve clinical management through clear operational metrics, streamlined data collection, monitoring, and evaluation; (2) realign resourcing (e.g., staff, facilities) to allow VHA to serve patients at the appropriate level of care; and (3) scale existing best practices and support further innovation at the local and national levels.

In order to facilitate implementation, additional detail on the supporting themes, as well as potential near-term actions can be found in the sub-assessment sections of this report (Sections 5-9). Furthermore, we have suggested owners for each of the "potential near-term actions." These owners should be viewed as suggestions based on our understanding of: (1) whether change is needed nation-wide or depends on specific facilities' need, and (2) whether VACO resources will be required to facilitate actions. Ultimately, initiatives should be driven by owners that are dedicated to making the improvement happen and well-positioned to drive the change necessary to achieve impact.

4.1.1 Improve Clinical Management Through Clear Operational Metrics, Streamlined Data Collection, Monitoring, and Performance Management

Appropriately defining standards for high performance and having accurate information on how departments and facilities measure against defined targets is the foundation of managing operations. Site visits, data analysis, and comparison against best and standard practices suggest that VHA lacks such visibility into clinical operations, significantly reducing its ability to address challenges and innovate (see Section 3.1). We believe that improving transparency is critical to ensuring effective, timely, and efficient delivery of care to Veterans, across many of our sub-assessment areas. In part, transparency could be improved through enhanced data management, meaning both better data integrity and sharper focus on a targeted set of key metrics needed to assess performance. Equally important, VHA should ensure that facilities have clear operational guidelines on how to set and track appropriate performance goals (e.g., by providing comprehensive staffing methodologies for service lines with no national guidance). The sub-assessment recommendations listed below illustrate specific changes that could help VHA increase transparency.

Supporting sub-assessment recommendations:

- **Clinical staffing, 5.3.1:** Increase transparency of staffing by providing evidence-based staffing methodologies for all clinical staff and improving data management. VHA should provide comprehensive staffing methodologies for services with no national guidance. VHA should also ensure that staffing is interdisciplinary, so that providers are staffed with the support they need to practice.

- **Access, 6.3.1:** Develop an accurate end-to-end picture of patient demand and VAMC capacity. VHA should simplify the process and required approvals by which beds are classified as operational and standardize the definition and tracking of patient diversions. Additionally, VHA should develop a prioritized set of standardized metrics to track patient flow, including current demand and capacity, at the facility, VISN, and VHACO level, to be compared to models of patient demand.

- **Patient experience, 8.3.1:** Collect more timely and relevant patient experience data to drive performance improvement at the facility, department, and individual level. VHA should ensure its patient satisfaction tool(s) delivers granular survey results (for example, at the individual department or unit level) in a timely (for example, real time or near real-time) and actionable format (for example consistent across the system).

- **Documentation and coding, 9.3.2:** Strengthen provider documentation standards (e.g., management of clinical templates, EHR review process) to promote optimal capture of patient information and improve resulting resource management. VHA should improve documentation practices through enhanced governance focused on template management, targeted guidance regarding EHR reviews, and improved performance management reinforcing query responsiveness.

4.1.2 Ensure Resourcing (e.g., staff, facilities) Allows VHA to Serve Patients at the Appropriate Level of Care

We observed many instances in which VHA resources were not appropriately matched to patient demand. As described in Section 1.4.2, the disconnect between resources and demand was seen in delayed hiring of staff needed to support patient care, misallocation of staff to tours (i.e., shifts), and limited outpatient and post-acute care options needed to ensure treatment at the appropriate level of care. In order to provide high quality care that promotes the health and well-being of Veterans in a cost efficient manner, VHA should ensure that resourcing allows the system to serve patients at the appropriate level of care. Broadly, we see three categories of changes that could help effect this recommendation: improve hiring, allocate staff to match patient demand (e.g., align that staffing on weekend, holiday, and evening hours is sufficient to meet patient need), and increase access to outpatient and post-acute care options. Specific recommendations related to our sub-assessment areas are included below.

Supporting sub-assessment recommendations:

- **Clinical staffing, 5.3.2:** Increase timeliness of hiring for patient care teams. VHA should refine HR service level agreements, streamline the hiring process, and review regulations that extend hiring timeline, for necessity.

- **Clinical staffing, 5.3.3:** Allocate staff to match patient care need. VHA should ensure that staffing on evenings, nights, and weekends matches hospital volumes, and that facilities have access to flexible resources that can help manage short-term understaffing.

- **Access, 6.3.2:** Decrease the number of clinically inappropriate admissions due to limited access to sub-acute care. VHA should assess the availability of alternative settings of care

---

(e.g., detox clinics, short-term rehabilitation centers), at the regional level, and dedicate appropriate patient support resources (e.g., case managers and social workers), at the facility level, to coordinate transitions from the ED and surgical departments. Once the infrastructure is in place to support these patients outside the acute setting, VAMCs should begin to hold physicians accountable for appropriateness of admissions (e.g., include utilization management in physician performance appraisals).

- **Length-of-stay, 7.3.1:** Mitigate discharge delays related to post-acute placement (e.g., increase availability of post-acute care options). VHA should evaluate the availability of VHA-operated programs and community resources to meet the post-acute care needs of Veterans. Based on availability, VHA should create appropriate partnerships or develop VHA-operated services aligned with Veteran needs and the organization's refined strategic mission.

4.1.3 Scale Existing Best Practices and Support Further Innovation at the Local and National Levels

A consistent theme during our site visits and interviews was the inconsistent adoption of best practices across VAMCs (see Section 1.4.3). In instances where best practices had been developed nationally, this challenge stemmed from unclear guidance on implementation, occasional flaws in the design of programs, and lack of VAMC adoption. In instances where best practices had been developed locally, scaling was inhibited by limited infrastructure for information-sharing and lack of resources. To address both sets of challenges, we suggest improving practices through a combination of targeted national guidance (e.g., streamline Veteran-centered care initiatives and directives) and nationally-supported local best practice-sharing and innovation (e.g., build infrastructure to promote cross-facility sharing of patient flow best practices). Specific recommendations to effect these changes, drawn from our sub-assessment recommendations, are included below.

Supporting sub-assessment recommendations:

- **Access, 6.3.3:** Expand use of evidence-based processes for managing patient flow, including clear role assignments and individual performance management. VHA should focus on standardization in triage through the early initiation of clinical protocols, in ED diagnostics by segmenting low acuity demand through a fast track processes, and in admission and bed assignment through clearer role assignment and better utilization of available tools.

- **Length-of-stay, 7.3.2:** Build on existing best practices, both internal and external to VHA, to increase local adoption of evidence-based inpatient care and discharge planning practices. VHA should provide technical support and facilitate targeted best practice sharing to assist facilities in improving upon local practices related to efficient care delivery and effective discharge planning. In addition, VHA should engage Veterans as active stakeholders in the care transition process by providing education regarding safe and effective transitions of care to the most appropriate post-acute care venue.

- **Patient experience, 8.3.2:** Strengthen national and facility level support for patient-centered care programs to increase adoption. VHA should strengthen adoption through

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

19

improved coordination of Veteran-centered initiatives across program offices, improved leadership turnover at the VAMCs and facilitated sharing of facility-driven best practices.

- **Documentation and coding, 9.3.1:** Increase local prioritization of clinical documentation through acceleration of national clinical documentation improvement (CDI) program and targeted provider education and training, supported by performance management at the facility and provider level. VHA should strengthen facility-level emphasis on accurate documentation and coding, building on existing programs and via new efforts. For example, VHA launched a national CDI program in 2013, but to date only 46 percent of VAMCs have implemented programs at the local level. VHA should strengthen the current CDI program by providing dedicated resourcing for CDI specialists at the facility level and by creating a national knowledge-sharing network to disseminate successful local practices.

4.2   Implementation Considerations

As previously noted and in alignment with Section 201 of the Choice Act, Section 201 assessments, findings and recommendations were developed independently. We therefore expect these recommendations will need to be refined and integrated by VHA leadership and the Commission on Care into the ongoing efforts.

Below, we have listed the changes that we believe are fundamental preconditions for successfully implementing the recommendations described in Sections 5-9, as well as suggested immediate actions to be taken at the national level.

4.2.1   Preconditions for Implementation

VHA clinical operations are driven by a complicated mix of congressional mandates, federal regulations, union agreements, VACO and VHACO policy, VISN supervision, and VAMC management. We see this assessment as an opportunity for solving long-standing challenges, to be achieved by all stakeholders through a combination of local, regional, and national action. Addressing these challenges will require sustained commitment as a part of an integrated transformation effort for the system as a whole.

The recommendations summarized earlier in this section include both fundamental shifts to the system as well as tactical changes that can be made at the local level, while more far-reaching solutions are being implemented. We believe there are four essential preconditions to implementing our recommendations in a sustainable manner and achieving excellence in inpatient clinical operations at VHA:

1. **Clearly define the range of services VHA is responsible for providing, as well as its target Veteran recipients**. Interviewees at every site we visited described the challenges of providing care for non-acute patients in the acute setting.[24] These patients ranged from same-day surgical patients being admitted due to a lack of transportation to patients ready for discharge but without space in a sub-acute facility. Admissions were a

---

[24] Site visit discharge planning assessment workshops (N=20)

large part of the challenge: staff described knowing that certain patients did not meet criteria for acute inpatient admission (e.g., a homeless Veteran in the ED with a diagnosis that does not meet criteria for admission) but admitting them nonetheless, either because they believe VHA had a duty to provide social care and other venues were not available or because they were concerned about potential political or media backlash from refusing admission. Placements to post-acute settings (e.g., skilled nursing facilities) were also reported to be difficult, due to limited VHA facilities and access to community resources (e.g., limited contracts with community facilities).[25] Lack of clarity as to what care VHA is responsible for providing, and limited venues for providing appropriate inpatient alternatives, contribute to clinically inappropriate admissions, prolonged LOS, and delayed treatment for non-medical issues. VHA, Congress, and relevant stakeholders need to clearly define VHA's mission and commit to providing resources needed to meet this mission.

2. **Substantially streamline operational requirements and policy,** including reporting requests, required programs, and earmarked funding, in order to sharpen VHA's focus and allow VAMCs the flexibility they require to address local care needs. Interviewees consistently reported that their ability to deliver care and innovate was hindered by shifting priorities, ad hoc changes to policy, time-consuming reporting requirements, and heavy earmarking of funding. For example, though VHA creates infrastructure to support targeted initiatives (e.g., fall reduction), changing priorities hamper implementation: as one quality manager reported, "You don't have enough time to implement before the next one [mandate] comes…Very good initiatives fail because [of this]."[26] Some facilities reported being visited by over 50 assessment teams a year. Site visits are not tracked by a single entity at VHA, so this number could not be validated, however based on conversations with VHACO leadership, we believe that it is likely that visits between program office, VISN, and external accrediting/certifying bodies' are indeed substantial in number. One staff member lamented, "We're constantly being audited, it's a challenge," while multiple interviewees across sites expressed the challenge that assessments pose to providing efficient care and focusing on improvement efforts. VHA should work with Congress to streamline current operational requirements and policy to become more flexible, efficient, and effective.

3. **Understand resource implications of new and existing mandates and directives**. Unfunded mandates and directives were seen as a significant challenge by staff at the VAMCs we visited. For example, congressionally mandated clinical staff positions on primary care and home care teams were reported by providers during site visits, as having been filled by pulling clinical staff from the inpatient setting, potentially detracting from facilities' ability to deliver care to hospitalized patients. Similarly, national guidance recommending implementation of clinical documentation improvement (CDI) programs at the facility-level has not been accompanied by corresponding funding to hire the CDI specialists to make these programs successful.

---

[25] Site visit discharge planning assessment workshops (N=20)

[26] Interview with a VAMC quality manager

While these examples are anecdotal and based on site visit interviews, it is clear that facilities are feeling challenged in their ability to execute against multiple requirements given finite resources. Streamlining mandates and directives should allow facilities to reallocate funding and staff from areas where there may be excess resources, allowing VAMCs to meet more of their current needs with existing resources. In any instances where targeted new mandates and directives are being contemplated, however, Congress and VACO should strongly consider whether additional resources are required and provide them as needed.

4. **Increase transparency and accountability for performance** against a limited set of the most important metrics. Site visit interviewees and workshop participants characterized limited accountability and performance management as a systemic barrier to high performance. For example, Associate Director of Patient Care Services (ADPCSs) and floor nurses reported that terminating nurses who were unsafe could take up to two years, during which time the nurse would be removed from patient care but remain on the payroll, occupying a spot on a patient care team and contributing to short-staffing. In addition, only ~24 percent of providers reported inclusion of documentation and coding metrics into individual performance reviews, in spite of the critical importance of clinical documentation to promote safe and effective patient care, enable appropriate allocation of VHA resources, and support optimal billing and collection from third-party payors.

4.2.2 Immediate Actions for Consideration

Some efforts should be considered for implementation right away, while others will likely require more advanced planning and resourcing before meaningful design or implementation can begin. See Table 4-1 for recommended immediate actions.

Table 4-1. Potential Immediate Actions for Preconditions of Implementation

Theme	Potential immediate actions
Define the range of services VHA is responsible for providing, as well as its target Veteran recipients	▪ Assemble a working group, including Veteran representatives and VAMC staff and leadership, to propose options for VHA's mission and model for delivering care including i. Examination of resources required to fulfill each option (e.g., provide social and medical care primarily through VHA facilities, requiring expansion of VHA post-acute care facilities or community partnerships) ii. Analysis of stakeholder preferences

Theme	Potential immediate actions
	▪ Determine an organizational mission and the path forward
Substantially streamline central mandates and directives	▪ Solicit input from VAMCs in developing a list of top priorities for clinical and operational focus ▪ Align on the top priorities across VHA, limited to foundational areas that merit long-term focus and system-wide investment ▪ Eliminate all existing mandates and directives that are not directly linked to the defined priorities, do not require national standardization, are duplicative, or are in conflict ▪ Establish a high bar for the addition of new mandates and directives
Understand resource implications of new and existing mandates and directives	▪ Conduct a full workforce assessment to understand what resources are needed and where efficiencies could be gained ▪ Institute a policy that analysis of resource requirements (staff, funding, or otherwise), developed with input from the field, be included in *all* proposals for new national mandates and directives ▪ Appoint an interdisciplinary board with cross-level representation (e.g., front-line, VISN leadership, VHACO) to determine the necessity of the mandate or directive and whether additional resourcing is needed. ▪ Establish a very high bar for the acceptance of unfunded mandates (e.g., highly limited additional staff effort needed, demonstrated not to interfere with ability to deliver care)
Increase transparency and accountability for performance	▪ Create a streamlined dashboard of critical metrics closely aligned to defined organizational priorities to truly provide visibility into performance ▪ Remove redundant or unhelpful metrics from existing dashboards to ensure only

Theme	Potential immediate actions
	usable, actionable, and relevant data is being tracked
	▪ Review existing disciplinary processes across levels, to identify opportunities to streamline steps and accelerate the process

5 Clinical Staffing

Part F ("Assessment F"), Section 201 of the Veterans Access, Choice, and Accountability Act of 2014 ("the Choice Act") mandates an assessment of the organization, processes, and tools used to support clinical staffing. Academic literature has established clear links between the caliber, mix, and number of clinical staff – directly affected by staffing practices – and quality of patient care and experience outcomes (McHugh and Swain, 2014; Ward et al., 2013; Harris and Hall, 2012; Needleman et al., 2011; Mudge et al., 2006; McMillan and Ledder, 2001). Maintaining effective staffing practices is critical to ensuring the delivery of high quality care, staff satisfaction, and cost-effective practice. While clinical staffing has a significant impact on VHA budget and operations, as Sections 6-8 describe, appropriate staffing also facilitates access, effective length-of-stay management and care transitions, and patient experience. Having the right staff in the right places at the right time to meet the clinical care needs of Veterans is essential and warrants attention for those reasons. The Blueprint for Excellence states that "serving Veterans proficiently requires improvement of VA and VHA management and business processes. Bottlenecks in meeting human resource needs must be addressed to assure operational effectiveness as both a delivery system today and an integrated healthcare services network tomorrow" (Blueprint for Excellence, 2014).

Due to the fact that there are varying definitions of "clinical staff," we have drawn on definitions from the American College of Physicians, American Medical Association, Utilization Review Committee, and Centers for Disease Control to interpret the term as providers and other licensed clinical staff able to provide care autonomously or under a clinician's supervision (see Appendix A.1). Given the scope of Assessment F, we focus specifically on clinical staff providing inpatient care [27] – physicians, advanced practitioners, nurses, nurse assistants, allied health professionals, and several types of therapy assistants and health technicians – at facilities with significant acute care inpatient capacity.[28] These staff members represent

---

[27] Either fully (e.g., hospitalists) or in part (e.g., consulting physicians).

[28] VHA divides facilities into five levels of complexity – Level 1a, 1b, 1c, 2, and 3. We have focused on Levels 1a, 1b, 1c, and 2, the high- and medium-complexity facilities, because Assessment F mandates an assessment of clinical workflows in the inpatient setting, and Level 3 facilities have very limited inpatient capacity.

---

approximately 124,000 FTEs[29] (nearly 45 percent of VHA staff[30,31]) and $7.6 billion in net pay annually.[32]

Throughout this report, we refer to staffing of "service lines." VHA service lines (sometimes shortened to "services") are multidisciplinary clinical care organizations, and may be organized around a patient population (e.g., Homeless Veterans Treatment Program), an occupation (e.g., Nursing), or a function (e.g., Rehabilitation Services). Consistent with VHA, the terms "service line" and "service" are used interchangeably to refer to programs, occupations, and functions. Service lines function much like departments at many private sector hospitals, though they may refer to patient populations or occupations, rather than just functions, which is typically seen in the private sector. We therefore refer at various points to "service line staffing methodologies," as well as, national and local "service line chiefs" who may lead specific programs, occupations, or functions at the VAMC or VHACO levels.

In keeping with standard industry approaches to staffing, we have examined four main aspects of staffing: (1) core staffing (i.e., resource management); (2) scheduling; (3) flexing (i.e., changes in staffing to meet variation in demand); and (4) supporting infrastructure. Figure 5.1, below, illustrates the linkages between these key areas and the main components of each. These components represent the primary focus areas, driven by findings from site visits and analyses, and are not exhaustive. See Table A-1 in Appendix A.2 for major differences in policies and practices for each of the core components by clinical occupation. Further information on staff productivity, a related concept, is included in Assessment G.

---

[29] Based on VHA Healthcare Talent Management (HTM) FTE data for FY14. Includes all staff in a given occupation at Level 1a, 1b, 1c, and 2 complexity VAMCs, as information was not available on the split between inpatient and outpatient FTE or work hours for each occupation. Occupations included: physicians (occupation code 0602), physician's assistants (0603), nurse anesthetists (0605), nurses (0610), practical nurses (0620), nursing assistants (0621), psychologists (0180), social workers (0185), physical therapists (0633), occupational therapists (0631), kinesiotherapists (0635), rehabilitation therapy assistants (0636), speech pathologists and audiologists (0665), registered respiratory therapists (0601), certified respiratory therapists (0640), dietitians and nutritionists (0630), orthotists and prosthetists (0667), pharmacists (0660), and pharmacy technicians (0661). Ancillary support (e.g., environmental services) and administrative roles (e.g., bed management) are examined insofar as they affect staffing of clinical occupations.

[30] Total VHA 2014 reported medical care FTEs = 278,249 FTEs (VA, 2015, VHA-26).

[31] Other staff include Level 3 complexity VAMC staff in the categories referenced above, VAMC clinical staff working only or primarily in the outpatient setting (e.g., dentists), VAMC non-clinical staff (e.g., administrative staff), staff at non-VAMC facilities (e.g., CBOCs, distribution centers), VHA Central Office (VHACO), and VA Central Office (VACO) staff.

[32] Based on VHA Support Service Center (VSSC), Paid Accounting Integrated Data (PAID) FY14 payroll data. Does not include benefits. Net pay = gross pay – deductions.

Figure 5-1. Components of Clinical Staffing[33,34]

Clinical Staffing consists of four core components

Core staffing	Scheduling	Flexing
▪ Determining staffing need (staffing methodologies) ▪ Resource management structure and decision-making ▪ Hiring processes ▪ Talent attraction and retention	▪ Hospital operating model (i.e., primary hours of operation) ▪ Ancillary support for scheduling ▪ Scheduling tools ▪ Tracking work hours	▪ Access to external supplemental resources (e.g., agency labor) ▪ Internal flex capacity (e.g., float pools)

Supporting infrastructure

Policies	Data management
▪ Mandatory training ▪ Performance management	▪ Metrics selected ▪ Data integrity and collection

5.1 Summary

5.1.1 Assessment Approach

As described in the summary of this report (Section 1), our approach consisted of information collection and analysis.

We collected information in several ways:

- Site visits completed to 21 VAMCs, in which we:
  - Conducted approximately 60 interviews with physician department chiefs (e.g., Chiefs of Surgery), Assistant Directors of Patient Care Services (ADPCSs, the

---

[33] "Float pools" refer to a group of nurses available for work on an ad hoc basis, typically used when census (the number of patients on a unit) is high or when staff nurses are unavailable (e.g., during periods of extended leave). Float pool nurses may be full- or, more commonly, part-time employees of the hospital (particularly in hospitals with high admissions) or may refer to contract nurses paid on a per diem basis.

[34] "Agency labor" refers to staff employed by a staffing agency, who are available for short-term contracts to supplement existing staffing.

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

equivalent of Chief Nursing Officers at VAMCs), and Allied Health Professional (AHP) chiefs of service lines (e.g., Chief of Physical Medicine and Rehab [PM&R])

- o Facilitated 19 workshops on staffing with front-line personnel from various clinical occupations[35]

- Data call sent to leadership of clinical service lines to gather staffing data that is not consistently maintained at the national level (e.g., annual work hours by role, department, and shift), completed by 55 of the 121 Level 1 and 2 complexity VAMCs (~45 percent)[36]

- Analysis of data gathered from national systems, including national Healthcare Talent Management and payroll data[37]

- Interviews on staffing with over 10 VACO and VHACO medical, HR, contracting, and training and education subject matter experts

Having collected information to understand current VHA staffing practices, we then analyzed the effectiveness of these practices by comparing them against benchmarks. Where quantitative benchmarks are used (e.g., overtime usage), we have attempted to identify best practices (e.g., ideal overtime usage) where these are published by professional associations, have consensus in the literature, or are found in high performing VAMCs and/or private sector hospitals (both typical private sector hospitals and high-performing private sector hospitals, as identified through their performance in national lists such as NDNQI rankings). Where there is no such clarity as to the best practice, we have used survey data published by professional associations and profiles of typical private sector hospitals to establish standard practices (e.g., average overtime usage across U.S. private sector hospitals). We have noted in figures or footnotes whether figures cited are considered best practice or industry standard practice.

Our ability to effectively benchmark VHA practices was, in many instances, hampered by lack of VHA data. For example, VHACO does not have ready access to each VAMC's staffing levels by unit or shift, precluding an analysis of skill mix and reduction in staffing on evenings and weekends ("downshifting") by unit type.[38] Given that clinical staffing needs vary considerably by type of unit (e.g., ICUs require a higher concentration of RN labor than Med/Surg floors), data access was a significant impediment to our ability to assess VHA staffing practices. VHA data management is inferior to that seen in the private sector, and likely affects VHA's own ability to effectively make clinical staffing decisions and monitor staffing levels at the local, regional, and national levels.

---

[35] Participants' roles varied from site to site. Typical participants included nurses, charge nurses, nurse managers, case managers and social workers, quality management and utilization management staff, medical support assistants, physical therapists, occupational therapists, pharmacists, and physicians. Two sites did not have workshops due to scheduling conflicts.

[36] Total VAMC count depends on whether campuses of the same parent station are counted as separate VAMCs or one entity. We have based the count used in our site selection (122) on data drawn from VSSC, 2014 and SAIL, 2014 (see Appendix). In some instances, we use 121 as the denominator, based on data available in the data sets most commonly used for that section.

[37] From VHA HTM and VHA VSSC

[38] VHA data stewards estimated 6 to 12 months to pull this data, using a labor mapping technique.

5.1.2 Summary of Findings

We observed several key challenges, and a few points of strength, within VHA clinical staffing. These findings apply to VHA organization, processes, and tools; a detailed mapping to the organization, processes, and tools framework is available in Appendix A.3.

5.2.1 VHA does not have the tools or data to set or monitor staffing levels appropriately. The lack of methodologies for estimating staffing needs for many services means VHA does not consistently know to what level it should be staffing, while poor data management means that VHA does not always know its staffing levels.

5.2.2 Hiring timeline significantly exceeds private sector benchmarks, affecting ability to fill vacancies. The issue of hiring timelines was a consistent complaint in interviews and staffing workshops – a challenge which is likely due to a combination of complex regulations and inefficient processing – though lack of data impeded a conclusive analysis of causes.

5.2.3 Allocation of staff does not consistently match patient care needs. Data call results and site visits indicate that staffing on weekend, holiday, evening, and night (WHEN) hours may be insufficient, and that access to flex labor is limited.

5.1.3 Summary of Recommendations

Our assessment revealed several areas where VHA can build on current strengths or address existing challenges to improve clinical staffing. We recommend that VHA consider three strategic themes, as detailed below. As with the findings, these themes apply to VHA organization, processes, and tools.

5.3.1 Increase transparency of staffing by providing evidence-based staffing methodologies for all clinical staff and improving data management. VHA should develop methodologies and tools that allow facilities to estimate how many FTEs they need and monitor staffing levels on an ongoing basis.

5.3.2 Increase timeliness of hiring to patient care teams. VHA should accelerate its hiring timeline by streamlining requirements, holding HR staff more accountable for efficiency, and giving facilities the financial flexibility they need to attract talented candidates.

5.3.3 Allocate staff to match patient care needs. Once staff are hired to the facility, VHA needs to ensure it is allocating them to match patient care needs – this means relaxing required positions and regulations that prevent VAMCs from deciding when and where to allocate staff – and shifting expectations for hospital operating models from a clinic hours model to truly 24/7 staffing.

Implementing these changes would likely have multiple positive effects, many of which cannot be easily quantified or clearly attributed to staffing changes alone (particularly given limitations with available HR data). However, we have estimated the potential effects of two aspects of our recommendations, described in Section 5.3.5:

- Potential savings from reduced overtime
- Possible reduced hiring timeline from streamlined credentialing and boarding

5.1.4 Past Findings and Recommendations

Previous reports have also assessed staffing practices at VA. Many of these reports have identified findings similar to the ones we observed, and suggested changes similar to our recommendations. For example, past reports have noted the lack of reliable staffing data (VA OIG, 2012) and the length of the hiring process (VA OIG, 2004 and 2009; GAO, 2014). See Appendix A.4 for illustrative examples of past reports' findings and recommendations. Note that these examples illustrate the type of factors identified in recent years, and are not intended to be a comprehensive listing.

These past assessments have tended to focus on specific issue areas and/or individual facilities, separately developing recommendations for improvement in discrete areas. In contrast, our assessment tries to take an end-to-end view of inpatient clinical operations across five key sub-assessment areas and all high- and medium-complexity VAMCs.

5.2 Findings

We have synthesized observations from site visits and data analysis into three primary findings, listed below. The sub-sections that follow (5.3.1, 5.3.2, and 5.3.4) describe these findings in detail, including information on what we believe to be the drivers of each finding.

5.2.1 VHA does not have the tools or data to set or monitor staffing levels appropriately

5.2.2 Hiring timeline significantly exceeds private sector benchmarks, affecting ability to fill vacancies

5.2.3 Allocation of staff does not consistently match patient care need

As noted in Section 5.1.1, data issues prevented us from conclusively assessing many areas of clinical staffing. We have used the national datasets that were available, information returned as part of the data call, and perceptions and experience reported or observed during site visits or via the staff survey. In many instances where data does not allow us to definitively comment, we have described the potential implications of the data points we do have, along with recommendations in Section 5.3 for further analysis.

5.2.1 VHA Does not Have the Tools or Data to Set or Monitor Staffing Levels Appropriately

Site visit interviewees and workshop participants often reported that their service lines were understaffed: about two-thirds of physician department chiefs, ADPCSs, and AHP leaders interviewed believed that staffing for their services was too low.[39] VHA does not have clear definitions of what appropriate staffing levels are for most service lines, however, and staffing

---

[39] Physician department chief N=19, ADPCS N=19, AHP leader N=21.

data is poor. Staffing levels are likely a mix of appropriate, too low, and excessive at different facilities for different occupations, but service line leaders do not have data on whether this is the case. Better information and clear staffing methodologies are needed so that leaders and staff can use a fact-driven approach to staffing based on best practice within and beyond VHA.

In particular, we find four key drivers affecting VHA's ability to set staffing levels appropriately, described in this section:

5.2.1.1 The nursing service has developed a comprehensive, evidence-based staffing methodology, though other occupations lack clear guidance on assessing staffing need

5.2.1.2 Some facilities manage data well locally; however, VHA as a whole does not consistently capture and track data needed to assess the appropriateness of staffing

5.2.1.3 Resource management is siloed by service line, resulting in inconsistent decision-making that does not always match needs

5.2.1.4 Local resource management decision-making does not always reflect national service line staffing guidance

5.2.1.1 The Nursing Service has Developed a Comprehensive, Evidence-Based Staffing Methodology, Though Other Occupations Lack Clear Guidance on Assessing Staffing Need

In 2010, the Office of Nursing Services (ONS) released a national staffing methodology for nursing roles (VHA Directive 2010-034). This methodology draws upon academic literature and private sector industry benchmarks, and includes both an FTE calculator and guidance on the process for developing and vetting FTE requests (see case study in this section). The methodology has been well-received by local nursing services, though there have been challenges with implementation and approval processes (see Section 3.2.2).

Outside of nursing, staffing guidance is limited. Many clinical services provide no national guidance on how to set staffing levels (Table 5-1). Many other services have released national staffing directives, but these consist of minimum staffing and coverage levels, without a methodology to estimate FTEs required to deliver those levels (e.g., if the emergency department requires a particular level of on-call mental health support, what implications does that have for mental health staffing?).

Table 5-1. Staffing Guidance Issued by National Leadership for key Clinical Service Lines

National staffing guidance	Description
FTE calculator and process guidance	▪ Nursing[40] (includes assistant nurse managers,[41] charge nurses, clinical nurse leaders, RNs, graduate nurses,[42] LPNs/LVNs, NAs, and patient care health technicians)[43]
Minimum staffing and coverage levels	▪ Emergency medicine (includes ED physicians, NPs, PAs, nursing staff, health care technicians,[44] paramedics,[45] patient support assistants (PSAs),[46] pharmacists,[47] clerical staff,[48] social workers, and on-call mental health providers[49])[50] ▪ Ophthalmology[51] (includes ophthalmologists, optometrists, and other eye care professionals, as well as required availability of prosthetics, laboratory, radiology, and other diagnostics and imaging)[52] ▪ Pharmacy[53] ▪ Radiology[54] (includes radiologists and technologists)

---

[40] Nursing coverage also included in other services' staffing directives, e.g., emergency medicine (VHA Directive 2010-010) and surgical services (VHA Directive 2010-018).

[41] While performing patient care

[42] Not yet licensed, who have completed unit orientation

[43] Nurse staffing directive (VHA Directive 2010-034) explicitly excludes nurse managers, assistant nurse managers while performing administrative duties, advanced practice nurses (NPs and CNSs), unit secretaries/unit clerks, monitor technicians, one-to-one (1:1) sitters, escorts, students who are fulfilling educational requirements, and therapy assistants.

[44] No specific target; mentioned as one of a group of "important supportive roles in the ED…The use of such additional staff is supported and encouraged" (VHA Directive 2010-010, 4)

[45] Ibid.

[46] Ibid.

[47] Ibid.

[48] Ibid.

[49] May be provided by psychiatrists, psychologists, social workers, physician assistants, advanced practice nurses, psychiatric residents, and psychology post-doctoral fellows

[50] Staffing levels are provided for each occupation, without guidance on recommendation ratios between occupations.

[51] VHA Handbook 1121.01

[52] Staffing levels are provided for each occupation, without guidance on recommendation ratios between occupations.

[53] Minimum coverage to support surgical services included in surgical infrastructure directive (VHA Directive 2010-018), reference also made to pharmacists as "important supportive roles in the ED" made in the emergency medicine staffing directive (VHA Directive 2010-010, 4).

[54] Minimum coverage to support surgical services also included in surgical infrastructure directive (VHA Directive 2010-018). Availability required to support ophthalmology (VHA Handbook 1121.01). Staffing levels are provided for each occupation, without guidance on recommendation ratios between occupations.

National staffing guidance	Description
	▪ Surgery (includes surgeons, CRNAs or other LIPs, surgical assistants, RNs, surgical technicians, anesthetists, and supporting services and diagnostics)[55]
No guidance	▪ Advanced practitioners (NPs, PAs, CNSs, and CRNAs) outside of emergency medicine[56] ▪ All physician specialties other than emergency medicine, radiology, ophthalmology, and surgery[57] ▪ Dietary and nutrition services ▪ Hospitalist medicine ▪ Inpatient mental health[58] ▪ Occupational therapy ▪ Physical medicine and rehabilitation[59] ▪ Respiratory therapy[60] ▪ Social work[61] ▪ Speech pathology and audiology

Lack of staffing guidance and limited staffing guidance create three challenges: (1) service lines without staffing guidance use inconsistent practices based on outpatient staffing practices; (2) service lines with guidance on minimum levels struggle to estimate need above the minimum; and (3) service lines with guidance on minimum coverage struggle to estimate FTEs needed for coverage.

---

[55] Including respiratory care, pharmacy, blood bank, physical therapy, SPD (supply, processing, and distribution), and availability of EKG, basic laboratory, basic radiology, cardiac stress testing, pulmonary function test, CT scan, vascular ultrasound, radiology interpretation, interventional cardiology, vascular and non-vascular interventional radiology, pre-operative risk assessment and post-operative consultation and services, PACU care, ICU care, pathology, dialysis, biomedical engineering

[56] Minimum anesthesiology coverage by an advanced practitioner to support surgical services included in surgical infrastructure directive (VHA Directive 2010-018).

[57] Minimum coverage by specialty consultants (anesthesiology, cardiology, pulmonary, gastroenterology, hematology, infectious disease, interventional radiology, nephrology, neurology, orthopedic surgery, pathology, thoracic surgery, urology, vascular surgery) to support surgical services included in surgical infrastructure directive (VHA Directive 2010-018).

[58] Minimum coverage to support emergency medicine included in emergency medicine staffing directive (VHA Directive 2010-010).

[59] Minimum coverage to support surgical services included in surgical infrastructure directive (VHA Directive 2010-018).

[60] Ibid.

[61] Minimum coverage to support emergency medicine included in emergency medicine staffing directive (VHA Directive 2010-010).

Service lines without staffing guidance use inconsistent practices based on outpatient staffing practices. Unsurprisingly, clinical occupations without comprehensive national staffing directives show variation in the data and processes used to estimate staffing need. For example, AHP leaders interviewed reported using a wide range of different metrics, varying from site to site: productivity (used by 76 percent of AHP leaders), historical census (52 percent), community standards (10 percent),[62] and length-of-stay (5 percent), among other factors.[63] Over half of AHP leaders and physician department chiefs interviewed reported that staffing was conducted on an entirely ad hoc basis, with no regular reviews.[64] OIG has reported several times over the past decade on the need to develop staffing methodologies for clinical service lines (VA OIG 2015, 2012, 2009, 2006, 2006, 2004, and 2004b). In the absence of clear methodologies, many facilities rely primarily on productivity comparisons, largely based on encounters, to justify requests for additional staff. These metrics have two key limitations:

(a) Measuring patient care productivity primarily based on encounters tends to be a more accurate means of capturing outpatient rather than inpatient workload. Inpatient providers and licensed independent practitioners (LIPs) tend to have duties related to patient care that occur outside of the visit: e.g., a hospitalist coordinating with specialists on consults.

(b) Given issues with data integrity, comparing productivity against other VAMCs likely results in highly skewed perceptions of facilities' relative productivity. Interviewees suggested that interpretations of codes for time outside of direct patient care (e.g., administrative time) varies considerably from site-to-site, making comparisons to other sites highly unreliable.

The academic literature tends to measure adequacy of physician staffing levels through physician-to-patient ratios (Epané and Weech-Maldonado, 2015; Ward et al., 2013; Phoenix Physicians, 2011; Collins, 2009; and Pronovost et al., 2002).[65] Suggested ratios or hours targets (e.g., physical therapist hours per patient bed-day) would likely prove more helpful to VAMCs as a staffing tool than productivity targets (see Section 5.3.1, Recommendations). See Assessment G for additional detail on workload measurement.

Service lines with guidance on minimum levels struggle to estimate need above the minimum. Several service lines provide guidance on an absolute minimum number of providers needed, based on which services are provided at the facility. This makes it very difficult for large facilities to estimate whether they need

---

[62] For example, comparison against staffing at other VAMCs of the same complexity level

[63] N=21. These metrics are not mutually exclusive – many AHP leaders used several of the metrics listed, among others.

[64] AHP leader N=20; physician department chief N=20.

[65] List is intended to illustrate key studies using staffing ratios to evaluate the adequacy of physician staffing. This list is not exhaustive.

additional providers above the minimum. Surgical services provides an example: under the surgical infrastructure directive, facilities must have at least two general surgeon FTEs to be designated as intermediate surgical complexity (VHA, 2010). Intermediate complexity VAMCs[66] range considerably in annual surgical admissions, however, meaning that two facilities with the same complexity but different numbers of admissions can have very different coverage levels and still meet minimum staffing level requirements. For example, both Cheyenne and Providence are intermediate complexity facilities with two general surgeon FTEs on staff, though Cheyenne has 160 surgical admissions each year and Providence has 466.[67] This results in ratios of general surgeons to surgical admissions of ~80:1 and ~238:1. Providing absolute minimums creates the potential for significantly different coverage at facilities ostensibly delivering the same services.

Service lines with guidance on minimum coverage struggle to estimate FTEs needed for coverage. Many services stipulate that a particular provider or service be available for a certain period of time or at a loosely defined level of accessibility. For example, the emergency medicine staffing directive requires that complexity Level 1a facilities have:

…mental health coverage, at a minimum…on-site (based in the ED) from 7:00 am to 11:00 pm…mental health providers covering on-site…may participate in activities throughout the medical facilities; however, they must not undertake any…activities that would prevent them from coming immediately to the ED if called (VHA, 2010)

This guidance provides facilities with considerable scope for interpretation on a daily basis. For example, how much capacity does a mental health provider need to set aside in order to be truly available to the ED during a given shift? Does this time need to be in set blocks between patient appointments, or should it be a more informal allocation? Provider coverage should reflect the patient population and provider caseload; minimum coverage targets are inflexible and not a true proxy for these factors. Additionally, coverage requirements do not easily translate into justification for an FTE request. Without a methodology to estimate FTEs required to meet coverage requirements, facilities may struggle to demonstrate a need for an additional provider.

In interviews, physician department chiefs and AHP leaders interviewed rarely perceived staffing practices for their occupations as highly effective, perhaps reflecting the lack of clear guidance for their services.[68] By contrast, over half of ADPCSs saw the nurse staffing

---

[66] Assuming that facilities with intermediate surgical complexity are also Level 2 complexity overall

[67] VHA National Surgery Office data, FY15Q1-FY14Q2

[68] "Effectiveness" was defined as the ability to use the staffing methodology to develop staffing requests matching perceived staffing need – that is, whether existing processes or tools allow services to accurately estimate FTE requirements." Physician department chief N=19, AHP leader N=21.

methodology as "highly effective," perhaps reflecting strengths of the nursing methodology (see case study below).[69]

Table 5-2. VAMC Case Study: Nurse Staffing Methodology

Best practice case study – nurse staffing methodology

The nurse staffing methodology is scalable and evidence-based, and may provide a model for other services (see Section 5.3.1, Recommendations).
 	
Key points on the nurse staffing methodology
 	
▪ The methodology principally consists of an FTE calculator and guidance on the process for assessing staffing annually. *Main steps in the nurse staffing methodology*, below, illustrates the principal components of estimating FTE need at the facility level.[70]
 	
▪ The FTE calculator is data-driven and evidence-based, relying upon private sector benchmarks for nursing hours per patient day (NHPDD) by unit,[71,72] historical census data (including turbulence, i.e., the amount of patient turnover on a unit in a given amount of time), and projected leave, among other factors
 	
▪ There are a few clear opportunities to improve upon the nurse staffing methodology (e.g., include 1:1 sitters, as recommended in 40 percent of staffing workshops),[73] though the core of the methodology is grounded in best practice
 	
▪ Despite the positive perception of the staffing methodology, 63 percent of ADPCSs interviewed felt that nurses were somewhat or highly understaffed.
 	
   ○ This may reflect the fact that the nurse staffing methodology is non-binding: the **resource management committees do not have to approve** requests made using the methodology. Whether and how to enforce staffing methodologies should be addressed when developing further staffing methodologies (see Section 5.3.1), while respecting the fact that budgetary constraints do exist at the local level and affect ability to hire new staff
 	
   ○ The nurse staffing methodology **also does not include many roles that support nurses** (e.g., sitters, transporters, housekeepers/environmental services staff). Nurses reported during site visit interviews and workshops that staffing these roles separately often resulted in insufficient numbers of support staff, leading nurses to work below top-of-license. If this is the case, and nurses at many facilities are completing both nursing work and responsibilities that other roles should perform, it could result in nurses

---

[69] N=19.

[70] See VHA Directive 2010-034, "Staffing Methodology for VHA personnel" (July 19, 2010) for more details

[71] Drawn from Labor Management Institute survey data.

[72] Nursing hours per patient day (NHPPD) is an industry-standard way of calculating the amount of nursing care provided to a patient. The American Nurses Association defines NHPPD as the total number of hours worked by nursing staff responsible for direct patient care on acute care units per patient day (ANA, 1996). Patients with different acuities require different NHPPD, meaning that best practice and industry-standard NHPPD varies by unit. See Appendix A.7 for data on recommended and benchmark NHPPD by unit.

[73] N=20

Best practice case study – nurse staffing methodology
feeling that staffing levels were too low, even when benchmarks are in line with the private sector. Given a lack of data, we were not able to substantiate whether staffing levels were appropriate; VHA should review nurse and support staff FTE numbers to evaluate whether there is merit to reported understaffing **Main steps in the nurse staffing methodology** 1. Unit panel (comprised of nurses across roles working in the unit) and unit nurse manager work together to develop a proposed staffing level and mix for the unit, calculating current NHPPD, comparing against NHPPD targets for comparable facilities, and incorporating factors such as turbulence and leave 2. Facility expert panel, primarily consisting of senior nurses and finance staff, reviews the unit panel's staffing proposal and approves or returns for changes 3. Resource management committee or other decision-making body, often following review by the ADPCS and Director, makes a decision on the staffing proposal

5.2.1.2 Some Facilities Manage Data Well Locally; However, VHA as a Whole Does not Consistently Capture and Track Data Needed to Assess the Appropriateness of Staffing

Lack of transparency is also a data management issue. VACO HR data does not capture key metrics needed to assess the overall staffing levels in the inpatient setting. For example, while interviewees at many sites perceived that they were understaffed on nights and weekends, available HR data does not include work hours by department or shift and therefore could not be used to compare VHA staffing across shifts against guidance in the academic literature.[74] VAMC and VISN insight into staffing levels appears to vary, driven by local and regional data management systems (e.g., some respondents to the data call where able to provide work hours by role, shift, and department, while others reported that their HR and payroll data did not include these cuts).

Poor data collection and tracking was observed in multiple sub-assessment areas of this report (see Sections 6, 7, 8, and 9). We observed two key data management challenges affecting VHA's ability to manage clinical staffing: (1) national systems lack key pieces of data needed to assess staffing levels; and (2) data can be inconsistent and unreliable. VHA may well be appropriately staffed – likely, there are sites and services where staffing is appropriate, too low, and excessive, across the system – but its data systems do not allow leaders to assess this, affecting their ability to scale best practices and resolve challenges.

> **National systems lack key metrics needed to assess the appropriateness of staffing levels.** While VHA collects a substantial amount of data, it does not appear to be well linked to key metrics nor highly usable. This approach not only drives challenges

---

[74] We were able to access FTE, position, vacancy, and turnover data from VHA HTM and FTE, position, hours, and pay data from VHA VSSC. See Driver 2 in this finding for more detail on limitations in metrics.

for monitoring and evaluation, but should also be re-assessed for its impact on staff productivity. Key examples:

(a) Vacancy rates measure the distance between approved and filled positions, with no information provided on positions requested or recommended by existing staffing methodologies. This creates an inaccurate picture of the size of staffing need, as facilities may not have approved positions that are needed to deliver patient care at an optimal level, given the limitations of existing staffing methodologies for many service lines (see Section 5.2.1.1). At best, this data challenge means that vacancy rates are not useful metrics; at worst, current measurements give leaders a misleading understanding of staffing need, implying that vacancies are low for a given occupation and should therefore not be a priority, when the staffing methodology (for service lines where staffing methodologies do exist) may actually suggest significantly higher staffing levels are needed. VA should track requested positions, budgeted positions, and filled positions to increase transparency (see Section 5.3.1).

(b) FTE, hours, and payroll data is measured by occupation and VAMC, but not by department or outpatient versus inpatient setting.[75] Appropriate staffing levels vary considerably by department (e.g., ICUs typically staff a 1:1 or 1:2 ratio of RNs to patients, compared to ~1:5 on med/surg floors [Labor Management Institute, 2014]). VHA HR data does not indicate the distribution of occupations to different departments, meaning VISN and VHACO management have no way of knowing whether VAMC departments are appropriately staffed.

(c) Hours data is not available by shift, though pay data is.[76] This, coupled with the lack of data at the department level, means that VHA has no way of using HR data to evaluate whether WHEN hours staffing is adequate (as appropriate WHEN staffing varies considerably by department, e.g., outpatient clinics compared to acute inpatient units). Studies have established that sufficient staffing on WHEN shifts is critical to ensuring patients have full and speedy recoveries (Wallace et al., 2012,[77] Cavallazzi et al., 2010; Ananthakrishnan et al.,

---

[75] The team was able to access FTE, position, vacancy, and turnover data from VHA HTM and FTE, position, hours, and pay data from VHA VSSC.

[76] Ibid.

[77] Wallace et al. find that night-time intensivist coverage reduces in-hospital mortality for facilities with a low-intensity day-time intensivist staffing model (defined as optional consultation with an intensivist), and see no effect of nighttime coverage for facilities with high-intensity coverage. This finding corroborates other studies demonstrating positive effects of nighttime intensivist coverage in facilities with low-intensity day-time coverage (Blunt and Burchett, 2000) and no effects in facilities with high-intensity day-time coverage (Kerlin et al., 2013; Gajic et al., 2008).

2009; Aujesky et al., 2009; Shaheen et al., 2009; Peberdy et al., 2008;[78] Brusco et al., 2007; and Kostis et al., 2007).[79]

Data can be inconsistent and unreliable. In addition to not collecting metrics needed to assess staffing, VHA also struggles to maintain data integrity. Comparing data available through national VHA data sets to responses submitted as part of our data call illustrates this challenge. For example, the VHA Paid Accounting Integrated Data [PAID] system indicates that one particular VAMC has 22 dietician and nutritionist FTEs in FY14, and the VHA Healthcare Talent Management Proclarity system provides a very similar figure of 23. Responding to our data call, however, this VAMC reported having 8.5 dietician and nutritionist FTEs, across the nutrition and food service line. The response rate to our data call on FTE information was low, and cannot be used to definitively assess discrepancies between national and local data sets. However, examples like this one do point to a significant potential challenge with respect to data integrity, which VHA should address in order to ensure transparency and visibility.

Table 5-3. VAMC Case Study: Local Data Management

Best practice case studies – local data management
Several VAMCs have invested in more **robust data management at the local level**, affording them greater insight into staffing levels and ability to manage them. This is in line with the Blueprint for Excellence which states that VHA will "advance value by measuring and supporting efficient clinical processes using industry-standard models of physician and staff productivity" (Blueprint for Excellence, 2014). These facilities provide a starting point for considering new national data management practices (see Section 5.3.1, Recommendations). **Selected examples:** The **Fort Harrison, Montana** VAMC has invested in **AcuStaf**, a scheduling and data tracking tool, and worked to integrate its functionalities with VHA information systems. Other visited facilities expressed that they had not been able to fully implement AcuStaf due to facility scheduling and payroll policies, or had found the data entry duplicative with existing VHA data collection requirements. Fort Harrison provides a model of effective implementation for other VAMCs. The **Palo Alto, California** VAMC employs a statistician who, among other responsibilities, assists with monitoring and analyzing staffing data. Similar to many other facilities, Palo Alto produces morning staffing reports including census and personnel numbers. In addition, Palo Alto runs summary reports on staffing weekly, monthly, and quarterly by unit to ensure that

---

[78] Studies cited found significant association between weekend admission, when staffing levels and mix decline, and poorer outcomes.

[79] Study found decreased LOS for patients who received Monday through Saturday physical therapy, as compared to a control group receiving Monday through Friday therapy.

Best practice case studies – local data management
all leaders and staff have an accurate and current understanding of staffing levels and how they compare to targets.

5.2.1.3 Resource Management is Siloed by Service Line, Resulting in Inconsistent Decision-making That Does not Always Match Needs

VHA lacks transparency on staffing needs and levels, as described earlier in this section. Having developed staffing requests, however, decision-making on resource management can be highly inconsistent and problematic. In large part, this stems from VHA's siloed organizational structure, a theme observed in other assessments (see Assessment L). Staffing decisions typically focus on single occupations, without considering the other occupations and services that support a given professional, even within a specific service line.

Clinical occupations are highly interrelated, with professionals relying on one another to provide clinical consults, continued care, and support enabling top-of-license practice. There is no definitive consensus in the literature or private industry as to whether health care organizations should staff along functional (e.g., surgery, internal medicine) or professional (e.g., physical therapy, nursing) lines (Hearld et al., 2008; West, 2001; and Snow and Hambrick, 1980). In either case, interdisciplinary collaboration on interdependent areas is critical to ensuring an appropriate staffing model. The academic literature has clearly established that interdisciplinary skill mix, driven by interdisciplinary collaboration on staffing, is critical to ensuring comprehensive, high-quality care for patients (Nancarrow et al., 2013[80]). The Cleveland Clinic, a highly respected private sector hospital, emphasizes interdisciplinary collaboration on all key aspects of clinical operations; as the Director of its Center for Multidisciplinary Simulation, John Jelovsek, says, "When you get in the work environment, it's more and more clear that the team causes the largest change in outcomes for patients" (quoted in Wood, 2012). Interviews with VHACO leadership and VAMC administration and staff suggest that VHA resource management is highly siloed by service line, with limited coordination at the national and local levels.

Siloing creates two key challenges: (1) national staffing guidance is not created in collaboration with related service lines; and (2) local staffing requests typically focus on individual occupations or professionals, not patient care teams. See Assessment L for additional findings on service line silos and recommended organizational changes that may help alleviate the challenges described below.

National staffing guidance is not created in collaboration with related service lines. Several service line chiefs interviewed reported that the level of collaboration

---

[80] Nancarrow et al. conduct a comprehensive review of the existing academic literature on interdisciplinary teamwork, finding 10 critical elements to effective collaboration: "positive leadership and management attributes; communication strategies and structures; personal rewards, training and development; appropriate resources and procedures; appropriate skill mix; supportive team climate; individual characteristics that support interdisciplinary team work; clarity of vision; quality and outcomes of care; and respecting and understanding roles" (Nancarrow et al., 2013, 11).

between their service and other related service lines on staffing was very low. As one VHACO service line chief said, "I'm not at all involved in developing other services' solutions… I have no knowledge or awareness [of what staffing guidance they are developing]." The effect of silos at the national level is that policies are developed without significant input from other services that will be affected by new practices. For example, nursing and physician assistant service lines have reportedly not been involved in developing the staffing methodologies currently being created by specialty care services. Given how closely physicians, advanced practitioners, and nurses work together in the inpatient setting, changes in the staffing of one of these occupations has implications for the others, which might be overlooked without open Communication

Local staffing requests typically focus on individual roles, not patient care teams. VAMCs typically approve staffing proposals through a resource management committee, comprised of senior hospital leaders tasked with making decisions on resource requests from all service lines. Resource management committees often require that service lines submitting requests attest to the fact that they developed their request in conjunction with related services, though several interviewees reported that this coordination rarely occurs in practice. As one Chief of PM&R described, "The goal of the resource management committee is to foster interdisciplinary communication, but it doesn't happen...as well as one might want." While there does appear to be strong interdisciplinary coordination at some facilities (see case study in this section), a significant portion of VAMCs does not achieve integrated staffing requests across service lines. In 40 percent of staffing workshops conducted, participants cited limited coordination between service lines as a major challenge.[81] Interviews conducted during site visits provide anecdotal evidence of limited coordination among service lines, with interviewees citing instances of:

(a) Transporters, environmental services, and sitters being rarely if ever staffed in conjunction with nurses, despite the interdependencies among these roles

(b) Orthopedic surgeons being hired without additional staffing of physical therapists or nurses to assist in recovery

(c) Physical therapists and occupational therapists being hired without additional staffing of ancillary staff (e.g., clerical support)

(d) Surgeons being hired without complementary staffing of OR technicians needed to support additional procedures

(e) Outpatient services being expanded, sometimes as a result of national directives, without increasing outpatient staff, resulting in inpatient and mixed staff covering outpatient services.

One impact of not staffing services together is the potential for understaffing of supporting roles. In 65 percent of staffing workshops, participants reported that limited ancillary support

---

[81] N=20

coverage made it difficult for clinical staff to work at top-of-license.[82] Low ancillary support staffing is also believed to affect patient flow and LOS (see Sections 6 and 7). A sizeable minority of physician department chiefs, ADPCSs, and AHP leaders cited making resource management more interdisciplinary as one of their top two priorities for improving core staffing: 19 percent, 29 percent, and 11 percent, respectively.[83] This is line with the Blueprint for Excellence which states that "attention must be given to supporting physician practices with adequate non-physician staff for team-based and efficient care" (Blueprint for Excellence, 2014).

Table 5-4. VAMC Case Study: Interdisciplinary Staffing

Best practice case studies – interdisciplinary staffing
In contrast to the trend seen at many sites we visited, a few VAMCs have established the **expectation that staffing occur in collaboration** between services.   **As an example,**   The **San Juan, Puerto Rico** VAMC typically staffs by department, developing team-based staffing requests. As one service line chief said, "We work in conjunction with other services," developing staffing requests in tandem. For example, internal medicine identified a need for additional PTs, OTs, and nurses for the ICU, and medicine, physical medicine and rehab, and the nursing service worked together to put together a consolidated staffing request.

5.2.1.4 Local Resource Management Decision-making Does not Always Reflect National Service Line Staffing Guidance

Interviewees at many sites suggested that local resource management committee decision-making does not always match national service line staffing guidance. In many cases this may be entirely appropriate: facility leaders face budgetary constraints and must consider trade-offs between many different expenditures, one of which is staffing. If a sizeable number of resource management committees is consistently not staffing to levels suggested by staffing methodologies, however, this either implies that methodologies are suggesting overly high staffing levels or that facilities lack the budgets they need to properly staff clinical care teams. Available data cannot be used to definitely prove either point. The finding that FTEs recommended by staffing methodologies are not always approved does, however, reinforce the finding that current staffing methodologies for many services do not allow facilities to appropriately assess staffing needs and generate consensus as to the need for FTEs.

The disconnect between resource management committee decision-making and national service line staffing guidance appears to be driven by the fact that: (1) evidence-based national staffing methodologies that do exist have no enforcement mechanisms; and (2) FTE ceilings limit potential staffing.

---

[82] N=20

[83] Physician department chief N=19, ADPCS N=18, AHP leader N=21

Several interviewees at the local and national levels suggested that resource management decision-making was highly relationship-driven. As one nursing leader described, "A lot [of whether staffing requests are approved] comes down to the relationship between the ADPCS and the Director." This claim cannot be substantiated; but if it is an accurate characterization of decision-making at some facilities, it would be expected to affect the resource management challenges described below.

> **Evidence-based national staffing methodologies that do exist have no enforcement mechanisms.** As noted in Section 5.2.1.1, not all service lines have staffing guidance. Several do, however. The nursing staffing methodology is the most robust, including NHPPD targets drawn from private sector benchmarks and an FTE calculator for estimating the number of FTEs needed to meet NHPPD targets. Several other services have recommended minimum coverage and staffing levels, reflecting service line leaders' research into minimum staffing needed to safely deliver care. Though these methodologies are evidence-based, however, and typically provide guidance on minimum staffing needed to deliver care, they have no minimum implementation requirements:
>
> (a) For the nursing service. The nursing staffing methodology does not recommend a single NHPPD target for each type of unit. Rather, facilities may choose to benchmark themselves against targets slightly above or below median private sector NHPPD targets, and we visited several facilities that benchmarked below private sector medians. Benchmarking below the median is highly likely to result in staffing targets that are below those seen as safe in the academic literature:
>
> > i. The academic literature has established a safe NHPPD of approximately nine for med/surg RNs, below which patient outcomes suffer (Aiken et al., 2003; Aiken et al., 2002; Needleman et al., 2002; Tourangeau et al., 2006; Kane et al., 2007a; Kane et al., 2007b). VHA takes its median NHPPD targets from the Labor Management Institute, which provides a median NHPPD for med/surg RNs of ~9.[84] Given that private sector medians and the academic literature converge, benchmarking below median level necessarily produces NHPPD targets below what evidence establishes as safe.
> > ii. Facilities are also not required to approve requests made to meet NHPPD targets below the median. That facilities are not required to staff to estimates generated using the evidence-based nursing methodology may explain why the methodology itself is well-received (53 percent of ADPCSs described the methodology as highly effective[85]), but only about

---

[84] The nurse staffing calculator uses data from the Labor Management Institute (LMI), which publishes NHPPD rates based on its survey of hospitals across the U.S. The LMI reports that median direct NHPPD for med/surg RNs in surveyed private sector hospitals is ~9, and NHPPD in the second quartile ranges from 6.2-8.7.

[85] ADPCS n=19. This is in contrast to 5% of physician department chiefs and 19% of AHP leaders. Physician department head n=19; AHP head n=21.

---

a third of ADPCSs believed that nurse staffing levels were adequate.[86] As one ADPCS said, "The NHPPD figure would be right if we were staffed to it."[87]

iii. Not staffing to recommended minimum levels has several potential effects: (1) Bed closures: 36 percent of respondents to our data call reported that they had previously closed beds due to insufficient staffing levels.[88] (2) Not working to top-of-license: Site visit interviewees and workshop participants reported that nurses often completed tasks typically performed by support staff, due to low support staff levels. We could not corroborate this with existing data sets, but if this is true, it would imply that nursing hours spent on patient care are even lower than NHPPD data would suggest.

(b) For services with absolute minimum staffing and coverage levels. Minimums provided by several services are not mandatory, but are required in order to achieve complexity designations (e.g., emergency department versus urgent care clinic status, or standard, intermediate, or complex surgical complexity). However, as described in Section 5.2.1.1, guidance on minimum coverage levels does not always clearly translate into FTE recommendations, creating challenges in justifying staffing requests).

FTE ceilings limit potential staffing. Fifty-two percent of VAMCs we visited reported wanting greater flexibility and local autonomy on setting staffing numbers, including by eliminating or relaxing FTE caps and reducing nationally mandated positions. VHA sets salary ceilings at the national level (per annum ceilings set by the Under Secretary for Health[89]), which are then translated into FTE caps at the local level.[90] Estimating and limiting annual spending on salary is a standard and necessary part of budgeting, and entirely appropriate for VHA to do. However, local FTE caps limit facilities' ability to manage their own budget and make decisions on how and where to allocate staffing funding (e.g., hire two additional NPs or one physician, which may represent the same total salary payment but different FTE numbers).

---

[90] See VA Handbook 5007, Part VI, Appendix J, p. VI-J-1: "Ceiling: The number of FTE (full-time employment equivalents) allocated for an occupation by local management officials."

5.2.2 Hiring Timeline Significantly Exceeds Private Sector Benchmarks, Affecting Ability to Fill Vacancies

Participants in 100 percent of staffing workshops conducted during site visits cited the length of the hiring process as a critical core staffing challenge.[91] Several past VA Inspector General (OIG) and Government Accountability Office (GAO) reports and the Blueprint for Excellence have also commented on this issue (for example, VA OIG, 2004 and 2009; GAO, 2014), suggesting it is a long-standing challenge.

Most interviewees and workshop participants claimed that hiring a new employee, from initiating the posting to the employee's start date, typically lasts about six months for most clinical occupations. We were not able to access data showing the average hiring timeline, and therefore could not substantiate this claim. However, in interivews we were informed about VHA HR timeliness targets: HR aims to move from a request for a posting to a tentative offer in 60 days.[92] This target does not include time to final offer, and is nonetheless still well beyond typical timelines in the private sector for many clinical occupations,[93] as exemplified in Figure 5-2, below. Workshop participants suggest that HR is not meeting the 60-day timeliness target, but even if this target were consistently met, VHA hiring would still lag the private sector.

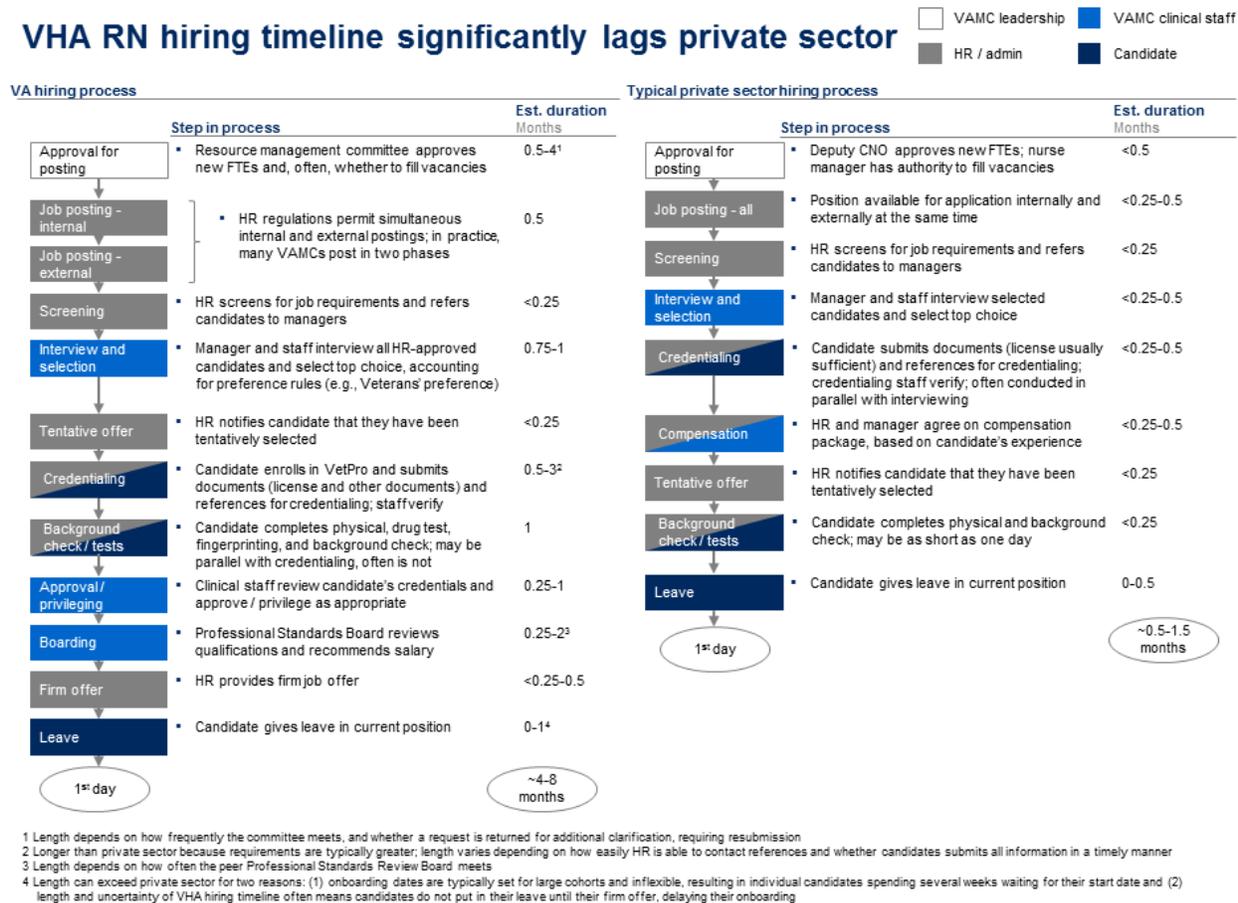
This delayed ability to hire has a significant effect on VHA's ability to compete for the best clinical talent in the market and ensure that its hospitals consistently have enough staff. Assessment L also focuses on HR capabilities, and includes additional detail on this topic.

---

[91] N=20

[92] ADPCS interviewed during a site visit

[93] Interviews with best practice private facilities suggest that particular physician specialties that are harder to recruit for may take 6-12 months to hire for. Many other clinical staff may be hired in under two months, however (e.g., nurses, nursing assistants, many AHPs, health technicians)

Figure 5-2. VHA Hiring Timeline[94]


There may be systematic barriers within the public sector that result in longer hiring timelines; the disparity between VHA and private sector hiring timelines is substantial, however, and creates significant challenges. Interviewees and workshop participants claimed that delayed hiring processes contributed significantly to the length and number of vacancies. Candidates for many roles are often unwilling to wait roughly six months to be onboarded, especially when positions with other hospitals are readily available. VHA competes directly with the private sector for talent and the speed at which private sector hospitals can offer positions gives them a distinct competitive advantage in hiring. As Figure 5-3 shows, vacancy rates exceed private sector benchmarks for several clinical occupations. Even for occupations and facilities with relatively low vacancy rates, however, the impact of vacancies is likely exacerbated by delays in filling positions, which are reported as resulting in long-standing openings.

As Figure 5-4 shows, there is a considerable population of VAMCs with total vacancy rates for clinical occupations well above private sector benchmarks. Local variation exists in any system, public or private. Nearly half of VAMCs exceed benchmark vacancy rates, with nearly 30

---

[94] VA hiring process flow based on interviews with VAMC clinical staff, VAMC HR staff, and VACO HR leaders. Private sector hiring flow based on interviews with leading private hospitals

percent exceeding the high end of private sector benchmarks by 30 percent or more. This suggests that a substantial share of sites may be facing acute staffing challenges.

Hiring delays appear to be driven by several key challenges, described in this section:

5.2.2.1 Hiring requirements (e.g., credentialing, boarding) are complex and time-consuming

5.2.2.2 Local hiring processing is reported to be inefficient

5.2.2.3 Attracting talented clinical staff can be a challenge due to low pay compared to private sector in many geographies

5.2.2.1 Hiring Requirements (e.g., credentialing, boarding) are Complex and Time-Consuming

One of the principal drivers of the length of the hiring process is the volume and complexity of VHA hiring requirements, which are driven by a combination of congressional mandates, federal regulations, union agreements, and VHA policies. The two greatest sources of delay, are that: (1) the credentialing process is particularly time-consuming; and (2) the boarding process is also lengthy.

The credentialing process is particularly time-consuming. Credentialing is the process of screening candidates' qualifications, including licenses, registrations and

certifications, education, training, experience, current competencies, and health (see VHA Directive 1200, VHA Directive 2006-067, and VHA Handbook 1100.19). All hospitals must confirm that candidates' licenses are valid and current. Where VHA credentialing differs from private hospitals' credentialing processes, and becomes significantly more time-consuming, is in the volume of material that candidates must supply and that facilities must screen. Private sector facilities typically rely primarily on licenses and a candidate's most recent reference(s) to assess their qualifications. The Joint Commission requires that organizations verify physician, LIP, and nurse licensure as part of their credentialing, but not transcripts or diplomas (Joint Commission, 2011a and 2011b). Many VAMCs require additional documentation. For example, job postings for OTs at many VAMCs[95] require written documentation of having passed the National Board for Certification in Occupational Therapy (NBCOT) entry-level certification examination for OTs, in addition to a license to practice occupational therapy. This requirement is duplicative: obtaining a license in occupational therapy requires proof of having passed the NBCOT examination (American Occupational Therapy Association, 2015). VAMC staff that we interviewed reported that VAMCs also often require that candidates submit original transcripts, in addition to licenses, as well as references for extensive prior work experience. Assembling and then checking this information can be challenging and time-consuming, typically lasting several months for most candidates. VHA must ensure that its staff are qualified. However, the amount of substantiation currently required significantly exceeds industry standards.

The boarding process is also lengthy. Boarding refers to the VAMC peer compensation panels that review a candidate's qualifications and agree on their job offer, including compensation (see VHA Handbook 5007). This process can last up to 2 months, depending on how often the board meets and how easily it is able to agree on a compensation package. In contrast, while some private sector hospitals have compensation committees as well, these are usually only for physicians and LIPs, and typically compile packages in under 2 weeks.[96] Furthermore, in many hospitals, managers and HR staff agree on compensation for clinical staff, without needing to go through a board at all.[97,98]

5.2.2.2 Local Hiring Processing is Reported to be Inefficient

Site visit interviewees and workshop participants also reported that local hiring processing was often inefficient, contributing to unnecessary delays in hiring. In particular: (1) facilities report inconsistent HR performance at the local level; (2) interviewees suggest that resource

---

[96] Based on interviews with best practice private sector hospitals

[97] Ibid.

[98] This is usually for staff other than physicians and LIPs.

management committees often do not backfill positions; and (3) VAMC staff report that hiring processes are not always completed in parallel. Delays in the receipt and incomplete nature of HR performance data, information on resource management committee decision-making, and/or information on clinical staff hiring processing inhibited our ability to corroborate these, and we have instead relied upon interviews. As a follow-on to this work, VHA should examine HR capabilities, resource management backfilling practices, and clinical staff hiring processing to ascertain whether and how these factors affect hiring timelines.

Facilities report inconsistent HR performance at the local level. Multiple leaders and front-line clinical staff interviewed during site visits cited poor local HR performance as a cause of delayed HR processing. One VAMC Chief of Mental Health characterized HR as a "black box," claiming that simply getting approval from HR to post for a position could take up to seven months. A VAMC AHP leader described how "[HR] has delegated a lot of the work to the [clinical] services, for example, even scanning documents." Only 15 percent of workshop groups cited HR performance as a core staffing strength. Inconsistent HR performance may be due to understaffing (described below). It seems likely, however, that HR underperformance is often due to low performance standards and limited alignment on service levels.

Interviewees suggest that resource management committees often do not backfill positions. Backfilling refers to the automatic approval of hiring to replace an existing position, without requiring re-justification of the position to the resource management committee. Interviewees and workshop participants at several sites claimed that their facilities had previously backfilled, but that budget concerns had led resource management committees to require justification of all positions, including ones previously approved. Ninety-five percent of sites reported that inability to backfill positions was a major core staffing challenge. Not backfilling means that the ~6-month hiring process cannot begin until staff members have vacated their positions, resulting in delayed hiring and loss of institutional knowledge, as incoming and outgoing staff do not overlap.

VAMC staff report that hiring processes are not always completed in parallel. While VHA HR leaders reported that VHA regulations allow facilities to complete credentialing, privileging, and boarding concurrently with a candidate's physical exam, drug test, and fingerprinting, several interviewees during site visits expressed their frustration that these processes were not completed in parallel, citing either national policy or union agreements as barriers. We were unable to corroborate claims that these processes are not consistently completed in parallel; however there does appear to be a misconception at the facility level as to what actions are allowable. A VACO HR leader interviewed suggested that service line leaders at many sites may simply not be aware of the fact that they can initiate several processes in tandem.

5.2.2.3 Attracting Talented Clinical Staff can be a Challenge Due to Low Pay Compared With Private Sector in Many Geographies

Hiring delays may also be driven by talent attraction challenges. Eighty-one percent of VAMCs we visited reported that compensation was a major talent attraction and retention challenge at their facility. As one Chief Hospitalist said, "[hospitalist] positions are posted but remain vacant since no one wants them."[99] Another specialist noted that he could "only afford to work at the VA because my wife is in private practice."[100]

Two key pay related challenges may limit VAMCs ability to attract top talent: (1) VHA pay may lag national benchmarks; and (2) VAMCs and VISNs lack authority to meaningfully increase pay to match local market rates for many clinical occupations (Blueprint for Excellence, 2014). While a comprehensive compensation benchmarking assessment was not in-scope of the assessment, the issue of pay disparities was raised frequently enough that we believe it could be a contributor, especially for more specialized fields.

> **VHA pay may lag national benchmarks.** As mentioned above, eighty-one percent of VAMCs we visited claimed that compensation impeded their ability to attract talented staff. This issue was anecdotally reported to be an especially acute challenge in hiring physicians. Given this, we completed a high-level analysis comparing mean physician pay in the private sector against mean VHA physician pay (Figure 5-5). As the figure below indicates, mean VHA pay is substantially lower than mean private sector pay for many physician specialties. VHA would need to conduct its own locality-based analyses with internal data to fully confirm this assessment and identify regional variations in disparity. Benchmarking benefits was also out of scope for this assessment, but should also be considered when looking at overall comparability of VHA physician compensation packages with those found in the private sector. It stands to reason, however, that pay disparities could deter some candidates, especially those expecting to earn well above national averages.

VAMCs and VISNs lack authority to meaningfully increase pay to match local market rates for many clinical occupations. VHA has implemented several pay structures intended to make salary more competitive. These primarily include market pay for physicians,[101] locality pay for other clinical staff, incentive awards, and retention allowances. However, the effectiveness of these mechanisms is limited, by the fact that they are capped, in many cases require VISN approval, are not available for all occupations and are not well publicized amongst VAMC leadership. Across clinical occupations, incentive awards and retention allowances equal about one percent of regular pay, without substantial variation by occupation.[102] This does mean that VHA guarantees a greater share of its compensation than is the case in the private sector where RVUs are managed, however the size of the overall pay discrepancy may not make this a valuable incentive. Challenges with implementation of incentive pay have been noted previously by the VA OIG (VA OIG, 2004), and HR leaders have suggested that this may be done as a way of managing budgetary constraints at the VAMC level.

[101] Dentists as well, though dentists are not examined in this report given our inpatient focus
[102] Ibid.

Whatever the reason for low utilization, facilities should be mindful of the potential effects on retention.

5.2.3 Allocation of Staff Does not Consistently Match Patient Care Need

Having identified the need for additional FTEs, approved the request, and hired on new staff, many VAMCs struggle to appropriately allocate staff. In part, allocation challenges manifest as persistent misallocation of staff to different tours (primarily, significant downshifting on the WHEN hours, though staffing levels may be too high in some places on the on-tour, i.e., daytime hours). Allocation challenges also emerge on a more day-to-day basis as limited access to flexible staffing options (e.g., agency staff), make it difficult for facilities to meet staffing needs when they have short-term understaffing (e.g., an unexpected vacancy).

This section covers two primary challenges related to allocation of staff:

5.2.3.1 Hospital operating models are skewed toward clinic hours

5.2.3.2 Access to flex resources is limited, inhibiting ability to meet peaks in demand or manage short-term understaffing

5.2.3.1 Hospital Operating Models are Skewed Toward Clinic Hours

Though many patients are admitted to the hospital on evenings and weekends, hospitals (public and private) tend to scale back staffing during these periods, reducing both the number and skill mix of staff on-site. The academic literature has clearly established that significant downshifting on the off-tour (i.e., weekends, holidays, evenings, and nights) worsens the quality of care; as Wong and Morra write, describing the health care system in general, "our current office-hours system of running hospitals threatens the lives of our sickest, most vulnerable patients" (Wong and Morra, 2011, p. 1050).

Admissions on weekends in particular are associated with worse patient outcomes, across hospitals (Cavallazzi et al., 2010; Ananthakrishnan et al., 2009; Aujesky et al., 2009; Shaheen et al., 2009; Kostis et al., 2007). Restricted off-tour services are also associated with delayed discharge and increased transfers (Menchine and Baraff, 2008; Conti, 2003; Varnava et al., 2002). Downshifting on nights is less clearly linked to adverse clinical outcomes (Ananthakrishnan et al., 2009; Aujesky et al., 2009; Shaheen et al., 2009; Kostis et al., 2007), though the literature on the effect of nurse understaffing implies that night tours should still meet minimum staffing and skill mix best practices to prevent increased mortality (Blegen et al., 2011; Patrician et al., 2011; Tourangeau et al., 2002; Bond et al., 1999). Moreover, the literature on risks inherent in physician hand-offs, likely to occur more often on nights and weekends, when physicians are covering for one another, may also suggest a need for more consistent physician staffing off-tour (Horwitz et al., 2008; Arora et al., 2005).

Sites responding to our data call demonstrated significant understaffing during WHEN hours compared to best practice and industry standard practice (see Figure 5-6 below). Response

rates were low, resulting in small sample sizes;[103] however, this data still provides directional information on VA downshifting patterns, and corroborates site visit interviewees and workshop participants' perceptions of WHEN hours understaffing (see Sections 6 and 7 for the perceived effect of downshifting on access and LOS).

Taken together, our quantitative and qualitative data points suggest that VAMCs may not be adequately staffed on the WHEN hours (see Appendix B.5 for full data). For example, data call results indicate that weeknight staffing declines by ~40-45 percent of daytime staffing among ED physicians, ~60-65 percent among hospitalists, and ~85-90 percent among intensivists. RN downshifting is less pronounced, decreasing by ~20-25 percent in the ED, ~10-15 percent on med/surg floors, and increasing in the ICU by ~40-45 percent, perhaps to account for reduced intensivist coverage. CNA support, by contrast, decreases by far more, ~70-75 percent in the ED, ~40-45 percent on med/surg floors, and ~55-60 percent in the ICU. This suggests that nurses may be assuming responsibilities typically performed by CNAs on the WHEN hours. This matches with interviews and workshop comments indicating that nurses in many facilities find that low levels of ancillary support impeded their ability to work at top-of-license. See Figure 5-6 below for average downshifting rates based on the data call made to Level 1 and 2 complexity VAMCs. Appendix B.5 includes citations from the academic literature and published survey data, used to assess best practice and standard practice, as well as the sample size (n-values) for each of the VHA statistics.

---

[103] Low response rates were exacerbated by respondents' inability in many cases to provide requested information on annual work hours by shift and department. For example, respondents noted in response fields, "This information cannot be provided," "Do not have access to that data at this time," "Fiscal is not able to break the data down by each shift and weekday [versus] weekend," "Unknown," "Overall [x%]. We did not separate specialties," and "Do not have a way to divide out weekend, weekday, nights or days so all the time is placed together." These comments corroborate our finding, in Section 3.2.1, that VA lacks visibility into staffing levels.

Figure 5-6. VHA Downshift Rate

Data call responses suggest VHA often downshifts more than is standard practice

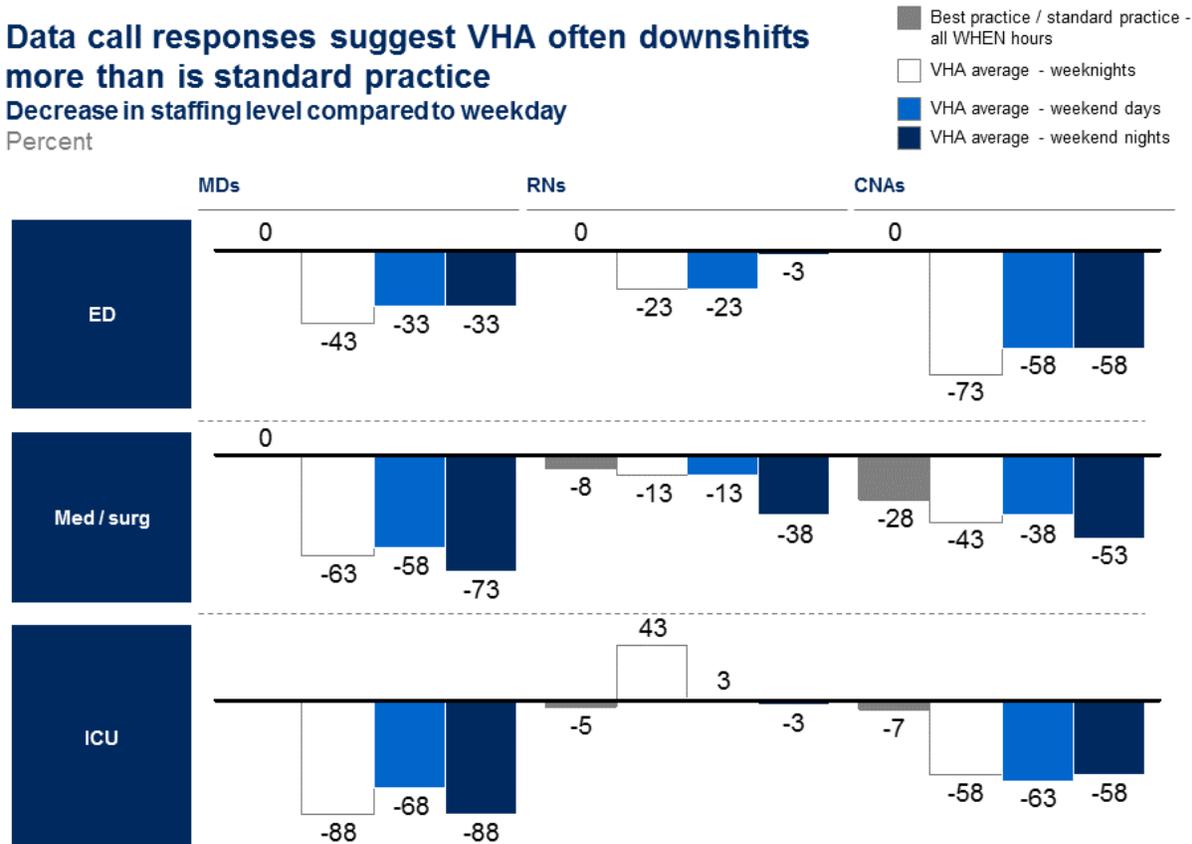
MDs, RNs, CNAs for ED, Med/surg, ICU


The available data does not allow us to comment definitively on whether VHA is, on average, understaffed on the off-tour, nor why this might be the case if understaffing is indeed occurring at many facilities. Based on site visits, however, we hypothesize that VAMCs' clinic-based hospital operating model may stem from two main causes: (1) other core staffing challenges reduce ability to fully staff on the WHEN hours; and (2) VHA's traditional value proposition for many staff has been sustainable lifestyle compared to the private sector.

Other core staffing challenges reduce ability to fully staff on the WHEN hours: The other core staffing challenges described earlier in this report likely make it more difficult to fully staff on the off-tour than might otherwise be the case. For example, if it is difficult to fully demonstrate need for an additional FTE in many service lines because there is no clear staffing guidance, it is likely especially difficult to demonstrate need for an additional FTE on shifts with lower demand (e.g., nocturnist). Poor data management may also mean that many facilities do not fully know the extent to which they downshift on the WHEN hours, and how this compares to patient need. We were only able to obtain data on downshifting through a data call made to all VAMCs. Many respondents to the data call were not able to report staffing data by department and shift, making comments such as, "Fiscal is not able to break the data down by each shift and weekday [versus]

weekend" and "Do not have a way to divide out weekend, weekday, nights or days so all the time is placed together." These comments corroborate our finding, in Section 5.2.1, that VHA lacks transparency on staffing levels. Furthermore, uncompetitive salary and benefits for part-time staff likely also create particular challenges for WHEN hours staffing, where need might justify a partial but not full FTE.

VHA's traditional value proposition for many staff has been sustainable lifestyle compared to the private sector: Section 5.2.2 describes the average gap between VHA and private sector pay for many clinical occupations. The disparity is most pronounced for providers, as well as some nursing and AHP roles. Several site visit interviewees shared that the historical value proposition of a career at VHA was lower pay in exchange for substantial benefits and sustainable lifestyle. As one Chief of Medicine said, "The traditional promise of working at VA was lower pay in return for easier lifestyle and not being on call." If this is the case, then we would expect low staffing on the WHEN hours, which are typically less attractive shifts. This is borne out by the downshifting rates shown in Appendix B.5. Physicians, for whom the private sector pay gap is significant, do downshift significantly, potentially reflecting a historical orientation toward clinic hours for these roles.

5.2.3.2 Access to Flex Resources is Limited, Inhibiting Ability to Meet Peaks in Demand or Manage Short-Term Understaffing

Ideally, facilities meet their staffing needs using their own employees, who are familiar with local practices, have worked together, and know the patient population. Short-term understaffing will occur from time to time, however, when facilities have unexpected vacancies or demand increases dramatically. In these instances, facilities rely upon a combination of increasing staff hours, float pools, per diem labor, agency labor, and other contract labor.

Excessive use of flex labor is a challenge at many private sector facilities, and is discouraged in the academic literature because it is expensive and often not optimal for patient care (Strzalka and Havens, 1996). Many VAMCs report having little to no ability to use flex labor, however, creating challenges meeting unexpected staffing need. As one senior VHACO nursing leader said, "You can wake up overnight with horrible shortages…and no way to fill." Figure 5-7 summarizes provider, nursing, and allied health service line chiefs' perceptions of the adequacy of flexing practices for their service. While there is some variation in perception by service line, only ~25 percent of respondents in each service line believed that flexing practices were highly effective, with ~75 percent believing that there were opportunities for improvement.

Figure 5-7. Perceived Adequacy of Flexing Practices by Occupation[104]

Perceived effectiveness of flexing practices by occupation
Percent

Legend: Physicians, Nurses, AHPs

	Physicians	Nurses	AHPs
Highly effective	21	26	24
Somewhat effective	37	26	38
Somewhat ineffective	32	26	33
Highly ineffective	11	21	5

---

[104] Based on interviews with physician, nurse, and allied health service line chiefs. Physician department head n=7, Assistant Director of Patient Care Services n=8, allied health service line chief n=9.

[105] Attendee roles varied, but included nurses, physicians, AHPs, and ancillary staff

---

Figure 5-8. Challenges Associated With Flexing Cited in Workshops With Nurses, Physicians, AHPs, and Ancillary Staff[106]

Floating, overtime use, and access to agency labor were the primary challenges associated with flexing

Percent, N = 19

Legend:
- Use of floor resources
- Access to supplemental resources
- Supporting infrastructure

Values:
- No intermittents / per diems: 16
- Uncompetitive float pool: 26
- Limited / ineffective bed management: 32
- No agency labor: 37
- Mandated overtime: 37
- High overtime use: 37
- Small / non-existent float pool: 47
- Excessive floating between units: 79

Limited access to flex resources is particularly problematic at VHA given lengthy hiring processes: with vacancies often lasting six months, and little recourse to supplemental labor, facilities are forced to rely on overtime and compensatory time to fill staffing need. Figure 5-9 illustrates VHA overtime and compensatory time use.[107] Our interviews with high performing private sector facilities suggest a target of approximately two percent overtime use (as a portion of total clinical staff time). There is also support in the academic literature for a best practice target of approximately two to four percent (American Healthcare Solutions, 2015). As Figure 5-10 shows, the vast majority of VAMCs have total overtime and compensatory time use rates greater than two percent.

Figure 5-10. VAMC Overtime Use Comparison

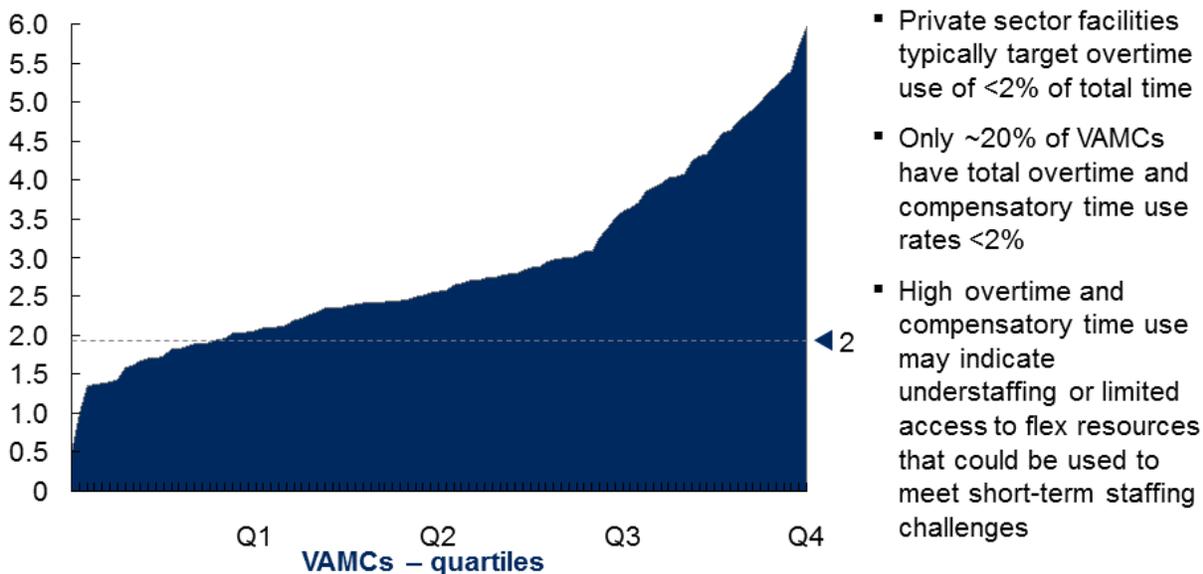
Overtime use exceeds typical private sector target at the majority of VAMCs

VAMC overtime and compensatory time hours as a portion of total hours, 2014

Percent[1]

- Private sector facilities typically target overtime use of <2% of total time

- Only ~20% of VAMCs have total overtime and compensatory time use rates <2%

- High overtime and compensatory time use may indicate understaffing or limited access to flex resources that could be used to meet short-term staffing challenges


1 All T38 clinical occupations, excluding Medical Officers, who do not receive overtime

SOURCE: VHA Talent Management, 2015

Limited access to flex resources primarily stems from two challenges: (1) contracting processes reduce ability to fill temporary staffing shortages with contract labor; and (2) few facilities have the per diem and float resources that front-line staff believe are needed to effectively flex capacity.

> **Contracting processes reduce ability to fill temporary staffing shortages with contract labor:** Facilities report that contracting processes significantly delay their ability to meet short-term understaffing. Interviewees on site visits reported that contracting can take up to about four months, reducing ability to use agency labor to meet short-term staffing needs (as hiring takes approximately six months, contract labor is only helpful for the last roughly two months of understaffing). [108] Access to contract and agency labor is limited across service lines, especially so outside of the nursing service: only 30 percent of physician department chiefs and 14 percent of AHP leaders reported using locum tenens and agency therapists to supplement core

---

[108] Based on site visit interviews with ADPCSs and workshops with nurses and nurse managers

staffing, respectively, compared to 55 percent of ADPCSs who reported using agency nurses during our site visits.[109]

Few facilities have the per diem and float resources that front-line staff believe are needed to effectively flex capacity: Access to flex labor sources is also due to limited per diem and float resources. We use per diem to refer to a standing roster of staff available for ad hoc shift work, and float resources to refer to standing float pools, which may consist of full-time or part-time employees. Float pool staff are intended to be allocated to different units based on changes in census or short-term staffing needs. Access to per diem and float pools is relatively limited across VHA: for example, 10 percent AHP leaders reported using per diems and/or float pools to supplement core staffing.[110] This challenge appears to stem from:

(a) Contracting and competency requirements can limit on-going access to per diems: Several facilities expressed that use of per diems was limited by VHA restrictions on maximum total spend with any given provider. We were not able to corroborate this claim with available data, and encourage VHA to conduct a more complete review to fully substantiate. The anecdotal reporting through interviews at 21 VAMCs does suggest that access to contract labor is a significant challenge, however. VHA has established a Travel Nurse Corps (TNC) of VHA nurses available for short-term engagements, intended to serve the same function as private agencies providing travel nurses. Only 10 percent of ADPCSs interviewed said that they had used the TNC to supplement staffing, however.[111] Many other ADPCSs said they had not used the service because it was too expensive or had low availability. This suggests there is either a need for a lower-cost VHA option or access to external agencies, at least in the nursing service.

(b) Float pools are challenging to maintain at VHA: Several facilities shared that they had previously established float pools but found them unsustainable, or had current float pools with many vacancies. In part, challenges maintaining float pools appear to be due to uncompetitive pay and benefits for part-time staff (float pools can be staffed by full-time employees, but are often staffed with part-time personnel). Staff at several facilities reported that staff in float pools often left for full-time positions at the VAMC or other facilities due to low compensation. In part, challenges maintaining float pools may also be due to staff preferences for working in units. Several facilities reported that staff hired into full-time float positions transferred to other units in the hospital when vacancies emerged, preferring the continuity of being on a unit. We did not have access to data on float pool turnover rates and reasons for leaving, and could not substantiate these claims. The consistency with which we heard this complaint,

---

[109] Physician department chief N=20, ADPCS N=20, AHP leader N=21. ADPCS figure includes external agencies and VA Travel Nurse Corps.

[110] Physician department chief N=20, ADPCS N=20, AHP leader N=21

[111] N=20

however, suggests that VHA should examine this potential challenge and review whether compensation for float positions is sufficient to attract and retain staff.

5.3 Recommendations

VHA staffing practices have multiple stakeholders: Congress and the executive branch, VACO, VHACO, VISN leadership, and VAMC management and staff. Encouraging innovation and addressing critical challenges in clinical staffing will require collaboration between all of these groups, and a commitment to making difficult, long-term change. Different recommendations should be owned by different groups (e.g., recommendation requiring changes to VACO policy versus local policy); however, support for change from all stakeholders is critical to effective implementation.

Our recommendations, building on existing strengths and addressing existing challenges in clinical staffing, can be categorized into three main themes.

> **5.3.1 Increase transparency of staffing by providing evidence-based staffing methodologies for all clinical staff and improving data management**
>
> **5.3.2 Increase timeliness of hiring to patient care teams**
>
> **5.3.3 Allocate staff to match patient care needs**

These themes are consistent with practices suggested by the academic literature, professional associations, and high-performing hospitals within VHA and outside the system, as well as solutions proposed by front-line VHA staff – further details are included in "summary of supporting evidence" sections in each sub-recommendation (see **Appendix B.8** for additional detail on our methodology for gathering this data). To help VHA implement our recommendations, we have also suggested next steps in the "potential near-term actions" sections of the sub-recommendations. Note, because different VAMCs may have already adopted some recommended practices or experience unique barriers, these suggestions should be tailored the individual circumstances of each VAMC. Each recommendation is supported by several sub-recommendations, which map to the "organization, workflow processes, and tools" domains specified in the Choice Act. For a detailed map of how the sub-recommendations relate to these domains, see **Table B-2** in **Appendix B.3**.

Several recommendations overlap with other assessment areas. Where this occurs, we have referenced the relevant assessment area, where additional detail can be found.

5.3.1 Increase Transparency of Staffing by Providing Evidence-Based Staffing Methodologies for all Clinical Staff and Improving Data Management

As noted in Section 5.2.1, VHA lacks transparency on staffing levels, driven both by non-existent or limited staffing methodologies and poor data management. VHA may well be appropriately staffed, but it has very little information to assess whether this is the case, and therefore limited ability to manage staffing.

We suggest several changes aimed at improving the process to both develop and approve staffing requests:

5.3.1.1 Provide and support scalable, evidence-based staffing methodologies and interdisciplinary resource management processes

5.3.1.2 Improve data management

5.3.1.1 Provide and Support Scalable, Evidence-Based Staffing Methodologies and Interdisciplinary Resource Management Processes

Staffing guidance for most VHA clinical occupations is very limited, affecting services' ability to accurately estimate FTE need. Private industry leaders typically employ robust, evidence-based staffing methodologies for clinical occupations. Consistent with these practices, VHA should provide clear guidance on how to assess FTE need and work across services to coordinate FTE requests.

Summary of supporting evidence:

- See Sections 5.2.1.1, 5.2.1.3, and 5.2.1.4 for more detail on findings.

- Seventy-six percent of sites visited[112] proposed the development of a comprehensive evidence based staffing methodology, as a solution to core staffing challenges. As one VAMC Chief of PM&R said, "It would…be very helpful to the field for a staffing model to be provided by Central Office…we'll be adding ten thousand patients [to one of our sites next year]…how many more PTs do I need? I don't know."

- Professional societies like the Society of Critical Care Medicine and the American College of Emergency Physicians have published staffing principles to guide hospitals in making evidence-based staffing decisions. These guidelines include maximum suggested provider-to-patient ratios (e.g., intensivists-to-patients, recommended by the Society of Critical Care Medicine [Ward et al., 2013] and ED physicians-to-patients, recommended by the American College of Emergency Physicians [Collins, 2009]), which allow for clear benchmarking.

- High performing private sector hospital networks have also established evidence-based, standard practices for evaluating staffing need across their systems. Intermountain Healthcare, for example, uses standard 'Request for Provider' and 'Request for Clinician' forms for establishing clinical need for new physician and advanced practitioner FTE requests. These forms include analysis of group finances, patient volume, population ratios, and RVUs, among other factors identified as important in assessing staffing need.[113]

Potential near-term actions:

- *VHACO:* Task each function-based service line (e.g., surgical services), currently lacking national directives on staffing, with developing comprehensive staffing guidance in close coordination with related role-based service lines (e.g., nursing service, rehabilitative services).

---

[112] N=16, out of 21 total VAMCs visited

[113] Intermountain Healthcare SME interview (April 2, 2015)

- *VHACO:* Solicit input from VAMC leadership and front-line staff in their service line and related services, to develop an interdisciplinary staffing methodology that includes:
  o Staffing guidance by team or function, including staffing mix: methodologies should include guidelines for all key roles involved in delivering a particular kind of care. For example, staffing guidance for surgical services could include a suggested staffing mix of one orthopedic surgeon to a certain number of OR techs, OR nurses, and PTs. Such guidance must be flexible, acknowledging that multiple roles can serve similar functions on teams (e.g., NPs and PAs can complete many of the same responsibilities) or provide care along a continuum (e.g., a CRNA and an Anesthesiologist).
  o Minimum staffing levels, coupled with target ratios of staff or staff time to patients or beds {would require accurate bed data – see Section 6 for more detail on issues with current bed data) above the minimum: staffing methodologies must be able to be adapted to facilities with different admissions numbers, to ensure that coverage is consistent regardless of facility size. Target ratios of staff to patients or beds (e.g., one physical therapists per a given number of patients), or of staff time to patients or beds (e.g., NHPPD, currently used by the nursing service) would allow facilities of varying sizes to estimate their FTE need. Furthermore, including minimum staffing levels up to a certain population threshold, beyond which ratios would be used, would ensure that very small facilities are still able to justify FTE needs based on the services they provide. Ratios and hours targets are evidence-based and used in the literature on clinical staffing and by professional associations (Ward et al., 2013; Epané and Weech-Maldonado, 2015; Phoenix Physicians, 2011; Collins, 2009; Schoo et al., 2006; Christie and Grimwood, 2006; Allied Health in Rehabilitation Consultative Committee, 2007; Australasian Faculty of Rehabilitation Medicine, 2005; ASHP, 2013).
  o FTE calculator: Having aligned on target ratios of staff or staff time to patients or beds, service lines should develop calculators that translate target ratios into FTEs needed:
    – The nursing FTE calculator includes many variables needed to do this (e.g., leave factor, turbulence), and can likely serve as a starting point for many services.
    – The factors most relevant to each service will vary, however and VACO should task VACO-level service line leadership with identifying the factors most relevant to their service lines and then developing an FTE calculator.
  o Guidance on process to develop staffing requests: staffing methodologies should also include guidance on how to solicit front-line input and how often to conduct comprehensive reviews of staffing levels (ideally, annually for most roles or in the case of a life-event of the hospital, e.g., opening of a new service line, closure of nearby hospital).
- *VHACO/VAMC:* Service line leaders should clearly communicate the purpose of the new staffing methodologies when they are developed and train front-line managers and staff on how to use them.

- *VACO/VHACO/VISN/VAMC:* Relax current restrictions on numbers and allocation of FTEs.

- *VACO/VHACO:* Remove FTE caps in favor of setting staffing budgets, to increase facilities' ability to manage their own staffing (e.g., allowing facilities to decide whether their needs are best met by hiring two NPs or one physician).

- *VACO/VHACO:* Reduce earmarking of the salary budget and mandated positions, to allow facilities to staff according to local needs and reallocate staff to areas where patient volumes are highest (see Section 5.2.1 for more detail).

- *VAMC:* Compare FTE levels suggested by new staffing methodologies (recommended above) to current staffing budgets at the facility. Identify areas where funding could be reallocated across the facility, and, having done so, evaluate whether and where there is a need for reductions or additional funding for salaries, and make any appropriate requests for changes in resourcing.

- *VAMC:* Enforce interdisciplinary development of staffing requests at the local level by requiring that requests for new staff members include analysis of needed support from other roles (e.g., if adding a new surgeon, review whether additional OR tech capacity would be needed to support additional surgery volumes).

5.3.1.2 Improve Data Management

We observed poor FTE and payroll data management at VHA. Ensuring reliable data that includes key metrics needed to assess the appropriateness of staffing is an obvious precondition to managing staffing. Improving VHA data collection and tracking should be a clear priority as VHA considers how to increase visibility into its operations. Improving data management is also a precondition to achieving many of the other recommendations that we make (e.g., appropriately allocating staff to match patient care needs).

Summary of supporting evidence:

- See Section 5.2.1.2 for more detail on findings.

- The academic literature has established that staffing data (data on staff time, in particular) is critical to accurately assessing staffing need in the hospital setting (Howard and Felton, 2013).

- State governments are increasingly moving to address the issue of FTE and payroll data management in private sector hospitals, requiring clear, comprehensive staffing data reports, maintained through improved data management, in order to ensure transparency (e.g., New Jersey, California, Illinois).[114,115,116]

- High performing private sector hospitals clearly identify the metrics that they need to assess staffing need, and track this data consistently. Texas Children's Hospital, for example, monitors "work hours per unit of service" (e.g., per patient visit, per procedure),

---

[114] See the New Jersey Department of Health's Hospital Care Staffing Reports
[115] See the California Office for Statewide Health Planning and Development staffing database
[116] See the Illinois Department of Public Health's Health Care Report Card

supported by centralized data management provided by an external vendor, and uses this information in its staffing decision-making (HealthCatalyst, 2015).

- Several VAMCs have developed local data management practices which allow them greater visibility into staffing at their facility (see Section 5.2.1.2) and represent best practices that other VAMCs could adopt. Palo Alto provides one best practice examples. It not only monitors staffing on a daily basis (as many facilities do, at least in the nursing service) but also analyzes data on a quarterly, semi-annual, and annual basis and employs a resident statistician to assist with data interpretation.

Potential near-term actions:

- *VACO:* Update and streamline HR and payroll codes, capturing FTE, work hours, and pay data by occupation, specialty, department, outpatient versus inpatient setting, and shift.

- *VHACO:* Review available tools for tracking staffing levels by shift, to more accurately capture work hours data. Time clocks may not be allowable, but VHA should identify alternative programs to capture this data and reduce manager workload on monitoring attendance.

- *VACO:* Designate a single source for national HR data, to reduce inconsistencies between multiple sources and avoid duplication of effort.

- *VHACO/VAMC:* Track metrics needed to assess the appropriateness of staffing, focusing on:
    - Ratios of staff or staff time to patients or beds, measured by occupation, department, outpatient versus inpatient setting, and shift.
    - Percentage decline in staffing by shift, measured by occupation, department, and outpatient versus inpatient setting.
    - Requested positions, in addition to approved and filled positions, measured by occupation, department, and outpatient versus inpatient setting.

5.3.2 Increase Timeliness of Hiring to Patient Care Teams

Timely and efficient hiring is critical to ensuring consistent, high-quality medical care in the right setting with the right kinds of support. As noted in Section 5.2.2, workshop participants' primary concern with core staffing was the length of the hiring process. Accelerating hiring could considerably reduce vacancy rates, improving the quality of care, patient experience, and staff satisfaction.

In particular, we suggest that VHA:

5.3.2.1 Review and streamline hiring requirements

5.3.2.2 Increase HR service level expectations needed to facilitate streamlined requirements

5.3.2.3 Communicate an optimal hiring process to VAMCs, clarifying their responsibilities and encouraging them to complete activities in parallel

5.3.2.4 Expand ability to increase pay to match market

5.3.2.1 Review and Streamline Hiring Requirements

VHA hiring requirements appear more substantial than those typically found in private sector hospitals. VHA must ensure that staff are qualified; however, comparison to private sector suggests that current safeguards and regulations are further-reaching, driving hiring delays that affect VAMCs' ability to staff appropriately and thereby safely provide care. We recommend reviewing requirements to identify areas that could be streamlined, and setting clear timeliness targets for hiring processing.

Summary of supporting evidence:

- See Section 5.2.2.1 for more detail on findings.
- 100 percent of the sites we visited suggested accelerating the hiring timeline, in part through streamlining credentialing and boarding requirements, as one of the key improvements they would make to core staffing[117].
- Standard practice in private sector hospitals is to use Joint Commission hiring and credentialing requirements, which include verification of licensure, but not the submission of transcripts, diplomas, test scores, or various other requirements VHA typically has.

Potential near-term actions:

- *VACO/VHACO:* Review and standardize credentialing and boarding processes
  - o Identify requirements that may be eliminated or reduced without compromising quality and security.
  - o Compare current requirements with private and local standards.
  - o Obtain input from the field on perceived security requirements.
  - o Consider accepting credentials and recent references alone, for experienced providers, rather than requiring all transcripts and complete references (see Joint Commission requirements, described above).
  - o Ensure that requirements are standardized across VAMCs.
- *VACO:* Set national timeliness targets for all aspects of the hiring process, not just the steps to a tentative offer, communicating these expectations to clinical leaders and HR.

5.3.2.2 Increase HR Service Level Expectations Needed to Facilitate Streamlined Requirements

Site visit interviewees and workshop participants reported that HR processing was often delayed. We refer readers to Assessment L for a detailed review of evidence suggesting that clear service level expectations are associated with efficient HR processing. We echo Assessment L's recommendation that VHA employ clear HR service level expectations.

Summary of supporting evidence:

- See Section 5.2.2.2 for more detail on findings.

---

[117] N=21

- 29 percent of VAMCs we visited saw improving HR capabilities as the most critical element of accelerating the hiring timeline[118].
- See Assessment L for more detail on best practices in service level expectations.

Potential near-term actions:

- *VACO/VHACO/VISN/VAMC:* Develop and enforce clear service level expectations for local and national HR staff, including:
  - o Clear targets for timeliness of HR processing.
  - o Performance bonus structure and/or recognition and growth opportunities.
  - o Ability to discipline in instances of underperformance.
- *VACO/VHACO:* Review current training for VHA HR staff, ensuring that HR staff receive formal training and mentorship from tenured HR specialists (e.g., shadowing period or peer buddy system) in addition to existing educational programs.

5.3.2.3 Communicate an Optimal Hiring Process to VAMCs, Clarifying Their Responsibilities and Encouraging Them to Complete Activities in Parallel

HR does not bear sole responsibility for completing the hiring process; VAMC leadership and clinical staff also have clear roles in the hiring process, which interviewees reported they do not always complete in an efficient and timely manner. Clear understanding of all parties' responsibilities and authorities is obviously critical to ensuring timely processing. We recommend clearly communicating which hiring processes are owned by VAMC leadership and clinical staff, and empowering facilities to conduct these processes in parallel.

Summary of supporting evidence:

- See Section 5.2.2.2 for more detail on findings.
- Interviews we conducted with high performing and typical private sector hospitals suggest that conducting background checks, credentialing, interviewing, and developing compensation packages in parallel is best practice. The private sector facilities we spoke with said that they were not always able to complete all activities in parallel, but strove to do so, suggesting that parallel processing wherever possible is a clear best practice.
- Completing credentialing and privileging in parallel with a candidate's physical exam, drug test, and fingerprinting could help reduce the overall HR timeline; currently, many VAMC staff believe that these processes cannot be conducted concurrently and do not launch them concurrently.
- In addition, concurrent internal and external posting of positions could approximately halve total posting time (in instances where internal and external posting periods are approximately equal), allowing facilities to interview candidates more quickly.

Potential near-term actions:

---

[118] N=6, out of 21 VAMCs visited

- *VHACO:* Develop a clear list of the hiring processes for which VAMC administrators and clinical staff are responsible (e.g., interviewing candidates) and communicate this to VAMCs, including guidance on which activities may be conducted in parallel.
- *VACO:* Create timeliness targets for components of the hiring process that are managed by service lines, in addition to targets for HR.

5.3.2.4 Expand Ability to Increase Pay to Match Market

In addition to delays related to internal processing, the hiring timeline appears also to be driven in many cases by challenges attracting talent to roles, due to uncompetitive pay (on average) compared to private sector. This factor is likely highly variable by geography, and would be best addressed by increasing local ability to adjust compensation packages to be competitive with market rates. However, while existing pay levers available to VAMCs (e.g., incentive awards, retention allowances) are limited, utilization and awareness of them appears to be highly variable across the country.

Summary of supporting evidence:

- See Section 5.2.2.3 for more detail on findings.
- 81 percent of sites suggested increasing the competitiveness of compensation for VHA clinical staff as a way to fill vacancies and improve staffing.
- Competitive compensation is clearly a key component of attracting talented clinical staff to positions, though obviously not the only element (Kneeland et al., 2010; Guthrie, 1999).
- Several VAMCs have successfully petitioned for increases in pay to match local rates (e.g., Fort Harrison, which reported increased ability to recruit nurses following an increase in nurse pay). Making it easier for more sites to do this would improve VAMCs' ability to attract talented staff in their market.

Potential near-term actions:

- *VACO/VHACO:* Complete a compensation benchmarking assessment across VHA, comparing total compensation (including salary, benefits, performance pay, incentive awards, and other financial structures) to local markets. Following this assessment:
  - ○ *VACO/VHACO:* Expand financial awards to include clinical staff that are not currently eligible (e.g., AHPs, psychologists).
  - ○ *VACO/VHACO:* Increase threshold above which VISN must approve discretionary financial awards or market pay adjustments, increasing facilities' ability to adjust pay to match local market rates.
  - ○ VAMC: Match salaries (across tenure levels) to local market rates, using existing financial awards and authorities; this may entail increases and decreases depending on the geography.
- *Congress and VACO:* Explore whether legislative change is needed to allow VHA to match pay to local market rates, and if so, consider legislation reforming VHA pay caps and competitiveness.

5.3.3 Allocate Staff to Match Patient Care Needs

Sufficient staffing on the WHEN hours is a critical component of delivering safe, effective care. As noted in Section 5.2.3, VHA faces challenges allocating staff to match patient demand, driven by both sharp downshifting on the WHEN hours and limited access to flex labor sources. This affects facilities' ability to ensure they are providing safe, efficient, and timely patient care and maintaining both patient and staff satisfaction.

We suggest several changes to better match staffing to patient need:

> **5.3.3.1 Ensure that staffing on WHEN hours is sufficient to meet patient need**
>
> **5.3.3.2 Make contracting more flexible and efficient**
>
> **5.3.3.3 Increase flexibility of float position structure and compensation**

5.3.3.1 Ensure That Staffing on WHEN Hours is Sufficient to Meet Patient Need

Our data call and site visits indicate that downshifting at many facilities may not match levels recommended in the academic literature. Academic studies provide clear data on the association between WHEN staffing levels for many clinical occupations and patient care outcomes. VHA should ensure that staffing levels on the WHEN hours match with recommendations from the literature and professional associations.

Summary of supporting evidence:

- See Section 5.2.3.1 for more detail on findings.
- There is a substantial literature linking adequate staffing on WHEN hours to patient care and staff satisfaction outcomes. For example:
  - Maintaining sufficient staffing on weekends is associated with improved patient care outcomes (Cavallazzi et al., 2010; Ananthakrishnan et al., 2009; Aujesky et al., 2009; Shaheen et al., 2009; Kostis et al., 2007).
  - Maintaining off-tour staffing has been linked to improved LOS (Menchine and Baraff, 2008; Conti, 2003; Varnava et al., 2002).
  - Ensuring sufficient staffing on nights is less clearly linked to improved clinical outcomes (Ananthakrishnan et al., 2009; Aujesky et al., 2009; Shaheen et al., 2009; Kostis et al., 2007), though the literature on the effect of adequate nurse staffing implies that night tours should still meet minimum staffing and skill mix best practices to ensure effective care (Blegen et al., 2011; Patrician et al., 2011; Tourangeau et al., 2002; Bond et al., 1999).
  - Physician hand-offs, which have harmful effects on the quality of patient care, are less likely to occur when staffing levels are higher and physicians are not covering for one another (Horwitz et al., 2008; Arora et al., 2005).
  - Please see Appendix A.7 for more detail.

Potential near-term actions:

- *VAMC:* match staffing on off-tour to best practices and industry standard practices, by:

---

o Improving data management to ensure that the facility has visibility into staffing levels on the off-tour (see Recommendation 5.3.1 for more detail on this).

o Evaluating whether there are instances of overstaffing on the on-tour and staff that could be reallocated to the off-tour.

o Assessing whether additional staff are needed to support proper WHEN hours staffing based on opportunities for reallocation.

5.3.3.2 Make Contracting More Flexible and Efficient

Site visits and interviews with VACO and VHACO leadership indicate that VHA contracting regulations and processing are often complicated and inefficient. Sufficient access to flexible labor sources is critical to ensuring that VAMCs are able to manage inevitable short-term understaffing from unexpected vacancies and/or increases in patient load. We recommend evaluating current regulations to identify areas that could be streamlined, and reviewing current contracting support.

Summary of supporting evidence:

• See Section 5.2.3.1 for more detail on findings.

• Fifty-two percent of sites we visited cited improving access to contract labor as a critical change that needed to be made to improve flexing.

• The academic literature has established that moderate, as-needed use of contract labor can be an effective and safe means of meeting short-term understaffing (Doty et al., 2009; Anderson et al., 1996; Griffiths et al., 2005).

• VAMC leadership also reported that support for contracting at the local level was limited, resulting in clinical leaders often driving the contracting process, despite their lack of expertise in this area.

Potential near-term actions:

• *VACO/VHACO:* Review federal contracting regulations governing VHA contracting to identify opportunities to streamline and reduce requirements.

• *VACO/VHACO:* Evaluate potential for increased use of blanket purchase agreements and other similar contracting structures to establish standing relationships with contract labor providers, allowing for faster processing of requests for locum tenens and agency staff, in order to ensure VAMCs are able to provide safe, high-quality care even while experiencing staffing shortages. In particular, VHA should explore national blanket purchase agreements, facilitated by standardized credentialing requirements, allowing facilities to quickly draw from nationally-approved flexible labor sources when the need arises.

• *VAMC:* Review accountabilities and performance management of contracting department and ensure that incentives and reporting structure promote accountability to VAMC leadership. At the same time, ensure that VAMC staff understand their responsibilities vis-à-vis contracting and are prepared and able to quickly carry out these responsibilities.

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

71

- *VHACO:* Evaluate contracting support at VAMCs to identify any sites without sufficient support (e.g., sites with no current agency or per diem use), and increase coverage to address.

5.3.3.3 Increase Flexibility of Float Position Structure and Compensation

We observed that challenges accessing flex resources were also driven by limited internal float pool support at many facilities. High performing private sector hospitals often use float resources to manage day-to-day variations in patient load. VHA should address internal access to flex resources as a way to manage short-term understaffing (this should be a particular priority at larger facilities that likely have more consistent demand for floaters).

Summary of supporting evidence:

- See Section 5.2.3.2 for more detail on findings.
- Eighty-one percent of sites we visited suggested improving recruitment into float pools (often, via compensation increases to match local market rates) as one of the most pressing changes needed to improve flexing.
- The academic literature suggests that competitiveness of compensation is important for attracting and retaining intermittent clinical staff (Hughes and Marcantonio, 1991).
- Seventy-one percent of sites we visited reported wanting to add a float pool or increase the size of an existing float pool in order to better manage flexing. Several site visit interviewees reported significant challenges attracting and retaining float pool staff (see Section 5.2.3). While we could not access data needed to substantiate this claim, staff perceptions suggest that VHA may have a significant challenge in this area.
- The Fargo VAMC has adopted shared positions, which split time across two units and act as a resource for both. This kind of shared resourcing appears to be especially useful in smaller facilities, where census is lower and particular occupations may not need a full FTE in any one given department or setting, or for larger facilities with like units that do not require a full FTE in any one single one.

Potential near-term actions:

- *VHACO:* Establish guidelines for setting pay differentials for float staff based on local market rates to improve VAMCs ability to attract float staff.
- *VAMC:* Create unit share positions where new staff are hired with the expectation of splitting time between designated units to build an expectation of floating amongst staff.

5.3.4 Potential Opportunity

Having the right number and type of staff on site at the right times is the foundation of delivering effective, efficient care. Sections 6, 7, 8, and 9 that follow are all directly affected by staffing allocations. Many VAMCs have entirely appropriate staffing models, with innovative practices; across the board, however, VHA lacks basic insight into whether staffing is appropriate, limited ability to hire staff quickly, and inconsistent allocation of staff. This creates significant potential for variation across the system, affecting the quality and level of care that

VHA provides to America's Veterans. Congress, the federal government, the public, and VHA must work together to enhance VHA staffing practices and, thereby, care for Veterans.

This page intentionally left blank.

6 Access

Part F ("Assessment F"), Section 201 of the Veterans Access, Choice, and Accountability Act of 2014 ("the Choice Act") mandates an assessment of the organization, workflow processes, and tools used to support inpatient access to care. We define access as the processes by which patients, in need of acute hospital care, are appropriately triaged and admitted to an inpatient bed. Patients may be admitted through a series of different channels including: through the Emergency Department (ED), as a direct admission from a physician's office, as a transfer from another facility, or as a scheduled admission following a procedure (e.g., a surgery that requires hospitalization following the procedure). Several factors contribute to inpatient access including, but not limited to, the availability of beds, the appropriateness of admissions, staffing and individual clinician capacity, scheduling of elective procedures relative to projected demand for beds, and the discharge of patients who no longer require acute care. Access to inpatient care is critical to ensure Veterans are afforded the ability to seek medical care at the appropriate setting when they need it most.

Across VHA's 121 level 1 and 2 complexity acute-care Medical Centers (e.g., VAMCs that have an ED and provide extensive inpatient care),[119] approximately 600,000 patients[120] are admitted each year. This assessment primarily focuses on the ED, as more than 75 percent of VHA inpatients are admitted through this channel.[121] Additionally, this assessment will focus on the bed management process by which patients are assigned a bed following direct admission, transfer, or surgery. While the scheduling process for elective procedures impacts inpatient access to care, it is an adjacency that falls in the scope for Assessment E. As a result, findings and recommendations related to scheduled procedures are addressed in Assessment E. Additionally, access bottlenecks related to patients who no longer require acute care yet continue to occupy inpatient beds, are covered in Section 7, length-of-stay management and care transitions, of this report. This section focuses exclusively on the organizational structure, workflow processes, and tools related to admissions in the acute setting and inpatient bed assignment. It supplements the findings outlined in Assessment A on current and projected Veteran demographics and in Assessment D on appropriate system-wide access standards, to assess the mechanisms in place, nationally and at the VAMCs, to support current Veteran demand for inpatient access to care.

---

[119] Given the focus of Assessment F on inpatient medical facilities, we chose to only visit VAMCs providing substantial inpatient medical care (complexity levels 1a, 1b, 1c, and 2), and did not include other types of facilities (e.g., community-based outpatient clinics [CBOCs], complexity level 3 facilities)

[120] VHA Med SAS encounter level data for Levels 1 and 2 VAMCs (n=121 facilities, 586,000 admissions)

[121] EDIS (FY14) patient intake data and National Surgery Office (FY14) admissions data. VHA data sources triangulated with site visit interviews and ED throughput workshop (n=21) to verify percentages.

6.1 Summary

6.1.1 Assessment Approach

As described in the methodology of this report (Section 2), we collected information in several ways, using a common approach across sub-assessment areas within Assessment F:

- Site visits completed to 21 VAMCs (complexity level 1a, 1b, 1c, and 2), in which we:
  - o Conducted over 50 interviews with administrative, ED, OR, bed management, and quality leadership, at the VAMC level, to gain their perspective on patient flow and inpatient access.
  - o Facilitated 21 ED throughput assessment workshops with 3 to 10 front-line ED and inpatient personnel representing a variety of disciplines (e.g., physicians, nurses, allied health professionals) to outline the facility's ED flow, document strengths and challenges, and discuss potential solutions/recommendations.
  - o Observed processes and tools implemented to address patient flow challenges, firsthand, through facility tours and on-unit observations with both day and night shift ED and floor nurses.

- Data call sent to leadership in ED, surgery, and bed management to gather data that is not consistently maintained at the national level (e.g., number of patients diverted from the ED due to insufficient bed availability, prevalence of best practices, current or planned performance management initiatives), completed by 55 respondents across 121 (45 percent) of VAMCs (complexity level 1a, 1b, 1c, and 2).[122]

- Survey sent to all clinical staff (e.g., ED physicians; surgeons; hospitalists; charge, floor and utilization management nurses; and allied health professionals) across VAMCs to understand their perspective on inpatient flow and access, completed by 247 respondents, 71 respondents across 121 (59 percent) of VAMCs (complexity level 1a, 1b, 1c, and 2).[123] Due to the fact that VHA does not track the setting of work (i.e., inpatient or outpatient) in available human resource data and we did not control the distribution of the survey to the end-user we are unable to calculate the significance of the total response rate, but do not believe it to be a representative sample across any of the roles. Given this, survey data should be viewed as providing anecdotal insights as opposed to a representative data sample.

- Data collection gathered from national tools (e.g., Emergency Department Integrated System, EDIS, National Bed Control Database, NBCD), including ED length of stay (LOS) for

---

[122] Total VAMC count depends on whether campuses of the same parent station are counted as separate VAMCs or one entity. We have based the count used in our site selection (122) on data drawn from VSSC, 2014 and SAIL, 2014 (see Appendix). In some instances, we use 121 as the denominator, based on data available in the data sets most commonly used for that section.

[123] Total VAMC count depends on whether campuses of the same parent station are counted as separate VAMCs or one entity. ---

admitted patients and the number of patients who leave the hospital without being seen (LWBS).

- Interviews with leadership from multiple VHACO offices, including the Department of Emergency Medicine and the Office of Systems Redesign and Improvement, focused on inpatient access.

Direct admits, surgery patients, and ED admissions are all funneled through the bed management process to receive bed assignments. Given the associated interdependencies across admission routes, a series of timeliness and quality metrics can be used to assess overall access to inpatient care and serve as proxy for bed availability across all admission channels (Hwang, 2011). While confounding factors influencing these metrics should be acknowledged, including number of ED visits that are not clinically appropriate, effects of inpatient bed occupancy, and discharge delays for patients without appropriate post-acute accommodations,[124] these metrics taken as a whole still provide an industry-accepted proxy for inpatient access (Welch, 2011).

Having collected information to understand VHA's practices with respect to inpatient access, we then assessed how these practices compared to best practices and industry benchmarks. Best practices and benchmarks, detailed in Appendix C-1, were identified through several sources, including:

- Interviews with leadership from high-performing hospitals (internal and external to VHA), selected based on their admitted ED LOS, as reported to CMS or in EDIS[125] (CMS Hospital Compare, 2014).
- Academic literature (e.g., research on best practices related to ED throughput) and public reporting of benchmark data to CMS.

In aggregate, a greater percentage of VHA admissions originate in the ED (75 percent of admissions) as compared to market averages (50 percent of admissions) (Pines, 2013). Additionally, VAMCs have longer-admitted ED LOS and a higher rate of LWBS patients, as compared to market averages,[126] as detailed in Section 6.2.3.[127] When comparing VHA performance statistics with private facilities, however, it is important to note the impact of different clinical services and patient populations on access. For example, if a facility offers fewer surgical services, then it will likely have fewer planned surgical admissions thus its percentage of ED admissions will likely be higher as compared to a hospital with more surgical services. Further in looking a different patient populations, the prevalence of mental health, co-morbidities, and sociodemographic challenges (e.g., low income and homelessness), which are currently being assessed by Assessment A, can lead to increased ED demand (Hastings 2013; Tsai, 2015; Doran, 2013). As a result, there are several reasons why VHA's unique patient

---

[124] Site visit ED throughput workshops (N =21 sites)

[125] EDIS (FY14)

[126] EDIS (FY14) and CMS Hospital Compare (FY14)

[127] VHA admit ED LOS is 277 minutes compared with a market average of 270, additionally LWBS rates are about 3 percent at VHA and the market average is 2 percent (VHA EDIS FY14 data, CMS Hospital Compare data FY14)

population could drive an increased ED demand, thus impacting its performance metrics relative to market averages:

- Higher incidence of mental health: Patients with mental health diagnoses are less likely to seek regular medical treatment (Hoester, 2012). When they do seek medical treatment it is often in the ED following the advancement of their condition and exacerbation of symptoms (Hoester, 2012). When presenting in the ED, these patients may also require additional resources (e.g., some mental health patients in the ED require a 1:1 clinician ratio). These factors are especially relevant given that on average, 20 to 40 percent of recently returned service members and Veterans are diagnosed with a mental disorder, compared with only 4.2 percent of the general population (Behavioral Health Barometer, 2014; Report of the Department of Defense on Mental Health, 2007).

- Higher incidence of co-morbidities: Patients with co-morbidities, especially related to cardiac disease, have greater ED use (Doran, 2013). This is noteworthy given the prevalence of hypertension among VHA patients is nearly double that of the private sector, 52 percent compared with 26 percent (Klein, 2011, Unique Veteran Users Report FY12, 2014).

- Higher incidence of homelessness: Homelessness is a key predictor of ED utilization (Doran, 2013). In 2010 Veterans accounted for 10 percent of the adult population but 16 percent of the adult homeless population (Profile of Sheltered Homeless Veterans for FY9 & FY10, 2012). Despite recent efforts and reductions in Veteran homelessness, rates of homelessness are still more than 30 percent higher than those of the general public (National Alliance to End Homelessness, 2015).

Given these confounding factors, we have chosen to balance market comparisons and benchmarks from the private sector with comparisons and benchmarks internal to VHA as well. However, our ability to effectively benchmark VHA practices was, in many instances, hampered by the unavailability of VHA data. For example, VHACO does not maintain standardized, accurate data on its current inpatient capacity, including the number of operational inpatient beds per facility and staffing levels by unit or shift. Additionally, VHA does not have a clear picture of its demand (e.g., patients in need of care from a VAMC) as it does not track, at a national level, the number of patients diverted to another facility due to insufficient VAMC capacity. Given that this demand and capacity data has inpatient access implications (e.g., patients that cannot be cared for at VAMCs due to capacity issues are diverted or transferred to private facilities and cared for with non-VA care funding), data access was a significant impediment to our ability to assess VHA inpatient access. Furthermore, VHA data management is inferior to that seen in the private sector, as detailed in Section 6.2.1, which we presume affects VHA's own ability to effectively manage inpatient access.

6.1.2 Summary of Findings

We observed several key areas of strength and challenge related to inpatient access at VHA. In accordance with the legislation, these findings apply to the organization, processes, and tools, currently in place at VHA; a detailed mapping to the organization, processes, and tools framework is available in Appendix C-2.

6.2.1 Data gaps limit VHA's understanding of patient demand patterns and available VAMC capacity. VHA maintains several different tools to manage access and flow; however, a lack of integration across tools, inconsistent methods for tracking data, and gaps in key flow metrics result in highly variable, non-actionable demand and capacity data. For example, in looking at one facility, the national bed control database (NBCD) shows that 81 percent of that VAMC's inpatient beds are operational[128] (e.g., beds are available for patients); however, the facility reports that only 51 percent of their beds are available for patients[129] due to unreported staffing and construction-related bed closures. Additionally, this facility does not consistently track its missed demand (e.g., patients who leave without being seen by a provider and/or patients who are diverted/transferred to another facility because the VAMC is at capacity or lacks required services), so it does not know if its limited bed capacity is impacting inpatient access. *Refer to Section 5 for additional detail on capacity limitations due to staffing.*

6.2.2 Hospital visits and admissions that are not clinically appropriate (e.g., from the ED and surgical suite) contribute to ED bottlenecks and limit bed availability. More than 120,000 admissions, approximately 20 to 25 percent[130] of ED and post-operative admissions fail to meet McKesson InterQual admissions criteria,[131] compared with 10 to 15 percent in the private sector (Sheehy, 2013; Stranges, 2010). Of those VHA admissions that failed to meet criteria, we found that 30 percent (7 percent of total admissions)[132] are attributed to limited access to the appropriate setting of care (e.g., outpatient access, level-of-care availability, and social issues).

6.2.3 Best practices related to workflow and performance management exist at some facilities, but have not been scaled across the system. Compared with market averages, 50 percent of VAMCs report longer LOS for patients admitted from the ED and 59 percent report higher LWBS rates[133] (i.e., more patients leave VAMCs without being seen by a provider). While some facilities have successfully operationalized industry-accepted best practices (e.g., fast track, clinical protocols in triage, flow management teams) — Boston VAMC's missed opportunities[134] are under 1 percent (the VAMC goal is under 3 percent[135]), adoption is limited system-wide.

6.1.3 Summary of Recommendations

Our assessment revealed several areas where VHA can build on current strengths or address existing challenges to improve inpatient access to care. We recommend that VHA consider three strategic themes, as detailed below. As with the findings, these themes apply to VHA organization, processes, and tools.

6.3.1 **Develop an accurate end-to-end picture of patient demand and VAMC capacity.** VHA should simplify the process and required approvals by which beds are classified as operational and standardize the definition and tracking of patient demand. Additionally, VHA should develop a prioritized set of standardized metrics to track patient flow, including current demand and capacity, at the facility, VISN, and VHACO levels. Once that infrastructure is in place, VHA can consider building an analytical model to more accurately predict future patient demand.

6.3.2 **Decrease the number of clinically inappropriate admissions due to limited access to sub-acute care.** VHA should assess the availability of alternative settings of care, at the regional level or VISN level, first to understand any gaps and then to determine how best to address those gaps (e.g., through direct investment and/or community partnership). At the facility level, VAMCs should dedicate appropriate patient support resources (e.g., case managers and social workers) to coordinate transitions from the ED and surgical departments to these settings of care. Once the infrastructure is in place to support these patients outside the acute setting, VAMCs should begin to hold physicians accountable for appropriateness of admissions (e.g., include utilization management in physician performance appraisals).

6.3.3 **Expand use of evidence-based processes for managing patient flow, including clear role assignments and individual performance management.** VHA should focus on expediting care in the ED through the early initiation of clinical protocols in triage and implementation of fast track processes for low-acuity patients. Additionally admission and bed assignment processes should be streamlined through clearer role assignment and better utilization of available tools.

6.1.4 Past Findings and Recommendations

Over the last ten years, the majority of access assessments has focused on outpatient care. While outpatient access has clear impacts on inpatient access, there are different metrics for evaluating inpatient access (Perlin, 2004). Details related to these previous reports are outlined in Assessment E.

In focusing our effort on inpatient access to care, OIG assessments and academic research identified several factors that hinder ED throughput and patient flow. These assessments have focused primarily on factors related to organization and processes, as detailed in Appendix C-3 and C-4, and reflect many of the same challenges and opportunities that we found during our assessment. Previously identified challenges include:

1. Insufficient inpatient bed availability to meet ED demand

2. Ineffective triage and monitoring at some facilities

3. Inadequate specialty services in the ED, particularly mental health services

Note that these three examples illustrate the type of factors identified in recent years, and are not intended to be a comprehensive listing. These past assessments have tended to focus on specific issues and/or individual facilities, separately developing recommendations for improvement in discrete areas. In contrast, our assessment tries to take an end-to-end view of inpatient clinical operations across the five key sub-assessment areas and all high- and medium-complexity VAMCs.

6.2   Findings

Through our site visits, data analysis, interviews, and benchmarking we identified strengths and challenges to inpatient access across VHA inpatient care setting. The sub-sections that follow (6.2.1, 6.2.2, and 6.2.3) describe these findings in detail, including information on what we believe the drivers of each finding to be.

6.2.1 Data gaps limit VHA's understanding of patient demand patterns and available VAMC capacity

6.2.2 Hospital visits and admissions that are not clinically appropriate (e.g., from the ED and surgical suite) contribute to ED bottlenecks and limit bed availability

6.2.3 Best practices related to workflow and performance management exist at some facilities, but have not been scaled across the system

As noted in Section 2.2, data issues prevented us from conclusively assessing many areas of inpatient access. We have used the national data sets that were available, information returned as part of the data call, and perceptions and experience reported or observed during site visits or via the staff survey. In many instances where data does not allow us to definitively comment, we have described the potential implications of the data points we do have, along with recommendations in Section 6.3 for further analysis.

6.2.1   Data Gaps Limit VHA's Understanding of Patient Demand Patterns and Available VAMC Capacity (e.g., bed and staffing)

Inconsistent methods for tracking available physical bed counts and patient care needs at the unit and facility levels limit VHA's ability to accurately manage VAMC capacity (e.g., staffing and bed availability) to patient demand. While, VHA has several different tools to monitor demand and capacity (e.g., National Bed Control System, Bed Management System, ED tracking system), they do not integrate with one another and each tool maintains its own master data. These technical limitations restrict end-users' ability to aggregate information across tools. Given the challenges and inaccuracies we encountered in both gathering and analyzing data, it raises the hypothesis that data access and validity are also an impediment to VHA's own ability to provide effective oversight.

Two key drivers of data challenges related to patient demand and inpatient capacity are:

> **6.2.1.1   Inaccurate view of bed capacity across multiple tools limits VHA's ability to understand current capacity**
>
> **6.2.1.2   Incomplete view of patient demand, including unmet patient care needs, limits VHA's ability to understand demand relative to current capacity**

6.2.1.1 Inaccurate View of Bed Capacity Across Multiple Tools

The VA National Bed Control Database (NBCD) and the VA Bed Management System (BMS) both track bed capacity, including the number of authorized beds, operational beds, and unavailable beds. The VHA handbook on Inpatient Bed Change Programs and Procedures defines "authorized beds as the potential capacity of a medical center, operational beds as the number of beds staffed and available for a potential admission, and unavailable beds as the number of beds closed for any reason" (VHA Handbook 1000.01, 2010). Our analysis, as demonstrated in **Figure 6-1** shows that the actual number of available beds at a VAMC may be lower than the reported number of operational bed numbers, as tracked in NBCD and BMS.

Figure 6-1. VAMC Bed Capacity

38% of VAMCs reported closing beds (e.g., due to staffing limitations and/or construction) without going through the national bed letter process; as a result it is unclear the actual number of available beds across the system

1 Total authorized acute beds (e.g., potential capacity of the system as reported to NBCD)
2 Total operating beds (e.g., staffed beds reported to NBCD)
3 Total actual operating beds (e.g., actual staffed beds as reported by the facilities)

SOURCE: National Bed Control Database; Handbook on Bed Management; Choice Act data call

The noted discrepancy in bed counts is likely a result of the heavily bureaucratic and political process required to officially adjust bed counts[136]. NBCD is used to provide Congressionally-mandated reports on VHA bed capacity and requires a formal process to make changes to a Medical Center's bed counts. Prior to submitting a bed change request, a facility must receive pre-approval and communicate its proposed changes to external stakeholders, including Veteran Service Organizations and Congressional offices. Next, the VAMC and/or VISN must submit an electronic bed change request (a "bed letter") through NBCD for approval from the VISN Director, VHACO Patient Care Services, the Deputy Under Secretary for Health for operations management and, in some instances, Congress. It is important to note that bed changes are only required for closures projected to be greater than 60 days (VHA Handbook 1000.01, 2010); which allows VAMCs the flexibility to not report bed closures they anticipate the closure will be less than 60 days.

Even once administrators have deemed a bed closure appropriate, there is often concern from the community. Some cities have held public forums to enable citizens to voice their opposition to the bed closures. Following the proposed closure of beds at a VAMC in South Dakota, one Veteran in a public forum stated, "public input needs to carry weight with any changes in the system, and there needs to be assurance that quality of service and care…is not compromised" (Wooster, 2011).

The result of this arduous bed change process and public concern is that VAMCs rarely submit formalized bed changes, resulting in inaccurate NBCD bed counts. In many cases this discrepancy incorrectly shows VAMCs working at well below capacity, because while they may have closed beds due to construction and/or insufficient staffing, those unavailable beds are not reflected in NBCD.[137] Take the following illustrative example: A facility has 100 operational beds in NBCD but they can only staff 80 beds (e.g., 20 beds are closed locally) and their average daily patient census is 75; it appears as if the facility is running at 75 percent capacity but in actuality it is at 94 percent capacity. This scenario is common across VAMCs — 44 percent of VAMC data call respondents indicated that they have closed beds due to insufficient staffing[138] and site visit interviewees stated that they regularly close beds without reporting bed closures to NBCD.[139] Section 5 provides additional context on the drivers behind staffing-related bed closures including: hiring challenges, a misallocation of staff as compared with patient demand, and limited flex resources (e.g., float pool, agency) to account for short-term vacancies (e.g., call-offs, vacations, sick-leave).

One goal of BMS is to attempt to address this discrepancy by supporting the day-to-day management of patient placement and bed flow. BMS allows users to remove beds from the "Operating Beds" roster and designate them as unavailable. The challenge is that while BMS pulls operating bed data from NBCD, local updates made in BMS are not updated in VistA or NBCD (BMS Quarterly Bed Reconciliation Report, 2015). Some facilities choose not to "close"

beds in the BMS tool so they can rotate bed assignments and expedite bed turnover.[140] This also limits the accuracy of the data.

6.2.1.2 Incomplete View of Patient Demand, Including Unmet Patient Care Needs, Limits VHA's Ability to Understand Demand Relative to Current Capacity

In addition to an inaccurate view of available bed capacity, VHA has an incomplete understanding of inpatient demand. Literature emphasizes the importance of tracking demand from both the ED (e.g., the number of ED encounters by hour and acuity, percentages of beds occupied by hour, admission rates by hour and acuity) and scheduled procedures (e.g., the number of scheduled procedures requiring inpatient admissions per day) (Welch, 2011).

While VHA tracks some of these measures consistently; including the volume of ED visits and scheduled procedures; ED, inpatient, and surgical data is siloed in tools (e.g., EDIS and NSO). For example, the Emergency Department Integrated Software (EDIS)[141] tracks ED encounters, the National Surgery Office tracks scheduled procedures, and BMS tracks inpatient bed occupancy, yet none of these tools integrates with one another.[142] Sixty-seven percent of individuals interviewed during sites visited cited this lack of tool integration as a challenge to patient flow.[143] As a result, most VAMCs lack an overall picture of demand across admission channels. Additionally, while EDIS tracks ED volume, disposition, and throughput measures for example, admitted LOS, discharged LOS, door to doctor, and LWBS rates) its accuracy is limited by inappropriate use of the tool. For example, EDIS data reliability metrics indicate that facilities are more than 90 percent accurate in documenting patient visits but only 50 percent reliable when inputting patient information required for timeliness and disposition metrics.[144] This variability in data accuracy and reliability further limits VHA's understanding of demand.

Some sites have developed sophisticated offline models, as demonstrated in **Table 6-1**, to reconcile data across the multiple tools; however, there is often a disconnect in the master data across tools challenging accuracy and reliability.

Table 6-1. VAMC Case Study: Data Management

Best practice case study – Palo Alto VAMC
Palo Alto aggregates patient flow data across VAMC tools, including: EDIS, NUMI, NBCD, and VistA, to provide front-line staff with daily reports and monthly dashboards on patient flow metrics and performance outcomes **Key reports from the data analytics team:**

---

[140] Site visit ED throughout assessment workshops (N=21 sites)

[141] EDIS is an application that extends the functionality of CPRS to help health care professionals in the ED track manage flow, including: "adding ED patients to a display board, viewing patient information on the display board, editing patient information, and creating administrative reports (EDIS user guide 1.0, 2010).

[142] Site visit ED throughput workshops (N =21 sites)

[143] Site visit ED throughput workshops (N =21 sites)

[144] EDIS FY14 data reliability metrics

Best practice case study – Palo Alto VAMC
- Bed control report: Daily report for inpatient medicine and surgery teams, includes data on ED throughput, new admissions, and patient flow[145]   - Admissions dashboard: Quarterly report for leadership and front line on admissions, fee costs, readmission rates, and utilization management[146]   - Bed stewardship and inpatient flow dashboard: Quarterly report for leadership and front-line on LOS, occupancy rates, census by unit, observation rates, and transfer rates[147]   **Lessons learned:**   - Develop, track, and distribute metrics that are most important to your team: ED and inpatient teams use the bed control report during their daily medical and surgical rounds; this has enabled the front-line to hone key metrics and has driven more accurate and timely input of those metrics (e.g., because data entry errors are readily apparent during rounding)[148]   - Outline workarounds to address gaps in tool functionality: ED always conducts a MRSA swab prior to admission; the time of this swab is used as a proxy to "start the clock" in measuring time from ED decision to admit to inpatient bed placement[149]   - Create early wins to gain front-line acceptance: Limited access to prosthetics was a common complaint in the ED, so one of the department's first process improvement initiatives was to use data to show the impact of prosthetic delays on patient flow and wait times, this has considerably improved access to prosthetics in the ED[150]   **Impact from the data analytics team:**   - Time from admission order to bed order time has decreased by almost 30min[151]   - ED LOS has remained constant from February 2014 to March 2015 despite a 37 percent increase in patient demand [152]   - Admissions delays due to bed availability have decreased from 92 percent in March FY13 to 30 percent in March FY15[153]   - Observation admissions have more than doubled since Feb 2014[154]

Best practice case study – Palo Alto VAMC
▪ Boarder percentages (e.g., patient who stay over 6 hours in the ED) have decreased from 79 percent in FY14 to 57 percent in FY15[155]

In addition to tracking patients cared for, literature also supports the importance of understanding missed or unmet patient demand (Welch, 2011). EDIS tracks missed opportunities (e.g., left without being seen, against medical advice); however, we did not observe a standardized process for tracking patients who are diverted or transferred to another facility because a VAMC is at capacity due to staffing or occupancy constraints. Some facilities have started to track diversions and transfers locally, but there are several challenges with this approach:

- There are not standard definitions for diversions and transfers — e.g., some VAMCs define diversion as an inability to accept ambulances while others declare diversion when all inpatient beds are full, or when the wait time for an inpatient bed will be in excess of 2 hours.[156]

- There are not standard processes for diverting or transferring patients — e.g., some VAMCs send patients in the ED to other hospitals when inpatient beds are not available, while others board those patients in the ED.[157]

- There is not a standard approach for tracking diversion and transfer data — e.g., most VAMCs track hours on diversion, but not patients diverted or transferred; without understanding the number of patients sent to another facility due to capacity constraints, VHA is unable to quantify its missed demand.[158]

At a central level, VHA tracks the spend on non-VHA care consults, but it does not segment this spend by the cause of the consults (e.g., diversions, availability of specialty, patient choice). Understanding the financial losses associated with missed demand, if they exist, would allow VHA to better understand its capacity at a basic level and provide clear support for increasing capacity (e.g., new physical beds and/or additional staffing) if necessary.

6.2.2 Hospital Visits and Admissions (e.g., from the ED and surgical suite) That are not Clinically Appropriate Contribute to ED Bottlenecks and Limit Bed Availability

As seen in the private sector, VAMC EDs often serve as a "catch-all" for patients who cannot find care in a more appropriate, lower-acuity setting. These low-acuity patients congest the ED, thus limiting access for other patients who require acute care.[159]

---

[155] Palo Alto performance dashboard (FY13-FY15)

[156] Site visit assessment workshops (N=21 sites)

[157] Site visit assessment workshops (N=21 sites)

[158] Site visit assessment workshops (N=21 sites)

[159] Site visit ED throughput workshop (N=21 sites)

The admission of patients who do not require acute medical care further congests the ED and limits bed availability. In many instances, it may be imprudent to discharge these Veterans home due to a variety of concerns, including: lack of housing and/or transportation issues following a procedure requiring sedation; mental health and substance abuse challenges; and an inability to care for themselves. A chief of surgery at one VAMC explained, "We have many patients who travel a long distance for an outpatient surgical procedure but who, following the procedure and the administration of conscious sedation drugs, have no one to drive them home and care for them while the medication wears off. Since we do not have domiciliary care or inpatient rehabilitation, our only option is to admit these patients [or proactively cancel their surgery].[160]" However, admitting these patients without an acute medical need not only limits bed availability for patients who do not require acute care and has clear financial implications, as detailed in Section 6.3.5., but it also puts those patients at risk for hospital-acquired infections. The CDC reports that 1 in 25 hospital patients has at least one hospital-acquired infection. As a result, patients who do not have an acute medical need for an inpatient stay are at a greater risk of disease if admitted (Magill, 2014).

In analyzing admissions through the ED, VHA admissions are approximately 65 percent higher than the national average, as shown in **Figure 6.2.[161]** While this variation could be attributed to the complexity of the VHA patient population, as outlined in Section 6.1.1, the acuity of patients that present in the ED, as defined by the Emergency Severity Index (ESI), are on par with national averages. ESI is a five-level ED triage algorithm that stratifies patients into five groups from least to most urgent based on patient acuity and resources needs, with an ESI-1 as the most urgent score. It is important to note that while ESI is an accepted tool to stratify patients based on acuity and resource needs, it is not designed to capture the nuances and complexity of the patient beyond their most acute needs. Given the co-morbidities and social dynamics of the VHA patient population[162] (e.g., mental health issues, substance abuse, homelessness) as compared with the general population, it is reasonable to assume that some of this discrepancy in admission rates may be justified. However, even assuming that a greater proportion of VHA admissions is justified due to patient demographics and comorbidities, VHA admission percentages are still considerably higher than those in the private sector and warrants further study.

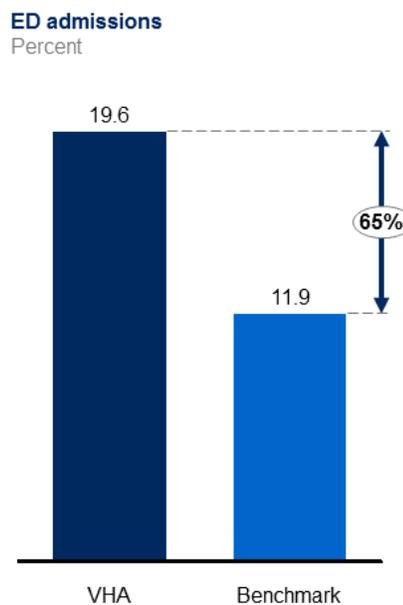
Figure 6-2. ED Acuity Analysis

Controlling for patient acuity, the VHA admits more ED patients than national benchmarks


1 ESI (Emergency Severity Index) is a 5-level emergency department triage algorithm that provides clinically relevant stratification of patients into 5 groups from least to most urgent based on patient acuity and resource needs. Highest acuity patients receive an ESI of 1

SOURCE: EDIS FY14 data and CDC ED Survey FY11 (published 2015)

Despite the lack of clarity on ED data and an inability to adjust admission percentages by patient complexity, more than 120,000 admissions, approximately 20 to 25 percent [163] of ED and post-surgical admissions fail to meet McKesson InterQual admissions criteria,[164] as demonstrated in **Figure 6.3.** This is nearly double the national average, which reports that for common ED and surgical diagnoses[165] approximately 10 to 15 percent of hospital admissions may be unnecessary (Sheehy, 2013; Stranges, 2010). VHA evaluates admission appropriateness using its National Utilization Management tool (NUMI). Utilization management (UM) staff are tasked with reviewing VHA admissions in NUMI to determine whether they criteria outlined in the tool. VHA Directive 1117 (2014) mandates that UM nurses perform case reviews on 75

---

[163] NUMI (FY14) admissions appropriateness

[164] McKesson InterQual is a tool that provides evidence-based clinical decision support on the appropriateness of care (including admissions and continuing stays)

[165] **Common medical diagnoses:** pneumonia, chest pain, cellulitis and abscess of leg, syncope and collapse, unspecified septicemia, abdominal pain, coronary atherosclerosis, atrial fibrillation and flutter, complication of transplanted organ, care involving other specified rehabilitation procedure; **Common surgical diagnoses:** abdominal pain, croup, diabetes with ketoacidosis, encounter for antineoplastic chemotherapy and immunotherapy, observation following other accident, hemorrhage of hematoma complicating a procedure, postoperative infection, complications of transplanted organ, osteoarthritis

---

percent of admissions, observation stays, and subsequent days of care and enter results into the NUMI application. Of VHA admissions that fail to meet InterQual criteria, 30 percent (or seven percent[166] of total admissions) are attributed to limited access to appropriate care, as an alternative to the inpatient setting (e.g., level of care availability, outpatient access, and social issues). In contrast to VHA, private sector hospitals must adhere to stringent criteria for Medicare inpatient admissions (e.g., InterQual) or face CMS fines through the Recovery Audit Contractor program (RAC)[167] (Sheehy, 2013).

Figure 6-3. Inpatient Admissions for Patients With Limited Access to Sub-Acute Care Hinder Access and Patient Flow

2 Admissions that fail to meet McKesson InterQual criteria due to provider clinical judgment, available level of care, non-medical (e.g., social) issues, and/or care better suited for the outpatient setting
3 Admissions that meet McKesson InterqQual criteria
4 Agency for Healthcare Research and Quality – Healthcare Cost and Utilization Project cited 10% of hospitalizations are potentially preventable for acute and chronic conditions based on 2008 data

SOURCE: NUMI data (FY14); Agency for Healthcare Research and Quality (2010)

Four key drivers of clinically inappropriate visits and admissions that were highlighted through our assessment, include:

---

[166] NUMI (FY14) admissions appropriateness

[167] "The Recovery Audit Program's mission is to identify and correct Medicare improper payments through the efficient detection and collection of overpayments made on claims of health care services provided to Medicare beneficiaries, and the identification of underpayments to providers so that the CMS can implement actions that will prevent future improper payments in all 50 states." (CMS.gov, 2015)

6.2.2.1   Demographic characteristics of Veterans (e.g., higher incidence of mental health diagnoses, co-morbidities, and homelessness among Veterans as compared to the general population)

6.2.2.2   Limited access to immediate (e.g., same day or same week) primary and urgent care clinic appointments, contributing to ED demand

6.2.2.3   Insufficient access to sub-acute facilities (e.g., short-term rehab, detox clinics) for patients who should not be discharged home following an ED visit or surgical procedure, but do not require admission to an inpatient bed

6.2.2.4   Minimal physician acceptance of and accountability for utilization management admission standards (e.g., the evaluation of the appropriateness of health care services according to evidence based criteria)

6.2.2.5 Lack of integration across tools

6.2.2.1 Demographic Characteristics of Veterans

As discussed in Section 6.1.1, VHA serves a unique patient population with a higher prevalence of mental health, co-morbidities, and homelessness, as compared with the general public (Behavioral Health Barometer, 2014; Report of the Department of Defense on Mental Health, 2007; Klein, 2011; Unique Veteran Users Report FY12, 2014; Profile of Sheltered Homeless Veterans for FY9 and FY10, 2012). Each of these characteristics is a predictor of higher repeat ED utilization, especially for care that may be better provided in a lower-acuity setting (Hastings 2013; Tsai, 2015; Doran, 2013). Refer to Assessment A for additional detail on Veteran demographics and demand for health care services.

6.2.2.2 Limited Access to Immediate (e.g., same day or same week) Primary and Urgent Care Clinic Appointments Contributes to ED Demand

ED leadership across sites commented on the volume of ED visits that are not clinically appropriate, remarking that patients rely on the ED for prescription refills, primary and follow-up care, as well as other non-urgent needs (Doran, 2013).[168] More than 70 percent of front-line employees who attended our ED workshop attribute this clinically inappropriate volume to outpatient access challenges, including understaffing of primary care and inconvenient clinic hours (e.g., lack of night and weekend availability).[169] While we are not addressing clinic access, as clinic scheduling is detailed in Assessment E, limited access to outpatient care is a key contributor to inpatient access challenges.

---

[168] Site visit ED shadowing sessions (N=21 sites)

[169] Site visit ED throughput workshops and shadowing sessions (N =21 sites)

6.2.2.3 Insufficient Access to Sub-acute Facilities (e.g., short-term rehab, detox clinics) for Patients who Should not be Discharged Home Following an ED visit or Surgical Procedure, but do not Require Admission to an Inpatient Bed

As demonstrated in **Figure 6-3,** more than 30 percent of admissions that fail to meet InterQual criteria are due to limited access to appropriate care settings.[170] Limited access may be attributed to: (1) insufficient number of sub-acute facilities; and (2) inadequate support in the hospital to help patients and physicians navigate admission alternatives.

Insufficient number of sub-acute facilities: Fifty-five percent of VAMCs visited attribute the high number of admissions that fail to meet NUMI criteria to a lack of VHA or contracted facilities for sub-acute care (e.g., detox clinics, short-term rehab).[171,172] Literature further supports this connection between availability of care alternatives and a reduction in clinically inappropriate hospital utilization, showing that offering transitional and long-term housing to homeless ED patients in conjunction with case management support led to a 29 percent reduction in admissions and a 24 percent decrease in ED visits compared with usual care (Sadowski, 2009).

Fargo VAMC recently contracted with a community detox center to care for patients who present in the ED for substance abuse issues. The detox center provides 24/7 care for those patients who do not require acute medical attention.[173] While it is too soon to assess the impact of this facility, ED staff have noticed an improvement in ED congestion. Additional detail on current health care capabilities and resources can be found in Assessment B and detail related to appropriate system-wide access to health care furnished by and through the department may be found in Assessment D.

Inadequate support in the ED and surgical suites to help patients and physicians navigate admission alternatives (e.g., more appropriate sub-acute settings of care): Fifty percent of VHA survey respondents reported staffing a case manager and/or social worker in the ED**[174]**; however, in many instances these individuals are only staffed during the day such that VAMCs lack night and weekend support; 69 percent of case managers interviewed during site visits reported that case managers and social workers are currently understaffed.[175] The result is that even when alternate facilities may be available for care – e.g., the detox center in Fargo or funding for conscious sedation patients to stay in a domiciliary unit – physicians and patients are unaware of these facilities and lack appropriate support to transition to these facilities.

---

[170] NUMI admissions appropriateness data (FY14)

[172] VAMC site visit Case Manager interviews (N=21 sites with one to five case manager and/or social workers in each interview)

[173] Site visit ED throughput assessment workshop

[174] Choice Act Survey (N=101 respondents)

[175] Site visit ED throughput assessment workshop

Current literature shows a correlation between case management in the ED and decreases in ED visits, as well as "improved clinical and social outcomes among frequent ED users" (Kumar, 2013). One study shows that a targeted interdisciplinary case management program in the ED led to a 7 percent decrease in ED visits among a historically challenging patient population, similar to VHA's population (e.g., patients who presented with psychiatric disease, substance abuse, medication non-compliance, and/or unstable housing) (Pillow, 2013).

6.2.2.4 Minimal Physician Acceptance of and Accountability for Utilization Management Admission Standards (e.g., the evaluation of the appropriateness of health care services according to evidence based criteria)

While over 50 percent of department chiefs interviewed cite UM as a high or very high priority at their VAMC,[176] they also recognize that "without alternatives (e.g., sub-acute facilities) and resources (e.g., case managers/social workers to help patient navigate alternative settings of care), UM is not very helpful in driving down inappropriate admissions.[177]" The perceived effectiveness of UM programs varies across VAMCs with 30 percent of facilities stating that their UM program has considerable impact, 30 percent citing marginal impact, and 35 percent identifying little to no impact (5 percent no response).[178] Limited physician engagement and adherence to UM standards are likely attributable to: (1) insufficient collaboration between UM RNs, ED physicians, and hospitalists; and (2) lack of physician performance standards around admission appropriateness.

Insufficient collaboration between UM RNs, ED physicians, and hospitalists:
Several different conclusions may be drawn from the high percentage of admissions that fail to meet UM criteria because of clinical judgment, as was demonstrated in Figure 6-4. Namely, physicians place little value on UM criteria, and/or documentation does not accurately reflect patients' care contributing to ineffective UM reviews (addressed in Section 9). McKesson's InterQual criteria supports more than 3,700 hospitals across the country (McKesson website, 2015), so we believe it is a relevant algorithm, albeit with potential for customization to reflect VA patient characteristics. Section 9 provides additional detail on provider documentation as a potential limiter to effective UM.
Across many facilities a tension exists between UM nurses and providers. One department chief commented that this tension is eased when "UM teams work directly with the providers, such that they can make admissions decisions as a team relying on both InterQual criteria and clinical judgment."**[179]** We observed this in one facility where the UM nurse sat in the ED and conducted prospective admissions reviews with the admitting providers. While effective in driving admission

[176] Site visit Department Chief interviews (n=21 facilities with one to three department chiefs in each interview)

[177] Site visit Department Chief interviews (n=21 facilities with one to three department chiefs in each interview)

[178] Site visit Department Chief interviews (n=21 facilities with one to three department chiefs in each interview)

[179] Site visit Department Chief interviews (n=21 facilities with one to three department chiefs in each interview)

appropriateness, this collaborative model is not the norm as we only observed it in a few facilities (less than 5 percent) who staffed UM nurses in the ED.[180]

Lack of physician performance standards around admission appropriateness: None of the facilities observed included UM's admission appropriateness metrics in physicians' performance appraisals. This is in direct contrast with best practices that promote individual ownership and accountability to drive change (Luxford, 2011) and decrease admissions that fail to meet NUMI criteria. While the infrastructure is not currently in place to support the care of all patients in alternative, non-acute settings, physicians also lack the incentives to direct patients to these settings.

6.2.2.5 Lack of Integration Across Tools

Adding to the complexity and inaccuracy of demand data, EDIS and BMS both track patient flow and throughput effectiveness, but they do not integrate with each another or with the VistA suite.[181] Sixty-seven percent of facilities visited cited tool issues (e.g., limited functionality of tool, lack of integration, insufficient training) as a challenge to patient flow.[182]

Some sites have developed sophisticated offline models, as demonstrated in **Table 6-2** to reconcile data across the multiple tools, but there is often a disconnect in the master data across these tools challenging accuracy and reliability.

6.2.3 Best Practices Related to Workflow and Performance Management Exist at Some Facilities, but Have not Been Scaled Across the System

Despite successful implementation of many operational best practices (e.g., fast track, clinical protocols in triage, flow management teams) in select facilities, as detailed in **Figure 6-4**, adoption is limited system-wide. Additionally, even in top-performing facilities based on ED LOS and LWBS rates, delays in inpatient access can result from insufficient bed availability and inconsistent admission and bed assignment processes.

On average, more than 50 percent of VAMCs have a longer-admitted ED LOS, as compared with the market average (EDIS FY14 and CMS HCAHPS FY14), also shown in **Figure 6-4.**[183] While VHA does serve a complex patient population as described in Section 6.1.1, VHA's ED acuity (as measured by ESI) is on a par with national averages, as was demonstrated in **Figure 6-2**. This suggests an opportunity to improve throughput by a more consistent, system-wide implementation of best practices with corresponding performance management.

Two key factors contribute to variability in best practice adoption across the system:

---

[180] Site visit ED throughput workshop (n=21 sites)

[181] Site visit ED throughput workshop (n=21 sites)

[182] Site visit ED throughput workshop (n=21 sites)

[183] More than 70 percent of VAMCs have a longer door-to-doctor time compared with market averages and more than 55 percent of VAMCs have a higher LWBS rate (EDIS FY14 and CMS FY14).

6.2.3.1 Inconsistent adoption of proven best practices to manage patient flow within facilities (e.g., early initiation of clinical protocols in ED triage, fast-track processes for low-acuity patients, team focused on managing flow)

6.2.3.2 Limited cross-facility communication and sharing of best practices

Figure 6-4. VHA Lags Market Averages

On average VHA patients spend more time in the ED as compared to market benchmarks, and a greater percentage of VHA patients LWBS

6.2.3.1 Inconsistent Adoption of Proven Best Practices to Manage Patient Flow Across Facilities

VHA's centralized Department of Emergency Medicine has taken a logical approach in driving ED performance improvement. It started by standardizing data collection and reporting through the use of the EDIS tool,[184] implemented in 2012 (EDIS Installation Guide, 2014). EDIS provides a common tool to track patient flow through the ED as well as measure throughput and effectiveness at a facility, VISN, and national level that is foundational to other improvements. While the Medical Centers use the EDIS tool to varying levels of sophistication, we observed

---

[184] EDIS: Emergency Department Integrated Tracking System

The views, opinions, and/or findings contained in this report are those of the assessment team and should not be construed as an official government position, policy, or decision.

100 percent utilization across our site visits.[185] In light of Finding 6.2.1, data gaps limit VHA understanding of patient demand patterns and available VAMC capacity, this achievement is no small feat.

According to the Department of Emergency Medicine,[186] its objective in its next phase is to drive best practice adoption using data and trends from EDIS and eventually from BMS. In the current state, best practice adoption is driven at a local level and varies across the system. This is most evident in the implementation of the following: (1) clinical protocols to initiate care in triage; (2) segmented process for the care of lower-acuity ED patients; and (3) flow management processes and roles to expedite admission and bed placement.

Some facilities, like Boston VAMC as demonstrated below in **Figure 6-5**, have successfully implemented each of these practices, while others are slower to adopt or have not adopted at all. Boston attributes its success to strong clinical leadership at the facility and ED levels, particularly between the ED Director and ED unit manager.[187]

[185] Site visit ED throughput workshops (N=21 sites)

[186] VHACO SME interview

[187] Site visit ED throughput workshop (Boston VAMC)

Figure 6-5. VAMC Case Study: ED Patient Flow

Boston VAMC has taken a systematic approach to managing patient flow

Approach

- Developed an **inpatient flow team**
- Focused on **targeted performance improvement initiatives**
- Encouraged **front line involvement**
- Supported by **strong, consistent leadership** involvement

Process improvement initiatives

- **Developed protocols for 5 major ED diagnoses** (chest pain, shortness of breath, fever, abdominal pain, mental status changes)
- **Promoted use of fast track;** more than 30% of ED patients are triaged to Fast Track
- **Reserved same-day primary care appointments** for low acuity patients who present in the ED
- Implemented organization-wide **centralized bed control and bed huddles**
- **Designated patients waiting more than 90 minutes** as highest priority patients
- **Instituted a pharmacy refill clinic** to assist patients that present in the ED strictly for prescription refills
- **Implemented a flow dashboard that links ED performance metrics with inpatient flow;** result has been to build cross-departmental awareness of ED throughput and bed turnaround times and drive front-line improvements

ED metrics – top quartile of VAMCs

- Admitted ED LOS: ~220 minutes
- Non-admitted ED LOS: 114 minutes
- Left without being seen: 0.44%

SOURCE: Institute for Health Care Improvement; Boston VAMC site visit, EDIS (FY14)

Varied implementation of clinical protocols in triage: Expediting care through the initiation of clinical protocols improves both patient safety and flow (Love, 2012). Dependent on ED volume, two approaches may be taken to expedite the initiation of clinical protocols in triage: staffing a provider (or advanced practitioner) in triage and/or establish standing order sets for RNs to initiate protocols under the supervision of a provider. Across sites surveyed, 24 percent of VAMC data call recipients reported staffing a provider in triage[188] and 24 percent of VAMC survey respondents reported using standing orders;[189] across data call and survey respondents 68 percent of facilities reported that they neither staff a provider in triage nor *utilize* standing orders.[190]

A provider in triage (e.g., a physician or advanced practitioner) has the ability to write orders, start clinical protocols, and discharge patients thereby improving both patient safety and flow. This is evident at Kaiser, which exclusively staffs providers in

---

[188] Choice Act data call (N= 55 sites)

[189] Choice Act survey (N=71 sites)

[190] Choice Act data call and survey (N= 91 sites)

ED triage[191]. Additionally, St Louis VAMC saw a 17 percent decrease in its daily mean ED LOS following the addition of a provider in triage (Day, 2013).

While literature supports the staffing of a provider in triage in high-volume EDs, it may not be appropriate in smaller facilities that cannot support dedicating a full-time physician or advanced practitioner. An alternative, observed at some VAMCs and high-performing institutions, is the establishment of RN standing orders. Standing orders follow evidence-based guidelines for specific disease sets or chief complaints and allow RNs in triage to initiate diagnostic tests and or interventions before the provider sees the patients. This has been shown in the literature to decrease ED LOS by improving patient turnover and bed availability (Retezar, 2011). Boston VAMC relies on RN standing orders to manage flow and expedite care — in many cases critical diagnostics (labs, imaging) are completed by the time the physician sees the patient. Standing orders have allowed Boston to consistently maintain a favorable LOS – it scores in the top quartile of VAMCs.[192] The facility attributes its successful implementation to nurse competencies and strong relationships and trust between the ED physicians and nurses.[193]

Varied implementation of ED fast-track processes for lower-acuity patients: As was demonstrated in Section 6.2.2.2, the number of low-acuity, clinically inappropriate[194] ED visits is a major challenge to patient flow; 86 percent of VHA ED visits are classified as low to moderate acuity based on the emergency severity index (ESI 3, 4, and 5).[195,196] While this is felt most acutely in the evening when outpatient clinics are closed, as detailed in Finding 6.2.2.2, this is also cited as an issue during the day when clinics are open.[197] Evidence supports the use of a fast-track process to treat these non-urgent patients in a dedicated area by dedicated staff, so as to minimize long wait times and prevent congestion of the main ED from low-acuity patients. Staffing a provider in fast-track allows the facility to care for and discharge lower-acuity patients without taking up resources in the main ED. In one study, the prevalence of a fast-track process decreased wait times by 51 minutes, length of stay by 28 minutes, and LWBS rates by 4 percent without a change in mortality and revisit rates (Sanchez, 2006). Facility-developed fast-track processes were seen in a little more than 50 percent of VAMC sites visited[198] and, consistent with evidence,

---

were cited as being successful in segmenting and caring for low-acuity ED visits and minimizing the disruption to inpatient access[199] (Sanchez, 2006).

Boston VAMC and Lexington VAMC have each implemented traditional fast track process in which dedicated providers see low acuity patients in a designated area of the ED.[200] Both facilities have shown considerable success from segmenting patients by acuity and discharging patients directly from the fast-track area. Boston VAMC channels more than 30 percent of its patients triaged through its fast track process (Institute for Healthcare Improvement, 2014) and scores in the top quartile of VAMCs in ED LOS, and Lexington VAMC scores in the top of quartile of facilities in door to doctor time.[201] Palo Alto has taken a different approach to treating low acuity patients. ED leadership recognized the value in segmenting patients by acuity, but understood that they did not have the space nor the resources to designate a "fast track" area in the ED and administer diagnostic testing (e.g., imaging and lab) in the ED for those patients. Instead, the ED has coordinated with on-site outpatient clinics to share diagnostic services through a "fast pass" process, as detailed in Table 6-2. As a result, Palo Alto has seen a 20 percent decrease in ED LOS for Medical admissions since 2012.[202]

Table 6-2. VAMC Case Study: Fast-Track Options

Palo Alto VAMC Alternative Fast Track
Context Palo Alto VAMC set the following patient flow goals for the ED[203] - Door to triage: 10 minutes - Door to doctor: 20 minutes - Decision to admit to patient placement in an inpatient bed: 1.5 hours **Approach** To achieve these goals, VA has instituted a "fast pass" system to expedite care for lower acuity patients; the system has the following components: - Low acuity patients are given a map and directed to the on-site outpatient clinic for diagnostic testing[204]

[203] Site visit ED throughput workshop

[204] Site visit ED throughput workshop (Palo Alto)

Palo Alto VAMC Alternative Fast Track
▪ Outpatient diagnostics maintain two lines, one to see the patients from the ED and one for traditional appointments; the ED patients have priority[205]
▪ Patients are tracked through EDIS such that their ED nurses know where they are and can identify any delays care[206]
Impact
▪ Since implementing this "fast process" in conjunction with other process improvement initiative the VAMC has been able to meet its throughput objectives 80 percent of the time[207]
▪ Front line ED staff commented that the fast track process not only "creates ED real estate [for higher acuity patients], but it is also popular among patients, as evident by our ED [Press Ganey] patient satisfaction scores[208]"

Varied implementation of flow management processes and roles to expedite admission and bed placement: Inpatient bed availability was cited as a challenge across visited VAMCs; 71 percent cited lack of bed availability as a primary source of ED bottlenecks.[209] While clinically inappropriate admissions and challenges with discharge contribute to bed availability issues, as detailed in Finding 6.2.1 and Section 7 respectively, inefficiencies in bed management further delay bed assignment limiting access for new ED and surgical admissions. Inefficiencies in bed management were associated with three factors: (a) inconsistent bed management organizational structure across VAMCs; (b) bed assignment order delays; (c) variable use of BMS.

(a) Inconsistent bed management organizational structure: There is considerable variability across VAMCs in their approach to bed management and flow. Sixty-one percent of VAMCs visited cited their bed coordinators as a strength in managing patient flow,[210] but stressed that most coordinators are only staffed during the day contributing to evening admission delays. A few facilities have begun to implement flow teams to support bed management and expedite admissions following bed turnover, but processes are variable. Boston VAMC, for example, has implemented an inpatient flow coordination center that manages all transfers, scheduled admissions, bed management, flow coordination, and collaborative care (for example, UM and discharge planning). Additionally, the coordination center engages a flow committee that includes an interdisciplinary

[210] Site visit ED throughput workshop (N=21 sites)

team of nurses, bed managers, physicians, and leadership to drive performance improvement projects. Previous projects have included a review of the admission process, ED physicians are now responsible for the admit decisions, and an analysis of observation utilization.[211] Complementing its inpatient flow team, Boston also started an ED flow group, in 2006, that meets weekly to discuss open issues related to ED throughput from the week before. The ED flow group includes all ED staff (e.g., nurses, physicians, housekeepers, clerks) and each participant is responsible for leading new performance improvement pilots.[212] The VAMC highlights its flow team as one reason it has been able to maintain ED LOS under the VHA goal of 4 hours for the past 2 years.[213]

(b) Bed assignment order delays: Across VAMCs, considerable delays often result from waiting to identify and assign patient beds until after the admission orders are written. As was depicted in **Figure 6-6**, ED physicians are often responsible for the initial admit decision, but bed assignment does not begin until after the hospitalist or resident (in a teaching facility) writes the admission order. While this process should incorporate checks and balances, especially for residents, executing these processes sequentially rather than in parallel, delays bed assignment and ED LOS.[214] One academic medical center streamlined its bed assignment and flow management processes through its active bed management program. Under this program physicians are designated as "triage hospitalists" and responsible for both admission decisions as well as bed management and flow. This has enabled admission and bed assignment decisions to happen almost simultaneously, and led to a 98 minute decrease in ED LOS (Howell, 2008).

Fargo VAMC has expedited the bed assignment process through a collaboration between the ED physicians and hospitalists. Once the ED physician makes the decision to admit, the bed coordinator is paged and bed assignment is initiated. Simultaneously, the ED physician calls the hospitalist to discuss the patient and admission orders. The hospitalist writes subsequent orders while the bed management team is identifying available placement.[215] This process has helped Fargo VAMC maintain an ED LOS for admitted patients of 204 minutes, which is well under the VHA goal of 240 minutes.[216] While orders are required to physically move a patient to an inpatient bed, no VHA directive to date precludes the upfront identification and assignment of a bed.[217]

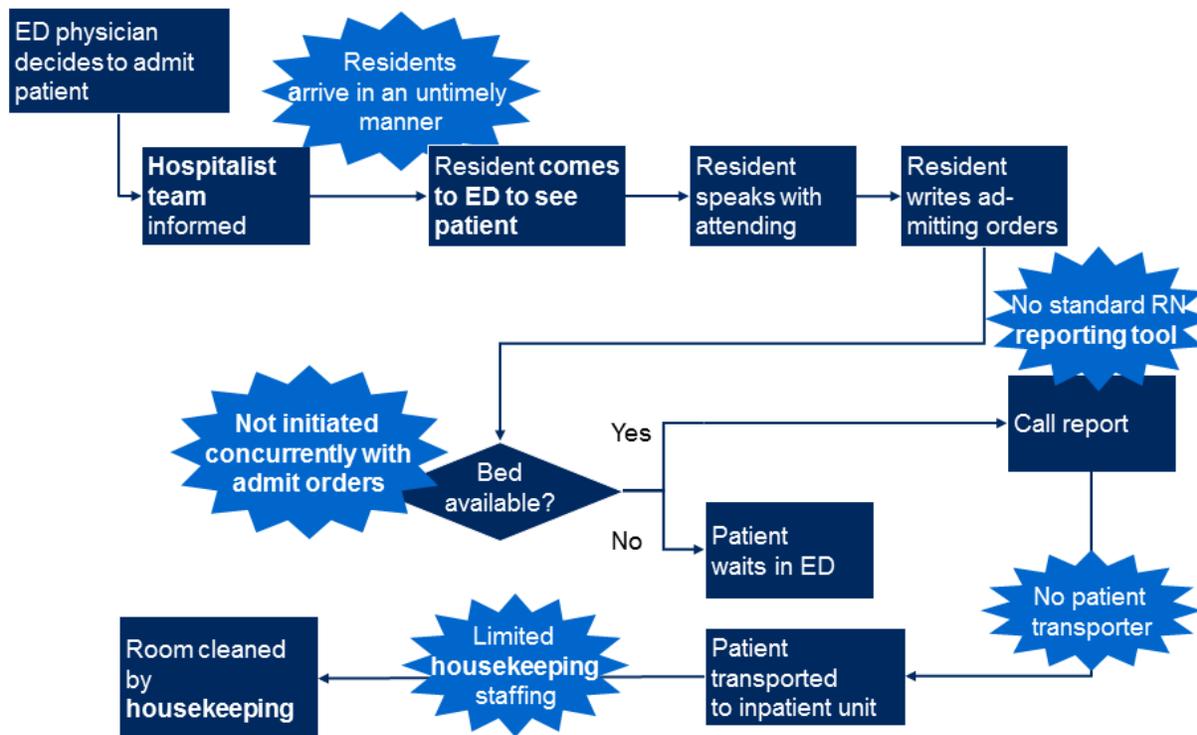
Figure 6-6. Ineffective Coordination Congests Flow and Limits Access


(c) **Variable use of BMS:** BMS, VHA's bed management tool, provides patient flow and tracking capabilities on par with private facilities (e.g., it offers a real-time view of patient movements within the inpatient continuum of care). However, its potential is limited by user acceptance, inadequate training, and a lack of integration with tools (e.g., EDIS). The challenge is that BMS is only effective when staff members make manual, real-time updates to reflect patient movements. Staff cite that these updates are often difficult to manage along with their patient care responsibilities.[218] One facility commented that the "[bed board] is used exclusively by visitors and paints an inaccurate view of bed assignments.[219]" The result of BMS's perceived ineffectiveness among some facilities is varied utilization of the tool across the system – 46 percent of workshop participants cited BMS as a strength in facilitating bed management and 33 percent cited the tool as a challenge.[220]

In contrast, a few facilities recognize the value of BMS and prioritize real-time updates stating, "We live and die by our bed board"[221] and "BMS' ability to queue beds has considerably improved our bed turnaround; the tool has also allowed us to better forecast bed needs."[222] Literature supports this view, stating that bed management tools, when implemented as part of a successful process improvement initiative, have shown to have a 55 percent improvement in overall bed turnaround time over a 3-year period, including a 29 percent improvement in housekeeping turnaround and a 42 percent improvement in patient transportation (Tortorella, 2013).

6.2.3.2 Limited Cross-facility Communication and Sharing of Best Practices
